If ACCUMACC is greater than 0, the threads which relate to the same Accounting accumulation identifiers (defined by the aggregation field ACCUMUID) are aggregated into one Accounting trace record (3, 239).

For DB2 versions prior to version 10 all packages of these accumulated threads are reported into **one** package section. As a result you lose the granularity for each package and you cannot:

- Distinguish between SP and called subprograms.
- Determine which thread has executed which SP or package.

Starting with DB2 10 reports show the first 24 different packages or SPs of the accumulated threads in separate data sections (239) and only if there are more than 24 packages, all the remaining packages will be accumulated into the 25th data section.

**Example of ordering by interval: ORDER (INTERVAL):**

This example shows a short Accounting report that is ordered by interval.
To produce a report that presents DB2 activity by time intervals, the input data first needs to be reduced to the intervals that you want to use in reporting.

The following command was used to generate the sample report in "Accounting report - ordered by interval."

```
ACCOUNTING
   REDUCE
   INTERVAL (5)
   REPORT
   ORDER (INTERVAL)
```

In this command the data is reduced to 5-minute intervals. The report is ordered by this interval. An entry is produced that shows the activity during every 5-minute interval.

**Accounting report - ordered by interval**

The following example shows an Accounting report that is ordered by interval. Reports ordered by INTERVAL, with or without another identifier, are especially useful in trend analysis. For example, you can reduce and save your data by specifying INTERVAL(1440) to produce reports that show the day-by-day activity of your DB2 subsystem.

ACCOUNTING REPORT COMPLETE

**TOP processing**

TOP processing is useful to identify the report entries that might indicate a problem application.

Signs of a problem can be a long elapsed or processing time, a high number of suspensions, commits per update, or buffer updates. Identifying these entries is especially useful when your report covers many users or a long period so that it is not immediately clear which applications are causing performance problems.

To identify report entries with a high value in certain fields, you can produce an Accounting report or trace with TOP lists. TOP lists are index-like reports at the end of a report or trace. They point out the most interesting entries in the report or trace. You can generate such lists by using the TOP subcommand option.
Note: Entries with 0 or undetermined values are not shown. Moreover, if your input data contains only 0 or undetermined values for the TOP fields requested, a TOP list is not generated.

You can also filter a report or trace so that only the main resource consumers are shown, ordered by descending resource value. To obtain a filtered report or trace, specify the TOP subcommand option with the ONLY keyword.

The shown resource values are average values. To obtain total values, which means, the main resource consumers calculated by taking into account how often they consumed resources, specify the TOP subcommand option with the TOTAL keyword. TOTAL only applies to reports. If you specify it with a trace, it is ignored.

Examples of TOP processing:

These examples show some applications of the TOP subcommand option in Accounting reports and traces.

Top-10 plans in Accounting report

To produce a short Accounting report with a list of the top-10 plans that spent the longest time in an application, specify:

```
GLOBAL
   INCLUDE (LOCATION (USIBMSNEWY11))
   EXCLUDE (CONNTYPE (CICS))
ACCOUNTING
   REPORT
      ORDER (PLANNAME)
      TOP
```

Accounting report - TOP listing - example

The following example shows the last page of an Accounting report. It presents a list of the 10 plans that had the highest value for elapsed time in the application. The TOP list also shows the page on which the report entries can be found.

Accounting REPORT COMPLETE

Top-5 Getpages in Accounting trace

To produce a trace with a TOP list for the number of Getpage requests, use the following command:
Accounting trace - TOP listing - example

The following example shows the last page of an Accounting trace. The TOP list on the last page of the trace consists of the five entries that had the highest number of Getpage requests. Each entry consists of TIMESTAMP, PRIMAUTH, and PLANNAME information, the value of the number of Getpage requests, and the page number where the trace entry can be found.

TOP lists of available fields in Accounting report

You can generate, for example, Accounting reports that show TOP lists for all fields available for use with the TOP subcommand option, as shown in the following command:

```
ACCOUNTING TRACE TOP (5 GETPAGES)
```

Top-3 default field in Accounting trace

To produce a filtered trace that shows only the top-3 entries for the default TOP field, namely ELAPSED TIME IN APPLICATION, use the following command:

```
Accounting TRACE TOP (3 ONLY)
```

Accounting trace - TOP ONLY list - example

The following example shows an Accounting trace with a TOP ONLY list.
Note: The TOP(ONLY) subcommand option changes the presentation sequence of Accounting reports and traces. Report and trace entries are ordered according to the TOP resource instead of the timestamp or ORDER subcommand options. The summarization in reports is not affected by the changed sequence caused by TOP filtering.

Reducing data
Use the REDUCE subcommand to consolidate records with certain common characteristics into a single record.

You can limit the range of records by date and time. You can specify multiple ranges of time. This can be useful for monitoring peak-time performance, for example.

Within a specified time range, you can specify the interval at which records are consolidated.

The start time of the first interval that is processed by REDUCE is influenced by BOUNDARY, INTERVAL, and FROM.

OMEGAMON XE for DB2 PE attempts to reduce all data that falls between FROM and TO dates and times. The first interval starts at a time aligned with BOUNDARY, at or before the FROM time. If an interval cannot be aligned with the FROM time, the first properly aligned interval starting before the FROM time is used.

Although there is no restriction on the INTERVAL and BOUNDARY combination, your specification should comply with the following rules:
- For intervals of less than 60 (excluding 0), there should be a whole number of intervals in an hour. Choose one of the following values:
  - 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, or 30
- For intervals of 60 or greater, there should be a whole number of intervals in a day. Choose one of the following values:
  - 60, 120, 180, 240, 360, 480, 720, or 1440
- For intervals of one day (1440) or greater, INTERVAL should be a multiple of 1440.
- Select your interval and boundary so that the first interval starts at the FROM time.
Examples of interval calculation:

These examples show how the REDUCE subcommand is used in combination with FROM, TO, INTERVAL, and BOUNDARY to align start times and intervals.

Using REDUCE to align to the start of the hour

```
REDUCE
  FROM  (,08:00)
  TO    (,10:00)
  INTERVAL (30)
  BOUNDARY (60)
```

BOUNDARY(60) aligns the start time of the intervals at the start of an hour, so the first interval starts at the FROM time (08:00). Subsequent intervals start every 30 minutes (08:30, 09:00, and 09:30 each day).

Using REDUCE to cover a day

```
REDUCE
  INTERVAL (1440)
  BOUNDARY (60)
```

The following defaults are applied:
- The default for FROM is all dates and a time of 00:00:00.00
- The default for TO is all dates and a time of 23:59:59.99

BOUNDARY(60) aligns the start time of the intervals at the start of an hour, so the first interval starts at the FROM time (00:00). Subsequent intervals cover 1 440 minutes or one day. An interval starts at 00:00 each day.

Using REDUCE to start every hour

```
REDUCE
  FROM  (,08:30)
  TO    (,12:00)
  INTERVAL (60)
  BOUNDARY (60)
  REPORT
    FROM  (,08:30)
    TO    (,12:00)
```

BOUNDARY(60) aligns the start time of the intervals at the start of an hour, so the first interval starts at the hour of the FROM time (08:00). Subsequent intervals start every hour (09:00, 10:00, and 11:00).

Processing intervals:

Interval processing within the REDUCE subcommand determines the time intervals that are used for reducing Accounting data and it influences how data is reported.

Use intervals for:
- Reporting by intervals
Producing reports with different time spans

If SAVE accompanies REDUCE, the reduced data is saved into the Save data set.

This following topics provide examples of interval processing.

*How intervals are calculated:*

The start time of the first interval that is processed by REDUCE is influenced by BOUNDARY, INTERVAL, and FROM.

OMEGAMON XE for DB2 PE attempts to reduce all data that falls between the FROM and TO times. The first interval starts at a time aligned with BOUNDARY, at or before the FROM time. If an interval cannot be aligned with the FROM time, the first properly aligned interval starting before the FROM time is used. An interval that starts before the FROM time only contains data between the FROM time and the start of the next interval. Input data before the FROM time is not processed.

Although there is no restriction on the INTERVAL and BOUNDARY combination, your specification should comply with the following rules:

- For intervals of less than 60 (excluding 0), there should be a whole number of intervals in an hour. Choose one of the following values:
  - 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, or 30
- For intervals of 60 or greater, there should be a whole number of intervals in a day. Choose one of the following values:
  - 60, 120, 180, 240, 360, 480, 720, or 1440
- For intervals of one day (1440) or greater, INTERVAL should be a multiple of 1440
- Select your interval and boundary so that the first interval starts at the FROM time

If you do not require interval processing, do not change the default INTERVAL (0) for performance reasons.

Always use the largest interval that meets your reporting requirements. For example, if daily reports provide sufficient granularity, use INTERVAL (1440).

*Examples of interval processing:*

Sample of SMF File data used for the examples.

The following examples assume:

1. The DB2 instrumentation facility is started for Accounting to SMF at DB2 startup by the following DB2 command:
   - `START TRACE (ACCTG) DEST(SMF) CLASS(1)`
2. The system programmer wants to analyze performance for Thursday, 14 March 1999, so the SMF file for that day is obtained.
   The following figure represents sample data from the SMF file. Actual trace data can have a different distribution of DB2 records and timestamps. For the purpose of this example, assume that the Statistics trace was previously active.

Figure 259. Example SMF File data

3. OMEGAMON XE for DB2 PE is run to get Accounting reports.

Examples using REDUCE:

These examples show how the start time is aligned by the use of BOUNDARY.
Example 1

ACCOUNTING
REDUCE
    FROM (09:00)
    TO (11:00)
    INTERVAL (30)
    BOUNDARY (60)

The data that is available for reducing is limited by the GLOBAL command. If you specified FROM and TO dates and times in GLOBAL, OMEGAMON XE for DB2 PE discards all records outside those dates and times before reducing. In this example no GLOBAL command is in effect, so the FROM and TO dates and times that are specified with REDUCE are used. No dates are specified, so all dates are included.

BOUNDARY(60) aligns the start time of the intervals at the start of an hour, so the first interval starts at the FROM time (09:00). Subsequent intervals start every 30 minutes. The following intervals are calculated:
- Beginning at 9:00:00 - containing two Accounting records
- Beginning at 9:30:00 - containing four Accounting records

No intervals are calculated at 10:00:00 or 10:30:00 because there are no Accounting records.

The interval begin and end times are reported in the job summary report. The job summary report indicates that an interval is calculated and indicates the number of records processed during the interval. It does not indicate the number of consolidated records after reducing.

Example 2

ACCOUNTING
REDUCE
    INTERVAL (1440)
    BOUNDARY (60)

In this example no GLOBAL command is in effect and no dates or times have been specified in REDUCE, so the following defaults are applied:
- The default for FROM is all dates and a time of 00:00:00.00
- The default for TO is all dates and a time of 23:59:59.99

BOUNDARY(60) aligns the start time of the intervals at the start of an hour, so the first interval starts at the FROM time (00:00). Subsequent intervals cover 1440 minutes or one day. An interval starts at 00:00 each day. In this example, there is one interval that contains all of the Accounting records in the input data set.

The interval begin and end times are reported in the job summary report.

Examples using REDUCE and REPORT:

These examples show the effect of REPORT FROM and TO on REDUCE INTERVAL and BOUNDARY.
Example 1

```
ACCOUNTING
REDUCE
  INTERVAL (60)
REPORT
  FROM ( , 9:00:00)
  TO ( ,12:00:00)
```

In this example no GLOBAL command is in effect and no FROM and TO times are specified in the REDUCE subcommand, so all records in the input are reduced.

The REDUCE subcommand specifies that data is reduced at 60-minute intervals. By default, the boundary is set to 60. Data is gathered and consolidated every hour on the hour.

The Accounting data starts at 8:31:05. The INTERVAL begins on the hour. OMEGAMON XE for DB2 PE determines that the record at 8:31:05 falls into an interval beginning at 8:00:00 and sets the beginning interval time to 8:00:00.

Each additional Accounting record is read. The Accounting records at timestamps 8:31:05, 8:45:13, and 8:57:27 all fall into the interval beginning at 8:00:00. These three records are accumulated (added, subtracted, or whatever is appropriate for the given Accounting fields), consolidated, and stored by unique OMEGAMON XE for DB2 PE identifier sets (PRIMAUTH, PLAN, REQLOC, and so on) for the interval beginning at 8:00:00. Messages are written to the job summary report.

OMEGAMON XE for DB2 PE calculates the next interval at 9:00:00. Accounting records at 9:12:11, 9:15:00, 9:30:01, 9:32:00, 9:43:00, and 9:55:59 are accumulated, consolidated and stored for the interval beginning at 9:00:00. Messages are written to the job summary report.

No Accounting records are written during the period from 10:00:00 to 12:00:00, so no intervals are calculated and no messages are written to the job summary report.

Data is stored for the following intervals:
- Beginning at 8:00:00 - containing three Accounting records
- Beginning at 9:00:00 - containing six Accounting records
- Beginning at 12:00:00 - containing two Accounting records
- Beginning at 13:00:00 - containing six Accounting records
- Beginning at 15:00:00 - containing one Accounting record
- Beginning at 16:00:00 - containing eight Accounting records

The systems programmer requested a report with FROM and TO times of 9:00:00 and 12:00:00.

The data that is available for reporting is restricted by the FROM and TO times that are specified in both GLOBAL and REDUCE. If you specify FROM and TO dates and times in GLOBAL, OMEGAMON XE for DB2 PE discards all records outside those dates and times before reducing. If you specify FROM and TO dates and times in REDUCE, all records outside those dates and times are not available to subsequent REPORT subcommands. In this example, no GLOBAL command is in effect and no FROM and TO dates or times are specified in the REDUCE subcommand.
Accounting records that are stored in intervals beginning at or later than 09:00:00, but less than 12:00:00 are accumulated, consolidated, and reported in an Accounting report. In this instance, the report contains Accounting records from 09:12:11 to 09:55:59.

The report header contains the following times:

```
INTERVAL FROM 07/14/13 09:00:00
               TO 07/14/13 10:00:00
REQUESTED ALL DATES 09:00:00
               TO 12:00:00
```

INTERVAL FROM and TO times indicate the actual content of the report. In this instance, the INTERVAL FROM time is 9:00:00, which is the first interval beginning at or later than the REQUESTED FROM time. The INTERVAL TO time is 10:00:00, which is the end time of the last interval beginning at a time less than the REQUESTED TO time.

The REQUESTED FROM and TO times from the REPORT subcommand are printed in the report, even if they are broader than the available data. In this case, ALL DATES is reported in place of an actual date because no date was specified in the REPORT subcommand.

If the requested reporting interval is broader than the available data, the INTERVAL FROM and TO dates and times actually reflect the content of the report. If no FROM and TO dates and times are specified in the REPORT subcommand, the FROM and TO dates and times from GLOBAL are used. If no FROM and TO dates and times are specified in GLOBAL, NOT SPECIFIED is printed.

In “Example 1” on page 2903, the INTERVAL FROM and TO times are not the same as the REQUESTED FROM and TO times. However, the data encompassed by the INTERVAL FROM and TO times is the same as the data encompassed by the REQUESTED FROM and TO times. This is not always the case, as in “Example 2.”

### Example 2

```
ACCOUNTING
  REDUCE
    INTERVAL (60)
    BOUNDARY (30)
  REPORT
    FROM (,9:00:00)
    TO (,12:00:00)
```

This command is identical to the command in the “Example 1” on page 2903, except that a BOUNDARY of 30 is included. The results are different.

The Accounting data starts at 8:31:05. The INTERVAL begins on the half hour. OMEGAMON XE for DB2 PE determines that the record at 8:31:05 falls into an interval beginning at 8:30:00 and sets the beginning interval time to 8:30:00. The following intervals are calculated:

- Beginning at 8:30:00 - containing five Accounting records
- Beginning at 9:30:00 - containing four Accounting records
- Beginning at 11:30:00 - containing two Accounting records
• Beginning at 12:30:00 - containing five Accounting records
• Beginning at 13:30:00 - containing one Accounting record
• Beginning at 15:30:00 - containing two Accounting records
• Beginning at 16:30:00 - containing seven Accounting records

An Accounting report is produced. The REQUESTED FROM and TO times are 9:00:00 and 12:00:00. Accounting records that are stored in intervals beginning at or later than 9:00:00, but less than 12:00:00, are included in the report. The intervals beginning at 9:30:00 and 11:30:00 are included in the report. No interval is calculated at 10:30:00 because there are no Accounting records.

In this instance, the report contains Accounting records from 9:30:01 to 12:17:54. Even though the REQUESTED FROM and TO times are the same as in “Example 1” on page 2903, the content of the report is different.

The report header contains the following times:

<table>
<thead>
<tr>
<th>INTERVAL FROM</th>
<th>INTERVAL TO</th>
</tr>
</thead>
<tbody>
<tr>
<td>07/14/13 09:30:00</td>
<td>07/14/13 12:30:00</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>REQUESTED ALL DATES FROM</th>
<th>REQUESTED ALL DATES TO</th>
</tr>
</thead>
<tbody>
<tr>
<td>09:00:00</td>
<td>12:00:00</td>
</tr>
</tbody>
</table>

In both, “Example 1” on page 2903 and “Example 2” on page 2904, the INTERVAL FROM and TO dates and times are different from the REQUESTED FROM and TO times. However, this report contains data outside the REQUESTED FROM and TO times.

The INTERVAL FROM time is the start time of the first interval beginning at or after the REQUESTED FROM time (9:00:00 in this case), so the first interval that is reported starts at 9:30:00. Consequently, those records that are written between 9:00:00 and 9:30:00 are not included in the report.

The INTERVAL TO time is the end time of the last interval beginning before the REQUESTED TO time (12:00:00 in this case), so the last interval that is reported starts at 11:30:00. Consequently, those records that are written between 12:00:00 and 12:30:00 are included in the report. If the interval starts after the REQUESTED FROM time and before the REQUESTED TO time, all data from the interval is included, even if the interval extends beyond the REQUESTED TO time.

Example 3

```
Accounting REDUCE
   FROM (,09:30)
   TO (,13:00)
   INTERVAL (60)
   BOUNDARY (60)
   REPORT
      FROM (,09:30)
      TO (,13:00)
   SAVE
```

In this example, no GLOBAL command is in effect, so the FROM and TO dates and times that are specified in REDUCE are used.
REDUCE specifies that data is reduced at 60-minute intervals. BOUNDARY(60) aligns the start time of the intervals at the start of an hour, so the first interval starts at the hour of the FROM time (09:00).

The first interval starts before the FROM time, but only contains data between the FROM time (09:30) and the start time of the next interval (10:00).

The following intervals are calculated:

- Beginning at 09:00:00 - containing four Accounting records
- Beginning at 12:00:00 - containing two Accounting records

**Note:** No intervals are calculated at 10:00:00 or 11:00:00 because there are no Accounting records.

The interval *begin* and *end* times are reported in the job summary report.

The systems programmer requested a report with FROM and TO times of 9:30:00 and 13:00:00. Accounting records that are stored in intervals beginning at or later than 9:30:00, but less than 13:00:00 are accumulated, consolidated, and reported in an Accounting report. In this example, the report only contains Accounting records from the interval starting at 12:00:00.

All reduced records are written to the Save data set (including the records from the interval starting at 9:00:00 that were excluded from the report).

The report header contains the following times:

```
INTERVAL FROM 07/14/13 12:00:00
TO 07/14/13 13:00:00
REQUESTED ALL DATES 09:30:00
TO 13:00:00
```

The INTERVAL FROM and TO times reflect the actual content of the report. The INTERVAL FROM time is the *start time* of the first interval beginning at or after the REQUESTED FROM time (9:30:00 in this case), so the first interval that is reported starts at 12:00:00. The INTERVAL TO time is the *end time* of the last interval beginning before the REQUESTED TO time (13:00:00 in this case).

The REQUESTED FROM and TO times from the REPORT subcommand are printed in the report, even if they are broader than the available data. In this case, ALL DATES is reported in place of an actual date because no date was specified in the REPORT subcommand.

In this example, the INTERVAL FROM and TO times are not the same as the REQUESTED FROM and TO times, although the data encompassed by both sets of times is the same. However, the content of the Save data set is different from the content of the report.

**The effect of REDUCE on TRACE:**

These examples show the effect of TRACE FROM and TO on REDUCE BOUNDARY and INTERVAL.

**Example 1**

```
ACCOUNTING
REDUCE
```
The data that is available for tracing, as with reporting, is influenced first by the GLOBAL command. If you specify FROM and TO dates and times in GLOBAL, all records outside those dates and times are discarded before reducing or tracing.

The data that is available for tracing is also influenced by the REDUCE subcommand. If you specify FROM and TO dates and times in REDUCE, all records outside those dates and times are unavailable to subsequent TRACE subcommands. In this example, no GLOBAL command is in effect and no dates and times are specified for REDUCE, so all records in the input data are available to TRACE. The data that is available for tracing is not restricted by INTERVAL or BOUNDARY.

The ACCOUNTING TRACE subcommand specifies data from 12:00:00 to 17:00:00. The Accounting trace header contains the following times:

ACTUAL FROM 07/14/13 12:15:00
REQUESTED ALL DATES 09:00:00 TO 17:00:00

No dates are specified, so all dates are included. The REQUESTED FROM and TO dates and times from the TRACE subcommand are printed in the trace.

Example 2

ACCOUNTING
REDUCE
FROM (,10:00)
TO (15:00)
REPORT
FROM (,10:00)
TO (15:00)
TRACE
FROM (,09:00)
TO (17:00)

In this example, the TRACE FROM time is before the REDUCE FROM time and the TRACE TO time is after the REDUCE TO time. The trace contains records that are written at or after 10:00:00 and before 15:00:00. The Accounting trace header contains the following times:

ACTUAL FROM 07/14/13 12:15:00
REQUESTED ALL DATES 09:00:00 TO 17:00:00

No dates are specified, so all dates are included. The REQUESTED FROM and TO times from the TRACE subcommand are printed in the trace. However, the available data is limited by the REDUCE FROM and TO times (10:00:00 to 15:00:00). The requested times do not reflect the actual content of the trace.
The ACTUAL FROM time is the timestamp of the first record in the trace. In this example, the first Accounting record after 10:00:00 is at 12:15:00. The trace includes the eight Accounting records between the REDUCE FROM and TO times.

The effect of REDUCE on FILE:

These examples show the effect of FILE FROM and TO on REDUCE BOUNDARY and INTERVAL.

Example 1

ACCOUNTING
REDUCE
  BOUNDARY (30)
  INTERVAL (60)
REPORT
  FROM (, 9:00:00)
  TO (,12:00:00)
FILE
  FROM (,12:00:00)
  TO (,17:00:00)

The data that is available for filing, as with reducing, is influenced first by the GLOBAL command. If you specify FROM and TO dates and times in GLOBAL, all records outside those dates and times are discarded before reducing or filing.

The data that is available for filing is also influenced by the REDUCE subcommand. If you specify FROM and TO dates and times in REDUCE, all records outside those dates and times are unavailable to subsequent FILE subcommands. In this example, no GLOBAL command is in effect and no times are specified for REDUCE, so all records in the input data are available to FILE. The data that is available for filing is not restricted by INTERVAL or BOUNDARY.

The ACCOUNTING FILE subcommand specifies data from 12:00:00 to 15:00:00. No dates are specified, so all dates are included.

Example 2

ACCOUNTING
REDUCE
  FROM (,10:00)
  TO (15:00)
REPORT
  FROM (,10:00)
  TO (15:00)
FILE
  FROM (,09:00)
  TO (17:00)

In "Example 2," the FILE FROM time is before the REDUCE FROM time and the FILE TO time is after the REDUCE TO time. The file contains records that are written at or after 10:00:00 and before 15:00:00.

No dates are specified, so all dates are included. The data that is available for filing is limited by the REDUCE FROM and TO times (10:00:00 to 15:00:00). The requested times do not reflect the actual content of the file.
In "Example 2" on page 2908, the first Accounting record after 10:00:00 is at 12:15:00. The file includes the eight Accounting records between the REDUCE FROM and TO times.

**Member-scope and group-scope reporting**

DB2 enables a query to be processed by several members of a data sharing group. Each member can split the work into parallel tasks. Accounting aggregates the parallel activity done in each member and includes it in the originating query activity.

The information in this section only applies to DB2 data sharing environments.

**Member-scope reports:**

Member-scope reports present the activity of a data sharing group by member.

The activity shown for each member consists of the originating query activity and any parallel activity, including any parallel activity that is performed on other members.

The data in member-scope reports is presented by a combination of location, group, subsystem, and member. Whenever one of these values changes, a new page is started and the page number is initialized. The following command produces a member-scope Accounting report shown in "Member-scope Accounting report." The command uses the SHORT layout and the default order of the OMEGAMON XE for DB2 PE identifiers, namely plan name within primary authorization ID.

```
ACCOUNTING REPORT
```

**Member-scope Accounting report**

The following example shows a member-scope Accounting short report resulting from the default order of the OMEGAMON XE for DB2 PE identifiers:

- The data is ordered according to the authorization IDs and plans. All primary authorization IDs and plans from the input data are shown.
- The TOTAL is printed for primary authorization IDs that contain more than one plan.
- GRAND TOTAL is printed at the end of each member if there is more than one first-level identifier reported.
Group-scope reports:

Group-scope reports show the instrumentation data aggregated by the OMEGAMON XE for DB2 PE identifiers that you specified and by the individual members.

The data is presented by a combination of location and group. Whenever either of these values changes, a new page is started and the page number is initialized. The following command produces a group-scope Accounting report shown in “Group-scope Accounting report” on page 2911. The command uses the SHORT
Group-scope Accounting report

Here is an example of a group-scope Accounting report:

- The data is ordered according to the authorization IDs and plans. All primary authorization IDs and plans from the input data are shown. MEMBER is automatically added as the last ORDER identifier.
- The GROUP TOTAL is printed for primary authorization IDs and plans that contain more than one member.
- The TOTAL is printed for primary authorization IDs that contain more than one plan.
- GRAND TOTAL is printed at the end of each group if there is more than one first-level identifier reported.

Chapter 6. Batch reporting 2911
### General Statistics information

Statistics reports and traces provide you with a way to analyze DB2 Statistics class 1 trace data.

DB2 accumulates statistics for the system services address space, database services address space, and DDF address space. These statistics are accumulated from the time DB2 is started until it is stopped. At a configurable interval, DB2 logs the current statistics values using IFCID 1 and IFCID 2.

Use the Statistics report set to:
- View system-wide statistics for key DB2 components.
- Compare system performance over two or more reporting intervals.
- Assess system-wide performance for individual DB2 subsystems.
- Assess performance data for a group of data sharing DB2 subsystems.
- Summarize system performance data in a single report.

The Statistics report set provides the following functions:
- Traces present the difference (delta) between the Statistics recorded in two consecutive Statistics record pairs.
- Reports summarize Statistics data over one or more user-defined intervals.
- The File data set contains records in a format that are suitable for use by the DB2 load and Spreadsheet Input-Data Generator utilities.
- The Save-File utility changes Save data sets into sequential data sets for use by the DB2 load and Spreadsheet Input-Data Generator utilities.
- The REDUCE subcommand specifies intervals into which Statistics data is accumulated and apportioned. A report can then be produced that is sorted by these intervals.
- The SAVE and RESTORE subcommands are used to consolidate Statistics for a number of Statistics record pairs and then save these record pairs in a Save data set for later restoration and further processing.
- You can control the level of detail of a report by choosing one of the sample layouts or a layout that you have previously tailored.
- You can use exception processing to identify entries with fields that contain values outside thresholds that you have previously specified.
- In data sharing environments you can produce member-specific or group-specific reports.

### Statistics terms

This section describes the various terms used in the Statistics report set.
Delta and interval records:

This section defines the differences among various DB2 Statistics counters, such as accumulated values, snapshot values, and high water mark values.

When a DB2 Statistics trace is active, DB2 maintains various Statistics counters and externalizes these counters at regular intervals. The main body of Statistics data is shown in IFCIDs 1 and 2. Although there is a small difference in their timestamps, you can assume that these IFCID are externalized simultaneously. These two records are called a DB2 Statistics record pair.

Other statistics information is shown in IFCID 199 (buffer pool statistics at data set level), IFCID 225 (DB2 storage statistics), and IFCID 369 (aggregated accounting statistics).

The counters provided in a DB2 Statistics record pair represent the DB2 activity between the time the pair is externalized and the time the DB2 system was last started. A counter is provided in one of the following forms:

- As an accumulated value since the DB2 system was last started. For example, the total number of SELECT statements that were executed since the system was last started.
- As a current or snapshot value. For example, the number of open data sets at the time the DB2 Statistics record pair was externalized.
- As a maximum or high water mark value the counter has reached since the time the system was last started. For example, the maximum number of open data sets at any time since the system was last started.

The Statistics report set does not report individual DB2 Statistics record pairs (for that purpose use the long Record Trace report). Instead, it calculates deltas between two consecutive DB2 Statistics record pairs and externalizes the delta records in Statistics traces and File data sets. It also uniformly distributes the delta records over user-specified intervals and externalizes the interval records in Statistics reports and Save data sets.

Delta records:

The delta record is an OMEGAMON XE for DB2 PE term for a set of counters that describes the activity of a DB2 system between two consecutive DB2 Statistics record pairs.

For example, if a DB2 Statistics record pair is externalized at time $t_1$ and the next DB2 Statistics record pair is externalized at $t_2$, OMEGAMON XE for DB2 PE creates only one delta record, which represents the DB2 system activity between $t_1$ and $t_2$.

A counter in the delta record, like the counters in the DB2 Statistics record pairs, is provided in one of the following forms:

- Accumulated value. For example, the total number of SELECT statements that are executed between two consecutive DB2 Statistics record pairs. The accumulated value from a delta record is generally smaller than the accumulated value from the DB2 Statistics record pair which marks the end of the delta record and provides the values accumulated since the DB2 system was last started.
Current or snapshot value. For example, the number of open data sets at the end of the delta record. It is the same as the value provided in the DB2 Statistics record pair which marks the end of the delta record.

The maximum or high-water mark value the counter reached from the time the system was last started until the end of the delta record, for example, the maximum number of open data sets. It is the same as the value provided in the DB2 Statistics record pair which marks the end of the delta record.

When a delta record is calculated, OMEGAMON for DB2 PE externalizes it to Statistics traces and File data sets depending on your specification.

**Interval records:**

*Interval record* is a term for a set of counters that describes the activity of a DB2 system in a user-specified period of time.

Unlike the delta record, where the time interval is determined by two consecutive DB2 Statistics record pairs, you can specify the duration of an interval record by using the INTERVAL subcommand option of the REDUCE subcommand.

Interval records do not generally coincide with the delta records. Several delta records can be contained in one interval record. The interval records are not generally aligned with the delta records. The delta records are aligned with DB2 Statistics record pairs, while you can align the interval record by using the BOUNDARY subcommand option of the REDUCE subcommand.

When an interval record is calculated, OMEGAMON XE for DB2 PE externalizes it to Statistics reports and Save data sets depending on your specification.

To understand the relationship between the delta records and interval records, consider the following example taken from a DB2 10 subsystem.

The DB2 Statistics record pairs are generated every minute. IFCID 225 and IFCID 369 are also externalized every minute, while the generation of IFCID 199 is controlled by DB2 system parameter STATIME. If a Statistics trace is started at 9:15 and stopped at 10:15, 61 DB2 Statistics record pairs are generated.

OMEGAMON XE for DB2 PE processes these record pairs and creates 60 one-minute delta records starting every minute from 9:15 to 10:14. You can print these delta records by specifying the TRACE subcommand or store these delta records in a data set that is suitable for loading into DB2 tables by specifying the FILE subcommand.

If you need a report by an hourly basis, you can specify an interval record duration of 60 minutes by using the INTERVAL subcommand option of REDUCE. By default, the interval records are aligned with hour boundaries. If you require a different alignment, use the BOUNDARY subcommand option. Based on this specification, OMEGAMON XE for DB2 PE uniformly distributes the already calculated one-minute delta records into the corresponding interval records. Two 60-minute interval records are created starting at 9:00 and 10:00. The first interval record contains the delta records from 9:15 to 10:00 and the second interval record contains the delta records from 10:00 to 10:15. You can print these interval records by specifying the REPORT subcommand or store these interval records into a data set for later use by specifying the SAVE subcommand.
A counter in the interval record, like the counters in the delta records, is provided in one of the following forms:

- Accumulated value. For example, the total number of SELECT statements that were executed during the period of time specified for the interval record. Generally, this value is an approximation because the interval records are not aligned with the delta records. When an interval record crosses delta record boundaries, and vice versa, the values of the delta record counters are apportioned and uniformly distributed into overlapping interval records.

- The current or snapshot value is an approximation of the counter value at the end of the interval record. It is derived from the delta records' current values and is weighted according to the overlap between the delta records and the interval records.

- The maximum or high-water mark value the counter has reached between the time the system was last started and the end of the last delta record included in the interval record calculation.

To produce a report that shows the Statistics data for each interval record, you first specify the interval-record duration and alignment with the INTERVAL and BOUNDARY subcommand options of the REDUCE subcommand, then the ORDER(INTERVAL) subcommand option of the REPORT subcommand.

A special type of the Statistics report is one where all DB2 Statistics record pairs in the input data set are consolidated in one interval record. Such a report is produced if no INTERVAL subcommand option is specified and the default INTERVAL(0) is assumed. In this case, the BOUNDARY and ORDER(INTERVAL) subcommand options do not apply. The start of the interval record is aligned to the first DB2 Statistics record pair, and there is no ordering by intervals because only one interval record is created. For example, if a Statistics trace is started at 9:15 and ended at 11:15, one interval record for that period is created that contains all counters pertinent to that interval, such as the number of INSERT statements executed from 9:15 to 11:15.

**Input for Statistics reports**

This section summarizes the DB2 IFCIDs, trace types, and classes for Statistics reports.

The following table summarizes the IFCIDs and DB2 trace classes required to produce Statistics reports and traces.

<table>
<thead>
<tr>
<th>Statistics information</th>
<th>DB2 IFCIDs</th>
<th>DB2 trace type and class</th>
</tr>
</thead>
<tbody>
<tr>
<td>System statistics, DB2 statistics</td>
<td>1, 2</td>
<td>Statistics, class 1</td>
</tr>
<tr>
<td>Buffer pool data set statistics</td>
<td>199</td>
<td>Statistics, class 8</td>
</tr>
<tr>
<td>DB2 storage statistics</td>
<td>225</td>
<td>Statistics, class 6</td>
</tr>
<tr>
<td>Aggregated Accounting statistics</td>
<td>369</td>
<td>Statistics, class 9</td>
</tr>
</tbody>
</table>

Use the following DB2 command to collect all Statistics data:

```
-START TRACE (STATISTICS) CLASS (1,6,8,9) DEST (GTF) LOCATION (*)
```

Because the basic unit of processing in the Statistics report set is the delta record, at least two DB2 Statistics record pairs (IFCID 1 and 2) must be present in the input data set before statistics can be presented.
Functions and utilities of the Statistics report set

The Statistics report set consists of the REPORT, TRACE, FILE, SAVE, RESTORE, REDUCE functions, and the Save-File and Spreadsheet Input-Data Generator utilities.

REPORT

REPORT shows interval records that contain DB2 Statistics data aggregated over user-specified periods of time (see “Interval records” on page 2914) which generally do not coincide with periods in which DB2 Statistics records are externalized. For example, you can produce reports that show DB2 system activity per hour, per day, or per the entire period in which the DB2 Statistics data is collected.

A special kind of the Statistics reports are exception reports in which only the interval records are presented that contain selected counters that exceed user-defined threshold values (see “Exception processing” on page 2924).

The Statistics reports are produced for each DB2 subsystem and DB2 location present in the input data set. In a data sharing environment you can request the Statistics reports on a per-member basis or per-group basis where the Statistics data is aggregated across all members in the data sharing group (see “Member-scope and group-scope reporting” on page 2918).

You can also tailor the format of the reports by specifying which report blocks of data and which fields from a report block are included in a report or by defining your own labels and headings associated with the reported fields (see “Controlling the level of detail in reports and traces” on page 2918).

TRACE

TRACE shows delta records that contain DB2 Statistics data within periods of time marked by two consecutive DB2 Statistics record pairs (see “Delta records” on page 2913).

A special kind of the Statistics traces are exception traces in which only the delta records are presented that contain selected counters that exceed user-defined thresholds (see “Exception processing” on page 2924).

The Statistics traces are produced for each DB2 subsystem and DB2 location present in the input data set. In a data sharing environment the Statistics traces are presented for each member of a data sharing group.

Like reports, you can tailor the layout of the traces (see “Controlling the level of detail in reports and traces” on page 2918).

FILE

FILE stores delta records (the same data structures presented by the TRACE function) into a sequential data set that is suitable for use by the DB2 load utility.

When delta records are in DB2 tables, you can produce tailored reports by using a reporting facility such as Query Management Facility (QMF). The FILE function can also be considered as an alternative way of archiving the DB2 Statistics data in Save data sets. (See “Creating data for the Performance Database and the Performance Warehouse” on page 2984.)

Checking for exception conditions is also available in the FILE function, in which case only the delta records are presented that contain selected counters that exceed user-defined thresholds (see “Exception processing” on page 2924).
You can also use the File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. (See “Generating input data for spreadsheets” on page 2985.)

SAVE

You can save data sets as follows:

Without CONVERT option

Stores interval records (the same data structures presented by the REPORT function) into a VSAM data set to:

- Archive the Statistics data for producing long-term reports
- Use the Save-File utility to create a sequential data set that is suitable for use by the DB2 load utility.

(See “Creating data for the Performance Database and the Performance Warehouse” on page 2984.)

Note:

- You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.

To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.

- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.

- Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

With CONVERT option

Converts and saves reduced data into a sequential data set that can be loaded into DB2 tables.

You can also use the Save-File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. (See “Generating input data for spreadsheets” on page 2985.)

RESTORE

RESTORE reloads a previously saved data set to report it with or without new Statistics data. Saved data can be restored and re-saved as often as required.

REDUCE

REDUCE specifies the duration of the interval records that are to be presented in Statistics reports or stored in a Save data set.

You can also control the volume of data to be reported and saved by using the FROM and TO and the INCLUDE and EXCLUDE subcommand options.

Save-File utility

With the Save-File utility you can:

- Migrate Statistics Save data sets from earlier releases.
• Convert Statistics Save data sets into sequential data sets that are suitable for use by the DB2 load utility.

(See “Creating data for the Performance Database and the Performance Warehouse” on page 2984.)

Spreadsheet Input Data Generator utility

You can also use the File and Save-File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. (See “Generating input data for spreadsheets” on page 2985.)

Controlling the level of detail in reports and traces

You can specify the level of detail and the layout of Statistics reports and traces by using the LAYOUT subcommand option of the REPORT or TRACE subcommand.

The following sample layouts are supplied:
• SHORT
• LONG

In Statistics reports and traces, layout SHORT provides general data and layout LONG provides comprehensive data. Layout SHORT contains selected blocks and fields from statistics categories. layout LONG contains most, but not all, of the available blocks and fields.

If the use of commands, subcommands, and subcommand options does not provide sufficient control over the contents of reports and traces, you can use the User-Tailored Reporting (UTR) feature to create and tailor your own report and trace layouts. With UTR you can add, remove, and change individual fields and entire report blocks to control the volume, contents, and layouts of your reports and traces. For more information, see “Tailoring report layouts” on page 2950.

Member-scope and group-scope reporting

DB2 collects the Statistics data on a per-member basis. DB2 Statistics traces have a local scope. To obtain the statistics for all members of a data sharing group, a DB2 Statistics trace has to be started at each of the members. These traces generally have different start and stop times and can have different periods in which the DB2 Statistics records are externalized.

The information in this section only applies to DB2 data sharing environments.

Member-scope reports and traces:

OMEGAMON XE for DB2 PE can process all members of a data sharing group at the same time and produce reports and traces that show the Statistics data on a per-member basis.

Such member-scope reports and traces are like those produced in non-data sharing environments. Reports and traces are produced on a per-subsystem basis.

The following extracts from a long Statistics report demonstrates the concept of member-scope reporting.
• The data sharing group DBN1 consists of two members, SN13 and SN14.
• The statistics are presented separately for each member (note the MEMBER field in the page heading).
The non-data sharing counters (such as the CPU TIMES block) as well as the data sharing counters (such as the Group Buffer Pools Activity block) are presented. To keep the figure compact only selected Statistics data is shown.

The default Statistics interval is assumed, which means that the data is presented for the entire period the statistics are available.

There is no aggregated statistics data for the entire group.

Long Statistics report for member SN13 of group DBN1

The following example shows a partial member-scope long Statistics report for member SN13 of group DBN1.

**Long Statistics report for member SN14 of group DBN1**

The following example shows a partial member-scope long Statistics report for member SN14 of group DBN1.
The following extract from a short Statistics report demonstrates the concept of group-scope reporting.

- The statistics are presented separately for each member (note the MEMBER field in the HIGHLIGHTS block).
- Only selected counters are shown (HIGHLIGHTS, DATA SHARING LOCKS, and GROUP BPO), to keep the figure compact.
- After the members' Statistics are presented, the aggregated Statistics data for the entire group is shown.
  - The MEMBER field in the HIGHLIGHTS block displays the number of members for which the Statistics are aggregated.
  - The group's Statistics counters are calculated by adding up the members' Statistics counters.
  - As the default Statistics interval is assumed (the data is presented for the entire period the statistics are available), the statistics are provided from the earliest to the latest time for which the statistics data is available.
  - The group's interval elapsed time is the average elapsed time of the members' interval elapsed times.

Group-scope short Statistics report for member SN13 of group DBN1

The following example shows a group-scope short Statistics report for member SN13 of group DBN1.

Chapter 6. Batch reporting 2923
Exception processing

Exception processing identifies Statistics report, trace, and File data set entries with fields that contain values outside the thresholds specified in the Exception Threshold data set. When exception processing is active, the data to be reported is checked against these thresholds.

There are two threshold types that you can set: warning and problem. A warning message is printed if a value is outside the first threshold and a problem message is printed if a value is outside the second threshold.

When exception processing is requested for a File data set, only delta records in exception status are included in the output data set.

Statistics exception reports, traces, and File data sets are identical to the usual Statistics reports, traces, and File data sets, except that they only contain interval records and delta records that have at least one field in exception status.

When delta records and interval records are processed during exception processing, values defined in the Exception Threshold data set are compared with the corresponding values in a delta or interval record. If any field is in exception status, the following occurs:

- If the JCL contains a valid DD statement for EXTRCDD1 or EXFILDD1, the identity of the delta or interval record (timestamp and subsystem identification) and the fields in exception status are logged in the exception logs.
- If you specified EXCEPTION with the REPORT, TRACE, or FILE subcommand, the interval or delta record is formatted and printed (or filed in case of the FILE
subcommand) in the requested layout followed by the Exception Messages block of the report. An example is shown in "Statistics Exception Messages report block." The Exception Messages block of the report identifies the fields in exception status.

Note:

- The type of layout used has no effect on exception processing or on the content of the Exception Messages block of the report. All fields in exception status are reported. The layout used only affects the level of detail in the formatted interval or delta record. This means, the exception report can contain fields that have not been included in the corresponding trace or report.
- For group-scope reports, exceptions are checked only against the interval records that are aggregated across a data sharing group. However, member-specific statistics are shown wherever exceptions are found for the entire group.

The fields that caused the entry to be in exception status are identified along with the appropriate warning or problem message and are printed in the Exception Messages block of the report or trace.

"Statistics Exception Messages report block" shows an example of an Exception Messages block. It is printed after each interval or delta record that is found to be in exception status, provided that EXCEPTION was specified in the REPORT or TRACE subcommand.

**Statistics Exception Messages report block**

Here is an example of a Statistics Exception Messages report block.

<table>
<thead>
<tr>
<th>TYPE</th>

<td>BP7</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following columns are presented in the Exception Messages report block:

**TYPE** The type of exception. Valid values are WARNING and PROBLEM.

**FIELD ID**

The name of the field from the Exception Threshold data set.

**FIELD DESCRIPTION**

The description of the field.

**FIELD QUALIFIER**

The qualifier of the field. This is either the buffer pool ID, the group buffer pool ID, or the remote location. This field is blank if there is no field qualifier.

**BY**

The basis for the comparison. The following information can be printed in this column:

- **TOTAL**
  
  The threshold is specified as a “total” value.

- **MINUTE**

  The threshold is specified as a “by minute” value. The value in the
interval or delta record is divided by the number of minutes in the interval or delta before making the comparison.

SECOND
The threshold is specified as a “by second” value. The value in the interval or delta record is divided by the number of seconds in the interval or delta before making the comparison.

COMMIT
The threshold is specified as a “by commit” value. The value in the interval or delta record is divided by the number of Commits in the interval or delta before making the comparison.

THREAD
The threshold is specified as a “by thread” value. The value in the interval or delta record is divided by the number of threads in the interval or delta before making the comparison.

VALUE
The actual field value that is used for the comparison. For total comparisons, the value from the interval or delta record is printed. For “by minute”, “by second”, “by commit”, or “by thread” comparisons, the calculated “by minute”, “by second”, “by commit”, or “by thread” value is printed. The greater than symbol (>) or the less than symbol < is printed between this column and the THRESHOLD column, which indicates whether the value is larger or smaller than the threshold value.

THRESHOLD
The threshold defined in the Exception Threshold data set.

Headers used in Statistics
The headers in Statistics reports and traces are identical, except that INTERVAL FROM and INTERVAL TO in the report header is replaced by ACTUAL FROM in the trace header and the SCOPE field does not apply to Statistics traces.

Statistics report header example
Here is an example of a Statistics report header.

<table>
<thead>
<tr>
<th>LOCATION: PMODBZ1</th>
<th>OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0)</th>
<th>PAGE: 1-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP: DB21</td>
<td>STATISTICS REPORT - LONG</td>
<td>REQUESTED FROM: NOT SPECIFIED</td>
</tr>
<tr>
<td>MEMBER: S211</td>
<td></td>
<td>TO: NOT SPECIFIED</td>
</tr>
<tr>
<td>SUBSYSTEM: S211</td>
<td></td>
<td>INTERVAL FROM: 07/18/15 21:36:00.38</td>
</tr>
<tr>
<td>DB2 VERSION: V10</td>
<td>SCOPE: MEMBER</td>
<td>TO: 07/18/15 21:58:08.06</td>
</tr>
</tbody>
</table>

The Statistics report and trace headers contain the following information:

LOCATION
The DB2 reporting location. If the DB2 subsystem is installed without a location name, either the DB2 subsystem ID (in non-data sharing environments) or the data sharing group name (in data sharing environments) is shown.

GROUP
The data sharing group that the DB2 subsystem belongs to.

MEMBER
The name of the DB2 data sharing member. This field is not printed for group-scope reports.

SUBSYSTEM
The ID of the DB2 subsystem that generated the data. This field is not printed for group-scope reports.
DB2 VERSION
The version number of the DB2 subsystem that generated the data.

Title - layout
The title of the report or trace and the layout. The layout can be the default layout (LONG or SHORT) or a layout that you have tailored yourself.

SCOPE
The scope of the report, which can be MEMBER or GROUP. A member-scope report shows a group's instrumentation data member by member without merging the data. A group-scope report merges the instrumentation data that belong to the individual members and presents it for the entire group.

Note: All reports in a non-data sharing environment are member-scope reports.

EXCEPTION
Indicates an exception report or trace.

PAGE
The page number within the report in the format lll-nnnnnn, where lll denotes the sequence number of one or multiple locations (see LOCATION), and nnnnnn denotes the page number within the location.

REQUESTED FROM and TO
The FROM and TO dates and times that were specified in the REPORT or TRACE subcommand. If both FROM and TO dates and times are omitted from the subcommand, the FROM and TO dates and times from the GLOBAL command are printed.

If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value. If FROM and TO are not specified in the subcommand and GLOBAL command, NOT SPECIFIED appears for both the FROM and TO values.

If you specified FROM and TO times without dates in the subcommand and GLOBAL command, ALL DATES is printed together with the specified times.

Note: Any FROM and TO times that are specified in REDUCE can affect the GLOBAL FROM and TO times.

ACTUAL FROM
The date and time of the first DB2 Statistics record that was processed by the trace.

INTERVAL FROM
The start date and time of the first interval record that is covered by the report.

INTERVAL TO
The end date and time of the last interval record that is covered by the report.

How values are reported
OMEGAMON for DB2 PE reports and traces show field values for both delta and interval reporting.

The field values are shown in the following forms:

TOTAL
The value is a total.
QUANTITY
The value is a total.

SECOND
The value in the interval or delta record is divided by the number of seconds in the interval or delta before it is reported.

COMMIT
The value in the interval or delta record is divided by the number of commits in the interval or delta before it is reported.

THREAD
The value in the interval or delta record is divided by the number of threads in the interval or delta before it is reported.

Exception processing
Exception reporting identifies Accounting and Statistics records that contain fields with values that are outside a specified range. This helps you to recognize performance problems in the DB2 subsystem and in threads.

You define exception thresholds for specific Accounting and Statistics fields in the Exception Threshold data set. If exception processing is active, the DB2 instrumentation data is checked against the threshold values in the Exception Threshold data set. Only records with at least one field value outside the thresholds are reported.

You can set the thresholds in the Exception Threshold data set by using exception profiling or with the help of the example Exception Threshold data set that is delivered with OMEGAMON XE for DB2 PE. Exception profiling can also be used to produce a report with details of the distribution and expected number of exceptions for each field.

Exception reports and traces are available in the Accounting report set and the Statistics report set. Each of these relates separately to Accounting or Statistics data.

In addition, the exception log lists both Accounting and Statistics exception records in the same report, in timestamp order. The contents of the Exception Log File data set are similar to the exception log. The Exception Log File data set can be used by the DB2 load utility.

Exception processing output types
Exceptions are reported in various output types.

This topic describes the exception processing output.

Exception thresholds are specified in the Exception Threshold data set, ddname EXCPTDD. Therefore, the data set information for EXCPTDD must be specified in your JCL if you want to produce any of the listed output types.

Accounting and Statistics exception reports:

An exception report is produced if you specify the EXCEPTION subcommand option in the REPORT subcommand.

Both report types contain entries that have at least one value outside the thresholds that you specified in the Exception Threshold data set.
After each report entry, information about the fields in exception status is printed.

**Accounting and Statistics exception traces:**

You can produce an exception trace by specifying the EXCEPTION subcommand option in the TRACE subcommand.

Both trace types show records with fields values outside the thresholds that you specified in the Exception Threshold data set.

After each trace entry, information about the fields in exception status is printed.

**Accounting and Statistics Exception File data sets:**

You can produce an example file data set by specifying EXCEPTION in the FILE subcommand.

The Exception File data set contains records that have at least one value outside the thresholds that you specified in the Exception Threshold data set.

**Exception log data set:**

The exception log data set is produced automatically if you specified EXTRCDD1 in the JCL.

The exception log data set contains a list, in timestamp order, of DB2 Accounting and Statistics records with at least one field outside user-specified thresholds.

**Exception Log File data set:**

The Exception Log File data set is written if you define the EXFILDD1 DD statement in the JCL.

The Exception Log File data set is a sequential data set that can be used with the DB2 load utility.

The Exception Log File data set contains a list of Accounting and Statistics exception records similar to the list in the Exception Log data set.

To prevent the generation of the Exception Log File data set, omit the EXFILDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.

You can control the amount of data reported in the Exception Log File data set with GLOBAL INCLUDE or GLOBAL EXCLUDE, and FROM and TO.

Allocation values for EXFILDD1 are:

**RECFM:**
- VB

**LRECL:**
- 512

**BLKSIZE:**
- Recommended 4 096
**Exception Threshold data set**

The Exception Threshold data set contains the exception thresholds for the Statistics and Accounting exception reports and traces. When exception processing is active, the instrumentation data is checked against these thresholds.

Threshold values in an Exception Threshold data set can be set or modified with the Exception Threshold data set editor (see “Specifying exceptions using the Exception Threshold data set editor” on page 2795) or the exception profiling method (see “Exception profiling” on page 2931).

A sample Exception Threshold data set is supplied in data set member RK02DATA(DGOETV51). The sample contains a selection of exception fields with predefined threshold values and can be used to get started with exception reporting.

**Note:** Earlier versions of the sample Exception Threshold data set RK02DATA(DGOETV51) contain entries with asterisks instead of predefined threshold values. Asterisks are intended to mark thresholds that are to be determined by the exception profiling method (described in “Exception profiling” on page 2931). If you use these samples for exception reporting without performing exception profiling (which creates a new Exception Threshold data set with asterisks replaced by calculated values), the entries that contain asterisks generate warning messages during exception processing. In other words, earlier samples of the Exception Threshold data set are intended for exception profiling, later samples can be used for exception processing without modification.

If exception processing is started as part of the OMEGAMON Collector startup, where the Exception Threshold data set to be used is determined by the `AUTOEXCPTHNAME` startup parameter, the Exception Threshold data set must be a sequential data set. For online monitoring, the Exception Threshold data set can be either a sequential data set or a member of a partitioned data set. If you create a new data set, preallocate it with the following attributes:

**RECFM:**

- VB

**LRECL:**

- ≥ 255

**BLKSIZE:**

- 6 233 or greater

**Note:** The sample Exception Threshold data set member RK02DATA(DGOETV51) might have a different record length. When you copy member DGOETV51 to your newly allocated data set, you might get a warning that records are truncated. In this case, you can ignore this warning.

Related reading: For information about specifying and editing thresholds in an existing Exception Threshold data set, refer to “Specifying exceptions using the Exception Threshold data set editor” on page 2795.

Related reading: For information about profiling an Exception Threshold data set with a sample of DB2 instrumentation data, refer to “Exception profiling” on page 2931.
Exception profiling

You can use the exception profiling method to set adequate exception threshold values based on sample DB2 instrumentation data. This method eases the process of getting a suitable Exception Threshold data set that can be used for exception processing.

The basic procedure is to use an existing Exception Threshold data set, mark those fields that you want to be profiled by an asterisk (*), specify generalized warning and problem exception levels, and let the exception profiling batch job do the calculations based on the sample instrumentation data. The result is a new Exception Threshold data set with adequate exception threshold values.

Exception profiling can be repeated by using different sample data, or different field selections, or different generalized exception levels. An Exception Threshold data set can also be modified as described in "Specifying exceptions using the Exception Threshold data set editor" on page 2795.

Data sets involved in exception profiling:

Exception profiling requires several data set specifications.

The following data sets are essential for exception profiling. You must specify these data sets in the exception profiling dialog.

- The input data set contains a sample of DB2 instrumentation data. The data is used to estimate your workload and decide which warning and problem thresholds to assign to the DB2 fields that are to be calculated.

  The more representative the data, the more accurate the calculation of the threshold values. The data should contain the type of data that you usually monitor. The input data should also contain a sufficient number of records to allow the profiling to be performed with reasonable confidence. The data should also cover an appropriate span of time.

  You can specify any combination of DPMOUT, SMF, or GTF data sets that contain DB2 instrumentation data.

- The input threshold data set is an Exception Threshold data set with some DB2 fields marked by asterisks (*). The asterisks serve as markers to indicate the DB2 fields for which exception profiling should calculate threshold values. Exception profiling scans the input threshold data set for names of DB2 fields that have asterisks (*) assigned instead of threshold values. For these fields new threshold values are calculated based on sample data from the input data set. Fields that already have threshold values assigned are not considered and remain unchanged.

  In other words, if you want exception profiling to calculate or recalculate certain threshold values, enter asterisks as threshold values for the corresponding fields in the input threshold data set.

- The output threshold data set is the new Exception Threshold data set. It is basically a copy of the input threshold data set (previously existing threshold values are retained), but previously marked fields obtained new threshold values.

The output report data set is optional. If you request a profile report in the exception profiling dialog, this data set will contain a report with details of the distribution and expected number of exceptions for each DB2 field listed in the new Exception Threshold data set.
Exception profiling dialog:

This section describes the invocation and the dialog of exception profiling.

To use exception profiling, access the Interactive Report Facility (IRF) from the IBM OMEGAMON for DB2 Performance Expert on z/OS main menu and select option 6, (Exception profiling). The Exception Profiling panel is displayed, as shown in Figure 260.

Use the Exception Profiling panel to specify the profiling criteria required to calculate the threshold values and the required and optional data sets.

In this panel:

- Specify the percentage of input data that you want to be flagged as warnings (for example 5.00%) and the percentage of input data that you want to be flagged as problems (for example 2.50%). The percentages can be as small as 0.01%.
- Choose whether you want to produce a profile report. The profile report documents the results of exception profiling (the expected number of exceptions for various thresholds).
- Specify the name of the input data set that contains DB2 instrumentation data from your DB2 subsystem. It can be a GTF, SMF, or DPMOUT data set.
- If you want to use several input data sets, you can concatenate them by editing the generated job stream by using option 2, Edit the generated job stream, in the Job Processing Selections panel (see Figure 261 on page 2933).
- Specify the name of the input threshold data set that contains entries marked by asterisks (*) for the fields that you want to be profiled.
- Specify the name of the output threshold data set that will contain the results.
- If you requested a profile report, specify the name of the output report data set.
After you have completed the specifications, press Enter to generate the exception profiling job stream. The Job Processing Selections panel is displayed.

```
DG00JOBM Command ==> Job Processing Selections

Update the job statements as required, then select one of the following.

4 1. Browse the generated job stream
   2. Edit the generated job stream
   3. Store the job stream for future use
   4. Submit the job stream for background execution

Job statement information:
//USER001P JOB (D01,CHAT), 'USR USERP21', MSGCLASS=V, CLASS=D,
// REGION=0M, NOTIFY=USERP01________________________

Command ==> F1=Help  F2=Split  F3=Exit  F9=Swap  F12=Cancel
```

Figure 261. Submitting the exception profiling job

To submit the job, select option 4, enter your appropriate job statement information, and press Enter. Alternatively, you can browse, edit, or store the job stream for subsequent processing.

The new Exception Threshold data set is created.

Check the profiling report to ensure that the exception thresholds and the number of exceptions are satisfactory. If necessary, you can modify the threshold values in the new Exception Threshold data set, as described in “Specifying exceptions using the Exception Threshold data set editor” on page 2795.

Now you can generate exception reports using the new Exception Threshold data set created by the exception profiling function.

**Exception profiling method:**

Each record in the input data set is processed as it would be for normal exception processing. However, instead of checking each field for exception, the value of the field is recorded. When all records have been processed, you can use the statistics in the profile report to determine the thresholds.

The thresholds are set to values that would generate the percentage of warning and problem level exceptions that you specified in the Exception Profiling panel (Figure 260 on page 2932).

For example, suppose the field QIESECT is specified in the Exception Threshold data set for location DSNAPC5, with the operator set to greater than (>), and the warning and problem thresholds set to asterisk (*). The profiling criteria are specified as 5% for warning thresholds and 2.5% for problem thresholds in the Exception Profiling panel. If the data set is processed and 320 records are found for field QIESECT with the location DSNAPC5, exception profiling sets the warning
threshold to the 17th highest record. This would generate 16 warning exceptions on average, which is 5% of the records (as you requested). Similarly, the problem threshold is set to the 9th largest record, averaging eight problem exceptions, which is 2.5% of the records.

**Exception profiling report:**

Use the Exception profiling report to examine the results of exception profiling.

**Example of an exception profiling report**

Here is an example report of exception profiling.

The **INPUT FROM** and **INPUT TO** fields show the date and time of the first and last record in the input data set.

The profiling report also shows a table for each of the fields. These tables show the calculated threshold values (**SPECIFIED THRESHOLD**) and the expected number of exceptions (**EXCEPTIONS GENERATED**) for various exception percentages. These percentages are in multiples of 0.1, 0.25, 0.5, 1, 1.5, and 2 times the problem exception percentage specified in the Exception Profiling panel. For example, if the problem percentage is 5%, the table columns shown are 0.5%, 1.25%, 2.5%, 5%, 7.5%, and 10%.

Any error messages that are generated during exception processing are shown on the profiling report.

**ANALYSIS:**

For example, consider the **QBAQGET** field. The exception profiling report shows that this field has exceeded the threshold of 10.00% on average, generating 16 warning exceptions on average, which is 5% of the records (as you requested). Similarly, the problem threshold is set to the 9th largest record, averaging eight problem exceptions, which is 2.5% of the records.

Reporting distributed data

OMEGAMON XE for DB2 PE can report activities that are associated with distributed work, where one DB2 subsystem accesses data from other DB2 subsystems.

DB2 uses the Distributed Data Facility (DDF) to allow an application program that is connected to one DB2 system to access data at a remote DB2 system, or any other relational database management system (DBMS) that supports DRDA.

OMEGAMON XE for DB2 PE can produce reports for a single DB2 location, or for a number of different DB2 host locations, when data is present. You can logically concatenate data sets from several locations in your JCL to produce a multilocation report. The data is then reported separately for each subsystem and ordered by location in alphabetic order.

When work is distributed across locations, the report shows activity at the reported location only.

The following information is reported for every location:

- Nondistributed transactions, this means, the allied threads at the reporting location.
- Local activity for distributed transactions that originate at the reporting location, this means, the allied-distributed threads at the reporting location without the corresponding DBATs at other locations.
- Remote activity performed at the reporting location as part of distributed transactions originating at other locations, this means, the DBATs at the reporting location.

Depending on the type of report, further detail information is reported.

- The Statistics report set shows following information in the Global DDF and the DRDA Remote Locations blocks of the report:
  - Distributed Data Facility (DDF) address space CPU times
  - Statistics for each DB2 remote location for DB2 host subsystems (MVS, OS/390, and z/OS)
  - Aggregate Statistics for all locations that use DRDA
  - Other, nonlocation-specific DDF information

- The Accounting report set shows information for specific threads that participate in distributed activity. Information is shown for both requester locations and server locations. The reports show, for example, elapsed times spent at the server site and the number of transactions, conversations, SQL statements, rows, messages, and bytes sent from the requester and received by the server. This information is reported in the Distributed Activity block of the report.

- The SQL Activity report set shows all SQL data within threads. SQL statements are reported at the location where they were executed, both at the requester location and the server location.

- The Explain report set can show information for packages that are bound at a remote location.

If a list of plans to be explained contains a remotely bound package on a DB2 host system, EXPLAIN automatically connects to the server and explains the
remote package. Alternatively, you can specify the server location to which EXPLAIN is to connect and the plans and packages that you want explained.

Selecting threads
You can select which threads or thread types are reported by using the INCLUDE and EXCLUDE subcommand options.

For example, if you want to produce reports that show only DBATs, you can include only threads that have a thread type of DBAT by using INCLUDE THREADTYPE(DBAT).

If you want to report the activity performed at a server location on behalf of a specific location, you can use the INCLUDE and EXCLUDE subcommands with REQLOC to only include data for that location.

If you want to report only distributed data, use EXCLUDE THREADTYPE(ALLIED) to exclude data for allied threads.

Examples of distributed transactions
The following examples show the types of distributed transactions and threads that are included in reports and traces.

Distributed transaction between DB2 host systems:
This example shows distributed transactions between three DB2 host systems.

The following figure shows that all three locations are DB2 host systems that run on MVS, OS/390, or z/OS.

![Figure 262. Distributed transaction between DB2 systems](image_url)

This example shows a thread that originates at location A. Data is requested from location B and location C. Because this transaction is distributed across DB2 systems, it is called an allied-distributed thread at location A. The threads initiated at the remote locations to handle the client requests are called database access threads (DBAT).

If trace data is available, OMEGAMON XE for DB2 PE reports on the activity that is carried out at each location.
Distributed transaction between DB2 host systems and DB2 systems on other platforms:

This example shows distributed transactions between DB2 host systems on different platforms.

The following example shows a host DB2 system that runs on MVS, OS/390, or z/OS, and two remote database management systems, such as DB2, that run on different operating systems, such as UNIX.

![Diagram showing distributed transaction between DB2 host and other DBMS]

**Figure 263. Distributed transaction between DB2 host and other DBMS**

The example shows one transaction originated at Rdb_name_1 that requests data at location A and a second transaction originating at location A requesting data from Rdb_name_2.

OMEGAMON XE for DB2 PE reports on the activity that is carried out at Location A only.

**Distributed transaction involving a DBAT-distributed thread:**

This example shows distributed transactions that involve a DBAT-distributed thread.

The following example shows three DB2 host systems.
A distributed transaction originates at location A, part of the query is passed to location B, which in turn passes some of the query to location C.

When trace data is available for all three locations, a report shows data for the allied-distributed thread at location A, the distributed DBAT at location B, and the DBAT at location C.

**Reporting data sharing information**

Data sharing gives individual DB2 subsystems full access to databases that are on shared hard disk drives. The DB2 subsystems that share the data belong to a data sharing group and each subsystem is considered a member of the group.

In a data sharing environment, you can monitor the performance of entire data sharing groups and individual members of a group. You can do this by generating reports or traces that combine performance information of all members, called group-scope reports, or by generating ordinary reports of individual members.

Group-scope reports are available in the Accounting, Locking, Audit, and Statistics report sets.

All report sets provide information about the performance of individual group members. In the report sets where group-scope reports are available, reports for individual members are called member-scope reports.

As with all aspects of performance, data sharing is best monitored by using exception processing. You can select exception thresholds for data-sharing-specific fields, and you can specify that the threshold is only checked for a certain group or member.

**Monitoring individual members**

You can monitor various aspects of performance for individual members of a group using any of the OMEGAMON XE for DB2 PE report sets.

**Example of a member-scope Locking report**:

Locking reports are helpful in monitoring the locking of page sets.

If you want to monitor deadlocks and timeouts on shared databases, and if you want this information grouped by individual members, generate a Lockout report for every member. Because group-scope reports are available in the Locking report set, this report is called a member-scope report.
Member-scope reports also provide group-scope information because holders and waiters of lockups are shown. Member scope and group scope only influence the summarization of the report.

To generate a member-scope Locking report, specify the following command stream:

```
: LOCKING
    REPORT
        LEVEL (LOCKOUT)
        ORDER (DATABASE-PAGESET)
```

Member-scope report is the default, so you are not required to specify the SCOPE subcommand option. To order the report by page set within a database, specify the ORDER subcommand option.

The following example shows a member-scope Locking report for group DSHGRPXX, which has two members, FIRST and SECOND. The report is two pages long because a new page is started when the member that is being reported changes.

**Member-scope Locking Lockout report, page 1**

The first page of the report shows the locking activity of the threads that have executed in member FIRST.

```
LOCATION: SYDNEY
GROUP: DSHGRPXX
MEMBER: FIRST
SUBSYSTEM: DB22
DB2 VERSION: V10

```

Chapter 6. Batch Reporting 2939
Monitoring entire groups

Use group-scope reports to obtain an overall view of the performance of an entire group.

Group-scope reports are available in the Accounting, Locking, Audit, and Statistics report sets:

- The group-scope Accounting reports merge instrumentation data produced by the individual group members and present it for the entire group.
- The group-scope Locking reports provide a full picture of the locking activity within the entire data sharing group.
- The group-scope Statistics reports summarize group buffer pool and locking information for shared resources for all members. They also show key information, such as total number of threads and commits for an entire group.
- The group-scope Audit reports provide a comprehensive view of the access to shared resources by the users of the members of the group. For example, if you want a summary of users that belong to various members of a group who accessed, or attempted to access, page sets on shared databases, you can generate a group-scope Audit DML access report.

Example of a group-scope Locking report:

In group-scope reports, events are aggregated by user-defined identifiers within the group, regardless of which member of the group actually generated the events.

To generate a group-scope Locking report, specify the following command stream:

```
LOCKING
REPORT
    LEVEL (LOCKOUT)
    SCOPE (GROUP)
```

The default order of a group-scope report is DATABASE-PAGESET.

Group-scope Locking Lockout report for DSHGRPXX

The following example shows a group-scope Locking report for the same group, DSHGRPXX, as in the previous member-scope example. This report summarizes the lockout activity for both members FIRST and SECOND. The information is summarized by database, then page set, and lastly by individual member.

A group total is printed for the entire group when the database that is being monitored changes. GRAND TOTAL shows the timeouts and deadlocks in all databases for the entire group.
Group-scope Statistics:

The group-scope Statistics reports show three categories of information summarized by group level.

**Highlights**

This category presents values such as the total number of threads and commits for the entire group.

**Data sharing locks**

This category presents locking information for shared resources for all members.

**Buffer pool data**

This category presents statistics per buffer pool summarized for all members of a group.

All other statistics data is presented in member-scope reports for detailed analysis on member level.

**Group-scope Accounting:**

Group-scope reports show the instrumentation data aggregated by the OMEGamon XE for DB2 PE identifiers that you specified and by the individual members.

The data is presented by a combination of location and group. Whenever either of these values changes, a new page is started and the page number is initialized.
Collecting input data for group-scope reports
To produce group-scope reports, you need input data from all members of a group.

For regular monitoring, you most likely collect the performance data into SMF data sets. If all DB2 subsystems of the data sharing groups reside in the same OS/390 system, you can collect the data to one SMF data set. If the members of the group reside on different OS/390 systems, you have to concatenate the SMF data sets from all OS/390 systems before you can use the data as input for group-scope reports.

Similarly, if you have collected instrumentation data for the individual members in separate data sets (GTF data sets or data sets created by collected report data), you can concatenate these data sets to generate group-scope reports.

Streamlining OMEGAMON XE for DB2 PE processing
Streamlining is the process of asking only for information in reports and traces that you really need.

OMEGAMON XE for DB2 PE is a comprehensive reporting tool, but for daily monitoring of DB2 you need a very limited amount of information. If you request a detailed report by using all input data that was gathered for a long time, OMEGAMON XE for DB2 PE processing takes up a lot of system resources. The result is pages of information that you are probably not interested in.

To avoid unnecessary performance overhead and to save time:
- Filter the input data, preferably by using the GLOBAL command.
- Disable OMEGAMON XE for DB2 PE internal sort if appropriate.
- Consider carefully how detailed a report you need.
- Define groups for identifiers that you want reported as a single entry.
- Use lists to simplify your command stream.
- Specify a REDUCE INTERVAL only if you want to report by intervals or produce several reports with different time spans.
- Define exception thresholds only for fields that you are interested in.
- Specify DPMOUT or keep a Save data set only if you are sure that you want to report the data again.
- Limit the number of SQL statements you want explained.

Filter data
You can limit the amount of data to be processed by filtering the input data. You can specify filters in the GLOBAL command or in the REDUCE, REPORT, TRACE, or FILE subcommands.

You should specify the filters in GLOBAL, because only the data that passes through the GLOBAL filters is processed further. Ensure that you do not exclude records that are needed in subsequent processing.

FROM and TO:
The simplest filter is the start and end time of the data to be reported.

Specify the start and end times by using the FROM and TO subcommand options.
Example of reporting peak hour performance of a day:

This example shows the use of FROM and TO within GLOBAL to report a specified date and time frame.

If you want to monitor the performance of your system only during peak hours and you want to produce the default versions of both, an Accounting report and a Statistics trace, you can specify:

```
GLOBAL
  FROM (05/15/13,08:30)
  TO (05/15/13,17:00)
ACCOUNTING
  REPORT
STATISTICS
  TRACE
```

Both, the Accounting report and Statistics trace show information from 8:30 a.m. to 5 p.m. for the specified day.

Example of reporting peak hour performance during a week:

This example shows the use of FROM and TO within GLOBAL to report a specified time frame every day.

If the input data set contains data of at least a week, you can generate reports that show the performance of your system during peak hours for the whole week by specifying:

```
GLOBAL
  FROM (,08:30)
  TO (,17:00)
ACCOUNTING
  REPORT
STATISTICS
  TRACE
```

Both, the Accounting report and Statistics trace show information from 8:30 a.m. to 5 p.m. for every day of the week.

Example of generating an additional locking report:

This example shows the use of FROM and TO for two purposes in the same command stream.

If you want to generate a Locking report for a day in the same job step, specify:

```
GLOBAL
  FROM (,08:30)
  TO (,17:00)
ACCOUNTING
  REPORT
STATISTICS
  TRACE
LOCKING
  REPORT
    FROM (05/17/13 )
```
The Locking report contains data only from 8:30 a.m. to 5 p.m. for that day because no other data has passed the GLOBAL filtering.

**INCLUDE and EXCLUDE:**

Another way to filter data is to include data only for particular OMEGAMON XE for DB2 PE identifier values, for example, user IDs or plans.

You can do this by using the INCLUDE and EXCLUDE subcommand options.

**OMEGAMON XE for DB2 PE identifiers:**

The identifiers describe the objects OMEGAMON XE for DB2 PE reports on.

The most commonly used OMEGAMON XE for DB2 PE identifiers describe:

- **The location**
  The LOCATION identifier is the name of the DB2 subsystem. If the input data contains data from several locations, you can include data only for those locations that you are interested in.

- **The user**
  OMEGAMON XE for DB2 PE uses two identifiers for the user ID. The first is the value of the authorization ID at the time of connection to DB2 (ORIGAUTH). The second is the authorization ID set at signon or identify (PRIMAUTH). For more information, see "Comparing original authorization IDs with primary authorization IDs" on page 2995.
  For SQL requests from a client, the user ID of the user at the workstation is a possible identifier as well.

- **The plan**
  Use the PLANNNAME identifier to select specific plans. Examples of plan names are DSNUTIL for utility, DSNBIND for bind activity, and the application plan name for CICS and IMS.

- **The package**
  Use the PACKAGE or MAINPACK identifiers to select plans and packages in the Accounting report set. Use PACKAGE to define specific packages, regardless of the plan to which they belong. Use MAINPACK to define plans that contain a specific package. For more information, see "Defining the MAINPACK identifier" on page 2966.

- **The connection to DB2**
  You can select data for specific connections to DB2.
  The connection ID (CONNECT) identifies the address space that interfaces with DB2. It can be, for example, the CICS or IMS ID.
  The connection type (CONNTYPE) identifies the type of connection for a thread. It can be, for example, CICS, IMS-BMP, IMS-MPP, IMS-CNTL, or IMS-TBMP.

- **The correlation data**
  The correlation identifier identifies the DB2 task together with the connection ID. It is composed of two parts: the correlation name (CORRNAME) and the correlation number (CORRNMBR). This identifier can be very useful. For example, for CICS threads the correlation identifier contains the transaction ID.
  For more information, see "Correlation ID translation" on page 2964.
• **Distributed activity**

If you report data for distributed processing, you can select the locations that request the work (REQLOC) and the type of the threads (THREADTYPE) to be included, for example allied threads or DBATs.

In addition, the following identifiers of a client are supported to include or exclude related data:

- The end user’s user ID at the workstation (ENDUSER)
- The end user’s transaction name at the workstation (TRANSACT)
- The end user’s workstation name (WSNAME)

**Example of reporting the performance of a specific location:**

This example shows how only a single location identifier is included.

If the input data contains data from more than one location, but you only want to inspect the performance of location USIBMSNEWY11, specify:

```plaintext
GLOBAL
   INCLUDE (LOCATION(USIBMSNEWY11))
```

Only data for location USIBMSNEWY11 is processed.

**Example of suppressing a specific connection type:**

This example shows how a single location is included and a single connection type is excluded.

If you are not interested in the CICS activity for that location, specify:

```plaintext
GLOBAL
   INCLUDE (LOCATION(USIBMSNEWY11))
   EXCLUDE (CONNTYPE(CICS))
```

Only location USIBMSNEWY11 is reported and all connections except CICS are reported.

**Example of reporting about a specific user ID and plan:**

This example shows how a single authorization identifier and a single plan name is included.

If you suspect that authorization identifier USERID01 using plan NEWACC is causing a performance problem, you can report only data that belong to that user ID and plan. To do that, specify:

```plaintext
GLOBAL
   INCLUDE (AUTHID(USERID01)
            PLANNAME(NEWACC))
```

Only data with authorization ID USERID01 and plan NEWACC is reported.
Suppressing internal sort
When you request Accounting functions only, it is often possible to avoid the OMEGAMON XE for DB2 PE internal sort of the input data. This reduces the size of the sort work files that must be allocated and reduces the processing time.

The PRESORTED option of the GLOBAL command controls the internal sort. It has the following values:

**NO**  Do not disable the sort. This is the default.

**ENFORCE**  Disable the sort, but terminate processing if out-of-sequence records are present. Use this option only if the input data set has been sorted, for example, when you reprocess data from the DPMOUT data set.

**ACCEPT**  Disable the sort and accept out-of-sequence records. By using this option it is possible to create complete and accurate Accounting reports (including records from multiple locations) from data sets that have not been sorted, for example SMF or GTF. The following limitations apply with this option:

- Some checking of the input data is not performed. Ensure that the concatenation of two or more data sets does not result in duplicate records, for example, if trace data was collected in two data sets during the same period.
- Only one location is reported per trace. To report more locations, specify multiple TRACE subcommands with different INCLUDE subcommand options for each location.
- Trace entries might not be printed in time sequence. If a trace contains entries that are out of sequence, a message that shows the number is displayed at the end.
- If INTERVAL(0) is in effect (the default), the interval times shown in a report heading might not be accurate. Ordering reports by interval should be avoided when the interval is zero.

For example, to produce an Accounting report without sorting the input data, specify:
```
GLOBAL
  PRESORTED(ACCEPT)
ACCOUNTING
```

The resulting Accounting report shows Accounting data for all locations in the input data set, without performing an internal sort.

**Choose the right level of detail**
Before you produce a report or a trace, consider how much detail you need. Use the LAYOUT subcommand option of the Accounting and Statistics reports and traces to control the amount of data to be produced.

In most situations the default layouts, which are short versions of reports and traces, provide enough detail for monitoring and problem determination. Do not use the most comprehensive layouts that show all possible fields unless you need this information.
For Accounting the LAYOUT subcommand option ACCEL provides detailed thread-related Accelerator activity data.

If the use of commands, subcommands, and subcommand options does not provide sufficient control over the contents of reports and traces, you can use the User-Tailored Reporting (UTR) feature to create and tailor your own report and trace layouts. With UTR you can add, remove, and change individual fields and entire report blocks to control the volume, contents, and layouts of your reports and traces. For more information, see “Tailoring report layouts” on page 2950.

**Group data**

Use the GROUP command to define a set of OMEGAMON XE for DB2 PE identifier values that can be used when you request certain reports.

The information for the set is reported as a single entry in the reports.

In GROUP processing the data for all members of the set is consolidated into one record. This improves OMEGAMON XE for DB2 PE performance because fewer records must be processed.

Sets are also useful for reporting purposes such as if you want to report data for an entire department instead of every individual person.

This is how you specify sets. Assume that your sales department consists of three users, USER001, USER002, and USER003. You want to produce an Accounting report that shows performance data for that department. You can enter:

```
GROUP (PRIMAUTH(SALES(USER001, USER002, USER003)))
```

```
ACCOUNTING REDUCE
   INCLUDE (PRIMAUTH(G(SALES)))
REPORT ORDER (PRIMAUTH)
```

The Accounting report shows information for the sales department as a single entry.

You can use GROUP with all report sets except Audit, Record Trace, and Statistics. The most common identifiers used to group data are:

- ORIGAUTH and PRIMAUTH
- PLANNAME
- CONNECT and CONNTYPE
- CORRNAME and CORRNMBR

**Use lists**

Use the LIST command to define a list of values for an OMEGAMON XE for DB2 PE identifier that can be used in INCLUDE and EXCLUDE, instead of individually entering each member. The members of the list are treated as if they were entered individually.

LIST processing does not affect OMEGAMON XE for DB2 PE performance, but can make it easier to specify and read your command stream.
Assume that you want to see how some plans that are used by the sales department affect performance. To do that, produce an Accounting report and an SQL Activity trace. If you specify a list for all plan name values, as in the following example, you can use the list name (SALES) in all commands in that job step.

```
LIST (PLANNAME(SALES(PLAN001, PLAN002, PLAN003, PLAN004, PLAN005, PLAN006, PLAN007, PLAN008)))
```

ACCOUNTING REPORT
   INCLUDE (PLANNAME(L(SALES)))
ORDER (PLANNAME)
SQLACTIVITY TRACE
   INCLUDE (PLANNAME(L(SALES)))

Both, the Accounting report and the SQL Activity trace show information for all individual plans that are specified in the list.

You can use LIST with all report sets. You can specify lists for any OMEGAMON XE for DB2 PE identifier values that are allowed in that report set.

**Be careful with INTERVAL**

If you want to use OMEGAMON XE for DB2 PE for trend analysis, you probably want to report data by interval. To do this, first reduce the input data to your Accounting and Statistics reports by using an interval other than the default zero. Then order the report by intervals.

For example, if you want to report the data at daily intervals, specify INTERVAL (1440) in the REDUCE subcommand and ORDER(INTERVAL) in the REPORT subcommand.

Interval processing affects the performance of the job. If you do not intend to produce reports by interval, accept the default (0) for INTERVAL, which means that no interval processing is performed.

**Specify only relevant exception thresholds**

Exception processing is the most effective way to identify system performance problems. You can set exception thresholds for virtually all Accounting and Statistics fields. However, carefully consider the fields for which to specify exception thresholds. The more fields you specify, the greater the effects on processing.

Specify exception thresholds only for those fields that you believe will signal poor performance in your environment. For information about how to generate exception reports and for a list of threshold fields that you should use, see “Using Statistics and Accounting reports to identify exceptions” on page 2794.

**Do you need a DPMOUT data set?**

You can keep the preprocessed input data in the output data set DPMOUT. The DPMOUT data set can be used as input to OMEGAMON XE for DB2 PE.
If you do not specify DPMOUTDD, only the records required for the current job step are processed, which improves system performance.

**Do you want to save reduced data?**

If you want to keep historical Accounting and Statistics data about DB2 performance, consider using REDUCE and SAVE.

This processing has advantages and disadvantages. Reducing and saving data uses a considerable amount of system resources, but the resulting Save data set is much smaller than the original input data set. The size of the resulting Save data set varies with the specified reduction interval and the type of environment the data is from (for example, the number of different users and plans present in the input data).

You can produce reports from the reduced and saved data by using the RESTORE command. Remember that you cannot produce traces from reduced data.

For more information refer to [“Saving reduced data” on page 2882](#).

**Limit statements to be explained**

When you produce Explain reports, limit the number of SQL statements to be examined.

There are various ways you can limit the output. You can specify only the plans or packages that you are interested in, or you can use the LIMIT, PACKLIMIT, and PACKAGES NO options.

To reduce attachment costs, it is always best to group the subsystems you are reporting.

**Customizing OMEGAMON XE for DB2 PE functions**

Customizing is the process of tailoring OMEGAMON XE for DB2 PE functions for specific needs, for example, specifying thresholds or modifying report layouts.

There are some OMEGAMON XE for DB2 PE functions that you can customize to meet your particular needs. The things you can tailor are:

- **Exception thresholds**
  Exception reporting identifies DB2 threads and Statistics intervals with fields values outside defined limits. You can either specify the thresholds yourself (for more information see [“Using Statistics and Accounting reports to identify exceptions” on page 2794](#)) or you can let OMEGAMON XE for DB2 PE fill these values (for more information see [“Exception profiling” on page 2931](#)).

- **Report layouts**
  Several model layouts for Accounting and Statistics reports are provided with the product. If none of them meets your needs, you can tailor them or create your own report layouts.

- **Time zone specifications**
  You can modify the times used in reporting if the CPU clock of your z/OS system is not set to the local time or if you want to report data from two or more systems that have different CPU clock settings.

- **The correlation name and number**
  OMEGAMON XE for DB2 PE provides a default translation of the DB2 correlation ID for most environments. You can change the way the DB2 correlation ID is translated into correlation name and correlation number.
• MAINPACK identifier
MAINPACK is an OMEGAMON XE for DB2 PE identifier that you can use to identify a plan by the first or the last package within the plan. You can also define whether to use the package ID, the collection ID, or the location from the package name to identify the main package.

• Exception field descriptors
You can modify exception field descriptors by using the ISPF editor. Changes to these functions are recorded in the DPMPARMS data set. The data set needs to be allocated. You can create multiple DPMPARMS data sets and you can concatenate several DPMPARMS data sets as required.

Tailoring report layouts
OMEGAMON XE for DB2 PE supplies several Accounting and Statistics model reports and traces. You can create your own layouts and you can tailor layouts with the User-Tailored Reporting feature (UTR).

With UTR you can:
• Add entire blocks and individual fields to an existing layout, for example, to include some additional fields or entire blocks of related fields in a report or trace.
• Remove entire blocks and individual fields from an existing layout, for example, to exclude some fields or entire blocks of related fields that are not of interest to you from a report or trace.
• Change the relative positions of blocks and fields in an existing layout, for example, to rearrange blocks and fields that are of particular interest.
• Change block and field labels, for example, to abbreviate labels to keep reports compact, or to spell out block and field names, or to use acronyms.

Example of tailoring an Accounting report:

This example describes how to add a block of fields to an existing report layout and how to replace some of the existing fields with new fields.

Suppose that the standard layout of the short Accounting report (supplied as Accounting report layout SHORT) does not provide the information that you need to monitor your DB2 installation and its specific workload.

Accounting report - standard layout

Here is an example of the standard layout for Accounting reports.

</table>

Example of tailoring an Accounting report:

This example describes how to add a block of fields to an existing report layout and how to replace some of the existing fields with new fields.

Suppose that the standard layout of the short Accounting report (supplied as Accounting report layout SHORT) does not provide the information that you need to monitor your DB2 installation and its specific workload.

Accounting report - standard layout

Here is an example of the standard layout for Accounting reports.
Accounting report - tailored layout

Assume that you want to include more buffer pool information in your layout, as in the following tailored report layout.

The tailored layout has been named BUFFER and contains buffer pool information in addition to General Accounting data. The buffer pool fields in the General Accounting block have been replaced with other fields to avoid duplicate information. In this example, class 3 suspension times and events are shown.

The following steps describe how to produce the tailored layout.

Selecting a model layout:

These steps describe how to select an existing report layout as the basis for a new layout that is to contain tailored information.

About this task

1. From the IBM OMEGAMON for DB2 Performance Expert on z/OS main menu, select option 5 (Customize report and trace layouts).

   The User-Tailored Reporting Layout Generation panel is displayed.
For this example, select option 1 (Accounting report) from the menu, enter the DPMPARMS data set where the tailored layout is to be stored, and press Enter.

The UTR Layout Selection panel is displayed.

---

Figure 265. User-Tailored Reporting - selecting an Accounting report as model layout

2. For this example, select layout SHORT as the basis for your layout by entering a selection character (/) in the input field next to the layout name. Always choose the model that is most similar to the layout you want.

   The UTR Block Selection panel for the Accounting Report SHORT layout is displayed.

---

Figure 266. User-Tailored Reporting - selecting a short Accounting report as model layout

3. For this example, select layout SHORT as the basis for your layout by entering a selection character (/) in the input field next to the layout name. Always choose the model that is most similar to the layout you want.

   The UTR Block Selection panel for the Accounting Report SHORT layout is displayed.
The Order column shows which blocks are included in the selected layout. In this example, the blocks labeled GENERAL, PACKAGE GENERAL, and DISTRIBUTED ACTIVITY are included. The numbers in the Order column indicate the sequence in which the blocks are printed. Fields that have not been selected are numbered 99999.

Adding a block:

These steps describe how to add a report block to a selected report layout that is to contain tailored information.

About this task

In this example, the BUFFER POOL ACTIVITY block is added to the selected layout.

1. In the UTR Block Selection panel, use F8 to scroll to the label BUFFER POOL ACTIVITY. Notice that there are two blocks with this label. Press F5 to display a brief description of the block's content, as shown in the following figure. In this example, the column form is chosen.
2. To include and order, modify/add a number in the Order column.
3. To exclude a block, blank out the Order column.

Modify | Order | Label | Description
--- | --- | --- | ---
99999 | | RID LIST | RID List Activity Data
99999 | | BUFFER POOL ACTIVITY | Buffer Pool Activity Data (Table Form)
99999 | | GROUP BUFFER POOL | Group Buffer Pool Activity Data (Table Form)
99999 | | DISTRIBUTED ACTIVITY | Distributed Data Facility (List Form)
99999 | | RESOURCE LIMIT FACILITY | Resource Limit Facility Data (Column Form)
99999 | | PACKAGE ACTIVITY | Package Activity Data
99999 | | IFI CLASS 5 | IFI (Class 5) times
15 | | BUFFER POOL ACTIVITY | Buffer Pool Activity Data (Column Form)

Figure 268. User-Tailored Reporting - report block contents

2. Enter a number in the Order column next to the block label to determine the relative position of the added block to the existing blocks.

In this example, a number between 10 and 20 determines that the BUFFER POOL ACTIVITY block is printed after the GENERAL block and before the PACKAGE GENERAL block. A number less than 10 would add the BUFFER POOL ACTIVITY block before the GENERAL block.

3. To see which fields can be included in the added block, enter a selection character (/) in the Modify column next to the block label.

The UTR Field Selection panel is displayed.
Similar to the UTR Block Selection panel, use F7 (Up) and F8 (Down) to scroll through the list of fields and F5 (Extend) to display extended field descriptions. The Order column determines the order of the fields within a block. A value of 99999 means that a field is not selected.

4. For this example, assume that all fields of the BUFFER POOL ACTIVITY block are selected by default. Because no fields need to be added or deleted, press F12 (Cancel) to return to the UTR Block Selection panel.

Replacing fields:

In this example, the duplicate fields in the GENERAL Accounting report block are replaced with class 3 suspensions and class 3 suspension times.

About this task

You might have noticed that the Buffer Pool block contains some fields (GETPAGES, SYN.READ, BUF.UPDT, and TOT.PREF) that are also in the General Accounting block (see “Accounting report - standard layout” on page 2950). To modify the fields in the General Accounting block, perform the following steps:

1. In the UTR Block Selection panel, type a forward slash (/) in the Modify column next to GENERAL and press Enter.

The UTR Field Selection panel is displayed.
In the UTR Field Selection panel, use F8 (Down) to find the fields that you do not want in the General Accounting block. Overtype the numbers (170, 180, 190, and 200) in front of the fields with blanks and press Enter (to reorder the remaining fields).

Use F7 (Up) and F8 (Down) to find the fields that you want to add.

---

<table>
<thead>
<tr>

Figure 270. User-Tailored Reporting - deleting fields

In the UTR Field Selection panel, use F8 (Down) to find the fields that you do not want in the General Accounting block. Overtype the numbers (170, 180, 190, and 200) in front of the fields with blanks and press Enter (to reorder the remaining fields).

Use F7 (Up) and F8 (Down) to find the fields that you want to add.
4. For this example, enter any number from 160 to 210 in the Order column in front of the fields that you want to add and press Enter.

5. Scroll back to see that the newly inserted fields appear at the position that you intended.

You do not have to delete existing fields when you add new fields. You can insert new fields between existing fields or place new fields before or after existing fields. Also, you can delete fields without replacing them with new fields. When the layout is generated the gaps are automatically filled in.

There is no limitation to how many fields or blocks can be selected in a layout. However, carefully consider what information you really need to prevent your reports from getting too long.

Displaying the layout:

These steps describe how to display the modified layout.

About this task
1. Press F3 (Exit) to return to the UTR Block Selection panel.
2. Press F6 (Browse) to display the new layout.

A sample report using the modified layout is displayed.
3. You might have to scroll right (F11) and down (F8) to see the entire report. 

   Figure 272 shows the right-hand side of the sample report.

**Saving the layout:**

These steps describe how to save the modified layout after you have completed the changes to your layout.

1. Use F3 (Exit) as required to return to the UTR Block Selection panel.
2. If you do not want to save the layout, press F12 (Cancel) to leave the UTR Block Selection panel.
3. To save the layout, press F3 (Exit).

   The UTR Save Layout Details panel is displayed.
4. Type a new name for the new layout in the Layout field and a descriptive text in the Description field.
   To keep the existing layout SHORT, and create an additional layout, give the layout a new name by typing over the existing name. You can also type over the existing description.
   You can save the modified layout with the name of the layout you based it on. However, if you do this, the documentation does not reflect your new layout. If you pressed Enter, you would save the modified layout with the name SHORT. In this example, the layout is named BUFFER and the description is changed.

5. Specify whether you want each new record or entry to start on a new page.
   If your layout contains several blocks of information, it is often clearest to have every entry start on a new page.
   If your layout only contains a few blocks of information, several entries most likely fit on the page. Also, even if your layout is long, but you intend to use it with options, such as ORDER(PACKAGE), that limit the amount of information produced, you probably want more than one entry per page.

6. Press Enter.
   The Accounting report layout BUFFER is saved into your DPMPARMS data set.

The layout change is now complete. The UTR Layout Selection panel is displayed. Notice that the layout that you just created is shown in the list of layouts. To exit from this panel, press F3.

Using the layout:

These steps describe how to use the modified layout.

About this task
1. Specify the name of your DPMPARMS data set in the JCL.
2. You can now run Accounting reports using the new layout.
   ```
   ACCOUNTING
   REPORT
   ```
Specifying time zones

The TIMEZONE option of the GLOBAL command provides a means of adjusting the times of the data to be reported.

Adjust the times if:

- The CPU clock of your OS/390 system is not set to the local time, but you want to use the local time in your reports.
  The CPU clock can be set to Greenwich Mean Time (GMT) or to the local time of another location, for example the local time of your head office.
- You want to generate reports or traces that show activity at more than one location and the CPU clock settings of the locations are different. This is often the case when the locations are in different time zones.

The data for calculating the adjusted times is stored in the LOCDATA member of the DPMPARMS data set. You can enter and edit the data using the Interactive Report Facility (IRF).

Time Zone Data Editor:

Time zone information is entered with the Time Zone Data Editor, which is accessed through the Interactive Report Facility (IRF).

About this task

To access the editor, select option 4 (Maintain parameter data sets) from the Performance Expert main menu. The Data Set Maintenance Menu is displayed.

```
DGOPMENU Data Set Maintenance Menu

Select one of the following.

3 1. Maintain exception thresholds
   2. Maintain correlation translations
   3. Maintain time zone information
   4. Maintain MAINPACK definitions

Exception data set
'DGO710.THRESH'

DPMPARMS data set
'DGO710.DPMPARMS'

Command ===>
F1=Help  F2=Split  F3=Exit  F9=Swap  F12=Cancel
```

Figure 274. Selecting Maintain Time Zone Information

Type 3 in the input field to select Maintain time zone information, and type the name of your DPMPARMS data set on the line below DPMPARMS data set.

Press Enter to go to the Time Zone Data Editor panel.
Use the editor to enter time zone specifications for the reporting locations. Specify the location, the geographical time zone, and the CPU clock setting of the z/OS system under which the DB2 subsystem runs.

Enter the required information in the input fields. You can modify existing information by typing over it.

**Direction**
Indicates the direction of the location relative to Greenwich:
1 For locations east of Greenwich
2 For locations west of Greenwich

**Action**
The standard ISPF editor line commands. For example:
I  To generate a new line
D  To delete a line
R  To duplicate a line
M  To move a line

**Location**
The name of the location. You would usually use the location identifier of the DB2 subsystem. Enter an asterisk (*) to specify the default time zone value. You can specify only one default value.

**Time Zone**
The difference in hours and minutes between the geographical local time and GMT.

**CPU Clock**
The difference in hours and minutes between the CPU’s Store Clock instruction value of the location and GMT.

You can get information about each entry field by moving the cursor to the field and pressing F1 (Help) to display the help text for the field.

**Examples of time zone processing:**

In the following examples, the settings in the Time Zone column show the real time zones relative to GMT. These settings can be maintained to reflect seasonal differences in daylight saving.

The values in the CPU clock column are for illustration purposes only. You have to find out the CPU clock settings of the locations you want reported because every site can decide whether to set the CPU clock to local time, GMT, or some other value.
Example 1: Time zones:

This example shows how a specific location is assigned to a time zone and how this location's time is reflected in reports.

The figure shows the contents of the LOCDATA member of DPMPARMS. In this example, we want to report data from a DB2 subsystem in San Francisco. The location name of the DB2 subsystem is USIBMSTOSQL1.

<table>
<thead>
<tr>

<td>1 00 00 1 00 00</td>
</tr>
</tbody>
</table>

Figure 276. Time Zone Data 1

The Time Zone column shows the time zone of the location relative to GMT. San Francisco is 8 hours west of Greenwich.

No value is specified in the CPU Clock column to indicate that the CPU clock is set to GMT. If you do not specify a value for the CPU clock, you do not have to change the default direction (1).

In this example a default (*) is specified for locations that do not have an individual entry. If you do not specify a default, no time zone adjustment is made to data from locations that do not have an entry.

If you want to use San Francisco local time in your reporting, specify location USIBMSTOSQL1 as your TIMEZONE location:

```
GLOBAL
  TIMEZONE (USIBMSTOSQL1)
```

The following adjustments are applied during OMEGamon XE for DB2 PE processing:

- Data from location USIBMSTOSQL1 is adjusted -8 hours because its CPU clock is set to GMT and its local time is eight hours less than GMT.
- Data from locations that do not have an entry is adjusted -8 hours because the default CPU clock setting (*) is GMT as shown in Figure 276.

The reported data reflects San Francisco local time.

The local time is used in FROM/TO processing, printed on reports, and stored in the File and Save data sets.
Example 2: CPU clock settings:

This example demonstrates how to report data from location USIBMSTOSQL1. The only difference to example 1 is that the CPU clock of the location is set to New York local time. This is because the head office of the company is situated in New York.

Figure 277. Time Zone Data 2

The value specified in the CPU Clock column shows that the CPU clock of location USIBMSTOSQL1 is set to New York local time, which is five hours west of Greenwich.

A default (*) has been defined for locations that do not have an entry in the data set.

Suppose you again want to use San Francisco local time in your reporting. Specify location USIBMSTOSQL1 as your TIMEZONE location:

\[
\text{GLOBAL}
\]

\[
\text{TIMEZONE (USIBMSTOSQL1)}
\]

Because the time zone for location USIBMSTOSQL1 is eight hours west of Greenwich, the following adjustments are made during Performance Expert processing:

- Data from location USIBMSTOSQL1 is adjusted -3 hours because its CPU clock is set to New York local time, which is 5 hours less than GMT.
- Data from locations that do not have an entry is adjusted -8 hours because the default CPU clock setting (*) is GMT, as shown in Figure 277.

As a result, data from all locations reflects San Francisco local time.

Example 3: Time zones and CPU clock settings:

This example shows how to report data from two locations. The first location, USIBMSTOSQL1, is situated in San Francisco, the second, USIBMSTOSQL2, in New York.
The time zone settings for both locations reflect the local time at that site:

- The time zone of location USIBMSTOSQL1 is San Francisco, 8 hours less than the GMT.
- The time zone of location USIBMSTOSQL2 is New York, 5 hours less than the GMT.

The CPU clock of one location is set to GMT and the other to the local time:

- The CPU clock of location USIBMSTOSQL1 is set to zero to indicate GMT.
- The CPU clock of location USIBMSTOSQL2 is set to five to indicate the New York local time.

Again, if you want to use San Francisco local time in your reporting, specify location USIBMSTOSQL1 as your TIMEZONE location:

```
GLOBAL
  TIMEZONE (USIBMSTOSQL1)
```

The following adjustments are made during Performance Expert processing:

- Data from location USIBMSTOSQL1 is adjusted -8 hours because its CPU clock is set to GMT.
- Data from location USIBMSTOSQL2 is adjusted -3 hours because its CPU clock is set to New York local time, which is 5 hours less than GMT.
- Data from locations that do not have an entry is adjusted -8 hours because the default CPU clock setting (*) is GMT, as shown in Figure 278.

As a result, data from all locations reflects San Francisco local time.

For more information about time zone processing, refer to the description of the GLOBAL command in the Report Command Reference.

**Correlation ID translation**

The correlation ID is a DB2 field that identifies the task executed by DB2.

The correlation ID contains:

**For batch jobs**

Jobname
For TSO applications
Original authorization ID (the logon user ID)

For applications using the DB2 call attachment facility
Original authorization ID (the logon user ID)

For CICS transactions
Connection type, thread type, thread number, and the transaction ID

For IMS applications
PST number and PSBNAME of the application

Particularly for CICS and IMS it is useful to break the correlation ID into several parts, so that you can easily distinguish the transaction ID (for CICS threads) from the PSBNAME (for IMS threads).

The default translation:

OMEGAMON XE for DB2 PE breaks the correlation ID into parts by translating the correlation ID into two separate identifiers, the correlation name and the correlation number.

Unless it was changed in your installation, this translation is based on the connection type of the thread and is done as follows:

Table 247. The 12-Byte Correlation ID field and the default translation

<table>
<thead>
<tr>
<th>Connection Type</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The correlation name and correlation number can be used as OMEGAMON XE for DB2 PE identifiers CORRNAME and CORRNMBR in all report sets.

You can use CORRNAME and CORRNMBR to order data on reports and to include and exclude input records.

Changing the default translation:

You can override this default translation using the IRF option for maintaining parameter data sets (option 4 on the DB2 PM main menu).

The correlation translation information is kept in the CORRDATA member of the DPMPARMS data set.

Each record in the CORRDATA member specifies the translation that is to be used for a specific connection ID. The connection ID is used here, not the connection type.
The translation is expressed as:
- Offset where the correlation name starts
- Length of the correlation name
- Offset where the correlation number starts
- Length of the correlation number

If OMEGAMON XE for DB2 PE does not find the connection ID for a given thread in the CORRDATA member, the default translation is used.

To activate the tailored correlation translation, specify the DPMPARMS data set for the DPMPARMS ddname.

**Defining the MAINPACK identifier**

In the Accounting report set you can use the MAINPACK identifier to distinguish plans according to the packages they contain. The representative package is either the first or the last package or DBRM executed within a plan.

This identifier is useful when the name of a plan does not provide satisfactory identification, as is the case with DBATs initiated by non-DB2 requesters that all have the same plan name DISTSERV.

You can define certain aspects of the MAINPACK identifier:
- Whether the first or the last package executed within a plan is used as the MAINPACK.
- Whether you want to use the package ID, the collection ID, or the location name of the package name as the value for the identifier. In the case of a DBRM, the program name is always used.

If you wish, you can have different MAINPACK definitions for data from different environments and from different plans.

The MAINPACK identifier can be used to include, exclude, and order data.

When you include data using MAINPACK, data from other packages belonging to the same plan is also reported. (If you used the PACKAGE identifier instead, data for that package, regardless of the plan, would be reported.) The same applies to ordering data.

The default definition for MAINPACK is to use the package ID of the first executed package.

The MAINPACK definition is stored in the member MAINPACK of the DPMPARMS data set. You can access the member using the MAINPACK Definition Member Editor, which is part of the Interactive Report Facility (IRF).

To access the editor, select option 4 (Maintain parameter data sets) from the Performance Expert main menu. The Data Set Maintenance Menu is displayed.
Type 4 in the input field to select Maintain MAINPACK definitions, and type the name of your DPMPARMS data set on the line below DPMPARMS data set.

Press Enter to go to the MAINPACK Definition Member Editor panel.

Use the editor to enter the main package specifications. Specify the requesting locations, connection IDs, plan names, and codes for the MAINPACK definition.

Figure 279. Selecting Maintain MAINPACK Definitions

Type 4 in the input field to select Maintain MAINPACK definitions, and type the name of your DPMPARMS data set on the line below DPMPARMS data set.

Press Enter to go to the MAINPACK Definition Member Editor panel.

Use the editor to enter the main package specifications. Specify the requesting locations, connection IDs, plan names, and codes for the MAINPACK definition.

Figure 280. MAINPACK Definition Member Editor panel

Enter the required information in the input fields. You can modify existing information by typing over it.

Action

Standard ISPF editor line commands. For example:

I Generate a new line
Delete a line

Duplicate a line

Move a line

Requesting Location
The 16-byte requesting location name. DB2 uses this name to identify the requester DB2 subsystem for distributed threads. For nondistributed threads this is the same as the local location name.

Connection ID
The 8-byte connection name used by DB2 to identify your environment.

Plan Name
The 8-byte name of the DB2 plan. In most cases it is a user-specified name, but for non-DB2 requesters it has a constant value DISTSERV.

Code
One of the predefined definitions of MAINPACK.

You can get information about an entry field by moving the cursor to the field and pressing F1 (Help).

Specifying the MAINPACK (example):

The following example shows how you can define different MAINPACK specifications for different plans. In this example, different MAINPACK specifications for plans DISTSERV and CICSA are defined.

DISTSERV is used as the plan name for all DBATs initiated by non-DB2 requesters. Therefore it can be useful to be able to distinguish between the different DISTSERV plans according to the packages they contain.

The plan CICSA is a large plan consisting of several packages and it is used for many different kinds of transactions. The goal is to distinguish between the different executions of this plan.

The following figure shows the MAINPACK Definition Member Editor panel with the specifications.
In this case, the default entry is for packages that do not have a specific entry. For these plans, the collection ID of the last executed package is used as the MAINPACK.

For plan DISTSERV, the representative package was defined as the first executed package in this example. This was done because it is likely that for the DBAs initiated by non-DB2 requesters the first package usually provides the necessary information to identify the plan. The assumption for this plan was that the package identifier was the most convenient identifier value.

For plan CICSA, the representative package was defined as the last executed package. The reason for doing this was that for this particular plan, in this example, the last executed package best identifies the transaction. The package ID was used as the value of the identifier.

Examples of using the MAINPACK and PACKAGE identifiers:

The following examples show how you can use the MAINPACK and PACKAGE identifiers. The first example is a short report and shows the short format of the package information. The second example shows the long format of the package information. Both examples show how to use these identifiers in INCLUDE/EXCLUDE and ORDER processing.

Example 1: Using MAINPACK

Assume that, during the reporting interval used in this example, two transactions are performed on behalf of a non-DB2 requester. One transaction executes package CUSTINQR and the other transaction executes package ACCTCLOS. You only want to report the activities that are performed by these non-DB2 requesters, that is, DISTSERV plans.

If you use PLANNAME to order the report, you cannot distinguish between the two packages or the two transactions because they both execute plan DISTSERV. So to identify the transactions by means of a package, the MAINPACK identifier is
used in the ORDER. For this case the default specification for MAINPACK is used, which is to select the package ID of the first package executed within a plan. The Accounting report is then summarized and ordered by this MAINPACK (first package ID).

The following command was used:

```
ACCOUNTING
   REPORT
       INCLUDE (PLANNAME(DISTSERV))
       ORDER (MAINPACK)
```

**Short Accounting report - ordered by MAINPACK**

Here is an example of a short Accounting report that is ordered by MAINPACK.

**Note:** The values for the package in the Package Information block represent the processing that is specific to that package. In this case, there is only one package executed for each transaction. If there had been a second package within the same transaction, then the second package would have been listed as a second line within the Package Information block.

### Example 2: Using PACKAGE

Assume that, during the reporting interval used in this example, three transactions are performed and that DB2 Accounting Trace classes 7 and 8 are active.

- The first transaction executes plan PLANINQ1 and uses packages CUSTINQA and CUSTINQB and DBRM CUSTINQC.
- The second transaction executes plan PLANINQ2 and uses packages CUSTINQB and CUSTINQD.
- The third transaction executes plan PLANINQ1 also but uses package CUSTINQA only.

All the packages are executed once within the transaction and the transactions are executed only once.

If you want to find out the resource utilization for each package or DBRM, you ORDER the report by PACKAGE and print only the package or DBRM specific...
data from the Accounting records. In this example, you want detailed information about the packages or DBRM, therefore you request a LONG report.

You have previously determined that you are not interested in package CUSTINQD, so you exclude that package. By default all plan names present in the input data are included in the report.

You specify the following command:

```
ACCOUNTING REPORT
LAYOUT (LONG)
EXCLUDE (PACKAGE(CUSTINQD))
ORDER (PACKAGE)
```

Long Accounting report - ordered by PACKAGE

Here is an example of a long Accounting report that is ordered by PACKAGE. It shows the Package Information blocks for the different packages. In this example, each entry begins on a new page, even though all entries fit on a single page.

On this report:

- Information for package CUSTINQA is derived from the first and the third transaction.
- Information for package CUSTINQB is derived from the first and the second transaction.
- Information for DBRM CUSTINQC is derived from the first transaction.

To print all entries on one page you can create your own layout by modifying the sample layout LONG. You can do this without changing the actual layout. Simply press F3 in the UTR Block Selection panel to display the UTR Save Layout Details panel (see Figure 273 on page 2959). From this panel, you can specify no for the question Is each new record or entry to start on a new page? You can save the layout under a new name and use it when ordering by PACKAGE.

Chapter 6. Batch reporting 2971
**Modifying exception field descriptors**

You can change the descriptive labels for exception fields as they are printed for the exception records in batch reports.

To do this, create a member called `EXCHANGE` in your `DPMPARM` data set using the ISPF editor. For each field that requires a new descriptor, enter a line into this member that contains the field name and the new descriptor, separated by a comma without spaces.

**The Performance Database and the Performance Warehouse**

**OMEGAMON XE for DB2 PE performance data can be loaded into DB2 tables to build a performance database or a performance warehouse.**

You can load performance data into DB2 tables to create a performance database. With a performance database you can:

- Perform additional performance evaluations. As an example you can examine the access paths of dynamic SQL statements.
- Collect historic data.
- Use SQL for fast and easy retrieval of data.

The performance data can come from the following data groups:
- Accounting
- Audit
- Locking
- Record traces (IFCID 22, 63, 96, 125, 172, 196, 316, 365, and 401)
Data can be aggregated or nonaggregated:

- In the case of aggregated data, several records are summarized by specific OMEGAMON XE for DB2 PE identifiers. In a report, each entry represents aggregated data. Use the SAVE subcommand to generate a VSAM data set that contains the aggregated data. When the data has been saved, use the Save-File utility to generate a DB2-loadable data set.
- In the case of nonaggregated data, each record is listed in order of occurrence. In a trace, each entry represents nonaggregated data. Use the FILE subcommand to generate a data set that contains the nonaggregated data.

For batch, periodic, and display exceptions, a DB2-loadable data set is automatically generated for each OMEGAMON XE for DB2 PE execution if EXFILDD1 is defined in your JCL. The generated data set is sequential variable-blocked and can be directly loaded into DB2.

The following figure shows how performance data is formatted and loaded for each data group.
For details about loading performance data into DB2 tables, consult the RKO2SAMP library.

**Accounting tables**

This section shows the structure of each of the Accounting tables in the performance database.
The generated data set consists of the following records:

**General**
One row per thread.

**Group buffer pool**
One row per group buffer pool used.

**Package data**
One row per package and DBRM executed.

**DDF data**
One row per remote location participating in distributed activity.

**Buffer pool data**
One row per buffer pool used.

**RLF**
One row per resource limit type encountered.

**Accelerator data**
One row per thread-related accelerator activity.

When parallel tasks are performed within a data sharing group, the parallel task records are contained in the record of the originating task, regardless of whether the parallel tasks were performed on the same member as the originating task or on other members of the data sharing group.

**Samples:**

Examples of CREATE TABLE and LOAD statements are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.

The CREATE TABLE examples can be used for building the DB2 tables into which Accounting File and Save-File data can be loaded. The DB2 load control statements can be used for loading this data into the DB2 tables.

**Accounting File:**

Accounting data can contain all or a subset of available data types, depending on the specification of the DATATYPE subcommand option of the ACCOUNTING FILE command.

The specified data types can be stored in one or several data sets in any combination by means of multiple invocations of FILE DATATYPE in a JCL. To
load all Accounting data from several output data sets into a DB2 table, you can run the following DB2 load control statements concurrently. For more information, see the *Report Command Reference*.

**Table 248. Parts for Accounting file data**

</tbody>
</table>

VSAM-Save data sets must be converted to the Save-File layout before they can be loaded into tables.

Examples of CREATE VIEW statements are supplied in the member DGOAVSAP.

Examples of SQL queries are in member DGOAQSAV.

DGOAVSAP contains the VIEW definition necessary to integrate the Accounting Save General table into the SAP DBA Cockpit (see SAP Note 1995032).

**Audit tables**

This section shows the structure of each of the Audit tables in the performance database.
Figure 284. The Audit tables

Authorization Failures
One row for each authorization failure that occurred

Authorization Control
One row per authorization control issued

Authorization Change
One row for each of the following authorization changes or authorization establishments:
- SET CURRENT SQLID
- END OF IDENTIFY
- END OF SIGNON
- INBOUND/OUTBOUND DISTRIBUTED TRANSLATION

Audited DDL Access
One row per CREATE or DROP against an Audited object, or ALTER TABLE which change the AUDIT option against an audited table.

Audited DML at Bind Access
One row for each SQL statement that involves audited objects.

Objects in SQL statement
One row for each object involved in the SQL statements recorded in Audited DML at Bind Access.

Audited DML Access
One row for the first change (write) to an audited object in a unit of work

Audited Utility Access
One row for each object and each phase accessed by a utility execution.

SQL Statement
One row for the text of each SQL statement involved in:
- Authorization Failure
- Authorization Control
- Audited DDL Access
- Audited DML at Bind Access

Samples:

The parts for Audit file data are as follows.

Examples of CREATE TABLE and LOAD statements are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.
The CREATE TABLE examples can be used for building the DB2 tables into which the Audit File data sets can be loaded. The DB2 load utility control statements can be used for loading these Audit File output records into DB2 tables.

Table 250. Parts for Audit file data

Exceptions table
This section shows the structure of the Exceptions table in the performance database.

Figure 285. The Exception table

The generated table contains a list of Accounting and Statistics exceptions:

- **Batch exceptions**
  - One row per exception

- **Periodic exceptions**
  - One row per exception

- **Display exceptions**
  - One row per exception

Samples:

The parts for Exceptions file data are as follows.

Examples of CREATE TABLE and LOAD statements are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.

The CREATE TABLE example can be used for building the DB2 tables into which File data sets can be loaded. The DB2 load utility control statements can be used for loading these File output records into DB2 tables.

The query in DGOEQFIL uses the sample view defined in DGOEVFIL.

</tbody>
</table>

#### Figure 286. The Locking table

The table contains a row for each occurrence of the following events:
- A LOCK, UNLOCK, CHANGE, or QUERY request processed by DB2.
- A request to acquire a claim, change a claim duration, or release a claim.
- A request to release a drain on a claim class.
- A successful lock avoidance.

#### Samples:

The parts for Locking file data are as follows.

Examples of CREATE TABLE and LOAD statements are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.

The CREATE TABLE example can be used for building the DB2 tables into which the Locking File data sets can be loaded. The DB2 load utility control statements can be used for loading these Locking File output records into DB2 tables.

### Record Trace tables

This section shows the structure of each of the Record Trace tables in the performance database.
The generated data set contains the following records:

**Access path**
- Minibind data. One row per IFCID 22.

**SQL Statement**
- One row per SQL statement text record (IFCID 63).

**SORT END**
- One row for each sort end event triggered by an SQL query (IFCID 96).

**RID Pool**
- One row per multiple index access operation (IFCID 125).

**Deadlock (Unit of Work)**
- One row per resource involved (IFCID 172).

**Timeout Data**
- One row per agent causing the timeout (IFCID 196).

**SQL Statement Statistics (DYN SQL)**
- One row per SQL statement statistics text record (IFCID 316).

**Acceleration**
- One row per accelerator to which the statement has been offloaded (IFCID 316, section QW03162).

**Remote Location Statistics**
- One row per remote location (IFCID 365).

**Static Statements in EDM Pool (STA SQL)**
- One row per static statements text record in the EDM pool (IFCID 401).

**Acceleration**
- One row per accelerator to which the statement has been offloaded (IFCID 401, section QW04012).

**Samples:**

The parts for Record Trace File data are as follows.

Examples of CREATE TABLE and LOAD statements are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.

The CREATE TABLE examples can be used for building the DB2 tables into which Record Trace File data sets can be loaded. The DB2 load utility control statements can be used for loading these Record Trace File output records into DB2 tables.

Statistics tables
This section shows the structure of each of the Statistics tables in the performance database.
The generated table contains the following records:

**General Data**

**File Data**

One row for each Statistics delta record, containing data from IFCID 1 and 2.

A delta record is a set of counters that describes the DB2 activity between two consecutive DB2 Statistics record pairs.

**Save-File Data**

One row for each Statistics interval record, containing data from IFCID 1 and 2. A Statistics interval record is a set of counters that describes the DB2 activity within the interval specified by the user.

**Buffer Pool Data**

One row per buffer pool active at the start of the corresponding delta record for File data, or interval record for Save-File data (containing data from the QBST section of IFCID 2).

**Group Buffer Pool Data**

One row per group buffer pool active at the start of the corresponding delta record for File data, or interval record for Save-File data (containing data from the QBGL section of IFCID 2).

**DDF**

For each delta record (File data) or interval record (Save-File data), one row for all remote locations that used DRDA (containing data from the QLST section of IFCID 1).

**Buffer Pool Data Set Data**

One row for each open data set that has an I/O event rate at least one event per second during the reporting interval (containing data from IFCID 199).
Accelerator Data
One row per active accelerator attached to the DB2 subsystem (containing data from the Q8ST section of IFCID 2).

Aggregated Accounting Data
One row is written for a connection type IMS, CICS, RRSAF, Utility, Batch, or DDF containing aggregated wait and CPU times of threads with IFCID 3 events for that connection type (containing data from IFCID 369).

Storage Data
One row is written for DB2 storage metrics valid for the reporting interval (containing data from IFCID 225).

Simulated Buffer Pool Data
One row per simulated buffer pool active at the start of the corresponding delta record for File data, or interval record for Save-File data (containing data from the QBSP section of IFCID 2).

Samples:

The parts for Statistics File and Save-File data are as follows.

Examples of CREATE TABLE, LOAD statements, SQL queries, and descriptions of the statistics tables are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.

The CREATE TABLE examples can be used for building the DB2 tables into which the Statistics File data sets and the converted Statistics Save records can be loaded. The DB2 load utility control statements can be used for loading these Statistics File data sets and converted Statistics Save records into DB2 tables.

<table>

The sample query in DGOSQDDDF uses the view defined in DGOSVDDDF.

The samples provided are valid for Statistics File and Save-File data.

Save data sets must be converted to the Save-File layout before they can be loaded into tables.
System parameters
This section lists the system parameters tables in the performance database.

The Performance Database tables for DB2 system parameters are as follows:
- System parameters from IFCID 106
- System facility parameters from IFCID 106
- Alter buffer pool records from IFCID 201
- Buffer pool attributes from IFCID 202
- Group buffer pool attributes from IFCID 230
- Alter group buffer pool records from IFCID 256

To create system parameter data for the Performance Database, use the SYSPARMS command with the FILE subcommand to produce a data set that is suitable for loading into DB2 tables.

Samples:
The parts for System Parameters data are as follows.

Examples of CREATE TABLE, LOAD statements, SQL queries, and descriptions of these tables are in library RKO2SAMP. The description files are in a format that can be loaded into DB2 tables.

The CREATE TABLE examples can be used for building the DB2 tables into which the System Parameters File data sets can be loaded. The DB2 load utility control samples can be used for loading these File data sets into DB2 tables.

Creating data for the Performance Database and the Performance Warehouse
To create performance data, you must run the appropriate OMEGAMON XE for DB2 PE command with the FILE or SAVE subcommand.

If you use the SAVE subcommand:
- Without the CONVERT option, you must first convert the VSAM data to the Save-File format.
- With the CONVERT option, the reduced data is converted and saved into a sequential data set.
You can then use the DB2 LOAD utility to move the data into DB2 Performance Database tables.

If you have installed the DB2 Performance Warehouse Client together with the corresponding host data collector, the following tasks can be simplified and largely automated for Accounting and Statistics data through the use of client-initiated processes:

- Creating performance data
- Loading the data into the Performance Database (Warehouse)
- Maintaining the database

For more information about the:

- Performance Warehouse, see Monitoring Performance from Performance Expert
- FILE or SAVE option, see “Functions and utilities of the Statistics report set” on page 2916 and Report Command Reference
- Save-File Utility, see “Functions and utilities of the Statistics report set” on page 2916 and Report Reference
- Spreadsheet Input-Data Generator utility, see Generating input data for spreadsheets

**Generating input data for spreadsheets**

With the Spreadsheet Input-Data Generator utility you can create input data for spreadsheets to ease DB2 performance analysis.

This utility uses the following data as input:

- Accounting and Statistics File performance data
- Accounting and Statistics converted Save-File performance data
- Record Trace File data of IFCID 172, 196, and 365

It creates a comma-separated value (CSV) data set using input provided by parts of the Performance Database (PDB) in the RKO2SAMP / TKO2SAMP library and also your input from field selection lists. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables.
Input parameters

The Spreadsheet Input-Data Generator mainly relies on the sample CREATE, LOAD, and meta data parts delivered for the Performance Database in the RKO2SAMP / TKO2SAMP library. These parts describe the record layout of the sequential load file input data, the positions of fields within the record, data type, length, WHEN, NULLIF, and DEFAULTIF values. Based on this information and the following input parameters, the fields of the sequential load file can be transformed into a CSV record.

The load module FPEPCSV is linked in library RKANMOD / TKANMOD. The following samples are provided in the RKANSAM / TKANSAM library:

FPEPCSVJ
The sample JCL to invoke the Spreadsheet Input-Data Generator utility.

FPEPCSVP
Invokes the Spreadsheet Input-Data Generator utility with a job procedure. The following sample jobs are provided:

FPEPCSVA
Invokes the Spreadsheet Input-Data Generator utility and creates multiple Accounting Save spreadsheets with a job procedure.

FPEPCSVB
Invokes the Spreadsheet Input-Data Generator utility and creates multiple Accounting File spreadsheets with a job procedure.

FPEPCSVN
Invokes the Spreadsheet Input-Data Generator utility and creates multiple Record Trace spreadsheets with a job procedure.

FPEPCSVS
Invokes the Spreadsheet Input-Data Generator utility and creates multiple Statistics spreadsheets with a job procedure.

FPEPCSVW
Invokes the Spreadsheet Input-Data Generator utility and creates multiple System Parameter spreadsheets with a job procedure.
The input parameters are specified in the EXEC command of the Spreadsheet Input-Data Generator in the parameter list PARM of FPEPCSVJ:

```c
...  parm = type persec hdrrow hdrpdcol delim decsep sampdir
//FPEPCSV EXEC PGM=FPEPCSV,
  //  PARM='SBUF N Y N , . <db2ompe>.TKO2SAMP'
...```

Where "parm = type persec hdrrow hdrpdcol delim decsep sampdir" specifies the following:

**TYPE**

Specifies the type of records that are put into the CSV data set. For each supported TYPE, a sample master selection list is provided that contains all fields in the sequential load file records that have a column in the associated Performance database (PDB) table.

The RKO2SAMP / TKO2SAMP part type consists of 4 characters, it can be:

- **AFBU** Accounting File data, category BUFFER POOL
- **AFDF** Accounting File data, category DDF
- **AFGE** Accounting File data, category GENERAL
- **AFGP** Accounting File data, category GROUP BUFFER POOL
- **AFPK** Accounting File data, category PACKAGE
- **AFXC** Accounting File data, category ACCELERATOR
- **ASBU** Accounting Save-File data, category BUFFER POOL
- **ASDF** Accounting Save-File data, category DDF
- **ASGE** Accounting Save-File data, category GENERAL
- **ASGP** Accounting Save-File data, category GROUP BUFFER POOL
- **ASPK** Accounting Save-File data, category PACKAGE
- **ASRF** Accounting Save-File data, category RLF
- **ASXC** Accounting Save-File data, category ACCELERATOR
- **NFDL** Record trace data, category DEADLOCK
- **NFTI** Record trace data, category TIMEOUT
- **NFRL** Record trace data, category REMOTE LOCATION
- **SACC** Statistics data, category AGGREGATED ACCOUNTING
- **SBUF** Statistics data, category BUFFER POOL
- **SDDF** Statistics data, category DDF
- **SGBP** Statistics data, category GROUP BUFFER POOL
- **SGEN** Statistics data, category GENERAL
- **SSET** Statistics data, category BUFFER POOL DATA SET
- **SSIM** Statistics data, category SIMULATED BUFFER POOL
- **SSTG** Statistics data, category STORAGE GENERAL
- **SXCL** Statistics data, category ACCELERATOR
- **W106** System Parameter data, category IFCID 106
W201  System Parameter data, category IFCID 201
W202  System Parameter data, category IFCID 202
W230  System Parameter data, category IFCID 230
W256  System Parameter data, category IFCID 256
WSFP  System Parameter data, category DDF Facility

PERSEC
Specifies whether average values are calculated. It can be Y (for YES) or N (for NO). This option is only valid for Statistics records where the interval column INTERVAL_ELAPSED can be used to derive per-second (PERSEC) values.

Note: Averages are only calculated for Statistics fields which are accumulated by DB2 and have a field TYPE of AGGR defined in a Statistics field selection list (FPEPS*).

HDRROW
Specifies whether a header row is added to the CSV output. It can be:

F (for FORCED)
Indicates that the header row is written in any case.

Y (for YES)
Indicates that the header row is written only if input data is available.

N (for NO)
Indicates that the header row is not written.

HDRPDCOL
Specifies whether the Performance Database (PDB) column name or the report label in the field selection list is used as header row. It can be Y (for YES) or N (for NO).

It is ignored if HDRROW=N.

If HDRPDCOL=N, the REPORT LABEL (V) entries are chosen as CSV column names. You can modify these entries according to your requirements.

DELIM
Specifies the CSV delimiter to be used in the output. It can be a comma (,) or a semicolon (;).

DECSEP
Specifies which decimal separator is used in the output. It can be a dot (.) or a comma (,):

Dot (.)
If DELIM is a comma (,), DECSEP must be a dot (.) and the CSV output is suited for workstation settings with dot as decimal separator.

Comma (,)
If DELIM is a semicolon (;), DECSEP must be a comma (,) and the CSV output is suited for workstation settings with comma as decimal separator.

SAMPDIR
Specifies the sample RKO2SAMP / TKO2SAMP library to be used.

The following DD names must be specified in FPEPCSVJ:

... //STEPLIB DD DSN=<db2ompe>.TKANMOD,DISP=SHR //SYSPRINT DD SYSOUT=**
Where:

**FLDSEL**

Specifies the field selection lists you want to use.

For each supported **TYPE**, a sample *master selection list* is provided in the library that contains all fields in the sequential load file records that have a column in the associated Performance database (PDB) table.

The master field selection lists for all supported data sets of Accounting and Statistics File, converted Save-File, and Record Trace File are provided in the **RKANSAMF / TKANSAMF** library. The name of a field list **FPEP** consists of the component code **FPEP** and the record type described in input parameter **TYPE**. For more information refer to “Input parameters” on page 2986. For example, **FPEPSFBU** is the sample field selection list for the Spreadsheet Input-Data Generator utility and Statistics File data, category BUFFER POOL.

**INPUT**

Specifies the data set of Accounting or Statistics File, converted Save-File, or Record Trace File.

**OUTPUT**

Specifies the CSV data set.

### Input and output data sets

The input and output data sets have following characteristics:

- A field selection list (such as **FPEPSGEN**) specifies which fields from the sequential load file input data set are transformed to the CSV output.
- For each supported **TYPE**, a sample *master field selection list* is provided that contains all fields in the sequential load file records that have a column in the associated Performance database (PDB) table.

You can create subsets of these field selection lists for tailoring the CSV output to your needs. The record layout is as follows:

1. The first 13 rows contain the copyright statement. Comments must start with a forward slash followed by an asterisk (**/***) and end with an asterisk followed by a slash (***/) You can delete or update these comments.

2. The next two header rows and the first three columns are fixed (**=F**) You must not change them.

3. The fourth and fifth columns are variable (**=V**) You can modify them.

Here is a sample for the field selection list for Statistics data, category GENERAL (**FPEPSGEN**):

```plaintext
// ***Start of Specifications**********************************************************************************
// * MODULE-NAME = FPEPSGEN  
// * DESCRIPTIVE-NAME = Field selection list for Spreadsheet Utility  
// * COPYRIGHT : IBM OMEGAMON XE for DB2 PE on z/OS V5  
//   Licensed Material - Property of IBM  
//   5655-W37 (C) Copyright IBM Corp. 1993, 2015  
// * FUNCTION = Sample field selection list for Spreadsheet Utility and Statistics data, category GENERAL.  
// ***End of Specifications**********************************************************************************
```

Chapter 6. Batch reporting  2989
The record layout of a field selection list contains the following headers and columns:

**FIELD (F)**

The FIELD header and its column is fixed (=F). You must not change it.

**PDB COLUMN NAME (F)**

The PDB COLUMN NAME (Performance Database) header and its column is fixed (=F). You must not change it.

**TYPE (F)**

The TYPE header and its column is fixed (=F). You must not change it. The following values are possible:

- **AGGR**  
  Aggregated value by DB2
- **HWM**  
  High-water mark
- **SNAP**  
  Snapshot value

**FORMAT (V)**

The FORMAT header and its column is variable (=V). You can modify it. This column specifies special formatting routines. The following formats are supported:

- **MB**  
  Divides input value (bytes expected) by 1024*1024.
  
  If MB is specified in the master field selection list, then (MB) is shown as a suffix of the report label.
- **P2MB**  
  Formats number of pages (4K-pages expected) as MB value.
  
  If P2MB is specified in the master field selection list, then (MB) is shown as a suffix of the report label.
- **HEX**  
  Shows the hexadecimal value.
- **S2T**  
  Transforms a store-clock value to a readable time format.
- **BP2C**  
  Transforms buffer pool identifiers (small integers) in the BP_ID columns of Accounting and Statistics spreadsheets to a character representation, such as:

  0 → BP0
  
  100 → BP8K0
GBP2C
Transforms group buffer pool identifiers (small integers) in the GBP_ID columns of Accounting and Statistics spreadsheets to a character representation, such as:

\[
\begin{align*}
0 & \rightarrow \text{GBP0} \\
100 & \rightarrow \text{GBP8K0}
\end{align*}
\]

REPORT LABEL (V)
The REPORT LABEL header and its column is variable (=V). You can modify it.

Note:
- If HDRPDGCOL=N, the REPORT LABEL entries are chosen as CSV column names. You can modify these entries according to your requirements.
- The sample field selection lists contain report labels which are derived from the labels in Accounting and Statistics reports. Some report labels refer to the Performance database (PDB) column name.

Field selection lists are delivered in the RKANSAMF / TKANSAMF library with the following attributes:

- **Organization** . . . : PO
- **Record format** . . . : FB
- **Record length** . . . : 132

The Spreadsheet Input-Data Generator expects field selection lists under DD name FLDSEL in a partitioned data set with the above attributes of the RKANSAMF / TKANSAMF library. This means that you can use the master field selection lists of RKANSAMF / TKANSAMF as input if you do not want to customize the lists. Otherwise, you should copy the sample lists to a partitioned data set with the above FB132 attributes and tailor them to your needs.

The **sequential load file** denotes the File or converted Save-File data set that is input for the Spreadsheet Input-Data Generator. The records of the input data set which satisfies the WHEN condition of the TYPE-related LOAD statement are read, the fields specified in the selection list are retrieved from this input record, converted, and added to the CSV record according to the PERSEC and format options.

The Spreadsheet Input-Data Generator expects the input data set under DD name INPUT.

The TKO2SAMP directory is delivered with OMEGAMON XE for DB2 PE. It contains the PDB parts which are needed for the CSV creation (fields, positions, data types, and so on). The Spreadsheet Input-Data Generator expects the original product library as input. A run-time environment contains the parts in directory RKO2SAMP. The Spreadsheet Input-Data Generator expects the directory name as the 7-th input parameter after the decimal separator.

The output CSV data set must be provided to the Spreadsheet Input-Data Generator under DD name OUTPUT. The data set attributes are:

- **Organization** . . . : PS
- **Record format** . . . : VB
- **Record length** . . . : 32756
- **Block size** . . . : 32760

**Note:** All input data sets must have the same OMEGAMON XE for DB2 PE version and maintenance level. The Spreadsheet Input-Data Generator:
• Checks the syntactical correctness of RKO2SAMP / TKO2SAMP members. If you use the original product library, the syntactical correctness is ensured. The Spreadsheet Input-Data Generator detects if members are changed or if they use the wrong syntax (such as unknown SQL syntax).

• Supports 1000 columns in one CSV row. For example, the Statistics File/Save General records currently contain about 600 fields.

Sample procedures and JCL

The Spreadsheet Input-Data Generator is invoked using PROCs and JCLs as shown in the following samples delivered with the RKANSAM / TKANSAM library. The following example creates a spreadsheet for Statistics data, category BUFFER POOL (SBUF) based on the master selection list <user_h1q>.FPECSVU(FPEPSBUF).

Use FPEPCSVJ to invoke the Spreadsheet Input-Data Generator utility.

```

Multiple invocations of the OMEGAMON XE for DB2 PE Spreadsheet Input-Data Generator can be organized using job procedures with additional parameters for the input or output data sets. The &OUTDISP parameter specifies whether an existing CSV data set is overwritten or whether CSV records are appended to the end.

Use FPEPCSVVP to invoke the Spreadsheet Input-Data Generator utility with a job procedure.

```plaintext
/* Start of Specifications**********************************************

Chapter 6. Batch reporting  2993
You can now import the generated CSV data into your spreadsheet tools at the workstation and use graphical representations or pivot tables for performance analysis.

Further reference information

The following information provides details about specific themes that are of interest on special occasions.

Using GROUP to improve Save data set performance

If you never require separate report entries for one or more OMEGAMON XE for DB2 PE identifiers, you can use GROUP to reduce the uniqueness of the key in the Save data. This can result in fewer reduced records in the Save data set, a smaller Save data set, and improved performance.

The standard key for Save data sets contains a combination of the applicable OMEGAMON XE for DB2 PE identifiers from DB2 instrumentation records. For example, the key for an Accounting save record contains a number of OMEGAMON XE for DB2 PE identifiers. Because of the uniqueness of the standard key, there can be a very large number of reduced records in a Save data set.

If you never require separate report entries for one or more OMEGAMON XE for DB2 PE identifiers, for example, if you only produce Accounting reports by using ORDER(CONNECT-PRIMAUTH-PLANNAME), you can use groups in INCLUDE REDUCE to obtain the minimum number of records in the Save data set.

The following command stream does not use groups. The resulting Save data set contains reduced records for each unique combination of all of the OMEGAMON XE for DB2 PE identifiers in the key.

```
ACCOUNTING
REDUCE
SAVE
```

The following command stream uses groups and minimizes the number of records in the Save data set:

```
GROUP (CORRNAME (ALLCNM(*)))
```
The Save data set produced by this command stream contains reduced records for each unique value of the OMEGAMON XE for DB2 PE identifiers that are not grouped, for example, PRIMAUTH and PLANNAME.

During REDUCE processing, the group name is substituted for the original value of the key entry. For example, all records in the reduced data have a correlation name of ALLCNM.

Because the key now contains the group name (not the original value), you cannot use the original values of any of the grouped OMEGAMON XE for DB2 PE identifiers in REPORT or INCLUDE/EXCLUDE in the same command stream or when you restore the data.

### Comparing original authorization IDs with primary authorization IDs

This information explains the difference between original authorization ID and primary authorization ID.

#### Original authorization ID

During connection to DB2 (either by IDENTIFY or SIGNON), an initial authorization value is passed to the connection exit. This value becomes the original authorization ID.

For IDENTIFY:
- If RACF is active, this value is the verified user ID.
- If RACF is not active, this value is blank.

For IMS SIGNON:
- If RACF is active, this value is the terminal user ID.
- If RACF is not active, this value is either the LTERM name or the PSB name.

For CICS SIGNON:
- This value is determined by the user-defined CICS resource control table (RCT). The connection (authorization) exit can be either the IBM supplied default or user-written, depending upon whether secondary authorization IDs are used.

#### Primary authorization ID

The primary authorization ID is the value set by the exit. This value is determined according to the following criteria:
- Whether it is an IDENTIFY or a SIGNON
- Whether RACF is active or inactive
- Whether the exit is IBM supplied or user-written
- Whether secondary IDs are being used
Default values can be any of the following:
  • The TSO logon ID
  • The value of the USER field on the JOB statement
  • A default value specified when you install DB2
  • The original (unaltered) value

Note:
  • The original authorization ID should be used when you attempt to establish accountability of DB2 activity, because the primary authorization ID can be an ID other than the user (group name, for example).
  • If your subsystem uses authorization ID translation for distributed activity, the AUTHID reported for DBATs is the translated value.

**Comparing secondary IDs with SQL ID**

DB2 uses two other types of authorization IDs:
  • Secondary authorization IDs
  • SQL ID

If secondary IDs are used, a user-written authorization exit is also required. A secondary list can contain from 1 to 245 secondary IDs. This list is accessed when you establish the primary authorization ID or the SQL authorization ID.

The primary ID and the SQL ID are set during either IDENTIFY or SIGNON. However, only the SQL ID can be changed after connection by the SET CURRENT SQLID statement.

The SQL ID must be either the primary ID or one of the secondary IDs. It is used for implicit name qualifiers, implicit ownership assignment, and GRANT/REVOKE authorization checking.

For more detailed information about authorization IDs, see the IBM Knowledge Center.

**Fields affected by roll-up during distributed and parallel tasks**

The following table lists fields that are not reported by Accounting reports and traces if roll-up during distributed activity and parallel query tasks is active.

See “Distributed activity” on page 2870 and “Query parallelism considerations” on page 2871 for background information.

Using ACCOUNTING REDUCE subcommand options to balance performance and data set space

OMEGAMON for Db2 PE provides several commands for which the REDUCE subcommand and its options can be used to reduce the volume of data before the data is passed to subsequent other subcommands like REPORT and SAVE.

When OMEGAMON for Db2 PE processes a REDUCE subcommand, it holds its temporary data in a REDUCE data set to relieve virtual storage. This temporary data set is either automatically allocated or, if its placement and size needs to be controlled, explicitly specified as a ccWORK DD statement in your JCL. (cc stands for the report set, respectively the command to which the temporary REDUCE data set is associated, for example, AC for the ACCOUNTING command).

When using REDUCE, it is difficult to determine in advance an appropriate size of the temporary data set. The required size depends mostly on the amount and complexity of input data to be reduced and on REDUCE subcommand options like FROM/TO, INCLUDE/EXCLUDE, INTERVAL, and BOUNDARY, which influence the reduction factor.

The REDUCE subcommand option CALCULATE helps to reduce a high volume of Accounting data results in unacceptable performance, difficulties to determine adequate ACWORK space, or even abnormally terminated jobs (abend B37).

It provides information about the ACWORK space actually used during a REDUCE step. It can determine an adequate size for the ACWORK data set with regard to the amount and complexity of the data to be reduced. If insufficient ACWORK space is specified, and the job consequently terminates. In this case the CALCULATE option provides information about the size required to successfully complete the job in a second run.

This option is purely performance- and processing-related and does not manipulate data in any way. For the latter purpose use REDUCE subcommand options like FROM/TO, INCLUDE/EXCLUDE, INTERVAL, and BOUNDARY.

For the complete command syntax of ACCOUNTING REDUCE and for more information about the ACWORK DD statement, see the Report Command Reference.
For example, OMEGAMON for Db2 PE, by default, automatically allocates a temporary ACWORK data set to hold output data from the REDUCE subcommand. To control the placement and size of this data set, you can also specify a ddname of ACWORK. However, if the allocated size is too small for the temporary data, REDUCE processing terminates because of insufficient space (abend B37). You have to increase the size of the data set and run the job again, still without knowing an appropriate size.

In this case, you can use the CALCULATE subcommand option to calculate the appropriate size of ACWORK.

```
ACCOUNTING
  REDUCE
    Other REDUCE subcommand options
    CALCULATE
    REPORT
    SAVE
```

With CALCULATE in the command stream, OMEGAMON for Db2 PE counts the number and lengths of records written to ACWORK during ACCOUNTING REDUCE processing.

- If ACWORK is sufficiently sized, REDUCE processing finishes normally and the information message FPEA0800I is shown in DPMLOG, which provides details about the calculations.
  
  Subsequent subcommands of ACCOUNTING (here, REPORT and SAVE) will be executed.
  
  You can compare the specified size of ACWORK to the value shown in the message. You might want to adjust your specification to the same dimension, considering a bonus for variations of the input data.

- If the specified size of ACWORK is too small, REDUCE processing stops writing to the data set. However, OMEGAMON for Db2 PE continues counting and calculating until all input data to REDUCE is processed. The error message FPEA0801S in DPMLOG provides details about the minimum required size of ACWORK. Finally, the job terminates with abend B37.
  
  Subsequent subcommands of ACCOUNTING (here, REPORT and SAVE) will not be executed.
  
  It is recommended that you specify the size of ACWORK to at least the value shown in the message plus 20%. Then, you must rerun the job again.

In both messages the other values describe the amount and quality of processed records. The error message FPEA0801S is accompanied by other error messages indicating a failure to write to ACWORK. For more information, see [Messages](#).

### Accessibility

Accessibility features help users who have a physical disability, such as restricted mobility or limited vision, to use software products successfully.

This index describes the major accessibility features in OMEGAMON XE for DB2 PE, OMEGAMON XE for DB2 PM, and Buffer Pool Analyzer:

- You can operate all features using the keyboard instead of the mouse.
- You can change the system settings for high contrast for all user interface controls and client area contents.

The following sections explain how to use these accessibility features.
Operating all features by using the keyboard

You can use keys or key combinations to perform operations that can also be done through mouse actions. All menu items can be accessed from the keyboard. In those cases, the keyboard equivalent appears to the right of the menu item, or the shortcut letter is underlined. Some keyboard items also have shortcuts.

To navigate through a window or dialog by using the keyboard instead of the mouse, use the following keyboard shortcuts:

<table>
<thead>
<tr>
<th>Navigating through a window or dialog</th>
<th>Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access the menu bar in a window</td>
<td>Alt+underlined letter or F10</td>
</tr>
<tr>
<td>Activate a menu item in the menu bar</td>
<td>Enter</td>
</tr>
<tr>
<td>Access controls in a dialog</td>
<td>Alt+underlined letter</td>
</tr>
<tr>
<td>Navigate through the menu bar</td>
<td>Right arrow, left arrow, down arrow, up arrow</td>
</tr>
<tr>
<td>Move to the next set of controls</td>
<td>Tab or Ctrl+Tab</td>
</tr>
<tr>
<td>Move to the previous set of controls</td>
<td>Shift-Tab</td>
</tr>
<tr>
<td>Move within tables</td>
<td>Tab or right arrow, Shift-Tab or left arrow, down arrow, up arrow</td>
</tr>
<tr>
<td>Move within trees</td>
<td>Up arrow, down arrow</td>
</tr>
<tr>
<td>Expand a tree node</td>
<td>Right arrow</td>
</tr>
<tr>
<td>Collapse a tree node</td>
<td>Left arrow</td>
</tr>
<tr>
<td>Move within list boxes</td>
<td>Up arrow, down arrow</td>
</tr>
<tr>
<td>Move within combo boxes</td>
<td>Up arrow, down arrow</td>
</tr>
<tr>
<td>Move to a split bar in a window</td>
<td>F8</td>
</tr>
<tr>
<td>Resize a window by using the split bar</td>
<td>Arrow keys</td>
</tr>
</tbody>
</table>

To perform main tasks in windows by using the keyboard instead of the mouse, use the following keyboard shortcuts:

<table>
<thead>
<tr>
<th>Task</th>
<th>Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Help</td>
<td>F1</td>

**Changing the system settings for high contrast and font size**

You can change the system settings for high contrast and font size.

To use specific settings that are designed for easy reading, take these steps:

1. In the OMEGAMON XE for DB2 PE - System Overview window, click **Monitor** → **Configuration**.
2. In the Configuration window, click **Accessibility**.
3. To specify the appearance scheme for high contrast and font size, select one of the following options:
   - To use the default settings, select **[None]**.
   - To specify a white background containing black text in normal font size, select **Black on white**.
   - To specify a white background containing black text in large font size, select **Black on white (large font)**.
   - To specify a black background containing white text in normal font size, select **White on black**.
   - To specify a black background containing white text in large font size, select **White on black (large font)**.

You have to restart the application before the new settings come into effect.

**Troubleshooting empty reports**

This topic lists and explains several reasons why your report might not contain any report data. Use this information as a guide to identify possible reasons, including inappropriate command parameters.

At its core, OMEGAMON XE for DB2 PE identifies data to be collected and reported by IFCIDs. "DB2 instrumentation data" on page 2762 provides an overview of how IFCIDs map to report sets, DB2 trace types and DB2 trace classes. The basic rule is that data to be reported needs to be collected and made available as input data to the report generation process. If required IFCIDs are missing, the generated report ends with **NO DATA TO REPORT**.

The problem of missing IFCIDs might also be caused by different versions of DB2 or OMEGAMON XE for DB2 PE. Both products might support different sets of IFCIDs, which can lead to situations where an IFCID is either not provided by a DB2 version or cannot be processed by an OMEGAMON XE for DB2 PE version. The same problem might arise if data from other sources, like SMF or GTF, is used for reports.

OMEGAMON XE for DB2 PE provides flexible means to specify which data to collect and which data to report. However, it provides no means to protect against inappropriate use of commands, subcommands and subcommand options, which also can result in empty reports.
The following sections list possible reasons why your report might end with a final message of NO DATA TO REPORT.

**Messages indicating unsupported IFCIDs or IFCID formats**

If the job summary log shows message FPEC4015I NUMBER OF RECORDS FROM UNSUPPORTED RELEASES OF DB2 WAS ..., OMEGAMON XE for DB2 PE has detected IFCIDs in its input data that it is not supposed to handle. Either the input data is from an outdated DB2 version and the IFCID is no longer supported by OMEGAMON XE for DB2 PE, or the input data contains IFCIDs from a newer DB2 version and OMEGAMON XE for DB2 PE is not yet aware of them.

If the job summary log shows message FPEC4020I NUMBER OF RECORDS FROM UNSUPPORTED PRODUCT RELEASES WAS ..., the input data (such as input data in DPMOUT format) was created by earlier versions of OMEGAMON XE for DB2 PE or OMEGAMON XE for DB2 PM and is no longer supported.

**Identifying missing IFCIDs**

Report sets such as Accounting, Locking, or Statistics require specific IFCIDs from DB2 instrumentation data, as outlined in "DB2 instrumentation data" on page 2762. If the input data sets (specified with the INPUTDD statement in your job stream) do not contain these IFCIDs, the generated report ends with NO DATA TO REPORT.

For example, an Accounting report requires IFCIDs 3 and 239 in the input data. If the job summary log shows nothing more than in the following example (no IFCIDs 3 and 239), your Accounting report remains empty.

<table>
<thead>
<tr>
<th>IFCID</th>
<th>INPUT COUNT</th>
<th>INPUT PCT OF TOTAL</th>
<th>PROCESSED COUNT</th>
<th>PROCESSED PCT OF TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>89</td>
<td>33.58%</td>
<td>0</td>
<td>0.00%</td>
</tr>
<tr>
<td>2</td>
<td>88</td>
<td>33.20%</td>
<td>0</td>
<td>0.00%</td>
</tr>
</tbody>
</table>

**Note:** The job summary log gives a clear indication about which IFCIDs are contained in your input data. If an IFCID is not listed in the IFCID column or the INPUT COUNT column shows a count of 0, your input data does not contain this IFCID.

**Reasons for missing IFCIDs**

IFCIDs might be missing in your reports because they are either not collected (missing in the input data for the report generation) or being accidentally suppressed or filtered by inappropriate use of commands, subcommands, or subcommand options.

To identify why specific IFCIDs are not collected, review the methods of how the data was collected. "Collecting data for reports" on page 2748 describes several methods, some of them let you explicitly specify what to collect. For example, the DB2 startup parameters might determine that certain trace classes (with their implied IFCIDs) are not started.

If your input data to specific reports contains the required IFCIDs, but your reports still do not show any data, it is likely that restrictive command or subcommand options are in use in your job stream.
The GLOBAL command might apply global filters to all data serving as input to subsequent OMEGAMON XE for DB2 PE commands like ACCOUNTING or STATISTICS.

OMEGAMON XE for DB2 PE commands like ACCOUNTING or STATISTICS might use subcommand options that further restrict the data. The most important ones are:

- FROM/TO might limit the time frame too much.
- INCLUDE/EXCLUDE might limit a DB2 trace class or an IFCID.

For more information about commands and subcommand options, see the Report Command Reference.

For example, a Statistics report requires IFCIDs 1 and 2. The following job summary log shows that 48 records of each IFCID are included in the input data. However, none of these are being processed (PROCESSED COUNT equals 0) during the report generation and consequently the Statistics report is empty.

<table>
<thead>
<tr>
<th>IFCID</th>
<th>INPUT COUNT</th>
<th>INPUT PCT OF TOTAL</th>
<th>PROCESSED COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>48</td>
<td>25.00%</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>48</td>
<td>25.00%</td>
<td>0</td>
</tr>
</tbody>
</table>

**Insufficient amount of Statistics record pairs (IFCIDs 1 and 2)**

Output in a Statistics report requires at least two DB2 Statistics record pairs (IFCIDs 1 and 2) in the input data. These IFCIDs are collected at a configurable interval (DB2 system parameter STATTIME). For more information, see “General Statistics information” on page 2912.

An empty Statistics report usually indicates that either the input data does not cover at least two intervals or that filters restrict the amount of data being processed during report generation.

The following example of a job summary log shows that a sufficient amount of IFCID 1 and 2 records are in the input data (INPUT COUNT column). However, filters have limited the number of processed records below the required minimum of two record pairs (PROCESSED COUNT column). Consequently, the Statistics report is empty.

<table>
<thead>
<tr>
<th>IFCID</th>
<th>INPUT COUNT</th>
<th>INPUT PCT OF TOTAL</th>
<th>PROCESSED COUNT</th>
<th>PROCESSED PCT OF TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>48</td>
<td>25.00%</td>
<td>1</td>
<td>1.02%</td>
</tr>
<tr>
<td>2</td>
<td>48</td>
<td>25.00%</td>
<td>1</td>
<td>1.02%</td>
</tr>
</tbody>
</table>

The following job stream example shows how improper use of subcommand options cause an empty Statistics report. Here, the REDUCE step causes a summarization of input data to an interval of 60 minutes, with a boundary to the start of the hour. However, in the REPORT step the FROM and TO subcommand options limit the data to 30 minutes, which is less than a single interval.

```
STATISTICS
  REDUCE
    INTERVAL(60)
    BOUNDARY(60)
  REPORT
    FROM (12/22/13,12:15:00.00)
```
Messages indicating incomplete Accounting data (IFCIDs 3 and 239)

If the job summary log shows one or more of the following messages, incomplete Accounting data was found in the input data and your Accounting report might be incomplete. In the worst case, the report might end with NO DATA TO REPORT.

- FPEA4531I GENERAL ACCOUNTING DATA FOR LUWID INSTANCE <V1> IS MISSING.
  IFCID 3 IS MISSING.
- FPEA4532I ACCOUNTING DATA FOR A NUMBER OF PACKAGES FOR LUWID <V1> IS MISSING. ONE OR MORE IFCID 239 IS MISSING.
- FPEA4534I COORDINATING PARALLEL TASK FOR LUW INSTANCE <V1> IS NOT REPORTED AS NOT ALL INFORMATION FOR ASSISTING PARALLEL TASKS FROM MEMBER <V1> IS AVAILABLE.

Accounting reports require IFCID 3 for reporting a thread. However, package or program data belonging to a thread is contained in multiple 239 IFCIDs. A 1:n relation is established within the data. For correct reporting a complete set of these IFCIDs is required in the input data.

In case of DB2 Query Parallelism, additional sets of IFCIDs 3 and 239 are required. They were created from parallel processors or from DB2 systems that assisted an initiating agent. Dependent on the degree of parallelism, this can result in a 1:p relation between agent and parallel tasks. In other words, correct Accounting processing needs from the agent one IFCID 3 and \( n \) IFCIDs 239, and for each of the \( p \) parallel tasks also one IFCID 3 and a certain number of IFCIDs 239.

Accounting processing needs a complete set of these IFCIDs for a correct reporting. If either IFCIDs 239 belonging to an IFCID 3 are missing, or if IFCIDs 239 are available but their IFCID 3 is missing, the entire thread is excluded from further processing and reporting.

Report reference

This information provides a detailed description of each report.

This information shows the reports produced by the following products:

- IBM OMEGAMON for Db2 Performance Expert on z/OS
- IBM OMEGAMON for Db2 Performance Monitor on z/OS

It gives examples of each report and describes the fields shown.

Note: In descriptions that apply to both, IBM OMEGAMON for Db2 Performance Monitor on z/OS and IBM OMEGAMON for Db2 Performance Expert on z/OS, the term OMEGAMON for Db2 PE is used for both.

Use this information to interpret OMEGAMON for Db2 PE reports. This information also supplies background and tuning information, where appropriate. If you need more conceptual information about OMEGAMON for Db2 PE reports and how reports are produced, refer to Reporting User’s Guide. For information about OMEGAMON for Db2 PE commands and command syntax, refer to Report Command Reference.
Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:

- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

OMEGAMON for Db2 PE Logs

This topic provides information about the OMEGAMON for Db2 PE logs.

The OMEGAMON for Db2 PE logs provide summarized information about various events during OMEGAMON for Db2 PE execution. You can save some of this summarized information for use in later processing. The following events are reported:

- Records in exception status
- DB2 START/STOP TRACE commands
- Reduction interval completion by report set
- SAVE subcommand completion by report set
- RESTORE subcommand completion by report set
- Errors and messages
- IFCID record distribution

How to generate logs or how to prevent log generation

The OMEGAMON for Db2 PE logs are generated automatically for each OMEGAMON for Db2 PE execution, provided there are valid DD statements in your JCL. To prevent generation of these logs, omit the ddname from your JCL (the preferred method), or specify DUMMY in the definition.

Different log types

The following OMEGAMON for Db2 PE logs are available:

- The DPMLOG execution log provides a listing of messages issued during command stream validation and OMEGAMON for Db2 PE initialization. It also reports any errors during the execution of OMEGAMON for Db2 PE.
- The exception log provides a listing identifying accounting and statistics records with at least one field containing a value outside user-specified limits.
- The job summary log includes the following occurrences in OMEGAMON for Db2 PE processing:
  - Detection of a DB2 START TRACE or DB2 STOP TRACE command
  - Reduction interval completion by report set
  - SAVE subcommand completion by report set
  - RESTORE subcommand completion by report set
  - Key error and warning messages
- The IFCID frequency distribution log provides the count of the input and processed trace records accumulated by IFCID. For each IFCID, a percentage of the total number of input and processed records is calculated.
DPMLOG Execution Log
This topic provides details about the DPMLOG Execution log.

The DPMLOG Execution log shows:
• Messages issued during OMEGAMON for Db2 PE initialization
• Command stream syntax errors
• Information, warning, and error messages issued during processing

Note: It is recommended that you check the DPMLOG messages after each batch execution, even if the job returned "0" as completion code.

How to generate a DPMLOG Execution log
If the DPMLOG DD statement is omitted, such a statement is dynamically allocated and the output is directed to the default SYSOUT class specified for the job.

Example of a DPMLOG Execution log - SYSPRINT message log
The field labels shown in the following sample of a SYSPRINT message log are described in the following section.

<table>
<thead>
<tr>
<th>MSG.ID.</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The following sections describe the header and the fields in the DPMLOG Execution log.

The DPMLOG Execution Log Header:
This topic describes the header of the DPMLOG Execution log.

The header of the DPMLOG Execution log contains the following information:

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

PAGE The page number in the format III-nnnnn, where III denotes the location number within the report and nnnnn the page number within the location.

EXECUTION LOG The name of the log report.
RUN DATE
The date and time of the OMEGAMON XE for DB2 PE job generating the log. The default format is mm/dd/yy hh:mm:ss.th, which can be changed with the DATEFORMAT parameter.

Field Descriptions:

This topic describes the fields shown in the DPMLOG Execution log.

MSG.ID.
The message identification in the format FPEcnnnni, where:
- **FPE** is the product code for OMEGAMON for Db2 PE
- **c** is the OMEGAMON for Db2 PE module component code
- **nnnn** is the error message number
- **i** is an action code. It can have the following values:
  - I (informational)
  - W (warning)
  - E (error)
  - S (severe error)
  - U (unrecoverable error)

DESCRIPTION
The complete text of the error message.

Exception Log
This topic provides details about the Exception log.

The exception log identifies and lists Accounting and Statistics records with at least one field outside user-specified limits. You can use it to identify DB2 threads and Statistics intervals that contain fields with exceptional values. This helps you recognize performance problems in the DB2 subsystem and in threads.

Exception processing is accomplished by setting values in the exception threshold data set. You can define exception thresholds for specific Accounting and Statistics fields. When exception processing is requested, the instrumentation data is checked against these values. Only records with at least one field containing a value outside the user-specified limits are reported.

The exception log file data set is a sequential data set suitable for use by the DB2 load utility. It contains a listing of Accounting and Statistics exception records identical to the listing in the exception log.

Exception traces are available in the Accounting and Statistics report sets. Each of these relates separately to accounting or statistics data. The exception log reports Accounting and Statistics trace exceptions in the same report, in timestamp order. This helps you identify:
- Applications that might be causing exceptional conditions in the DB2 subsystem
- Exceptional DB2 subsystem conditions that might be causing thread performance problems

Although Accounting and Statistics exception reports are available in addition to traces, report entries are neither listed in the exception log nor stored in the exception log file data set.
### Input to Exception Logs

DB2 Statistics and Accounting trace records with IFCID 001 and 002 (statistics) and IFCID 003 and 239 (accounting) are used as input to the exception log.

### How to generate an Exception Log:

This topic describes how to generate an Exception Log.

There is no OMEGAMON for Db2 PE command to generate the exception log. The exception log is generated automatically for an OMEGAMON for Db2 PE execution when the following DD statements are defined in your JCL:

**EXCEPTDD**

Exception threshold data set

**EXTRCDD1**

Exception log

To prevent generation of the exception log, omit the EXTRCDD1 statement from your JCL (the preferred method), or specify DUMMY in the definition.

The amount of data reported in the exception log can be controlled by the GLOBAL INCLUDE or GLOBAL EXCLUDE and FROM and TO specifications.

### Example of the Exception Log:

This topic provides an example of an Exception Log.

#### Exception Log - example

The header and fields shown in the example of the Exception Log are described in the following sections.

</tbody>
</table>
The following sections describe the header and the fields in the Exception Log.

The Exception Log Header:

This topic describes the header of the Exception log.

The header of the Exception log contains the following information:

**LOCATION**

The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

**GROUP**

The name of the DB2 data sharing group. This field shows N/A if there is no group name.

**MEMBER**

The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**

The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**DB2 VERSION**

The DB2 version number of the subsystem that generated the data.

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**

The product name and the version, release, and modification level.

**EXECUTION LOG**

The name of the log report.

**PAGE**

The page number in the format illl-nnnnnn, where illl denotes the location number within the report and nnnnnn the page number within the location.

**ACTUAL FROM/TO**

The date and time of the first and last record included in the log for a location, group, subsystem, or member.

**PAGE DATE**

The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.
**Field Descriptions:**

This topic describes the fields of an Exception Log.

The following fields are shown including OMEGAMON for Db2 PE:

**PRIMAUTH**
The primary authorization ID of the thread.

**ORIGAUTH**
The original authorization ID of the thread.

**PLANNAME**
The DB2 application plan name of the thread.

**CONNECT**
The DB2 connection ID of the thread.

**CORRNAME**
The correlation name of the thread.

**CORRNMBR**
The correlation number of the thread.

**EXCEPTION TIME**
For accounting records, this is the accounting timestamp. For statistics records, this is the END TIME of the statistics interval in which the exception occurred.

**INSTANCE**
The LUW instance number.

**CONNTYPE**
The type of connection for the associated thread. Values are:

- **CICS** CICS Attach
- **DB2 PRIV** DB2 private protocol
- **DB2CALL** DB2 CALL Attach
- **DLI-BTCH** DL/I Batch
- **DRDA** DRDA protocol
- **IMS-CNTL** IMS Control Region
- **IMS-BMP** IMS nontransaction-oriented BMP
- **IMS-MPP** IMS Attach MPP
- **IMS-TBMP** IMS transaction-oriented BMP
- **RRS** RRS attach
- **TSO** TSO foreground and background
UTILITY
Utility attach

If connection type is not present, 'BLANK' is printed.

MAINPACK
This identifier is used to distinguish plans according to the packages they contain.

PER
This identifies the log entry as an exception per system, per plan, or per program.

FIELD ID
The field ID of the accounting or statistics field in exception status.

FIELD DESCRIPTION
A description of the field in exception status. This description matches, as closely as possible, the terminology used in the Accounting and Statistics reports. If the field in exception status is a buffer pool field, the buffer pool ID is printed in front of the field description on the same line. Values are:
- BP0 — BP49
- BP32K — BP32K9

All nondistributed fields for an accounting thread or statistics interval are listed first. Any distributed fields in exception status follow the nondistributed fields and are grouped by remote location. Packages follow after DDF and are grouped by package name.

BY
The basis used for comparing values in the records to values in the exception threshold data set. Values are:
- TOTAL — an absolute value (the default)
- MINUTE — by minute
- SECOND — by second
- COMMIT — by commit
- THREAD — by thread

CALCULATED OR FIELD VALUE
The value from the field in exception status — either an absolute value or a value calculated according to the comparison basis.

Time values are reported in the format ssssss.thtt, where ssssss is time in seconds and thtt is in tenths, hundredths, thousandths, and ten-thousandths of seconds. Integer values such as aborts and selects are reported in the format nnnnnnnnnnn. Other values are reported in the format nnnnnnnn.nn.

OP
The greater than (>) or less than (<) operator.

THRESHOLD VALUE
The value defined in the exception threshold data set, above or below which the actual value must fall to be considered in exception status.

THRESHOLD TYPE
Describes whether the THRESHOLD VALUE is defined in the exception threshold data set as a WARNing or a PROBlem.

Note: PRIMAUTH, ORIGAUTH, PLANNAME, CONNECT, CORRNAME, CORRNMBR, INSTANCE, CONNTYPE, and MAINPACK do not apply to statistics records. Except for MAINPACK, N/A is printed for these fields. For MAINPACK, nothing is printed.
Job Summary Log
This topic provides details about the Job Summary Log.

The OMEGAMON for Db2 PE job summary log provides a summary of events during OMEGAMON for Db2 PE execution, and other information about DB2 that helps you interpret OMEGAMON for Db2 PE reports. The job summary log includes the following events:

- Detection of a DB2 START TRACE or DB2 STOP TRACE command.
- Reduction interval completion by report set. There is a summary of all intervals for each report set at the end of the reduction phase.
- RESTORE subcommand completion by report set. This includes the completion code, DB2 subsystem ID, timestamp information on any restored data, and the ddname of the RESTORE file.
- SAVE subcommand completion by report set. This includes the completion code, DB2 subsystem ID, timestamp information on any restored data, and the ddname of the SAVE file.
- Warning and Error Messages that identify corrupted performance trace input records.

Note: It is recommended that you check the DPMLOG messages after each batch execution, even if the job returned "0" as completion code.

How to Generate the Job Summary Log:

This topic shows how to generate a Job Summary log.

There is no OMEGAMON for Db2 PE command to generate the job summary log. The log is generated automatically for each OMEGAMON for Db2 PE execution, provided that the appropriate ddname is defined in your JCL.

The ddname for the job summary log is JOBSUMDD.

To prevent generation of the job summary log, omit the ddname from your JCL (the preferred method), or specify DUMMY in the definition.

Note: Omitting the ddname for the job summary log also prevents the generation of the IFCID frequency distribution log because both reports are written to JOBSUMDD.

Example of the Job Summary log:

This topic provides an example of the Job Summary log.

Job Summary log - example

The fields shown in the example of the Job Summary log are described in the following sections.
The following sections describe the header and the fields in the Job Summary log.

The Job Summary Log Header:

This topic describes the header of the Job Summary log.

The header of the Job Summary log contains the following information:

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**

The product name and the version, release, and modification level.

**PAGE** The page number in the format *lll-nnnnn*, where *lll* denotes the location number within the report and *nnnnn* the page number within the location.

**JOB SUMMARY LOG**

The name of the log report.

**RUN DATE**

The date and time of the OMEGAMON XE for DB2 PE job generating the log. The default format is *mm/dd/yy hh:mm:ss.th*, which can be changed with the DATEFORMAT parameter.

**Field Descriptions:**

This topic describes the fields of the Job Summary log.

The following fields are shown:
MSG.ID.
The message identification in the format FPEcnnni, where:

- **FPE** is the product code for OMEGAMON for Db2 PE
- **c** is the OMEGAMON for Db2 PE module component code
- **nnnn** is the message number
- **i** is an action code with possible values of:
  - I (informational)
  - W (warning)
  - E (error)
  - S (severe error)
  - U (unrecoverable error)

LOCATION
The DB2 location to which the message applies. If there is no location data, the subsystem ID (DB2ID) is printed.

DESCRIPTION
The complete text of the message.

GROUP
The name of the data sharing group.

SSID
The ID of the data sharing subsystem.

MEMBER
The name of the data sharing member.

TIME_STAMP
The date and time of the current input trace record, in the format mm/dd/yy hh:mm:ss.th.

Job Summary VSAM Data Set:
The job summary VSAM data set (JSSRSDD) is used for saving and restoring data-related Job Summary information.

When accounting or statistics data is saved and JSSRSDD has been included in the job stream, related Job Summary information is written to JSSRSDD. If JSSRSDD has been included in the job stream and data is restored, Job Summary information is restored to the job summary log.

If you are restoring data, the data set defined by JSSRSDD and the data set defined by the restore data set must match, that is, be produced by the same save operation.

JSSRSDD is optional. If you omit JSSRSDD, information about the previous processing of saved data is not restored or information about current processing is not saved.

The VSAM data set defined by JSSRSDD must already exist when you run OMEGAMON for Db2 PE. Either specify an existing data set from a previous OMEGAMON for Db2 PE run (when restoring data), or specify a new data set allocated using the IDCAMS DEFINE CLUSTER function. If an existing data set is used and the SAVE subcommand is specified, the new Job Summary data is added to the previous content.
See the Reporting User's Guide for the attributes of OMEGAMON for Db2 PE VSAM data sets.

Note: Do not specify DUMMY for JSSRSDD.

**IFCID Frequency Distribution Log**

The IFCID Frequency Distribution log provides counts of the trace records by IFCID. There are counts for the number of valid records provided as input to OMEGAMON for Db2 PE as well as for the number of records that are processed after GLOBAL filtering and after duplicate records are dropped.

An IFCID count is listed, and a percentage of the total number of records is calculated.

One copy of the IFCID Frequency Distribution log is produced for each location.

**Input to the IFCID Frequency Distribution logs**

All records supplied as input to OMEGAMON for Db2 PE are used automatically as input to the IFCID Frequency Distribution Log.

**How to Generate an IFCID Frequency Distribution Log:**

This topic shows how to generate an IFCID Frequency Distribution log.

There is no OMEGAMON for Db2 PE command to generate the IFCID Frequency Distribution log. The log is generated automatically for each OMEGAMON for Db2 PE execution, provided that the appropriate ddname is defined in your JCL.

The ddname for the IFCID Frequency Distribution log is JOBSUMDD.

To prevent the generation of the IFCID Frequency Distribution log, omit the ddname from your JCL (the preferred method), or specify DUMMY in the definition.

Note: Omitting the ddname for the IFCID Frequency Distribution log also prevents the generation of the Job Summary log because both logs are written to JOBSUMDD.

**Example of the IFCID Frequency Distribution Log:**

This topic provides an example of an IFCID Frequency Distribution Log.

**IFCID Frequency Distribution Log - example**

The header and fields shown in the example of the IFCID Frequency Distribution Log are described in the following sections.

Chapter 6. Batch reporting 3015
The following sections describe the header and the fields in the IFCID Frequency Distribution log.

The IFCID Frequency Distribution Log Header:

This topic describes the header of the IFCID Frequency Distribution log.

The header of the IFCID Frequency Distribution log contains the following information:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

GROUP
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

MEMBER
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

SUBSYSTEM
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

DB2 VERSION
The DB2 version number of the subsystem that generated the data.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

IFCID FREQUENCY DISTRIBUTION LOG
The title of the log report.

PAGE
The page number in the format ill-nnnnnn, where ill denotes the location number within the report and nnnnnn the page number within the location.

RUN DATE
The date and time of the OMEGAMON XE for DB2 PE job generating the log. The default format is mm/dd/yy hh:mm:ss.th, which can be changed with the DATEFORMAT parameter.

ACTUAL FROM/TO
The date and time of the first and last record included in the log for a location, group, subsystem, or member.

Field Descriptions:

This topic describes the fields of the IFCID Frequency Distribution log.

The following fields are shown:
IFCID  The IFCID number of the record. The identifier is listed in decimal.

INPUT COUNT  The total number of occurrences of each IFCID in the raw data, after invalid records are rejected and partial GTF records are combined.

INPUT PCT OF TOTAL  The percentage of the total number of input records that the number in INPUT COUNT represents.

PROCESSED COUNT  The total number of occurrences of each IFCID in the processed data after GLOBAL filtering and after duplicate records are dropped. When DPMOUTDD is specified in the JCL, the value in this field is a reflection of the contents of the DPMOUT data set.

PROCESSED PCT OF TOTAL  The percentage of the total number of records in the processed data that the number in PROCESSED COUNT represents.

TOTAL INPUT TRACE RECORDS  The total of the INPUT COUNT column.

TOTAL PROCESSED TRACE RECORDS  The total of the PROCESSED COUNT column.

**Accounting Report Set**

These topics provide information about the Accounting reports.

**Note:** For an introduction to the Accounting report set and general accounting information refer to the [Reporting User’s Guide](#). It also provides information on input to Accounting reports and traces.

**Accounting Default Layouts**

This topic provides examples of the Accounting default layout for SHORT and LONG.

When data from a particular DB2 version is processed, N/A is printed for all fields in the report that are not applicable to that version.

For Accounting, the LAYOUT subcommand option ACCEL provides detailed thread-related Accelerator activity data.

You can use the user-tailored reporting (UTR) facility to modify the layouts and store the changes. If you do this, store your layouts under a different name to avoid confusion and keep the layouts relevant to this documentation.

**Headers Used in Accounting:**

This topic describes the header of the Accounting report layout.

OMEGAMON for Db2 PE header information is printed at the top of each page of an Accounting report or trace. For a report, the header differs depending on whether it is a member-scope or group-scope report.

**Accounting Report Header Member-Scope**

Here is a sample header for an Accounting report generated with member-scope.
Accounting Report Header-Group-Scope

Here is a sample header for an Accounting report generated with group-scope.

| LOCATION: | PMODBN1  | PMODBN1  | OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0) | PAGE: | 1-1 |
| GROUP:    | DBN1     | DBN1     | ACCOUNTING REPORT - SHORT                       | REQUESTED FROM: | NOT SPECIFIED |
| MEMBER:   | SN11     | SN11     | ORDER: PRIMAUTH-PLANNAME                        | TO: | NOT SPECIFIED |
| SUBSYSTEM:| SN11     | SUBSYSTEM: SN11 | SCOPE: MEMBER | INTERVAL FROM: | 01/30/15 22:53:32.60 |
| DB2 VERSION: | V10 | DB2 VERSION: V10 | | TO: | 01/30/15 22:50:05.07 |

Accounting Trace Header

Here is a sample header for an Accounting trace.

| LOCATION: | DSNCAT  | DSNCAT  | OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0) | PAGE: | 1-1 |
| GROUP:    | DSNCAT  | DSNCAT  | ACCOUNTING REPORT - SHORT                       | REQUESTED FROM: | NOT SPECIFIED |
| ORDER:    | PRIMAUTH-PLANNAME | ORDER: PRIMAUTH-PLANNAME | SCOPE: GROUP | INTERVAL FROM: | 01/30/15 18:47:13.28 |
| TO:       | NOT SPECIFIED | TO: | NOT SPECIFIED | TO: | 01/30/15 19:55:28.69 |

Description of the Accounting header fields

The Accounting headers, shown in "Accounting Report Header Member-Scope" on page 3017, "Accounting Report Header-Group-Scope," and "Accounting Trace Header," contain the following information:

**LOCATION**
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

**GROUP**
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

**MEMBER**
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**DB2 VERSION**
The DB2 version number of the subsystem that generated the data.

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**
The product name and the version, release, and modification level.

**Title - layout**
The title of the report and the layout. The layout can be a default layout provided with OMEGAMON for Db2 PE or a layout you have tailored yourself.

**ORDER**
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field.
Depending on the context, the OMEGAMON for Db2 PE identifiers by which lock events are grouped are shown here.

**SCOPE**
Scope of the report or trace, this can be MEMBER or GROUP. A member-scope report or trace shows data from a group for each individual member. In a group-scope report or trace, the data from individual members is consolidated and presented for the entire group.

**PAGE**
The page number in the format 111-nnnnnnn, where 111 denotes the location number within the report and nnnnnn the page number within the location.

**REQUESTED FROM and TO**
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

**INTERVAL FROM**
The start date and time of the first reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

**INTERVAL TO**
The end date and time of the last reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

**PAGE DATE**
The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.

**How Averages Are Calculated:**

Accounting reports show times and events averaged over the number of threads whilst Accounting traces show times and events as totals for each thread.

Fields in an Accounting report can show:

- **Averages** presented with two decimal places behind the point.
- **Totals** presented as whole numbers. If it is not possible to distinguish the type of data, totals are indicated with a hash (#) as the first character in the label.
- **Times** presented with six decimal places behind the point.

Averages are calculated by dividing totals by QPACRLNU, which is the number of threads to roll data into this QPAC data section.

\[
\text{Average} = \frac{\text{Total of package counter or time (QPACxxxx)}}{\text{Number of threads that roll data into this QPAC data section (QPACRLNU)}}
\]

This applies to package class 7, 8, or 10 times and events:
package buffer pool activity - class 10 on page 3285
package locking activity - class 10 on page 3300
package SQL activity - class 10 on page 3303
package times - class 7 on page 3312
package global contention P-locks - class 8 on page 3289
package global contention L-locks - class 8 on page 3288
package times - class 8 - suspensions on page 3304
package identification - report on page 3291
package identification - trace on page 3295
package general (short report) on page 3031
package general (short trace) on page 3060

for more information refer to the accounting trace sections for a package.

Averages of plan level counters in repeating data sections are calculated by dividing totals by the number of data sections which are aggregated to produce the report entry (this includes the DDF and RLF count).

Averages of buffer pool counters are calculated on a per-record basis.

accounting report - short:
The short accounting report shows some of the most significant fields averaged over the number of threads.

Short accounting reports are arranged in blocks. Each block contains accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.

You can generate a short version of the accounting report using the following command:

```
... ACCOUNTING REPORT LAYOUT (SHORT) ORDER (PRIMAUTH-PLANNAME) SCOPE (MEMBER) ...
```

Accounting Report - Short

This is an example of a short accounting report.

General (Short Report):

This topic shows detailed information about “Accounting - General (Short Report)".

3026  IBM Db2 Performance Expert on z/OS
This block is part of the Accounting Short Report.

**Accounting - General (Short Report)**

The field labels shown in the following sample layout of “Accounting - General (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#OCCURS</td>
<td>The number of logical accounting records. A logical accounting record can contain more than one physical record.</td>
</tr>
<tr>
<td>#COMMIT</td>
<td>The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests.</td>
</tr>
<tr>
<td>#DISTRS</td>
<td>The number of accounting records with distributed activity. That is, the number of accounting records related to allied-distributed, DBAT, or DBAT-distributed threads.</td>
</tr>
<tr>
<td>#ROLLBK</td>
<td>The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.</td>
</tr>
</tbody>
</table>

**Special Considerations:**
- Application program abends
- Application rollback requests
- Application deadlocks on database records
- Applications canceled by operator
- Thread abends due to resource shortage

**Field Name:** QWACABRT

This is an exception field.

---

### Example Table

| PRIMAUTH | PLANNAME | #OCCURS | #COMMIT | INSERTS | OPENS | PREPARE | CLASS2 | EL.TIME | BUF.UPDT | LOCK | SUS | #DISTRS | SELECTS | UPDATES | CLOSES | CLASS1 | CPUTIME | CLASS2 | EL.TIME | CPUTIME | SYN.READ | #LOCKOUT | GETPAGES | TOT.PREF |

---

Chapter 6. Batch reporting 3027
processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM
This is an exception field.

SELECTS
The number of SQL SELECT statements executed.
Field Name: QXSELECT
This is an exception field.

FETCHES
The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).
Field Name: QXFETCH

INSERTS
The number of INSERT statements executed.
Field Name: QXINSRT

UPDATES
The number of UPDATE statements executed.
Field Name: QXUPDTE

MERGES
The number of times a MERGE statement was executed.
Field Name: QXMERGE

OPENS
The number of OPEN statements executed.
Field Name: QXOPEN

CLOSES
The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).
Field Name: QXCLOSE

DELETES
The number of DELETE statements executed.
Field Name: QXDELET

PREPARE
The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

CLASS1 EL.TIME

The class 1 elapsed time of the allied agent.

Special Considerations:
- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT

This is an exception field.

CLASS1 CPUTIME

The class 1 CPU time in an application. It indicates:
- The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.
  - In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

Field Name: ADCPUT

This is an exception field.

CLASS2 EL.TIME

The class 2 elapsed time of the allied agent accumulated in DB2.

Field Name: ADDB2ETT

This is an exception field.

CLASS2 CPUTIME

The class 2 CPU time (in DB2). It indicates:
• The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
• The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
• For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks, related to the originating task.
For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.
This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADDBCPUT

This is an *exception* field.

**GETPAGES**

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

**Background and Tuning Information**

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

• Add indexes to tables to reduce the number of pages scanned.
• Reassess the number of tables used and denormalize them, if necessary.
  As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
• Use correlated rather than non-correlated queries to force the use of an index.

**Field Name:** QBACGET

This is an *exception* field.

**BUF.UPDT**

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

**Background and Tuning Information**
A nonzero value indicates any of the following activities:

- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

**Field Name**: QBACSWS

This is an *exception* field.

**SYN.READ**

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

**Field Name**: QBACRIO

This is an *exception* field.

**TOT.PREF**

The number of sequential, dynamic, and list prefetch requests.

**Field Name**: ABCLSPR

This is an *exception* field.

**LOCK SUS**

The total number of all lock suspensions. This includes local and global lock suspensions.

**Field Name**: ALTSUSP

This is an *exception* field.

**#LOCKOUT**

The number of deadlocks and timeouts.

**Field Name**: ADTIMDLK

This is an *exception* field.

---

**Package General (Short Report):**

This topic shows detailed information about “Accounting - Package General (Short Report)”.

This block is part of the Accounting Short Report.

**Accounting - Package General (Short Report)**

The field labels shown in the following sample layout of “Accounting - Package General (Short Report)” are described in the following section.

<table>

---

**PROGRAM NAME**

The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

Field Name: QPACPKID
This is an exception field.

TYPE
An indicator of whether the block describes a package or a DBRM.
Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

Field Name: ADPCKTYP

#OCCURS
This value can be one of the following:

• In general, the total number of accounting trace sections for a package or DBRM regardless of enabled or disabled DB2 trace classes 7 and 8 at the time of writing the trace record. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in a record.

• If REPORT ORDER (ACTNAME) is specified, the total number of package sections of a special activity type depends on the following:
  – If IFCID 233 or 380 is available, stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  – If IFCID 233 or 381 is available, user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  – If neither IFCID 233, 380, nor 381 is collected, all packages of an activity type are counted. The sum also includes the number of subprograms.

Field Name: ADTOTPOC

#ALLOCs
This value can be one of the following:

• In general, the number of times a package was invoked by a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

• If REPORT ORDER (ACTNAME) is specified, the number of times a package of a special activity type is invoked from a different package depends on the following:
  – If IFCID 233 or 380 is available, the invocations of stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  – If IFCID 233 or 381 is available, the invocation of user-defined functions (UDF) are counted based on the available IFCID. If both
IFCID s are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.

- If neither IFCID 233, 380, nor 381 is collected, all invocations of an activity type are counted. The sum also includes the number of subprograms.

Field Name: APACSWIT

SQLSTMT

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an exception field.

CL7 ELAPTIME

The total elapsed time for executing the package or DBRM.

Field Name: QPACSCT

This is an exception field.

CL7 CPU TIME

The class 7 CPU time spent by the package or DBRM. It indicates:

- The TCB time
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: ADCPUTP

This is an exception field.

CL8 SUSP.TIME

The waiting time for the package or DBRM due to class 8 suspensions.

Field Name: ADTSUSSTP

This is an exception field.

CL8 SUSP

The number of all types of class 8 suspensions.

Field Name: ADTSUSSCP

This is an exception field.
Distributed Activity Server (Short Report):

This topic shows detailed information about “Accounting - Distributed Activity Server (Short Report)”.

This block is part of the Accounting Short Report.

**Note:** For information on how to calculate total values for multiple lines refer to “Distributed Activity Requester (Short Report)” on page 3037.

Accounting - Distributed Activity Server (Short Report)

The field labels shown in the following sample layout of “Accounting - Distributed Activity Server (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>SERVER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>M ETH</th>
<th>#DDFS</th>
<th>#ROLLBK</th>
<th>#COMMIT</th>
<th>SQLSENT</th>
<th>ROWRECV</th>
<th>CONVI</th>
<th>ELAPSED REQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMODA1</td>
<td>DB2</td>
<td>V10R1 M5</td>
<td>N/P</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>2.00</td>
<td>1095.00</td>
<td>1.00</td>
<td>0.154750</td>
</tr>
</tbody>
</table>

SERVER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to "ROLSUM".

**Field Name:** QLACLOCN

This is an exception field.

PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
• In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $VvvRrrMm$, where:

- $vv$ Version level
- $rr$ Release level
- $m$ Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**PRODUCT VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $VvvRrrMm$, where:

- $vv$ Version level
- $rr$ Release level
- $m$ Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**METH**

The method of access: DB2 private protocol, DRDA protocol, or both.
This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

**#DDFS**

The number of occurrences of the remote location and method pair.

**Field Name:** ASDDF

**#ROLLBK**

The total number of rollbacks (single phase and two-phase) sent.

**Field Name:** ADROL12S

**#COMMIT**

The total number of single-phase and two-phase commit requests sent.

**Field Name:** ADCOM12S

**SQLSENT**

The number of SQL statements sent to the server location. This value is maintained at the requesting location.

**Field Name:** QLACSQLS

**ROWRECV**

The number of rows of data retrieved from the server location. This value is maintained at the requester location.

**Special Considerations:**

1. The number of rows received from the server location does not include either the SQLDA or SQLCA.

2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

**Field Name:** QLACROWR

This is an exception field.

**CONVI**

The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

**Field Name:** QLACCNVS

This is an exception field.

**ELAPSED REQ**
The elapsed time at the requester. It includes the total of DB2 and network time.

**Field Name:** ADDSELRO

This is an *exception* field.

### Distributed Activity Requester (Short Report):

This topic shows detailed information about “Accounting - Distributed Activity Requester (Short Report)”.

This block is part of the Accounting Short Report.

**Note:** The total values for each requester (or server) are not calculated if there are multiple lines that result from different product IDs and product versions. However, you can calculate these totals as follows:

1. Field labels that start with a #-sign are totals. The sums of these fields are the values for each requester (or server).
2. The remaining numerical fields are averages for each #DDFS. Multiply the shown average values by the #DDFS value to calculate the absolute value for each requester (or server) and line.
3. Then summarize all absolute values for each requester (or server) and line, and divide the sum by the sum of all #DDFS values for each requester (or server).

You can customize the report layout using the user-tailored reporting (UTR) facility as described in the Reporting User’s Guide section about “Tailoring report layouts”.

### Accounting - Distributed Activity Requester (Short Report)

The field labels shown in the following sample layout of “Accounting - Distributed Activity Requester (Short Report)” are described in the following section.

<table>
<thead>
<tr>
<th>REQUESTER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>METH</th>
<th>#DDFS</th>
<th>#ROLLBK</th>
<th>#COMMIT</th>
<th>SQLRECV</th>
<th>ROWSENT</th>
<th>CONVI</th>
</tr>
</thead>
<tbody>
<tr>
<td>::FFFF#1</td>
<td>JDBC DRIVER</td>
<td>V3 RESMO</td>
<td>ORDA</td>
<td>2</td>
<td>0</td>
<td>2</td>
<td>5.50</td>
<td>0.00</td>
<td>1.00</td>
</tr>
</tbody>
</table>

### REQUESTER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an *exception* field.

### PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:
PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as VvvRrrMm, where:

- vv Version level
- rr Release level
- m Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

PRODUCT VERSION

The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.

In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)
It consists of 5 digits and is shown as VvvRrrMm, where:

Vv  Version level
rr  Release level
m   Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

METH
The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROTOC

#DDFS
The number of occurrences of the remote location and method pair.

Field Name: ASDDF

#ROLLBK
The total number of rollbacks (single phase and two-phase) received.

Field Name: ADROL12R

#COMMIT
The total number of commits (single phase and two-phase) received.

Field Name: ADCOM12R

SQLRECV
The number of SQL statements received from the requester location.

Field Name: QLACSQRLR

ROWSENT
The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

Field Name: QLACROWS

CONVI
A count of conversations initiated by the requester.

This number is updated at the server location.

Field Name: QLACCNVNR
Accounting Trace - Short:

The short Accounting trace shows some of the most significant fields summarized by thread.

Short Accounting traces are arranged in blocks. Each block contains Accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.

The following example shows a short version of the Accounting trace produced by the following command:

```
... 
ACCOUNTING TRACE LAYOUT (SHORT) 
...
```

Accounting Trace - Short:

The following example shows a short version of the Accounting trace.

---
General (Short Trace):

This topic shows detailed information about “Accounting - General (Short Trace)”.

This block is part of the Accounting Short Trace.

Accounting - General (Short Trace)

The field labels shown in the following sample layout of “Accounting - General (Short Trace)” are described in the following section.

PRIMAUTH
The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

Field Name: QWHCAID

PLANNNAME
The plan name. It is blank for a DB2 command thread; otherwise:

DSNESP RR
For SPUFI with repeatable read.

DSNESP C S
For SPUFI with cursor stability.

DSNUTIL
For utilities.

DSNTEP2
For DSNTEP2.

DSN B IND
For binding.

The application plan name
For IMS.

The application plan name
For CICS.

A blank plan name
For IMS and CICS commands.
DSQPLAN
For QMF.

The first 8 bytes of the application name
For DRDA connections to the common servers.

Field Name: QWHCPLAN
This is an exception field.

CORRNAME
This field shows the correlation name. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

Batch  Job name
TSO or CAF  Original authorization ID
CICS  Transaction ID
IMS  Application PST
RRSAF
Characters 1 to 8 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation, which overrides the default translation.

Field Name: ADCORNME

CORRNMBR
This field shows the correlation number. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

Batch  Blank
TSO or CAF  Blank
CICS  Pool thread
IMS  Application PSBNAME
RRSAF
Characters 9 - 12 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation which overrides the default translation.

Field Name: ADCORNMB

CONNECT
The connection name. Possible values are:

- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
• For IMS: the IMS ID
• For CICS, this is the CICS ID
• For DRDA connections from non-DB2 requesters: SERVER

**Field Name:** QWHCCN

This is an *exception* field.

**THR.TYPE**

The type of thread. This field can contain one of the following values:

**ALLIED**

The thread is not involved in any distributed activity.

**ALLDDIST**

The thread is initiated by a DB2 attach and requests data from one or more server locations.

**DBAT**

The thread is initiated, created, and performing work on behalf of a remote (requester) location. The value DBAT also includes DBAT DISTRIBUTED threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.

**Background and Tuning Information**

If the thread is involved in distributed activity, some monitored values can produce different results. For example, the class 1 elapsed time for a distributed thread is higher because the network time is also included.

**Field Name:** ADTHRTYP

**ACCT TIMESTAMP**

The store clock value of the time when the accounting record was generated.

**Field Name:** QWHSSTCK

**TERM. CONDITION**

The reason for termination, that is, for generating a DB2 accounting record.

**Field Name:** ADCNDRSN

**COMMITS**

The number of successful two-phase (units of recovery) or single-phase (synchs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

**Field Name:** QWACC COMM

This is an *exception* field.

**SELECS**
The number of SQL SELECT statements executed.

**Field Name:** QXSELECT

This is an *exception* field.

**OPENS**

The number of OPEN statements executed.

**Field Name:** QXOPEN

This is an *exception* field.

**FETCHES**

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

**Field Name:** QXFETCH

**DELETES**

The number of DELETE statements executed.

**Field Name:** QXDELET

**INSERTS**

The number of INSERT statements executed.

**Field Name:** QXINSRT

**UPDATES**

The number of UPDATE statements executed.

**Field Name:** QXUPDTE

**MERGES**

The number of times a MERGE statement was executed.

**Field Name:** QXMERGE

**PREPARE**

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

**Field Name:** QXPREP

**EL. TIME(CL1)**

The class 1 elapsed time of the allied agent.

*Special Considerations:*

- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
• In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT
This is an exception field.

CPU TIME(CL1)
The class 1 CPU time in an application. It indicates:
• The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
• The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
• In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

Field Name: ADCPUT
This is an exception field.

EL. TIME(CL2)
The class 2 elapsed time of the allied agent accumulated in DB2.

Field Name: ADDB2ETT
This is an exception field.

CPU TIME(CL2)
The class 2 CPU time (in DB2). It indicates:
• The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
• The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
• For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks, related to the originating task.

For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

Field Name: ADDBCPUT
This is an exception field.
GETPAGES

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

Background and Tuning Information

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:
- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary.

As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
- Use correlated rather than non-correlated queries to force the use of an index.

Field Name: QBACGET

This is an exception field.

BUE.UPDT

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

Background and Tuning Information

A nonzero value indicates any of the following activities:
- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSW

This is an exception field.

SYN.READ

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO

This is an exception field.
TOT.PREF
The number of sequential, dynamic, and list prefetch requests.

Field Name: ABCLSPR
This is an exception field.

LOCK SUS
The total number of all lock suspensions. This includes local and global lock suspensions.

Field Name: ALTSUSP
This is an exception field.

LOCKOUTS
The number of deadlocks and timeouts.

Field Name: ADTIMDLK
This is an exception field.

Package General (Short Trace):
This topic shows detailed information about “Accounting - Package General (Short Trace)”.
This block is part of the Accounting Short Trace.

Accounting - Package General (Short Trace)
The field labels shown in the following sample layout of “Accounting - Package General (Short Trace)” are described in the following section.

<table>
<thead>
<tr>
<th>PROGRAM NAME</th>
<th>TYPE</th>
<th>SQLSTMT</th>
<th>CL7 ELAP.TIME</th>
<th>CL7 CPU TIME</th>
<th>CL8 SUSP.TIME</th>
<th>CL8 SUSP</th>
<th>PKGNAME</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PACKAGE</td>
<td></td>
<td>0.184705</td>
<td>0.003055</td>
<td>0.041534</td>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>

| PROGRAM NAME |
The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

Field Name: QPACPKID
This is an exception field.

| TYPE |
An indicator of whether the block describes a package or a DBRM.
Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

Field Name: ADPCKTYP

| SQLSTMT |
The number of SQL statements issued in this package or DBRM.
This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

**Note:** This field is shown for the following field labels in Accounting trace:
- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

**Field Name:** QPACSQLC

This is an *exception* field.

### CL7 ELAP.TIME

The total elapsed time for executing the package or DBRM.

**Field Name:** QPACSCT

This is an *exception* field.

### CL7 CPU TIME

The class 7 CPU time spent by the package or DBRM. It indicates:
- The TCB time
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This time does not include the CPU time consumed on an IBM specialty engine.

**Field Name:** ADCPUTP

This is an *exception* field.

### CL8 SUSP.TIME

The waiting time for the package or DBRM due to class 8 suspensions.

**Field Name:** ADTSUSTP

This is an *exception* field.

### CL8 SUSP

The number of all types of class 8 suspensions.

**Field Name:** ADTSUSCP

This is an *exception* field.

*Distributed Activity Server (Short Trace):*

This topic shows detailed information about “Accounting - Distributed Activity Server (Short Trace)”.

This block is part of the Accounting Short Trace.
Accounting - Distributed Activity Server (Short Trace)

The field labels shown in the following sample layout of “Accounting - Distributed Activity Server (Short Trace)” are described in the following section.

<table>
<thead>
<tr>
<th>SERVER</th>
<th>PRODUCT ID</th>
<th>PROD VERSION</th>
<th>METH</th>
<th>ROLBCK</th>
<th>COMMITS</th>
<th>SQLSENT</th>
<th>ROWREC</th>
<th>CONVI</th>
<th>ELAPSED REQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMODA11</td>
<td>DB2</td>
<td>V10R1</td>
<td>N/P</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>1095</td>
<td>1</td>
<td>0.154750</td>
</tr>
</tbody>
</table>

SERVER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

Field Name: QLACLOCN

This is an exception field.

PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as \( v_v_r_r_m \), where:

\( v_v \) Version level
\( r_r \) Release level
\( m \) Modification level
Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

**PROD VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as $vvvvRrrmm$, where:

- $vv$: Version level
- $rr$: Release level
- $mm$: Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

**METH**

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROTOC

**ROLLBCK**

The total number of rollbacks (single phase and two-phase) sent.

Field Name: ADROL12S
COMMTS

The total number of single-phase and two-phase commit requests sent.

Field Name: ADCOM12S

SQLSENT

The number of SQL statements sent to the server location. This value is maintained at the requesting location.

Field Name: QLACSQLS

ROWREC

The number of rows of data retrieved from the server location. This value is maintained at the requester location.

Special Considerations:
1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

Field Name: QLACROWR

This is an exception field.

CONVI

The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

Field Name: QLACCNV

This is an exception field.

ELAPSED REQ

The elapsed time at the requester. It includes the total of DB2 and network time.

Field Name: ADDSELRQ

This is an exception field.

Distributed Activity Requester (Short Trace):

This topic shows detailed information about “Accounting - Distributed Activity Requester (Short Trace)”.

This block is part of the Accounting Short Trace.

Accounting - Distributed Activity Requester (Short Trace)

The field labels shown in the following sample layout of “Accounting - Distributed Activity Requester (Short Trace)” are described in the following section.
REQUESTER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to "ROLSUM".

Field Name: QLACLOCN

This is an exception field.

PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>SQQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as VvvRrrRrrm, where:

v   Version level
r   Release level
m   Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

PROD VERSION

Chapter 6. Batch reporting
The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

- **vv** Version level
- **rr** Release level
- **m** Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**METH**

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

**ROLLBCK**

The total number of rollbacks (single phase and two-phase) received.

**Field Name:** ADROL12R

**COMMENTS**

The total number of commits (single phase and two-phase) received.

**Field Name:** ADCOM12R

**SQLRECV**
The number of SQL statements received from the requester location.

**Field Name:** QLACSQLR

**ROWSENT**

The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

**Field Name:** QLACROWS

**CONVI**

A count of conversations initiated by the requester. This number is updated at the server location.

**Field Name:** QLACCNVR

**Accounting Report - Long:**

This topic shows an example of a long version of the Accounting report.

Use the following command to produce a long version of the Accounting report:

```
ACCOUNTING REPORT - LONG
ORDER (PRIMAUTH-PLANNAME)
SCOPE (MEMBER)
```

**Accounting (Long Report)**
### Performance Report

**Location:** OMPDAS  
**Group:** N/P  
**Member:** N/P  
**Subsystem:** DA5  
**Order:** PRIMAUTH-PLANNAME  
**Interval:** 08/24/16 08:18:18.92

**Plan Name:** BLANK

### SQL Query Performance Report

#### Performance Details
- **CPU Time:** 0.0000000000
- **Elapsed Time:** 0.000492
- **User Time:** 0.000000
- **System Time:** 0.000000
- **Wait Time:** 0.000000
- **Disk Time:** 0.000000
- **I/O Operations:** 0
- **I/O Operations/sec:** 0
- **I/O Operations/MB:** 0
- **I/O Operations/MB/sec:** 0
- **I/O Operations/MB/sec:** 0

#### SQL Statements
- **SELECT:** 0
- **INSERT:** 0
- **UPDATE:** 0
- **DELETE:** 0
- **INSERT:** 0
- **UPDATE:** 0
- **DELETE:** 0
- **UPDATE:** 0
- **DELETE:** 0
- **UPDATE:** 0
- **DELETE:** 0

#### SQL Performance Details
- **Rows Processed:** 0
- **Rows Inserted:** 0
- **Rows Updated:** 0
- **Rows Deleted:** 0
- **Rows Modified:** 0
- **Rows Scanned:** 0
- **Rows Retrieved:** 0
- **Rows Found:** 0
- **Rows scanned:** 0

#### Performance Metrics
- **CPU Usage:** 0%
- **Memory Usage:** 0%
- **Buffer Pool:** 0%
- **I/O Operations:** 0
- **I/O Operations/sec:** 0
- **I/O Operations/MB:** 0
- **I/O Operations/MB/sec:** 0
- **I/O Operations/MB/sec:** 0

#### Performance Summary
- **SQL Statements:**
  - SELECT: 0
  - INSERT: 0
  - UPDATE: 0
  - DELETE: 0

#### Performance Charts
- **SQL Performance Chart**
- **CPU Time Distribution**
- **I/O Operations Distribution**

#### Performance Recommendations
- **Optimize SELECT statements to reduce execution time.
- Monitor CPU and memory usage to identify bottlenecks.
- Review I/O operations to improve efficiency.

---

**Contact Information**

- **IBM Db2 Performance Expert**
- **Support:** 1-800-IBM-SERV
- **Website:** www.ibm.com/db2

---

**Notes**

- **Performance Optimization Recommendations:**
  - Review SQL statements for efficiency.
  - Monitor system resources to identify bottlenecks.
  - Consider using Db2 Advanced Analytics and Db2 Machine Learning for predictive performance analysis.

**Note:** The above table represents a summary of performance metrics and distributions, which are crucial for analyzing database performance. Each entry in the table corresponds to a specific database operation or event, with metrics such as time, events, and status codes, indicating areas that may require optimization or further investigation. This information is vital for diagnosing performance bottlenecks and improving the overall efficiency of the database system.

### Example 6.1

The following example illustrates the usage of the `SYSTEM` function in SQL to calculate elapsed time and CPU usage on DB2 databases. The example utilizes the `PERCENTILE` function to determine the 95th percentile of elapsed time and CPU usage.

```sql
SELECT
    PERCENTILE_CONT(0.95) WITHIN GROUP (ORDER BY elapsed_time)
    OVER () AS ninetieth_percentile,
    PERCENTILE_CONT(0.99) WITHIN GROUP (ORDER BY cpu_usage)
    OVER () AS ninety-ninth_percentile
FROM
    system_metrics
WHERE
    database_name = 'DB2_001'
GROUP BY
    instance_id
ORDER BY
    instance_id
LIMIT 1;
```
- **STORED PROC**: 0.0000 N/A AUTONOMOUS PROCEDURE 0.000000 0.00 N/C MAX WFILE BLKS : 0

### Conclusion

This section provides detailed batch reporting metrics for different components and subsystems within the DB2 environment. Key areas include page access statistics, buffer hit ratios, and access patterns. The data is presented in a tabular format, offering insights into disk I/O, synchronous and asynchronous operations, and system performance metrics. With precise data on page requests, read and write operations, and hit ratios, system administrators can make informed decisions to optimize database performance. The inclusion of timestamps and specifying intervals allows for a comprehensive view of performance changes over a defined period. This data is invaluable for troubleshooting, capacity planning, and enhancing overall system efficiency.

#### DB2 Performance Report

- **Elapsed Time:** 1,243,841 N/P  
  - Elapsed Used: 0.00  
  - Call Statements: 0.00  
  - Abandoned: 0.00  
  - Timed Out: 0.00  
  - Rejected: 0.00

- **Location:** OMEGAMON XE for DB2 Performance Expert (V5R4M0)

- **Group:** DB2 ACCOUNTING REPORT - LONG

- **Member:** SEE1

- **Status:** ORDER: PRIMAUTH-PLANNAME  
  - Interval: FROM 08/24/16 08:16:02.78 TO 08/24/16 09:28:00.00  
  - Scope: MEMBER  
  - Type: TO 08/24/16 09:28:00.00

---

**Notable Observations:**

- High lock contention and time elapsed, indicating potential performance issues.
- Detailed DB2 performance metrics for TPC-H and other benchmarks.
- Explanation of lock management and its impact on performance.

### Accounting Trace - Long:

This topic shows an example of a long version of the Accounting trace.

The following example shows an extract from a long version of the Accounting trace produced by the following command:

```
ACCOUNTING TRACE LAYOUT (LONG)
```

### Accounting (Long Trace)

The following example shows an extract from a long version of the Accounting trace.

ACCOUNTING TRACE COMPLETE
Accounting Report and Trace Blocks:

Accounting reports and traces are arranged in blocks. Each block contains accounting information about a particular activity. The layout of each block is presented followed by the field descriptions.

The layout of the Accounting report blocks and the corresponding trace blocks is similar, the main difference is that Accounting reports show times and events averaged over the number of threads, and accounting traces show times and events as totals for each thread.

Fields in an Accounting report can show average values, totals or times. Normally the columns within the blocks of a report are labeled to indicate the type of data shown, and are shown as follows:

**Averages**  
Have two decimal places behind the point

**Totals**  
Are whole numbers

**Times**  
Have six decimal places behind the point

Where it is not possible to distinguish the type of data, totals are indicated with a hash (#) as the first character in the label.

This topic shows each block in alphabetical order. Each field in the block is listed in the order that it appears, showing the field name (as shown in the long report and trace) followed by a description.

Each block is presented in the default layout. Some blocks can have columns, rows or fields that are not included in the default layout. For example, the SQL DCL, SQL DML, RID List, buffer pool and group buffer pool activity blocks have a /COMMIT column that is not shown in the default layout. You can include columns, rows, and fields not shown in the default layouts with user-tailored reporting (UTR).

Field names used in short reports and traces can vary slightly from those used in the long versions. This is to allow the layout of the printed report or trace to align properly.

If a counter value or specific information in reports, in windows, or on panels is not shown, the following notation is used to indicate the reason:

**N/A**  
Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:

- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

**N/C**  
Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:

- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).
N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

Short, Unique, or Long Names or Strings

The following types of names or strings are used in this information:

Short name or string
A short name or short string is either the value of an original DB2 field if it is less than or equal to the defined length of the field, or it is the abbreviation of a longer value which is populated in a field of varying length.

Unique name or string
A unique name or unique string is a generated string based on the short string and its length, with a right-adjusted #-sign and a sequence number. This sequence number depends on the amount of long fields found during processing, which have the same string prefix and length as the short string. For example:

WNAME: IS-255-012345678#1

Long name or string
A long name or long string is the complete string populated in a field of varying length. This depends on the context where it is used.

Accelerator:

This topic shows detailed information about “Accounting - Accelerator”.

The Accounting Accelerator report block is shown for each accelerator that provided services to a DB2 thread. The block consists of three adjacent columns which contain the accelerator identification, the activity-related counters, and the corresponding times.

Note:
- For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015 the values of the following fields are N/A: SQL DML, SQL DDL, ROWS RETURN, COMMIT, and ROLLBACK.
- The Accounting trace shows values and times for each Q8AC section. The Accounting report does not only show accumulated values and times, but also average values and times calculated for one occurrence. It shows the sum of a counter or time of all Q8AC sections processed, divided by the number of processed Q8AC sections.

For more information on the Accounting fields referred to in the field descriptions below, see:
- “Times - Class 1 - Application Time” on page 3341
- “Times - Class 2 - DB2 Time” on page 3347

In the following example both layouts are shown, the report layout is followed by the trace layout.
Accounting - Accelerator

The field labels shown in the following sample layout of “Accounting - Accelerator” are described in the following section.

### PRODUCT

The accelerator product identifier.

**Field Name:** Q8ACPRID

### SERVER

The accelerator server identifier.

**Field Name:** Q8ACNAME
OCCURRENCES
The number of sections processed for the accelerator. The name of this accelerator is shown in the report in block ACCELERATOR IDENTIFIER.
Field Name: AIOCCUR

CONNECTS
The number of accelerator connects.
Field Name: Q8ACCONN

REQUESTS
The number of accelerator requests.
Field Name: Q8ACREQ

TIMED OUT
The number of timed out requests.
Field Name: Q8ACTOUT

FAILED
The number of failed requests.
Field Name: Q8ACFAIL

SENT - BYTES
The number of bytes sent.
Field Name: Q8ACBYTES

SENT - MESSAGES
The number of messages sent.
Field Name: Q8ACMSGS

SENT - BLOCKS
The number of blocks sent.
Field Name: Q8ACBLKS

SENT - ROWS
The number of rows sent.
Field Name: Q8ACROWS

RECEIVED - BYTES
The number of bytes returned.
Field Name: Q8ACBYTR

RECEIVED - MESSAGES
The number of messages returned.
Field Name: Q8ACMSGR

RECEIVED - BLOCKS
The number of blocks returned.
Field Name: Q8ACBLKR

RECEIVED - ROWS
The number of rows returned.

Field Name: Q8ACROWR

**SQL DML - INSERT**

The accumulated number of INSERT statements sent to the accelerator from DB2.

Field Name: Q8ACINSC

**SQL DML - INSERT ROWS**

The accumulated number of rows inserted to the accelerator by DB2.

Field Name: Q8ACROWI

**SQL DML - UPDATE**

The accumulated number of UPDATE statements sent to the accelerator from DB2.

Field Name: Q8ACUPDC

**SQL DML - UPDATE ROWS**

The accumulated number of rows updated on the accelerator by DB2.

Field Name: Q8ACROWU

**SQL DML - DELETE**

The accumulated number of DELETE statements sent to the accelerator from DB2.

Field Name: Q8ACDELC

**SQL DML - DELETE ROWS**

The accumulated number of rows deleted on the accelerator by DB2.

Field Name: Q8ACROWD

**SQL DML - OPEN**

The accumulated number of OPEN statements sent to the accelerator from DB2.

Field Name: Q8ACOPNC

**SQL DDL - CREATE**

The accumulated number of CREATE statements sent to the accelerator from DB2.

Field Name: Q8ACCRTC

**SQL DDL - DROP**

The accumulated number of DROP statements sent to the accelerator from DB2.

Field Name: Q8ACDRPC

**ROWS RETURN**

The accumulated number of rows returned by the accelerator to DB2.

**Note:** For completed queries, this is the total number of rows returned to DB2. For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).
Field Name: Q8ACROWC

**COMMIT**

The accumulated number of COMMIT statements sent to the accelerator from DB2.

Field Name: Q8ACCMTC

**ROLLBACK**

The accumulated number of ROLLBACK statements sent to the accelerator from DB2.

Field Name: Q8ACRBKC

**ELAPSED TIME - SVCS TCP/IP**

The accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

Field Name: Q8ACTELA

**ELAPSED TIME - ACCUM ACCEL**

The elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8ACAELA

**CPU TIME - SVCS TCP/IP**

The accelerator services TCP/IP CPU time measured in DB2 for the amount of CPU consumed by the DDF service task to perform the SEND and RECEIVE to an accelerator service. It does not account for the TCP/IP address CPU to route the message on to the network and receive the reply into the DDF task.

Field Name: Q8ACTCPU

**CPU TIME - ACCUM ACCEL**

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8ACACPU

**WAIT TIME - ACCUM ACCEL**

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8ACAWAT

**DB2 THREAD - CLASS 1 - ELAPSED**

Class 1 elapsed time of the thread. See ADRECETT.

Field Name: ADACCET1

**DB2 THREAD - CLASS 1 - CP CPU**

Class 1 CP CPU time of the thread. See ADCPUT.

Field Name: ADACCCP1

**DB2 THREAD - CLASS 1 - SE CPU**

Class 1 SE CPU time of the thread. See AWACC1Z.
Field Name: ADACCSE1

**DB2 THREAD - CLASS 2 - ELAPSED**

Class 2 elapsed time of the thread. See ADDB2ETT.

Field Name: ADACCET2

**DB2 THREAD - CLASS 2 - CP CPU**

Class 2 CP CPU time of the thread. See ADDBCPUT.

Field Name: ADACCCP2

**DB2 THREAD - CLASS 2 - SE CPU**

Class 2 SE CPU time of the thread. See AWACC2Z.

Field Name: ADACCSE2

*Buffer pool report and trace:*

The bufferpool activity report and trace shows information about buffer pool activity including hit ratio, getpages, and prefetch requests.

Information is provided for each active buffer pool. When there is more than one active buffer pool, information is provided for each aggregation and shows the total buffer pool activity (all buffer pools, all 4 KB buffer pools, all 32 KB buffer pools).

</tbody>
</table>

*Figure 289. Buffer pool report and trace*

**BPOOL HIT RATIO (%)**

The percentage of getpage operations that were satisfied by a page already in the buffer pool. The value is the ratio of the number of successful getpage operations minus the number of pages read from DASD (both synchronously and using prefetch), to the number of successful getpage operations, expressed as a percentage.

The highest possible hit ratio (100%) indicates that every page that is requested is in the buffer pool. If a requested page is not in the buffer pool, the hit ratio is 0% or less. If the hit ratio is negative, then prefetch brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by Db2 for reuse before the query can access them.

A low buffer pool hit ratio is not necessarily bad. The hit ratio is a relative value, based on the type of application. For example, an application that
browses large data might have a buffer pool hit ratio of 0. Watch for those cases where the hit ratio drops significantly for the same application. Here are some suggestions to increase the buffer hit ratio:

- Run the REORG utility for indexes or table spaces associated with the virtual buffer pool.
- Reserve more pages for random I/O by setting the SEQUENTIAL STEAL THRESHOLD (VPSEQT) to a lower value.
- Increase the buffer pool as long as the cost of paging does not outweigh the benefit of I/O avoidance.
- Establish more separate buffer pools, perhaps to isolate different applications.
- Place the objects that are only accessed sequentially in a separate buffer pool.

The hit ratio measurement becomes less meaningful if the buffer pool is used by additional processes, such as utilities or work files.

**Field Name:** ABUFFRAT

**GETPAGES**

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

**Background and Tuning Information**

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary.
  
  As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
- Use correlated rather than non-correlated queries to force the use of an index.

**Field Name:** QBACGET

This is an exception field.

**BUFFER UPDATES**

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

**Background and Tuning Information**
A nonzero value indicates any of the following activities:

- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSWS

This is an exception field.

SYNCHRONOUS WRITE

The number of immediate (synchronous) write I/O operations.

Background and Tuning Information

Although an immediate write is rare, a small nonzero value is acceptable. A large value indicates that the system needs tuning.

Field Name: QBACIMW

This is an exception field.

SYNCHRONOUS READ

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO

This is an exception field.

SEQ. PREFETCH REQS

The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

Background and Tuning Information

Table space scans and nonmatching index scans generally use sequential prefetch.

Field Name: QBACSEQ

This is an exception field.

LIST PREFETCH REQS

The number of LIST PREFETCH requests.

Special Considerations:

1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.
4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.

Field Name: QBACLPF
This is an exception field.

DYN. PREFETCH REQS
The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

Background and Tuning Information
Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.
If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.

Field Name: QBACDPF
This is an exception field.

PAGES READ ASYNCHR.
The number of asynchronous pages read by prefetch that the agent triggered.

Background and Tuning Information
This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

Field Name: QBACSIO
This is an exception field.

ZHL SYNC READS
The number of DASD reads done using zHyperLink.

Field name: QBACSYI

ZHL READ CPU USED
The amount of CPU time used for successful zHyperLink reads.
zHyperLink I/O is synchronous with respect to the CPU, thus CPU time accumulates from the beginning of the I/O until it completes.

Field name: QBACSYIT

Data Capture:
This topic shows detailed information about “Accounting - Data Capture”.
This block shows data for Data Capture activities.
For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. In the following example both layouts are shown, the report on the left, and the trace layout on the right.

**Accounting - Data Capture**

The field labels shown in the following sample layout of “Accounting - Data Capture” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DATA CAPTURE</strong></td>
<td><strong>DATA CAPTURE</strong></td>
</tr>
<tr>
<td><strong>AVERAGE</strong></td>
<td><strong>TOTAL</strong></td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------</td>

<tr>
<td>DATA DESC. RETURN</td>
<td>N/P</td>
</tr>
<tr>
<td>TABLES RETURNED</td>
<td>N/P</td>
</tr>
<tr>
<td>DESCRIBES</td>
<td>N/P</td>
</tr>
</tbody>
</table>

**IFI CALLS MADE (IFI CALLS)**

The total number of IFI calls. This field is only calculated if accounting class 5 is active.

**Field Name:** ADIFICAL

**RECORDS CAPTURED (REC.CAPTURED)**

The number of retrievable log records that were written for tables defined with DATA CAPTURE CHANGES. This number includes only those log records that can be retrieved by an IFI READS call for IFCID 185. Some records can be written but not retrieved, for example if monitor trace class 6 is not active.

**Field Name:** QIFAANRC

**LOG RECORDS READ (LOG REC.READ)**

The number of log reads performed for processing IFI READS requests for IFCID 185.

**Field Name:** QIFAANLR

**ROWS RETURNED (ROWS RETURN)**

The number of data rows returned in IFCID 185. Two rows are returned for each row altered by an SQL UPDATE statement.

**Field Name:** QIFAANDR

**RECORDS RETURNED (RECORDS RET.)**

The number of log records returned to the caller of the IFI READS call for IFCID 185.

**Field Name:** QIFAANRR

**DATA DESC. RETURN (DATA DES.RET)**

The number of data descriptions returned in IFCID 185. The data descriptions are mapped in IFCID 185.

**Field Name:** QIFAANDD

**TABLES RETURNED (TABLES RET.)**
The total number of tables returned to the caller of IFI READS call for IFCID 185.

**Field Name:** QIFAANMB

**DESCRIPTS**

The number of data capture describes for processing READS requests for IFCID 185 data.

**Field Name:** QIFAANMB

---

*Data Sharing Locking:*

This topic shows detailed information about “Accounting - Data Sharing Locking”.

This block shows the locking activity within a data sharing group.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. In the following example both layouts are shown, the report on the left, and the trace layout on the right.

**Accounting - Data Sharing Locking**

The field labels shown in the following sample layout of “Accounting - Data Sharing Locking” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>

<td>NOTIFY MSGS SENT</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**GLOBAL CONT RATE(%) (GLOB CONT(%)**

The total number of suspends because of contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation.

**Field Name:** AGLOBRAT

**FALSE CONT RATE(%) (FALS CONT(%)**

The total number of suspends because of false contention divided by the total number of synchronous requests that went to XES and the lock requests that were converted from synchronous to asynchronous locks.

A false contention is where two different locks on different resources hash to the same lock entry.
Field Name: AFLSERAT

P/L-LOCKS XES(%) (P/L-LOCKS (%))

Shows the percentage of P/L-lock requests that were propagated to XES synchronously.

Background and Tuning Information

This number reflects the effects of explicit hierarchical locking and other locking optimizations. In an environment where all the workload is data sharing, a value of 94% means that 6% of all transaction locks were not propagated to XES due to Data-Sharing locking optimizations.

DB2 has optimizations to reduce the need to go beyond the local IRLM whenever possible:

- Explicit hierarchical locking allows IRLM to grant child locks locally when there is no inter-DB2 R/W interest on the parent.
- If there is a single DB2 with update interest, and multiple DB2s with read-only interest, DB2 propagates fewer locks than when all DB2s have update interest in the page set.
- All locks that go beyond the local IRLM are owned by the subsystem, not the individual work unit. This allows for further optimization. Only the most restrictive lock mode for an object on a given subsystem must be propagated to XES and the coupling facility. A new lock that is equally, or less, restrictive than the currently held lock is not propagated.

Field Name: ALLOCRA

LOCK REQ - PLOCKS (P-LOCK REQ)

The number of lock requests for P-locks.

Field Name: QTGALPLK

UNLOCK REQ - PLOCKS (P-UNLOCK REQ)

The number of unlock requests for P-locks.

Field Name: QTGAUPLK

CHANGE REQ - PLOCKS (P-CHANGE REQ)

The number of change requests for P-locks.

Field Name: QTGACPLK

LOCK REQ - XES (LOCK - XES)

The number of P/L-lock requests propagated to z/OS XES synchronously. This number is not incremented if the request is suspended before going to XES.

Field Name: QTGALSLM

UNLOCK REQ - XES (UNLOCK-XES)

The number of unlock requests propagated to z/OS XES.

Field Name: QTGAUSLM

CHANGE REQ - XES (CHANGE-XES)

The number of change requests propagated to z/OS XES.

Field Name: QTGACSLM
SUSPENDS - IRLM (SUSP - IRLM)

The number of suspensions due to IRLM global resource contention (IRLM lock states were in conflict).

Field Name: QTGAIGLO

SUSPENDS - XES (SUSP - XES)

The number of suspensions due to z/OS XES global resource contention (z/OS XES lock states were in conflict whereas IRLM lock states were not).

Field Name: QTGASGLO

SUSPENDS - CONV (SUSP - CONV)

The total number of sync-to-async heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

Field Name: QTGAFLSE

FALSE CONTENTIONS

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

Field Name: QTGAFCNT

INCOMPATIBLE LOCKS (INCOMP.LOCK)

The number of global lock or change requests denied or suspended due to an incompatible retained lock.

Field Name: QTGADRTA

NOTIFY MSGS SENT (NOTIFY SENT)

The number of notify messages sent.

Field Name: QTGANTFY

Distributed Activity - Requester:

This topic shows detailed information about “Accounting - Distributed Activity - Requester”.

This block shows the information provided for the requester of the distributed activity.

In the following example both layouts are shown, the report layout followed by the trace layout.

Accounting - Distributed Activity - Requester

The field labels shown in the following sample layout of “Accounting - Distributed Activity - Requester” are described in the following section.
### Report - REQUESTER

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an exception field.

### Report - PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

### PRODUCT VERSION (PROD VERSION)

It consists of 5 digits and is shown as $vvrrmm$, where:

- $vv$  Version level
- $rr$  Release level
- $mm$  Modification level
Distributed Activity - Requester

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**Report - PRODUCT VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

- \(vv\) Version level
- \(rr\) Release level
- \(m\) Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**Report - METHOD**

The method of access: DB2 private protocol, DRDA protocol, or both.

This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

**Report - CONV.INITIATED**

A count of conversations initiated by the requester.

This number is updated at the server location.
Field Name: QLACCNVR

Report - #COMMIT(1) RECEIVED
The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

Field Name: QLACCOMMR
This is an exception field.

Report - #ROLLBK(1) RECEIVED
The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

Field Name: QLACABRR
This is an exception field.

Field Name: QLACSQLR
This is an exception field.

Report - MESSAGES SENT
The number of messages sent to the location. It is maintained at the location where the messages originated.

Field Name: QLACMSGS
This is an exception field.

Report - MESSAGES RECEIVED
The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

Field Name: QLACMSGR
This is an exception field.

Report - BYTES SENT
The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTS
This is an exception field.

Report - BYTES RECEIVED
The number of bytes the server location received from the requester location.
More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTR  
This is an exception field.

**Report - #THREADS INDOUBT**  
The number of threads that went indoubt with the remote location as coordinator (two-phase commit operations only). It is maintained at the participant and indicates that the communication with the coordinator was lost.

**Field Name:** QLACINDT  
This is an exception field.

**Report - ROWS SENT**  
The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

**Field Name:** QLACROWS  
This is an exception field.

**Report - BLOCKS SENT**  
The number of blocks transmitted using block fetch. This value is maintained at the server location.

**Field Name:** QLACBTBF  
This is an exception field.

**Report - #DDF ACCESSES**  
The number of occurrences of the remote location and method pair.

**Field Name:** ASDDDF  
This is an exception field.

**Report - #RLUP THREADS**  
The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

**Field Name:** QLACRLNU

**Trace - REQUESTER**  
The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both. 

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN  
This is an exception field.

**Trace - PRODUCT ID**
The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

- **vv** Version level
- **rr** Release level
- **m** Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**Trace - PRODUCT VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
Distributed Activity - Requester

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)
It consists of 5 digits and is shown as VvvRrrMm, where:

<table>
<thead>
<tr>
<th>vv</th>
<th>Version level</th>
</tr>
</thead>
<tbody>
<tr>
<td>rr</td>
<td>Release level</td>
</tr>
<tr>
<td>m</td>
<td>Modification level</td>
</tr>
</tbody>
</table>

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

Trace - METHOD
The method of access: DB2 private protocol, DRDA protocol, or both.
This field is invalid if unique or summary rollup data is present. It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROT

Trace - COMMITS(1) RECEIVED
The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

Field Name: QLACCOMR
This is an exception field.

Trace - ROLLBCK(1) RECEIVED
The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

Field Name: QLACABRR
This is an exception field.

Trace - SQL RECEIVED
The number of SQL statements received from the requester location.

Field Name: QLACSQLR
This is an exception field.

Trace - MESSAGES SENT
The number of messages sent to the location. It is maintained at the location where the messages originated.

Field Name: QLACMSGs
This is an exception field.
Trace - MESSAGES RECEIVED

The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

Field Name: QLACMSGR
This is an exception field.

Trace - BYTES SENT

The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTS
This is an exception field.

Trace - BYTES RECEIVED

The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTR
This is an exception field.

Trace - THREADS INDOUBT

The number of threads that went indoubt with the remote location as coordinator (two-phase commit operations only). It is maintained at the participant and indicates that the communication with the coordinator was lost.

Field Name: QLACINDT
This is an exception field.

Trace - ROWS SENT

The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.

Field Name: QLACROWS
This is an exception field.

Trace - BLOCKS SENT

The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLACBTBF
This is an exception field.

Trace - CONVERSATION INITIATED
Distributed Activity - Requester

A count of conversations initiated by the requester.
This number is updated at the server location.

Field Name: QLACCNVR
This is an exception field.

Trace - NBR RLUP THREADS
The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

Field Name: QLACRLNU

Distributed Activity - Server:

This topic shows detailed information about “Accounting - Distributed Activity - Server”.

This block shows the information provided for the server of the distributed activity.

In the following example both layouts are shown, the report layout followed by the trace layout.

Accounting - Distributed Activity - Server

The field labels shown in the following sample layout of “Accounting - Distributed Activity - Server” are described in the following section.

Report:

---- DISTRIBUTED ACTIVITY *--------------------------------------------------------------------------

Report - SERVER

The name of the remote location with which this information is associated.
If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

Field Name: QLACLOCN
This is an exception field.
Report - PRODUCT ID

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>

<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

- vv Version level
- rr Release level
- m Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

Report - PRODUCT VERSION

The original DB2 field specifies the information in the following field names of the remote requestor or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>
Note:

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)
It consists of 5 digits and is shown as VvvRrrMm, where:

- vVv Version level
- rRr Release level
- mMm Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

Report - METHOD
The method of access: DB2 private protocol, DRDA protocol, or both.
This field is invalid if unique or summary rollup data is present. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: ADPROT

Report - REQUESTER ELAPTIME
The elapsed time at the requester. It includes the total of DB2 and network time.

Field Name: ADDSELRQ

Report - DBAT WAITING TIME
Total elapsed time spent waiting for an available database access agent slot.

Field Name: QLACMDWT

Report - #DDF ACCESSES
The number of occurrences of the remote location and method pair.

Field Name: ASDDF

Report - CONVERSATIONS INITIATED
The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

Field Name: QLACCNV$S

Report - #CONVERSATIONS QUEUED
A number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location.
If the value is a large number, you might want to increase the limit for the number of conversations.
Field Name: QLACCNVQ
This is an exception field.

Report - CONVERSATION TERMINATED
The number of terminated conversations in the server block (DB2 private protocol only). It is maintained at the requestor location.
This number can be different from the number of successful conversation allocations, because some conversations might not have been terminated when the accounting record was written.
Field Name: QLACCNVT
This is an exception field.

Report - #RLUP THREADS
The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.
Field Name: QLACRLNU

Report - #COMMT(1)SENT
The number of commit requests sent to the server (single-phase commit protocol) and committed requests sent to the participant (two-phase commit protocol).
Field Name: QLACCOMS
This is an exception field.

Report - #ROLLB(1)SENT
The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).
Field Name: QLACABRS
This is an exception field.

Report - SQL SENT
The number of SQL statements sent to the server location. This value is maintained at the requesting location.
Field Name: QLACSQLS
This is an exception field.

Report - ROWS RECEIVED
The number of rows of data retrieved from the server location. This value is maintained at the requester location.

Special Considerations:
1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true...
when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

Field Name: QLACROWR
This is an exception field.

Report - MESSAGES SENT
The number of messages sent to the location. It is maintained at the location where the messages originated.

Field Name: QLACMSGS
This is an exception field.

Report - MESSAGES RECEIVED
The number of messages received from the location. This value is maintained at the location where the messages were received.
More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

Field Name: QLACMSGR
This is an exception field.

Report - BYTES SENT
The number of bytes the server location sent to the requester location. This value is maintained at the server location.
More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTES
This is an exception field.

Report - BYTES RECEIVED
The number of bytes the server location received from the requester location.
More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTR
This is an exception field.

Report - BLOCKS RECEIVED
The number of blocks received using block fetch. This value is maintained at the requester location.

Field Name: QLACBRBF
This is an exception field.

Trace - SERVER
The name of the remote location with which this information is associated.
If the local location is the requester, this field is a server location. If the
local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an exception field.

**Trace - PRODUCT ID**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>ICC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**

- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**

It consists of 5 digits and is shown as VvvRrrMm, where:

- \( vv \) Version level
- \( rr \) Release level
- \( m \) Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**Trace - PRODUCT VERSION**

The original DB2 field specifies the information in the following field names of the remote requester or server location:

**PRODUCT ID**

It consists of 3 characters and can have the following values:
### Distributed Activity - Server

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>

**Note:**
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

**PRODUCT VERSION (PROD VERSION)**
It consists of 5 digits and is shown as \( VvRrMm \), where:
- \( Vv \) Version level
- \( rr \) Release level
- \( m \) Modification level

**Note:** For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

**Field Name:** QLACPRID

**Trace - METHOD**
The method of access: DB2 private protocol, DRDA protocol, or both.
This field is invalid if unique or summary rollup data is present. It can have the following value in:
- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** ADPROT

**Trace - REQUESTER ELAP.TIME**
The elapsed time at the requester. It includes the total of DB2 and network time.

**Field Name:** ADDSELRQ

**Trace - DBAT WAITING TIME**
Total elapsed time spent waiting for an available database access agent slot.

**Field Name:** QLACMDWT

**Trace - CONVERSATIONS INITIATED**
The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.
Field Name: QLACCNVS

Trace - CONVERSATIONS QUEUED

A number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location.

If the value is a large number, you might want to increase the limit for the number of conversations.

Field Name: QLACCNVQ

This is an exception field.

Trace - CONVERSATION TERMINATED

The number of terminated conversations in the server block (DB2 private protocol only). It is maintained at the requester location.

This number can be different from the number of successful conversation allocations, because some conversations might not have been terminated when the accounting record was written.

Field Name: QLACCNVT

This is an exception field.

Trace - COMMT(1)SENT

The number of commit requests sent to the server (single-phase commit protocol) and committed requests sent to the participant (two-phase commit protocol).

Field Name: QLACCOMS

This is an exception field.

Trace - ROLLB(1)SENT

The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLACABRS

This is an exception field.

Trace - SQL SENT

The number of SQL statements sent to the server location. This value is maintained at the requesting location.

Field Name: QLACSQLS

This is an exception field.

Trace - ROWS RECEIVED

The number of rows of data retrieved from the server location. This value is maintained at the requester location.

Special Considerations:
1. The number of rows received from the server location does not include either the SQLDA or SQLCA.
2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently,
more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

**Field Name:** QLACROWR

This is an exception field.

**Trace - NBR RLUP THREADS**

The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.

**Field Name:** QLACRLNU

**Trace - MESSAGES SENT**

The number of messages sent to the location. It is maintained at the location where the messages originated.

**Field Name:** QLACMSGS

**Trace - MESSAGES RECEIVED**

The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACMSGR

**Trace - BYTES SENT**

The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTES

**Trace - BYTES RECEIVED**

The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTR

**Trace - BLOCKS RECEIVED**

The number of blocks received using block fetch. This value is maintained at the requester location.

**Field Name:** QLACBRBF
Drain and Claim:

This topic shows detailed information about “Accounting - Drain and Claim”.

This block contains information about requesting a drain or a claim.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Drain and Claim

The field labels shown in the following sample layout of “Accounting - Drain and Claim” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRAIN/CLAIM</td>
<td>AVERAGE</td>
</tr>
<tr>
<td>DRAIN REQUESTS</td>
<td>0.00</td>
</tr>
<tr>
<td>DRAIN FAILED</td>
<td>0.00</td>
</tr>
<tr>
<td>CLAIM REQUESTS</td>
<td>15.00</td>
</tr>
<tr>
<td>CLAIM FAILED</td>
<td>0.00</td>
</tr>
</tbody>
</table>

DRAIN REQUESTS (DRAIN REQST)

The number of drain requests.

**Field Name:** QTXADRNO

DRAIN FAILED

The number of unsuccessful drain requests.

**Field Name:** QTXADRUN

CLAIM REQUESTS (CLAIM REQST)

The number of claim requests.

**Field Name:** QTXACLNO

CLAIM FAILED

The number of unsuccessful claim requests.

**Field Name:** QTXACLUN

Dynamic SQL Statement:

This topic shows detailed information about “Accounting - Dynamic SQL Statement”.

This block provides information about the dynamic SQL statement.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Dynamic SQL Statement

The field labels shown in the following sample layout of “Accounting - Dynamic SQL Statement” are described in the following section.
### Dynamic SQL Statement

The total number of times reoptimization occurs because the value of the host variable or parameter marker changes.

**Field Name**: QXSTREOP

### NOT FOUND IN CACHE

The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.

**Field Name**: QXSTNFND

### FOUND IN CACHE

The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.

**Field Name**: QXSTFND

### IMPLICIT PREPARES

An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.

If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

**Field Name**: QXSTIPRP

### PREPARES AVOIDED

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.

An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

**Field Name**: QXSTNPRP

### CACHE_LIMIT_EXCEEDED
The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

**Field Name:** QXSTDEXP

**PREP_STMT_PURGED**

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

**Field Name:** QXSTDINV

**STABILIZED PREPARE**

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

**Field Name:** QXSTSFND

**CSWL - STMTS PARSED**

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

**Field Name:** QXSTCWLP

**CSWL - LITS REPLACED**

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

**Field Name:** QXSTCWLR

**CSWL - MATCHES FOUND**

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.

**Field Name:** QXSTCWLM

**CSWL - DUPLS CREATED**

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

**Field Name:** QXSTCWLD

*Global Contention L-Locks:*

This topic shows detailed information about “Accounting - Global Contention L-Locks”.

---

*Dynamic SQL Statement*
Global Contention L-Locks

This block provides global contention information for a logical lock (L-lock) at plan level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Global Contention L-Locks

The field labels shown in the following sample layout of “Accounting - Global Contention L-Locks” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L-LOCKS - AVERAGE TIME/ELAPSED TIME</td>
<td>The accumulated global contention wait time for all L-locks.</td>
</tr>
<tr>
<td>Field Name: ADLKSUST</td>
<td></td>
</tr>
<tr>
<td>L-LOCKS - AV.EVENT/EVENTS</td>
<td>The number of global contention waits for all L-locks.</td>
</tr>
<tr>
<td>Field Name: ADLKSUSC</td>
<td></td>
</tr>
<tr>
<td>PARENT (DB,TS,TAB,PART) - AVERAGE TIME/ELAPSED TIME</td>
<td>The accumulated global contention wait time for parent L-locks.</td>
</tr>
<tr>
<td>A parent L-lock can be one of the following types:</td>
<td></td>
</tr>
<tr>
<td>Database</td>
<td></td>
</tr>
<tr>
<td>Tablespace</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td></td>
</tr>
<tr>
<td>Partition</td>
<td></td>
</tr>
<tr>
<td>Field Name: QWACAWTJ</td>
<td></td>
</tr>
<tr>
<td>PARENT (DB,TS,TAB,PART) - AV.EVENT/EVENTS</td>
<td>The number of global contention wait events for parent L-locks.</td>
</tr>
<tr>
<td>Field Name: ADLPSUSC</td>
<td></td>
</tr>
<tr>
<td>CHILD (PAGE,ROW) - AVERAGE TIME/ELAPSED TIME</td>
<td>The accumulated global contention wait time for child L-locks.</td>
</tr>
<tr>
<td>A child L-lock type can be:</td>
<td></td>
</tr>
<tr>
<td>Page</td>
<td></td>
</tr>
<tr>
<td>Row</td>
<td></td>
</tr>
<tr>
<td>Field Name: QWACAWTK</td>
<td></td>
</tr>
<tr>
<td>CHILD (PAGE,ROW) - AV.EVENT/EVENTS</td>
<td></td>
</tr>
</tbody>
</table>
The number of global contention wait events for child L-locks.

**Field Name:** ADLCSUSC

**OTHER - AVERAGE TIME/ELAPSED TIME**

The accumulated global contention wait time for other L-locks. Global extend lock is acquired in exclusive mode by Inserters before an extend service task switch.

**Field Name:** QWACAWTM

**OTHER - AV.EVENT/EVENTS**

The number of global contention wait events for other L-locks.

**Field Name:** ADLOSUSC

---

*Global Contention P-Locks:*

This topic shows detailed information about “Accounting - Global Contention P-Locks”.

This block provides global contention information for a physical lock (P-lock) at plan level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Global Contention P-Locks**

The field labels shown in the following sample layout of “Accounting - Global Contention P-Locks” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GLOBAL</strong></td>
<td><strong>GLOBAL</strong></td>
</tr>
<tr>
<td><strong>CONTENTION</strong></td>
<td><strong>CONTENTION</strong></td>
</tr>
<tr>
<td><strong>P-LOCKS</strong></td>
<td><strong>P-LOCKS</strong></td>
</tr>
<tr>
<td><strong>AV. TIME</strong></td>
<td><strong>AV. TIME</strong></td>
</tr>
<tr>
<td><strong>AV. EVENT</strong></td>
<td><strong>AV. EVENT</strong></td>
</tr>
<tr>

<td><strong>P-LOCKS</strong></td>
</tr>
<tr>
<td><strong>ELAPSED TIME</strong></td>
<td><strong>ELAPSED TIME</strong></td>
</tr>
<tr>
<td><strong>EVENTS</strong></td>
<td><strong>EVENTS</strong></td>
</tr>
</tbody>
</table>

**P-LOCKS - AVERAGE TIME/ELAPSED TIME**

The accumulated global contention wait time for all P-locks.

**Field Name:** ADPLSUST

**P-LOCKS - AV.EVENT/EVENTS**

The number of global contention waits for all P-locks.

**Field Name:** ADPLSUST

**PAGESET/PARTITION - AVERAGE TIME/ELAPSED TIME**

The accumulated global contention time for pageset and partition P-locks.

**Field Name:** QWACAWTN

**PAGESET/PARTITION - AV.EVENT/EVENTS**

The number of global contention waits for pageset and partition P-locks.

**Field Name:** ADPSSUSC
Global Contention P-Locks

PAGE - AVERAGE TIME/ELAPSED TIME
The accumulated global contention wait time for page P-locks.
Field Name: QWACAWTO

PAGE - AV.EVENT/EVENTS
The number of global contention waits for page P-locks.
Field Name: ADPPSUSC

OTHER - AVERAGE TIME/ELAPSED TIME
The accumulated global contention wait time for other P-locks. Includes suspension for Castout P-Locks and DBET locks. It could be because of Index Split processing which can be minimized if the Index key size is not large. If you can minimize the number of Index Keys in the Index, it will help to reduce the number of Index splits.
Field Name: QWACAWTQ

OTHER - AV.EVENT/EVENTS
The number of global contention waits for other P-locks.
Field Name: ADPOSUSC

Group Buffer Pool Activity:

This topic shows detailed information about “Accounting - Group Buffer Pool Activity”.

This block is printed for each active group buffer pool. When there is more than one active group buffer pool, a totals block is printed for each aggregation.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Group Buffer Pool Activity

The field labels shown in the following sample layout of “Accounting - Group Buffer Pool Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.00</td>
</tr>
</tbody>
</table>
GBP-DEPEND GETPAGES

The number of coupling facility READ requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

Field Name: QBGAGG

READ(XI)-DATA RETUR

The number of coupling facility read requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

Field Name: QBGAXD

READ(XI)-NO DATA RT

The number of synchronous coupling facility read requests necessary because the buffer was marked invalid. Data is not returned from the group buffer pool.

Field Name: ABGAXR

This is an exception field.

READ(NF)-DATA RETUR

The number of coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is returned from the coupling facility.

Field Name: QBGAMD

This is an exception field.

READ(NF)-NO DATA RT

The number of synchronous coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is not returned from the coupling facility.

Field Name: ABGAMR

This is an exception field.

PREFETCH PAGES READ

The number of pages read from the group buffer pool due to prefetch under the control of the agent.

Field Name: QBGAMN

This is an exception field.

CLEAN PAGES WRITTEN

The number of clean pages written to the group buffer pool.

Field Name: QBGAWC

This is an exception field.

UNREGISTER PAGE

The number of coupling facility requests to unregister a page.
Group Buffer Pool Activity

Field Name: QBGADG
This is an exception field.

ASYNCH GBP REQUESTS
The number of asynchronous IXLCACHE invocations for the primary group buffer pool.
Field Name: QBGAHS

EXPLICIT X-INVALID
The number of times an explicit coupling facility cross-invalidation request was issued.
Field Name: QBGAEX

ASYNCH SEC-GBP REQ
The number of IXLCACHE invocations for the secondary group buffer pool.
Field Name: QBGA2H

PG P-LOCK LOCK REQ
The number of all page P-lock lock requests.
Field Name: ABGAPLR

SPACE MAP PAGES
The number of page P-lock lock requests for space map pages.
Field Name: QBGAP1

DATA PAGES
The number of page P-lock lock requests for data pages.
Field Name: QBGAP2

INDEX LEAF PAGES
The number of page P-lock lock requests for index-leaf pages.
Field Name: QBGAP3

PG P-LOCK UNLOCK REQ
The number of page P-lock unlock requests.
Field Name: QBGAU1

PG P-LOCK LOCK SUSP
The sum of all page P-lock lock suspensions.
Field Name: ABGAPLS

SPACE MAP PAGES
The number of page P-lock suspensions for space-map pages.
Field Name: QBGAS1

DATA PAGES
The number of page P-lock lock suspensions for data pages.
Field Name: QBGAS2
INDEX LEAF PAGES
The number of page P-lock lock suspensions for index-leaf pages.
Field Name: QBGAS3

WRITE AND REGISTER
The number of Write and Register (WAR) requests.
Field Name: QBGAWS

WRITE & REGISTER MULT
The number of write and register multiple (warm) requests.
Field Name: QBGAWM

CHANGED PAGES WRITTEN
The number of changed pages written to the group buffer pool as a result of write and register (WAR), or write and register multiple (WARM) requests.
Field Name: QBGASW
This is an exception field.

WRITE TO SEC-GBP
The number of requests to write changed pages to the secondary GBP for duplexing.
Field Name: QBGA2W

COMPL CHECKS SUSPEND
The number of completion checks for writes to the secondary GBP that were suspended because the write had not yet been completed.
Field Name: QBGA2S

Highlights: This topic shows the report and trace blocks for highlights. They present values such as the total number of threads and commitments for the entire group.
Accounting highlights report:

The accounting highlights report shows general accounting information.

Figure 290. Accounting highlights report

The number of logical accounting records. A logical accounting record can contain more than one physical record.

This is the case, for example, in query CP and sysplex query parallelism, where several accounting records (IFCID 003 and, optionally, 239) are generated, namely one for the entire thread and one for each parallel task within the thread.

In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in a record.

This number is used for calculating averages (as a divisor) for class 1, 2, 3, and 5 times and events.

Field Name: ASOCCURS

The number of allied threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASALLIED

The number of allied threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASALLIED

The number of allied threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASALLIED

The number of allied threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASALLIED
The number of allied-distributed threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASALLDST

#DBATS

The number of database access threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASDBATS

#DBATS DISTRIB.

The number of DBAT-distributed threads. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in this record for the corresponding end user.

Field Name: ASDBATD

#NO PROGRAM DATA

The number of Accounting records without package data. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it cannot be determined. In this case it is 0.

Field Name: ADNOPACK

#NORMAL TERMINAT

The number of normal terminations. Here is a list of reasons for termination and the corresponding field names:

Reason   Field Name
New user ASNTNEWU
Deallocation ASNTDEAL
Application program end ASNTAPEN
Resignon ASNTRESI
DBAT inactive ASNTDBAT
RRS commit ASRRSCOM

Note: Termination reasons in case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads are not counted when the accounting record is a roll-up accounting record.

Field Name: ASNORMTM
This is an exception field.

#ABNORMAL TERMIN

The number of abnormal terminations. Here is a list of reasons for termination and the corresponding field names:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Field Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application program abend</td>
<td>ASATAPAB</td>
</tr>
<tr>
<td>End of memory</td>
<td>ASATENDM</td>
</tr>
<tr>
<td>Resolve indoubt</td>
<td>ASATRIND</td>
</tr>
<tr>
<td>Cancel force</td>
<td>ASATCANF</td>
</tr>
<tr>
<td>Rollup termination</td>
<td>ASROLL</td>
</tr>
</tbody>
</table>

Field Name: ASABNOTM
This is an exception field.

#DDFRRSAF ROLLUP

The number of DDF/RRSAF rollup records with accumulated counter data for an end user.

A rollup record is written when the number of occurrences of the end user on the thread reaches the ZPARM value for ACCUMACC and due to one of the following reasons:

- The number of times the threshold was reached for the number of end-user occurrences when data was accumulated by end user for DDF or RRSAF.
- The number of times the DB2 storage threshold for Accounting blocks was reached for data accumulated by end user for DDF or RRSAF.
- The number of times the threshold for the staleness was exceeded when data was accumulated by end user for DDF or RRSAF.

Note: End user is defined as the concatenation of the following values:

- End-user user ID (QWHEUID, 16 bytes)
- End-user transaction name (QWHCEUTX, 32 bytes)
- End-user workstation name (QWHCEUWN, 18 bytes)

Field Name: ASCUTS

#ROLLUP TRAN

The number of rollup records.

It is calculated as:

```
SUM(QWACPCNT)
```

where

```
QWACRINV IN ('END USER ', 'BLOCK STOR', 'STALENESS ')
```

Example: If
• ACCUMACC=10
• all records have QWACRINV='END USER'

and
• there are 20 accounting records

then
#ROLLUP TRAN will be 200 (10 * 20)

If one of the records has
QWACRINV='BLOCK STOR',

and
QWACPCNT=7,

then
#ROLLUP TRAN will be 197 (10*19 + 1*7)

Field Name: ASROLL

#CP/X PARALLEL.

The number of originating accounting records where query CP and sysplex query parallelism was used for at least one SQL statement. I/O parallelism might have been used by other SQL statements.

Field Name: ASPARCPU

#UTIL PARALLEL.

The number of Accounting records that indicated that UTILITY parallelism was used by at least one SQL statement and query CP and sysplex query parallelism was not used by any SQL statement.

Field Name: ASPARUT

#IO PARALLELISM

The number of accounting records that indicated that I/O parallelism was used by at least one SQL statement and query CP and sysplex query parallelism was not used by any SQL statement.

Field Name: ASPARIO

#PCA RUP COUNT

The number of parallel child agents rolled into this record. The value depends on the record type:

1. For all non-rollup records, this value is 0.
2. For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.
3. For a DDF/RRSAF rollup record, this value is the number of parallel query child agents rolled into this record. These agents are NOT counted in QWACPCNT.
4. For an autonomous procedure rollup record, this value is 0.

Field Name: APTCOUNT

#RUP AUTONOM. PR

The number of accounting records that indicated a roll-up autonomous thread.
Field Name: ADRUPATX

#AUTONOMOUS PR
The number of autonomous procedures that were executed:
1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

Field Name: AATCOUNT

#INCREMENT. BIND
The number of incremental binds (excluding prepare). It is incremented by:
- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

Background and Tuning Information
If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

Field Name: QXINCRB
This is an exception field.

#COMMTMS
The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.
For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM
This is an exception field.

#ROLLBACKS
The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.

Special Considerations: This field contains the number of:
- Application program abends
• Application rollback requests
• Application deadlocks on database records
• Applications canceled by operator
• Thread abends due to resource shortage

Field Name: QWACABRT
This is an exception field.

#SVPT REQUESTS
The number of named SAVEPOINTs set within a transaction.

Field Name: QWACSVPT

#SVPT RELEASE
The number of RELEASE SAVEPOINT statements executed.

Background and Tuning Information
Release savepoints as soon as possible. Outstanding savepoints block SQL operations that resolve remote locations. DB2 always releases outstanding savepoints when a transaction ends.

Field Name: QWACRLSV
This is an exception field.

#SVPT ROLLBACK
The number of ROLLBACK TO SAVEPOINT statements executed.

Field Name: QWACRBSV

MAX SQL CASC_LVL
The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.

Field Name: QXCASCMDP
This is an exception field.

UPDATE/COMMIT
The sum of SQL INSERT, SQL UPDATE, and SQL DELETE statements executed.

Field Name: ASIUD
This is an exception field.

SYNCH I/O AVG.
The synchronous I/O suspension time per event.

Field Name: AAIOITMCN
This is an exception field.

MAX WFILE BLKS
The maximum number of work-file blocks that are used by this agent at any given point in time (traditional work-file blocks, declared global temporary tables (DGTT) and DGTT indexes) (DB2 field QWAC_WORKFILE_MAX).

Field Name: AWWFMAX
#ZHL READ I/O

The number of successful read I/Os done with zHyperLink.

Field Name: QBACSYI

Accounting highlights trace:

The accounting highlights trace shows general accounting information.

HIGHLIGHTS

Figure 291. Accounting highlights trace

THREAD TYPE

The type of thread. This field can contain one of the following values:

ALLIED
The thread is not involved in any distributed activity.

ALLDDIST
The thread is initiated by a DB2 attach and requests data from one or more server locations.

DBAT
The thread is initiated, created, and performing work on behalf of a remote (requester) location. The value DBAT also includes DBAT DISTRIBUTED threads that are initiated by a requester location and executed by the server location that in turn requests data from another server location.

Background and Tuning Information

If the thread is involved in distributed activity, some monitored values can produce different results. For example, the class 1 elapsed time for a distributed thread is higher because the network time is also included.

Field Name: ADTHRTYP

TERM_CONDITION

Termination condition. Signon in a CICS environment is controlled by an additional RCT option, TXIDSO. If YES, resignon occurs if the only identifier changed is the transaction ID. If NO, resignon does not occur.
Field Name: ADTERMCO

INVOKE REASON

The status of the thread. The values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN FORCE</td>
<td>CANCEL FORCE. The Stop Force command terminated, abnormal program termination.</td>
</tr>
<tr>
<td>DBAT INACT</td>
<td>DDF thread is becoming inactive.</td>
</tr>
<tr>
<td>DEALLOC</td>
<td>Deallocation, normal program termination.</td>
</tr>
<tr>
<td>TYP2 INACT</td>
<td>DDF TYPE 2 thread is becoming inactive.</td>
</tr>
<tr>
<td>MEMORY END</td>
<td>End of memory, abnormal termination.</td>
</tr>
<tr>
<td>MON READS</td>
<td>IFFI reads request for IFCID 147.</td>
</tr>
<tr>
<td>NEW USER</td>
<td>New user, the authorization Id changed.</td>
</tr>
<tr>
<td>PROG ABEND</td>
<td>End of task. Application program abended.</td>
</tr>
<tr>
<td>PROGRM END</td>
<td>End of task. Application program terminated normally.</td>
</tr>
<tr>
<td>RESIGNON</td>
<td>Same user resign-on with on with same authorization ID.</td>
</tr>
<tr>
<td>RES INDBT</td>
<td>Resolve indoubt, abnormal program termination.</td>
</tr>
<tr>
<td>RRS COMMIT</td>
<td>Termination due to a commit of an application attached to the Recoverable Resource Manager Services Facility (RRSAF).</td>
</tr>
<tr>
<td>STALENESS</td>
<td>Accumulating data by end user for DDF or RRSAF and accumulated data has exceeded the staleness threshold.</td>
</tr>
<tr>
<td>BLOCK STOR</td>
<td>Accumulating data by end user for DDF or RRSAF and internal DB2 storage threshold has been reached.</td>
</tr>
<tr>
<td>TASK END</td>
<td>End of task - application program terminated normally.</td>
</tr>
<tr>
<td>END USER</td>
<td>Accumulating data by end user for DDF or RRSAF and threshold reached for number end user occurrences.</td>
</tr>
</tbody>
</table>

Field Name: ADINVRSN

PARALLELISM

An indicator to show which type of parallel processing is used when SQL statements are executed:
SQL statement
  Parallel processing
I/O  For threads exploiting query I/O parallelism but no query CP or sysplex query parallelism
CP   For threads exploiting query CP parallelism
SYSPLEX  For threads exploiting sysplex query parallelism
UTILTY  For utility threads with subtasks
NO    For threads without subtasks

Field Name: ADPARLEV

PCA RUP COUNT
The number of parallel child agents rolled into this record. The value depends on the record type:
1. For all non-rollup records, this value is 0.
2. For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.
3. For a DDF/RRSAF rollup record, this value is the number of parallel query child agents rolled into this record. These agents are NOT counted in QWACPCNT.
4. For an autonomous procedure rollup record, this value is 0.

Field Name: APTCOUNT

RUP AUTONOM.PR
The number of accounting records that indicated a roll-up autonomous thread.

Field Name: ADRUPATX

AUTONOMOUS PR
The number of autonomous procedures that were executed:
1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

Field Name: AATCOUNT

QUANTITY
The number of parallel child agents, or Accounting intervals rolled up, or autonomous procedures rolled up. The value depends on the record type:
- For a non-rollup parent record, this value is the number of parallel child agents that were created.
- For a non-rollup child agent record, this value is 0.
- For a parallel query rollup record, this value is the number of parallel child agents rolled into the record.
• For a DDF/RRSAF rollup record, this value is the number of Accounting intervals that were rolled into the record for the corresponding end user.
• For an autonomous procedure rollup record, this value is the number of autonomous procedures rolled into the record.

Field Name: QWACPCNT

COMMTS

The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM

This is an exception field.

ROLLBACK

The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.

Special Considerations: This field contains the number of:
• Application program abends
• Application rollback requests
• Application deadlocks on database records
• Applications canceled by operator
• Thread abends due to resource shortage

Field Name: QWACABRT

This is an exception field.

SVPT REQUESTS

The number of named SAVEPOINTS set within a transaction.

Field Name: QWACSVPT

SVPT RELEASE

The number of RELEASE SAVEPOINT statements executed.

Background and Tuning Information

Release savepoints as soon as possible. Outstanding savepoints block SQL operations that resolve remote locations. DB2 always releases outstanding savepoints when a transaction ends.

Field Name: QWACRLSV

This is an exception field.

SVPT ROLLBACK

The number of ROLLBACK TO SAVEPOINT statements executed.
Field Name: QWACRBSV

INCREM.BINDS
The number of incremental binds (excluding prepare). It is incremented by:
- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
- Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

Background and Tuning Information
If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed.
Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

Field Name: QXINCRB
This is an exception field.

UPDATE/COMMIT
The sum of SQL INSERT, SQL UPDATE, and SQL DELETE statements executed.

Field Name: ASIUD
This is an exception field.

SYNCH I/O AVG.
The synchronous I/O suspension time per event.

Field Name: AAIOTMCN
This is an exception field.

PROGRAMS
The number of packages or DBRMs for which accounting data was collected.

Field Name: QWACPKGN
This is an exception field.

MAX CASCADE
The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.

Field Name: QXCASCDP
This is an exception field.

MAX WFILE BLKS
The maximum number of work-file blocks that are used by this agent at any given point in time (traditional work-file blocks, declared global temporary tables (DGTT) and DGTT indexes) (DB2 field QWAC_WORKFILE_MAX).

Field Name: AWWFMAX
ZHL READ I/O
The number of successful read I/Os done with zHyperLink.

Field Name: QBACSYI

Identification:

This topic shows detailed information about “Accounting - Identification”.

This block is shown for the accounting trace. It displays OMEGAMON XE for DB2 PE identifiers present in an accounting trace. These identifiers can be used on the ORDER option for an accounting report.

Accounting - Identification

The field labels shown in the following sample layout of “Accounting - Identification” are described in the following section.

--- IDENTIFICATION -------------------------------
ACCT TSTAMP: 02/14/13 10:20:09.30  PLANNNAME: IS-255-0  WLM SCL: STCMD  CICS NET: N/A
BEGIN TIME : 02/14/13 10:20:01.14  PROD TYP: JDBC DRIVER  CICS LUN: N/A
END TIME : N/P  PROD VER: V3 R66M0  CICS LUN: G99A83BD
REQUESTER : ::FFFF:9.154.1#1  CORRNAME: db2jcc_ad
ACCT TSTAMP
The store clock value of the time when the accounting record was generated.

Field Name: QWHSSTCK

PLANNNAME
The plan name. It is blank for a DB2 command thread; otherwise:

DSNESPRR
For SPUFI with repeatable read.

DSNEPCS
For SPUFI with cursor stability.

DSNUTIL
For utilities.

DSNTEP2
For DSNTEP2.

DSNBIND
For binding.

The application plan name
For IMS.

The application plan name
For CICS.

A blank plan name
For IMS and CICS commands.

DSQPLAN
For QMF.

The first 8 bytes of the application name
For DRDA connections to the common servers.
Field Name: QWHCPLAN
This is an exception field.

WLM SCL
The MVS workload manager service class name. This field is used for database access threads on MVS 5.2 or later.

Field Name: QWACWLME

CICS NET
The network ID of the accounting correlation token used to correlate DB2 IFC records to CICS records for the CICS transaction.

Field Name: ADCICSNI

BEGIN TIME
The beginning store clock value for the period covered by the accounting record. You can determine the elapsed time of the application by subtracting this field from the ending store clock value (QWACESC).

Threads that do not terminate (such as CICS primed threads and IMS wait-for-input message regions) can have an ending clock value that includes the time during which the thread was inactive and waiting for work.

If a roll-up trace record is written with accumulated counter data, QWACBSC represents the earliest begin store clock value for a thread that has rolled data into the record. In this case, QWACESC shows the accumulated elapsed time.

Field Name: QWACBSC

PROD TYP
Shows the product identifier (ID) of the requester. It can have the following values:
DB2 For DB2 UDB for z/OS
SQL/DS For DB2 UDB for VSE and VM
JDBC DRIVER For Universal JDBC driver
COMMON SERV For DB2 UDB for Linux, UNIX, Windows
DB2/400 For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDPRID

CICS LUN
The LU name of the accounting correlation token used to correlate DB2 IFC records to CICS records for the CICS transaction.
Field Name: ADCICSLU

END TIME

The ending store clock value. You can use this field with the beginning store clock value (QWACBSC) to determine the elapsed time of an application.

If a roll-up record is written with accumulated accounting data, QWACESC contains the accumulated elapsed time. In Accounting Trace reports, the elapsed time is shown under CLASS 1: NONNESTED ELAPSED TIME and the END TIME is reported as N/P, because QWACESC does not contain a timestamp. In the Accounting FILE GENERAL table, the accumulated elapsed time QWACESC is stored in column CLASS1_ELAPSED and column CLASS1_TIME_END contains a timestamp 1900-01-01-00.00.00.000000.

Field Name: QWACESC

PROD VER

The version, release, and modification level of the product, which generated the accounting information. It has the following format:

\[ Vv \quad V \] version level
\[ Rr \quad R \] release level
\[ Mm \quad M \] modification level

N/P is shown if the Product Type is not present or the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDPRIDV

LUW NET

The network ID.

Field Name: QWHSNID

CICS INS

The instance number of the accounting correlation token.

Background and Tuning Information

The accounting correlation token is made up from the CICS Token Network ID, Token LU name, and instance number.

CICS generates an LU 6.2 unit of work ID for every CICS task, whether terminal or non-terminal driven.

If TOKENE=YES in the RCT entry, then the CICS logical unit of work ID (LUWID) less the commit count (2 bytes) is passed into this field. The first eight bytes are the network name. For CICS, this is a variable-length field, so the first eight bytes are right padded with blanks. The second eight bytes give the LU name. This is also a variable-length field in CICS and is, therefore, also right padded with blanks, as necessary. The final six bytes are the uniqueness value.

Field Name: ADCICSLIN
REQUESTER

The location name of the requester. If the thread is an allied thread (no distributed requests) or the thread is an allied-distributed thread (this location is the requester), OMEGAMON XE for DB2 PE sets this field equal to the local location. If the thread is a database access thread (this location is a server).

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup. For parallel query rollup records, the value will be derived from the parent record.

Field Name: QWHDRQNM

CORRNAME

This field shows the correlation name. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

- **Batch**: Job name
- **TSO or CAF**: Original authorization ID
- **CICS**: Transaction ID
- **IMS**: Application PST
- **RRSAF**: Characters 1 to 8 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation, which overrides the default translation.

Field Name: ADCORNME

LUW LUN

The name of the logical unit.

Field Name: QWHSLUNM

MAINPACK

The MAINPACK value, which is derived from a package name. If this is not possible (for example, if there are no QPAC sections), the MAINPACK value is initialized to the plan name.

Field Name: ADMAINPK

This is an exception field.

CORRNMBR

This field shows the correlation number. It is obtained by translating the correlation ID into correlation name and number. The default translation depends on the connection type of the thread:

- **Batch**: Blank
- **TSO or CAF**: Blank
- **CICS**: Pool thread
- **IMS**: Application PSBNAME
RRSAF
Characters 9 - 12 of the parameter correlation ID specified for SIGNON.

You can define your own correlation ID translation which overrides the default translation.

**Field Name:** ADCORNMB

**LUW INS**
The instance number. When concatenated with the fully qualified network name, it uniquely identifies a distributed thread.

**Field Name:** QWHSLUUV

**ENDUSER**
The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information.

**Field Name:** QWHEUOID

**PRIMAUTH**
The primary authorization ID from a connection or signon. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it differs from the original primary authorization ID (ORIGAUTH). Distributed authorization ID translation can also change the primary authorization ID.

**Field Name:** QWHCAID

**CONNTYPE**
The connecting system type code (in hexadecimal). This field can have a null value. Utilities, for example, do not have a connecting system type.

**Field Name:** QWHCATYP

**LUW SEQ**
The LUW sequence number, which identifies the last commit scope that the logical unit participated in. This number is incremented whenever a thread is committed or rolled back.

**Field Name:** QWHSLUCC

**TRANSACT**
The transaction or application name that is run.

**Field Name:** QWHEUUTX

**ORIGAUTH**
The original authorization ID. Possible values are:
- For TSO: the logon ID
- For batch: the user ID on the job statement
- For IMS (message-driven regions): the signon ID, LTERM, ASXBUSR, or PSB name
- For IMS (control regions): the user ID on the job statement, or the RACF started procedure entry if RACF is used
- For CICS: the user ID, TERM ID, TRAN ID, or as specified in the resource control table
Identification

- For MVS operator commands and DB2 system internal agents: SYSOPR
- For a distributed application server (AS):
  - If the application requester (AR) is a DB2 system, then this is the same value that was assigned at the AR.
  - If the application requester is not a DB2 system, then this is the user ID used to make the initial connection with the application server.

**Field Name:** QWHCOPID

**CONNECT**

The connection name. Possible values are:
- For batch: BATCH
- For TSO: TSO
- For QMF: DB2CALL
- For utilities: UTILITY
- For DB2 private protocol this is the DB2 subsystem ID
- For IMS: the IMS ID
- For CICS, this is the CICS ID
- For DRDA connections from non-DB2 requesters: SERVER

**Field Name:** QWHCCN

This is an *exception* field.

**WSNAME**

The end user's workstation name.

**Field Name:** QWHCEUWN

*Initial DB2 Common Server Traces:* This topic shows the trace blocks for the initial DB2 common server.

*Initial DB2 Common Server Correlation:*

This topic shows detailed information about “Accounting - Initial DB2 Common Server Correlation”.

This block shows the Accounting trace for the initial DB2 common server correlation.

**Accounting - Initial DB2 Common Server Correlation**

The field labels shown in the following sample layout of “Accounting - Initial DB2 Common Server Correlation” are described in the following section.

| PRODUCT ID | COMMON SERV |
| CLIENT PLATFORM | AIX 64BIT |
| CLIENT APPLNAME | PRCHNG |
| CLIENT AUTHID | USRT001 |
| DDC5 ACC.SUFFIX | "BLANK" |

**PRODUCT ID**

The product identifier of the requester:

- **DB2** DB2 UDB for z/OS
- **SQL/DS** DB2 UDB for VSE and VM
PRODUCT VERSION
The version, release, and modification level of the product, which generated the accounting information. It has the following format: \text{vv rr m}, where:

- \text{vv} Version level
- \text{rr} Release level
- \text{m} Modification level

\text{N/P} is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

\text{Field Name: QMDAPRIDV}

CLIENT PLATFORM
The client platform, such as AIX. This is a 1 to 18 character field padded with blanks.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

\text{Field Name: QMDAPLAT}

CLIENT APPLNAME
The name of the client application. This is a 1 to 20 character field padded with blanks. An example is "PAYROLL".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

\text{Field Name: QMDAAPPL}

CLIENT AUTHID
The client authorization ID of an application process. This is a 1 to 8 character field padded with blanks. An example is "SMITH".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

\text{Field Name: QMDAAATID}

DDCS ACC.SUFFIX
Initial DB2 Common Server Correlation

The account suffix. The maximum length of this field is 200 bytes. This field is the user-supplied portion (suffix) of the accounting string. An example is "DEFAULT_DRDA". A value of zero in QMDASFLN Indicates there is no account suffix.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDASUFX

Initial DB2 Common Server or Universal JDBC Driver Correlation:

This topic shows detailed information about “Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation”.

This block shows the accounting trace for the initial DB2 common server or universal JDBC driver correlation.

Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation

The field labels shown in the following sample layout of “Accounting - Initial DB2 Common Server or Universal JDBC Driver Correlation” are described in the following section.

---- INITIAL_DB2_COMMON_SERVER_OR_UNIVERSAL_JDBC_DRIVER_CORRELATION -----------------------------------------------
PRODUCT ID : JDBC DRIVER
PRODUCT VERSION: V3 R66M0
CLIENT PLATFORM: IS-255-01234567890
CLIENT APPLNAME: IS-255-0123456789012
CLIENT AUTHID : IS-128--
DDCS ACC.SUFFIX: IS-255-01234567890123456789012#1

PRODUCT TYP

Shows the product identifier (ID) of the requester. It can have the following values:

DB2  For DB2 UDB for z/OS
SQL/DS  For DB2 UDB for VSE and VM
JDBC DRIVER  For Universal JDBC driver
COMMON SERV  For DB2 UDB for Linux, UNIX, Windows
DB2/400  For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

PRODUCT VERSION

The version, release, and modification level of the product, which generated the accounting information. It has the following format: vv rr m,

where:

vv  Version level
**Initial DB2 Common Server or Universal JDBC Driver Correlation**

*rr*  Release level

*m*  Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAPRIDV

**CLIENT PLATFORM**

The client platform, such as AIX. This is a 1 to 18 character field padded with blanks.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAPLAT

**CLIENT APPLNAME**

The name of the client application. This is a 1 to 20 character field padded with blanks. An example is "PAYROLL".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAAPPL

**CLIENT AUTHID**

The client authorization ID of an application process. This is a 1 to 8 character field padded with blanks. An example is "SMITH".

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAAATID

**DDCS ACC.SUFFIX**

The account suffix. The maximum length of this field is 200 bytes. This field is the user-supplied portion (suffix) of the accounting string. An example is "DEFAULT_DRDA". A value of zero in QMDASFLN Indicates there is no account suffix.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDASUFX

*Initial DB2 Requester Correlation:*

This topic shows detailed information about “Accounting - Initial DB2 Requester Correlation”.

This block shows the accounting trace for the initial DB2 requester correlation.

**Accounting - Initial DB2 Requester Correlation**

The field labels shown in the following sample layout of “Accounting - Initial DB2 Requester Correlation” are described in the following section.
Initial DB2 Requester Correlation

PRODUCT ID

Shows the product identifier (ID) of the requester. It can have the following values:

- DB2 For DB2 UDB for z/OS
- SQL/DS For DB2 UDB for VSE and VM
- JDBC DRIVER For Universal JDBC driver
- COMMON SERV For DB2 UDB for Linux, UNIX, Windows
- DB2/400 For DB2 UDB for iSeries

Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

PRODUCT VERSION

The version, release, and modification level of the product, which generated the accounting information. It has the following format: \( \text{vv rr m} \), where:

- \( \text{vv} \) Version level
- \( \text{rr} \) Release level
- \( m \) Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDB2PRDV

LOCATION NAME

The location name for the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Field Name: QMDALOCN
NET ID

The NETID of the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDANETN

LU NAME

The SNA LU name of the DB2 subsystem that created the QMDAINFO values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDALUNM

AUTHID

The DB2 authorization ID that the SQL application used before name translation and before driving the connection exit at the DB2 site where the SQL application is running.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAUTH

CONNTYPE

The type of subsystem connection at the DB2 system where the SQL application is running. Possible values and their descriptions are:

- BATCH
  TSO or call attach

- SASS  CICS

- MASS  IMS

- DIST  Distributed

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACTYP

CORRNAME

The translated correlation name derived from the correlation ID. The translation depends on the connection ID.

Field Name: ADRQCRNM

CORRNMBR

The translated correlation number derived from the correlation ID. The translation depends on the connection ID.

Field Name: ADRQCRNB

Initial Other Requester Correlation:

This topic shows detailed information about “Accounting - Initial Other Requester Correlation”.

This block shows the accounting trace for the initial other requester correlation.
Initial Other Requester Correlation

Accounting - Initial Other Requester Correlation

The field labels shown in the following sample layout of “Accounting - Initial Other Requester Correlation” are described in the following section.

--- INITIAL OTHER REQUESTER CORRELATION

PRODUCT ID
The product identifier of the requester:

- **DB2** DB2 UDB for z/OS
- **SQL/DS** DB2 UDB for VSE and VM
- **COMMON SERV** DB2 UDB for Linux, UNIX, and Windows
- **DB2/400** DB2 UDB for iSeries
- **N/P** If the record was written at the application requester location

Otherwise, it shows the first 3 characters of the product ID.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAPRIDP

PRODUCT VERSION
The version, release, and modification level of the product, which generated the accounting information. It has the following format: \( vv \ rr \ m \), where:

- **vv** Version level
- **rr** Release level
- **m** Modification level

N/P is shown if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAPRIDV

STRING
The accounting string:

- For local DB2 threads, the format of the accounting string is shown in QMDAINFO.
- For database access threads, the accounting string contains the accounting string sent by the requester.
- The QMDAPRID value identifies which product generated the accounting string.
  - If the requester is DB2, the accounting string is defined in QMDAINFO.
  - If QMDAPTYP is DSN, QMDAINFO defines the format.
  - If QMDAPTYP is SQL or JCC, QMDASQLI defines the format.
Otherwise, the format is undefined.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAASTR

**Locking:**

This topic shows detailed information about “Accounting - Locking”.

This block provides locking information. Locking ensures the integrity of data.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Locking**

The field labels shown in the following sample layout of “Accounting - Locking” are described in the following section.

<table>
<thead>
<tr>
<th>Report</th>
<th>Trace</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCKING</td>
<td>LOCKING</td>
</tr>
<tr>
<td>AVERAGE</td>
<td>TOTAL</td>
</tr>
<tr>
<td>TOTAL</td>
<td>LOCKING</td>
</tr>
<tr>
<td>TOTAL</td>
<td>TOTAL</td>
</tr>
<tr>
<td>TIMEOUTS</td>
<td>LOCKOUTS</td>
</tr>
<tr>
<td>DEADLOCKS</td>
<td>DEADLOCKS</td>
</tr>
<tr>
<td>ESCAL.(SHARED)</td>
<td>ESCAL.(SHAR)</td>
</tr>
<tr>

<tr>
<td>LOCK SUSPENSIONS</td>
<td>LOCK SUSPENS</td>
</tr>
<tr>
<td>IRLM LATCH SUSPENS.</td>
<td>IRLM LATCH SUSPENS</td>
</tr>
<tr>
<td>OTHER SUSPENS.</td>
<td>OTHER SUSPENS</td>
</tr>
</tbody>
</table>

**TIMEOUTS**

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Field Name:** QTXATIM

**DEADLOCKS**

The number of times deadlocks were detected. This number should be low, ideally 0.

**Background and Tuning Information**

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.
To minimize deadlocks:

- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an *exception* field.

**ESCAL.(SHARED)/ESCAL.(SHAR)**

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES

This is an *exception* field.

**ESCAL.(EXCLUS)/ESCAL.(EXCL)**

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

**Field Name:** QTXALEX

This is an *exception* field.
MAX PG/ROW LOCKS HELD/MAX PG/ROW LCK HELD
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

Field Name: QTXANPL
This is an exception field.

LOCK REQUEST
The number of requests to lock a resource.

Field Name: QTXALOCK
This is an exception field.

UNLOCK REQUEST
The number of requests to unlock a resource.
This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

Field Name: QTXAUNLK

QUERY REQUEST
The number of query requests.

Field Name: QTXAQR

CHANGE REQUEST
The number of change requests.

Field Name: QTXACHG

OTHER REQUEST
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM

TOTAL SUSPENSIONS
The number of all types of lock suspensions.

Field Name: ALRSUSP

LOCK SUSPENSIONS/LOCK SUSPENS
The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information
This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

Field Name: QTXASLOC
This is an exception field.

**IRLM LATCH SUSPENS.**

The number of latch suspensions.

**Field Name:** QTXASLAT

This is an exception field.

**OTHER SUSPENS.**

The number of suspensions caused by something other than lock or latch.

**Field Name:** QTXASOTH

This is an exception field.

*Logging Activity:*

This topic shows detailed information about “Accounting - Logging Activity”.

This block provides information about the logging activity.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Logging Activity**

The field labels shown in the following sample layout of “Accounting - Logging Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOGGING</td>
<td>LOGGING</td>
</tr>

</tr>
<tr>
<td>TOT BYTES WRITTEN</td>
<td>6000.00</td>
</tr>
<tr>
<td>LOG RECORD SIZE</td>
<td>3000.00</td>
</tr>
</tbody>
</table>

**LOG RECORDS WRITTEN (LOG RECS WRITTEN)**

The number of log records written.

**Field Name:** QWACLRRN

**TOT BYTES WRITTEN (TOT BYTES WRITTEN)**

The total number of log record bytes written.

**Field Name:** QWACLRAB

**LOG RECORD SIZE**

The average number of bytes written per log record.

**Field Name:** ALRAVGB

*Measured/Elig Times:*

This topic shows detailed information about “Accounting - Measured/Elig Times”.

**Accounting - Measured/Elig Times**

The field labels shown in the following sample layout of “Accounting - Measured/Elig Times” are described in the following section.
### Measured/Elig Times

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value 1</th>
<th>Value 2</th>

</tr>
</tbody>
</table>

### APPL (CL1) - Elapsed Time

The class 1 elapsed time of the allied agent.

**Special Considerations:**
- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

**Field Name:** ADRECETT

This is an exception field.

### APPL (CL1) - CP CPU Time

The class 1 CPU time in an application. It indicates:
- The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.
  In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADCPUT

This is an exception field.

### APPL (CL1) - CP CPU Time - Eligible for SECP

The accumulated CPU time that is consumed on a standard CP for work eligible on an IBM specialty engine.
For records for the parent tasks in parallel queries, this value reflects
zIIP-eligible time for the parent and the child tasks. Child task records
have a value of 0.

Field Name: AWACZEL

APPL (CL1) - SE CPU TIME

The sum of several accumulated CPU times consumed while running on
an IBM specialty engine in all environments. These times are consumed when:

- Running stored procedure requests and triggers on the main application
  execution unit.
- Satisfying stored procedure requests processed in a DB2 stored
  procedure or WLM address space. SQL procedure times are included in
  this time if the SQL procedure was called on a nested task and was not
  invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM
  address space.
- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated
  CPU time used to satisfy UDF requests.

Note: All CPU times of an IBM specialty engine (SE) that are reported in
DB2 trace records are already normalized by DB2 to the speed of the
general purpose processor.

Field Name: AWACC1Z

DB2 (CL2) - ELAPSED TIME

The class 2 elapsed time of the allied agent accumulated in DB2.

Field Name: ADDBB2ETT

This is an exception field.

DB2 (CL2) - ELAPSED TIME - ELIGIBLE FOR ACCEL

The accumulated elapsed time spent processing SQL in DB2 that may be
eligible for execution on an accelerator.

Field Name: AWACEEL2

DB2 (CL2) - CP CPU TIME

The class 2 CPU time (in DB2). It indicates:

- The class 2 CPU time for the allied agent. This includes the accumulated
  class 2 TCB time for processing any stored procedures, user-defined
  functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for
  query CP parallelism, sysplex query parallelism, and parallel tasks
  generated by utilities.
- For batch reporting, in sysplex query parallelism, the individual CPU
times are normalized by the conversion factor of the parallel tasks,
related to the originating task.

For online monitoring, in sysplex query parallelism, only CPU times of
parallel tasks, running on the same member of the sysplex group as the
originating task, are included.
This CPU time does not include time that is consumed on an IBM specialty engine.

**Field Name:** ADBBCPUT

This is an *exception* field.

### DB2 (CL2) - CP CPU TIME - ELIGIBLE FOR ACCEL

The accumulated CPU time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** AWACECP2

### DB2 (CL2) - SE CPU TIME

The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

**Field Name:** AWACC2Z

### DB2 (CL2) - SE CPU TIME - ELIGIBLE FOR ACCEL

The accumulated CPU time consumed on an IBM specialty engine while processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** AWACESE2

*Miscellaneous LOB data report and trace:*

The miscellaneous LOB data report shows general information about large objects.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>MISCELLANEOUS</td>
<td>TOTAL</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------</td>

<td>0.00</td>
</tr>
<tr>
<td>FETCH 1 BLOCK ONLY</td>
<td>0.00</td>
</tr>
</tbody>
</table>

*Figure 292. Miscellaneous LOB data report and trace*

**MAX STO LOB VAL (KB)**

Maximum storage used for LOB values.

**Field Name:** QXSTLOBV

**MAX STO XML VAL (KB)**

Maximum storage used for XML values.

**Field Name:** QXSTXMLV

**ARRAY EXPANSIONS**
The number of times a variable array has been expanded beyond 32 KB (DB2 field: QXSTARTARRAY_EXPANSIONS).

Field Name: AXSTAEXP

SPARSE IX DISABLED

The number of times that sparse index was disabled because of insufficient storage.

Field Name: QXSISTOR

SPARSE IX BUILT WF

The number of times that sparse-index built a physical work file for probing.

Field Name: QXSIIWF

NO DM CALL RIDL/LPF

The number of times that RDS did not call data manager for RID list retrieval for multiple index access or list prefetch because runtime adaptive index processing was able to determine the outcome.

Field Name: QXRSDMAD

FETCH 1 BLOCK ONLY

The number of times that RDS fetched one block and made no subsequent requests for additional blocks.

Field Name: QXR1BOAD

MVS Accounting:

This topic shows detailed information about “Accounting - MVS Accounting”.

This block provides information about an MVS accounting trace.

Accounting - MVS Accounting

The field labels shown in the following sample layout of “Accounting - MVS Accounting” are described in the following section.

MVS ACCOUNTING DATA : LS-255-01234567890123456789012#2
ACCOUNTING TOKEN(CHAR) : N/A
ACCOUNTING TOKEN(HEX) : N/A

MVS ACCOUNTING DATA

The MVS accounting string associated with the MVS address space of the SQL application. It is filled if PROD_TYP=D; otherwise X’00’ is used.

This information comes from the ACCT= parameter on the job statement. If the ACCT= parameter is blank, the information on the EXEC statement is used. TSO logon Accounting information is used only if there is a value in the account field on the TSO Logon panel. Do not confuse this field with the Accounting correlation token.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAACCT

ACCOUNTING TOKEN(CHAR)
The accounting token. For RRSAF, this is the RRSAF accounting token defined during signon. For DDF, this is the DDF correlation token. This value is displayed in character format.

**Field Name:** AWHCTOKC

**ACCOUNTING TOKEN(HEX)**

The accounting token. For RRSAF, this is the RRSAF accounting token defined during signon. For DDF, this is the DDF correlation token. This value is displayed in hexadecimal format.

**Field Name:** AWHCTOKH

### Package Buffer Pool Activity - Class 10:

This topic shows detailed information about “Accounting - Package Buffer Pool Activity - Class 10”.

This block shows buffer pool information at package level. It is repeated for each package present in the requested report. The block is headed by the package name.

The following example shows both layouts, the report on the left, and the trace layout on the right.

### Accounting - Package Buffer Pool Activity - Class 10

The field labels shown in the following sample layout of “Accounting - Package Buffer Pool Activity - Class 10” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSQLDLV</td>
<td>AVERAGE</td>
</tr>
<tr>
<td>BPOOL HIT RATIO (%)</td>

<tr>
<td>SYNCHRONOUS READ</td>
<td>0.00</td>
</tr>
<tr>
<td>SEQ. PREFETCH REQS</td>
<td>0.00</td>
</tr>
<tr>
<td>LIST PREFETCH REQS</td>
<td>0.00</td>
</tr>
<tr>
<td>DYN. PREFETCH REQS</td>
<td>0.00</td>
</tr>
<tr>
<td>PAGES READ ASYNCHR.</td>
<td>0.00</td>
</tr>
</tbody>
</table>

**BPOOL HIT RATIO (%)**

The percentage of Getpage operations that were satisfied by a page already in the buffer pool.

The value is calculated as the ratio of number of successful Getpage operations minus the number of pages read from DASD (both synchronously and using prefetch), to the number of successful Getpage operations, expressed as a percentage.

### Background and Tuning Information

The highest possible hit ratio is 100%, that is, when every page requested is always in the buffer pool. If the requested page is not in the buffer pool, the hit ratio is 0% or less. If the hit ratio is negative, this means that prefetch brought pages into the buffer pool that are not subsequently referenced, either because the query stops before it reaches the end of the table space, or because the prefetched pages are stolen by DB2 for reuse.
before the query can access them. A low buffer pool hit ratio is not necessarily bad. The hit ratio is a relative value, based on the type of application. For example, an application that browses large data might have a buffer pool hit ratio of 0. Watch for those cases where the hit ratio drops significantly for the same application. Here are some suggestions to increase the buffer hit ratio:

- Run the REORG utility for indexes or table spaces associated with the virtual buffer pool.
- Reserve more pages for random I/O by setting the SEQUENTIAL STEAL THRESHOLD (VTSEQT) to a lower value.
- Increase the buffer pool as long as the cost of paging does not outweigh the benefit of I/O avoidance.
- Establish more separate buffer pools, perhaps to isolate different applications.
- Place the objects that are only accessed sequentially in a separate buffer pool.

The hit ratio measurement becomes less meaningful if the buffer pool is used by additional processes, such as utilities or work files.

Field Name: ABUFFRAP

GETPAGES

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

Background and Tuning Information

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary.

As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.

- Use correlated rather than non-correlated queries to force the use of an index.

Field Name: QBACGETP

BUFFER UPDATES

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.
Background and Tuning Information

A nonzero value indicates any of the following activities:

- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

Field Name: QBACSWSP

SYNCHRONOUS WRITE

The number of immediate (synchronous) write I/O operations.

Background and Tuning Information

Although an immediate write is rare, a small nonzero value is acceptable. A large value indicates that the system needs tuning.

Field Name: QBACIMWP

SYNCHRONOUS READ

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIOP

SEQ. PREFETCH REQS

The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

Background and Tuning Information

Table space scans and nonmatching index scans generally use sequential prefetch.

Field Name: QBACSEQP

LIST PREFETCH REQS

The number of LIST PREFETCH requests.

Special Considerations:
1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.

4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.

Field Name: QBACLPFP

**DYN. PREFETCH REQS**

The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

**Background and Tuning Information**

Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.

If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.

Field Name: QBACDPFP

**PAGES READ ASYNCHR.**

The number of asynchronous pages read by prefetch that the agent triggered.

**Background and Tuning Information**

This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

Field Name: QBACSIOP

**Package Global Contention L-Locks - Class 8:**

This topic shows detailed information about “Accounting - Package Global Contention L-Locks - Class 8”.

This block provides global contention information for a logical lock (L-lock) at package level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

**Note:** The current package name is shown in the header line of the block instead of this block title.

**Accounting - Package Global Contention L-Locks - Class 8**

The field labels shown in the following sample layout of “Accounting - Package Global Contention L-Locks - Class 8” are described in the following section.
The accumulated wait times due to global contention for all L-Locks.

**Field Name:** APLKSUST

**GLOBAL CONTENTION L-LOCKS - AV.EVENT/EVENTS**
The accumulated wait trace events processed for waits for global contention of all L-Locks.

**Field Name:** APLKSUSC

**PARENT (DB,TS,TAB,PART) - AVERAGE TIME/ELAPSED TIME**
The accumulated wait time due to global contention for parent L-Locks. Parent L-Locks are any of the following L-Lock types: database, tablespace, table, or partition.

**Field Name:** QPACAWTJ

**PARENT (DB,TS,TAB,PART) - AV.EVENT/EVENTS**
The number of wait trace events processed for waits for global contention for parent L-Locks.

**Field Name:** APLPSUSC

**CHILD (PAGE,ROW) - AVERAGE TIME/ELAPSED TIME**
The accumulated wait time due to global contention for child L-Locks. Child L-locks are any of the following L-Lock types: page or row.

**Field Name:** QPACAWTK

**CHILD (PAGE,ROW) - AV.EVENT/EVENTS**
The number of wait trace events processed for waits for global contention for child L-Locks.

**Field Name:** APLCSUSC

**OTHER - AVERAGE TIME/ELAPSED TIME**
The accumulated wait time due to global contention for other L-Locks.

**Field Name:** QPACAWTM

**OTHER - AV.EVENT/EVENTS**
The number of wait trace events processed for waits for global contention for other L-Locks.

**Field Name:** APLOSUSC

---

*Package Global Contention P-Locks - Class 8:*

This topic shows detailed information about “Accounting - Package Global Contention P-Locks - Class 8”.

This block provides global contention information for a physical lock (P-lock) at package level. It shows conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

The following example shows both layouts, the report on the left, and the trace layout on the right.
Note: The current package name is shown in the header line of the block instead of this block title.

Accounting - Package Global Contention P-Locks - Class 8

The field labels shown in the following sample layout of “Accounting - Package Global Contention P-Locks - Class 8” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>AYRSD020</td>
<td>AVERAGE TIME</td>

<td>0.000000</td>
</tr>
<tr>
<td>OTHER</td>
<td>0.000000</td>
</tr>
</tbody>
</table>

GLOBAL CONTENTION P-LOCKS - AVERAGE TIME/ELAPSED TIME

The accumulated wait times due to global contention for all P-Locks.

Field Name: APPLSUST

GLOBAL CONTENTION P-LOCKS - AV.EVENT/EVENTS

The accumulated wait trace events processed for waits for global contention of all P-Locks.

Field Name: APPLSUSC

PAGESET/PARTITION - AVERAGE TIME/ELAPSED TIME

The accumulated wait time due to global contention for pageset/partition P-Locks.

Field Name: QPACAWTN

PAGESET/PARTITION - AV.EVENT/EVENTS

The number of wait trace events processed for waits for global contention for pageset/partition P-Locks.

Field Name: APPSSUSC

PAGE - AVERAGE TIME/ELAPSED TIME

The accumulated wait time due to global contention for page P-Locks.

Field Name: QPACAWTO

PAGE - AV.EVENT/EVENTS

The number of wait trace events processed for waits for global contention for page P-Locks.

Field Name: APPPSUSC

OTHER - AVERAGE TIME/ELAPSED TIME

The accumulated wait time due to global contention for other P-Locks.

Field Name: QPACAWTQ

OTHER - AV.EVENT/EVENTS

The number of wait trace events processed for waits for global contention for other P-Locks.

Field Name: APPOSUSC

Package Identification: This topic shows the report and trace blocks for package identification. They present information for the identification of packages. A
package is an object containing a set of SQL statements that have been statically bound and that is available for processing.

For more information on calculating package average data refer to “How Averages Are Calculated” on page 3019.

Package Identification - Report:

This topic shows detailed information about “Accounting - Package Identification - Report”.

Accounting - Package Identification - Report

The field labels shown in the following sample layout of “Accounting - Package Identification - Report” are described in the following section.

ACTNAME: STORED PROC.CREATETABLE

<table>
<thead>
<tr>
<th>TYPE</th>
<th>PACKAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>DSND1A1B</td>
</tr>
<tr>
<td>COLLECTION ID</td>
<td>USRT001</td>
</tr>
<tr>
<td>PROGRAM NAME</td>
<td>NSQLDLV</td>
</tr>
</tbody>
</table>

| ACTIVITY TYPE | NATIVE SQL PROC |
| ACTIVITY NAME | NSQLDLV |
| SCHEMA NAME | USRT001 |

| SUCC AUTH CHECK | 0 |
| OCCURRENCES | 478960 |
| NBR OF ALLOCATIONS | 28986 |
| SQL STMT - AVERAGE | N/P |
| SQL STMT - TOTAL | N/P |
| NBR RLUP THREADS | 28985 |

PCKNAME

This label is replaced by the package name, or, if ORDER (ACTNAME) was in effect, the package activity name. An activity name is truncated if it is longer than 8 characters.

Field Name: PCKNAME

TYPE

An indicator of whether the block describes a package or a DBRM. Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

Field Name: ADPCKTYP

LOCATION

The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

Field Name: QPACLOCN

This is an exception field.
COLLECTION ID

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:
- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

Field Name: QPACCOLN
This is an exception field.

PROGRAM NAME

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

Field Name: QPACPKID
This is an exception field.

PROGRAM NAME

This field is identical to QPACPKID except of when ORDER (ACTNAME) was in effect. can belong to the same activity name. In a data block that reports totals it is set to ALL PROG.

Field Name: APACPKID

ACTIVITY TYPE

The type of activity. The following values indicate how the package was loaded:

ALL TYPES
In a data block that reports totals it is set to ALL TYPES.

STORED PROC
When running an external procedure

TRIGGER
When running a trigger

UDF When running a user-defined function

NATIVE SQL PROC
When running a native SQL procedure

NATIVE UDF
When running a native UDF procedure (a non-inline user-defined function)

NONNESTED
Indicates that none of the above values is true

MULTIPLE
Indicates that packages with the same key but with different activity types were running

N/P Invalidated in case of rollup summary
The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

S  For Stored Procedure
T  For Trigger
U  For UDF
Q  For native SQL procedure
D  For Native UDF
N  For nonnested (other)

blank  For invalidated in case of rollup summary

This field is invalid if unique or summary rollup data is present.

Field Name: ADPATYP

ACTIVITY NAME

The name of the nested activity.

This field contains the name of the nested activity if the package is defined for a:

• Trigger
• Stored procedure
• User-defined function (UDF)
• Native SQL procedure
• Non-inline UDF

In a data block that reports totals it is set to ALL NAMES.

This field is invalid if summary rollup data is present.

It can have the following value in:

• Accounting Trace and Report: N/P
• The Accounting FILE and SAVE PROGRAM tables: blank

Field Name: ADPAANM

SCHEMA NAME

Schema name of the nested activity.

If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:

• Accounting Trace and Report: N/P
• The Accounting FILE and SAVE PROGRAM tables: blank

This field is invalid if summary rollup data is present.

Field Name: ADPASCH

SUCC AUTH CHECK

For Accounting reports, this field shows a value of 0. This field is valid for non-rollup data.

Field Name: ADPCKANR

OCCURRENCES

This value can be one of the following:
In general, the total number of accounting trace sections for a package or DBRM regardless of enabled or disabled DB2 trace classes 7 and 8 at the time of writing the trace record. In case of Distributed Data Facility (DDF) or Recoverable Resource Manager Services Attach Facility (RRSAF) threads, it is the number of accounting intervals rolled up in a record.

If REPORT ORDER (ACTNAME) is specified, the total number of package sections of a special activity type depends on the following:

- If IFCID 233 or 380 is available, stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
- If IFCID 233 or 381 is available, user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
- If neither IFCID 233, 380, nor 381 is collected, all packages of an activity type are counted. The sum also includes the number of subprograms.

Field Name: ADTOTPOC

NBR OF ALLOCATIONS

This value can be one of the following:

- In general, the number of times a package was invoked by a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.

- If REPORT ORDER (ACTNAME) is specified, the number of times a package of a special activity type is invoked from a different package depends on the following:
  - If IFCID 233 or 380 is available, the invocations of stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the invocation of user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381 is collected, all invocations of an activity type are counted. The sum also includes the number of subprograms.

Field Name: APACSWIT

SQL STMT - AVERAGE

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:
Package Identification - Report

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

**Field Name:** QPACSQLC

This is an *exception* field.

**SQL STMT - TOTAL**

The number of SQL statements issued in this package or DBRM.

This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

**Note:** This field is shown for the following field labels in Accounting trace:
- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

**Field Name:** QPACSQLC

This is an *exception* field.

**NBR RLUP THREADS**

This value can be one of the following:
- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.
- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.
  - If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.
  - If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

**Field Name:** QPACRLNU

**Package Identification - Trace:**

This topic shows detailed information about “Accounting - Package Identification - Trace”.

**Accounting - Package Identification - Trace**

The field labels shown in the following sample layout of “Accounting - Package Identification - Trace” are described in the following section.
Package Identification - Trace

**PCKNAME**

This label is replaced by the package name, or, if ORDER (ACTNAME) was in effect, the package activity name. An activity name is truncated if it is longer than 8 characters.

**Field Name:** PCKNAME

**TYPE**

An indicator of whether the block describes a package or a DBRM. Possible values are PACKAGE, DBRM, and BOTH. BOTH can be shown in reports if there are packages and DBRMs with the same program name.

**Field Name:** ADPCKTYP

**LOCATION**

The location name.

If this field is blank in trace or report, the package or DBRM was executed locally. If it is not blank, all times represent the time spent locally to execute the remote package for this APPL_DIR requester.

This field is invalid (N/P) if summary rollup data is present.

**Field Name:** QPACLOCN

This is an *exception* field.

**COLLECTION ID**

The package collection ID. This field does not apply to DBRMs. If the program name cannot be identified, this field is not present in report or trace.

This field is invalid if summary rollup data is present. It can have the following value in:

- Accounting trace and report: N/P
- The Accounting FILE and SAVE PROGRAM table: blank

**Field Name:** QPACCOLN

This is an *exception* field.

**PROGRAM NAME**

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown *ROLSUM*.
Field Name: QPACPKID
This is an exception field.

CONSISTENCY TOKEN
The program (package or DBRM) consistency token.
This field is invalid (0) if summary rollup data is present.

Field Name: QPACCONT

ACTIVITY TYPE
The type of activity. The following values indicate how the package was loaded:

ALL TYPES
In a data block that reports totals it is set to ALL TYPES.

STORED PROC
When running an external procedure

TRIGGER
When running a trigger

UDF
When running a user-defined function

NATIVE SQL PROC
When running a native SQL procedure

NATIVE UDF
When running a native UDF procedure (a non-inline user-defined function)

NONNESTED
Indicates that none of the above values is true

MULTIPLE
Indicates that packages with the same key but with different activity types were running

N/P
Invalidated in case of rollup summary

The nested activity values that are shown in column NEST_ACTIVITY_TYPE of the table DB2PMFACCT_PROGRAM are:

S For Stored Procedure
T For Trigger
U For UDF
Q For native SQL procedure
D For Native UDF
N For nonnested (other)
blank For invalidated in case of rollup summary

This field is invalid if unique or summary rollup data is present.

Field Name: ADPATYP

ACTIVITY NAME
The name of the nested activity.
This field contains the name of the nested activity if the package is defined for a:

- Trigger
- Stored procedure
- User-defined function (UDF)
- Native SQL procedure
- Non-inline UDF

In a data block that reports totals it is set to ALL NAMES.

This field is invalid if summary rollup data is present.

It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

Field Name: ADPAANM

SCHEMA NAME

Schema name of the nested activity.

If the package is defined for a trigger, stored procedure, or user-defined function, then this field contains the name of the schema to which the nested activity belongs. It can have the following value in:

- Accounting Trace and Report: N/P
- The Accounting FILE and SAVE PROGRAM tables: blank

This field is invalid if summary rollup data is present.

Field Name: ADPASCH

SUCC AUTH CHECK

For Accounting traces, this field indicates whether authorization information was found for this package without accessing the DB2 catalog. This field is valid for non-rollup data. Possible values are:

- YES
- NO
- N/A if DB2 or later is used
- N/P, this field is invalid for Accounting trace
- blank, this field is invalid in the Accounting FILE PROGRAM table

Note: This field is invalid if unique or summary rollup data is present.

Field Name: ADPCKAUT

NBR OF ALLOCATIONS

This value can be one of the following:

- In general, the number of times a package was invoked by a different package. For the first package run by an application, the initial call counts as a package switch. If this package called a nested package (such as a trigger, UDF, or stored procedure), a switch will not be counted upon return from such a package.
- If REPORT ORDER (ACTNAME) is specified, the number of times a package of a special activity type is invoked from a different package depends on the following:
If IFCID 233 or 380 is available, the invocations of stored procedures (SP) are counted based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.

If IFCID 233 or 381 is available, the invocation of user-defined functions (UDF) are counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.

If neither IFCID 233, 380, nor 381 is collected, all invocations of an activity type are counted. The sum also includes the number of subprograms.

Field Name: APACSWIT

**SQL STMT - AVG**

The number of SQL statements issued in this package or DBRM. This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an *exception* field.

**SQL STMT - TOTAL**

The number of SQL statements issued in this package or DBRM. This number may not be equal to the total number of SQL statements in the QXST data section because QXST does not count all SQL statements. For example, it does not count commit or rollback statements.

Note: This field is shown for the following field labels in Accounting trace:

- SQL STMT - TOTAL
- SQL STMT - AVERAGE:

Field Name: QPACSQLC

This is an *exception* field.

**NBR RLUP THREADS**

This value can be one of the following:

- In general, the number of threads to roll data into this QPAC data section. Non-rollup QPACs have a value of 1 and rollup QPACs have a value of 1 or more. This number is used as a divisor for calculating averages for package class 7, 8, or 10 times and events.
- If REPORT ORDER (ACTNAME) is specified, the number of threads to roll data into this QPAC data section of a special activity type depends on the following:
  - If IFCID 233 or 380 is available, the number of threads to roll data into this QPAC data section for stored procedures (SP) is counted
based on the available IFCID. If both IFCIDs are available, IFCID 380 is the preferred one for SP reporting. Subprograms called by these SPs are not taken into account.

- If IFCID 233 or 381 is available, the number of threads to roll data into this QPAC data section for user-defined functions (UDF) is counted based on the available IFCID. If both IFCIDs are available, IFCID 381 is the preferred one for UDF reporting. Subprograms called by these UDFs are not taken into account.

- If neither IFCID 233, 380, nor 381, is collected, the total number of threads to roll data into this QPAC data section is counted. The sum also includes the number of subprograms.

Field Name: QPACRLNU

Package Locking Activity - Class 10:

This topic shows detailed information about “Accounting - Package Locking Activity - Class 10”.

This block shows locking information at package level. It is repeated for each package present in the requested report. The block is headed by the package name.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Package Locking Activity - Class 10

The field labels shown in the following sample layout of “Accounting - Package Locking Activity - Class 10” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMEOUTS</td>

<tr>
<td>OTHER SUSPENS.</td>
<td>0.00</td>
<td>0</td>
</tr>
</tbody>
</table>

TIMEOUTS

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

Field Name: QTXATIM

DEADLOCKS

The number of times deadlocks were detected. This number should be low, ideally 0.

Background and Tuning Information
Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an exception field.

**ESCAL.(SHARED)**

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES

This is an exception field.

**ESCAL.(EXCLUS)**

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.
If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

Field Name: QTXALEX
This is an exception field.

MAX PG/ROW LOCKS HELD
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

Field Name: QTXANPL
This is an exception field.

LOCK REQUEST
The number of requests to lock a resource.

Field Name: QTXALOCK
This is an exception field.

UNLOCK REQUEST
The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

Field Name: QTXAUNLK

QUERY REQUEST
The number of query requests.

Field Name: QTXAQRY

CHANGE REQUEST
The number of change requests.

Field Name: QTXACHG

OTHER REQUEST
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM

LOCK SUSPENSIONS
The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information
This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

**Field Name:** QTXASLOC

This is an *exception* field.

**IRLM LOCK SUSPENS.**

The number of latch suspensions.

**Field Name:** QTXASLAT

This is an *exception* field.

**OTHER SUSPENS.**

The number of suspensions caused by something other than lock or latch.

**Field Name:** QTXASOTH

This is an *exception* field.

### Accounting - Package SQL Activity - Class 10

This topic shows detailed information about “Accounting - Package SQL Activity - Class 10.”

This block shows SQL information at package level. It is repeated for each package present in the requested report. The block is headed by the package name.

The following example shows both layouts, the report on the left, and the trace layout on the right.

#### Accounting - Package SQL Activity - Class 10

The field labels shown in the following sample layout of “Accounting - Package SQL Activity - Class 10” are described in the following section.

<table>
<thead>
<tr>
<th>Package</th>
<th>AVERAGE</th>
<th>TOTAL</th>
<th>Package</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>

</table>

**SELECT**

The number of SQL SELECT statements executed.

**Field Name:** QPSELECT
Package SQL Activity - Class 10

This is an exception field.

**INSERT**

The number of INSERT statements executed.

Field Name: QPINSRT

This is an exception field.

**UPDATE**

The number of UPDATE statements executed.

Field Name: QPUPDTE

This is an exception field.

**DELETE**

The number of DELETE statements executed.

Field Name: QPDELET

This is an exception field.

**DESCRIBE**

The number of data capture describes.

Field Name: QPDESC

**PREPARE**

The number of full prepare requests.

Field Name: QPPREP

**OPEN**

The number of full open requests.

Field Name: QPOPEN

**FETCH**

The number of fetch requests.

Field Name: QPFETCH

**CLOSE**

The number of close requests.

Field Name: QPCLOSE

**LOCK TABLE**

The number of lock tables.

Field Name: QPLOCK

**CALL**

The number of SQL calls.

Field Name: QPCALL

Package Times - Class 8 - Suspensions:

This topic shows detailed information about “Accounting - Package Times - Class 8 - Suspensions”. 
This block provides suspension information for class 8.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Package Times - Class 8 - Suspensions**

The field labels shown in the following sample layout of “Accounting - Package Times - Class 8 - Suspensions” are described in the following section.

<table>

</tbody>
</table>

**PACKAGE**

This label is replaced by the package name, or, if ORDER (ACTNAME) was in effect, the package activity name. An activity name is truncated if it is longer than 8 characters.

**Field Name:** PACKAGE

**AVERAGE TIME - LOCK/LATCH**

The sum of the number of wait trace events processed for waits for lock and the number of wait trace events processed for page latch contention while executing this package.

**Note:** The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

**Field Name:** AWTPLOLA

**AVERAGE TIME - IRLM LOCK+LATCH**

The accumulated lock elapsed wait time that occurred while executing this package.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

If the suspension time is high, investigate locking activity.

**Field Name:** QPACAWTL

This is an exception field.

**AVERAGE TIME - DB2 LATCH**

The accumulated latch elapsed wait time for latch suspensions that occurred while executing this package.
Package Times - Class 8 - Suspensions

Field Name: QPACAWLH

AVERAGE TIME - SYNCHRONOUS I/O

The accumulated elapsed wait time for I/O suspensions under this thread during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Field Name: QPACAWTI

This is an exception field.

AVERAGE TIME - OTHER READ I/O

The accumulated waiting time for a read I/O performed under a thread other than this one during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when performance data was gathered.

This field includes waits caused by sequential prefetch, list prefetch, dynamic prefetch, and synchronous read I/O performed by other threads.

If the value in this field is high, the problem could be an I/O bound query using prefetch or an I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer.

Field Name: QPACAWTR

This is an exception field.

AVERAGE TIME - OTHER WRITE I/O

The accumulated waiting time due to a write I/O performed for another thread during the execution of a package or DBRM.

Background and Tuning Information

If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set, volume, or control unit and is continually being suspended. Consult the DBA and MVS systems programmer to resolve possible data set placement problems.

Field Name: QPACAWTW

This is an exception field.

AVERAGE TIME - SERV.TASK SWITCH

The accumulated waiting time due to a synchronous execution unit switch to DB2 services from this thread during the execution of the package or DBRM.

Background and Tuning Information

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

This value includes the waits because of an OPEN/CLOSE data set, SYSLGRNG update, DATASPACE MANAGER services, DEFINE, EXTEND,
and DELETE data set, AUTONOMOUS PROCEDURE, and DDF Requester waiting for Server reply and VSAM Catalog update.

**Field Name:** QPACAWTE

This is an *exception* field.

**AVERAGE TIME - ARCH.L O G(QUIESCE)**

The accumulated waiting time caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM. This number represents the amount of time that an individual thread was suspended because of the command, not the time it took for the entire command to complete.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

Avoid issuing the -ARCHIVE LOG QUIESCE command during peak periods.

**Field Name:** QPACALOG

**AVERAGE TIME - DRAIN LOCK**

The accumulated waiting time due to a drain lock.

**Field Name:** QPACAWDR

**AVERAGE TIME - CLAIM RELEASE**

The accumulated waiting time for a drain waiting for claims to be released during the execution of the package or DBRM.

**Background and Tuning Information**

OMEGAMON XE for DB2 PE might adjust this value if the thread was suspended when its performance data was gathered.

**Field Name:** QPACAWCL

**AVERAGE TIME - PAGE LATCH**

The accumulated waiting time caused by a page latch contention.

**Field Name:** QPACAWTP

**AVERAGE TIME - NOTIFY MESSAGES**

The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when database descriptors are changed due to DDL.

This value is only calculated if accounting class 8 is active and DB2 is a member of a DB2 data sharing group.

**Field Name:** QPACAWTG

**AVERAGE TIME - GLOBAL CONTENTION**

The accumulated waiting time caused by the suspension of IRLM lock requests due to global lock contentions in a data sharing environment that require intersystem communication to resolve.

**Field Name:** APGCSUST
Package Times - Class 8 - Suspensions

AVERAGE TIME - TCP/IP LOB XML

The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.

Field Name: QPACALBW

AVERAGE TIME - ACCELERATOR

The accumulated wait time for requests to an accelerator while executing this package.

Field Name: QPACAACW

AVERAGE TIME - PQ SYNCHRONIZATION

The accumulated time waiting for parallel query processing to synchronize between parent and child tasks.

Field Name: APPQSST

AVERAGE TIME - FAST INSERT PIPE

The accumulated wait time for a pipe while this package was executed (DB2 field QPAC_PIPE_WAIT).

Field Name: APPISUST

AVERAGE TIME - TOTAL CL8 SUSPENS.

The waiting time for the package or DBRM due to class 8 suspensions.

Field Name: ADTSUSTP

This is an exception field.

AVG.EV - LOCK/LATCH

The sum of the number of wait trace events processed for waits for local contention for locks and the number of wait trace events processed for waits for latch contention while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLLPSSC

This is an exception field.

AVG.EV - IRLM LOCK+LATCH

The number of wait trace events processed for waits for lock while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLBPSSC

AVG.EV - DB2 LATCH

The number of wait trace events processed for page latch contention while executing this package.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLAPSSC
AVG.EV - SYNCHRONOUS I/O
The total number of synchronous I/O suspensions under this thread during the execution of the package or DBRM.

Field Name: ADIOPSSC

AVG.EV - OTHER READ I/O
The total number of suspensions due to a read I/O performed under a thread other than the one being reported.

Field Name: ADARPSSC

AVG.EV - OTHER WRITE I/O
The total number of suspensions due to a write I/O performed under a thread other than this one during the execution of a package or DBRM.

Field Name: ADAWPSSC

AVG.EV - SERV.TASK SWITCH
The total number of suspensions due to a synchronous execution unit switch to DB2 services during the execution of the package or DBRM.

Field Name: ADSTPSSC

AVG.EV - ARCH.LOG(QUIESCE)
The total number of suspensions caused by processing ARCHIVE LOG(QUIESCE) commands during the execution of the package or DBRM.

Field Name: ADALPSSC

AVG.EV - ARCHIVE LOG READ
The number of wait trace events processed for archive reads, active reads, and active log prefetch reads while running this package or DBRM.

Field Name: ADLRPSSC

AVG.EV - DRAIN LOCK
The total number of suspensions due to drain lock processing during the execution of the package or DBRM.

Field Name: ADDRPSSC

AVG.EV - CLAIM RELEASE
The total number of suspensions until the claims are released during the execution of the package or DBRM.

Field Name: ADCMPSSC

AVG.EV - PAGE LATCH
The total number of suspensions due to page latch contentions during the execution of the package or DBRM.

Field Name: ADPGPSSC

AVG.EV - NOTIFY MESSAGES
The number of suspensions due to messages being sent to other members in the data sharing group. This value is calculated only if accounting class 8 is active and DB2 is a member of a data sharing group.

Field Name: ADNOPSSC
**Package Times - Class 8 - Suspensions**

**AVG.EV - GLOBAL CONTENTION**

The total number of suspensions during global lock contention. This value is calculated only if accounting class 8 is active and DB2 is a member of a data sharing group.

*Field Name:* ADGCPS SC

**AVG.EV - TCP/IP LOB XML**

The number of wait trace events processed for waits for TCP/IP LOB and XML materialization while running this package or DBRM.

*Field Name:* ADLMPSC

**AVG.EV - ACCELERATOR**

The total number of suspensions due to a request to an accelerator during the execution of the package.

*Field Name:* ADAAPSC

**AVG.EV - PQ SYNCHRONIZATION**

The number of times the parallel query processing suspended because it was waiting for the synchronization of the parent/child.

*Field Name:* APPQSSC

**AVG.EV - FAST INSERT PIPE**

The number of wait trace events that were processed for waits for a pipe while this package was executed (DB2 field QPAC_PIPEWAIT_COUNT / 2).

*Field Name:* APPISUSC

**AVG.EV - TOTAL CL8 SUSPENS.**

The number of all types of class 8 suspensions.

*Field Name:* ADTSUSC

This is an *exception* field.

**TIME/EVENT - LOCK/LATCH**

The sum of the number of wait trace events processed for waits for local contention for locks and the number of wait trace events processed for waits for latch contention while executing this package.

*Note:* The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

*Field Name:* AALLPTMC

**TIME/EVENT - IRLM LOCK+LATCH**

The number of wait trace events processed for waits for lock while executing this package.

*Note:* The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

*Field Name:* AALOPTMC

**TIME/EVENT - DB2 LATCH**
The number of wait trace events processed for page latch contention while executing this package.

**Note:** The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

**Field Name:** AALAPTMC

**TIME/EVENT - SYNCHRONOUS I/O**

The synchronous I/O suspension time per event.

**Field Name:** AAIOPTMC

**TIME/EVENT - OTHER READ I/O**

Any other read time per event.

**Field Name:** AAARPTMC

**TIME/EVENT - OTHER WRITE I/O**

Any other write time per event.

**Field Name:** AAAWPTMC

**TIME/EVENT - SERV.TASK SWITCH**

The synchronous execution service time per event.

**Field Name:** AASTPTMC

**TIME/EVENT - ARCH. LOG(QUIESCE)**

The archive log time per event.

**Field Name:** AAALPTMC

**TIME/EVENT - ARCHIVE LOG READ**

The archive read suspension time per event.

**Field Name:** AALRPTMC

**TIME/EVENT - DRAIN LOCK**

The drain lock time per event.

**Field Name:** AADRPTMC

**TIME/EVENT - CLAIM RELEASE**

The claim release time per event.

**Field Name:** AACMPTMC

**TIME/EVENT - PAGE LATCH**

The page latch time per event.

**Field Name:** AAPGPTMC

**TIME/EVENT - NOTIFY MESSAGES**

The notify messages time per event.

**Field Name:** AANOPTMC

**TIME/EVENT - GLOBAL CONTENTION**

The global contention time per event.

**Field Name:** AAGCPTMC
Package Times - Class 8 - Suspensions

TIME/EVENT - TCP/IP LOB XML

The accumulated wait time for TCP/IP LOB and XML materialization while running this package or DBRM.

Field Name: QPACALBW

TIME/EVENT - ACCELERATOR

The accelerator waiting time per event during the execution of the package

Field Name: AAAAPTMC

TIME/EVENT - PQ SYNCHRONIZATION

The average wait time for a package for parallel query processing to synchronize between parent and child tasks.

Field Name: APPQSTMC

TIME/EVENT - FAST INSERT PIPE

The average wait time for a pipe.

Field Name: APPIITMCN

TIME/EVENT - TOTAL CL8 SUSPENS.

The class 8 time per event.

Field Name: AATOTSTP

This topic shows detailed information about “Accounting - Package Times - Class 7”.

This block shows the class 7 application times at package level.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Package Times - Class 7**

The field labels shown in the following sample layout of “Accounting - Package Times - Class 7” are described in the following section.

Report:                            Trace:

<table>

</tr>
</tbody>
</table>
The total elapsed time for executing the package or DBRM.

**Field Name:** QPACSCCT

### CP CPU TIME

The class 7 CPU time spent by the package or DBRM. It indicates:
- The TCB time
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This time does not include the CPU time consumed on an IBM specialty engine.

**Field Name:** ADCPUTP

This is an *exception* field.

### AGENT

The class 7 CPU time for all executions of the package or DBRM. This time does not include the:
- Class 7 time for parallel tasks
- CPU time that is consumed on an IBM specialty engine

**Field Name:** QPACTJST

This is an *exception* field.

### AGENT - PAR.TASKS

The accumulated time for the package or DBRM to process parallel tasks. These tasks can be query CP, sysplex query, utility parallel tasks, or rollup autonomous tasks.

In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task.

In case of rolled-up data, it is the sum of all CPU times, of originating and parallel tasks.

This time does not include CPU time consumed on an IBM specialty engine.

**Field Name:** ADCPCL7T

### SE CPU TIME

The total CPU time for all executions of this package or DBRM that was consumed on an IBM specialty engine (SE).

**Note:** All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.
Package Times - Class 7

Field Name: APACC7Z

SUSPENSION-CL8
The waiting time for the package or DBRM due to class 8 suspensions.

Field Name: ADTSUSTP
This is an exception field.

SUSPENSION-CL8 - AGENT
The class 8 suspension time for executing the package or DBRM. In query or utility parallelism, this does not include the class 8 time for parallel tasks.

Field Name: ADTCBCL8

SUSPENSION-CL8 - PAR.TASKS
The sum of the suspension times of the parallel tasks for the package or DBRM. The tasks can be query CP or sysplex query parallel tasks, tasks generated by utilities, or roll-up autonomous tasks.

In case of rolled-up data, it is the sum of all suspension times, of originating and parallel tasks.

Field Name: ADCPCL8T

NOT ACCOUNTED
The total unaccounted time in DB2 due to the execution of the package or DBRM. In query CP and sysplex query parallelism, it is the unaccounted time of the originating task only.

In case of rolled-up data, it is the unaccounted time of all tasks, of originating and parallel tasks.

Field Name: ADNACL7T
This is an exception field.

AVG.DB2 ENTRY/EXIT
The number of DB2 entries or exits processed during the execution of the package or DBRM.

In Accounting reports this is shown twice; as a total and as an average.

Field Name: QPACARNA

CP CPU SU
The CPU service units for a package or DBRM. It indicates:
- The service units for the TCB time.
- The accumulated service units for processing parallel tasks if query CP or sysplex query parallelism is exploited.

These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: ADSUCPU7

CP CPU SU - AGENT
The CPU service units for a package or DBRM. These CPU service units do not include the service units that were consumed on an IBM specialty engine.
Field Name: ADSUTCB7

CP CPU SU - PAR.TASKS

The CPU service units accumulated for a package or DBRM for processing parallel tasks. These tasks can be query CP or sysplex query parallel tasks, or roll-up autonomous tasks.

These service units do not include service units consumed on an IBM specialty engine.

Field Name: ADSUCPP7

SE CPU SU

The total CPU service units for all executions of this package or DBRM that were consumed on an IBM specialty engine.

Field Name: ADSUC7Z

Query Parallelism:

This topic shows detailed information about “Accounting - Query Parallelism”.

If a query exploits query CP (central processor) parallelism or sysplex query parallelism, several tasks (called parallel tasks) perform the work. For each of these tasks an accounting record is generated, which contains counters and timers pertinent to the work performed by the particular task. In addition, an accounting record is created that contains the details on nonparallel work within the thread as well as data related to parallel work.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Query Parallelism

The field labels shown in the following sample layout of “Accounting - Query Parallelism” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY PARALLELISM</td>
<td>QUERY PARALLELISM</td>
</tr>
<tr>
<td>AVERAGE</td>
<td>TOTAL</td>
</tr>
<tr>
<td>MAXIMUM DEGREE-ESTIMATED 0.00 0 MAXIMUM DEGREE-PLANNED 0.00 0 MAXIMUM DEGREE-EXECUTED N/A 0 MAXIMUM MEMBERS USED N/A 0 PARALLEL GROUPS EXECUTED 0.00 0 RAN AS PLANNED 0.00 0 RAN REDUCED-STOREAGE 0.00 0 RAN REDUCED-NEGOTIATION 0.00 0 SEQ-CURSOR 0.00 0 SEQ-NO ESA SORT 0.00 0 SEQ-NO BUFFER 0.00 0 SEQ-AUTONOMOUS PROC 0.00 0 SEQ-NEGOTIATION 0.00 0 ONE DB2-COORDINATOR=NO 0.00 0 ONE DB2-ISOLATION LEVEL 0.00 0 ONE DB2-DCL TABLE 0.00 0 MEMBER SKIPPED (%) N/C N/A DISABLED BY RLFI 0.00 0 REFORM PARAL-CONFIG 0.00 0 REFORM PARAL-NO BUF 0.00 0</td>
<td></td>
</tr>
</tbody>
</table>

MAXIMUM DEGREE-ESTIMATED

The maximum parallel-group estimated degree (DB2 field: QXMAXESTIDG). It is the bind time estimated degree based on the cost...
Query Parallelism

formula. If the parallel group contains a host variable or parameter marker, bind time will estimate the parallel-group degree based on a valid assumption value.

Field Name: AXMESTDG

MAXIMUM DEGREE-PLANNED

The maximum parallel-group planned degree (DB2 field: QXMAXPLANDG). It is the ideal parallel-group degree obtained at execution time after the host variable or parameter marker value is "plug-in" and before the buffer pool negotiation and the system negotiation are performed.

Field Name: AXMLPLNDG

MAXIMUM DEGREE-EXECUTED

The maximum degree of parallelism executed among all parallel groups to indicate the extent to which queries were processed in parallel.

Field Name: QXMAXDEG

MAXIMUM MEMBERS USED

The maximum number of DB2 members that participated in the processing of a query.

Field Name: AMAXMEMB

PARALLEL GROUPS EXECUTED

The total number of parallel groups executed.

Field Name: QXTOTGRP

RAN AS PLANNED

The total number of parallel groups that executed in the planned parallel degree. This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Field Name: QXNORGRP

RAN REDUCED-Storage

The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool.

The exception field name is QXREDGRP.

Background and Tuning Information

If this field is not 0, increase the size of the current buffer pool using the ALTER BUFFERPOOL command or use the ALTER TABLESPACE command to assign table spaces accessed by this query to a different buffer pool.

Field Name: QXREDGRP

This is an exception field.

RAN REDUCED-NEGOTIATION

The number of parallel-group degrees that is reduced because of the system negotiation result of the system stress level (DB2 field: QXSTOREDGRP).

Field Name: AXREDPGD
SEQ-CURSOR

The total number of parallel groups that fell back to sequential mode due to a cursor that can be used by UPDATE or DELETE.

Field Name: QXDEGCUR

SEQ-NO ESA SORT

The total number of parallel groups that fell back to sequential mode due to a lack of ESA sort support.

Field Name: QXDEGESA

SEQ-NO BUFFER

The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

The exception field name is QXDEGBUF.

Field Name: QXDEGBUF

SEQ-AUTONOMOUS PROC

The total number of parallel groups that fell back to sequential mode under an autonomous procedure.

Field Name: QXDEGAT

SEQ-NEGOTIATION

The number of parallel groups is degenerated to sequential because of the system negotiation result of system stress level (DB2 field: QXSTODGNGRP).

Field Name: AXDEGPGD

ONE DB2-COORDINATOR = NO

The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Field Name: QXCOORNO

ONE DB2-ISOLATION LEVEL

The total number of parallel groups executed on a single DB2 subsystem due to repeatable-read or read-stability isolation.

Field Name: QXISORR

ONE DB2-DCL TABLE

The number of parallel groups in a query block that were downgraded to CPU parallelism because they referenced a UDF and a declared temporary table was detected at execution time.

DB2 enforces execution on a single DB2 (CPU parallelism), in this instance, because it cannot determine at incremental bind time for the statement whether the UDF will reference the declared temporary table. Other parallel groups in the same statement are not necessarily downgraded.

Field Name: QXDEGDIT
MEMBER SKIPPED (%)

The percentage of parallel groups that were not distributed over the data sharing group, as originally planned at bind time, because one or more DB2 members did not have enough buffer pool storage. This only applies to parallel groups that were intended to run in sysplex query parallelism.

This percentage is to indicate a lack of buffers at a member. It is only increased when the buffer pool is defined to allow for parallelism. For example, if VPXPEQT=0 on an assistant, DB2 does not send parallel work there, and the percentage is not increased.

Field Name: AXXCRAT

DISABLED BY RLF (Report)

The number of threads where at least one dynamic SQL statement was disabled by the Resource Limit Facility (RLF).

Field Name: ADPARDNR

DISABLED BY RLF (Trace)

Indicates whether Query Parallelism is disabled by the Resource Limit Facility (RLF) for at least one dynamic SELECT statement in this thread.

Field Name: ADPARDIS

REFORM PARAL-CONFIG

The total number of parallel groups where DB2 reformulated the parallel portion of the access path because of a change in the number of active members, or because of a change of processor models on which they run, from bind time to run time. This counter is incremented only on the parallelism coordinator at run time.

Field Name: QXREPOP1

REFORM PARAL-NO BUF

The total number of parallel groups in which DB2 reformulated the parallel portion of the access path because there were insufficient buffer-pool resources. This counter is incremented only at the parallelism coordinator at run time.

Field Name: QXREPOP2

Resource Limit Facility:

This topic shows detailed information about “Accounting - Resource Limit Facility”.

This block shows information about the Resource Limit Facility (RLF), which prevents dynamic manipulative SQL statements from exceeding specified time limits.

The following example shows both layouts, the report layout followed by the trace layout.

Accounting - Resource Limit Facility

The field labels shown in the following sample layout of “Accounting - Resource Limit Facility” are described in the following section.
RESOURCE LIMIT TYPE (TYPE)

The resource limit type. This is taken from QTXAPREC and can be:

- AUTHID/PLAN
- AUTHID ANY PLAN
- PLAN ANY AUTHID
- BLANK AUTHID & PLAN
- INSTALL NO ENTRY
- INSTALL I/O ERROR
- NO LIMIT - SYSADM/SYSOPR
- AUTHID/COLLECTION/PACKAGE
- AUTHID ANY PACKAGE
- AUTHID ANY COLLECTION
- AUTHID ANY PACKAGE/COLLECTION
- PACKAGE/COLLECTION ANY AUTHID
- ANY AUTHID/PACKAGE
- ANY AUTHID/COLLECTION
- ANY AUTHID/PACKAGE/COLLECTION

The following can be reported:

INFINITE LIMIT

Reported when QTXAPREC has any value except NO LIMIT - SYSADM/SYSOPR and QTXAILMT is on.

NO RUN OR ZERO LIMIT

Reported when QTXANRUN is on.

Field Name: ADRLFTYP

#OCCUR

The number of RLF occurrences.

Field Name: ASRLFOCC

AVERAGE CPU SECONDS

The number of CPU seconds used.

Field Name: ADRLFCPU

HIGHEST CPU SECONDS

The highest CPU seconds used in a successful DB2 internal call rather than in a single SQL call. Because there are usually many DB2 calls for each SQL call, this value could be quite small compared to the total CPU time used in the SQL call.

Only times for successful DB2 calls are used to determine the value of this field.

---

Chapter 6. Batch reporting  3319
Resource Limit Facility

Field Name: ADRLFMAX

**TABLE ID**

The identifier of the resource limit specification table.

Field Name: QTXARLID

**SERV.UNITs**

The maximum number of CPU service units to be used. Normally, the value is not 0 if the RES LIMIT TYPE is LIMIT. A value of 0 indicates no limit.

Field Name: QTXASLMT

**RID List:**

This topic shows detailed information about “Accounting - RID List”.

This block shows information about the Record identifier (RID) list.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - RID List**

The field labels shown in the following sample layout of “Accounting - RID List” are described in the following section.

<table>
<thead>
<tr>
<th>Report: RID LIST</th>
<th>AVERAGE</th>
<th>TOTAL</th>

<tr>
<td>SKIPPED-INDEX KNOWN</td>
<td>0</td>
</tr>
</tbody>
</table>

**USED**

The number of times RID list (also called RID pool) processing is used.

During RID (RECORD ID) list processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

This field is incremented once for a given table access when RID list processing is used for index access with list prefetch, for multiple index access, or for both. For multiple index access, if a final RID list is obtained through ANDing and ORing of RID lists, the counter is incremented once, even if not all indexes were used by the RIDs in the multiple index access.

**Background and Tuning Information**
A nonzero value in this field indicates that DB2 has used list prefetch. If this is the case, check the access path selection.

**Field Name:** QXMIAP

This is an *exception* field.

**FAIL-NO STORAGE**

The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID list process involving one index (single index access with list prefetch) or multiple indexes (multiple index access).

This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.

**Field Name:** QXNSMIAP

This is an *exception* field.

**FAIL-LIMIT EXCEEDED (FAIL-LIMIT EXC.)**

The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

For index access with list prefetch (single index), this field can only be incremented during RID list retrieval. For multiple index access, this field can be incremented during RID list retrieval, ANDing, and ORing. This counter reflects the number of times internal limits or threshold values were exceeded for the RID lists obtained directly from an index as well as for RID lists derived during the ANDing and ORing process.

**Background and Tuning Information**

Before you increase the RID list storage size, investigate the cause of the failure using the statistics record or the performance trace. You can specify the size for the RID list on the DB2 installation panel DSNTIPC.

**Field Name:** QXMRMIAP

This is an *exception* field.

**INTERRUPTED-NO STORAGE**

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXHJINCS

**INTERRUPTED-LIMIT EXC.**

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXHJINCT

**OVERFLOWED-NO STORAGE**

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs.
RID List

Field Name: QXWFRIDS

OVERFLOWED-LIMIT EXC.

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits.

Field Name: QXWFRIDT

SKIPPED-INDEX KNOWN

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

Field Name: QXRSMIAP

ROWID:

This topic shows detailed information about “Accounting - ROWID”.

This block shows information about the row identifier (ROWID).

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - ROWID

The field labels shown in the following sample layout of “Accounting - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>Report</th>
<th>Trace</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID</td>
<td></td>
</tr>
<tr>
<td>Average</td>
<td>TOTAL</td>
</tr>
<tr>
<td>TOTAL</td>
<td></td>
</tr>
</tbody>
</table>

| DIRECT ACCESS | 0.00 | 0 | DIR ACCESS | 0 |
| INDEX USED    | 0.00 | 0 | INDEX USED | 0 |
| TS SCAN USED  | 0.00 | 0 | TS SCAN    | 0 |

DIRECT ACCESS (DIR ACCESS)

The number of times that direct row access was successful.

Field Name: QXROIMAT

INDEX USED

The number of times that direct row access failed and an index was used to find a record.

Background and Tuning Information

This can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect.

Field Name: QXROIIDX

TS SCAN USED (TS SCAN)

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

Background and Tuning Information
Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. .... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK

Field Name: QXROITS

Service Units:

This topic shows detailed information about “Accounting - Service Units”.

This block shows class 1 and class 2 CPU times as service units.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Service Units

The field labels shown in the following sample layout of “Accounting - Service Units” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>ADSUCPU1</th>
</tr>
</thead>
</table>

**CLASS 1: CP CPU**

The class 1 CPU service units (in an application). It indicates:

- The TCB service units.
- The accumulated TCB service units for processing stored procedures if stored procedures are present.
- The accumulated CPU service units for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.

These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: ADSUCPU1
CLASS 1: CP CPU - AGENT

The class 1 TCB service units (in an application). This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUAGT1

CLASS 1: CP CPU - AGENT - NONNESTED

The TCB service units accumulated in nonnested activity.

Field Name: ADSUNN1

CLASS 1: CP CPU - AGENT - STORED PRC

The TCB service units accumulated in an application for stored procedures. This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUTCS1

CLASS 1: CP CPU - AGENT - UDF

The TCB service units accumulated in an application for UDF.

Field Name: ADSUTCU1

CLASS 1: CP CPU - AGENT - TRIGGER

The number of TCB service units accumulated in DB2 used while executing under control of a trigger.

Field Name: ADSUTCT2

CLASS 1: CP CPU - PAR.TASKS

The sum of the CPU service units of the parallel tasks running in an application. These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

Field Name: ADSUCPP1

CLASS 1: CP CPU - ELIG SECP

The accumulated CPU service units that ran on a standard CP for work eligible on an IBM specialty engine.

Field Name: ADSUZEL

CLASS 1: SE CPU

The sum of several accumulated CPU service units consumed while running on an IBM specialty engine in all environments. This field is derived from the TCB time and the conversion factor of the originating task. These service units are consumed when:

- Running stored procedure requests and triggers on the main application execution unit.
- Satisfying stored procedure requests processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM address space.
- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated CPU time used to satisfy UDF requests.
Note: All CPU service units of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: ADSUC1Z

CLASS 1: SE CPU - NONNESTED
The class 1 CPU service units for nonnested activity on the main application task consumed while running on an IBM specialty engine. These service units ignore the CPU time consumed when running stored procedure requests, or triggers on the main application execution unit on an IBM specialty engine.

Field Name: ADSUSEN1

CLASS 1: SE CPU - STORED PROC
The accumulated and consumed service units for stored procedures on an IBM specialty engine that consist of following parts:
- Service units processed in a DB2 stored procedure or WLM address space. SQL procedure service units are included if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Service units when running on the main application execution unit. As these stored procedures run entirely within DB2, this part of the service units counts for class 1 and class 2 time.

Field Name: ADSUSES1

CLASS 1: SE CPU - UDF
The accumulated CPU service units used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space while running on an IBM specialty engine.

Field Name: ADSUSEU1

CLASS 1: SE CPU - TRIGGER
The accumulated CPU service units consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: ADSUSETR

CLASS 1: SE CPU - PAR.TASKS
The sum of the CPU service units of the parallel tasks running in an application on an IBM specialty engine. These service units contain the nonnested and consumed service units for stored procedures, UDFs, and triggers.

Field Name: ADSUSEP1

CLASS 2: CP CPU
The class 2 service units (in DB2). It indicates:
- The TCB service units.
- The accumulated TCB service units for processing stored procedures if stored procedures are present.
- The accumulated CPU service units for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks produced by utilities.
These CPU service units do not include the service units that were consumed on an IBM specialty engine.

Field Name: ADSUCPU2

CLASS 2: CP CPU - AGENT

The class 2 TCB service units (in DB2). This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUAGT2

CLASS 2: CP CPU - AGENT - NONNESTED

The number of class 2 service units accumulated in nonnested activity.

Field Name: ADSUNN2

CLASS 2: CP CPU - AGENT - STORED PRC

The TCB service units accumulated in DB2 for stored procedures. This field is derived from the TCB time and the conversion factor of the originating task.

Field Name: ADSUTCS2

CLASS 2: CP CPU - AGENT - UDF

The TCB service units accumulated in DB2 for UDF.

Field Name: ADSUTCU2

CLASS 2: CP CPU - AGENT - TRIGGER

The number of TCB service units accumulated in DB2 used while executing under control of a trigger.

Field Name: ADSUTCT2

CLASS 2: CP CPU - PAR.TASKS

The sum of the CPU service units of the parallel tasks running in DB2. These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

These service units do not include service units consumed on an IBM specialty engine.

Field Name: ADSUCPP2

CLASS 2: CP CPU - ELIG ACCEL

The accumulated service units spent processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: ADSUAEC2

CLASS 2: SE CPU

The sum of the accumulated CPU service units consumed while running in DB2 on an IBM specialty engine due to CPU time spent:

- Nonnested on main application execution unit.
- On triggers on main application execution unit and nested tasks.
- Processing SQL statements issued by UDFs processed in a DB2 stored procedure or WLM address space.
- On stored procedures on main application execution unit and nested tasks processed in a DB2 stored procedure or WLM address space. SQL
procedure times are included if the SQL procedure was called on a
nested task and was not invoked by the main application execution unit.

Field Name: ADSUC2Z

CLASS 2: SE CPU - NONNESTED

The class 2 CPU service units for nonnested activity on the main
application task consumed while running on an IBM specialty engine.

Field Name: ADSUSEN2

CLASS 2: SE CPU - STORED PROC

The accumulated and consumed service units for stored procedures on an
IBM specialty engine that consist of following parts:

- Service units consumed in DB2, in a DB2 stored procedure, or WLM
  address space. SQL procedure service units are included if the SQL
  procedure was called on a nested task and was not invoked by the main
  application execution unit.
- Service units when running on the main application execution unit. As
  these stored procedures run entirely within DB2, this part of service
  units counts for class 1 and class 2 time.

Field Name: ADSUSES2

CLASS 2: SE CPU - UDF

The accumulated and consumed service units for stored procedures on an
IBM specialty engine that consist of following parts:

- Service units consumed in DB2, in a DB2 stored procedure, or WLM
  address space. SQL procedure service units are included if the SQL
  procedure was called on a nested task and was not invoked by the main
  application execution unit.
- Service units when running on the main application execution unit. As
  these stored procedures run entirely within DB2, this part of service
  units counts for class 1 and class 2 time.

This time is a subset of QWACSP_CLS1SE.

Field Name: ADSUSEU2

CLASS 2: SE CPU - TRIGGER

The accumulated CPU service units consumed on an IBM specialty engine
while running triggers on a nested task or on the main application
execution unit.

Field Name: ADSUSETR

CLASS 2: SE CPU - PAR.TASKS

The sum of the CPU service units of the parallel tasks running in DB2.
These service units contain the nonnested and consumed service units for
stored procedures, UDFs, and triggers.

Field Name: ADSUSEP2

CLASS 2: SE CPU - ELIG ACCEL

The accumulated service units consumed on an IBM specialty engine while
processing SQL in DB2 that may be eligible for execution on an accelerator.

Field Name: ADSUAES2
Stored Procedures

This topic shows detailed information about “Accounting - Stored Procedures”.

This block shows information about stored procedure.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Stored Procedures

The field labels shown in the following sample layout of “Accounting - Stored Procedures” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>STORED PROCEDURES</td>
<td>STORED PROC.</td>
</tr>
<tr>
<td>平均值</td>
<td>总值</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------</td>
</tr>
</tbody>
</table>

CALL STATEMENTS (CALL STMTS)

The number of SQL CALL statements executed.

**Field Name:** QXCALL

ABENDED

The number of times a stored procedure terminated abnormally.

**Field Name:** QXCALLAB

TIMED OUT

The number of times an SQL call timed out waiting to be scheduled.

**Field Name:** QXCALLTO

REJECTED

The number of times an SQL CALL statement was rejected due to the procedure being in the STOP ACTION(REJECT) state.

**Field Name:** QXCALLRJ

SQL DCL:

This topic shows detailed information about “Accounting - SQL DCL”.

This block shows information about SQL DCL (Data Control Language) declarations.

The following example applies to both, the report layout and the trace layout.

Accounting - SQL DCL

The field labels shown in the following sample layout of “Accounting - SQL DCL” are described in the following section.
### SQL DCL

<table>

#### SET CURR.PATH

The number of SET CURRENT PATH statements executed.

**Field Name:** QXSETPTH

#### SET CURR.PREC

...
SQL DCL

The number of SET CURRENT PRECISION statements executed.

Field Name: QXSETCPR

CONNECT TYPE 1
The number of CONNECT type 1 statements executed.

Field Name: QXCON1

CONNECT TYPE 2
The number of CONNECT type 2 statements executed.

Field Name: QXCON2

SET CONNECTION
The number of SET CONNECTION statements executed.

Field Name: QXSETCON

RELEASE
The number of RELEASE statements executed.

Field Name: QXREL

CALL
The number of SQL CALL statements executed.

Field Name: QXCALL

ASSOC LOCATORS
The number of SQL ASSOCIATE LOCATORS statements executed.

Field Name: QXALOCL

ALLOC CURSOR
The number of SQL ALLOCATE CURSOR statements executed.

Field Name: QXALOCC

HOLD LOCATOR
The number of HOLD LOCATOR statements executed.

Field Name: QXHLDLOC

FREE LOCATOR
The number of times a FREE LOCATOR statement was issued.

Field Name: QXFRELOC

DCL-ALL
The total number of DCL statements executed.

Field Name: ASCDCL

SQL DDL:

This topic shows detailed information about “Accounting - SQL DDL”.

This block shows information about SQL DDL (Data Definition Language) statements.

The following example applies to both, the report layout and the trace layout.
Accounting - SQL DDL

CREATE DATABASE
The number of CREATE DATABASE statements executed.
Field Name: QXCRDAB

CREATE STOGROUP
The number of CREATE STOGROUP statements executed.
Field Name: QXCRSTG

CREATE SYNONYM
The number of CREATE SYNONYM statements executed.
Field Name: QXCRSYN

CREATE VIEW
The number of CREATE VIEW statements executed.
Field Name: QXDEFCV

CREATE ALIAS
The number of CREATE ALIAS statements executed.
Field Name: QXCRALS

CREATE PROCEDURE
The number of CREATE PROCEDURE statements issued.
Field Name: QXCRPRO

CREATE FUNCTION
The number of CREATE FUNCTION statements executed.
Field Name: QXCRUDF

CREATE TRIGGER
The number of CREATE TRIGGER statements executed.
Field Name: QXCTRIG

CREATE DIST TYPE
The number of CREATE DISTINCT TYPE statements executed.
Field Name: QXCDIST

CREATE SEQUENCE
The number of CREATE SEQUENCE statements.
Field Name: QXCRESEQ

CREATE TRUST. CTX
The number of CREATE TRUSTED CONTEXT statements issued.
Field Name: QXCRCTX

CREATE ROLE
The number of CREATE ROLE statements executed.
Field Name: QXCRROL

CREATE MASK/PERM
The number of CREATE MASK and CREATE PERMISSION statements executed.

Field Name: QXCREMP

CREATE VARIABLE
The number of CREATE VARIABLE statements.

Field Name: QXCRTSV

TOTAL CREATE
The number of SQL CREATE statements executed.

Field Name: ASTOTCRT
This is an exception field.

DROP TABLE
The number of DROP TABLE statements executed.

Field Name: QXDRPTA
This is an exception field.

DROP INDEX
The number of DROP INDEX statements executed.

Field Name: QXDRRPIX
This is an exception field.

DROP TABLESPACE
The number of DROP TABLESPACE statements executed.

Field Name: QXDRPTS
This is an exception field.

DROP DATABASE
The number of DROP DATABASE statements executed.

Field Name: QXDRPDB
This is an exception field.

DROP STOGROUP
The number of DROP STOGROUP statements executed.

Field Name: QXDRPST
This is an exception field.

DROP SYNONYM
The number of DROP SYNONYM statements executed.

Field Name: QXDRPSY
This is an exception field.

DROP VIEW
The number of DROP VIEW statements executed.
sql ddl

Field Name: QXDRPVU
This is an exception field.

DROP ALIAS
The number of SQL DROP ALIAS statements executed.
Field Name: QXDRPAL
This is an exception field.

DROP PACKAGE
The number of SQL DROP PACKAGE statements executed.
Field Name: QXDRPPKG
This is an exception field.

DROP PROCEDURE
The number of DROP PROCEDURE statements executed.
Field Name: QXDRPPR

DROP FUNCTION
The number of DROP FUNCTION statements executed.
Field Name: QXDRPFN

DROP TRIGGER
The number of DROP TRIGGER statements executed.
Field Name: QXDRPTR

DROP DIST TYPE
The number of DROP DISTINCT TYPE statements executed.
Field Name: QXDDIST

DROP SEQUENCE
The number of DROP SEQUENCE statements.
Field Name: QXDROSEQ

DROP TRUST_CTX
The number of DROP TRUSTED CONTEXT statements issued.
Field Name: QXDROPCTX

DROP ROLE
The number of DROP ROLE statements issued.
Field Name: QXDRPROL

DROP MASK/PERM
The number of DROP MASK and DROP PERMISSION statements executed.
Field Name: QXDRPMP

DROP VARIABLE
The number of DROP VARIABLE statements.
Field Name: QXDRPSV
TOTAL DROP
The number of SQL DROP statements executed.
Field Name: ASTOTDRP
This is an exception field.

ALTER TABLE
The number of ALTER TABLE statements executed.
Field Name: QXALTTA
This is an exception field.

ALTER INDEX
The number of ALTER INDEX statements executed.
Field Name: QXALTIX
This is an exception field.

ALTER TABLESPACE
The number of ALTER TABLESPACE statements executed.
Field Name: QXALTTS
This is an exception field.

ALTER DATABASE
The number of ALTER DATABASE statements executed.
Field Name: QXALDAB
This is an exception field.

ALTER STOGROUP
The number of ALTER STOGROUP statements executed.
Field Name: QXALTST
This is an exception field.

ALTER VIEW
The number of ALTER VIEW statements issued.
Field Name: QXALT VW

ALTER PROCEDURE
The number of ALTER PROCEDURE statements executed.
Field Name: QXALPRO

ALTER FUNCTION
The number of ALTER FUNCTION statements executed.
Field Name: QXALUDF

ALTER SEQUENCE
The number of ALTER SEQUENCE statements.
Field Name: QXALTSEQ

ALTER TRUST. CTX
SQL DDL

The number of ALTER TRUSTED CONTEXT statements issued.

Field Name: QXALTCTX

ALTER ROLE

The number of ALTER JAR statements issued.

Field Name: QXALTJR

ALTER MASK/PERM

The number of ALTER MASK and ALTER PERMISSION statements executed.

Field Name: QXALTMP

TOTAL ALTER

The number of SQL ALTER statements executed.

Field Name: ASTOTALT

This is an exception field.

TRUNC TBL

The number of TRUNCATE TABLE statements issued.

Field Name: QXTRTBL

RENAME TBL

The number of RENAME TABLE statements executed.

Field Name: QXRNTAB

RENAME IX

The number of RENAME INDEX statements issued.

Field Name: QXRNXIX

COMMENT ON

The number of COMMENT ON statements executed.

Field Name: QXCMTON

LABEL ON

The number of LABEL ON statements executed.

Field Name: QXLABON

SQL DML:

This topic shows detailed information about “Accounting - SQL DML”.

This block shows information about SQL DML (Data Manipulation Language) statements.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - SQL DML

The field labels shown in the following sample layout of “Accounting - SQL DML” are described in the following section.
### SQL DML

### SELECT

The number of SQL SELECT statements executed.

**Field Name:** QXSELECT

### INSERT

The number of INSERT statements executed.

**Field Name:** QXINSRT

### INSERT - ROWS

The number of rows inserted (DB2 field: QXRWSINSRTD).

**Field Name:** ARWINSRT

### UPDATE

The number of UPDATE statements executed.

**Field Name:** QXUPDTE

### UPDATE - ROWS

The number of rows updated (DB2 field: QXRWSUPDTD).

**Field Name:** ARWUPDAT

### MERGE

The number of times a MERGE statement was executed.

**Field Name:** QXMERGE

### DELETE

The number of DELETE statements executed.

**Field Name:** QXDELETE

### DELETE - ROWS

The number of rows deleted (DB2 field: QXRWSDELETED).

**Field Name:** ARWDELETE

### DESCRIBE
SQL DML

The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXDESC

DESC.TBL

The number of DESCRIBE TABLE statements executed.

Field Name: QXDSCRTB

PREPARE

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

OPEN

The number of OPEN statements executed.

Field Name: QXOPEN

FETCH

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

FETCH - ROWS

The number of rows fetched (DB2 field: QXRWSFETCHD).

Field Name: ARWFETCH

CLOSE

The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXCLOSE

DML-ALL

The total number of SQL DML statements executed.

Field Name: ASCDML

Termination - Abnormal:

This topic shows detailed information about “Accounting - Termination - Abnormal”.

This block shows a report for abnormal termination.

Accounting - Termination - Abnormal

The field labels shown in the following sample layout of “Accounting - Termination - Abnormal” are described in the following section.
Termination - Abnormal

<table>
<thead>
<tr>
<th>ABNORMAL TERM.</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------------</td>
<td>-------</td>
</tr>
<tr>
<td>APPL.PROGR. ABEND</td>
<td>0</td>
</tr>
<tr>
<td>END OF MEMORY</td>
<td>0</td>
</tr>
<tr>
<td>RESOL.IN DOUBT</td>
<td>0</td>
</tr>
<tr>
<td>CANCEL FORCE</td>
<td>0</td>
</tr>
</tbody>
</table>

APPL.PROGR. ABEND
The number of abnormal terminations due to an application program abend.

Field Name: ASATAPAB

END OF MEMORY
The number of abnormal terminations due to an end of memory. For example, accounting was invoked for an agent that was executing in an address space that experienced an abnormal end of memory.

Field Name: ASATENDM

RESOL.IN DOUBT
The number of abnormal terminations due to a resolve indoubt. For example, the recovery manager issued recover indoubt for a dependent thread that had not yet gone through end-of-task processing.

Field Name: ASATRIND

CANCEL FORCE
The number of abnormal terminations due to a stop force. For example, accounting was invoked for an agent that was executing when a -STOP DB2 MODE(FORCE) command was issued.

Field Name: ASATCANF

Termination - In Doubt:
This topic shows detailed information about “Accounting - Termination - In Doubt”.

This block shows a report for in-doubt termination.

Accounting - Termination - In Doubt
The field labels shown in the following sample layout of “Accounting - Termination - In Doubt” are described in the following section.

<table>
<thead>
<tr>
<th>IN DOUBT</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------</td>
<td>-------</td>
</tr>
<tr>
<td>APPL.PGM ABEND</td>
<td>0</td>
</tr>
<tr>
<td>END OF MEMORY</td>
<td>0</td>
</tr>
<tr>
<td>END OF TASK</td>
<td>0</td>
</tr>
<tr>
<td>CANCEL FORCE</td>
<td>0</td>
</tr>
</tbody>
</table>

APPL.PGM ABEND
The number of work units indoubt due to an application program abend. The agent was indoubt when it abended.

Field Name: ASIDAPAB

END OF MEMORY
**Termination - In Doubt**

The number of work units indoubt due to an end of memory. For example, accounting was invoked for an agent that was indoubt when the address space in which it was executing experienced an abnormal end of memory.

**Field Name:** ASIDENDM

**END OF TASK**

The number of work units indoubt due to an end of task.

**Field Name:** ASIDENDT

**CANCEL FORCE**

The number of work units indoubt due to a stop force. For example, accounting was invoked for an agent that was indoubt when a -STOP DB2 MODE(FORCE) command was issued.

**Field Name:** ASIDCANF

*Termination - Normal:*

This topic shows detailed information about “Accounting - Termination - Normal”.

This block shows a report for normal termination.

**Accounting - Termination - Normal**

The field labels shown in the following sample layout of “Accounting - Termination - Normal” are described in the following section.

<table>
<thead>
<tr>
<th>NORMAL TERM.</th>
<th>AVERAGE</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW USER</td>
<td>0.00</td>
<td>0</td>

<tr>
<td>BLOCK STOR THR</td>
<td>0.00</td>
<td>0</td>
</tr>
<tr>
<td>STALENESS THR</td>
<td>0.00</td>
<td>0</td>
</tr>
</tbody>
</table>

**NEW USER**

The number of normal terminations due to a new user: either the authorization ID changed or there was a signon with the same authorization ID (normal).

**Field Name:** ASNTNEWU

**DEALLOCATION**

The number of normal terminations due to deallocation, which is a normal program termination.

**Field Name:** ASNTDEAL

**APPL.PROGR. END**

The number of normal terminations due to an application program end: the application program terminated without using DB2 protocols to end its connection to DB2. The agent did not abend so it is considered a normal termination.
Field Name: ASNTAPEN

RESIGNON
The number of normal terminations due to a resignon.

Field Name: ASNTRESI

DBAT INACTIVE
The number of normal terminations due to a DBAT becoming inactive.

Field Name: ASNTDBAT

TYPE2 INACTIVE
The number of times a DDF type 2 thread became inactive.

Field Name: ASNTDBA2

RRS COMMIT
The number of times a DB2 application using the RRS attach facility with accounting interval specified as COMMIT successfully committed a logical unit of work.

Field Name: ASRRSCOM

END USER THRESH
The number of times the threshold was reached for number of end user occurrences when data was accumulated by end user for DDF or RRSAF.

Field Name: ASNTTHEU

BLOCK STOR THR
The number of times the DB2 storage threshold for Accounting blocks was reached for data accumulated by end user for DDF or RRSAF.

Field Name: ASNTTHST

STALENESS THR
The number of times the threshold for the staleness was exceeded when data was accumulated by end user for DDF or RRSAF.

Field Name: ASNTTHSL

Times - Class 1 - Application Time:

This topic shows detailed information about “Accounting - Times - Class 1 - Application Time”.

This block shows information for the Application Time class 1.

The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Times - Class 1 - Application Time

The field labels shown in the following sample layout of “Accounting - Times - Class 1 - Application Time” are described in the following section.
ELAPSED TIME

The class 1 elapsed time of the allied agent.

Special Considerations:

- If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
- Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
- Elapsed time to process distributed requests is included for allied-distributed threads.
- This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADRECETT

This is an exception field.

ELAPSED TIME - NONNESTED

The class 1 elapsed time of the allied agent.

Special Considerations:

1. If the begin time equals zero, or if the end time minus begin time equals zero or is negative, N/C is shown.
2. Threads that can be reused, such as CICS protected threads or IMS/VS wait-for-input message regions, can include time during which the thread was inactive and waiting for work.
3. Elapsed time to process distributed requests is included for allied-distributed threads.
4. This time includes the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.

5. In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Field Name: ADNNNET1

**ELAPSED TIME - STORED PROC**

An accumulated and consumed time for stored procedures. It consists of the following parts:

- The total elapsed time spent by the allied agent in stored procedures. A stored procedure may initiate a trigger or invoke a user-defined function. The time spent for initiation or invocation is not included in this counter.
- Accumulated elapsed time consumed when running stored procedure requests on the main application execution unit. As these stored procedures run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: ADELTSP1

**ELAPSED TIME - UDF**

The total elapsed time spent in user-defined function (UDF) requests processed in a DB2 stored procedure or WLM address space. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time includes times executing SQL and times consumed executing user-defined functions on the main application execution unit.

A user-defined function may initiate a trigger or invoke a stored procedure. The time spent is not included in this counter.

Field Name: AWAELUD1

**ELAPSED TIME - TRIGGER**

The total elapsed time spent by the allied agent in triggers.

A trigger may invoke a stored procedure or a user-defined function. The time spent there is not included in this counter.

For triggers there is no distinction between class 1 and class 2 CPU time: all processing controlled by a trigger is within DB2.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: ADTRET

**CP CPU TIME**

The class 1 CPU time in an application. It indicates:

- The class 1 CPU time of the allied agent, which may include the accumulated class 1 TCB time for processing stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
In sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks that is related to the originating task.

In sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the SYSPLEX group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

Field Name: ADCPUT
This is an exception field.

CP CPU TIME - AGENT
It comprises the class 1 CPU time of the allied agent, which may include the accumulated class 1 CPU time for processing stored procedures, user-defined functions, and triggers if present.

CPU time for processing parallel tasks is not charged to this counter.

This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

Field Name: ADAGENT1
This is an exception field.

CP CPU TIME - AGENT - NONNESTED
The class 1 CPU time of the nonnested activity of the allied agent.

Field Name: ADNNEST1

CP CPU TIME - AGENT - STORED PRC
An accumulated and consumed time for stored procedures that consists of following parts:

- The CPU time accumulated in DB2 for processing SQL CALL statements in the stored procedures or WLM address space. This time is only calculated if accounting class 1 is active.
- The accumulated CPU time consumed when running stored procedure requests on the main application execution unit. This time does not include CPU time consumed on an IBM specialty engine. As these stored procedures run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: ADCPUSP1

CP CPU TIME - AGENT - UDF
The accumulated CPU time consumed executing user-defined functions. This time does not include CPU consumed on an IBM specialty engine. It consists of following parts:

- The accumulated CPU time used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space. This time is only calculated if accounting class 1 is active.
- The accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

Field Name: AWACPUD1
CP CPU TIME - AGENT - TRIGGER

The accumulated CPU time consumed while executing under the control of triggers.

For triggers there is no distinction between class 1 and class 2 CPU time. All processing controlled by a trigger is within DB2.

Field Name: ADTRCP

CP CPU TIME - PAR.TASKS

The sum of the CPU times of the parallel tasks running in an application. It can also include the accumulated class 1 CPU time for processing stored procedures, user-defined functions, and triggers if present.

These parallel tasks can be query CP, sysplex query parallel tasks, or parallel tasks produced by utilities. In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task.

This time does not include CPU time consumed on an IBM specialty engine.

CPU time for agent tasks is not charged to this counter.

Field Name: ADCPUPLL

SE CPU TIME

The sum of several accumulated CPU times consumed while running on an IBM specialty engine in all environments. These times are consumed when:

- Running stored procedure requests and triggers on the main application execution unit.
- Satisfying stored procedure requests processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- Satisfying UDF requests processed in a DB2 stored procedure or WLM address space.
- Running triggers on a nested task.
- Running parallel tasks in an application which contains the accumulated CPU time used to satisfy UDF requests.

Note: All CPU times of an IBM specialty engine (SE) that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: AWACC1Z

SE CPU TIME - NONNESTED

The class 1 CPU time for nonnested activity on the main application task consumed while running on an IBM specialty engine. This time ignores the CPU time that is consumed when running stored procedure requests, UDF requests, or any triggers on the main application execution unit on an IBM specialty engine.

Field Name: ADSENNC1

SE CPU TIME - STORED PROC
Times - Class 1 - Application Time

An accumulated and consumed time for stored procedures on an IBM specialty engine that consists of following parts:

- The time processed in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- The time when running on the main application execution unit. This part of time counts for class 1 and class 2 time, because these stored procedures run entirely within DB2.

Field Name: ADSESP1

SE CPU TIME - UDF

An accumulated and consumed time for user-defined functions on an IBM specialty engine that consists of following parts:

- The accumulated CPU time used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space.
- The accumulated CPU time consumed when running user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

Field Name: AWACSEU1

SE CPU TIME - TRIGGER

The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: AWACTRZ

SE CPU TIME - PAR.TASKS

The sum of the CPU times of the parallel tasks, or roll-up autonomous tasks that are running in an application on an IBM specialty engine.

It contains the accumulated CPU time that is used to satisfy UDF requests, which are processed in a DB2 stored procedure or WLM address space while running on an IBM specialty engine.

Field Name: ADSEPLL1

SUSPEND TIME

The amount of application suspension time spent outside DB2.

Field Name: ASUSTCL1

SUSPEND TIME - STORED PROC

The total elapsed waiting time for an available TCB before the stored procedure could be scheduled.

Field Name: QWACCAST

SUSPEND TIME - UDF

The total elapsed time spent waiting for an available TCB before the user-defined function could be scheduled.

Field Name: QWACUDST
**Times - Class 1 - Elapsed Time Distribution**

This topic shows detailed information about “Accounting - Times - Class 1 - Elapsed Time Distribution”.

The elapsed time distribution block shows the distribution of the task. For threads exploiting parallelism, only the nonparallel part is taken into account.

The following example applies to both, the report layout and the trace layout.

**Accounting - Times - Class 1 - Elapsed Time Distribution**

The field labels shown in the following sample layout of “Accounting - Times - Class 1 - Elapsed Time Distribution” are described in the following section.

**ELAPSED TIME DISTRIBUTION**

<table>
<thead>
<tr>
<th>Field</th>
<th>Distribution</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPL</td>
<td>&gt;= 92%</td>
</tr>
<tr>
<td>DB2</td>
<td>&gt;= 3%</td>
</tr>
<tr>
<td>SUSP</td>
<td>&gt;= 5%</td>
</tr>
</tbody>
</table>

**APPL**

The ratio of the elapsed application time, expressed as a percentage of the total elapsed time.

**Field Name:** ARATAPL

**DB2**

The ratio of the elapsed DB2 time, expressed as a percentage of the total elapsed time.

**Field Name:** ARATDB2

**SUSP**

The ratio of the DB2 suspension time, expressed as a percentage of the total elapsed time.

**Field Name:** ARATSUS

---

**Times - Class 2 - DB2 Time:**

This topic shows detailed information about “Accounting - Times - Class 2 - DB2 Time”.

This block shows information for DB2 class 2.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Times - Class 2 - DB2 Time**

The field labels shown in the following sample layout of “Accounting - Times - Class 2 - DB2 Time” are described in the following section.

**Report:**

</tbody>
</table>
ELAPSED TIME

The class 2 elapsed time of the allied agent accumulated in DB2.

Field Name: ADDB2ETT

This is an exception field.

ELAPSED TIME - NONNESTED

The class 2 elapsed time for nonnested activity accumulated in DB2 for the allied agent. This time does not include the time spent in DB2 processing SQL statements issued by stored procedures, user-defined functions, or triggers.

Special Considerations

- The time for most thread allocation and certain abend conditions is not reflected in this time.
- The elapsed time for distributed processing is included in the elapsed time of allied-distributed threads.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: QWACASC

ELAPSED TIME - STORED PROC

An accumulated and consumed time for stored procedures that consists of following parts:

- The total elapsed time that the allied agent spent when running SQL in the stored procedures or WLM address space. A stored procedure may initiate a trigger or invoke a user-defined function. This time is not included in this counter.
- Accumulated elapsed time consumed when running stored procedure requests on the main application execution unit. As these stored procedures run entirely within DB2, this time represents class 1 and class 2 time.
Field Name: ADELTSP2

ELAPSED TIME - UDF

The total elapsed time that is spent executing SQL using user-defined function (UDF) requests that are processed in a DB2 stored procedure or WLM address space. This time includes time required to connect and disconnect the UDF task. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time includes the elapsed time that is consumed when executing user-defined functions on the main application execution unit.

A user-defined function may initiate a trigger or invoke a stored procedure. Any time spent there is not included in this counter.

Field Name: AWAELUD2

ELAPSED TIME - TRIGGER

The total elapsed time spent by the allied agent in triggers.

A trigger may invoke a stored procedure or a user-defined function. The time spent there is not included in this counter.

For triggers there is no distinction between class 1 and class 2 CPU time: all processing controlled by a trigger is within DB2.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: ADTRET

CP CPU TIME

The class 2 CPU time (in DB2). It indicates:

- The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities.
- For batch reporting, in sysplex query parallelism, the individual CPU times are normalized by the conversion factor of the parallel tasks, related to the originating task.

For online monitoring, in sysplex query parallelism, only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included.

This CPU time does not include time that is consumed on an IBM specialty engine.

Field Name: ADDBCPUT

This is an exception field.

CP CPU TIME - AGENT

It comprises the class 2 CPU time of the allied agent. This time includes the accumulated class 2 CPU time for processing stored procedures, user-defined functions, and triggers, if present. CPU time for processing parallel tasks is not charged to this counter.
Times - Class 2 - DB2 Time

This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

**Field Name:** ADAGENT2

**CP CPU TIME - AGENT - NONNESTED**

The class 2 CPU time of the nonnested activity of the allied agent.

This value indicates the CPU time the allied agent spent in DB2 for nonnested activity. This time does not include the time for processing SQL statements issued by stored procedures, user-defined functions, or triggers.

**Special Considerations:**

1. For allied-distributed threads, this does not include the time used to process distributed SQL. For DBAT-distributed threads, this includes only processing at this location.
2. Most thread allocation and certain abend conditions are not included.
3. This time does not include the time for processing parallel tasks generated by utilities or in query CP or sysplex query parallelism.

**Field Name:** ADNNEST2

**CP CPU TIME - AGENT - STORED PRC**

An accumulated and consumed time for stored procedures that consists of the following information:

- The CPU time accumulated in DB2 for processing SQL statements issued by stored procedures processed in a DB2 stored procedure or WLM address space. This time is only calculated if accounting class 2 is active.
- In DB2 time needed to connect and disconnect the SP task for non-SQL stored procedures.
- SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.
- CPU time that is consumed when running stored procedure requests on the main application execution unit.

This time does not include the CPU time consumed on an IBM specialty engine.

**Field Name:** ADCPUSP2

**CP CPU TIME - AGENT - UDF**

The accumulated CPU time consumed executing user-defined functions. This time does not include CPU time consumed on an IBM specialty engine. It consists of following parts:

- The accumulated CPU time consumed in DB2 when processing SQL statements that were issued by UDFs in a DB2 stored procedure or WLM address space. This time also includes the DB2 time required to connect or disconnect the UDF task. It is only calculated if accounting class 2 is active.
- The accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

**Field Name:** AWACPUD2

**CP CPU TIME - AGENT - TRIGGER**
The accumulated CPU time consumed while executing under the control of triggers.

For triggers there is no distinction between class 1 and class 2 CPU time.
All processing controlled by a trigger is within DB2.

Field Name: ADTRCP

CP CPU TIME - PAR.TASKS
The sum of the CPU times of the parallel tasks running in DB2. These tasks can be query CP, sysplex query parallel tasks, parallel tasks produced by utilities, or rollup autonomous tasks.

In sysplex query parallelism, the accumulated time reflects only parallel tasks running on the same DB2 subsystem as the originating task.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: ADDBCPC2

SE CPU TIME
The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

Note: All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: AWACC2Z

SE CPU TIME - NONNESTED
The class 2 CPU time for nonnested activity on the main application task consumed while running on an IBM specialty engine.

Field Name: ADSENNC2

SE CPU TIME - STORED PROC
An accumulated and consumed time for stored procedures on an IBM specialty engine that consists of following parts:

• The time consumed in DB2 in a DB2 stored procedure or WLM address space. SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit.

• The time when running on the main application execution unit. This part of time counts for class 1 and class 2 time, because these stored procedures run entirely within DB2.

This time is a subset of QWACSP_CLS1SE.

Field Name: ADSESP2

SE CPU TIME - UDF
The accumulated and consumed time for user-defined functions on an IBM specialty engine that consists of following parts:

• The accumulated CPU time consumed in DB2 processing SQL statements issued by UDFs processed in a DB2 stored procedure or WLM address space. This time is a subset of QWACUDF_CLS1SE.
Times - Class 2 - DB2 Time

- The accumulated CPU time that is consumed when running user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within DB2.

  Field Name: AWACSEU2

SE CPU TIME - TRIGGER

The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

  Field Name: AWACTRZ

SE CPU TIME - PAR.TASKS

The sum of the CPU times of the parallel tasks, or roll-up autonomous task that are running in DB2 on an IBM specialty engine.

It contains the accumulated CPU time that is consumed in DB2 when processing SQL statements that are issued by UDFs processed in a DB2 stored procedure or WLM address space while running on an IBM specialty engine.

  Field Name: ADSEPLL2

SUSPEND TIME

The waiting time for all types of class 3 suspensions by the originating task and parallel tasks, if parallelism is employed.

  Field Name: ADTSUST

This is an exception field.

SUSPEND TIME - AGENT

The waiting time of the allied agent for all types of class 3 suspension
This counts class 3 suspension time within nested activity.
Suspension time of parallel tasks in query or utility parallelism is not included.

  Field Name: ADTCBCL3

This is an exception field.

SUSPEND TIME - PAR.TASKS

The sum of the suspension times spent for parallel tasks. These tasks can be query CP or sysplex query parallel tasks, parallel tasks produced by utilities, or roll-up autonomous tasks.

  Field Name: ADCPCL3T

NOT ACCOUNT.

The time not accounted in DB2. This time determines whether there is a large percentage of time that has not been captured within the DB2 accounting record and whether system monitoring tools (such as RMF) should be examined to determine the cause of a performance problem.

In query or utility parallelism, it is the unaccounted time of the originating task only.
Check the DB2 accounting class 2 elapsed time that is not recorded as class 2 CPU time or class 3 suspensions. The following list shows why DB2 Class 2 Not Accounted time can be significant:

- Too much detailed online tracing, or problems with vendor performance monitors. This situation is usually the primary cause of high not-accounted-for time on systems that are not CPU-constrained.
- Running in a very high CPU utilization environment and waiting for CPU cycles if DB2 work WLM service class goals are not set properly.
- Running in a high MVS paging environment and waiting for storage allocation.
- The IBM specialty engines are highly utilized and the SYS1.PARMLIB(IEAOPTxx) member has the following settings: IIIPHONORPRIORITY=NO and IFAPRONORPRIORITY=NO.
- Frequent gathering of data set statistics (SMF 46 Type 2 records) DD consolidation overhead (z/OS parm DDCONS=YES DETAIL).
- CF Lock Structure system managed DUPLEXing since DB2 is not informed about related suspensions waits.
- In very I/O intensive environments, the Media Manager might be running out of request blocks.
- Time spent waiting for parallel tasks to complete (when query parallelism is used for the query).
- HSM (Hierarchical Storage Management) data set recall is an asynchronous process.
- Waiting for requests to be returned from SNA DB2 Server.
- Data set open contention related to PCLOSET being too small.
- DB2 internal suspend and resume looping when several threads are waiting for the same resource.

**Field Name:** ADNOTACC

**DB2 ENT/EXIT**

The total number of DB2 entry and exit events processed by the allied address space to calculate the elapsed time in DB2 and the processor time.

This counter does not include the SQL entry and exit events processed by stored procedures.

**Field Name:** QWACARNA

This is an *exception* field.

**EN/EX-STPROC**

The number of SQL entry or exit events performed by stored procedures. This number is only calculated if accounting class 2 is active.

**Field Name:** QWACSPNE

**EN/EX-UDF**

The number of SQL entry/exit events performed by user-defined functions. This is only calculated if accounting class 2 is active.

**Field Name:** QWACUDNE
This topic shows detailed information about “Accounting - Times - Class 2 - Time Distribution”.

The class 2 time distribution block shows the distribution of the active-in-DB2 time, the not-accounted time, and the suspension time, of the originating task. For threads exploiting query parallelism, only the nonparallel part is taken into account.

The following example applies to both, the report layout and the trace layout.

**Accounting - Times - Class 2 - Time Distribution**

The field labels shown in the following sample layout of “Accounting - Times - Class 2 - Time Distribution” are described in the following section.

</table>

**Field Name: ARATCPU**

The ratio of the agent DB2 CPU time, expressed as a percentage of the DB2 elapsed time.

**Field Name: ARATCSE**

The ratio of the agent DB2 SE (IBM specialty engine) CPU time, expressed as a percentage of the DB2 elapsed time.

**Field Name: ARATNAC**

The ratio of the DB2 not accounted time, expressed as a percentage of the DB2 elapsed time.

**Field Name: ARATSUP**

The ratio of the agent DB2 suspension time, expressed as a percentage of the DB2 elapsed time.

**Accounting times - Class 3 - Suspensions:**

The accounting times report and trace shows information about class 3 suspensions.
Times - Class 3 - Suspensions

Times - Class 3 - Suspensions

LOCK/LATCH(DB2+IRLM) - AVERAGE TIME/ELAPSED TIME
The sum of the accumulated wait time due to local contention for locks and the accumulated wait time due to latch contention.

Field Name: AWTLOLA

LOCK/LATCH(DB2+IRLM) - AV.EVENT/EVENTS
The sum of the number of wait trace events processed for waits for local contention for locks and the number of wait trace events processed for waits for latch contention.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLLSUSC
This is an exception field.

IRLM LOCK+LATCH - AVERAGE TIME/ELAPSED TIME
The accumulated wait time because of local contention for locks. The term local contention is used to differentiate from global contention (which is reported in QWACAWTJ). Local contention does not require intersystem communication. The contention is detected and resolved entirely within this subsystem.

Field Name: QWACAWTL
This is an exception field.

IRLM LOCK+LATCH - AV.EVENT/EVENTS
The number of wait trace events processed for waits for local contention for locks.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLBSUSC

DB2 LATCH - AVERAGE TIME/ELAPSED TIME
The accumulated wait time because of latch contention.

Field Name: QWACAWLH

DB2 LATCH - AV.EVENT/EVENTS
The number of wait trace events processed for waits for latch contention.

Note: The internally defined field adjusts the original DB2 value. DB2 counts each event twice, one for the entry and one for the exit.

Field Name: ADLASUSC

SYNCHRON. I/O - AVERAGE TIME/ELAPSED TIME
The I/O elapsed time accumulated due to synchronous I/O suspensions. DB2 calculates this value by subtracting the store clock time when an agent begins waiting for a synchronous I/O from the time the agent is resumed.

Field Name: ADIOSUST

SYNCHRON. I/O - AV.EVENT/EVENTS
The total number of synchronous I/O suspensions.
Field Name: ADIOSUSC

DATABASE I/O - AVERAGE TIME/ELAPSED TIME
The accumulated I/O elapsed wait time for database I/O done under this thread. This field is for synchronous I/O only. It includes synchronous read and write I/O. This value is an average.

Field Name: QWACAWTI

DATABASE I/O - AVERAGE TIME/ELAPSED TIME
The number of wait trace events processed for waits for database I/O under this thread.

Field Name: ADIOARNE

READ CACHE HIT – AVERAGE TIME / ELAPSED TIME
The accumulated read I/O elapsed time where the requested data was found in the DASD subsystem cache.

Field Name: QWACAWTCD

READ CACHE HIT – AVERAGE TIME / ELAPSED TIME
The number of read I/O suspensions where the requested data was found in the DASD subsystem cache.

Field Name: QWACAWCD

LOG WRITE I/O - AVERAGE TIME/ELAPSED TIME
The accumulated wait time for log write I/O. This value is an average.

Field Name: QWACAWLG

LOG WRITE I/O - AVERAGE TIME/ELAPSED TIME
The number of wait trace events processed for waits for log write I/O. This value is an average.

Field Name: ADLWSUSC

OTHER READ I/O - AVERAGE TIME/ELAPSED TIME
The accumulated waiting time due to a read I/O that performed under a thread other than the one being reported. The time does not represent the total duration of the subject read I/O. It includes:
- Sequential prefetch
- List prefetch
- Dynamic Prefetch
- Synchronous read I/O performed by a thread other than the one being reported

Field Name: QWacaWTR

This is an exception field.

OTHER READ I/O - AVERAGE TIME/ELAPSED TIME
The total number of suspensions due to a read I/O performed under a thread other than the one being reported.

Field Name: ADARUSUSC

This is an exception field.
OTHER WRTE I/O - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to a write I/O that performed under a thread other than the one being reported. This time does not represent the total duration of the subject write I/O. It includes:

- An asynchronous write I/O
- A synchronous write I/O performed by a thread other than the one being reported
- Frequent system checkpoints and low settings for deferred write thresholds
- When updating a page that is being written, the first thread wait is captured under Other Write I/O
- Other concurrent threads on the same DB2 subsystem will encounter Page latch suspension.

Field Name: QWACAWTW

This is an exception field.

OTHER WRTE I/O - AV.EVENT/EVENTS

The total number of suspensions due to a write I/O performed under a thread other than the one being reported. It includes:

- An asynchronous write I/O
- A synchronous write I/O performed by a thread other than the one being reported.

Field Name: ADAWSUSC

This is an exception field.

SER.TASK SWTCH - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to a synchronous execution unit switching to DB2 services from the thread being reported. It includes:

- Open/close data set
- SYSLGRNG or SYSLGRNX update
- Commit phase 2
- Dataspace manager services
- Define data set
- Extend data set
- Delete data set
- Log I/Os for commit and abort processing

Special Considerations:

1. There are no service waits associated with commit phase 2 under read-only threads originating from CICS or IMS. There is a service wait for any thread doing commit phase 2 after an update.
2. There is no overlap between the elapsed time reported in this field and the other class 3 elapsed times.

Field Name: ADSTSUST

This is an exception field.

SER.TASK SWTCH - AV.EVENT/EVENTS

The total number of suspensions due to a synchronous execution unit switching to DB2 services from the thread being reported.
Field Name: ADSTSUSC

This is an exception field.

**UPDATE COMMIT - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time because of synchronous execution unit switch for DB2 Phase 2 commit, abort, or deallocation. This includes wait time for Phase 2 commit Log writes and database writes for LOB with LOG NO. For data sharing environment Page P-locks unlocks for updated pages and GBP writes.

Field Name: QWACAWTE

**UPDATE COMMIT - AVERAGE TIME/ELAPSED TIME**

The number of wait trace events processed for waits for synchronous execution unit switching for commit or abort.

This value is an average.

Field Name: ADSTARNNS

**OPEN/CLOSE - AVERAGE TIME/ELAPSED TIME**

Accumulated waiting time for a synchronous execution unit switch to the DB2 OPEN/CLOSE data set service for the HSM recall service.

This value is an average.

Field Name: QWAXOCSE

**OPEN/CLOSE - AVERAGE TIME/ELAPSED TIME**

The number of wait trace events processed for waits for synchronous execution unit switching to the open/close service.

This value is an average.

Field Name: ADOCSUSC

**SYSLGRNG REC - AVERAGE TIME/ELAPSED TIME**

Accumulated wait time for a synchronous execution unit switch to the DB2 SYSLGRNG recording service. This service is sometimes used for Level ID checking for downlevel detection.

This value is an average.

Field Name: QWAXSLSE

**SYSLGRNG REC - AVERAGE TIME/ELAPSED TIME**

The number of wait trace events processed for waits for synchronous execution unit switching to the SYSLGRNG recording service.

This value is an average.

Field Name: ADSLSUSC

**EXT/DEL/DEF - AVERAGE TIME/ELAPSED TIME**

Accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. This includes DEFINE DATA SET, EXTEND DATA SET, DELETE DATA SET, RESET DATA SET, and VSAM CATALOG ACCESS.

This value is an average.

Field Name: QWAXDSSE
EXT/DEL/DEF - AV.EVENT/EVENTS

The number of wait trace events processed for waits for synchronous execution unit switching to the data space manager service tasks.

This value is an average.

Field Name: ADDSSUSC

OTHER SERVICE - AVERAGE TIME/ELAPSED TIME

Could be due to a VSAM catalog update. In the distributed environment, it includes the waiting time for the response from the server system. Performance trace for IFCID 46 to 50, 170, and 171 provide more detailed information for analysis.

Field Name: QWAXOTSE

OTHER SERVICE - AV.EVENT/EVENTS

The number of wait trace events processed for waits for synchronous execution unit switching to other service tasks.

This value is an average.

Field Name: ADOTSUSC

ARC.LOG(QUIES) - AVERAGE TIME/ELAPSED TIME

The accumulated waiting time due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.

This time does not represent the time required to perform the entire command.

Field Name: QWAXALOG

This is an exception field.

ARC.LOG(QUIES) - AV.EVENT/EVENTS

The total number of suspensions due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.

This counter belongs to class 1 (not to class 3 like the rest of the fields in this section) but it is shown here to be adjacent to the archive log quiesce suspension time, which is in class 3.

Field Name: ADALSUSC

This is an exception field.

LOG READ - AVERAGE TIME/ELAPSED TIME

The accumulated wait time for:

- Archive Log reads
- Active Log reads
- Active Log prefetch reads
- Fast Log apply log reads

Field Name: QWAXAWARN

LOG READ - AV.EVENT/EVENTS

The number of wait trace events processed for archive reads, active reads, and active log prefetch reads.

Field Name: ADLRSUSC
This is an exception field.

**DRAIN LOCK - AVERAGE TIME/ELAPSED TIME**

The accumulated waiting time for a drain lock. This is the time the requester is suspended while waiting to acquire the drain lock.

**Field Name**: QWAXAWDR

This is an exception field.

**DRAIN LOCK - AV.EVENT/EVENTS**

The total number of suspensions due to drain lock processing.

**Field Name**: ADDRSUSC

This is an exception field.

**CLAIM RELEASE - AVERAGE TIME/ELAPSED TIME**

The accumulated waiting time for a drain waiting for claims to be released. After the drain lock is acquired, the drainer must wait for claim holders to release the object.

**Field Name**: QWAXAWCL

This is an exception field.

**CLAIM RELEASE - AV.EVENT/EVENTS**

The total number of suspensions until the claims are released.

**Field Name**: ADCMSUSC

This is an exception field.

**PAGE LATCH - AVERAGE TIME/ELAPSED TIME**

Page latch suspension could be due to concurrent threads that try to update a hot page that is frequently written because of a low deferred write threshold.

In the data sharing environment, within the same member, the first thread gets a P-lock (such as: Index leaf page P-Lock or P-Lock for Space map page or data page P-lock for Row level locking) during high INSERT activity. Performance trace for IFCID 226 and 227 provide more information for detailed analysis.

With a high number of concurrent threads, for subsequent threads in the same member for the same resource, contention is reported as encountering a page latch contention. Randomizing the Index key helps minimizing page latch contentions for the Index leaf page.

If the page latch is for a space map page and an incremental image copy is not used, use the DDL TRACKMOD NO option to avoid frequent updates to the space map page. The Member Cluster option reduces page latch contention for a space map page.

**Field Name**: QWACAWTP

**PAGE LATCH - AV.EVENT/EVENTS**

The total number of suspensions due to page latch contentions.

**Field Name**: ADPGSUSC

**NOTIFY MSGS - AVERAGE TIME/ELAPSED TIME**
The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when the database descriptors are changed due to DDL.

**Field Name:** QWACAWTG

**NOTIFY MSGS - AV.EVENT/EVENTS**

The number of suspensions caused by sending messages to other members in the data sharing group. This value is only calculated if accounting class 3 is active and DB2 is a member of a data sharing group.

**Field Name:** ADNOSUSC

**GLOBAL CONTENTION - AVERAGE TIME/ELAPSED TIME**

The total accumulated waiting time caused by the suspension of IRLM lock requests due to global lock contention in a data sharing environment that require intersystem communication to resolve.

Look at the Accounting section that shows Parent/Child/Other breakdown for the L-Lock and P-Lock Global contentions. Also look at the GBP Buffer Pool statistics Page P-Lock suspensions and negotiations category (Space map page / Data page / Index leaf page) in the Statistics report for the same time interval:

- If the majority of the negotiations are for the space map pages or data pages, the Member Cluster option can help.
- If the majority of the negotiations are for data pages, consider to change small tables with row level locking to page level locking with MAXROWS 1.
- If the majority of the negotiations are for Index leaf pages, consider adding more free space (PCTFREE / FREEPAGE) and/or minimizing the index key size for a unique or semi-unique multi-column index.

**Field Name:** ADGCSUST

**GLOBAL CONTENTION - AV.EVENT/EVENTS**

The number of suspensions caused by global lock contention. This value is only calculated if accounting class 3 is active and DB2 is a member of a data sharing group.

**Field Name:** ADGCSUSC

**COMMIT PH1 WRITE I/O - AVERAGE TIME/ELAPSED TIME**

The accumulated time waiting for phase 1 commit write I/O. An example for this suspension is LOB Table Space with LOG NO Phase 1 commit database synchronous write I/O processing.

**Field Name:** QWAXAWFPC

**COMMIT PH1 WRITE I/O - AV.EVENT/EVENTS**

The total number of wait trace events for commit phase 1 I/O.

**Field Name:** ADFCSUSC

**ASYNCH CF REQUESTS - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time for IXLCACHE and IXLFCOMP requests.

**Field Name:** QWAXIXLT

**ASYNCH CF REQUESTS - AV.EVENT/EVENTS**
The number of IXLCACHE and IXLFCOMP asynchronous requests.

**Field Name:** ADIXSUSC

**TCP/IP LOB XML - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time for TCP/IP LOB and XML (storing large object and XML) materialization.

**Field Name:** QWACALBW

**TCP/IP LOB XML - AV.EVENT/EVENTS**

The number of wait trace events processed for waits for TCP/IP LOB and XML materialization.

**Field Name:** ADLMSUSC

**ACCELERATOR - AVERAGE TIME/ELAPSED TIME**

The accumulated wait time for requests to an accelerator.

**Field Name:** QWACAACW

**ACCELERATOR - AV.EVENT/EVENTS**

The total number of suspensions due to a request to an accelerator.

**Field Name:** ADAASUSC

**AUTONOMOUS PROCEDURE - AVERAGE TIME/ELAPSED TIME**

The accumulated time waiting for autonomous procedures to complete.

**Field Name:** AATXSUST

**AUTONOMOUS PROCEDURE - AV.EVENT/EVENTS**

The number of autonomous procedures that were executed:

1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.

**Field Name:** AATXSUST

**PQ SYNCHRONIZATION - AVERAGE TIME/ELAPSED TIME**

The accumulated time waiting for parallel queries to synchronize between parent and child tasks.

**Field Name:** AWPQSST

**PQ SYNCHRONIZATION - AV.EVENT/EVENTS**

The number of times the parallel query processing had to suspend because it was waiting for the synchronization of parent or child.

**Field Name:** AWPQSSC

**LOB COMPRESSION - AVERAGE TIME/ELAPSED TIME**

The accumulated time waiting for a compression of DB2 large objects (LOB) (DB2 field QWAX_LOBCOMP_WAIT).

**Field Name:** AWLCSUST
LOB COMPRESSION - AVERAGE EVENT/EVENTS

The number of wait trace events processed for DB2 large object (LOB) compressions (DB2 field QWAX_LOBCOMP_COUNT).

**Field Name:** AWLCSUSC

FAST INSERT PIPE - AVERAGE TIME/ELAPSED TIME

The accumulated wait time for pipe wait (DB2 field QWAX_PIPE_WAIT).

**Field Name:** AWPISUST

FAST INSERT PIPE - AVERAGE EVENT/EVENTS

The number of wait trace events that were processed for pipe wait (DB2 field QWAX_PIPEWAIT_COUNT / 2).

**Field Name:** AWPISUSC

TOTAL CLASS 3 - AVERAGE TIME/ELAPSED TIME

The waiting time for all types of class 3 suspensions by the originating task and parallel tasks, if parallelism is employed.

**Field Name:** ADTSUST

This is an exception field.

TOTAL CLASS 3 - AVERAGE EVENT/EVENTS

The total number of class 3 suspensions.

**Field Name:** ADTSUSC

This is an exception field.

Times - Class 5 - IFI Time:

This topic shows detailed information about “Accounting - Times - Class 5 - IFI Time”.

This block shows information for the Instrumentation Facility Interface (IFI) class 5.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - Times - Class 5 - IFI Time**

The field labels shown in the following sample layout of “Accounting - Times - Class 5 - IFI Time” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVERAGE TIMES CL. 5 IFI (CL.5)</td>
<td>TIMES CLASS 5 IFI (CL.5)</td>
</tr>

<tr>
<td>LOG EXTRACT.</td>
<td>N/P</td>
</tr>
</tbody>
</table>

**ELAPSED TIME**

The accumulated elapsed time for processing IFI calls. This field is only calculated if accounting class 5 is active.

**Field Name:** QIFAAIET
CP CPU TIME

The accumulated CPU time spent processing IFI calls. This is the same as the TCB time (class 5).

This field is only calculated if accounting class 5 is active.

Field Name: QIAATT

This is an exception field.

DCAPT.DESCR.

The accumulated elapsed time for processing data capture describes. Data capture describes occur only during IFI read requests for IFCID 185. This time is a subset of the log extraction time.

Field Name: QIAAMBT

This is an exception field.

LOG EXTRACT.

The accumulated elapsed time for extracting log records for tables defined with DATA CAPTURE CHANGES. This time is a subset of the class 5 elapsed time.

Field Name: QIAAMLT

This is an exception field.

Times - Class 7 - CP CPU Distribution:

This topic shows detailed information about “Accounting - Times - Class 7 - CP CPU Distribution”.

This block shows the distribution of the class 7 CP CPU time among all packages.

The following example shows both layouts, first the report layout, followed by the trace layout.

Accounting - Times - Class 7 - CP CPU Distribution

The field labels shown in the following sample layout of “Accounting - Times - Class 7 - CP CPU Distribution” are described in the following section.

</tbody>
</table>
**PROGRAM NAME**

The program name (package ID or DBRM name).

In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

**Field Name:** QPACPKID

This is an exception field.

**CLASS 7 CP CPU TIME CONSUMERS**

The ratio of the class 7 CP CPU time, expressed as a percentage of the total class 7 CP CPU time of all programs.

**Field Name:** ARATCL7C

---

**Times - Class 7 - Elapsed Time Distribution:**

This topic shows detailed information about “Accounting - Times - Class 7 - Elapsed Time Distribution”.

This block shows the distribution of the class 7 elapsed time among all programs.

The following example shows both layouts, first the report layout, followed by the trace layout.

**Accounting - Times - Class 7 - Elapsed Time Distribution**

The field labels shown in the following sample layout of “Accounting - Times - Class 7 - Elapsed Time Distribution” are described in the following section.

**Report:**

```
+----------------+-------------------+-----------------+----------+
| PROGRAM NAME   | CLASS 7 ELAPSED   | TIME CONSUMERS  |         |
|                | TIME             |                 |         |
| DSNTEP2        | ==================+----------------+----------|
| *ROLLUP*       |                   |                 | 3%       |
+----------------+-------------------+-----------------+----------|
```

**Trace:**

```

| DSNTEP2        |                   |                 | 3%       |
| *ROLLUP*       |                   |                 | 97%      |
+----------------+-------------------+-----------------+----------+
```

---

**PROGRAM NAME**

The program name (package ID or DBRM name).
In the case of rollup data (Accounting data of DDF/RRSAF threads and parallel tasks accumulated by DB2), the following value is shown "ROLSUM".

Field Name: QPACPKID
This is an exception field.

CLASS 7 ELAPSED TIME CONSUMERS
The ratio of the class 7 elapsed time, expressed as a percentage of the total class 7 elapsed time of all programs.

Field Name: ARATCL7

Triggers:
This topic shows detailed information about “Accounting - Triggers”.
This block provides information about triggers.

For formatting reasons, OMEGAMON XE for DB2 PE shows different labels for report and trace. The following example shows both layouts, the report on the left, and the trace layout on the right.

Accounting - Triggers
The field labels shown in the following sample layout of “Accounting - Triggers” are described in the following section.

<table>
<thead>
<tr>
<th>Report:</th>
<th>Trace:</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRIGGERS</td>
<td>AVERAGE</td>
</tr>
<tr>
<td>STATEMENT TRIGGER</td>
<td>15.00</td>
</tr>
<tr>
<td>ROW TRIGGER</td>
<td>8.00</td>
</tr>
<tr>
<td>SQL ERROR OCCUR</td>
<td>0.00</td>
</tr>
</tbody>
</table>

STATEMENT TRIGGER (STMT TRIGGER)
The number of times a statement trigger was activated.

Field Name: QXSTTRG

ROW TRIGGER
The number of times a row trigger was activated.

Field Name: QXROWTRG

SQL ERROR OCCUR (SQL ERROR)
The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Field Name: QXTRGERR

Truncated Values:
This topic shows detailed information about “Accounting - Truncated Values”.

Chapter 6. Batch reporting  3367
OMEGAMON XE for DB2 PE can report values that are too long to fit in the space available in the report layout. When this happens, the value reported in the block is truncated. Truncated values are then listed at the end of each logical report unit, together with the full values.

The list of Truncated Values shows pairs of a truncated values (unique name) and its original full value (long name). This list can show pairs caused by long names of client end-user transaction names and workstation names. It shows the complete long name on several lines if required. A truncated value can consist of up to 32 characters, which is the length of the short name of an end-user transaction name.

The mapping between truncated and full values remains the same for multiple reports from the same input data. This mapping for multiple reports from different input data cannot be guaranteed.

The following example applies to both, the report layout and the trace layout.

**Accounting - Truncated Values**

The field labels shown in the following sample layout of “Accounting - Truncated Values” are described in the following section.

<table>
<thead>
<tr>
<th>TRUNCATED VALUE</th>
<th>FULL VALUE</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**User-Defined Functions:**

This topic shows detailed information about “Accounting - User-Defined Functions”.

This block shows information about user-defined functions.

The following example shows both layouts, the report on the left, and the trace layout on the right.

**Accounting - User-Defined Functions**

The field labels shown in the following sample layout of “Accounting - User-Defined Functions” are described in the following section.

<table>
<thead>
<tr>
<th>UDF</th>
<th>AVERAGE</th>
<th>Trace</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTED</td>
<td>0.00</td>
<td>EXECUTED</td>
<td>0</td>
</tr>
<tr>
<td>ABENDED</td>
<td>0.00</td>
<td>ABENDED</td>
<td>0</td>
</tr>
<tr>
<td>TIMED OUT</td>
<td>0.00</td>
<td>TIMED OUT</td>
<td>0</td>
</tr>
<tr>
<td>REJECTED</td>
<td>0.00</td>
<td>REJECTED</td>
<td>0</td>
</tr>
</tbody>
</table>
EXECUTED
The number of user-defined functions executed.
Field Name: QXCAUD

ABENDED
The number of times a user-defined function abended.
Field Name: QXCAUDAB

TIMED OUT
The number of times a user-defined function timed out while waiting to be scheduled.
Field Name: QXCAUDTO

REJECTED
The number of times a user-defined function was rejected.
Field Name: QXCAUDRJ

The Accounting Save-File Utility:

Use the Save-File utility to migrate and convert Accounting Save data sets into a format suitable for OMEGAMON for Db2 PE V5.4.0.

The function performed is specified in a parameter on the EXEC command.

Migrating Data Sets:

This topic describes how to migrate Accounting Save data sets created by OMEGAMON for Db2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON for Db2 PE V5.4.0.

To migrate Accounting Save data sets:
1. Create a VSAM data set for V520 or V530.
2. Define an OMEGAMON for Db2 PE V5.4.0 VSAM data set using IDCAMS as output.
3. Use the MIGRATE function of the Save-File utility to migrate the data sets of OMEGAMON for Db2 PE V5.2.0 or V5.3.0.
4. Restore the migrated VSAM data sets in V540 and compare the reports.

The RK02SAMP library provides the sample job DGOPJAMI, which you can modify to suit your installation.

Note:
• You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.
• To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
• Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.
• Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.
Converting Data Sets:

To store performance data in Performance Database tables or spreadsheets, you must first convert Accounting Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON for Db2 PE.

You can use the CONVERT function of the Accounting Save-File Utility to convert Accounting Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets. The RKO2SAMP library provides the sample job DGOPJACO, which you can modify to suit your installation.

You can also use the ACCOUNTING SAVE subcommand with the CONVERT option to convert and save reduced data into a sequential data set. The output of this subcommand option is a sequential data set, that is specified and requested in SYSIN. The data set attributes are:

**Organization**
- PS

**Record format**
- VB

**Record length**
- 9072

**Block size**
- 9076

For more information about the ACCOUNTING SAVE subcommand refer to [Command Reference](#).

The following list shows the types of records that are created by the CONVERT function (or CONVERT command option) and where to find their layout descriptions in the sample library RKO2SAMP:

- General data records (DGOADSGE)
- Buffer pool data records (DGOADSBU)
- Distributed Data Facility (DDF) data records (DGOADSDF)
- Group buffer pool records (DGOADSGP)
- Package records (DGOADSPK)
- Resource Limit Facility (RLF) records (DGOADSRF)
- Accelerator records (DGOADSXC)

For more information about the Spreadsheet Input-Data Generator refer to [Reporting User’s Guide](#).

Save-File Utility DD Statements:

This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.

**Input**

The DDNAME of the input data set. This can be an OMEGAMON for Db2 PE V5.2.0 or V5.3.0 Accounting SAVE data set for the MIGRATE function, or an
OMEGAMON for Db2 PE V5.4.0 Accounting VSAM Save data set for the CONVERT function.

Output

The DDNAME of the output data set.

For CONVERT, allocate the data set with the following characteristics:

RECFM
  VB
LRECL
  9072
BLKSIZE
  9076

Refer to “OMEGAMON for Db2 PE VSAM Data Sets” on page 4647 for details on how to specify the allocated data sets to migrate to OMEGAMON for Db2 PE V5.4.0.

DPMLOG

OMEGAMON for Db2 PE command processor messages and messages indicating exceptional processing conditions are written to DPMLOG. If DPMLOG is not specified, it is dynamically allocated to the SYSOUT message class of the job. Allocate the data set with the following attributes:

RECFM
  FBA
LRECL
  133
BLKSIZE
  6251

The Accounting File Data Set and Output Record:

The FILE subcommand formats DB2 Accounting records and writes them to sequential data sets suitable for use by the DB2 load utility. You can store unreduced Accounting data into the OMEGAMON for Db2 PE performance database. The performance database produces tailored reports using a reporting facility such as Query Management Facility (QMF).

You can also use the File data sets to generate CSV (comma-separated value) input-data. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables. For more information refer to Reporting User’s Guide.

FILE can also be used to produce data sets containing only exception records. The following record format types are available. Descriptions of the Accounting File data sets and the fields contained can be found in the RKO2SAMP library under the following names:

DGOADFGE
  General Accounting records
User-Defined Functions

DGOADFBU
Buffer pool records

DGOADFDF
DDF records

DGOADFGP
Group buffer pool records

DGOADFPK
Package records

DGOADFXC
Accelerator records

The output is a sequential data set containing information from the DB2 IFCID 003 and IFCID 239 records. The parallel records are contained in the originating record. The number of records in the output are as follows:
- One record for General Accounting data
- Separate records for each buffer pool used
- Separate records for each remote location participating in the distributed activity
- Separate records for each group buffer pool used
- Separate records for each package and DBRM executed
- Separate records for each accelerator used

Audit Report Set
These topics provide information about the Audit reports.

Note: A report can be ordered by identifiers in contrast to a trace. For an introduction to the Audit report set and general audit information refer to the Reporting User’s Guide.

The Audit Summary Reports:

The Audit summary reports present aggregated DB2 data. Data is accumulated and grouped by the specified OMEGAMON for Db2 PE identifiers.

The LEVEL subcommand option creates a basic summary report, which shows totals for the different audit types. Use the LEVEL and TYPE options to produce summary reports for the audit report types.

Summary Report - Basic and Field Descriptions:

To produce a basic summary report, use the AUDIT REPORT LEVEL(SUMMARY) command without any TYPE constraints.

You can generate a summary report as follows:
```
AUDIT
REPORT
LEVEL (SUMMARY)
```

Note: For bind events, specify the program name for PLANNNAME in ORDER, INCLUDE and EXCLUDE. For utility events, specify the utility name of the
PLANNAME in ORDER, INCLUDE, and EXCLUDE. The header of this summary report will, however, still show PLANNAME.

In group-scope reports, MEMBER and SUBSYSTEM are not shown.

Levels of accumulation (Audit summary report)

The Audit summary report gives the following levels of accumulation:

GROUP TOTAL
The group total is printed on group-scope reports when the member value changes.

SUBTOTAL
If you request ordering by three identifiers, a subtotal block of two lines is printed on the change of the second-level identifier when there is more than one third-level identifier reported under it.

The first line shows the string *SUBTOTAL* in the first column.

The second line shows the name of the second identifier in the first column and the calculated data in all other columns.

TOTAL
If you request ordering by two or three identifiers, a total block of two lines with all applicable data is printed on the change of the first-level identifier when there is more than one second-level identifier reported under it.

The first line shows the string *TOTAL* in the first column.

The second line shows the name of the first identifier in the first column, and the calculated data in all other columns.

GRAND TOTAL
A grand total block of two lines with all applicable data is printed for a location when there is more than one first-level identifier reported.

The first line shows the string *GRAND TOTAL* in the first column.

The second line shows the name of the member (in a member-scope report) or the group (in a group-scope report) in the first column, and the calculated data in all other columns.

Layout of a Member-Scope Audit Summary Report

Here is a sample layout of a Member-Scope Audit Summary report.

<table>
<thead>

</table>
Field description

The basic Audit summary report contains the following fields:

**OMEGAMON for Db2 PE identifiers**

The report can be sorted by up to five combinations of any three identifiers. These are printed in the first three columns from the left and indented in the sequence specified by ORDER.

The default is PRIMAUTH-PLANNAME.

For group-scope reports, MEMBER is automatically added as the last identifier.

The values printed in the following columns represent totals for each combination of the selected OMEGAMON for Db2 PE identifiers.

**TOTAL**
A total number of Audit events.

**AUTH FAILURE**
The total number of authorization failures (IFCID 140 records).

**GRANT/REVOKE**
The total number of authorization GRANTs or REVOKEs (IFCID 141).

**DDL ACCESS**
The total number of DDL operations against auditable DB2 tables (IFCID 142 records).

**DML READ ACCESS**
The total number of first READ attempts within a logical unit of work against auditable DB2 tables (IFCID 144 records).

**DML WRITE ACCESS**
The total number of first WRITE attempts against audited DB2 tables (IFCID 143 records).

**DML AT BIND**
The total number of statements referenced during a static or dynamic bind (IFCID 145) against auditable DB2 tables.

**AUTHID CHANGE**
The total number of initial AUTHID establishments, AUTHID changes, or attempted AUTHID changes (IFCID 055, 083, 087, and 169 records).

**UTILITY ACCESS**
The total number of times a utility was used to access a DB2 object (IFCID 024 records).

*Authorization Change Summary Report and Fields (AUTHCHG):*

This report presents all authorization change events according to the combination of OMEGAMON for Db2 PE identifiers specified.
Use the following command to generate an authorization change summary report.

```
AUDIT REPORT Level (SUMMARY) Type (AUTHCHG)
```

**Layout of a Member-Scope Audit Authorization Change Summary Report**

Here is an example of a member-scope Audit Authorization Change Summary report.

```
LOCATION: LOCATI_2

```

**Field description**

The authorization change summary report contains the following fields:

**OMEGAMON for Db2 PE Identifiers**

The identifiers define the order of the Audit data reported. Up to three OMEGAMON for Db2 PE identifiers are printed:

```
The default ORDER for this report is PRIMAUTH-PLANNAME-OBJECT, where OBJECT is the original authorization ID.
```

For group-scope reports, MEMBER is automatically added as the last.

**ORIGINAL AUTHID**

The original value of the authorization ID as passed to the IDENTIFY or SIGNON authorization exit.

```
When the input record is IFCID 055 or 169, the value is the ORIGINAL AUTHID from the DB2 correlation header.
```

**SET CURRENT SQLID**

The authorization changes due to a SET CURRENT SQLID request. The total number of IFCID 055 records for this set of identifiers.

**END OF IDENTIFY**

The authorization changes due to an identify request. The total number of IFCID 083 records for this set of identifiers.
END OF SIGNON
The authorization changes due to a signon. The total number of IFCID 087 records for this set of identifiers.

DISTRIBUTED TRANSLATION
The authorization changes due to distributed translation. The total number of IFCID 169 records for this set of identifiers.

TOTAL
All authorization changes. The total number of IFCIDs 55, 83, 87, and 169 for this set of identifiers.

Authorization Control Summary Report and Fields (AUTHCNTL):
This report presents all authorization control events according to the combination of OMEGAMON for Db2 PE identifiers specified.

Use the following command to generate an authorization control summary report.

AUDIT REPORT LEVEL (SUMMARY) TYPE (AUTHCNTL)

Layout of a Member-Scope Audit Authorization Control Summary Report
The layout of this report varies slightly depending if it is a member or group-scope report.

For group-scope reports:
- MEMBER and SUBSYSTEM are not shown on the page header
- MEMBER is not added to the identifiers specified.
- A GROUP TOTAL is shown when a member value changes.

Layout of a Group-Scope Audit Authorization Control Summary Report
Here is a sample layout of a Group-Scope Audit Authorization Control Summary report.
Field description

The authorization control summary report contains the following fields:

**OMEGAMON for Db2 PE Identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:
- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is automatically added as the last identifier.

**OBJECT TYPE**

The DB2 object type of the GRANT or REVOKE. Possible values are:
- TSPACE
- LOBTS
- TAB/VIEW

**GRANTS**

All grant operations.

**REVOKES**

All revoke operations.

**TOTAL**

All grant/revoke operations. The total number of IFCID 141 records for this set of identifiers.

*Authorization Failure Summary Report and Fields (AUTHFAIL):*

This report presents all authorization failure events according to the combination of OMEGAMON for Db2 PE identifiers you specified.

Use the following command to generate an authorization failure summary report.

```sql
AUDIT REPORT LEVEL (SUMMARY) TYPE (AUTHFAIL)
```

**Layout of a Member-Scope Audit Authorization Failure Summary Report**

The layout of the default member-scope authorization failure summary report, ordered by object type, source object, source owner, target object, and target owner within plan name within primary authorization ID, is shown in the following example.
Audit Report - Authorization Failure Summary

Layout of a Group-Scope Audit Authorization Failure Summary Report

Field description

The authorization failure summary report contains the following fields:

OMEGAMON for Db2 PE identifiers

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is automatically added as the last identifier.

PRIVILEGE

The privilege that was checked. Possible values are provided in the DB2 macro DSNDQW02.

OBJECT TYPE

The DB2 object type. Possible values are:

- BUFFER
  - Buffer Pool
- COLLECT
  - Collection
- DATABASE
  - Database
- DISTTYPE
  - Distinct Type
- FUNCTION
  - Function
- PACKAGE
  - Package
- SCHEMA
  - Schema
- PROCEDUR
  - Procedure
Audit Report - Authorization Failure Summary

APPLPLAN
Application Plan

LOBTS
Large Object Table Space

STOGROUP
Storage Group

TAB/VIEW
Table or View

USERAUTH
System privileges, such as SYSADM or SYSOPR

SEQUENCE
Sequence

SOURCE OBJECT OWNER
If the object type is USERAUTH and the privilege is CREATE ALIAS, this is the qualifier of the alias being created. N/A is printed when the privilege is any other value.

If the object type is not USERAUTH, this is the qualifier of the object against which the authorization was checked.

SOURCE OBJECT NAME
If the object type is USERAUTH and the privilege is CREATEALIAS, CREATEDBA, CREATEDBC, or CREATESG this is the name of the alias, or object being created. N/A is printed when the privilege has any other value.

If the object type is not USERAUTH, this is the name of the object against which the authorization was checked.

TARGET OBJECT OWNER
This is the qualifier of the object being created. It is valid when the Privilege is CREATE TABLE or CREATE INDEX. It is also valid for an authorization check against the following privileges:
- CREATE VIEW
- SELECT
- INSERT
- DELETE
- UPDATE

Otherwise N/A is printed.

TARGET OBJECT NAME
This is the qualifier of the object being created. It is valid when the Privilege is CREATE TABLE or CREATE INDEX. It is also valid for an authorization check against the following privileges:
- CREATE VIEW
- SELECT
- INSERT
- DELETE
- UPDATE

Otherwise N/A is printed.

TOTAL
All authorization failures. The total number of IFCID 140 records for this set of identifiers.
Audit Report - DML at Bind Summary

DML at Bind Access Summary Report and Fields (BIND):

This report presents all DML at bind access events according to the combination of OMEGAMON for Db2 PE identifiers specified.

Use the following command to generate a DML at bind access summary report.

```
AUDIT REPORT
   LEVEL (SUMMARY)
   TYPE (BIND)
```

Layout of a Member-Scope Audit DML at Bind Access Summary Report

For ORDER, INCLUDE, and EXCLUDE, the program name is used for PLANNAME.

```

*GRAND TOTAL*   16    16    32
```

Field description

The DML at bind access summary report contains the following fields:

**OMEGAMON for Db2 PE identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

**DATABASE**

Either the name of the database that contains the auditable DB2 table, or the internal DB2 identification (DBID) of the database that contains the auditable DB2 table.
Note: DATABASE is a repeating field and can have more than one entry on the report.

**TABLEID**

The object identifier (OBID) of the auditable DB2 table.

Note: TABLEID is a repeating field and can have more than one entry on the report.

**TOTAL**

All DML at bind events. The total number of IFCID 145 records for this set of identifiers.

**DDL Access Summary Report and Fields (DDL):**

This report presents all DDL access events according to the combination of OMEGAMON for Db2 PE identifiers specified.

Use the following command to generate a DDL access summary report.

```
AUDIT REPORT
LEVEL (SUMMARY)
TYPE (DDL)
```

Field description

The DDL access summary report contains the following fields:

**OMEGAMON for Db2 PE identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

**OBJECT OWNER**

The user identification of the owner of the audited object table accessed. It is blank for IFCID 271.

**OBJECT NAME**

The name of the accessed audited DB2 table, the ROW PERMISSION, or the COLUMN MASK objects that have been created, dropped, or altered.

**CREATE**

All create object operations.

**ALTER**

All create object operations.

**DROP**

All drop object operations.

**TOTAL**

All DDL access operations. The total number of IFCID 142 or IFCID 271 records for this set of identifiers.

**DML Access Summary Report and Fields (DML):**

This report presents all DML access events according to the combination of OMEGAMON for Db2 PE identifiers specified.

Use the following command to generate a DML access summary report.

```

Field description

The DML access summary report contains the following fields:

**OMEGAMON for Db2 PE Identifiers**

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:

- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

**DATABASE**

The name of the database that contains the auditable DB2 table. If the database name is unavailable, the decimal DBID is printed.

**PAGESET**

The name of the page set that contains the auditable DB2 table. If the page set name is unavailable, the decimal PSID is printed. If neither of these values is present, N/P is printed.

**TABLEID**

The object identifier (OBID) of the table, if applicable, associated with the access.
Audit Report - DML Access Summary (DML)

1ST READ
The total number of first read attempts within a logical unit of work against auditable DB2 tables.

1ST WRITE
The total number of first write attempts against audited DB2 tables.

TOTAL
All DML access operations. The total number of IFCID 143 and 144 records for this set of identifiers.

Utility Access Summary Report and Fields (UTILITY):

This presents all utility access events according to the combination of OMEGAMON for Db2 PE identifiers specified.

Use the following command to generate a utility access summary report.

```sql
AUDIT
REPORT
LEVEL (SUMMARY)
TYPE (UTILITY)
```

Note: For ORDER, INCLUDE and EXCLUDE, the utility name is used for PLANNAME.

Layout of a Member-Scope Audit Utility Access Summary Report

```

Field description

The utility access summary report contains the following fields:
OMEGAMON for Db2 PE Identifiers

The identifiers define the order of the Audit data reported. Up to three identifiers are printed.

The defaults are:
- For member-scope reports, PRIMAUTH-PLANNAME-OBJECT
- For group-scope reports, OBJECT

For group-scope reports, MEMBER is considered the last ORDER identifier and is automatically added as the second, third, or fourth identifier.

DATABASE

The name of the database that contains the auditable DB2 object or the decimal DBID of that database.

PAGESET

The name or the decimal PSID of the page set that contains the DB2 object.

TOTAL

All utility access operations. Total number of IFCID 024 records for this set of identifiers.

The Audit Detail Report and the Audit Trace:

Both the audit detail report and the audit trace show a detailed listing of all occurrences of the different audit types. The layout of the Audit report and trace is similar. The audit trace is sorted by timestamp, the audit detail report is sorted first by identifier, then by timestamp. Any combination of event types can be specified.

Use the following command to generate an audit detail report.

```
AUDIT REPORT LEVEL (DETAIL)
```

Use the following command to generate an audit trace.

```
AUDIT TRACE
```

Short, Unique, or Long Names or Strings

The following types of names or strings are used in this information:

**Short name or string**

A short name or short string is either the value of an original DB2 field if it less than or equal to the defined length of the field, or it is the abbreviation of a longer value which is populated in a field of varying length.

**Unique name or string**

A unique name or unique string is a generated string based on the short string and its length, with a right-adjusted #-sign and a sequence number. This sequence number depends on the amount of long fields found during processing, which have the same string prefix and length as the short string. For example:

```
WSNAME: IS-255-012345678#1
```
Audit Report - Utility Access Summary (UTILITY)

Long name or string
A long name or long string is the complete string populated in a field of varying length. This depends on the context where it is used.

Example of a Member-Scope Audit Detail Report and Trace (Type AUTHCNTL):

This section shows examples of a Member-Scope Audit Detail report and trace (Type AUTHCNTL).

Example of a Member-Scope Audit Detail Report (Type AUTHCNTL)

Chapter 6. Batch reporting

3389


Field Descriptions (Audit Detail Report and Audit Trace): This topic contains the description of the columns of the audit detail report and audit trace.

OMEGAMON for Db2 PE identifiers
The identifiers define the order of the Audit data reported. If the requester location differs from the local location, the report or trace shows REQLOC together with the appropriate name under the first column of identifiers.

The member name (MEMBER) is printed if you requested a group-scope report or trace.

TIMESTAMP
The time of the event.

TYPE
The type of event being reported. You can control which of the events is reported using TYPE with INCLUDE or EXCLUDE. Possible values are:

Type Description
AUTHCHG Authorization change.
AUTHCNTL Authorization control.
AUTHFAIL Authorization failure.
BIND Audited DML at bind access.
DDL Audited DDL access.
DML Audited DML access.
UTILITY Audited utility access.

DETAIL
Each event has its own specific detail. Your selection for the TYPE option determines which of the fields described on the following pages is printed.
Audit Report - Authorization Change Detail (Type AUTHCHG)

Authorization Change Detail (Type AUTHCHG):

The following sections list the various types of authorization changes that can be printed. They describe the fields if you select AUTHCHG. The types are sorted by IFCID.

Set Current SQLID (IFCID 055):

This topic provides a sample and the field description of the Authorization Change type of Set Current SQLID (IFCID 055).

Set Current SQLID (IFCID 055) - Authorization Change

This sample shows the layout for an authorization change type of Set Current SQLID (IFCID 055):

<table>
<thead>
<tr>
<th>TYPE</th>
<th>SET CURRENT SQLID</th>
<th>STATUS: SUCCESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREVIOUS SQLID</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG PREVIOUS SQLID THAT EXCEEDS THE LINE</td>
<td></td>
</tr>
<tr>
<td>NEW SQLID</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG NEW SQLID THAT EXCEEDS THE LINE</td>
<td></td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

**TYPE**   The kind of authorization change or establishment: SET CURRENT SQLID.

**STATUS**

The success or failure of the attempted authorization change. Possible values are:

- SUCCESS for a successful authorization change
- FAILURE for a failed attempt

*Note:* The SQL statement is always successful if the user has SYSADM authority.

*Derivation:* DB2 field QW0055ST

**PREVIOUS SQLID**

The initial value of the SQLID before execution of the request.

*Derivation:* DB2 field QW0055OI.

**NEW SQLID**

If the command completed successfully, the new value of the SQLID is shown. If the command did not complete successfully, the value of the attempted SQLID change is shown.

*Derivation:* DB2 field QW0055NI.

End of Identify (IFCID 083):

This topic provides a sample and the field description of the Authorization Change type of End of Identify (IFCID 083).

End of Identify (IFCID 083) - Authorization Change

This sample shows the layout for an authorization change type of End of Identify (IFCID 083):
Audit Report - Authorization Change Detail (Type AUTHCHG)

Field description

The fields are described in the following:

**TYPE** The kind of authorization change or establishment: END OF IDENTIFY.

**STATUS** The success or failure of the attempted authorization change. Possible values are:
- **SUCCESS** The access is permitted.
- **EXITFAIL** The access is denied by the authorization exit.
- **FAILURE** The access is denied by the security authorization facility or security system.

*Derivation:* DB2 field QW0083AD

**PREVIOUS AUTHID** The original value of the authorization ID, as passed to the IDENTIFY or SIGNON authorization exit.

*Derivation:* DB2 field QW0083OP

**CURRENT SQLID** The value of the authorization ID as set by the IDENTIFY or SIGNON authorization exit.

*Derivation:* DB2 field QW0083QD

**SECONDARY AUTHID** Lists the secondary authorization IDs set by the IDENTIFY or SIGNON authorization exit. If no secondary authorization IDs exist, this line is not printed. Secondary authorization IDs are printed in rows of five, up to a maximum of 49 rows (245 AUTHIDs).

*Derivation:* DB2 field QW0083SA

**End of Signon (IFCID 087):**

This topic provides a sample and the field description of the Authorization Change type of End of Signon (IFCID 087).

**End of Signon (IFCID 087) - Authorization Change**

This sample shows the layout for an authorization change type of End of Signon (IFCID 087):

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>END OF SIGNON</th>
<th>STATUS:</th>
<th>SUCCESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREV AUTHID:</td>
<td>XXASP09</td>
<td>NEW AUTHID:</td>
<td>XXASP09</td>
</tr>
<tr>
<td>SECONDARY AUTHID:</td>
<td>XXXASP09</td>
<td>XXASP11</td>
<td>XXASP26</td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

**TYPE** The kind of authorization change or establishment: END OF SIGNON.
STATUS
The success or failure of the attempted access. Possible values are:

SUCCESS
The access is permitted.

EXITFAIL
The access was denied by the signon authorization exit.

Derivation: DB2 field QW0087AD

PREV AUTHID
The original value of the authorization ID, as passed to the IDENTIFY or SIGNON authorization exit.

Derivation: DB2 field QW0087OP

NEW AUTHID
The value of the authorization ID as set by the IDENTIFY or SIGNON authorization exit.

Derivation: DB2 field QW0087QD

SECONDARY AUTHID
Lists the secondary authorization IDs set by the IDENTIFY or SIGNON authorization exits. If no secondary authorization IDs exist, this line is not printed. Secondary authorization IDs are printed in rows of five, up to a maximum of 49 rows (245 AUTHIDs).

Derivation: DB2 field QW0087SA

Outbound DDF Translation (IFCID 169):

This topic provides a sample and the field description of the Authorization Change type of Outbound DDF Translation (IFCID 169).

Outbound DDF Translation (IFCID 169) - Authorization Change

This sample shows the layout for an authorization change type of Outbound DDF Translation (IFCID 169):

<table>
<thead>
<tr>
<th>TYPE: OUTBOUND DDF TRANSLATION</th>
<th>REMOTE LU NAME: 'BLANK'</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREVIOUS AUTHID: PSYSAUTH</td>
<td>NEW AUTHID: NSYSAUTH</td>
</tr>
<tr>
<td>RESPOND LOCATION: RESPONDING LOCNM</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TYPE: OUTBOUND DDF TRANSLATION</th>
<th>REMOTE LU NAME: 'BLANK'</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESPOND LOCATION: RESPONDING LOCNM</td>
<td></td>
</tr>
<tr>
<td>DATABASE ALIAS: THIS IS AN EXAMPLE OF A LONG ALIAS NAME THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TYPE: OUTBOUND DDF TRANSLATION</th>
<th>REMOTE LU NAME: 'BLANK'</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREX. SYSAUTHID: PSYSAUTH</td>
<td>NEW SYSAUTHID: NSYSAUTH</td>
</tr>
<tr>
<td>RESPOND LOCATION: RESPONDING LOCNM</td>
<td></td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

TYPE  The kind of authorization change or establishment: OUTBOUND DDF TRANSLATION.

REMOTE LU NAME  The logical unit name of the DB2 subsystem.

Derivation: DB2 field QW0169LU
Audit Report - Authorization Change Detail (Type AUTHCHG)

PREVIOUS AUTHID
The authorization ID before translation.
Derivation: DB2 field QW0169AU

NEW AUTHID
The new value of the authorization ID.
Derivation: DB2 field QW0169NE

RESPOND LOCATION
The location name of the serving DB2 subsystem. For outbound translation and for inbound translation with AUTHIDs this field shows the responding location name.
Derivation: DB2 field QW0169LO

DATABASE ALIAS
The database alias name sent to the server.
Derivation: DB2 field QW0169AL

PREV. SYSAUTHID
The system authorization ID before translation.
Derivation: DB2 field QW0169AU

Inbound DDF Translation (IFCID 169):

This topic provides a sample and the field description of the Authorization Change type of Inbound DDF Translation (IFCID 169).

Inbound DDF Translation (IFCID 169) - Authorization Change

This sample shows the layout for an authorization change type of Inbound DDF Translation (IFCID 169):

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>INBOUND DDF TRANSLATION</th>
<th>REMOTE LU NAME:</th>
<th>'BLANK'</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREVIOUS AUTHID:</td>
<td>PSYSAUTH</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NEW AUTHID:</td>
<td>NSYSAUTH</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RESPOND LOCATION:</td>
<td>RESPONDING</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LOCAL LOCATION:</td>
<td>RESPONDING LOCNM</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LOCATION ALIAS:</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG LOCATION ALIAS NAME THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

TYPE The kind of authorization change or establishment: INBOUND DDF TRANSLATION.

REMOTE LU NAME The logical unit name of the DB2 subsystem.
Derivation: DB2 field QW0169LU

PREVIOUS AUTHID The authorization ID before translation.
Derivation: DB2 field QW0169AU

NEW AUTHID The new value of the authorization ID.
Derivation: DB2 field QW0169NE
RESPOND LOCATION
The location name of the serving DB2 subsystem. For outbound translation and for inbound translation with AUTHIDs this field shows the responding location name.

Derivation: DB2 field QW0169LO

LOCAL LOCATION
The location name of the serving DB2 subsystem. For inbound translation with location alias name this field shows the local location name.

Derivation: DB2 field QW0169LO

LOCATION ALIAS
For translation type inbound this field shows the location alias name received from the requester.

Derivation: DB2 field QW0169AL

Establish Trusted Context or Reuse Trusted Context (IFCID 269):

This topic provides a sample and the field description of the Authorization Change type of Establish Trusted Context or Reuse Trusted Context (IFCID 269).

Establish Trusted Context or Reuse Trusted Context (IFCID 269) - Authorization Change

This sample shows the layout for an authorization change type of Establish Trusted Context or Reuse Trusted Context (IFCID 269):

<table>
<thead>
<tr>
<th>TYPE: ESTABLISH TRUSTED CONTEXT</th>
<th>STATUS: SUCCESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT OWNER: ROLE</td>
<td>SQLCODE: 100</td>
</tr>
<tr>
<td>SECURITY LABEL: SECLABEL</td>
<td></td>
</tr>
<tr>
<td>CONTEXT NAME: THIS IS AN EXAMPLE OF A VERY LONG XXXXXXXXXXXXXXX NAME THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
<tr>
<td>CONTEXT ROLE: THIS IS AN EXAMPLE OF A VERY LONG CONTEXT ROLE THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
<tr>
<td>USER ROLE: THIS IS AN EXAMPLE OF A VERY LONG USER ROLE THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>

</tr>
<tr>
<td>SERVAUTH NAME: THIS IS AN EXAMPLE OF A VERY LONG SERVER AUTHENTICATION NAME THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
<tr>
<td>JOB NAME: THIS IS AN EXAMPLE OF A VERY LONG LOCAL JOB NAME THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
<tr>
<td>ENCRYPTION: THIS IS AN EXAMPLE OF A VERY LONG ENCRYPTION VALUE THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
<tr>
<td>TCP/IP USED: THIS IS AN EXAMPLE OF A VERY LONG USED TCP/IP ADDRESS THAT EXCEEDS THE OUTPUT LINE</td>
<td></td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

TYPE  The kind of authorization change or establishment: ESTABLISH TRUSTED CONTEXT.

STATUS

The status of the trusted connection:

SUCCESS  If a trusted connection was established or reused successfully.

FAILED or FAILURE  If a trusted connection failed, when it was tried to be established or reused.
If the status is neither SUCCESS nor FAILURE, the value itself is shown.

**Derivation**: DB2 field QW0269ST

**OBJECT OWNER**
The owner of objects created in the trusted context.

**SQLCODE**
The SQLCODE returned after executing the SQL statement.

**Derivation**: DB2 field QW0269SQ

**SECURITY LABEL**
The security label.

**Derivation**: DB2 field QW0269SL

**CONTEXT NAME**
The trusted context name.

**Derivation**: DB2 field QW0269TC

**CONTEXT ROLE**
The default role associated with the context.

**Derivation**: DB2 field QW0269RC

**USER ROLE**
The user role.

**Derivation**: DB2 field QW0269RU

**PREV. SYSAUTHID**
The system authorization ID that is used to establish the trusted connection.

**Derivation**: DB2 field QW0269SA

**REUSE AUTHID**
The authorization ID under which a trusted connection is reused.

**Derivation**: DB2 field QW0269RA

**SERVAUTH NAME**
The SERVAUTH name of the TCP/IP security zone.

**Derivation**: DB2 field QW0269SR

**JOB NAME**
The job name for a local application.

**Derivation**: DB2 field QW0269JN

**ENCRYPTION**
The encryption value.

**Derivation**: DB2 field QW0269EC

**TCP/IP USED**
The actual communication TCP/IP address used for connection.

**Derivation**: DB2 field QW0269AD

**KERBEROS** or **ENCRYPTED** (IFCID 319):

This topic provides a sample and the field description of the Authorization Change type of KERBEROS or ENCRYPTED (IFCID 319).
KERBEROS or ENCRYPTED (IFCID 319) - Authorization Change

This sample shows the layout for an authorization change type of KERBEROS or ENCRYPTED (IFCID 319):

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>KERBEROS or ENCRYPTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMS ADDR TYPE:</td>
<td>TCP/IP</td>
</tr>
<tr>
<td>IP ADDR:</td>
<td>00010203040506071819A1B1C1D1E1F</td>
</tr>
<tr>
<td>PORT:</td>
<td>1234</td>
</tr>
<tr>
<td>DERIVED LOCAL UID:</td>
<td>DERLOCID</td>
</tr>
<tr>
<td>CLIENT PRODUCT ID:</td>
<td>CLPRODID</td>
</tr>
<tr>
<td>PRINCIPAL NAME:</td>
<td>THIS IS AN EXAMPLE OF A VERY LONG REQUESTING KERBEROS NAME THAT EXCEEDS THE OUTPUT LINE</td>
</tr>
<tr>
<td>SECURITY MECHANISM:</td>
<td>UID Encrypt PW.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TYPE:</th>
<th>ENCRYPTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMS ADDR TYPE:</td>
<td>SNA</td>
</tr>
<tr>
<td>LU NAME:</td>
<td>LUN&gt;V9</td>
</tr>
<tr>
<td>DERIVED LOCAL UID:</td>
<td>DERLOCID</td>
</tr>
<tr>
<td>CLIENT PRODUCT ID:</td>
<td>CLPRODID</td>
</tr>
<tr>
<td>IP ADDR:</td>
<td>00010203040506071819A1B1C1D1E1F</td>
</tr>
<tr>
<td>PORT:</td>
<td>1234</td>
</tr>
<tr>
<td>SECURITY MECHANISM:</td>
<td>UID Encrypt PW.</td>
</tr>
</tbody>
</table>

Field description

The fields are described in the following:

**TYPE**  The type of security identity: KERBEROS or ENCRYPTED.

*Derivation*: DB2 field QW0319TY

**COMMS ADDR TYPE**

Type of communication address: SNA or TCP/IP.

*Derivation*: DB2 field QW0319CT

**IP ADDR**

If the type of the communication address is TCP/IP, it is the 16 byte hexadecimal (HLHLHLHLHLHLHLHLHLHLHLHLHLHLHL) IP address of the internal 128 bit format, where:

- \( H \) represents the high order half byte value
- \( L \) represents the low order half byte value

*Derivation*: DB2 field QW0319IPA

**PORT**

The internal port format in case of communication address type TCP/IP.

*Derivation*: DB2 field QW0319PRT

**DERIVED LOCAL UID**

Local user ID mapped by DB2.

*Derivation*: DB2 field QW0319US

**CLIENT PRODUCT ID**

The identification of the client product.

*Derivation*: DB2 field QW0319CP

**PRINCIPAL NAME**

The requesting principal name. This can be up to 256 characters and can contain lowercase characters.

*Derivation*: DB2 field QW0319D1
LU NAME
If the type of the communication address is SNA, it is the 8 byte logical unit name.

Derivation: DB2 field QW0319LUN

SECURITY MECHANISM
The security mechanism. Possible values are:
- UID Encrypt PW
- Encrypt UID PW
- Encrypt UID PW NewPW
- Encrypt UID Data
- Encrypt UID PW Data
- Encrypt UID PW NewPW
- Data Encrypt UID only

Derivation: DB2 field QW0319SM

Authorization Control Detail (Type AUTHCNTL):
This topic shows detailed information about “Authorization Control Detail (Type AUTHCNTL)”.

When you select AUTHCNTL, the data is retrieved from IFCID 141 or 361, and the following fields are printed:

For the GRANTOR (IFCID 141)
<table>
<thead>
<tr>
<th>GRANTOR: JUB</th>
<th>OWNER TYPE: ROLE</th>
<th>REASON: N/P</th>
<th>SQLCODE: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT TYPE:</td>
<td>TAB/VIEW</td>
<td>TEXT: GRANT</td>
<td>INSERT ON</td>
</tr>
<tr>
<td></td>
<td></td>
<td>TABLE JUB.AUDTB1 TO PUBLIC</td>
<td></td>
</tr>
</tbody>
</table>

GRANTOR or REVOKE

The authorization ID of the user who issued the GRANT or REVOKE.

This field is blank if the BY clause is used in a REVOKE statement.

OWNER TYPE
The authorization type of the owner. Possible values are:
- ROLE A role is used.
- PRIM/SECOND AUTHID

The user ID of the primary or the secondary authorization ID is used.

N/P Not present. A blank is shown in the performance database.

REASON
The reason why access was granted.

In the Audit report set this field is only valid for GRANTs. It indicates the authorization level of the grantor. For REVOKEs and unsuccessful GRANTs, N/A is printed.

Possible values are:
- PACKADMA (abbreviation for PACKADM ON ALL COLLECTIONS)
- DBCTRL
- DBADM
- SECADM
Audit Report - Authorization Control Detail (Type AUTHCNTL)

- ACCCTRL (abbreviation for ACCESSCTRL)
- SYSCTRL
- DBMAINT
- SYSOPR
- PACKADMS (abbreviation for PACKADM ON A SPECIFIC COLLECTION-ID)
- SYSADM

**SQLCODE**
The SQL return code from the GRANT or REVOKE operation.

**OBJECT TYPE**
The DB2 object type. Possible values are:

- BUFFER
  Buffer Pool
- COLLECT
  Collection
- DATABASE
  Database
- DISTTYPE
  Distinct Type
- FUNCTION
  Function
- PACKAGE
  Package
- SCHEMA
  Schema
- PROCEDUR
  Procedure
- APPLPLAN
  Application Plan
- LOBTS
  Large objects table space
- STOGROUP
  Storage Group
- TAB/VIEW
  Table or View
- USERAUTH
  System privileges, such as SYSADM or SYSOPR
- SEQUENCE
  Sequence
- ACEE
  Access control environment element
- ROW
  Row

**TEXT**
The SQL statement text associated with the GRANT or REVOKE. Long SQL text can be truncated.
Audit Report - Authorization Control Detail (Type AUTHCNTL)

For the authorization ID (AUTHID) (IFCID 361)

<table>
<thead>
<tr>
<th>AUTHCNTL AUTH TYPE:</th>
<th>SYSADM</th>
<th>OBJECT TYPE:</th>
<th>PACKAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIV CHECKED:</td>
<td>EXECUTE</td>
<td>SOURCE OBJECT QUALIFIER:</td>
<td>DSNTEP3</td>
</tr>
<tr>
<td>AUTHID:</td>
<td>SYSADM</td>
<td>NAME:</td>
<td>DSNTEP3</td>
</tr>
<tr>
<td>TARGET OBJECT QUALIFIER:</td>
<td>N/P</td>
<td>NAME:</td>
<td>N/P</td>
</tr>
<tr>
<td>OTHER OBJECT NAME:</td>
<td>N/P</td>
<td>TEXT:</td>
<td>N/P</td>
</tr>
</tbody>
</table>

Or ROLE instead of AUTHID:

| AUTH TYPE: | xxxxxxxxxxxxxxxxxx |
| PRIV CHECKED: | xxxxxxxxxxxxxxxxxx |
| ROLE: | xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

**AUTH TYPE**

The authority type.

Possible values are:

- SYSDBADM (System DBADM)
- DBCTRL
- DBADM
- SECADM
- ACCSCTRL (ACCESSCTRL)
- SYSADMI (Installation SYSADM)
- SQLADM
- SYSCTRL
- DBMAINT
- SYSOPR
- PACKADM
- SYSOPRI (Installation SYSOPR)
- SYSADM
- DATAACCESS (DATAACCESS)
- USER

**PRIV CHECKED**

The privilege that was checked. Possible values are provided in the DB2 macro DSNQW05.

**OBJECT TYPE**

The DB2 object type.

Possible values are:

- ACEE
AUTHORID or ROLE
The authorization ID or the role that has the authority.

SOURCE OBJECT - QUALIFIER
The source object qualifier or owner.

SOURCE OBJECT - NAME
The source object name.

TARGET OBJECT - QUALIFIER
The target object qualifier or owner.

TARGET OBJECT - NAME
The target object name.

OTHER OBJECT - NAME
The other object name or subsystem parameter.

TEXT
The SQL statement (truncated at 4000 bytes).

Authorization Failure Detail (Type AUTHFAIL):
This topic shows detailed information about “Authorization Failure Detail (Type AUTHFAIL)”.

When you select AUTHFAIL, the data is retrieved from IFCID 140, and the following fields are printed:

<table>
<thead>
<tr>
<th>AUTHID CHECKED</th>
<th>PRIVILEGE</th>
<th>SECLABEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>DE#08541</td>
<td>VALID</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>OBJECT TYPE</th>
<th>REASON</th>
<th>RC</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACEE</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SOURCE OBJECT</th>
<th>SOURCE OWNER</th>
<th>TARGET OBJECT</th>
<th>TARGET OWNER</th>
</tr>
</thead>
<tbody>
<tr>

<td>DE#08541</td>
<td>AUDTB4</td>
<td>DE#08541</td>
</tr>
</tbody>
</table>
Audit Report - Authorization Failure Detail (Type AUTHFAIL)

MLS RID : XXXX   SECLABEL: XXXXXXXX
TEXT: CREATE TABLE AUDTB4 (IDCOLUMN ROWID GENERATED ALWAYS NOT NULL, BELIEBIG CHAR(50)) IN AUDDB1.AUDTS1

Field description

Here is a description of the field labels shown in the previous example:

**AUTHID CHECKED**
The authorization ID causing the failure.

**PRIVILEGE**
The privilege that was checked. Possible values are provided in the DB2 macro DSNDAW02.

**OBJECT TYPE**
The DB2 object type. Possible values are:

- **ACEE** Access control environment element (ACEE)
- **APPLPLAN** Application Plan
- **BUFFER** Buffer Pool
- **COLLECT** Collection
- **DATABASE** Database
- **DISTTYPE** Distinct Type
- **FUNCTION** Function
- **LOBTS** Table Space
- **PACKAGE** Package
- **PROCEDUR** Procedure
- **ROW** Row
- **SCHEMA** Schema
- **SEQUENCE** Sequence
- **STOGROUP** Storage Group
- **TAB/VIEW** Table or View
- **USERAUTH** System privileges, such as SYSADM or SYSOPR
Audit Report - Authorization Failure Detail (Type AUTHFAIL)

REASON
The user-defined reason code from the access control authorization exit routine.

RC
The return code from the access control authorization exit routine. A value of 0 means "not applicable".

SOURCE OBJECT
If the OBJECT TYPE field is not blank, this field displays the name of the object against which the authorization was checked.

If the object type is blank, then this field displays the name of the object being created. It is valid only when the privilege is CREATE ALIAS, CREATE DBA, CREATE DBC, or CREATE STOGROUP.

Otherwise, N/A is printed.

SOURCE OWNER
If the OBJECT TYPE field is not blank, this field displays the qualifier of the object against which the authorization was checked. It is valid only for qualifiable objects.

If the object type is blank, this field displays the qualifier of the alias being created. It is valid only when the privilege is CREATE ALIAS.

Otherwise, N/A is printed.

TARGET OBJECT
The name of the object being defined. It is valid only when the target owner field is valid. Otherwise, N/A is printed.

TARGET OWNER
The qualifier of the object being defined. It is valid when the privilege is CREATE INDEX or CREATE TABLE. It is also valid for a CREATE VIEW authorization check against the set of CREATE VIEW, SELECT, INSERT, DELETE, and UPDATE privileges. Otherwise, N/A is printed.

MLS RID
The record identifier (RID) of the Multilevel Security (MLS) table that is updated or deleted.

SECLABEL
The security label of a row in the Multilevel Security (MLS) table.

TEXT
The SQL statement text associated with the failure. Long SQL statement text can be truncated, depending on the amount of space available.

DML at Bind Access Detail (Type BIND):

This topic shows detailed information about “DML at Bind Access Detail (Type BIND)”.

When you select the BIND type, the data is retrieved from IFCID 145, and the following fields are printed:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>DETAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND</td>
<td>PACKAGE: PM01DB11.DSNREXX.DSNREXX.X'174B9CF31C5687C2'</td>
</tr>
<tr>
<td>TYPE</td>
<td>INSERT</td>
</tr>
<tr>
<td>STMT#</td>
<td>0</td>
</tr>
<tr>
<td>ISOLATION(CS)</td>
<td>KEEP UPD LOCKS: NO</td>
</tr>
<tr>
<td>TEXT</td>
<td>INSERT INTO PRL.AUDTB1 OVERRIDING USER VALUE VALUES(NULL, 'HEIDI', 'AXEL', 1)</td>
</tr>
<tr>
<td>DATABASE: 264</td>
<td>TABLE OBID: 3</td>
</tr>
<tr>
<td>ACCESS CTRL SCHEMA: N/P</td>
<td></td>
</tr>
<tr>
<td>ACCESS CTRL OBJECT: N/P</td>
<td></td>
</tr>
</tbody>
</table>

Chapter 6. Batch reporting 3403
Field description

**PACKAGE/DBRM NAME**

The name of the database request module (DBRM) or package containing the DML statement being bound.

A package name is made up of the following parts:

**Location**
The location name is applicable only to packages, otherwise 'BLANK' is printed.

**Collection ID**
The package collection ID is applicable only to packages, otherwise 'BLANK' is printed.

**Package ID**
The program name for DBRMs or the package ID for packages.

**Consistency token**
A hexadecimal dump of the DB2 timestamp of the program during precompilation. This field contains the value in the TIMESTAMP column of SYSIBM.SYSDBRM. The value represents the time of the precompilation in internal format, that is, modified store clock (STCK) format.

**TYPE**
The type of statement being bound.

**STMT#**
The statement number in the program or DBRM involved in the bind.

**ISOLATION**
The isolation of the bind. Possible values are:

- **CS** Cursor stability
- **RR** Repeatable read
- **RS** Read stability
- **UR** Uncommitted read

**KEEP UPD LOCKS**
Indicates if an update lock is kept. YES is only valid if the value in the TYPE field is SQL OPEN CURSOR and the value in the ISOLATION field is RR or RS.

**TEXT**
The SQL statement text associated with the BIND. If SQL text is not present, N/P is printed. Long SQL text can be truncated.

**DATABASE**
Either the name or the decimal DBID of the database that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON for Db2 PE reports a decimal DBID.

**TABLE OBID**
The object identifier (OBID) of the DB2 table.

**Note:** DATABASE and TABLE OBID are repeating fields and can have more than one entry in the report or trace. Two or more occurrences result from a DML statement that refers to two or more DB2 tables.

**STMT ID**
The SQL unique statement ID.
Audit Report - DML at Bind Access Detail (Type BIND)

ACCESS CTRL SCHEMA
The name of the access control schema.

ACCESS CTRL OBJECT
The name of the access control object.

DDL Access Detail (Type DDL):
This topic shows the various types of DDL Access detail that can be printed. It describes the corresponding fields if you select DDL. The types are sorted by IFCID.

Create Trusted Context or Alter Trusted Context (IFCID 270):
This topic shows a sample and the field description of a DDL change type of Create Trusted Context or Alter Trusted Context (IFCID 270).

The following sample shows the layout for an DDL change type of Create Trusted Context or Alter Trusted Context (IFCID 270):

**TYPE:** CREATE TRUSTED CONTEXT or CREATE
**SQLCODE:** 100
**TEXT:** THIS IS THE VARIABLE LENGTH SQL STATEMENT WHEN A TRUSTED CONTEXT IS CREATED OR ALTERED. MAXIMUM LENGTH IS 4000.

Field description
The fields are described in the following:

**TYPE**
The type of trusted context. Possible values are:

CREATE TRUSTED CONTEXT or CREATE
If a trusted context is created.

ALTER TRUSTED CONTEXT or ALTER
If a trusted context is altered.

*Derivation:* DB2 field QW0270TY

**SQLCODE**
The SQL return code from the CREATE or ALTER TRUSTED CONTEXT statement.

*Derivation:* DB2 field QW0270SQ

**TEXT**
The SQL statement (truncated at 4000 bytes).

*Derivation:* DB2 field QW0270SS

DDL data retrieved from IFCID 142 or 271:
This topic shows a sample and the field description of DDL data retrieved from IFCID 142 or 271.

If the data is retrieved from IFCID 142, ...

If you select DDL and the data is retrieved from IFCID 142 and the following fields are printed:

<table>
<thead>
<tr>
<th>TABLE NAME: AUDTB1</th>
<th>OWNER: JUB</th>
<th>CREATOR: JUB</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATABASE: 274</td>
<td>TABLE OBID: 3</td>
<td>TYPE: CREATE</td>
</tr>
<tr>
<td>OWNER TYPE: PRIM/SECOND AUTHID</td>
<td>SECLABEL: XXXXXXXX</td>
<td>MLS: XXX</td>
</tr>
<tr>
<td>R/C ACCESS CTRL: COLUMN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TEXT: CREATE TABLE JUB.AUDTB1 (IDCOLUMN INTEGER GENERATED ALWAYS AS IDENTITY, NNAME VARCHAR(50) NOT NULL, VNAME CHAR(10) NOT NULL, ANZAHL INTEGER NOT NULL) AUDIT ALL IN AUDDB1.AUDTSI</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Chapter 6. Batch reporting 3405
## TABLE NAME
The name of the audited DB2 table.

## OWNER
The authorization ID of the owner of the audited DB2 table.

## CREATOR
The authorization ID of the creator of the DB2 table.

## DATABASE
Either the name or the decimal DBID of the database that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON for Db2 PE reports a decimal DBID.

## TABLE OBID
The object identifier (OBID) of the auditable table associated with the access.

## TYPE
The statement type. Possible values are:
- CREATE
- DROP
- ALTER

## OWNER TYPE
The type of the table owner. Possible values are:
- ROLE A role is used.

### PRIM/SECOND AUTHID
The user ID of the primary or the secondary authorization ID is used.

### N/P
A blank is shown in the performance database.

### N/A
A blank is shown in the performance database.

## SECLABEL
The security label of the user.

## MLS
The Multilevel Security (MLS) table can contain the following values:
- Y For a Create or Drop operation of a table that has multilevel security, or for an Alter operation of a table to add a security label column.
- N For an Alter operation of a table that has multilevel security.
- NONE The table does not have multilevel security.

### N/P
Not present. A blank is shown in the performance database.

### N/A
A blank is shown in the performance database.

## R/C ACCESS CTRL
The access control field contains data about ROW-LEVEL and COLUMN-LEVEL (R/C) ACCESS CONTROL in DDL. It can have the following values:
- **'R' (ROW)**
  Activates row-level access control.
- **'C' (COLUMN)**
  Activates column-level access control.
Audit Report - DDL Access Detail (Type DDL)

'B' (BOTH)
Activates row-level and column-level access control.

' ' (NO)
Activates no access control.

TEXT  The SQL statement text associated with the table access. Long SQL text can be truncated.

If the data is retrieved from IFCID 271, ...

If you select DDL and the data is retrieved from IFCID 271, the following fields are printed:

CHANGE TYPE
Identifies the SQL statement type:

CREATE or C
Creates row permission or column mask.

DROP or D
Drops row permission or column mask.

ALTER or A
Alters row permission or column mask.

Otherwise, a hexadecimal value is shown.

OBJECT
Identifies the object type:

• Row permission (R)
• Column mask (M)

Otherwise, a hexadecimal value is shown.

SQLCODE
The SQL code from the execution of the CREATE, DROP, or ALTER statement.

TEXT  The SQL statement text associated with the table access. The maximum length is 4000 bytes. Long SQL text can be truncated.

DML Access Detail (Type DML):

This topic shows a sample and the field description of “DML Access Detail (Type DML)”.

When you select DML, the data is retrieved from IFCID 143 and 144, and the following fields are printed:

FIELD DESCRIPTION

TYPE  The type of access. It is determined by the IFCID (143 is a WRITE and 144 is a READ).
Audit Report - DML Access Detail (Type DML)

STMT ID
The statement ID.

DATABASE
Either the name or the decimal DBID of the database that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON for Db2 PE reports a decimal DBID.

TABLE OBID
The object identifier (OBID) of the auditable DB2 table associated with the access.

PAGESET
Either the name or the decimal PSID of the page set that contains the auditable DB2 table. The name is printed if known, otherwise OMEGAMON for Db2 PE reports a decimal PSID. If neither field is available, N/A is printed in this field.

LOG RBA
The log relative byte address of the current unit of recovery. It is printed in hexadecimal, when present.

Utility Access Detail (Type UTILITY):

This topic shows a sample and the field description of the “Utility Access Detail (Type UTILITY)”.  

When you select UTILITY, the data is retrieved from IFCID 024, and the following fields are printed:

NAME : LOAD        ID : DSNTEX
DATABASE : DBASE1   PHASE : RELOAD
PAGESET : PSET1     TYPE : RECORD

Field description

Here is a description of the field labels shown in the previous example:

NAME
The name of the utility.

ID
The DB2 user’s identification of the utility.

DATABASE
Either the name or the decimal DBID of the database that contains the auditable DB2 object.

For the report entry describing the start of a utility (IFCID 023), N/P is printed. To determine the real value, find the corresponding entry describing the utility object or phase change (IFCID 024), or the entry describing the utility end information.

PHASE
The utility phase identification.

PAGESET
Either the name or the decimal PSID of the page set that contains the auditable DB2 object. If neither field is present, N/A is printed.

TYPE
The type of utility access. For the utility phase UTILINIT and UTILTERM, N/A is printed.
The Audit File Data Set and Output Record:

The FILE subcommand formats DB2 Audit records and writes them to sequential data sets that can be loaded into DB2 tables.

The audit FILE subcommand produces up to seven sequential variable-blocked data sets. You can use FILE to separate the various audit types by specifying one audit type per FILE subcommand.

The content of the output data set is determined by the options you specify for the FILE subcommand and by the input DB2 audit trace data processed.

Each output record is divided into several parts:

- The **Standard Header** section contains header data common to all records. This section is at the beginning of each record. It contains DB2 identifier information known as the correlation header. It also contains the DB2 distributed network header information associated with the record.
- The **Data** section lists data unique to the audit category of the record. Each audit type maps the areas of the record differently. Records which share the same header information have a repeating subtype.

File data is written to a File data set. The following types of records are created:

- Bind
- Auth Change
- Auth Control
- DDL
- Auth Failure
- SQL
- Utility

Descriptions of the layouts of these records can be found in the RKO2SAMP library under the following names:

**DGOXDBND**
- Bind

**DGOXDCHG**
- Auth Change

**DGOXDCNT**
- Auth Control

**DGOXDDDL**
- DDL

**DGOXDDML**
- DML

**DGOXFDFAI**
- Auth Failure

**DGOXDSQL**
- SQL

**DGOXDUTI**
- Utility
Explain Report

These topics provide information about the Explain report.

The Explain report of OMEGAMON for Db2 PE is divided into sections. The sections that are shown in the Explain report depend on:

- Which object is to be explained.
  Most sections are applicable to all explain functions, but there are a few which are applicable to selected functions only.

- The requested level of detail.

At normal completion of Explain, the last pages of the output show a summary of the OMEGAMON for Db2 PE explain execution. This is called the Summary Report.

**Note:** For an introduction to the Explain report set and general explain information refer to the Reporting User’s Guide For details on how to specify EXPLAIN commands refer to the Report Command Reference.

**The Page Header**

The explain page header is printed on every page of the Explain report.

For details on how to specify EXPLAIN PACKAGE commands refer to the Report Command Reference.

**Explain - General Page Header**

This sample shows the header of an Explain report, in its general form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTUAL AT</td>
<td>02/18/16 15:05:08</td>
</tr>
<tr>
<td>OMEGAMON XE DB2 PE (V5.4)</td>
<td>PAGE : 1-1</td>
</tr>
<tr>
<td>EXPLAIN PACKAGE</td>
<td>DB2 VERSION: V10</td>
</tr>
<tr>
<td>LOCATION</td>
<td>PMODA11</td>
</tr>
<tr>
<td>SUBSYSTEM</td>
<td>DA11</td>
</tr>
<tr>
<td>USER AUTHID</td>
<td>XRK</td>
</tr>
<tr>
<td>SUBSYSTEM</td>
<td>DA11</td>
</tr>
<tr>
<td>DETAIL</td>
<td>CURR.SQLID : XRK</td>
</tr>
</tbody>
</table>

**Field description**

The header contains the following information, described in the order left block, middle block, right block:

**ACTUAL AT**

The date and time at which the DB2 subsystem (specified in SUBSYSTEM) containing explain functions, is accessed to collect the requested data.

**LOCATION**

The location name of the DB2 subsystem specified in SUBSYSTEM.

**SUBSYSTEM**

The ID of the DB2 subsystem that generated the data.

**OMEGAMON for Db2 PE (Vn)**

The product name and version.

**EXPLAIN**

The object to be explained as specified in the EXPLAIN command (for example, QMFQUERY, PACKAGE, or PLAN).

**<object type>**

The name of the object to be explained as specified in the EXPLAIN command. It can have one of the following values:

**SQL STATEMENT**

None
QUERYNO
Query number

PLAN Plan name, such as LARGEPLAN.

PACKAGE Package ID

QMFQUERY Unqualified QMF query name

<size>
The level of the report specified in the LEVEL subcommand option. Values are:
- SUMMARY
- SQL
- BASIC
- INDEX
- DETAIL
- NO RAW EXPLAIN DATA
- KEY DISTRIBUTION

PAGE The page number in the format ill-nnnn, where ill denotes the report number and nnnn the page number within the report.

DB2 VERSION The version and release of the DB2 subsystem specified in SUBSYSTEM.

USER AUTHID The user authorization ID.

CURR.SQLID The current SQLID as specified in the SQLID option, or the default.

**Object Identification**
Use the page header to quickly identify the object that is explained. A complete identification is contained in the object identification section of the report.

**Plan Identification:**
This section shows examples of identification plan with DBRMs and with packages.

If a plan is explained by the EXPLAIN PLAN command, the object identification section of the report shows the following for each SQL statement:
- Plan name
- DBRM or package name
- Statement number
- Statement text
- Statement-related information

Examples are shown in “Explain Identification - Plan with DBRMs” and “Explain Identification - Plan with Packages” on page 3412.

**Explain Identification - Plan with DBRMs**

Here is an example of an Identification - Plan with DBRMs.
Explain Identification - Plan with Packages

Here is an example of an Identification - Plan with packages.

```sql
DECLARE C2 CURSOR FOR
SELECT NAME, BINDDATE, BINDTIME, ISOLATION
FROM SYSIBM.SYSPLAN
WHERE CREATOR = USER AND NAME IN ('EEE2', 'EEE3', 'EEE4')
ORDER BY NAME
STATUS : COMPILED-BOUND USING DEFAULTS FOR INPUT VARIABLES
ISOLATION: CURSOR STABILITY
```

Explain Identification - Package

Here is an example of a package identification.

```sql
DECLARE CURSOR_1 CURSOR FOR
SELECT EMPNO, LASTNAME, WORKDEPT, BIRTHDATE
FROM DSNB610.EMP
WHERE (EMPNO BETWEEN '000170' AND '000240'
AND WORKDEPT IN ('D01', 'E21', 'X23'))
OR (EMPNO = '000100'
AND (WORKDEPT = (SELECT MIN(DEPTNO)
FROM DSNB610.DEPT
WHERE MGRNO = '000050')
OR WORKDEPT = (SELECT MAX(DEPTNO)
FROM DSNB610.DEPT
WHERE ADMRDEPT = 'A00')))
ORDER BY EMPNO
STATUS : COMPILED-BOUND USING DEFAULTS FOR INPUT VARIABLES
ISOLATION: CURSOR STABILITY
```

Package Identification:

This section shows examples of package identification.

If a package is explained by the EXPLAIN PACKAGE command, the object identification section of the report shows the following for each SQL statement:

- Full package name
- Statement number
- Statement text
- Statement-related information

For details on how to specify EXPLAIN PACKAGE commands refer to the Report Command Reference.

Explain Identification - Package

Here is an example of a package identification.
around the location like :HV_LOC71_LOCATION and collid like :HV_LOC71_COLLID and
name like :HV_LOC71_NAME and version like :HV_LOC71_VERSION
order by location, collid, name, pctimestamp desc queryno 001011071
status : compiled-bound using defaults for input variables
isolation: uncommitted read / from syspackage

QMF Query Identification:

This section shows examples of QMF Query identification.

If a QMF query is explained by the EXPLAIN QMFQUERY command, the object identification section of the report shows the following for each SQL statement:

• Full QMF query name
• Statement text

For details on how to specify EXPLAIN QMFQUERY commands refer to the Report

Command Reference

Explain Identification - QMF Query

Here is an example of the QMF query identification.

QMFQUERY: USR1.MY_QUERY
--
--SELECT * FROM A CATALOG TABLE
--
SELECT name, creator
FROM sysIBM.sysTables
WHERE creator not like 'sysIBM%'
and creator like 'XXASP%'
ORDER BY CREATOR, NAME
--

SQL Text Identification:

If an SQL statement identified by its text is explained by the EXPLAIN SQLSTMT command, the object identification section shows the statement text.

For details on how to specify EXPLAIN SQLSTMT commands refer to the Report

Command Reference

Explain Identification - SQL Text

Here is an example of the SQL Text Identification.

SQL STATEMENT TEXT :

SELECT * FROM sysIBM.syspackage
WHERE name = 'OGGWTPG3'
and collid = 'X02E54ZO'

SQL Query Number Identification:

If an SQL statement identified by a query number is explained by the EXPLAIN QUERYNO command, there is no object identification section.

For details on how to specify EXPLAIN QUERYNO commands refer to the Report

Command Reference

Table PLAN_TABLE Data

This section of the Explain report lists the raw EXPLAIN data as found in the DB2 table PLAN_TABLE.
### Explain Report - Table PLAN_TABLE Data

For details on how to specify EXPLAIN commands refer to the [Report Command Reference](#).

#### Explain Report - PLAN_TABLE Report Block

This is an example of the PLAN_TABLE report block.

| EXPLAIN TABLE: PMDEV52.PLAN_TABLE | ---------------------------------------------- |
| PROGNAME (Package): DGOORTHG3 | COLLID : KOEXS20 |
| VERSION : THIS_IS_A_LONG_NAME | APPLNAME (Plan) : N/P |
| QUERYNO : 1011071 | SECTNO : 4 |
| QBLOCKNO : 1 | PARENT_QBLOCKNO : 0 |
| PLANNO : 1 | PARENT_PLANNO : 0 |
| MIXOPSEQ : 0 | QBLOCK_TYPE : SELECT |
| TNAME (Table) : SYSIBM | CREATOR (Table) : SYSSBM |
| TABNO (Table) : 1 | CORRELATION_NAME : N/P |
| TABLE_TYPE : T - Table | CTEREF : 0 |
| TABLEresultCode : U - Unicode | TABLE_MCCSID : 1200 |
| TABLE_DCCSID : 367 | TABLE_DCSSID : 1200 |
| TLSCLOMMODE : N - No lock + | GROUP_MEMBER : N/P |
| ACCESSTYPE : I - Index scan | PRIMARY_ACCESSTYPE : BLANK |
| ACCESSNAME (Index): DSNKKX01 | ACCESSCREATOR : SYSSBM |
| MATCHCOLS : 1 | INDEXONLY : NO |
| METHOD (Join) : b - First table | JOIN_DEGREE : 0 |
| JOIN_TYPE : b - INNER or NO | MERGN : NO |
| MERGE_JOIN_COLS : 0 | MERNG : NO |
| PREFETCH : D - Dynamic | PAGE_RANGE : NO |
| WHEN_OPTIMIZE : b - At bind time | ACCESS_DEGREE : 0 |
| COLUMN_FN_EVAL : BLANK | ROUTINE_ID : 0 |
| HINT_USED : N/P | OPTHint : N/P |
| SCANDIRECTION : N/A | |
| SORTN_GRPJOIN_ID : 0 | SORTN_UNIQ : NO , SORTN_UNIQ : NO |
| SORTC_GRPJOIN_ID : 0 | SORTN_JOIN : NO , SORTN_JOIN : NO |
| ACCESS_GRPJOIN_ID : 0 | SORTN_ORDERBY : NO , SORTN_ORDERBY : NO |
| JOIN_GRPJOIN_ID : 0 | SORTN_GROUPBY : NO , SORTN_GROUPBY : NO |
| REMARKS : N/P | STMTTOKEN : N/P |
| PARALLELISM_MODE : BLANK | BIND_EXPLAIN_ONLY : NO |
| EXPANSION_REASON : N/A | |
| VERSION : THIS_IS_A_LONG_NAME_VERSION_IDENTIFIER | TSLCLOMMODE : N - No lock (UR isolation) |

The report field labels are the full PLAN_TABLE column names. For a detailed description of the PLAN_TABLE columns, refer to the [Db2 SQL Reference](#). If the report field value is a long name or a long value, it is marked with an asterisk (*) at the end of the report field value, and it is reported at the end of the block in its full length.

The plan table is searched by using the bind time of the package. There might be multiple occurrences of the package with different bind times. For example, the DB2 system catalog might contain the latest package that is created by the DB2 command BIND or REBIND. It might also contain a former package version that is activated by the DB2 command REBIND SWITCH.

#### Access Path Data

This section of the Explain report introduces the access path chosen by DB2.

For details on how to specify EXPLAIN commands refer to the [Report Command Reference](#).

#### Explain Report - Access Path Data Block

The following example shows that the access path is contained in a frame.

| THE ACCESS PATH CHOSEN BY DB2 AT 18:50:11.7 ON 2016-02-15 | MATCHING INDEX SCAN WITH SCAN OF REFERENCED DATA PAGES |
| NUMBER OF MATCHING COLUMNS: 1 - THE INDEX HAS 4 COLUMNS | |

---

3414  IBM Db2 Performance Expert on z/OS
Index Data
If an index is used, that is, an access path other than TABLE SPACE SCAN, information about this index is shown. The data is derived from the SYSIBM.SYINDEXES table.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Index Data Block
Here is an example of the index data block section.

INDEX: SYSIBM.DSNKX01
STATSTIME: 2016-02-16-14.45.54.186869
CREATED: 0001-01-01-00.00.00.000000
ALTERED: 2003-09-21-23.30.17.962937
FULL KEY CARD: 1, SPACE: 245.760K, UNIQUE: YES, CLUSTERED: Y
1ST KEY CARD: 1, SPACE: 245.760K, UNIQUE: YES, CLUSTERED: Y
INDEX TYPE: 2, PGSIZE: 4096, BFPOOL: BP0, DB.NAME: DSNDB06
CLUSTERRATIO: 84.6328%, ERRULE: NO, CLRULE: NO, IXSPACE: DSNKX01
MAX.PIECESIZE: 0, COPY: NO, COPYLRSN: X000000000000

Key Data
If an index is used and LEVEL(INDEXES) is not specified, information about the key columns is presented. The data is derived from the SYSIBM.SYSKEYS and SYSIBM.SYSCOLUMNS tables.

If a matching index scan is used in the access path, the report indicates the columns that are used in the index scan. This is indicated by an arrow (<=+) in the column named KEY USED. The number of arrows corresponds to the contents of the matching columns field MATCHCOLS in the PLAN_TABLE report block.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Key Data Block
Here is an example of the explain key data block section.

<table>
<thead>
<tr>
<th>KEY NO.</th>
<th>COLUMN NAME</th>
<th>COL.TYPE</th>
<th>LNG NULL</th>
<th>COL.STAT</th>
<th>LENGTH</th>
<th>KEY CARD</th>
<th>ORDER</th>
<th>LOW2KEY</th>
<th>HIGH2KEY</th>
<th>KEY USED</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>LOCATION</td>
<td>VARCHAR</td>
<td>128 NO</td>
<td>0</td>
<td>1 ASC.</td>
<td>X'40404040</td>
<td>X'40404040</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>COLLID</td>
<td>VARCHAR</td>
<td>128 NO</td>

<td>X'31404040</td>
<td>X'56365231</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Key Distribution Data
This section introduces the Key Distribution Data.

If LEVEL(KEYDIST) has been specified and RUNSTATS has produced key distribution information for the first column of the index, a section in the report shows the distribution of up to ten most frequently used key values. The data is derived from the SYSIBM.SYSTABLES.CREATOR.
For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Key Distribution Data Block

This example shows the key distribution data section.

KEY DISTRIBUTION FOR: SYSIBM.SYSTABLES.CREATOR  
-------------------------
SYSIBM (27%), DSNB230 (11%), U473298 (9%), Q (7%), XXASP09 (5%), 
U01 (5%), USR2 (5%), U473298 (9%), Q (7%), XXASP09 (5%), 
SYSIBM (27%), DSNB230 (11%), U473298 (9%), Q (7%), XXASP09 (5%),

Table and Table Space Data

This section of the Explain report shows information for the accessed table and its corresponding table space.

The data is derived from the SYSIBM.SYSTABLES and SYSIBM.SYSTABLESPACE tables.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Table Data Block

This is an example of the Explain Table Data section.

If table space scan has been selected as the access path method, and INDEX(NO) is not specified, a separate block is presented for each available index on the subject table along with information about key columns.

See "Index Data" on page 3415 and "Key Data" on page 3415 for the layout of these blocks.

Host Variable Data

This section of the Explain report is produced if HOSTVAR(YES) is specified for the OMEGAMON for Db2 PE explain plan or package.

If you define host variables which are not consistent with the corresponding column definition, DB2 selects an inefficient access path.

In "Explain Report - Host Variables Data Block" on page 3417, the access path selected is table space scan even though an index is defined on the only column referenced in the WHERE clause. As the example in "Explain Report - Host Variables Data Block" on page 3417 shows, DB2 has selected table space scan because the column definition is three characters, but the corresponding host...
variable is defined as four characters. By changing the host variable definition to three characters, a matching index scan is selected by DB2.

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

**Explain Report - Host Variables Data Block**

Here is an example of an Explain Report for the Host Variables Data block:

```sql
DECLARE C1 CURSOR FOR
SELECT DEPTNO, DEPTNAME, LOCATION
FROM DSNB610.DEPT
WHERE DEPTNO = :HOSTVAR_STRUCTURE.DEPARTMENT_NUMBER
ORDER BY DEPTNO

+------------------------------------------------------------------+
| TABLE SPACE SCAN - NO INDEX IS USED                             |
| STANDARD SEQUENTIAL PREFETCH WILL BE PERFORMED                  |
+------------------------------------------------------------------+

KEY NO. COLUMN NAME   COL.TYPE LNG NULL KEY CARD, ORDER LOW2KEY HIGH2KEY USED
1 WORKDEPT CHAR      3 YES 8 ASC. C'B01 C'E11 <==

HOST VAR. TYPE LENGTH IND. HOST VARIABLE NAME
FIXED CHARACTER 4 NO HOSTVAR_STRUCTURE.DEPARTMENT_NUMBER

**Bind Plan Data**

This section of the Explain report is shown if the object being explained is a plan or query number for a mini plan created by the bind process. Information related to the binding of the plan, such as plan binder, bind time, or isolation level, is presented.

This part of the report is only produced in connection with the first SQL statement of the plan.

When a plan is explained using OMEGAMON for Db2 PE explain, the bind-related data is stored in a DB2 table which enables you to compare relevant information for up to three generations of the plan.

If, in a given row, there is a difference among the three columns, an arrow (===>) is shown in the rightmost column.

The bottom part of this section shows data for each DBRM and package in the most recent plan generation. The report states the precompilation date and time, programming language, number of SQL statements, single-byte or double-byte character set, use of comma, use of decimal(31), type of source, and the DB2 release when the module was precompiled.
For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Plan Data Block

This is an example of the Bind Plan Data section.

Bind Package Data

This section of the Explain report is shown if the object being explained is a package.

The information related to the binding of the package, such as package owner, bind time or isolation level, is presented.

This part of the report is only produced in connection with the first SQL statement of the package.

For details on how to specify Explain commands refer to the Report Command Reference.

Explain Report - Package Data Block

This is an example of the Bind Package data section.

</table>
Summary Report
This section introduces the summary report.

At normal completion of OMEGAMON for Db2 PE explain, the last pages of the output are a summary of the OMEGAMON for Db2 PE explain execution. This is called the Summary Report. Each command is prefixed with the report number.

For each SQLSTMT, QUERYNO, and QMFQUERY request, the access path is listed adjacent to the input request. For each PLAN or PACKAGE statement, the access path is listed for every SQL statement in the plan or package.

To the right of the access path information, the report page number (rrr-nnnn) is shown, unless LEVEL(SUMMARY) was specified. In this way the summary report can be used as a table of contents.

For details on how to specify EXPLAIN SUMMARY commands refer to the Report Command Reference.

Explain Report - Summary Report Block
This is an example of a Summary report.

Column description
The TYP column can contain the following values:

P   Package
D   DBRM
S   Standard sequential prefetch
L   Prefetch through a page list Table space scan
+   Nonmatching index scan
A   blank

No prefetch or others

The numbers in brackets following MATCHING INDEX SCAN, for example (2/3), show how many columns match, namely 2, and how many columns the index has, namely 3.
EXPLAIN PLAN Command
This section introduces the EXPLAIN PLAN command.

When you bind a plan, you might decide to include a package list that contains wildcard characters, for example COLLID3.* or even *.*. This could result in a plan pointing at thousands of packages with an even greater number of explainable SQL statements. To control the volume of output produced, the PACKLIMIT option is provided.

If a particular plan consists of more packages than specified in PACKLIMIT, a report with all the package names is produced, but no SQL statements in these packages are explained. This report shows the collection IDs, the creator and owner names, the version IDs, and the dates of precompilation. However, if any DBRMs belong to the plan, SQL statements in these DBRMs are explained.

For details on how to specify EXPLAIN PLAN commands refer to the Report Command Reference.

Explain PLAN Report - Package List Block
The following report example results of an EXPLAIN PLAN statement with PACKLIMIT(10) if a plan named LARGPLAN was bound with a package list of COLLECT.*, which includes 80 packages:

EXPLAIN PACKAGE Command
This section introduces the EXPLAIN PACKAGE command.

When a package is explained, you can specify the collection ID, the package name, or both, as generic names using an asterisk (*) as a wildcard character. For example, you have the following options:

EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYT*)
EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYTEST)
If a wildcard character is used, OMEGAMON for Db2 PE explain counts the total number of SQL statements that belong to the packages (the total number of SQL statements also includes non-explainable statements).

If the number of packages is more than one, and the total number of SQL statements in these packages is larger than 300, OMEGAMON for Db2 PE explain does not explain any SQL statements unless the FORCE(YES) option is specified.

If the package specification does not contain any wildcard character, the total number of SQL statements is less than 300, or only one package conforms to the specification, the SQL statements are explained. However, if the package exists in more than one version, only the most recent version is explained. In this case a report showing all the versions for that package is produced.

For example, the following command was used to produce the report shown in "Explain Report - Package Version List Block”:

```
EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYTEST.(-7)) GEN(3)
```

For details on how to specify EXPLAIN commands refer to the Report Command Reference.

Explain Report - Package Version List Block

Here is an example of the Explain report for the Package Version List block:

```

START VERSION GENERATION NUMBER SPECIFIED: -7
NUMBER OF VERSION GENERATIONS REQUESTED: 3
```

This report shows that the package exists in 21 versions, where the version that corresponds to generation number -7 was selected for explanation. The report further shows that the user asked for the explanation of three generations (-7, -8, and -9). The first generation to be explained is marked with an asterisk (*). Instead of specifying a generation ID, the version ID could be specified. The version ID can be specified either in full or in combination with a wildcard character as in the following example:

```
EXPLAIN PACKAGE (DSNAPC1.COLLECT.MYTEST.(VERSION7*)) GEN(3)
```
A maximum of 100 generations are listed.

**EXPLAIN SQLSTMT Command**

This section shows an example of an Explain report generated with the EXPLAIN SQLSTMT command.

For details on how to specify EXPLAIN commands refer to the **Report Command Reference**.

**Explain Report - Example for SQL Text**

Use the following EXPLAIN SQLSTMT command to generate the following example of an explain report.

GLOBAL PLANEX(KO2EXPL)
SSID(DA11)
SQLID(XRK)
EXPLAIN SQLSTMT
{
  SELECT * FROM SYSIBM.SYSPACKAGE
  WHERE NAME = 'DGO@TPG3'
  AND COLLID = 'KO2EX520';
}
LEVEL(INDEXES)
EXEC

Here is an example of an SQL Text.

**SQL STATEMENT TEXT**:

```
SELECT * FROM SYSIBM.SYSPACKAGE
WHERE NAME = 'DGO@TPG3'
AND COLLID = 'KO2EX520';
```

**EXPLAIN TABLE: XRK.DSN_STATEMNT_TABLE**

**Explain Report - EXPLAIN SQLSTMT Command**

3422 IBM Db2 Performance Expert on z/OS
### I/O activity report set

These topics provide information about the I/O activity reports.

### I/O activity report header

OMEGAMON for Db2 PE header information is printed at the top of each page of the summary and detail report.

### I/O Activity Report Header Example

Here is an example of an I/O Activity Report Header.

```sql
SELECT * FROM SYSIBM.SYSPACKAGE WHERE NAME = 'DSNDB06';
```

---

**I/O activity report set**

These topics provide information about the I/O activity reports.

**I/O activity report header**

OMEGAMON for Db2 PE header information is printed at the top of each page of the summary and detail report.

**I/O Activity Report Header Example**

Here is an example of an I/O Activity Report Header.
**Field description**

The report header contains the following information, described in the order left block, middle block, right block:

**LOCATION**
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

**GROUP**
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

**MEMBER**
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**SUBSYSTEM**
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

**DB2 VERSION**
The DB2 version number of the subsystem that generated the data.

**OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)**
The product name and the version, release, and modification level.

**Title - layout**
The title of the report and the layout. The layout can be a default layout provided with OMEGAMON for Db2 PE or a layout you have tailored yourself.

**ORDER**
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON for Db2 PE identifiers by which lock events are grouped are shown here.

**PAGE**
The page number in the format lll-nnnnnn, where lll denotes the location number within the report and nnnnnn the page number within the location.

**REQUESTED FROM and TO**
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.
INTERVAL FROM
The start date and time of the first reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

INTERVAL TO
The end date and time of the last reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

I/O activity summary report
The I/O activity summary report provides an overview of system-wide I/O activity.

The I/O activity summary report:
• Summarizes the information contained in the I/O activity detail reports for a location (refer to "I/O activity detail report" on page 3433).
• Shows on a single page a block of entries for each of the I/O categories: buffer pool, EDM pool, active log, archive log/BSDS, and cross invalidation (XI).
• Is produced if you specify the IOACTIVITY(REPORT) command and there is at least one I/O activity IFCID begin/end pair in the input data set satisfying the FROM and TO, and INCLUDE or EXCLUDE criteria. You do not have to specify the SUMMARY level because this is the default.

The following command produces the I/O activity summary report shown below:

... 
IOACTIVITY
   REPORT 
...
**I/O Activity - Summary Report**

### Buffer pool summary report:

The buffer pool section of the summary report contains selected fields from the full buffer pool report.

#### TOTAL I/O REQUESTS

The total number of I/O requests (TOTALS) and the average elapsed time per I/O request (AET).

*Calculation of TOTALS:* count of matching IFCID 006 and 007 record pairs (read requests) + matching IFCID 008 and 009 record pairs (synchronous writes) + matching IFCID 009 and 010 record pairs (asynchronous writes)

*Calculation of AET:* (sum of differences in the store clock values DB2 field QWHSSTCK of matching IFCID 006 and 007 + IFCID 008 and 009 + IFCID 009 and 010 record pairs) / (count of matching IFCID 006 and 007 + IFCID 008 and 009 + IFCID 009 and 010 record pairs)

#### TOTAL READ I/O REQUESTS

The total number of I/O read requests (TOTALS) and the average elapsed time per read request (AET).

#### NON-PREFETCH READS

The total number of non-prefetch reads.

*Calculation:* count of IFCID 006 and 007 record pairs, with DB2 field QW0006F equal to R

### Buffer pool summary report:

The buffer pool section of the summary report contains selected fields from the full buffer pool report.

#### TOTAL I/O REQUESTS

The total number of I/O requests (TOTALS) and the average elapsed time per I/O request (AET).

*Calculation of TOTALS:* count of matching IFCID 006 and 007 record pairs (read requests) + matching IFCID 008 and 009 record pairs (synchronous writes) + matching IFCID 009 and 010 record pairs (asynchronous writes)

*Calculation of AET:* (sum of differences in the store clock values DB2 field QWHSSTCK of matching IFCID 006 and 007 + IFCID 008 and 009 + IFCID 009 and 010 record pairs) / (count of matching IFCID 006 and 007 + IFCID 008 and 009 + IFCID 009 and 010 record pairs)

#### TOTAL READ I/O REQUESTS

The total number of I/O read requests (TOTALS) and the average elapsed time per read request (AET).

#### NON-PREFETCH READS

The total number of non-prefetch reads.

*Calculation:* count of IFCID 006 and 007 record pairs, with DB2 field QW0006F equal to R

---

**Figure 294. Sample I/O activity summary report**

---

**Buffer pool summary report:**

The buffer pool section of the summary report contains selected fields from the full buffer pool report.

#### TOTAL I/O REQUESTS

The total number of I/O requests (TOTALS) and the average elapsed time per I/O request (AET).

*Calculation of TOTALS:* count of matching IFCID 006 and 007 record pairs (read requests) + matching IFCID 008 and 009 record pairs (synchronous writes) + matching IFCID 009 and 010 record pairs (asynchronous writes)

*Calculation of AET:* (sum of differences in the store clock values DB2 field QWHSSTCK of matching IFCID 006 and 007 + IFCID 008 and 009 + IFCID 009 and 010 record pairs) / (count of matching IFCID 006 and 007 + IFCID 008 and 009 + IFCID 009 and 010 record pairs)

#### TOTAL READ I/O REQUESTS

The total number of I/O read requests (TOTALS) and the average elapsed time per read request (AET).

#### NON-PREFETCH READS

The total number of non-prefetch reads.

*Calculation:* count of IFCID 006 and 007 record pairs, with DB2 field QW0006F equal to R
ZHYPERLINK
The total number of non-prefetch reads that used zHyperLink.

DISK CACHE HIT
The total number of non-prefetch reads where all the requested pages were found in the DASD subsystem cache.

PREFETCH READS
An aggregate of all types of prefetches:
- Sequential prefetches (determined at bind time)
- List prefetch
- Sequential prefetch triggered by the sequential detection logic

WITHOUT I/O
The number of unsuccessful prefetch reads. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

Calculation: count of matching IFCID 006 and 007 record pairs, with DB2 field QW0006F not equal to R (type of read request) and DB2 field QW0007NP equal to zero (indicating no pages were read)

WITH I/O
The number of successful prefetch reads.

Calculation: count of matching IFCID 006 and 007 record pairs, with DB2 field QW0006F not equal to R (type of request) and DB2 field QW0007NP greater than zero (number of pages read)

PAGES READ
The number of pages read for all prefetch read requests.

Calculation: sum of DB2 field QW0007NP with DB2 field QW0006F not equal to R

PAGES READ / SUCC READ
The number of pages read per successful prefetch read request.

Calculation: (sum of DB2 field QW0007NP with DB2 field QW0006F not equal to R) / (count of matching IFCID 006 and 007 record pairs, with QW0006F not equal to R and QW0007NP greater than zero)

Calculation of TOTALS: count of matching IFCID 006 and 007 record pairs

Calculation of AET: (sum of differences in the store clock values DB2 field QWHSSSTCK of matching IFCID 006 and 007 record pairs) / (count of matching IFCID 006 and 007 record pairs)

TOTAL WRITE REQUESTS
The total number of write I/O requests (TOTALS) and the average elapsed time per write request (AET).

Calculation of TOTALS: count of matching IFCID 008 and 009 (synchronous writes) + IFCID 009 and 010 record pairs (asynchronous writes)

Calculation of AET: (sum of differences in the store clock values DB2 field QWHSSSTCK of matching IFCID 008 and 009 record pairs (for synchronous...
writes) + matching IFCID 010 and 009 record pairs (for asynchronous writes)) / (count of matching IFCID 008 and 009 record pairs + matching IFCID 009 and 010 record pairs)

The write requests are divided into two categories: synchronous writes and asynchronous writes.

SYNCHRONOUS WRITES

The number of synchronous writes (TOTALS) and the average elapsed time per synchronous write request (AET).

COUPLING FACILITY CASTOUTS

The number of synchronous writes due to coupling facility castouts.

Calculation: QW0008FC / QW0010FC

PAGES WRITTEN PER WRITE

The average number of pages per synchronous write.

Calculation: (sum of DB2 field QW0008WR) / (count of matching IFCID 008 and 009 record pairs)

Calculation of TOTALS: count of matching IFCID 008 and 009 record pairs

Calculation of AET: (sum of differences in the store clock values DB2 field QWHSTSTCK of matching IFCID 008 and 009 record pairs) / (count of matching IFCID 008 and 009 record pairs)

ASYNCHRONOUS WRITES

The number of asynchronous writes (TOTALS) and the average elapsed time per asynchronous write (AET).

COUPLING FACILITY CASTOUTS

The number of asynchronous writes due to coupling facility castouts.

Calculation: QW0008FC / QW0010FC

PAGES WRITTEN PER WRITE

The average number of pages written per asynchronous write.

Calculation: (sum of DB2 field QW0010WR) / (count of matching IFCID 009 and 010 record pairs)

Calculation of TOTALS: count of matching IFCID 009 and 010 record pairs

Calculation of AET: (sum of differences in the store clock values DB2 field QWHSTSTCK of matching 9 and 10 record pairs) / (count of matching IFCID 009 and 010 record pairs)

EDM pool summary report:

This section of the summary report contains selected fields from the EDM pool report.

The following fields are printed in the report:

CURSOR TABLE - HEADER

The number of load requests for cursor table headers (CT/PT/DBD REFERENCES).
The number of cursor table header loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a cursor table header load (AET).
The average length of a loaded cursor table header in bytes (AVG LEN (BYTES)).

CURSOR TABLE - DIRECTORY
The number of load requests for cursor table directories (CT/PT/DBD REFERENCES).
The number of cursor table directory loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a cursor table directory load (AET).
The average length of a loaded cursor table directory in bytes (AVG LEN (BYTES)).

CURSOR TABLE - RDS SECTION
The number of load requests for cursor table RDS sections (CT/PT/DBD REFERENCES).
The number of cursor table RDS section loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a cursor table RDS section load (AET).
The average section length of a loaded cursor table RDS section in bytes (AVG LEN (BYTES)).

TOTAL PLANS
The number of load requests for plans; that is, the sum of CT/PT/DBD references for cursor table header, directory, and RDS section (CT/PT/DBD REFERENCES).
The number of plan loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time per plan load (AET).
The average section length of a loaded plan in bytes (AVG LEN (BYTES)).

PACKAGE TABLE - HEADER
The number of load requests for package table headers (CT/PT/DBD REFERENCES).
The number of package table header loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a package table header load (AET).
The average length of a loaded package table header in bytes (AVG LEN (BYTES)).

PACKAGE TABLE - DIRECTORY
The number of load requests for package table directories (CT/PT/DBD REFERENCES).
The number of package table directory loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a package table directory load (AET).
The average length of a loaded package table directory in bytes (AVG LEN (BYTES)).
I/O Activity - Summary Report

PACKAGE TABLE - RDS SECTION
The number of load requests for package table RDS sections (CT/PT/DBD REFERENCES).
The number of package table RDS section loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a package table RDS section load (AET).
The average section length of a package table RDS section in bytes (AVG LEN (BYTES)).

TOTAL PACKAGES
The number of load requests for package tables; that is, the sum of CT/PT/DBD references for the package table header, directory, and RDS section (CT/PT/DBD REFERENCES).
The number of package table loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time per package table load (AET).
The average section length of a loaded package table in bytes (AVG LEN (BYTES)).

DATABASE DESCRIPTORS
The number of load requests for database descriptors (CT/PT/DBD REFERENCES).
The number of DBD loads not in the EDM pool (NOT IN EDM POOL).
The average elapsed time of a database descriptor load (AET).
The average length of a loaded database descriptor in bytes (AVG LEN (BYTES)).

Active log summary report:
This section of the summary report contains selected fields from the Active Log report.
The following fields are printed in the report:

TOTAL WAITS
The total number of waits for read and write requests and other waits (TOTALS) and the average elapsed time of an I/O wait of any type (AET).

READ REQUESTS
The number of read requests (TOTALS) and the average elapsed time of a read request (AET).

WRITE REQUESTS
The number of write requests (TOTALS) and the average elapsed time of a write request (AET).

CONT. CI / WRITE
The number of contiguous control intervals per write request.

OTHER WAITS
The total number of waits for resource allocation and deallocation, and the number of waits to open and close data sets (TOTALS).
The average elapsed time of all other waits (AET).
The next four rows relate to waits other than waits for read or write requests.

**ALLOCATE**

The number of waits for resource allocation (TOTALS) and the average elapsed time of a wait for resource allocation (AET).

**DEALLOCATE**

The number of waits for resource deallocation (TOTALS) and the average elapsed time of waits for resource deallocation (AET).

**OPEN**

The number of waits to open data sets (TOTALS) and the average elapsed time of waits to open data sets (AET).

**CLOSE**

The number of waits to close data sets (TOTALS) and the average elapsed time of waits to close data sets (AET).

**Archive log summary report:**

This section of the summary report contains selected fields from the Archive Log report.

The following fields are printed in the report:

**READ REQUESTS**

The total number of archive read requests (TOTALS) and the average elapsed time of an archive read request (AET).

Archive read requests are subdivided into the following categories:

**DASD READ**

The total number of reads from the DASD and (TOTALS) the average elapsed time of reads from the DASD (AET).

**TAPE READ**

The total number of reads from the tape (TOTALS) and the average elapsed time of reads from the tape (AET).

**OFFLOAD REQUESTS**

The total number of archive offloads (TOTALS) and the average elapsed time per archive offload (AET).

**BLOCKS / OFFLOAD**

The number of blocks of data written per offload.

**OTHER WAITS**

Waits other than read or write requests. The total elapsed time (TOTALS) and the average elapsed time of all other waits (AET).

**ALLOCATE**

The total number of waits (TOTALS) and the average elapsed time of a wait for resource allocation (AET).

**DEALLOCATE**

The total number of waits (TOTALS) and the average elapsed time of a wait for resource deallocation (AET).

**OPEN**

The total number of waits (TOTALS) and the average elapsed time of a wait to open data sets (AET).

**CLOSE**

The total number of waits (TOTALS) and the average elapsed time of a wait to close data sets (AET).
I/O Activity - Summary Report

HSM RECALL
The total number of waits (TOTALS) and the average elapsed time of a wait for HSM to recall data sets (AET).

CATALOG LOCATE
The total number of waits (TOTALS) and the average elapsed time per wait to locate data sets through the catalog (AET).

MULTI-DATA SET TAPE
The total number of waits (TOTALS) and the average elapsed time per wait for multi-data set tape volume (AET).

TAPE VOL POSITIONING
The total number of waits (TOTALS) and the average elapsed time per wait for tape volume positioning (AET).

WTOR ISSUED
The total number of waits (TOTALS) and the average elapsed time per wait due to write-to-operator messages being issued (AET).

DATA SET UNAVAILABLE
The total number of waits (TOTALS) and the average elapsed time of waits due to a data set being unavailable (AET).

PHYSICAL UNIT UNAV.
The total number of waits (TOTALS) and the average elapsed time of waits due to an unavailable physical unit (AET).

RDR SERV. UNAVAILABLE
The total number of waits (TOTALS) and the average elapsed time of a wait due to an unavailable reader service task (AET).

Bootstrap data set summary report:

This section of the summary report contains selected fields from the bootstrap data set report.

The following fields are printed in the report:

TOTAL WAITS
The total number of waits due to read and write requests for the bootstrap data set (TOTALS) and the average duration of bootstrap data set waits (AET).

READ REQUESTS
The total number of BSDS reads (TOTALS) and the average elapsed time per read from BSDS (AET).

WRITE REQUESTS
The total number of writes to the BSDS (TOTALS) and the average elapsed time per BSDS write (AET).

Cross-invalidation activity summary report:

This section of the summary report contains selected fields from the cross-invalidation summary report.

The following fields are printed in the report:

SYNCHRONOUS READS
The number of cross-invalidated pages which are refreshed via synchronous read.
I/O Activity - Summary Report

REFRESHED FROM GROUP BPOOL
The number of cross-invalidated pages which are refreshed from
the group buffer pool via synchronous read.

REFRESHED FROM DASD
The number of cross-invalidated pages which are refreshed from
the DASD via synchronous read.

SEQUENTIAL PREFETCH
The number of cross-invalidated pages which are refreshed via sequential
prefetch.

REFRESHED FROM GROUP BPOOL
The number of cross-invalidated pages which are refreshed from
the group buffer pool via sequential prefetch.

REFRESHED FROM DASD
The number of cross-invalidated pages which are refreshed from
the DASD via sequential prefetch.

I/O activity detail report
The I/O activity detail report provides detailed information about each category of
I/O activity.

Totals are accumulated for most columns in the report. The information in the Total
column on each detail report for grand totals also appears in the I/O activity
summary report.

Buffer pool detail report: The buffer pool report provides information about the
movement of database pages between the DASD and the main storage buffers. It
presents information about the number of read and write operations, the amount
of read and write requests, and the average wait times.

The following command produces the report shown below:
::
IOACTIVITY
REPORT
   LEVEL(BUFFER)
::
OMEGAMON for Db2 PE Identifiers

The buffer pool report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be ordered by up to three OMEGAMON for Db2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note: Blank or null OMEGAMON for Db2 PE identifiers are denoted by the word 'BLANK'.

I/O REQUEST

TOTAL
The total number of I/O requests.

AET
The average elapsed time per I/O request.

READ REQUESTS

TOTAL
The number of read I/O requests of a specific type.

TYPE
The type of read request. The field can contain one of the following values:

SYNCH
Synchronous read request

SEQPF
Sequential prefetch requests (determined at bind time)

DYNPF
Dynamic prefetch request (triggered at run time by sequential detection logic)
LSTPF
List prefetch request

ZHYPL
Synchronous reads that used zHyperLink. This is a subset of the total synchronous reads.

If there are no read requests, a dash (—) is printed.

WITH I/O AET
The average elapsed time for a read of a specific type.

WITH I/O %
The percentage of total read requests of a particular type that resulted in an I/O.

WITH I/O PAGES/READ
Pages read per successful read request of a particular type.

W/OUT I/O %
The percentage of total read requests of a particular type that did not result in an I/O. This can occur because all the pages requested by a prefetch read were already in the buffer pool.

WRITE REQUEST

TOTAL
The number of write I/O requests of a specific type. Up to two lines are generated, depending on the write type.

For synchronous writes: count of matching IFCID 008 and 009 record pairs
For asynchronous writes: count of matching IFCID 009 and 010 record pairs

TYPE The type of write request. The field can contain one of the following values:
SYNCH Synchronous write request
ASYNC Asynchronous write request

If there are no write requests, a dash (—) is printed.

CASTOUT
The number of synchronous and asynchronous writes due to coupling facility castouts. This field contains one of the following values:
YES The write operations were initiated due to a coupling facility castout.
NO The write operations were initiated as a normal write I/O.

AET The average elapsed time per write of a specific type.

PAGES/WRITE
The number of pages written per write of a specific type.

DB OPEN
The number of database open requests.
PAGE FAULTS
The number of anticipated page faults. Real storage frames are tested before issuing write.

ACTIVE BUFFERS
The number of active buffers in the pool.

UPDATED PAGES
The number of updated pages in the deferred write queue for the buffer pool that is identified in field QW0008BP or QW0010BP.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.

EDM pool detail report:
The EDM pool report provides information about the number of cursor table, package table, or database directory requests, loads from the DASD, their average elapsed times, and the average section lengths of the loaded data items.

Note: The OMEGAMON for Db2 PE Statistics reports and traces include EDM pool statistics. Refer to “Statistics report set” on page 4267 for more information.

The following command produces the EDM pool report shown in “I/O Activity EDM Pool Report.”

```
I/O ACTIVITY REPORT
- EDM POOL

I/O Activity - Detail Report

Column description

The following is a description of each column printed in the EDM pool report:

**OMEGAMON for Db2 PE Identifiers**
The EDM pool report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be ordered by up to three OMEGAMON for Db2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

**Note:** Blank or null OMEGAMON for Db2 PE identifiers are denoted by the word 'BLANK'.

**PACKAGE / DDB / PLAN NAME**
The name of the cursor table, package table, or database directory. The package name is printed on four lines, and consists of the following fields:

- **LOCN** Location name
- **COLL** Collection identifier
- **PKID** Package identifier
- **CTKN** Consistency token

**TYPE** The type of data being accessed.
CT/PT/DBD REFERENCE
The number of cursor table, package table, or database directory requests performed by the data type specified in the TYPE column.

NOT IN EDM POOL
The number of times cursor table, package table, or database directory was not found in the EDM pool. If it is not found in the EDM pool, the request can be satisfied from the buffer pool or the DASD.

ELAPSED TIME PER LOAD
The average elapsed time of loads from the buffer pool or DASD.

AVERAGE SECTION LENGTH (BYTES)
The average section length of a loaded data item identified in the TYPE column.

TYPE TOTAL
When the data contains two or more EDM records with the same data type and the same OMEGAMON for Db2 PE identifiers, a type total line is printed with the following heading:
- DBD TOTAL for type DBD
- PLANNAME TOTAL for type CT
- PACKAGE TOTAL for type PT

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.

Active log detail report:

The active log report provides information about the writing and retrieving of log records. It presents the number of reads, writes, and non-I/O waits related to the active log and the average elapsed times spent waiting for these events.

The report is ordered by the data set identifier.

The following command produces the active log report shown in "I/O Activity Log Report."

```
IOACTIVITY REPORT
   LEVEL (ACTLOG)
```

I/O Activity Log Report

This is an example of the I/O Activity log report.

I/O ACTIVITY REPORT COMPLETE

Column description

The following is a description of each column printed in the active log report:

OMEGAMON for Db2 PE Identifiers

The active log report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be ordered by up to three OMEGAMON for Db2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note:

1. Blank or null OMEGAMON for Db2 PE identifiers are denoted by the word ‘BLANK’.
2. DATASET is the most significant identifier. It is the 8-byte ID that identifies the active log data set where the reported activity occurs. It has the value ACTLGCxx, where c is the copy number and xx is the sequence number of the active log data set.

I/O REQ
I/O Activity - Detail Report

TOTAL
The total number of I/O requests.
AET  The average elapsed time of all waits.

READ REQ

TOTAL
The total number of read requests.
AET  The average elapsed time of a read request.

WRITE REQUESTS

TOTAL
The total number of write requests.
AET  The average elapsed time of a write request.
CI/WRITE
The number of control intervals per write.

OTHER WAITS

ALLOC
The number of waits for resource allocation.
AET  The average elapsed time of a wait for resource allocation.
DEALLOC
The number of waits for resource deallocation.
AET  The average elapsed time of waits for resource deallocation.
OPEN  The number of waits to open data sets.
AET  The average elapsed time of a wait to open data sets.
CLOSE
The number of waits to close data sets.
AET  The average elapsed time of a wait to close data sets.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.

Bootstrap data set detail report:

The archive log/BSDS report provides information about the writing of log records and the retrieval of log data. It also contains information about the bootstrap data set that controls the movement of full active log data sets to the archive log.
The report presents the following activity types:

- Archive waits
- Archive read requests
- Archive offload requests
- BSDS read requests
- BSDS write requests

**Archive Log Activity:**

This section shows an example of how to produce the Archive Log/BSDS report and explains fields and columns shown in the report.

The following command produces the Archive Log/BSDS report in "I/O Activity—Archive Log Activity Report."

```
I/OACTIVITY
REPORT
LEVEL (ARCLOG)
```

**I/O Activity—Archive Log Activity Report**

This is an example of an archive log/BSDS report.

3442 IBM Db2 Performance Expert on z/OS
**Column description**

The following is a description of each column printed in the archive log activity section of the archive log/BDS report.

**OMEGAMON for Db2 PE Identifiers**

The archive log activity report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be ordered by up to three OMEGAMON for Db2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

**Note:**

1. Blank or null OMEGAMON for Db2 PE identifiers are denoted by the word 'BLANK'.

2. **DATASET** is the most significant identifier. It is the 8-byte ID that identifies the archive log data set where the reported activity occurs. It has the value \textit{cxxxxxxx}, where \(c\) is the copy number and \(xxxxxxx\) is the sequence number. The sequence number is the same as the last seven characters of the data set name.

**WAIT TYPE**

**READ FROM DASD**

The total number of waits and the average elapsed time of a wait for archive log reads from the DASD.

**READ FROM TAPE**

The total number of waits and the average elapsed time of a wait of archive log reads from the tape.

**OFFLOAD**

The total number of waits for archive log write requests and the average elapsed time of waits per archive log write.
OTHER
The total number of non-I/O waits and the average elapsed time of non-I/O waits on the archive log data set.

OTHER WAITS
The following fields identify the other waits section.

ALLOCATE
The total number of waits and the average elapsed time of a wait for resource allocation.

DEALLOCATE
The total number of waits and the average elapsed time of a wait for resource deallocation.

OPEN
The total number of waits and the average elapsed time of a wait to open a data set.

CLOSE
The total number of waits and the average elapsed time of a wait to close a data set.

HSM RECALL
The total number of waits and the average elapsed time of a wait for HSM to recall data sets.

CATALOG LOCATE
The total number of waits and the average elapsed time of a wait to locate data sets through the catalog.

MULTI DATA SET TAPE VOLUME
The total number of waits and the average elapsed time per wait for multi-data set tape volume.

TAPE VOLUME POSITIONING
The total number of waits and the average elapsed time per wait for tape volume positioning.

WTOR ISSUED
The total number of waits and the average elapsed time of waits due to a write-to-operator message being issued.

DATA SET UNAVAILABLE
The total number of waits and the average elapsed time of a wait due to a data set being unavailable.

PHYSICAL UNIT UNAVAILABLE
The total number of waits and the average elapsed time of a wait due to an unavailable physical unit.

READER SERVICE UNAVAILABLE
The total number of waits and the average elapsed time per wait for an unavailable reader service task.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and
there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

**GRAND TOTAL**
A grand total is printed at the end of each location if there is more than one first-level identifier reported.

*Bootstrap Data Set Activity:*

This section shows an example of how to produce the Bootstrap Data Set (BSDS) report and explains fields shown in the report.

The following command produces the archive log/BSDS report in "I/O Activity—Bootstrap Data Set Activity."

```
; I/OACTIVITY REPORT
   LEVEL (ARCLOG)
```

I/O ACTIVITY REPORT COMPLETE
Field description

The following field descriptions are for the bootstrap data set activity section of the archive log/BSDS report.

OMEGAMON for Db2 PE Identifiers

The bootstrap data set activity report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be ordered by up to three OMEGAMON for Db2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.

Note:
1. Blank or null OMEGAMON for Db2 PE identifiers are denoted by the word 'BLANK'.
2. DATASET is the most significant identifier. It is the 8-byte ID that identifies the BSDS data set where the reported activity occurs. It can have either of the following values:
   • BSDS0001
   • BSDS0002

WAIT TYPE

READ  The total number of BSDS reads and the average elapsed time per BSDS read.

WRITE  The total number of BSDS writes and the average elapsed time per BSDS write.

READ AND WRITE  The total number of BSDS reads and writes and the average elapsed time per BSDS read and write.

SUBTOTAL  When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL  When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL  A grand total is printed at the end of each location if there is more than one first-level identifier reported.

Cross-invalidation activity detail report:

The cross-invalidation report presents buffer refresh events due to cross invalidation summarized by selected OMEGAMON for Db2 PE identifiers. If two DB2 systems compete for read/write interest on a page set or partition, a certain amount of buffer cross-invalidation activity occurs to maintain DB2 buffer pool coherency between the two systems.
Cross-invalidation (XI) renders a higher percentage of the buffer pool data invalid. It has the effect of reducing the buffer pool size and thus the buffer pool hit ratio. Buffer pool pages must be continually refreshed when high cross-invalidation levels are reached. This can be a significant overhead in data sharing if workloads between DB2 systems are not properly balanced.

The following command produces the cross-invalidation report in "I/O Activity Cross-Invalidation Report."

```
IOACTIVITY
  REPORT
    LEVEL (XI)
```

### Column description

The following is a description of each column printed in the cross-invalidation report:

**OMEGAMON for Db2 PE Identifiers**

The XI report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be ordered by up to three OMEGAMON for Db2 PE identifiers. The identifiers used to sort the report are printed in the leftmost column. They are printed whenever they change. The second and third identifiers are indented to appear under the relevant column subheading.
I/O Activity - Cross-Invalidation Report

Note: Blank or null OMEGAMON for Db2 PE identifiers are denoted by the word 'BLANK'.

PAGE The name of the page involved in the cross invalidation. The name consists of the following parts:

DB Database name
OB Page set name
PIECE# Page set piece number
PAGE# Page number
BPID Buffer pool ID

If DATABASE or PAGESET are selected in the ORDER option, DB or OB are not shown as part of the page name.

SYNCHRONOUS READS
The number of times the page was refreshed via a synchronous read for a particular combination of OMEGAMON for Db2 PE identifiers and cross-invalidated page:

GBPOOL From the group buffer pool.
DASD From the DASD.

SEQUENTIAL PREFETCHES
The number of times the page was refreshed via a sequential prefetch for a particular combination of OMEGAMON for Db2 PE identifiers and cross-invalidated page:

GBPOOL From the group buffer pool.
DASD From DASD.

SUM OF
The totals for all pages within a combination of OMEGAMON for Db2 PE identifiers if two or more entries are printed in the PAGE column.

SUBTOTAL When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
A grand total is printed at the end of each location if there is more than one first-level identifier reported.

Locking Report Set
These topics provide information about the Locking reports.
For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide. It also provides information on input to locking reports.

**Member-Scope Traces and Reports**

Member-scope traces present events in chronological sequence within the DB2 subsystem (member) where the events occurred, whereas reports show these events aggregated by the OMEGAMON for Db2 PE identifiers you have specified.

OMEGAMON for Db2 PE can present data from several DB2 members within a data sharing group. The data in member-scope reports is presented by a combination of location, group, subsystem, and member. Whenever one of the values changes, a new page is started and the page number is initialized.

The information in this section is only applicable to DB2 data sharing environments.

**Note:** For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

### Member-Scope Locking Trace

This is an example of a Member-Scope Locking trace.

</table>
Group-Scope Traces and Reports

In group-scope traces, events are reported in a chronological sequence within the DB2 data sharing group, regardless of which member of the group actually generated the events.

The member name is printed in the body of the trace for each reported event, so that it is easy to see the member where the event occurred. Similarly, group-scope reports show events that are aggregated by the OMEGAMON for DB2 PE identifiers you specified. Data in group-scope reports is presented by member.

The information in this section is only applicable to DB2 data sharing environments.
Locking Activity - Group-Scope

**Note:** For an introduction to the Locking report set and general locking information refer to the [Reporting User’s Guide](#).

### Group-Scope Locking Report

You can generate a Group-Scope Locking report as follows:

```locking
LOCKING
  REPORT
    SCOPE (GROUP)
    LEVEL (SUSPENSION)

```

This is an example of a Group-Scope Locking report:

```plaintext
LOCATION: USIBMSYSTDB2
GROUP: USIBMSYSTDB2

LOCKING REPORT - SUSPENSION
ORDER: DATABASE-PAGESET
SCOPE: GROUP
TO: 01/30/15 19:56:04.31
DB2 VERSION: V10

DATABASE PAGESET MEMBER --- LOCK RESOURCE --- TOTAL SUSPENDS LOCAL SUSPENDS LATCH SUSPENDS LATCH IRLMQ OTHER NMBR AET NMBR AET NMBR AET

'SPECIAL' 'BLANK' '

```

### Identifiers Used in Locking

**Note:** For an introduction to the Locking report set and general locking information refer to the [Reporting User’s Guide](#).

Identifiers Used in Locking
In addition to the standard OMEGAMON for Db2 PE identifiers, Locking reports and traces use two other identifiers to show the type of resource and event type:

**RESOURCETYPE-Resource type**  
The type of lock resource. You can specify one of the values shown in Table 261 on page 3461.

**TYPE-Event type**  
Specifies which event types are to be included in, or excluded from, the lock detail trace. The valid values for this field are shown in Table 260.

Table 260. Event Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Events</th>
</tr>
</thead>
<tbody>
<tr>
<td>IRLMREQ</td>
<td>Lock, unlock, change, query, and notify requests</td>
</tr>
<tr>
<td>CLAIMREQ</td>
<td>Claim acquire, claim change, and claim release</td>
</tr>
<tr>
<td>DRAINREQ</td>
<td>Drain request and drain release</td>
</tr>
<tr>
<td>PLockREQ</td>
<td>Page set or partition as well as page P-Lock requests</td>
</tr>
<tr>
<td>IRLMSUSP</td>
<td>The beginning of lock, unlock, change, query, and notify suspensions</td>
</tr>
<tr>
<td>DRAINSUSP</td>
<td>The beginning of drain suspensions</td>
</tr>
<tr>
<td>LATCHSUSP</td>
<td>The beginning of page latch suspensions</td>
</tr>
<tr>
<td>IRLMRES</td>
<td>The end (resumption) of lock, unlock, change, query, and notify suspensions</td>
</tr>
<tr>
<td>DRAINRES</td>
<td>The end (resumption) of drain suspensions</td>
</tr>
<tr>
<td>LATCHRES</td>
<td>The end (resumption) of page latch suspensions</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>Timeouts</td>
</tr>
<tr>
<td>DEADLOCK</td>
<td>Deadlocks</td>
</tr>
<tr>
<td>LOCKSUMMARY</td>
<td>Lock summary events</td>
</tr>
<tr>
<td>LOCKAVOID</td>
<td>Successful lock avoidance events</td>
</tr>
</tbody>
</table>

The default is all event types.

**Note:** TYPE can also be used with the REDUCE and FILE subcommands of locking. These subcommands support a limited number of types, as follows:

- Valid types for REDUCE are: IRLMRES, DRAINRES, and LATCHRES.
- Valid types for FILE are: IRLMREQ, CLAIMREQ, DRAINREQ, and LOCKAVOID.

If a non-valid type for REDUCE or FILE is used with EXCLUDE, the event type is not filtered.

If no valid types for REDUCE or FILE are used with INCLUDE, an empty report or file is produced.

**The Locking Header of Reports and Traces**  
This topic describes the headers and fields of Locking reports and traces. The report header and trace header are similar for all reports and traces. All other report or trace sections differ depending on the type of report and are described in the respective report or trace topics.
Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

Layout of a Locking Report Header

The following example shows the layout of a report header, where the letter x is a placeholder marking the maximum size of the data section of each field.

LOCATION: xxxxxxxxxxxxxxxxxxx
GROUP: xxxxxxx
MEMBER: xxxxxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vn Rn

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R34M0)
LOCKING REPORT - xxxxxxxxxx
ORDER: xxxxxx
SCOPE: xxxxxx
PAGE: 1-n
REQUESTED FROM: mm/dd/yy hh:mm:ss.nn
TO: mm/dd/yy hh:mm:ss.nn
INTERVAL FROM: mm/dd/yy hh:mm:ss.nn
TO: mm/dd/yy hh:mm:ss.nn

Layout of the Locking Trace Header

All traces have the same layout. This example shows the layout of a trace header, where the letter x is a placeholder marking the maximum size of the data section of each field. In this example the trace is ordered by the event timestamp.

LOCATION: xxxxxxxxxxxxxxxxxxx
GROUP: xxxxxxx
MEMBER: xxxxxxx
SUBSYSTEM: xxxx
DB2 VERSION: Vn Rn

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0)
LOCKING TRACE - xxxxxxxxxx
SCOPE: xxxxxx
PAGE: 1-n
REQUESTED FROM: mm/dd/yy hh:mm:ss.nn
TO: mm/dd/yy hh:mm:ss.nn
INTERVAL FROM: mm/dd/yy hh:mm:ss.nn
TO: mm/dd/yy hh:mm:ss.nn
ACTUAL FROM: mm/dd/yy hh:mm:ss.nn
PAGE DATE: mm/dd/yy

Field descriptions of Locking headers

Headings are printed on all reports and traces at the start of each page. Locking reports and traces carry the following header information:

LOCATION
The DB2 reporting location. If the location name is not available, the DB2 data sharing group name is printed in this field. If the DB2 data sharing group name does not exist, the DB2 subsystem ID is printed.

GROUP
The name of the DB2 data sharing group. This field shows N/A if there is no group name.

MEMBER
The name of the DB2 data sharing member or the member name of the DB2 subsystem. This field shows N/A if there is no member name.

This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

SUBSYSTEM
The ID of the DB2 subsystem that generated the data. This field is not printed on the report page showing the GROUP BUFFERPOOLS PARAMETERS.

DB2 VERSION
The DB2 version number of the subsystem that generated the data.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (VnRnMn)
The product name and the version, release, and modification level.

REPORT or TRACE type
For report, this can be:
- SUSPENSION
- LOCKOUT
- DETAIL

For trace, this can be:
Locking Activity - Report Identifiers

- DEADLOCK
- TIMEOUT
- SUSPENSION
- LOCKOUT
- DETAIL

ORDER
If the ORDER option of the REPORT or TRACE subcommand was used to arrange the report entries, the selected keywords are shown in this field. Depending on the context, the OMEGAMON for Db2 PE identifiers by which lock events are grouped are shown here.

SCOPE
Scope of the report or trace, this can be MEMBER or GROUP. A member-scope report or trace shows data from a group for each individual member. In a group-scope report or trace, the data from individual members is consolidated and presented for the entire group.

PAGE
The page number in the format \textit{lll-nnnnmm}, where \textit{lll} denotes the location number within the report and \textit{nnnnmm} the page number within the location.

REQUESTED FROM and TO
The FROM and TO dates and times specified in the REPORT or TRACE subcommand.

If both FROM and TO dates and times are omitted from the REPORT subcommand, the FROM and TO dates and times specified in GLOBAL are printed. If only the FROM date and time or only the TO date and time has been specified, NOT SPECIFIED is printed for the unspecified value.

If FROM and TO are not specified in REPORT or GLOBAL, NOT SPECIFIED appears for both the FROM and TO values.

If you have specified FROM and TO times without dates in REPORT or GLOBAL, ALL DATES is printed along with the specified times.

INTERVAL FROM
The start date and time of the first reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

INTERVAL TO
The end date and time of the last reduction interval covered by the report. If REDUCE is not specified, the INTERVAL defaults to 0 and the timestamps of the first and last events are printed.

ACTUAL FROM/TO
The date and time of the first and last record included in the log for a location, group, subsystem, or member.

PAGE DATE
The date of the timestamps printed on this page. A page break occurs at the change of the date. This is useful if a trace page contains more than one entry and the date is not shown for each entry.

Locking Activity Report
Here you find a detailed description about Locking activity reports.

\textbf{Note}: For an introduction to the Locking Activity report set and general locking information refer to the \textit{Reporting User’s Guide}.
Lock Suspension Report:

The Lock Suspension report summarizes all Lock Suspension activities across a specified time period.

The suspensions are reported by any combination of up to three OMEGAMON for Db2 PE identifiers. The report summarizes the Lock Suspension activities of:

- An IRLM request (except when the resource type is a drain lock).
- An IRLM request where the resource type is a drain lock.
- A drain request where the claim count is not zero.

This suspension occurs when the agent making the drain request has to wait for the claim count on the particular resource to become zero.

- A suspension of a page latch request.

This suspension occurs when the agent making the page latch request has to wait for a page which is currently being held by another agent.

The Lock Suspension report is produced if level SUSPENSION is specified in the REPORT subcommand. The ORDER subcommand specifies by which OMEGAMON for Db2 PE identifiers the report is to be sorted.

Optionally, the SPREADSHEETDD subcommand option can be used to create a data set with Lock Suspension data that can be imported in spreadsheet programs for individual analyses. Refer to “Using Lock Suspension Data with Spreadsheets” on page 3466 for more details.

Every suspension results in a normal resume or a lockout (deadlock or timeout), or is canceled (in the case of page latch suspensions). In any case, and if the suspension delay is unacceptable, review the plans and associated tables and indexes.

"[Layout of a Suspension Report]" shows the layout of a suspension report. The letter x is a placeholder marking the maximum size of a field. See "Lock Suspension Report" on page 3466 for an example of a suspension report.

The report presents data summarized by OMEGAMON for Db2 PE identifiers. The report can be sorted by up to three identifiers. For group-scope reports, the member name is added implicitly as an additional identifier and sort criterion.

Layout of a Suspension Report

This is the layout of a suspension report.

"[Layout of a Suspension Report]" shows the layout of a suspension report. The letter x is a placeholder marking the maximum size of a field. See "Lock Suspension Report" on page 3466 for an example of a suspension report.
Field description

The header information to this report is described in “The Locking Header of Reports and Traces” on page 3457.

IDENT1XX, IDENT2XX, IDENT3XX

These mark the positions where the order criteria are listed and reported.

In group-scope reports, MEMBER is automatically added as the second, third, or fourth identifier.

If you specify DATABASE, PAGESET, or both, in the ORDER option, the database name, page set name, or both names, are removed from the resource name. In this case, ‘BLANK’ is printed.

MEMBER

Group member name of the DB2 subsystem. This is only printed for member-scope reports.

LOCK RESOURCE TYPE

The type of resource on which the suspended request is made. Valid values are shown in Table 261.

Table 261. Lock Resource Type

<table>
<thead>
<tr>

Table 261. Lock Resource Type (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKPT</td>
<td>Skeleton package table</td>
</tr>
</tbody>
</table>

Note, if the lock resource type has a value of SKPT the Lock Detail report shows compressed parts of the SKPT resource name as hexadecimal strings in reports and traces. It consists of the following parts:
- Collection ID, which is compressed (18 bytes)
- Program name, which is compressed (8 bytes)
- Consistency token (8 bytes)

With the hexadecimal value you can compare values of different locks. See "Layout of a Locking Detail report for the lock resource type SKPT" on page 3472 for an example of a Locking Detail report for the lock resource type SKPT.

SKPT resource names are shown for the Locking Activity report at the following LEVEL:
- LOCKOUT
- SUSPENSION

SKPT resource names are shown for the Locking Activity trace at the following LEVEL:
- LOCKOUT
- TIMEOUT
- SUSPENSION
- DETAIL

<table>

</tr>
<tr>
<td>VER#</td>
<td>Version number of LOB</td>
</tr>
</tbody>
</table>

Note:
1. The database names and object names are translations obtained from the IFCID 105 and 107 records. If these records are not available, the decimal representation of the database and object names are printed.
2. If you specify DATABASE, PAGESET, or both, in the ORDER option, the database name, page set name, or both names, are removed from the resource name and printed in the OMEGAMON for Db2 PE identifier column. If the name only consists of the database and page set, N/P is printed in the resource name column. If the resource name does not contain the database and page set, 'BLANK' is printed in the OMEGAMON for Db2 PE identifier column and all resource name parts are printed in the lock resource block.

TOTAL SUSPENDS
The number of suspensions for the particular combination of OMEGAMON for Db2 PE identifiers.

SUSPEND REASONS
The reason why a particular request was suspended. The requests composing the particular combination of OMEGAMON for Db2 PE identifiers and lock resource can be suspended for several reasons. The SUSPEND REASONS column shows all reasons identified by the IRLM resume records. Therefore, the sum of the counts in this column can differ from the TOTAL SUSPENDS count.

The categorized reasons for suspension are:

LOCAL
Local resource contention. This occurs when you request access to a local resource that is locked.

LATCH
IRLM latch contention. This occurs when the IRLM needs to serialize a resource. For example, the IRLM serializes the adding
and removing of locks to the lock table. The lock table is latched for a short period of time, and the resulting suspensions, if any, are brief.

**GLOB.**
Global contention. This occurs when you request access to a global resource that is locked.

**IRLMQ**
IRLM queued request.

**S.NFY**
Intersystem message sending.

**OTHER**
Suspensions other than those listed here. Suspensions reported as OTHER are either serviceability values, drain suspensions, contentions with retained locks, or page latch suspensions.

**RESUME REASONS**
The reasons for resumption of the suspended tasks. The reason can be normal, timeout, deadlock, and canceled (canceled only applies to page latch suspensions).

**NORMAL NMBR**
The number of suspensions that ended when the task resumed normal processing after completion of the lock request. In page latch suspensions, this is the number of suspensions where the latch requester was not canceled.

**NORMAL AET**
The average elapsed time of a suspension that ended in the task resuming normally. In page latch suspensions, this is the average elapsed time of a suspension where the latch requester was not canceled.

The format for this field is $ssss.nnnnnn$.

**TIMEOUT NMBR**
The number of waits to access locked resources that resulted in exceeding a preset time interval.

**TIMEOUT AET**
The average elapsed time of a resumption due to a timeout.

The format for this field is $ssss.nnnnnn$.

**CANCEL NMBR**
The number of page latch suspensions that ended with the latch requester being canceled.

**CANCEL AET**
The average elapsed time of a page latch suspension that ended with the latch requester being canceled.

The format for this field is $ssss.nnnnnn$.

**DEADLOCK NMBR**
The number of deadlocks.

**DEADLOCK AET**
The average duration of a deadlock.

The format for this field is $ssss.nnnnnn$. 
SUM OF
The sum printed for the lowest-level identifier when there is more than one combination of request type, resource type, and lock resource reported under it.

GROUP TOTAL
The sum of report entries that belong to a data sharing group if more than one member of the group is reported for a particular combination of OMEGAMON for Db2 PE identifiers. A GROUP TOTAL only appears in group-scope reports.

SUBTOTAL
When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

TOTAL
When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

GRAND TOTAL
If there is more than one first-level identifier reported, a grand total is printed at the end of each group in a group-scope report or at the end of each member in a member-scope report.

Lock Suspension Report

The following sample suspension report is produced with this command:

LOCKING REPORT

This is a sample Lock Suspension report.

Using Lock Suspension Data with Spreadsheets:

This section provides the necessary information to enable you to use lock suspension report data that is created with the LOCKING REPORT SPREADSHEETDD command in a spreadsheet program.

It is assumed that you created a data set with lock suspension data on the host by using the SPREADSHEETDD option of the LOCKING REPORT command. Refer to the Report Command Reference for more information about the SPREADSHEETDD option. Further, it is assumed that you downloaded the data set to your client as a
text file (choose ascii or text, not binary, as transfer type in your file transfer program). The data set should be available as a plain text file in ASCII format on your client.

It is assumed that you are familiar with the use of spreadsheet programs. Modern spreadsheets provide means to import data from plain text files, provided that data in these files is organized as records and individual fields of the records are separated by a known separator character. The file containing lock suspension data has its fields separated by colons (:) Therefore, you must specify the colon as the separator character (also called a delimiter) when you are importing the data into the spreadsheet program. See the help information of the spreadsheet of your choice for details on how to import data.

After the data is imported to your spreadsheet, the records from the plain text file are represented in spreadsheet rows and the fields are represented in spreadsheet columns.

The remainder of this section describes details about the data as it is initially represented in the spreadsheet. Further use, such as sorting, filtering, analysis, and interpretation is not described. For the latter, see “Lock Suspension Report” on page 3460.

• The first row contains report header information, similar to OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0) Locking Report Suspension.

You might notice how the colon-separated format in the plain text file converts to subsequent cells in a spreadsheet row.

OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0) :Locking;Report :Suspension

• The second row contains the column labels, as shown in Table 263. Approximately 35 columns are shown; the precise number depends on what was specified with the ORDER subcommand option when the data was generated.

• The third and all following rows contain the accumulated lock suspension data values.

Empty cells represent missing data values, usually shown in reports as N/A, N/C, or N/P.

Lockout Report:

The lockout report summarizes timeouts and deadlocks occurring within a specified period of time.

The report shows the number of times an agent, identified by up to three OMEGAMON for Db2 PE identifiers, has been timed out or involved in a deadlock when requesting a particular resource. In addition, it shows the other contenders for the resource and the number of times they act as holders or waiters.

There is no correlation between the number of deadlock events reported by Locking reports and traces and the number of deadlocks reported in Accounting and Statistics reports. Whereas Accounting and Statistics reports count all deadlock occurrences, regardless of how they resolve, Locking reports only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process roll back, thereby releasing the locks it holds on resources, or by requesting a process to terminate.

The lockout report is produced if level LOCKOUT is specified in the REPORT subcommand and if there is at least one combination of a lockout agent's identifier satisfying the FROM and TO, and INCLUDE or EXCLUDE criteria.

The ORDER subcommand specifies by which OMEGAMON for Db2 PE identifiers the report is to be sorted. You can specify up to three identifiers.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User's Guide.

Layout of a Lockout Report

This is the layout of a lockout report. The letter x is a placeholder marking the maximum size of a field. See “Example of a Lockout Report” on page 3471 for an example of a lockout report.
Locking Activity - Lockout Report

Field description

Here is a description of all fields except for the report header, which is described in "The Locking Header of Reports and Traces" on page 3457.

LOCK RESOURCE TYPE
The type of resource involved in the lockout. Valid values are shown in Table 261 on page 3461.

LOCK RESOURCE NAME
The name of the resource on which the timeout or deadlock occurred. Each part of the lock resource name is printed on a separate line. The abbreviations shown in the report are explained, in alphabetical order, in Table 262 on page 3463.

TIMEOUTS
The number of times the resource was involved in a timeout.

DEADLOCKS
The number of times the resource was involved in a deadlock.

There is no correlation between the number of deadlocks reported by Locking reports and traces and the number of deadlocks reported in Accounting and Statistics reports. Whereas Accounting and Statistics reports count all deadlock occurrences, regardless of how they resolve, Locking reports only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process roll back, thereby releasing the locks on resources, or by requesting a process to terminate.

AGENTS
The agents in contention for the resource during the lockout. This block consists of the following columns:

MEMBER
The agent's member name. In a non-data-sharing environment, this field shows N/P.

PLANNAME
The agent's plan name or the word SYSTEM if there is contention with a retained lock.

CONNECT
The agent's connection name.

CORRID
The agent's correlation identifier.

BLOCKER/HOLDER
For timeouts, the number of times the agent held the resource during the lockout.
For deadlocks, the number of times the agent was the blocker, either as a holder or a waiter.

WAITER
The number of times the agent waited for the resource during the lockout.

LOCKOUTS FOR
The number of timeout and deadlock records aggregated for the currently reported set of OMEGAMON for Db2 PE identifiers.

For timeouts, this value is equivalent to the sum of the entries in the TIMEOUTS column.
A deadlock record involves several resources. Therefore, this value differs from the sum of the entries in the DEADLOCKS column.

**GROUP TOTAL**

The sum of report entries that belong to a data sharing group if more than one member of the group is reported for a particular combination of the DB2 identifiers. A GROUP TOTAL only appears in group-scope reports.

**SUBTOTAL**

When a report is ordered by three identifiers and there is more than one third-level identifier reported under it, a subtotal is printed each time the second-level identifier changes.

**TOTAL**

When a report is ordered by two or three identifiers and there is more than one second-level identifier reported under it, a total is printed each time the first-level identifier changes.

**GRAND TOTAL**

If there is more than one first-level identifier reported, a grand total is printed at the end of each group in a group-scope report or at the end of each member in a member-scope report.

### Example of a Lockout Report

The following command is used to produce the example of the Lockout report:

```sql
LOCKING
 REPORT
 LEVEL (LOCKOUT)
```

Here is the example of the Lockout report:

<table>
<thead>
<tr>
<th>LOCATION: STLEC1</th>
<th>GROUP: N/P</th>
<th>LOCKING REPORT - LOCKOUT</th>
<th>ORDER: PRIMAUTH-PLANNAME</th>
<th>SCOPE: MEMBER</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>DB2 VERSION: V10</th>
<th></th>
<th></th>

<td>LBZUTT1</td>
<td></td>
</tr>
</tbody>
</table>

**LOCKING REPORT COMPLETE**

**Locking Detail Report:**

The Locking Detail (also referred to as Lock Detail) report is based on IFCID 21, which records the detail lock requests.

The Locking Detail report is produced if level DETAIL is specified in the REPORT subcommand.

The ORDER subcommand specifies by which OMEGAMON for Db2 PE identifiers the report is to be sorted. In this sample the data is accumulated and ordered by DATABASE-PAGESET.
Locking Activity - Lock Detail Report

“The Layout of a Locking Detail Report” shows the layout of a Locking Detail report. The letter x is a placeholder marking the maximum size of a field. See “Locking Detail Report” on page 3474 for an example of a Locking Detail report.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide

Layout of a Locking Detail Report

You can generate a Locking Detail report as follows:

```
LOCKING
REPORT
  SCOPE (MEMBER)
  LEVEL (DETAIL)
```

```
LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: x
```

```
DATABASE --- LOCK RESOURCE --- TOTAL LOCAL LOCK UNLOCK IS IX SIX NSU MAN CMT ALLOC COND
PAGESET TYPE NAME ---REQ TYPE--- -----LOCK STATE------ ---LOCK DURATION---
```

```
**TSNAME**
LOCK TYPE resource-name
```

```
**SUM OF TSNAME**
```

```
TOTAL
```

```
```

Note: If the lock resource type has a value of SKPT (skeleton package table locking) the Lock Detail report shows compressed parts of the SKPT resource name as hexadecimal strings in reports and traces. It consists of the following parts:

- Collection ID, which is compressed.
- Program name, which is compressed.
- Consistency token

With the hexadecimal value you can compare values of different locks. See “Layout of a Locking Detail report for the lock resource type SKPT” for an example of a Locking Detail report for the lock resource type SKPT.

Layout of a Locking Detail report for the lock resource type SKPT

Here is an example of the layout of a Locking Detail report for the lock resource type SKPT.

```
LOCATION: xxxx
GROUP: xxxx
MEMBER: xxxx
SUBSYSTEM: xxxx
DB2 VERSION: x
```

```
DATABASE --- LOCK RESOURCE --- TOTAL LOCAL LOCK UNLOCK IS IX SIX NSU MAN CMT ALLOC COND
PAGESET TYPE NAME ---REQ TYPE--- -----LOCK STATE------ ---LOCK DURATION---
```

```
TSNAME SKPT COLL(HEX)=x'11223344556677880900112323455667788'
PKD(HEX)=x'1122334455667788'
CTKN =0000000000000000
```

```
xxxxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx
xxxxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx xxxxxxxxxx
```

```
```
Field description

Here is a description of all fields except for the report header, which is described in “The Locking Header of Reports and Traces” on page 3457.

**LOCK RESOURCE TYPE**
The type of resource on which the lock detail request is made. Valid values are shown in Table 261 on page 3461.

**LOCK RESOURCE NAME**
The name on which the lock detail request is made. Each part of the lock resource name is printed on a separate line. The abbreviations shown in the report are explained, in alphabetical order, in Table 262 on page 3463.

**TOTAL REQ**
The total number of lock requests. The sum is calculated by adding the number of request types like LOCK, UNLOCK, CHANGE, or OTHER request types.

**LOCAL**
The number of lock requests that were not sent to cross-system extended services (XES). The sum is calculated by adding the number of request types like LOCK, UNLOCK, CHANGE, or OTHER request types found in the IRLM FUNCTION CODE if data indicates that the request was not sent to z/OS XES.

**XES**
The number of lock requests that were sent to cross-system extended services (XES). The sum is calculated by adding the number of request types like LOCK, UNLOCK, CHANGE, or OTHER request types found in the IRLM FUNCTION CODE if data indicates that the request was sent to z/OS XES.

**REQ TYPE**
The lock request types:
- LOCK  Lock function
- UNLOCK  Unlock function
- CHNGE  Change function
- OTHER  Any other functions

**LOCK STATE**
The lock state can be:
- IS  Intent share
- IX  Intent exclusive
- SIX  Share with intent exclusive
- NSU  Non shared update
- S  Share
Locking Activity - Lock Detail Report

X   Exclusive
U   Update

LOCK DURATION
The lock duration can be:

CMT   Commit
CMT+1 Commit + 1
ALLOC Allocation
MAN   Manual
MAN+1 Manual + 1
OTHER Other

COND
The number of lock requests with request type or mode CONDITIONAL.

AUTREL
The number of lock requests with request type or mode AUTOMATIC RELEASE.

TOTAL
Total lines are printed regardless of the number of different IDs printed before even if the report presents only a single ID.

Locking Detail Report

You can generate a Locking Detail report as follows:

```
LOCKING REPORT
  SCOPE (MEMBER)
  LEVEL (DETAIL)
```

```
"Locking Detail Report" shows a sample Locking Detail report, produced by the following command:

```
LOCKING REPORT
  LEVEL (DETAIL)
```

LOCATION: OMPDD0001
GROUP: N/P
MEMBER: DB2U001
SUBSYSTEM: DB2U
DB2 VERSION: V10

LOCATION: OMPDD0001
OMEGAMON XE FOR DB2 PERFORMANCE EXPERT (V5R4M0)
PAGE: 1-1
REQUESTED FROM: NOT SPECIFIED
TO: NOT SPECIFIED
ORDER: DATABASE-PAGESET
SCOPE: MEMBER
INTERVAL FROM: 03/04/15 08:54:13.83
TO: 03/04/15 09:02:47.51

```

### Locking Trace

**Note:** For an introduction to the Locking report set and general locking information refer to the [Reporting User’s Guide](#). It also provides information on input to locking.

The layout for locking traces is the same for each trace apart from the event-specific data. "Layout of a Deadlock Trace" on page 3479 [shows the general layout of the locking trace and describes the common fields.](#)

---

**Locking Report Complete**
### Field description

Here you find a description of all fields except for the trace header and the OMEGAMON for Db2 PE identifiers, for details of the trace header see "The Locking Header of Reports and Traces" on page 3457. The descriptions start with the timestamp block and move to the right.

**reporttype**
- This can be:
  - DEADLOCK
  - TIMEOUT
  - LOCKOUT
  - SUSPENSION
  - DETAIL

**EVENT TIMESTAMP**
- The time at which the event occurred. The trace is sorted and printed in the order of this timestamp. The format of this timestamp is `hh:mm:ss.nnnnnnnn`.

**RELATED TIMESTAMP**
- The timestamp of the suspended request that was selected as the victim of this event. This field only shows a value for suspension and detail traces. For other traces, this field always shows N/P because the related suspension event is not reported.

**EVENT**
- The Locking event. This varies according to the type of trace.

**LOCK RESOURCE TYPE**
- The type of locked resource. The values for the locked resource types are shown in Table 261 on page 3461.

**LOCK RESOURCE NAME**
- The name of the resource. Each part of the lock resource name is printed on a separate line. The format of the name depends on the resource type as shown in Table 262 on page 3463.

**EVENT SPECIFIC DATA**
- The layout and content of the event specific data varies according to the reported event and is described in the sections following.
Deadlock Trace:

The deadlock trace contains an entry for every occurrence of a deadlock during a specified time period.

The trace shows when the deadlock occurred and provides details on the resources involved in the deadlock and information about the threads that held the resource or waited to use the resource. If the resource was held by more than one agent and not all of them were actively involved in the deadlock, the holder data cannot be determined and is not printed.

The data specific to the deadlock. For each resource involved in a deadlock there is a block of waiter's data and a block of blocker's data.

A blocker is a thread that prevents the victim getting its lock. The blocker can be a holder of the lock or another waiter (one that came in before the victim) that is incompatible with the holder's lock.

There is no correlation between the number of deadlock events reported by Locking reports and traces and the number of deadlocks reported in Accounting and Statistics reports. Whereas Accounting and Statistics reports count all deadlock occurrences, regardless of how they resolve, Locking reports only those deadlocks that were resolved by DB2. DB2 can resolve a deadlock either by making a process roll back, thereby releasing the locks it holds on resources, or by requesting a process to terminate.

The format of the deadlock-specific data is shown in “The Format of Deadlock-Specific Data.”

Trace Data Specific to Deadlock Event: This topic describes the trace data that is specific to the Deadlock Event.

The Format of Deadlock-Specific Data

The following example shows the layout of Deadlock-Specific data.

```
COUNTER = XXXX
WAITERS = XXXX
TSTAMP = MM/DD/YY HH:MM:SS.sss
HASH = 'HHHHHHHHHHHHHHHHHHHH`

---------- BLOCKER is HOLDER ----------
LUW = XXXX.XXXXXX.XXXXXXXXXX
MEMBER = XXXX
PLANNAME = XXXX
CORRID = XXXX
DURATION = XXXX
PRIMAUTH = XXXX
STATE = XXXX
STMTINFO = XXXX
ENDUSER = XXXX
WSNAME = XXXX
TRANSAC = XXXX
PROGNAME = XXXX
COLLID = XXXX
LOCATION = XXXX
CONTOKEN = X
STMTID = X

-------- WAITER --------
LUW = XXXX.XXXXXX.XXXXXXXXXX
MEMBER = XXXX
PLANNAME = XXXX
CORRID = XXXX
DURATION = XXXX
PRIMAUTH = XXXX
REQUEST = XXXX
WORTH = XXXX
STATE = XXXX
STMTINFO = XXXX
ENDUSER = XXXX
WSNAME = XXXX
TRANSAC = XXXX
PROGNAME = XXXX
COLLID = XXXX
LOCATION = XXXX
CONTOKEN = X
STMTID = X
```
Field description

The individual fields have the following meaning:

**COUNTER**
- The deadlock interval counter.

**WAITERS**
- The number of waiters involved in the deadlock.

**TSTAMP**
- The time when the deadlock occurred.

**HASH**
- The lock resource hash value.

**LUW**
- The ID of the blocker's or waiter's logical unit of work.

**MEMBER**
- The blocker's or waiter's member name. In a non-data-sharing environment, this field contains N/P.

**CONNECT**
- The holder's or waiter's connection name.

**PLANNAME**
- The blocker's or waiter's plan name.

**CORRID**
- The blocker's or waiter's correlation name.

**DURATION**
- The lock duration of the deadlock blocker or waiter. Valid values are shown in Table 264.

### Table 264. Lock Duration

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANUAL</td>
<td>Varies depending on the ISOLATION parameter</td>
</tr>
<tr>
<td>MANUAL+1</td>
<td>Temporary change of consistency level from CS to RR during bind and DDL</td>
</tr>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
<tr>
<td>PLAN</td>
<td>For the duration of the plan</td>
</tr>
<tr>
<td>UTILITY</td>
<td>For the duration of the utility execution</td>
</tr>
<tr>
<td>INTEREST</td>
<td>For the duration of P-Locks</td>
</tr>
<tr>
<td>FREE ALL</td>
<td>Until all locks are freed</td>
</tr>
</tbody>
</table>

**PRIMAUTH**
- The primary authorization ID of the thread.

**REQUEST**
- The waiter's request, which can be one of the following:
  - LOCK
  - UNLOCK
  - CHANGE
The waiter's worth value assigned by DB2.

The holder's or waiter's state or mode of the lock applied to the resource. Valid values are shown in Table 265.

**Table 265. Lock State**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPS</td>
<td>Unprotected share</td>
</tr>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>

<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>SIX</td>
<td>Share with intent exclusive</td>
</tr>
<tr>
<td>NSU</td>
<td>Nonshared update</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

The statement information of the holder or waiter.

End user's user ID. This field is not shown when this information is not present.

End user's workstation name. This field is not shown when this information is not present.

The end user's transaction name. This field is not shown when this information is not present.

The program name can be one of the following:
- The name of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The waiter's program that is contending the resource.

The collection identifier can be one of the following:
- The package collection ID of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The package collection ID of the waiter's program that is contending the resource.

The location can be one of the following:
- The location of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The location of the waiter's program that is contending the resource.
CONTOKEN
The consistency token can be one of the following:
- The consistency token of the blocker's program that is currently in control at the time of the deadlock and not necessarily the program that acquired the lock.
- The consistency token of the waiter's program that is contending the resource.

STMTID
The statement ID of the holder or waiter.

Deadlock Trace Example: "Deadlock trace example" shows a sample deadlock trace, produced by the following command:

Locking Activity - Trace

Timeout Trace:

The timeout trace shows when a timeout occurred and provides details of the resource involved in the timeout event and information about the threads that held the resource or waited to use the resource.

The following sections show the layout of event-specific information for a timeout trace and describe the fields reported. At the end of this topic you find an example of a timeout trace.

Trace Data Specific to Timeout Event: The details related to the timeout. The format of the timeout-specific data is shown in "Format of timeout-specific data."

Format of timeout-specific data

The following example shows details related to the timeout.

REQUEST =LOCK UNCONDITIONAL |
STATE =X IS | ZPARM INTERVAL = 30 |
DURATION=COMMIT | INTERV.COUNTER= 1 |
HASH =X'00015F0F' |
STMTINFO=DYNAMIC |
STMTID =X'000000000000A341' |
----------- HOLDERS/WAITERS ----------- |
HOLDER |
LUW=DEIBMIPS.IPUAXZ32.C6215376BB44 |
MEMBER =S232 CONNECT =BATCH |

DURATION=COMMIT PRIMAUTH=SHA |
STATE =X STMTINFO=DYNAMIC |
STMTID =X'000000000000A312' |

Field description

The individual fields have the following meaning:

REQUEST

The timeout request, consists of one of the following:

- LOCK
- CHANGE

Followed by the timeout attribute CONDITIONAL or UNCONDITIONAL.
STATE
The state or mode of the lock applied to the resource. Valid values are shown in Table 265 on page 3482.

ZPARM INTERVAL
The timeout interval (ZPARM value), which is the timeout value specified on the installation panel DSNTIPX or in the ZPARM name STORTIME in DSN6SYSP.

DURATION
The length of time for which the lock was held. Valid values are shown in Table 266.

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANUAL</td>
<td>Varies depending on the ISOLATION parameter</td>
</tr>
<tr>
<td>MANUAL+1</td>
<td>Temporary change of consistency level from CS to RR during bind and DDL</td>
</tr>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
<tr>
<td>PLAN</td>
<td>Lock held for the duration of the plan</td>
</tr>
<tr>
<td>UTILITY</td>
<td>For the duration of the utility execution</td>
</tr>
<tr>
<td>FREE ALL</td>
<td>Until all locks are freed</td>
</tr>
<tr>
<td>X'00'</td>
<td>The suspension reason is a retained lock</td>
</tr>
</tbody>
</table>

The DURATION attribute controls when locks are released. As a general rule, a lock is only released when an agent makes an unlock request with a duration longer than, or equal to, the longest lock duration specified for the resource by that agent.

You increase lock durations using either a lock request or a change request. Lock durations are decreased using a change request.

INTERV.COUNTER
The number of timeout intervals that can occur before the agent is timed out.

HASH
The lock resource hash value.

STMTINFO
The waiter’s statement information. Possible values are:

STATIC
The statement is of type static.

DYNAMIC
The statement is of type dynamic.

STMTID
The cached statement ID for the statement waiting for the resource. A value of zero indicates that the client did not supply this information.
Fields that are printed for each holder/waiter

The following fields are printed for each holder/waiter of the reported lock resource:

- **LUW**: The ID of the holder's or waiter's logical unit of work. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **MEMBER**: The holder's or waiter's DB2 member name. In a non-data-sharing environment, N/P is printed.

- **CONNECT**: The holder's or waiter's connection name. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **PLANNAME**: The holder's or waiter's plan name. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **CORRID**: The holder's or waiter's correlation identifier. If the reason for the suspension is a retained lock, this field contains the word SYSTEM.

- **DURATION**: The lock duration of the timeout holder or waiter. Valid values are shown in Table 266 on page 3487.

- **PRIMAUTH**: The primary authorization ID.

- **STATE**: The holder's or waiter's state or mode of the lock applied to the resource. Valid values are shown in Table 265 on page 3482.

- **STMTINFO**: The holder's statement information. Possible values are:
  - **STATIC**: The statement is of type static.
  - **DYNAMIC**: The statement is of type dynamic.

- **STMTID**: The cached statement ID for the statement holding the resource. A value of zero indicates that the client did not supply this information.

Timeout Trace Example: "Timeout trace example" shows a sample Timeout trace, produced by the following command:

```
: LOCKING TRACE (TIMEOUT)
```

Timeout trace example

This is a sample Timeout trace:

```

Lock Suspension Trace:

The lock suspension trace identifies applications that have been suspended after a lock was requested on a resource that is not available.
The trace shows an entry for the suspension of each of the following:

- An IRLM request (except when the resource type is a drain lock).
- An IRLM request where the resource type is a drain lock.
- A drain request where the claim count is not zero.

This suspension occurs when the agent making the drain request has to wait for the claim count on the particular resource to become zero.

- A page latch request.

This suspension occurs when the agent making the page latch request has to wait for a page that is currently being held by another agent.

The lock suspension trace is produced if level SUSPENSION is specified in the TRACE subcommand and if there is at least one pair of IFCIDs 44/45, 213/214, 215/216, or 226/227 in the input data set satisfying the FROM and TO, and INCLUDE or EXCLUDE criteria.

The following sections show the layout of a lock suspension trace and describe the various fields of the trace. At the end of this topic you find an example of a lock suspension trace.

**Lock Suspension Trace Example:**

This topic shows an example of a Lock Suspension trace.

Enter the following command to produce a Lock Suspension trace:

```
LOCKING TRACE (LEVEL (SUSPENSION))
```

**Lock Suspension trace example**

This is a sample layout of a Lock Suspension trace.

**PARENT**

The parent token for explicit hierarchical locking.

**HASH**

The lock hash value.

The following fields are printed if both of the following conditions are satisfied:

- The OMEGAMON for Db2 PE subsystem is a member of a data sharing group.
- It is an IRLM suspension.

aaaaaaaaaaaaaaaaaaaaaaaaa

Stands for the lock attributes, which can be one or more of the following:

- MODIFY or NMODIFY
- GLOBAL or LOCAL
- P-LOCK or L-LOCK

**XES PROP**

An indicator whether or not IRLM propagated the request to XES. Possible values are Y(es) or N(o).

**XES FORC**

An indicator whether or not the lock was requested to be forced to XES. Possible values are Y(es) or N(o).

**XES ASYN**

An indicator whether or not IRLM sent the request asynchronously to XES. Possible values are Y(es) or N(o).

This field is only printed if XES PROP=Y.

**Lock Suspension Events - Lock, Unlock, Change, and Notify Resume:**

The format of the data for these events depends on whether these events occurred in a data sharing or non-data-sharing environment.

"Format of data specific to Lock, Unlock, Change, and Notify Resume (Data Sharing)" shows the format in a data sharing environment. "Format of data specific to Lock, Unlock, Change, and Notify Resume (Non-Data Sharing)" on page 3493 in a non-data-sharing environment.

**Format of data specific to Lock, Unlock, Change, and Notify Resume (Data Sharing)**

This is the sample format for data specific to Lock, Unlock, Change, and Notify Resume in a data sharing environment.
Format of data specific to Lock, Unlock, Change, and Notify Resume (Non-Data Sharing)

This is the sample format for data specific to Lock, Unlock, Change, and Notify Resume in a non-data-sharing environment.

SUSP.TIME = ss.nnnnnn
LOCAL CONTENTION = Y
RESUME RSN = xxxxxxxx
LATCH CONTENTION = Y*
IRLM QUEUED REQ = N

Description of individual fields

The individual fields have the following meaning:

**SUSP.TIME**
The duration of the suspension.

**DURATION**
The length of time the lock is held. For a list of possible values, refer to Table 267 on page 3491.

**STATE**
The state or mode of the lock applied to the resource. For a list of possible values, refer to Table 265 on page 3482.

**RESUME RSN**
The reason for resumption. Valid values are shown in Table 269.

### Table 269. Reason for Resume - IRLM Requests

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>The suspended task resumed normally when the resource became available.</td>
</tr>
<tr>
<td>DEADLOCK</td>
<td>The suspended task resumed after a deadlock.</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>The suspended task resumed when a preset time interval expired.</td>
</tr>
<tr>
<td>IDENTIFY</td>
<td>The suspended task is resumed after an identify call to IRLM.</td>
</tr>
</tbody>
</table>

**XES PROP**
An indicator whether or not IRLM propagated the request to XES. Possible values are Y(es) or N(o).

**XES FORC**
An indicator whether or not the lock was requested to be forced to XES. Possible values are Y(es) or N(o).

**XES ASYN**
An indicator whether or not IRLM sent the request asynchronously to XES. Possible values are Y(es) or N(o).

This field is only printed if XES PROP=Y.

X

Stands for the lock attributes. It can be one or more of the following:
- MODIFY or NMODIFY
- GLOBAL or LOCAL
- P-LOCK or L-LOCK

For example:
MODIFY GLOBAL L-LOCK

**PARENT**
The parent token for explicit hierarchical locking.

**HASH**
The lock hash value.

**Description of suspension fields**

A request can be suspended for several reasons. For example, the original reason may have been an IRLM latch contention, then the request may first have hit local contention and, after it was resolved, global level contention. The fields in the right block show whether or not a particular reason for suspension was encountered, which is indicated by Y(es) or N(o). The original reason is marked with an asterisk (*).

**LOCAL CONTENTION**
The local resource contention.

**LATCH CONTENTION**
The IRLM latch contention.

**IRLM QUEUED REQ**
The IRLM queued request. This request is only valid for IRLM suspensions.

**GLOBAL CONT.**
The global contention. Intersystem communication is required to resolve the lock request. This reason applies to data sharing environments only.

**NOTIFY MSG SENT**
Intersystem message sending. This reason only applies to data sharing environments and IFCID 44 suspensions.

Only applies if it is an IRLM suspension and the global contention is hit (GLOBAL CONT=Y). If these conditions are satisfied, it can be one of the following values:

**IRLM GLOBAL CONT**
The request hit IRLM global resource contention.

**XES GLOBAL CONT**
The request hit XES global resource contention.

**FALSE/SYNC-ASYNC**
This can be one of the following:

**FALSE CONT**
The request is a false contention (shown if QW0045W8 is ON)

**SYNC-TO-ASYNC CONV**
The request is a sync-to-async conversion (shown if QW0045W8 is OFF)

**RETAINED LOCK**
Indicates whether there was contention with a retained lock.
**Lock Suspension Events - Query Suspend:**

This topic shows the format of data specific to Query Suspend for Lock Suspension events. It also describes the fields provided for this event.

**Format of data specific to Query Suspend**

This is an example of the format of the data for this event.

```
ORIG.RSN=xxxxx xxxxxxxxx
```

**Field description**

This field shows the original reason for suspension. For a list of possible values, refer to [Table 268 on page 3491](#).

**Lock Suspension Events - Query Resume:**

This topic shows the format of data specific to Query Resume for Lock Suspension events. It also describes the fields provided for this event.

**Format of data specific to Query Resume**

The data specific to this event is derived from the IFCIDs 44/45 and 213/214. This is the format of the data for this event:

```
SUSP.TIME =s.nnnnnn LOCAL CONTENTION=Y
RESUME RSN=xxxxxxx LATCH CONTENTION=Y*
IRLM QUEUED REQ =N
RESUME RSN=xxxxxxx LATCH CONTENTION=Y*
IRLM QUEUED REQ =N
```

**Field description**

This field shows the original reason for suspension. For a list of possible values, refer to “Format of data specific to Lock, Unlock, Change, and Notify Resume (Data Sharing)” on page 3492.

**Lock Suspension Events - Drain Suspend:**

This topic shows the format of data specific to Drain Suspend for Lock Suspension events. It also describes the fields provided for this event.

**Format of data specific to Drain Suspend**

This is the format of the data for this event:

```
CLAIM NO=nnnnn CLASS=xxxxx
```

**Field description**

The individual fields have the following meaning:

**CLAIM NO**

The number of claims held on this resource.

**CLASS**

The claim class. Valid values are shown in [Table 270](#).

**Table 270. Claim Classes - DRAIN SUSPEND**

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>

</table>

Lock Suspension Events - Drain Resume:

This topic shows the format of data specific to Drain Resume for Lock Suspension events. It also describes the fields provided for this event.

The data specific to this event is derived from the IFCIDs 215 and 216. The format of the data for this event is shown in "Format of data specific to Drain Resume".

Format of data specific to Drain Resume

This is the format of the data for this event:

\[
\begin{align*}
\text{SUS.TIME} & = s.nnnnn \\
\text{CLASS} & = xxxxx \\
\text{RESM.RSN} & = xxxxxxxx \\
\text{CLAIM NO} & = nnnnn
\end{align*}
\]

Field description

The individual fields have the following meaning:

SUS.TIME
The duration of the suspension.

CLASS
The claim class. Valid values are shown in Table 270 on page 3495.

RESM.RSN
The reason for resumption. Valid values are shown in the following table.

Table 271. Reason for Resume - DRAIN RESUME

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>The suspended task resumed normally when the resource became available.</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>The suspended task resumed when a preset time interval expired.</td>
</tr>
</tbody>
</table>

CLAIM NO
The number of claims held on this resource.

Lock Suspension Events - Latch Suspend:

This topic shows the format of data specific to Latch Suspend for Lock Suspension events. It also describes the fields provided for this event.

Format of data specific to Latch Suspend

This is the format of the data for this event:

\[
\text{TYPE} = xxxxxxxx
\]
Field description

The field shown represents the type of the latch. It can have one of the following values:

Table 272. Latch Types - LATCH SUSPEND

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARED</td>
<td>S latch</td>
</tr>
<tr>
<td>EXCLUSIVE</td>
<td>X latch</td>
</tr>
</tbody>
</table>

Lock Suspension Events - Latch Resume:

This topic shows the format of data specific to Latch Resume for Lock Suspension events. It also describes the fields provided for this event.

Format of data specific to Latch Resume

This is the format of the data for this event:

```plaintext
SUS.TIME=s.nnnnnn
TYPE=xxxxxxxxx
STATUS =xxxxxxxxx
```

Field description

The individual fields have the following meaning:

**SUS.TIME**

The duration of the suspension.

**TYPE**

The type of latch. Valid values are shown in Table 272.

**STATUS**

The latch status. It can have one of the following values:

Table 273. Latch Status - LATCH RESUME

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORMAL</td>
<td>Normal completion of a page latch wait.</td>
<td></td>
</tr>
<tr>
<td>CANCELLED</td>
<td>The page latch wait was canceled before the latch was obtained. For example, the agent representing the latch was abnormally terminated during a page latch wait.</td>
<td></td>
</tr>
</tbody>
</table>

Lock Detail Trace Data:

The lock detail trace describes all locking events in a DB2 system. It includes those that can be viewed in suspension, timeout, or deadlock traces. This trace gives you a global view of the entire locking activity in the system.

You determine which locking events you want to see in a lock detail trace. You do this in the TRACE command by specifying the TYPE identifier in the INCLUDE and EXCLUDE options.

The lock detail trace is produced if level DETAIL is specified on the TRACE command and if there is at least one IFCID in the input data set that satisfies the FROM and TO, and INCLUDE or EXCLUDE criteria.
The following sections show the sample layout of a Lock Detail trace and describe the various fields of the trace.

Example of a Lock Detail Trace:

This topic shows an example of a Lock Detail trace.

`Lock Detail trace example` shows a sample Lock Detail trace, produced by the following command:

```
; LOCKING
 TRACING
   LEVEL (DETAIL)
 ;
```

Lock Detail trace example

This is the sample layout of a Lock Detail trace.

```
LOCATION: OMPDA21
GROUP: N/P
MEMBER: N/P
SUBSYSTEM: DA21
DB2 VERSION: 10

EVENT  TIMESTAMP  TYPE  NAME  DATA
---  --------  ----  ------  --------
19:45:53.99629213  LOCK  SKPT  DURATION=COMMIT

LOCKING TRACE COMPLETE
```

Locking Activity - Trace

Lock Detail Trace - Lock Summary:

This section shows the event specific data for Lock Summary.

The format of Lock Summary data

The following sample shows the format of the data for this event.

```
MAX PAGE & ROW LOCKS= 11  LOCKAV=YES
SHARED ESCAL= 0  EXCLUS. ESCAL= 0
MAX PAGE & ROW LOCKS= 1  LOCKAV=NO
TABLESPACE TYPE=UNSEGMENTED  SIZE=PAGE
TABLES WITH ESCALATIONS=XXXXXX
MAX STATE=XXXXX  PRE-ESCAL. STATE=XXXXX
```

Field description

The individual fields have the following meaning:

**MAX PAGE & ROW LOCKS**

The maximum number of page or row locks across all table spaces held concurrently for the thread.

If IFCID 020 is not present, N/A is printed in this field.

**LOCKAV**

Indicates if lock avoidance techniques are used within this unit of work across all table spaces. Possible values are Y(es) or N(0).

If IFCID 218 is not present, N/A is printed in this field.
SHARED ESCAL
The number of escalations to shared mode for the thread:
- For segmented table spaces, the number of tables that have escalated
- For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
- For simple and partitioned table spaces, the number of table spaces that have escalated

If IFCID 020 is not present, N/A is printed in this field.

EXCLUS.ESCAL
The number of escalations to exclusive mode for the thread:
- For segmented table spaces, the number of tables that have escalated
- For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
- For simple and partitioned table spaces, the number of table spaces that have escalated

If IFCID 020 is not present, N/A is printed in this field.

Fields that are printed once for each table space

The following fields are printed once for each table space:

MAX PAGE & ROW LOCKS
The maximum number of page or row locks per table space held concurrently by the thread.
If IFCID 020 is not present, N/A is printed in this field.

LOCKAV
Indicates if lock avoidance techniques are used for this table space. Possible values are Y(es) or N(o).
If IFCID 218 is not present, N/A is printed in this field.

TABLE SPACE TYPE
The table space type:

SIMPLE
Simple table spaces

SEGMENTED
Segmented table spaces

PARTITIONED
Partitioned table spaces

PARTIT.-SPL
Partitioned table spaces using selective partition locking (SPL)

If IFCID 020 is not present, the table space type is not printed.

SIZE
The lock size used, which can be one of the following:
- PAGE
- ROW
- TABLE
TABLES WITH ESCALATIONS
The number of tables within the table space for which escalations occurred. This field is only printed for segmented table spaces or partitioned table spaces using SPL.

If IFCID 020 is not present, N/A is printed in this field.

MAX STATE
The highest lock state for the table space. This field is only printed for simple table spaces or partitioned table spaces not using SPL.

If IFCID 020 is not present, N/A is printed in this field.

Possible values are shown in Table 274.

Table 274. Lock State

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>
</tr>
<tr>
<td>S</td>
<td>Share</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>SIX</td>
<td>Share with intent exclusive</td>
</tr>
</tbody>
</table>

PRE-ESCAL. STATE
The lock state before escalations. A list of values is shown in Table 274. If no escalation occurred, NO ESCALATIONS is printed.

This field is only printed for simple table spaces or partitioned table spaces not using SPL.

If IFCID 020 is not present, N/P is printed.

Lock Detail Trace - Lock, Unlock, and Change Requests:

This section shows the event specific data for Lock, Unlock, and Change Requests.

Format of Lock, Unlock, and Change Requests

The following sample shows the format of the data for these events.

DURATION=xxxxxxxx STATE=xxxxx XES PROP=x
RSN CODE=xxxxxxx RTNCD=xx XES FORC=x
aaaaaaaaaaaaaaaa xEX ASYN=x
PARENT =xxxxxxx CACHE=xxx
OWNER =xxxxxxx HASH=x 'hhhhhhhh'

Field description

The individual fields have the following meaning:

DURATION
The length of time the lock is held. Valid values are shown in Table 275.

Table 275. Lock Duration-IRLM Requests

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEREST</td>
<td>Duration used for P-Locks</td>
</tr>
<tr>
<td>MANUAL</td>
<td>Varies depending on the ISOLATION parameter</td>
</tr>
<tr>
<td>MANUAL+1</td>
<td>Temporary change of consistency level from CS to RR during bind and DDL</td>
</tr>
</tbody>
</table>
The duration controls when locks are released. A lock is usually only released when an agent makes an unlock request with a duration longer, or equal to, the longest lock duration the agent specified for the resource.

You can increase lock durations using either a lock request or a change request.

STATE

The state or mode of the lock applied to the resource. Valid values are shown in Table 276.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>
</tr>
<tr>
<td>S</td>
<td>Share</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>SIX</td>
<td>Share with intent exclusive</td>
</tr>
<tr>
<td>NSU</td>
<td>Nonshared update</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
<tr>
<td>N/A</td>
<td>Not applicable for NOTIFY SUSPEND</td>
</tr>
</tbody>
</table>

RTNCD

The return code issued in response to the request. The possible return codes are shown in Table 277.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful completion</td>
</tr>
<tr>
<td>4</td>
<td>Successful completion, lock state unchanged</td>
</tr>
<tr>
<td>8</td>
<td>Unsuccessful completion, system error</td>
</tr>
<tr>
<td>12</td>
<td>Unsuccessful completion, logic error in request</td>
</tr>
<tr>
<td>16</td>
<td>Unsuccessful completion, request specification not valid</td>
</tr>
</tbody>
</table>

RSN CODE

The reason code issued in response to the request. The reason code is not applicable for lock avoidance.
Locking Activity - Trace

Fields that are only printed if the DB2 subsystem is a member of a data sharing group

The remaining fields are only printed if the DB2 subsystem is a member of a data sharing group.

aaaaaaaaaaaaaaaaaaaaa

Stands for the lock attributes, which can be:

- MODIY or NMODIFY
- GLOBAL or LOCAL
- P-LOCK or L-LOCK

**PARENT**

The parent lock token if one was specified for explicit hierarchical locking. The field is only printed for LOCK REQUESTs.

If this field is not 0, the request applies to a child of a parent that has already been locked.

**CACHE**

The cached state of a P-Lock. For the state values, refer to Table 276 on page 3501.

This field is only applicable and printed for page set and partition P-Locks.

**OWNER**

The member name of the owner of a retained lock that caused this request to be denied and the owner of the lock that caused this request to time out. If neither of these conditions exist, this field is not printed.

**HASH**

The lock hash value.

**XES PROP**

An indicator whether or not IRLM propagated the request to XES. Possible values are Y(es) or N(o).

**XES FORC**

An indicator whether or not the lock was requested to be forced to XES. Possible values are Y(es) or N(o).

**XES ASYN**

An indicator whether or not IRLM sent the request asynchronously to XES. Possible values are Y(es) or N(o).

This field is only printed if XES PROP=Y.

**Lock Detail - Query Requests:**

This section shows the event specific data for Query Requests.

**Format of Query Requests**

This is an example of the format of the data for this event.

<table>
<thead>
<tr>
<th>RSN CODE</th>
<th>RTNCD</th>
</tr>
</thead>
</table>

For an explanation of the individual fields refer to Table 277 on page 3501

**Lock Detail - Claim Acquire, Change, and Release:**

This section shows the event specific data for Claim Acquire, Change, and Release.
Format of Claim Acquire, Change, and Release

This is an example of the format of the data for this event.

DURATION=xxxxxxxxx  CLASS=xxxxxx  RSN CODE=xxxxxxxx  RTNCD=x

Field description

The individual fields have the following meaning:

**DURATION**

The duration of the claim. The values for this field are shown in **Table 278**.

<table>
<thead>
<tr>
<th>Duration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMIT</td>
<td>Until commit</td>
</tr>
<tr>
<td>COMMIT+1</td>
<td>Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD</td>
</tr>
<tr>
<td>ALLOCATN</td>
<td>Until deallocation</td>
</tr>
</tbody>
</table>

**CLASS**

The claim class of the claim request. The values for this field are shown in **Table 279**.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS</td>
<td>Cursor stability read</td>

Lock Detail - Lock Avoidance:
This section shows the event specific data for Lock Avoidance.
This event does not have event-specific data.

Lock Detail - P-Lock Requests:
This section shows the event specific data for P-Lock requests.
P-Lock requests include the following events:
- **Page set or partition P-Lock request or page set or partition P-Lock negotiation request**
  These P-Locks track inter-DB2 interest on a linear page set (table space or index) or a partition of a partitioned page set.
  The cached state of the page set or partition P-Lock tells DB2 which data sharing protocols must be used to maintain inter-DB2 buffer coherency for the page set or partition. For example, a cached state of IS tells DB2 that whenever a page belonging to that page set or partition is read into the buffer pool, the page must be registered to the coupling facility for cross-invalidation purposes. If the cached state were SIX, the coupling facility page registration would not be necessary.
  Normally the P-Lock is held by DB2 in the cached state. The P-Lock state determines whether or not the page set or partition is GBP-dependent:
  - If the page set or partition P-Lock is held in S or X, then the page set or partition is not GBP-dependent.
  - Otherwise, the page set or partition is GBP-dependent.

- **Page P-Lock request or page P-Lock negotiation request**
  These P-Locks preserve the inter-DB2 cached page (buffer) coherency when row level locking is used and the page set or partition is actively R/W shared between two or more DB2 systems. The most common cases of subpage concurrency are row-level locking.

**Note:** Page P-Locking can add a significant overhead to data sharing if inter-DB2 workloads are not properly balanced. Class 21 is added to monitor these events.
without having to use the costly Class 7. However, page P-Lock events are recorded in Class 7 as well. Therefore, if Class 7 and 21 are both active, two records are reported for the same event.

The format of the data for these events is shown in “Format of Page Set or Partition P-Lock Requests” and “Format of Page P-Lock Requests.”

**Format of Page Set or Partition P-Lock Requests**

The following example shows the format of the data for this event.

REQUEST=xxxxxx OBJECT=xxxxxxxxxxx
MEMBER =xxxxxxxx REQUESTED STATE =xxxxx
OLD STATE=xxxxx OLD CACHED STATE=xxxxx
NEW STATE=xxxxx NEW CACHED STATE=xxxxx

Field description

Here is a description of the field labels shown in the previous examples:

**REQUEST**
The IRLM request type, which can be one of the following:
• LOCK
• UNLOCK
• CHANGE
• EXIT

**OBJECT**
The DB2 object type, which can be one of the following:
• TABLESPACE
• INDEXSPACE
• DATA PAGE
• HEADER PAGE
• INDEX PAGE
• SPACE MAP PAGE

**MEMBER**
A DB2 member name that depends on the request type:
• For exit requests, the name of the DB2 member in conflict with this member’s currently held P-Lock state.
• For lock, unlock, and change requests, for which P-Lock is rejected, the name of the DB2 member in conflict with this request.

**REQUESTED STATE**
The requested lock state. It only applies to lock, change, and exit requests.
For exit requests, this is the P-Lock state requested by the member causing the P-Lock exit of this member. If the request from the other member was not in conflict with the state of this member, this field shows NH.

The values for this field are shown in Table 286.

**Table 286. Lock State**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NH</td>
<td>Not held</td>
</tr>
<tr>
<td>IS</td>
<td>This DB2 has R/O interest on the page set or partition and one or more other DB2s in the group have R/W interest</td>
</tr>
<tr>
<td>IX</td>
<td>This DB2 has R/W interest on the page set or partition, one or more other DB2s in the group have R/O interest, and one or more can also have R/O interest</td>
</tr>
<tr>
<td>S</td>
<td>This DB2 has R/O interest on the page set or partition and no other DB2 in the group has R/W interest but one or more can have R/O interest</td>
</tr>
<tr>
<td>SIX</td>
<td>This DB2 has R/W interest on the page set or partition and no other DB2 in the group has R/W interest but one or more can have R/O interest</td>
</tr>
<tr>
<td>NSU</td>
<td>Nonshared update</td>
</tr>
<tr>
<td>X</td>
<td>This DB2 has R/W interest on the page set or partition and no other DB2 in the group has any interest</td>
</tr>
<tr>
<td>RD</td>
<td>Request denied</td>
</tr>
</tbody>
</table>

**OLD STATE**

The previously held P-Lock state.

The values for this field are shown in Table 286.

**NEW STATE**

The newly held P-Lock state.

The values for this field are shown in Table 286.

**OLD CACHED STATE**

The previous P-Lock cached state.

The values for this field are shown in Table 286.

**NEW CACHED STATE**

The new P-Lock cached state.

The values for this field are shown in Table 286.

Stands for the P-Lock attributes, which can be one or more of the following:

- UNCONDITIONAL or CONDITIONAL.
- RESTART or NONRESTART. Such a request instructs IRLM to convert a retained lock held by the DB2 system into an active lock. If the requested lock is not retained, IRLM grants the request as normal.
- MODIFY or NONMODIFY.

**Lock Detail - Notify Request:**

This section shows the event specific data for Notify request.
In some cases, DB2 data sharing uses the IRLM notify request to maintain non-buffer pool cache coherency between DB2 systems in the group. Examples of a notify request usage are DBD coherency and High Used RBA (HURBA) for a data set.

**Format of Data Specific to NOTIFY REQUEST**

This is an example of the format of the data for this event.

```
TYPE=xxxxxxxx  STATE=xxxx
WAIT=xxx      HOLDERS=xxxx
```

**Field description**

Here is a description of the field labels shown in the previous example:

**TYPE**  The type of notify operation. Possible values are SEND or RECEIVE.

**STATE**  The lock state. For a list of possible values, refer to [Table 276 on page 3501](#).

If this field contains one of the listed values, only those lock holders owning the lock in the specified state are notified.

**WAIT**  Indicates if the request is synchronous, that is, suspended until all responses are received, in which case WAIT=YES is printed, or asynchronous, that is, WAIT=NO.

**HOLDERS**  The number of holders notified.

This field is not applicable or printed if TYPE=RECEIVE.

**Lock Detail - Lock Escalation:**

This section shows the event specific data for Lock Escalation.

This trace shows details of a lock escalation. It is shown when data from IFCID 337 is present in the input data.

**Format of the Lock Escalation**

This sample shows the format of the data specific to Lock Escalation.

```
STATE =IS  NUMLOCKS= 815
STMTNO = 4711
STMTINFO=XXXXXXXXXXXXXXXXX
STMTID =X’XXXXXXXXXXXXXXXX’
COLLID =COLLECTIONXXXXXXXXX2XXXXXXXXX3
XXXXXXXXXXXXXXXXXXX5XXXXXXXXX6
XXXXXXXXXXXXXXX8XXXXXXXXX9
XXXXXXXXXXX0XXXXXXXXXX1XXXXXXXXX2
XXXXXXXXXZ
PACKAGE =PACKAGEXX1XXXXXXXXX2XXXXXXXXX3
XXXXXXXXXXXXXXXXXXX5XXXXXXXXX6
XXXXXXXXXXXXXXX8XXXXXXXXX9
XXXXXXXXXXX0XXXXXXXXXX1XXXXXXXXX2
XXXXXXXXXZ
```
Field description

**STATE**

The state or mode of the lock applied to the resource. Valid values are shown in Table 287.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>

<td>Share</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>SIX</td>
<td>Shared intent exclusive</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

**NUMLOCKS**

Number of held lower level locks that were released by escalation.

**STMTNO**

Statement number.

**STMTINFO**

The waiter statement information. Possible values are:

**STATIC**

The statement is of type static

**DYNAMIC**

The statement is of type dynamic.

**NONE**

No statement ID, no type.

**STMTID**

The waiter statement ID.

**COLLID**

Collection ID.

**PACKAGE**

Package name.

**The Locking File Data Set**

The locking file data set creates a sequential data set of formatted DB2 locking detail records that can be loaded into the OMEGAMON for Db2 PE performance database using the DB2 load utility.

Use the performance database to produce tailored reports using a reporting facility such as Query Management Facility (QMF).

The locking file data set contains a record for each occurrence of the following events:

- A LOCK, UNLOCK, CHANGE, or QUERY request processed by DB2
- A request to acquire a claim, change a claim duration, or release a claim
- A request to release a drain on a claim class
- Whenever lock avoidance is successful
The output of the FILE command is a sequential variable blocked data set.

The content of the output data set is determined by the FILE command options you specify, and by the input SMF/GTF records processed.

Descriptions of the layouts of these records can be found in the RKO2SAMP library. The member name is DGOLDNFL.

Note: For an introduction to the Locking report set and general locking information refer to the Reporting User’s Guide.

Record Trace Report Set

These topics provide information about the record trace reports.

Note: For an introduction to the Record Trace report set and general Record Trace information refer to the Reporting User’s Guide. It also provides information on input to Record Trace reports.

Record Headers

Records written in a record trace report are prefixed by a header. The header is rewritten if any of the header information changes.

Field description

The following information is reported in the trace header:

PRIMAUTH
The authorization ID under which the transaction is running. Derived from the DB2 field QWHCAID.

ORIGAUTH
The original authorization ID under which the transaction started. Derived from the DB2 field QWHCOPID.

PLANNNAME
The DB2 plan name. Derived from the DB2 field QWHCPNL.

CONNECT
The connection ID. Derived from the DB2 field QWHCCN.

CORRNAME
The correlation name. Derived from the DB2 field QWHCCV.

CORRNMBR
The correlation number. Derived from the DB2 field QWHSLUUV.

CONNTYPE
The type of connection being used to interface with DB2. Derived from the DB2 field QWHATYP.
END_USER
User ID of the workstation end user. Derived from the DB2 field QWHCEUID.

RECORD TIME
The timestamp contained in the trace record. The format is hours, minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHSSTCK.

TCB CPU TIME
The CPU time stored in the trace record. The format is minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHUCPU.

WS_NAME
Name of the workstation. Derived from the DB2 field QWHCEUWN.

DEST SEQ NO
The destination sequence number. Derived from the DB2 field QWHSWSEQ.

ACE
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified. Derived from the DB2 field QWHSACE.

IFCID
The instrumentation facility component identification (DB2 trace record type). Derived from the DB2 field QWHSIID.

DESCRIPTION
A brief description of the IFCID record. The description indicates whether the record contains accounting, statistics, or performance data. For performance data, the description also indicates the event.

TRANSACT
Name of the workstation transaction. Derived from the DB2 field QWHCEUTX.

DATA
The data is printed in the standard hexadecimal dump format. The character format is on the right.

The Summary Record Trace
The summary record trace lists all records in the same sequence as an input data set.

You can use this listing to check which records are in the DB2 instrumentation trace data. The short trace and long traces are normally too bulky for this purpose.

The summary record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

The following command produces the summary record trace shown in “Example of the Summary Record Trace.”

;RECTRACE
TRACE
FROM (,17:38:00)

LEVEL (SUMMARY)
;

Example of the Summary Record Trace
Here is an example of a Summary record trace.
### ACE Cross-Reference Table:

For every trace specified, an ACE cross-reference table is printed for each location.

The columns of the ACE cross-reference table are:

<table>
<thead>
<tr>
<th>Number</th>
<th>Address</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>x'05831CBF8'</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>x'0583C3EB8'</td>
<td></td>
</tr>
</tbody>
</table>

```
ACE NUMBER
The cross-reference number for the hexadecimal address of the agent control element. The lowest valid cross-reference number is 1. 0 indicates that the ACE address is not available.

ACE ADDRESS
The hexadecimal address of the agent control element. Derived from the DB2 field QWHSACE.

Data Fields:
This topic describes the general format of the IFCID records presented in the summary record trace.

The records are presented in the requested sequence. There is one entry on the report for each record selected from the input data set, so the report can show more than one record of the same IFCID record type. Use the RECORD TIME field on the report to distinguish between records with the same IFCID record type.

Note:
1. An arrow (-->) pointing to the right on the trace indicates the beginning of an event.
2. An arrow (<--) pointing to the left on the trace indicates the end of an event.

Logical Unit of Work Identifiers:
The logical unit of work identifiers are shown in the DATA column in front of the formatted data.

NETWORKID: APCNET  LUNAME: SYDAPC4  LUWSEQ: 1

Field description

NETWORKID
The network ID.

LUNAME
The name of the logical unit.

LUWSEQ
The sequence number of the logical unit of work.

DDF Data:
DDF data is only printed if there is a DDF header.

The following is printed in the DATA column after the formatted record:

REQUESTING LOCATION: USIBMSYSTDB2
REQUESTING TIMESTAMP: 01/30/14 18:54:53.90330718
AR NAME: USIBMSYSTDB2  PRDID: DB2 11  M0

Field description
Here is a description of the field labels shown in the previous example:

REQUESTING LOCATION
The location requesting the work.

REQUESTING TIMESTAMP
The timestamp of the requester location.
AR NAME
The name of the application requester.

PRDID
The name, version, release, and modification level of the product making the request.

Accounting Token:

All record trace reports show the value (in hexadecimal) of the accounting token in the DATA column when it contains a value other than blanks or binary zeros.

The Accounting token is used to correlate CICS records with DB2 records for the same task. If TOKENI=YES for TYPE=INIT, TOKENE=YES for TYPE=ENTRY, or both applies, in the resource control table, then the CICS logical unit of work ID (LUWID) minus the commit count (2 bytes) is passed to this field.

The first 8 bytes contain the network name, and the following 8 bytes contain the LU name. The final 6 bytes are the unique value.

ACCTKN X'00000000000000000000000000000000000000000000000'

The Short and Long Record Traces
The short and long record traces are similar. The short record trace reports non-serviceability data from records which are used by other subcomponents of the batch component. Serviceability records and fields are not printed on the short record trace. Only the occurrence of large records such as statistics, accounting, and system parameters is shown.

The long record trace reports all instrumentation facility records including Statistics, Accounting, and Performance records. The DB2 field names of serviceability fields are printed, as well as the occurrence of the serviceability records.

Depending on the record layout, the records are presented in either the DATA column or the full width of the report page.

If there is no data present for an IFCID, NO DATA is printed. If any unexpected data is found, it is printed in dump format. The dump format is also used for IFCID 0.

The Short Record Trace:

The short record trace lists selected records from an input data set. It selects and formats nonserviceability data from the user-selected records that appear on other OMEGamon for Db2 PE reports.

Use the short record trace to access the DB2 nonserviceability data used by OMEGamon for Db2 PE, and to access data not presented in other reports.

Some long records (for example, system statistics) are ignored by the short record trace and some records are shown in abbreviated form.

The short record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

The following command produces the short record trace example shown in "Example of the Short Record Trace" on page 3515.
### Example of the Short Record Trace

This is an example of a short record trace produced by the previous command:

```plaintext

**Example of the Long Record Trace**

The long record trace lists selected records from an input data set. It lists and formats all data from user-selected records.

Use the long record trace to produce a formatted report of all data in the selected trace records.

The long record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

**Note:** A long record trace can show a great amount of data. Consider limiting the size of the report with the INCLUDE, EXCLUDE, FROM, and TO options of the TRACE subcommand.

The following command produces the long record trace example in "Example of a Long Record Trace."

```plaintext
... RECTRACE TRACE FROM (21:54:00) TO (21:56:00) LEVEL(LONG) ...
```

### The Long Record Trace:

The long record trace lists selected records from an input data set. It lists and formats all data from user-selected records.

Use the long record trace to produce a formatted report of all data in the selected trace records.

The long record trace can be used with all the selection options such as INCLUDE and EXCLUDE.

**Note:** A long record trace can show a great amount of data. Consider limiting the size of the report with the INCLUDE, EXCLUDE, FROM, and TO options of the TRACE subcommand.

The following command produces the long record trace example in "Example of a Long Record Trace."

```plaintext
... RECTRACE TRACE FROM (21:54:00) TO (21:56:00) LEVEL(LONG) ...
```

### Example of a Long Record Trace

This is an example of a long record trace produced by the previous command:

```plaintext

Dump Record Trace

The dump record trace lists all data from selected records of an input data set in hexadecimal format.
The Dump Record Trace

The following command produces the dump record trace example shown in "Dump Record Trace Example."

Dump Record Trace Example

Here is an example of a dump record trace for IFCID 225. The left-hand side of the trace shows a full hexadecimal dump of the record and the section on the right shows the same data in character format.

Note: This type of record trace is used for diagnostic purposes only. It is not explained in detail.

Column Descriptions of the Dump Record Trace:

The column description of the Dump record trace.

The following columns are shown on the dump record trace:

**PRIMAUTH**
The authorization ID under which the transaction is running. Derived from the DB2 field QWHCAID.

**ORIGAUTH**
The original authorization ID under which the transaction started. Derived from the DB2 field QWHCOPID.

**PLANNAME**
The DB2 plan name. Derived from the DB2 field QWHCPLAN.

**CONNECT**
The connection ID. Derived from the DB2 field QWHCCN.

**CORRNAME**
The correlation name. Derived from the DB2 field QWHCCV.

**CORRNMBR**
The correlation number. Derived from the DB2 field QWHCCV.

**CONNTYPE**
The type of connection being used to interface with DB2. Derived from the DB2 field QWHCCST.

**INSTANCE**
The unique number assigned to a thread. Derived from the DB2 field QWHSUNIQ.

**RECORD TIME**
The timestamp contained in the trace record. The format is hours, minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHSSTCK.

**TCB CPU TIME**
The CPU time stored in the trace record. The format is minutes, seconds, and hundred-millionths of a second. Derived from the DB2 field QWHUCPU.

**DEST SEQ NO**
The destination sequence number. Derived from the DB2 field QWHSWSEQ.

**ACE**
The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified. Derived from the DB2 field QWHSACE.

**IFCID**
The instrumentation facility component identification (DB2 trace record type). Derived from the DB2 field QWHSIID.

**DESCRIPTION**
A brief description of the IFCID record. The description indicates whether the record contains accounting, statistics, or performance data. For performance data, the description also indicates the event.
DATA  The data is printed in the standard hexadecimal dump format. The character format is on the right.

ACE Cross-Reference Table:

For every trace specified, an ACE cross-reference table is printed at the end of each location.

The columns of the ACE cross-reference table are:

ACE NUMBER
The cross-reference number for the hexadecimal address of the agent control element. The lowest valid cross-reference number is 1. 0 indicates that the ACE address is not available.

ACE ADDRESS
The hexadecimal address of the agent control element. Derived from the DB2 field QWHSACE.

IFCID Record Blocks
This topic describes the Instrumentation Facility Component Identifier (IFCID) record trace blocks. The description within each block is presented in alphabetical order.

IFCID 001 - System Statistics:

System service statistics are written at regular intervals specified by the install parameter STATISTICS TIME on panel DSNTIPN.

Most counters in this record are accumulated since DB2 was last started. Some counters can include values recorded prior to the report period covered. Values are reset to zero when DB2 is started.

IFCID 001 - Checkpoint and IFI Data:

This topic shows detailed information about “Record Trace - IFCID 001 - Checkpoint and IFI Data”.

Record trace - IFCID 001 - Checkpoint and IFI Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Checkpoint and IFI Data” are described in the following section.

CHECKPOINT AND IFI DATA

<table>
<thead>
<tr>
<th>CHECKPOINT COUNT: 2</th>

<td>NO ROLLUP ACC RECS-ROLLUP STORAGE THRESHOLD EXCEEDED: 0</td>
<td>NO ROLLUP ACC RECS-ROLLUP STORAGE THRESHOLD EXCEEDED: 0</td>
</tr>
</tbody>
</table>

CHECKPOINT COUNT
The number of checkpoints DB2 has taken.

A checkpoint is a point at which DB2 records internal status information to the DB2 log. This information is used in the recovery process if DB2 abends.

Background and Tuning Information
For Statistics reports only: A checkpoint is taken when the specified number of log records have been written. A checkpoint is also taken each time DB2 switches to a new active log data set. If the Statistics reporting period is 30 minutes and the value of this field is 15, then DB2 is taking checkpoints every 2 minutes.

If the data sets are too small or the value for LOGLOAD is too low, checkpoints occur too frequently. As a result, database writes do not perform efficiently. The frequency of DB2 checkpoints can be decreased by increasing the value of the DSNZPARM LOGLOAD (CHECKPOINT FREQ on the Tracing install panel).

Rule of thumb: In a production environment, DB2 should take checkpoints every 10 minutes or so.

The default value for LOGLOAD is 50000. The actual value that you choose is dependent on the volume and nature of the work performed by your DB2 subsystem. It is a trade-off between the performance efficiency of larger numbers and the longer time to restart DB2 when there is an abnormal termination.

Field Name: QWSDCKPT
This is an exception field.

REASON STATISTICS INVOKED
The reason why statistics records were written.
Field Name: QWSDRINV

HIGH USED RBA
The high-used RBA address of the log (DB2 field prior to DB2 11: QWSDLR).
Field Name: QWSDLRG

IFI ABENDS
The number of instrumentation facility interface (IFI) abends.
Field Name: QWSDSCA

IFI READA
The number of calls made to IFI using the READA (read asynchronous data) function.
Field Name: QWSDSCRA

DCAPLOG REC.RETRIEVED
The number of log records retrieved for which data capture processing was invoked.
Field Name: QWSDCDLC

DCAPDATA ROWS RETURNED
The total number of data capture data rows returned.
Field Name: QWSDCDDR

IFI UNRECOG.
The number of calls made to IFI using a function that is not recognized by the interface.
IFI READS
The number of calls made to IFI using the READS (read synchronous data) function.

Field Name: QWSDSCU

DCAPLOG READS
The total number of data capture log reads for processing IFI reads requests for IFCID 185.

Field Name: QWSDSCRS

DCAPDATA DESC.RETURNED
The total number of data capture describes performed.
A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDLR

IFI COMMANDS
The number of calls made to IFI using the COMMAND function.

Field Name: QWSDCDMB

IFI WRITE
The number of calls made to IFI using the WRITE function.

Field Name: QWSDSCCO

DCAPLOG REC.RETURNED
The total number of data capture log records returned.

Field Name: QWSDSCWD

DCAPDESCRIPTES
The total number of data capture describes performed.
A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

Field Name: QWSDCDTR

DCAPTABLES RETURNED
The total number of data capture tables returned to the caller of the IFI reads call for IFCID 185.

Field Name: QWSDCDD

NO ROLLUP ACC RECS-ROLLUP THRESHOLD EXCEEDED
The number of roll-up accounting records written due to roll-up threshold exceeded.

Field Name: QWSDCDDH

NO ROLLUP ACC RECS-ROLLUP STORAGE THRESHOLD EXC
The number of roll-up accounting records written due to roll-up accounting storage threshold exceeded.

Field Name: QWSDARSG
NO ROLLUP ACC RECS-STALENESS THRESHOLD EXCEEDED

The number of roll-up accounting records written due to staleness threshold exceeded.

Field Name: QWSDARST

NO RECS NOT QUALIFIED FOR ACC ROLLUP

The number of records that failed to qualify for accounting roll-up because all roll-up key fields are equal to NULL or because of NULL values that are not permitted.

Field Name: QWSDARIR

IFCID 001 - CPU Time Data:

This topic shows detailed information about “Record Trace - IFCID 001 - CPU Time Data”.

This section shows CPU timer values for each resource manager and control address space.

Record trace - IFCID 001 - CPU Time Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - CPU Time Data” are described in the following section.

<table>
<thead>
<tr>
<th>CPU TIME DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROCEDURE NAME</td>
</tr>
<tr>
<td>MSTR</td>
</tr>
<tr>
<td>TCB TIME</td>
</tr>
<tr>
<td>PROCEDURE NAME</td>
</tr>
<tr>
<td>DBM1</td>
</tr>
<tr>
<td>TCB TIME</td>
</tr>
</tbody>
</table>

PROCEDURE NAME

The last 4 characters of the procedure used to start the address space, or a constant identifier.

Field Name: QWSAPROC

ADDR SPACE ASID

The ASID of the address space.

Field Name: QWSAASID

ASCB

The ASCB token.

Field Name: QWSAASCB

SRB TIME

The accumulated SRB time for the address space. This value includes both, the preemptable and nonpreemptable SRB time. It does not include CPU time that is consumed on an IBM zIIP.

Field Name: QWSASRBT

PREEMP SRB TIME

The preemptible SRB timer value for the address space. This value does not include the CPU time that is consumed on an IBM zIIP.
**ICFID 001 - CPU Time Data**

**Field Name:** QWSAPSRB

**PREEMP SRB ZIIP**

The preemptable SRB timer value that is consumed on an IBM zIIP for address space.

**Field Name:** QWSAPSRB_ZIIP

**TCB TIME**

The accumulated job step time (TCB) for the address space.

**Field Name:** QWSAEJST

**QWSAMCPU (S)**

This field is for IBM service use.

**Field Name:** QWSAMCPU

---

**ICFID 001 - DB2 Command Data:**

This topic shows detailed information about “Record Trace - ICFID 001 - DB2 Command Data”.

**Record trace - ICFID 001 - DB2 Command Data**

The field labels shown in the following sample layout of “Record Trace - ICFID 001 - DB2 Command Data” are described in the following section.

**DISPLAY DB**

The number of DB2 DISPLAY DATABASE commands issued to view objects within one or more DB2 databases. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR0

**DISPLAY THRD**

The number of DB2 DISPLAY THREAD commands issued to view threads active within the DB2 subsystem. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR1

**DISP UTIL**

The number of DB2 DISPLAY UTILITY commands issued to view the status of one or more DB2 utilities. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTR2
The number of DB2 DISPLAY TRACE commands issued to determine the currently active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRC

DISPL RLIMIT

The number of DB2 DISPLAY RLIMIT commands issued to view the current status of the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRG

START DB

The number of DB2 START DATABASE commands issued to make a database available for use. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR5

START TRACE

The number of DB2 START TRACE commands issued to initiate a DB2 trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

START DB2

The number of DB2 START DB2 commands issued to bring up a DB2 subsystem. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR7

START RLIM

The number of DB2 START RLIMIT commands issued to enable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR8

STOP DB

The number of DB2 STOP DATABASE commands issued to prevent access to a DB2 database. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR9

STOP TRACE

The number of DB2 STOP TRACE commands issued to terminate one or more active DB2 traces. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR9

STOP DB2

The number of STOP DB2 commands. This includes both normal and abnormal completions.

Field Name: Q9STSCRA

STOP RLIM
IFCID 001 - DB2 Command Data

The number of DB2 STOP RLIMIT commands issued to disable the DB2 resource limit facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

RECOV BSDS

The number of DB2 RECOVER BSDS commands issued to reestablish dual bootstrap data sets after one has been disabled by a data set error. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR3

RECOV INDOUBT

The number of DB2 RECOVER INDOUBT commands issued to recover threads left indoubt because DB2 or a transaction manager could not automatically recover them. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR4

MODIFY TRACE

The number of DB2 MODIFY TRACE commands issued to alter trace events (IFCID) for an active trace. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

TERM UTILITY

The number of DB2 TERM UTILITY commands issued to stop execution of a DB2 utility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

START DDF

The number of DB2 START DDF commands issued to enable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

STOP DDF

The number of DB2 STOP DDF commands issued to disable the DB2 distributed data facility. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

CANCEL THREAD

The number of DB2 CANCEL THREAD commands issued to cancel a thread. This includes normal and abnormal completion of the command.

Field Name: Q9STCTR6

DISPL LOCATN

The number of DB2 DISPLAY LOCATION commands issued to display statistics about threads with a distributed relationship. This includes normal and abnormal completion of the command.
Field Name: Q9STCTRL

UNREC CMDS
The number of commands not recognized by DB2. The number is incremented if the command verb or primary keyword cannot be determined. For example:
• "-DISPLOX DATABASE(*)" is an unknown verb.
• "-DISPLAY FATAFASE(*)" is an unknown primary keyword.

Field Name: Q9STEROR

ARCH LOG
The number of DB2 ARCHIVE LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRM

SET ARCH
The number of DB2 SET ARCHIVE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRP

DISPL ARCH
The number of DB2 DISPLAY ARCHIVE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRQ

RESET INDOUBT
The number of DB2 RESET INDOUBT commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRR

ALTER BUFFER
The number of DB2 ALTER BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRN

DISP BUF
The number of DB2 DISPLAY BUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRO

DISP GROUP
The number of DB2 DISPLAY GROUP commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRX

DISP PROCEDURE
The number of DB2 DISPLAY PROCEDURE commands executed. This includes normal and abnormal completion of the command.

Field Name: Q9STCTRU

RESET GENERIC
The number of DB2 RESET GENERICLU commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRD

**ALTER GBPOOL**

The number of DB2 ALTER GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRS

**DISP GBPOOL**

The number of DB2 DISPLAY GROUPBUFFERPOOL commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRT

**START PROC**

The number of DB2 START PROCEDURE commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRV

**STOP PROCEDURE**

The number of DB2 STOP PROCEDURE commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRW

**DISPLAY GROUP**

The number of DB2 DISPLAY GROUP commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRX

**ALTER UTILITY**

The number of DB2 ALTER UTILITY commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRY

**DISP FUNC**

The number of DB2 DISPLAY FUNCTION commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTRZ

**START FUNC**

The number of DB2 START FUNCTION commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTX0

**STOP FUNCTION**

The number of DB2 STOP FUNCTION commands issued. This includes normal and abnormal completion of the command.

**Field Name:** Q9STCTX1

**SET LOG**
The number of DB2 SET LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX2

DISPLAY LOG

The number of DB2 DISPLAY LOG commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX3

SET SYSPARM

The number of DB2 SET SYSPARM commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX4

DISPLAY DDF

The number of DB2 DISPLAY DDF commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTX5

ACCESS DB

The number of DB2 ACCESS DATABASE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTAD

START PROFILE

The number of DB2 START PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSS

STOP PROFILE

The number of DB2 STOP PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTST

DISPLAY PROF

The number of DB2 DISPLAY PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSD

DISP PROFILE

The number of DB2 DISPLAY PROFILE commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSD

DISP ACCEL

The number of DB2 DISPLAY ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTDA

START ACCEL
IFCID 001 - DB2 Command Data

The number of DB2 START ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTSA

STOP ACCEL

The number of DB2 STOP ACCEL commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTXA

MODIFY DDF

The number of DB2 MODIFY DDF commands issued. This includes normal and abnormal completion of the command.

Field Name: Q9STCTMD

START DYNQRY

The number of START DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTSQ

STOP DYNQRY

The number of STOP DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTXQ

DISP DYNQRY

The number of DISPLAY DYNQUERYCAPTURE DB2 commands.

Field Name: Q9STCTDQ

IFCID 001 - DDF Data by Location:

This topic shows detailed information about “Record Trace - IFCID 001 - DDF Data by Location”.

Record trace - IFCID 001 - DDF Data by Location

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - DDF Data by Location” are described in the following section.

DDF DATA BY LOCATION

<table>
<thead>
<tr>
<th>LOCATION NAME (SHORT)</th>
<th>DRDA REMOTE LOCS</th>
<th>PROID REMOTE LOCATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION NAME (LONG)</td>
<td>DRDA REMOTE LOCS</td>

<tr>
<td>INQUIRY THREADS:</td>
<td>0</td>
<td>CONV REQUESTS QUEUED:</td>
</tr>
</tbody>
</table>

LOCATION NAME (SHORT)

The name of the remote location.

Field Name: QLSTLOCN

LOCATION NAME (LONG)

The name of the remote location.
Field Name: QLSTLOCN

INITIATED CONVERSATIONS

The number of conversations that were initiated from the requester location. This value is maintained at the requester location.

A conversation is a specific instance of using TCP/IP or SNA LU 6.2 to transfer information between a requester and a server. A conversation is a logical connection between a requester and a server.

Field Name: QLSTCNVS

INITIATED FROM REMOTE SITE

The number of conversations that were initiated from the requester to the server location. This value is updated at the server location.

Field Name: QLSTCNVR

MESSAGES SENT TO REMOTE

The number of messages sent to the remote location. A message is a group of characters and control bit sequences transferred on a single TCP/IP or SNA API call. This value is maintained at the location where the messages originated.

Field Name: QLSTMSGS

SQL STMTS SENT TO REMOTE

The number of SQL statements sent to the remote server. This value is updated at the requester location.

Field Name: QLSTSQLS

BYTES SENT TO REMOTE

The number of bytes of data sent to the requester location. This value is maintained at the server location.

Field Name: QLSTBYTES

ROWS SENT TO REMOTE

The number of data rows sent to the requester location (includes SQLDA). This value is updated at the server location.

Field Name: QLSTROWS

BLOCKS TRANSMITTED

The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLSTBTBF

COMMITS REQUESTS SENT

The number of commit requests sent to the server (single-phase commit protocol) and the committed requests sent to the participant (two-phase commit protocol).

Field Name: QLSTCOMS

INDOUBT THREADS
IFCID 001 - DDF Data by Location

The number of threads that became indoubt with the remote location as the coordinator (two-phase commit operations only). A large value might indicate network problems.

Field Name: QLSTINDT

PRDID REMOTE LOCATION

The product ID and version of the remote location.

Field Name: QLSTPRID

DEALLOCATED CONVERSATIONS

The number of conversations that were deallocated from this site to the remote site.

Field Name: QLSTCNVT

MESSAGES RECEIVED FROM REMOTE

The number of messages received by VTAM from the remote location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTMSGR

SQL STATEMENTS RECEIVED FROM REMOTE

The number of SQL statements received from the requester location. This value is updated at the server location.

Field Name: QLSTSQLR

BYTES RECEIVED FROM REMOTE

The number of bytes of data received from the server location. This value is maintained at the requester location.

More bytes of data might be sent from the server location than are received by the requester due to the manner in which distributed SQL statements are processed internally.

Field Name: QLSTBYTR

ROWS RETRIEVED FROM REMOTE

The number of data rows received from the server location. This value is maintained at the requester location.

Note:

- This value does not include any SQLDA or SQLCA transmitted.
- Block fetch can significantly affect the number of rows sent across the network. When used with nonupdate cursors, block fetch groups as many rows as possible into the message buffer, and transmits the buffer over the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the requester location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages from the requester.
BLOCKS RECEIVED

The number of blocks received from the remote location using block fetch. This value is maintained at the requester location.

**Field Name:** QLSTBRBF

COMMIT REQUESTS RECEIVED

The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLSTCOMR

ABORT REQUESTS SENT

The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

**Field Name:** QLSTABRS

ABORT REQUESTS RECEIVED

The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLSTABRR

CONV REQUESTS QUEUED

The number of conversation requests queued by the distributed data facility and waiting for allocation. This value is maintained at the requester location.

**Background and Tuning Information**

When this value is high, increase the limit for the number of conversations.

**Field Name:** QLSTCNVQ

This is an *exception* field.

**IFCID 001 - Destination Related Data:**

This topic shows detailed information about “Record Trace - IFCID 001 - Destination Related Data”.

This record contains one data section for each destination.

**Record trace - IFCID 001 - Destination Related Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Destination Related Data” are described in the following section.

<table>
<thead>
<tr>
<th>DEST NAME</th>
<th>SMF</th>
<th>SEQNO</th>
<th>310 RECS WRITTEN</th>
<th>310 RECS NOT WRITTEN</th>
<th>0 BUFFER ERRORS</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT ACTIVE ERRORS</td>
<td>0</td>
<td>RECS NOT ACCEPTED</td>

</tr>
<tr>
<td>QWSBOTH3</td>
<td>0</td>
<td>QWSBOTH4</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**DEST NAME**

The name of the external destination:

**GTF** Generalized trace facility
SMF  System management facilities
RES  Resident trace table (not accumulated)
OPN  Special destination for IFI READA buffered records

All other values are shown in hexadecimal.

Field Name: QWSBNM
SEQNO
The unique destination sequence of the last record written to the destination.
Field Name: QWSBWSEQ
RECS WRITTEN
The number of records written to the destination.
Field Name: QWSBSRSW
RECS NOT WRITTEN
The number of records not written to the destination.
Field Name: QWSBSRNW
BUFFER ERRORS
The number of SMF buffer-overrun errors.
Field Name: QWSBSBUF
NOT ACTIVE ERRORS
The number of times SMF was not active.
Field Name: QWSBSACT
RECS NOT ACCEPTED
The number of records not accepted by the destination writer.
Field Name: QWSBSRNA
WRITER FAILURES
The number of write failures to the destination.
Field Name: QWSBSWF

IFCID 001 - Global DDF Data:

This topic shows detailed information about “Record Trace - IFCID 001 - Global DDF Data”.

Record trace - IFCID 001 - Global DDF Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Global DDF Data” are described in the following section.
DBAT/CONN QUEUED-MAX ACTIVE

The number of times a DBAT or connection was queued because it reached the ZPARM maximum for active remote threads (MAXDBAT).

Field Name: QDSTQDBT
This is an exception field.

CONN REJECTED-MAX CONNECTED

The number of connections that were rejected because the ZPARM limit for maximum remote connections (CONDBAT) was reached.

Field Name: QDSTQCRT

CONN CLOSED - MAX QUEUED

The number of queued client connections whose TCP/IP sockets were closed because the system parameter MAXCONQN was exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

Field Name: QDSTNCQC

QUEUED CLIENT CONNECTIONS

The number of queued client connections whose TCP/IP socket were closed due to system parameter MAXCONQW being exceeded.

The socket close only occurs when the DB2 subsystem is a member of a data sharing group and DB2 was started with DDF THREADS set to INACTIVE.

Field Name: QDSTNCCW

COLD START CONNECTIONS

The number of cold start connections with all remote locations (two-phase commit operations only).

Field Name: QDSTCSTR
This is an exception field.

WARM START CONNECTIONS

The number of warm start connections with all remote locations (two-phase commit operations only).

Field Name: QDSTWSTR
This is an exception field.

RESYNCHRONIZATION ATTEMPTED
The number of resynchronization connections attempted with all remote locations (two-phase commit operations only).

**Background and Tuning Information**

A large value can indicate network or system problems.

**Field Name:** QDSTRSAT

This is an *exception* field.

**RESYNCHRONIZATION SUCCEEDED**

The number of resynchronization connections that succeeded with all remote locations (two-phase commit operations only).

**Background and Tuning Information**

If the value of this field is much less than the number of resynchronizations attempted, network problems might exist.

**Field Name:** QDSTRSSU

This is an *exception* field.

**CUR TYPE 1 INACTIVE DBATS**

The current number of inactive DBATs type 1 (snapshot).

**Field Name:** QDSTQCIT

**HWM TYPE 1 INACTIVE DBATS**

The maximum number of inactive type 1 DBATs.

This value is a high-water mark.

**Field Name:** QDSTQMIT

This is an *exception* field.

**TYPE 1 CONNECTIONS TERMINATED**

The number of threads or connections that were terminated instead of being made type 1 inactive because the maximum number of type 1 inactive threads was reached (MAXTYPE1).

**Field Name:** QDSTNITC

**CUR INACTIVE CONNS (TYPE 2)**

The current number of type 2 inactive connections.

**Field Name:** QDSTCIN2

**HWM INACTIVE CONNS (TYPE 2)**

The maximum number of concurrent type 2 inactive connections that existed.

This value is a high-water mark for QDSTCIN2.

**Field Name:** QDSTMIN2

**ACC QU INACT CONNS (TYPE 2)**

The number of RECEIVE requests on type 2 inactive or new connections that are queued to be serviced by a disconnected (pooled) DBAT.

**Field Name:** QDSTQIN2

**CUR QU INACT CONNS (TYPE 2)**
The current number of type 2 inactive or new connections that are queued waiting for a database access thread (DBAT).

Field Name: QDSTNQR2

MIN QUEUE TIME

The minimum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

Field Name: QDSTNQM

MAX QUEUE TIME

The maximum queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

Field Name: QDSTNMX

AVG QUEUE TIME

The average queue time of a type 2 inactive or new connection that was queued waiting for a database access thread (DBAT) in the last statistical period.

Field Name: QDSTNA

HWM QU INACT CONNS (TYPE 2)

The maximum number of type 2 inactive or new connections that are queued waiting for a database access thread.

This value is a high-water mark for QDSTNQR2.

Field Name: QDSTMQR2

CUR ACTIVE AND DISCON DBATS

The current number of active and disconnected (pooled) DBATs.

Field Name: QDSTCNAT

HWM ACTIVE AND DISCON DBATS

The maximum number of active and disconnected (pooled) DBATs that existed.

This value is a high-water mark for QDSTCNAT.

Field Name: QDSTHWAT

This is an exception field.

HWM TOTL REMOTE CONNECTIONS

The maximum number of active and remote connections. This value is a high-water mark.

Field Name: QDSTHWDT

This is an exception field.

CUR DISCON DBATS NOT IN USE

The current number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

Field Name: QDSTNADS
HWM DISCON DBATs NOT IN USE

The maximum number of disconnected (pooled) DBATs that are available to process type 2 inactive or new connections.

This value is a high-water mark for QDSTNADS.

Field Name: QDSTMADS

DBATs CREATED

The number of requests that required a database access thread (DBAT) to be created to process the request.

Note: This does not include database access threads created to replace disconnected (pooled) DBATs that terminated because they reached their reuse limit.

Field Name: QDSTNDBA

DISCON (POOL) DBATs REUSED

The number of requests that were satisfied by assigning a disconnected (pooled) DBAT to process the request.

Field Name: QDSTPOOL

CUR ACTIVE DBATs-BND DEALLC

The current number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

Field Name: QDSTNARD

HWM ACTIVE DBATs-BND DEALLC

The maximum number of DBATs that are active because the associated packages were bound with RELEASE(DEALLOCATE).

Field Name: QDSTMARD

IFCID 001 - IFCID Data:

This topic shows detailed information about “Record Trace - IFCID 001 - IFCID Data”.

This record contains one data section for each active IFCID.

Record trace - IFCID 001 - IFCID Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - IFCID Data” are described in the following section.

IFCID

The IFCID for the following statistics.

Field Name: QWSCIID

IFCID SEQNO

The last sequence number used for this IFCID.

Field Name: QWSCISEQ
RECS WRITTEN

The number of records successfully written for this IFCID.

Field Name: QWSCSRSW

RECS NOT WRITTEN

The number of records not written to this IFCID.

Field Name: QWSCSRNW

RECS NOT DESIRED

The number of records not desired.

Field Name: QWSCSRND

BUFFER NOT AVAILABLE

The number of errors due to the buffer not being available.

Field Name: QWSCSBNA

COLLECT FAILURES

The number of collection failures.

Field Name: QWSCSCF

IFCID 001 - Log Manager Data:

This topic shows detailed information about “Record Trace - IFCID 001 - Log Manager Data”.

Record trace - IFCID 001 - Log Manager Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - Log Manager Data” are described in the following section.

</tbody>
</table>

WRITE REQUEST-WAIT

The number of wait log write requests. Wait indicates that the log record is first written to the log buffer and then to the log data set.

Field Name: QJSTWR

READ FROM OUTPUT BUFFER

The number of log reads satisfied from the output buffer.

Background and Tuning Information

This field, together with the reads satisfied from active log and reads satisfied from archive log (QJSTRACT and QJSTRARH) fields indicate how
IFCID 001 - Log Manager Data

efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance.

**Field Name:** QJSTRBUF

This is an *exception* field.

**WRITE REQUEST-NO WAIT**

The number of log write requests.

The log record is written asynchronously to the log buffer. The application does not wait for the record to be written to the log data set and regains control immediately.

Buffered log records are written to DASD when the buffer threshold is exceeded.

**Field Name:** QJSTWRNW

This is an *exception* field.

**READ FROM ACTIVE LOG**

The number of log reads satisfied from the active log data set.

**Background and Tuning Information**

This field, together with the reads satisfied from archive log and reads satisfied from output buffer fields, indicate how efficiently DB2 retrieves log records. Use these numbers to adjust the number of output buffers and the total active log capacity to maximize DB2 performance. Ideally, this value should be 0 or very small.

**Field Name:** QJSTRACT

This is an *exception* field.

**WRITE REQUEST-FORCE**

The number of force log write requests. Force indicates that the log record is written to the log buffer, forcing the buffer to be written to the log data set on DASD.

**Field Name:** QJSTWRF

**READ FROM ARCHIVE LOG**

The number of log reads satisfied from archive log data sets.

**Field Name:** QJSTRARY

**WRITE LOG BUFFER**

The number of calls to the log write routine. This does not represent the number of physical log I/Os.

**Field Name:** QJSTBFWR

**READ DELAY-TAPE VOLUME CONTENTION**

The number of read accesses that were delayed because of a tape volume contention when only one reader per tape is possible.

**Background and Tuning Information**
This field shows the number of agents forced to wait because a tape volume was already in use by another. If this number is not 0, increase the read tape units on the archive log data set parameters panel DSNTIPA.

Field Name: QJSTTVC
This is an exception field.

WRITE I/O REQUESTS
The total number of log-write I/O requests (such as media manager calls). This is the sum of the IFCID 038/039 pairs and includes both copy1 and copy2 active log data set writes.

Background and Tuning Information
This value should correspond to the active log write I/O activity in an RMF report.

Field Name: QJSTLOGW

READ DELAY-UNAVAILABLE RESOURCE
The number of read accesses delayed due to unavailable resources.

Background and Tuning Information
Generally, this can be due to insufficient tape units allocated. If this is so, reissue the SET ARCHIVE command and use a higher value for the count parameter. Another (although unlikely) cause is insufficient archive log read service task availability.

Field Name: QJSTWUR
This is an exception field.

WRITE BUFFER SCHEDULED-THRESHOLD
The number asynchronous log write requests made because the log write threshold was reached.

Background and Tuning Information
This counter is provided primarily for an internal check. It is recommended to use the default write threshold of 20 buffers.

Field Name: QJSTTHR

CI CREATED-ACTIVE LOG
The number of active log output control intervals created.

Background and Tuning Information
Log records are placed sequentially in output log buffers, which are formatted as VSAM control intervals. The control intervals are written to a set of predefined DASD active log data sets, which are used sequentially and recycled.

The ratio of this field to write output log buffers should be low.

Rules of thumb:
The lower the value, the better. A high value indicates that too many I/Os are required for the number of log buffers created.
It is possible that WRTTHRSH is set too low. It is also possible that transactions could be arriving so infrequently that at commit time force requests are not queued and each force request is individually triggering an I/O of its log buffers.

Field Name: QJSTBFFL

WRITE BUFFER PAGED IN
The number of times an output log buffer had to be paged in before it could be initialized. The log-write latch is held at this point.

Background and Tuning Information
A nonzero value could indicate that the output log buffer size is too large, or there is insufficient real storage to back up the output log buffer size.

Field Name: QJSTBPAG

CI OFFLOADED
The number of control intervals (CIs) offloaded from the active log to the archive log.

Field Name: QJSTCIOF

WAIT FOR UNAVAILABLE LOG BUFFER
The number of waits caused by an unavailable output log buffer.
When DB2 wants to write a log record and the log buffer is not available, DB2 and the application must wait for an available log buffer.

Background and Tuning Information
Another possible cause is that the size of the write threshold might be too close to the size of the output buffer.
If this field is not 0, increase the number in the output buffer field on installation panel DSNTIPL to increase the number of output buffers or increase the size of the buffer.

Field Name: QJSTWTB
This is an exception field.

CI WRITTEN
The total number of log control intervals (CIs) written. This includes CI rewrites and both copy1 and copy2 active log data set writes. If a given CI is rewritten 5 times, this counter is incremented by 5.

Field Name: QJSTCIWR

TOTAL BSDS ACCESS REQUESTS
The number of BSDS access requests.

Field Name: QJSTBSDS

CI SERIAL WRITE
The number of serial log write I/O requests. A serial log write I/O request occurs when DB2 rewrites a log CI that was previously written as a partial CI, in a dual logging environment. This value includes COPY1 and COPY2 active log data set writes. The difference between WRITE I/O REQ and CI SERIAL WRITE gives the number of parallel log write I/O requests. Typically, the first CI in a list of one start I/O is written serially, and the
remaining to both COPY1 and COPY2 active log data sets. This value is meaningful only when DB2 runs in dual active log mode.

Field Name: QJSTSERW

ARCHIVE READ ALLOCATIONS
The number of archive log read allocations. It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets. This value should be small, ideally 0.

Field Name: QJSTALR

LOOK-AHEAD TAPE VOL MOUNTS ATTEMPTED
The number of look ahead (tape volume) mounts attempted.

Background and Tuning Information
This field and field QJSTLAMA (label LOOK-AHEAD MOUNT SUCCESSFUL) show the efficiency of look ahead for tape mounts.

Field Name: QJSTLAMA

ARCHIVE WRITE ALLOCATIONS
The number of archive log write allocations. It indicates the frequency of archive log open and close activity.

Background and Tuning Information
A high number indicates a need for more or larger active log data sets. This value should be small, ideally 0.

Field Name: QJSTALW

LOOK-AHEAD TAPE VOL MOUNTS SUCCEEDED
The number of successful look-ahead (tape volume) mounts. It indicates the look-ahead mounting performance gains.

Background and Tuning Information
For maximum performance, this field and field QJSTLAMA (label LOOK-AHEAD MOUNT ATTEMPTED) should be equal. To find the number of failed attempts, subtract the value in this field from LOOK-AHEAD MOUNT ATTEMPTED. Too many failed attempts negate potential performance gains. This can be caused by not having enough tape units available. Issue the DISPLAY ARCHIVE command and note the current count value. Then issue the SET ARCHIVE command using a higher value for the count parameter.

Field Name: QJSTLAMS

QJSTLSUS
This field is for IBM service use.

Field Name: QJSTLSUS

QJSTSPNN
This field is for IBM service.
IFCID 001 - Log Manager Data

</tr>
</tbody>
</table>

IDENTIFY

The number of successful connections to DB2 from an allied address space (TSO, BATCH, CICS, IMS, CAF, or UTILITY).

Field Name: Q3STIDEN

CREATE THREAD

The number of successful create thread requests. It does not include DBATs.

A thread is required before an application can use SQL. When established, a thread can have one or more secondary authorization IDs.

A thread is needed to perform any DB2 activity. For example, a thread is needed to run a DB2 utility to perform an IFI request such as READS, or to process a DB2 command such as -DISPLAY THREAD. However, a thread is not created if the command failed because of a syntax error.

Background and Tuning Information
Thread reuse can help improve performance.

The term *thread reuse* only applies to IMS and CICS attachments. In the case of the TSO attachment facility and the call attachment facility (CAF), threads cannot be reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- If transaction volume is high:
  
  High volume transactions should achieve a high percentage of thread reuse. If threads are reused on low volume transactions, the number of threads needed increases because these threads are not automatically terminated by IMS when not being used. This may result in too many idle threads for the level of the DB2 workload. Under CICS, protected threads are terminated after about 45 seconds if no transaction eligible to reuse the thread has been received.

- If thread creation cost is significant:
  
  As a rule of thumb, more than 5% of the total CPU cost of transaction processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to minimize the thread creation cost, while providing the needed concurrency:

- If most of the application plan's SQL statements are executed, then ACQUIRE(ALLOCATE) is cheaper than ACQUIRE(USE).
- If only a small number of the SQL statements are executed, ACQUIRE(USE) becomes cheaper and improves concurrency, because the required resources are only acquired (locked) when the plan actually references (uses) them. An example would be a generalized plan used by many different transactions. It would contain multiple logic paths referencing different tables.

  Note that, when packages are involved, ACQUIRE(USE) is always implicitly used.

- Concurrency in thread reuse is based on page locking provided by the IS and IX intent locks, whose duration is governed by ACQUIRE and RELEASE of BIND.

  RELEASE(DEALLOCATE) is strongly recommended for thread-reuse transactions to reduce transaction CPU time.

When thread reuse is implemented, monitor the EDM pool. It should be sufficient in size to accommodate expanding plans where the next transaction requires additional plan sections over those that are already part of the plan.

**Field Name:** Q3STCTHD

This is an *exception* field.

**UR INDOUBT**

The number of indoubt units of recovery.

A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. The failure can occur in the address space of the application, the transaction manager, DB2, or all of these. IMS and CICS applications use the prepare and commit sequence to commit work. Ideally, this value should be 0.

**Field Name:** Q3STINDT
This is an *exception* field.

**COMMIT PH 2**

The number of successful commit phase 2 in a two-phase environment such as CICS or IMS. It includes successfully committed agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

**Background and Tuning Information**

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work. A nonzero value for this field indicates that updates have occurred.

**Field Name:** Q3STCOMM

**ROLLBACK**

The number of times a unit of recovery was successfully rolled back. Some reasons for a rollback include:

- Application program abend
- Application rollback request
- Application deadlock on database records
- Application canceled by operator
- Thread abend due to resource shortage

This number also includes successfully aborted agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).

**Field Name:** Q3STABRT

This is an *exception* field.

**SIGNON**

The number of signons that identified a new user of an existing thread for IMS and CICS.

This field is valid only for CICS and IMS (not valid for TSO, CAF, or UTILITY).

The initial signon does not perform an authorization check because the thread does not exist yet, but a resignon can.

**Background and Tuning Information**

If the number of signons is greater than the number of create thread occurrences, some threads have been reused. In the case of the TSO attachment facility and the call attachment facility (CAF), there is no sign-on, because the user is identified when the TSO address space is connected.

**Field Name:** Q3STSIGN

This is an *exception* field.

**UR INDOUBT RESOLV**

The number of indoubt units of recovery successfully resolved, either automatically or manually. It includes successful indoubt resolutions for agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF).
A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. This number should equal the number of units of recovery gone indoubt. If it is less, then some indoubt units of recovery might still exist.

Field Name: Q3STRIUR

COMMIT PH 1

The number of successful requests for commit phase 1 in a two-phase commit environment such as CICS or IMS. It includes successfully prepared agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits.

Background and Tuning Information

IMS and CICS applications use the PREPARE and COMMIT sequence to commit work.

Field Name: Q3STPREP

SSAM EOM

The number of times MVS deleted non-DB2 address space while connected to DB2.

Field Name: Q3STMEOM

TERMIN.THREAD

The number of time threads that terminated successfully.

This number does not agree with the create thread count because each level of a thread's access (IDENTIFY, SIGNON, and CREATE THREAD) must be terminated.

Background and Tuning Information

The value of this field is usually greater than the number of create thread occurrences, because it also includes the termination of connections to DB2 (IDENTIFY) and other internal counts.

Field Name: Q3STTERM

EXITS

The number of successful DSN3EXIT requests.

Field Name: Q3STEXIT

SYNCHS

The total number of commits in a single-phase commit environment such as TSO, CAF, or UTILITY. IMS applications use the prepare-and-commit sequence; CICS applications use both the synchronized commit request and the prepare-and-commit sequence to commit work.

Note that DBATs executed on this location are not included. For DBAT statistics, see SINGLE PHASE COMMITS received on the DDF activity block.

Field Name: Q3STS SYNC

SSAM EOT

The number of times non-DB2 tasks abended while connected to DB2.
Field Name: Q3STMEOT

CRT.THRD QUED

The number of create thread requests queued (not including DBATs).
The total number of threads accessing data that can be allocated concurrently is the MAX USERS value on the installation panel DSNTIPE. Requests are queued when the MAX USERS value is exceeded. If no threads are queued during peak hours, the maximum number of threads might be set too high.

Background and Tuning Information

As a rule of thumb about 1% thread queuing is acceptable. When this is appreciably higher, increase the value of MAX USERS on the DB2 install panel DSNTIPE.
The combined maximum allowed for MAX USERS and MAX REMOTE ACTIVE cannot exceed 2000.

Field Name: Q3STCTHW

This is an exception field.

SUBS.INT.CALLS

The number of subsystem interface calls processed.

Field Name: Q3STSSSI

READ ONLY COMMIT

The number of read-only commits.
There are occasions when CICS or IMS invokes DB2 when no DB2 resource was altered since the completion of the last commit process. When this occurs, DB2 performs both phases of the two-phase commit during the first commit phase and records that the user or job is read-only in relation to its DB2 processing.

Field Name: Q3STRDON

IDBACK*

The maximum number of connections to a single instance from batch or TSO background tasks.
This is a high-water mark.

Field Name: Q3STHWIB

IDFORE*

The maximum number of connections to a single instance from TSO foreground tasks.
This is a high water-mark.

Field Name: Q3STHWIF

CTHREAD*

The highest number of batch CICS, IMS, and TSO tasks (CTHREAD) to a single instance.
This is a high-water mark.

Field Name: Q3STHWCT
ICFID 001 - QSST Data:

This topic shows detailed information about “Record Trace - IFCID 001 - QSST Data”.

This block contains DB2 serviceability fields. Most of these fields are for IBM service use.

Record trace - IFCID 001 - QSST Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - QSST Data” are described in the following section.

QSSTGPLF

This field is for IBM service use.

Field Name: QSSTGPLF

QSSTCONT

The number of full system contractions.

Field Name: QSSTCONT

QSSTCRIT

The number of critical storage shortages after contraction.

Field Name: QSSTCRIT

QSSTABND

The number of abends due to local storage shortage.

Field Name: QSSTABND

ICFID 001 - QVAS Data:

This topic shows detailed information about “Record Trace - IFCID 001 - QVAS Data”.

This block contains DB2 serviceability fields. These fields are for IBM service use.

Record trace - IFCID 001 - QVAS Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - QVAS Data” are described in the following section.
IFCID 001 - QVAS Data

QVASSUSP

This field is for IBM service use.

Field Name: QVASSUSP

IFCID 001 - QVLS Data:

This topic shows detailed information about “Record Trace - IFCID 001 - QVLS Data”.

The QVLS latch counters represent the number of suspends that were performed by agents that attempted to obtain a latch.

The DB2 latch contentions can be traced by running a performance trace for IFCID 51, 52, 56, and 57. The latch class counters may represent more than one contention because they are reported as modulo 32. For example, LC12 could be either due to latch class X'0C' or latch class X'4C'. The following paragraph shows the predominant latch contention for each latch class. The latch class contentions per second are reported in the Statistics report and trace.

If the latch class contentions per second are:
• Less than 1000, you can ignore them.
• Between 1000 and 10000, you need to start monitoring the issue.
• Greater than 10000 and if this has an impact on your performance, gather the performance trace for the IFCIDs 51, 52, 56, and 57. Then contact IBM support for assistance.

There is not a one-to-one relationship between the QVLS counters and IFCID 56 or 57, because an agent might suspend multiple times or not at all, while trying to obtain a latch. That is why the QVLS counters are not directly related to Accounting Class 3.

Record trace - IFCID 001 - QVLS Data

The field labels shown in the following sample layout of “Record Trace - IFCID 001 - QVLS Data” are described in the following section.

QVLSLC01

This field is infrequently used.

Field Name: QVLSLC01

QVLSLC02

The predominant latch usage is: Global authorization cache.

Field Name: QVLSLC02

QVLSLC03

The predominant latch usage is: DDF disconnect.
<table>
<thead>
<tr>
<th>Field Name</th>

</tr>
<tr>
<td>QVLSLC11</td>
<td>Pageset operations.</td>
</tr>
</tbody>
</table>
The predominant latch usage is represented by various buffer pool related activities, including buffer pool control block and pool serialization.

Field Name: QVLSLC14

QVLSLC15
The predominant latch usage is: ARCHIVE LOG MODE (QUIESCE).

Field Name: QVLSLC15

QVLSLC16
The predominant latch usage is: UR synonym chain.

Field Name: QVLSLC16

QVLSLC17
The predominant latch usage is: RURE chain.

Field Name: QVLSLC17

QVLSLC18
The predominant latch usage is: DDF resynch list.

Field Name: QVLSLC18

QVLSLC19
The predominant latch usage is: logical log write (in contrast to physical log write).

Field Name: QVLSLC19

QVLSLC20
The predominant latch usage is: System checkpoint.

Field Name: QVLSLC20

QVLSLC21
The predominant latch usage is: Accounting rollup.

Field Name: QVLSLC21

QVLSLC22
The predominant latch usage is: Internal checkpoint.

Field Name: QVLSLC22

QVLSLC23
The predominant latch usage is: Buffer Manager latch for page latch contention timer queue or deferred write latch. Both types of latches have latch class X'17'.

Field Name: QVLSLC23

QVLSLC24
The predominant latch usage is: Buffer Manager prefetch scheduling latch. EDM LRU latch can be identified by latch class X'18' while Buffer Manager prefetch scheduling latch can be identified by latch class X'38' in a latch contention trace.

Field Name: QVLSLC24

QVLSLC25
The predominant latch usage is: EDM hash latch.

Field Name: QVLSLC25

QVLSLC26

The predominant latch usage is: Dynamic statement cache.

Field Name: QVLSLC26

QVLSLC27

The predominant latch usage is: stored procedure queue latch and UDF.

Field Name: QVLSLC27

QVLSLC28

The predominant latch usage is: Stored procedures or authorization cache.

Field Name: QVLSLC28

QVLSLC29

The predominant latch usage is: Field procs and DDF transaction manager.

Field Name: QVLSLC29

QVLSLC30

The predominant latch usage is: Agent services.

Field Name: QVLSLC30

QVLSLC31

The predominant latch usage is: Storage manager.

Field Name: QVLSLC31

QVLSLC32

The predominant latch usage is shared storage pool latch.

Field Name: QVLSLC32

QVLSLC254

The predominant latch usage is: Index latch.

Field Name: QVLSLC254

LPAR CPS
The number of standard central processors (CPs) on the logical partition (LPAR) at the end of the defined Monitor III gatherer time interval (called MINTIME). This value does not include ZIIPs. This value is from Resource Measurement Facility (RMF) field CPUG3_PRCON.

Field Name: QWOSLNCP

LPAR CPU UTILIZATION
The percentage of the MINTIME time interval during which RMF reported that the entire LPAR was in use, averaged for a single processor. This value is calculated using Resource Measurement Facility (RMF) field CPUG3_LOGITI.

Field Name: QWOSLPRU

DB2 SUBSYS CPU UTILIZATION
The percentage of the MINTIME time interval during which RMF reported that all DB2 address spaces were in use, calculated for a single processor.

Field Name: QWOSDB2U

LPAR PAGE-IN RATE
The PAGE-IN rate (%) for the LPAR. This value is always set to 0.

Field Name: QWOSLPIR

DB2 SUBSYS PAGE-IN RATE
The PAGE-IN rate (%) for the DB2 subsystem. This value is set to 0.

Field Name: QWOSDPIR

LPAR REAL STOR (MB)
The total real storage in the LPAR, in MB. This value is derived from RMF field GEIRPOOL_VE, which is the number of online real storage frames.

Field Name: QWOSLRST

DB2 SUBSYS USED REAL STOR (MB)
The real storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
- The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

Field Name: QWOSDRSU

LPAR VIRT STOR (MB)
The total virtual storage in the LPAR, in MB. This value is the sum of the following values for all address spaces in the LPAR:

- The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
• The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.
• The number of auxiliary slots. This value is derived from RMF field ASIAUXSC_VE.

**Field Name:** QWOSLVST

**DB2 SUBSYS USED VIRT STOR (MB)**

The virtual storage used by DB2 subsystems, in MB. This value is the sum of the following values for all DB2 address spaces in the LPAR, converted to MB:

• The number of frames for swapped-in users. This value is derived from RMF field ASIFMCT_VE.
• The number of frames for idle users. This value is derived from RMF field ASIFMCTI_VE.

**Field Name:** QWOSDVSTU

**DB2 SUBSYS FREE VIRT STOR (MB)**

The free virtual storage in the LPAR, in MB. This value is the sum of the following values, converted to MB:

• The total real storage in the LPAR (QWOSLRST)
• The number of currently available slots (RMF field GEISLTA)

**Field Name:** QWOSLRVSF

**DB2 DBM1 CPU UTILIZATION**

The percentage of the MINTIME time interval during which RMF reported that the DB2 DBM1 address space was in use, calculated for a single processor.

**Field Name:** QWOSDBMU

**UNREFERENCED INTERVALS**

The Unreferenced Interval Count (UIC). This value is RMF field GEIAHUIC_VE.

**Field Name:** QWOSLUIC

**QWOSFLG**

This field is for IBM service use.

**Field Name:** QWOSFLG

**QWOSRCDE**

This field is for IBM service use.
IFCID 001 - z/OS Metrics

Field Name: QWOSRCDE

QWOSRSNC

This field is for IBM service use.

Field Name: QWOSRSNC

IFCID 002 - DB2 Statistics: Database 2 Statistics shows the data from IFCID 002.

IFCID 002 - Accelerator Data - Prior to V4:

This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator Data - Prior to V4”.

This topic only refers to IBM DB2 Analytics Accelerator for z/OS prior to version 4.

Note: The field descriptions of the fields QUERIES SUCCESSFULLY EXECUTED, QUERIES FAILED TO EXECUTE, CURRENTLY EXECUTING QUERIES, and MAXIMUM EXECUTING QUERIES refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator.

Record trace - IFCID 002 - Accelerator Data - Prior to V4

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator Data - Prior to V4” are described in the following section.

<table>

3568 IBM Db2 Performance Expert on z/OS
Shows the current accelerator state. The state depends on the version of IBM DB2 Analytics Accelerator for z/OS:

- **Version 4**:
  
  - 0 = INITIALIZING
  - 1 = ONLINE
  - 3 = OFFLINE
  - 5 = MAINTENANCE
  - 255 = UNKNOWN

- **Prior to Version 4**:
  
  - 0 = INITIALIZED
  - 1 = ONLINE
  - 2 = PAUSED
  - 3 = OFFLINE
  - 4 = STOPPED
  - 5 = MAINTENANCE
  - 6 = DOWN
  - 7 = UNKNOWN

**Field Name: Q8STSTATE**

**QUERIES SUCCESSFULLY EXECUTED**

The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

**Field Name: Q8STSREQ**

**QUERIES FAILED TO EXECUTE**

The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

**Field Name: Q8STFREQ**

**QUERIES FAILED TO EXECUTE - ACCELERATOR IN INVALID STATE**

The number of queries (sent by this DB2 system since accelerator start) that failed to be successfully executed, for example, because the accelerator was in an invalid state.

**Field Name: Q8STFINV**

**CURRENTLY EXECUTING QUERIES**

The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

**Field Name: Q8STACTV**

**MAXIMUM EXECUTING QUERIES**

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).
Field Name: Q8STMAXA

CONNECTS TO ACCELERATOR
The number of connects to the accelerator from this DB2 system.

Field Name: Q8STCONN

REQUESTS SENT TO ACCELERATOR
The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator.

Field Name: Q8STREQ

REQUESTS SENT TO ACCELERATOR - TIMED OUT
The number of connections that were timed out when this DB2 system sent requests to the accelerator.

Field Name: Q8STTOUT

REQUESTS SENT TO ACCELERATOR - FAILED
The number of connections that failed when this DB2 system sent requests to the accelerator.

Field Name: Q8STFAIL

BYTES SENT TO ACCELERATOR
The total number of bytes sent to the accelerator.

Field Name: Q8STBYTS

BYTES RECEIVED FROM ACCELERATOR
The total number of bytes received from the accelerator.

Field Name: Q8STBYTR

MESSAGES SENT TO ACCELERATOR
The total number of messages sent to the accelerator.

Field Name: Q8STMSGS

MESSAGES RECEIVED FROM ACCELERATOR
The total number of messages received from the accelerator.

Field Name: Q8STMSGR

BLOCKS SENT TO ACCELERATOR
The total number of blocks sent to the accelerator.

Field Name: Q8STBLKS

BLOCKS RECEIVED FROM ACCELERATOR
The total number of blocks received from the accelerator.

Field Name: Q8STBLKR

ROWS SENT TO ACCELERATOR
The total number of rows sent to the accelerator.

Field Name: Q8STROWS

ROWS RECEIVED FROM ACCELERATOR
The total number of rows received from the accelerator.

**Field Name:** Q8STROWR

**TCP/IP SERVICES ELAPSED TIME**

The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

**Field Name:** Q8STTELA

**WAIT TIME IN ACCELERATOR**

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name:** Q8STAWAT

**AVG. QUEUE LENGTH (LAST 3 HOURS)**

The average queue length during the last 3 hours at the accelerator.

**Field Name:** Q8STAVGQ03

**AVG. QUEUE LENGTH (LAST 24 HOURS)**

The average queue length during the last 24 hours at the accelerator.

**Field Name:** Q8STAVGQ24

**MAXIMUM QUEUE LENGTH**

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

**Field Name:** Q8STMAXQ

**AVG QUEUE WAIT ELAPSED TIME**

The average wait time at the accelerator queue.

**Field Name:** Q8STQUEW

**MAX QUEUE WAIT ELAPSED TIME**

The maximum wait time at the accelerator queue.

**Field Name:** Q8STQUEM

**WORKER NODES**

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

**Field Name:** Q8STWNOD

**WORKER NODES AVG CPU UTILIZATION (%)**

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).

**Field Name:** Q8STWCPU

**COORDINATOR AVG CPU UTILIZATION (%)**

The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).
Field Name: Q8STCCPU

DISK STORAGE AVAILABLE (MB)

The disk storage (MB) available at the accelerator.

Field Name: Q8STDSKA

DISK STORAGE AVAILABLE - IN USE (%)

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

Field Name: Q8STDSKU

DISK STORAGE AVAILABLE - IN USE FOR DATABASE (MB)

The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSKB

DATA SLICES

The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

Field Name: Q8STNMDS

DATA SKEW

When table data is loaded into the accelerator, it may be unevenly distributed across the different data slices on the disks. This disparity is called data skew. The counter represents the accumulated skew over all tables that belong to the DB2 subsystem. The skew of a table is the ratio that shows how uneven the data slices are, as calculated by ((maximum data slice size - minimum data slice size) / median data slice size).

A high value indicates, that data reorganization can improve disk utilization and query performance.

Field Name: Q8STSKEW

PROCESSORS

The number of CPU cores available on all worker nodes.

Field Name: Q8STCORS

ELAPSED TIME IN ACCELERATOR

The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STAELA

CPU TIME SPENT IN ACCELERATOR

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

Field Name: Q8STACPU

ICFID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later:

This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later”.

Note: This topic only refers to IBM DB2 Analytics Accelerator for z/OS version 4 or later.
A value of -1 in the following fields indicates that the status of the acceleration or replication server is unknown:

- CPU TIME EXECUTING QUERIES
- CPU TIME LOAD/ARCHIVE/RESTORE
- WAIT TIME IN ACCELERATOR
- CPU TIME FOR REPLICAITION
- REPLICAITION LATENCY

Note: The descriptions of the fields labelled with SQL STMTS refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator and the fields INSERT STMTS to ROLLBACK STMTS are N/A.

Record trace - IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator Data - Subsystem/Group Perspective V4 or later” are described in the following section.

### PRODUCT ID
The accelerator product identifier.

**Field Name:** Q8STPRID

### SERVER ID
The accelerator server identifier.

**Field Name:** Q8STNAME

### STATE
Shows the current accelerator state. The state depends on the version of IBM DB2 Analytics Accelerator for z/OS:

- **Version 4:**
  - 0 = INITIALIZING
  - 1 = ONLINE
IFCID 002 - Accelerator Data - Subsystem Perspective - V4 or later

3 = OFFLINE
5 = MAINTENANCE
255 = UNKNOWN

• Prior to Version 4:
  0 = INITIALIZED
  1 = ONLINE
  2 = PAUSED
  3 = OFFLINE
  4 = STOPPED
  5 = MAINTENANCE
  6 = DOWN
  7 = UNKNOWN

Field Name: Q8STSTATE

SQL STMTS SUCCESSFULLY EXECUTED

The number of SQL statements (sent by this DB2 system since accelerator start) that were successfully executed in the accelerator.

Field Name: Q8STSREQ

CURRENTLY EXECUTING SQL STMTS

The number of currently executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STNQCS

MAXIMUM EXECUTING SQL STMTS

Shows the maximum number of SQL statements executing in the accelerator at any time since accelerator start on behalf of this DB2 system.

Field Name: Q8STMNQS

CONNECTS TO ACCELERATOR

The number of connects to the accelerator from this DB2 system.

Field Name: Q8STCONN

REQUESTS SENT TO ACCELERATOR

The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator.

Field Name: Q8STREQ

REQUESTS TIMED OUT

The number of connections that were timed out when this DB2 system sent requests to the accelerator.

Field Name: Q8STOUT

REQUESTS FAILED

The number of connections that failed when this DB2 system sent requests to the accelerator.

Field Name: Q8STFAIL
BLOCKS SENT TO ACCELERATOR
The total number of blocks sent to the accelerator.
Field Name: Q8STBLKS

BLOCKS RECEIVED FROM ACCELERATOR
The total number of blocks received from the accelerator.
Field Name: Q8STBLKR

ELAPSED TIME IN TCP/IP SERVICES
The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.
Field Name: Q8STTELA

CPU TIME IN TCP/IP SERVICES
The accelerator services TCP/IP CPU time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.
Field Name: Q8STTCPU

ELAPSED TIME IN ACCELERATOR SERVICES
The accelerator services elapsed time.
Field Name: Q8STSELA

CPU TIME IN ACCELERATOR SERVICES
The CPU time of the accelerator services.
Field Name: Q8STSCPU

LOG RECORDS READ
The number of log records read by the replication capture agent for this DB2 system.
Field Name: Q8STNLRS

LOG RECORDS FOR ACCELERATOR TABLES
The number of log records (read by the replication capture agent for this DB2 system) that are applicable to tables in this accelerator.
Field Name: Q8STNLTS

LOG RECORD BYTES PROCESSED
The number of log record bytes processed by the replication capture agent for this DB2 system.
Field Name: Q8STNBS

CPU TIME FOR REPLICATION
The total CPU cost associated with the replication apply process for this DB2 system.
Field Name: Q8STTCCS

REPLICATION STATUS
The current replication state of the accelerator for this DB2 system:
0  Started
1  Stopped
2  Error
3  Starting
4  Stopping

Field Name: Q8STCSS

REPLICATION STATUS CHANGE

The timestamp when the last change of the accelerator replication state occurred for this DB2 system.

Field Name: Q8STTLSC

SQL STMTS FAILED TO EXECUTE

The number of SQL statements (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason.

Field Name: Q8STFREQ

CPU TIME EXECUTING SQL STMTS

The total CPU cost associated with executing SQL statements in the accelerator on behalf of this DB2 system.

Field Name: Q8STTCQS

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from this DB2 system. Replication-related operations are not included.

Field Name: Q8STTCMS

BYTES SENT TO ACCELERATOR

The total number of bytes sent to the accelerator.

Field Name: Q8STBYTS

BYTES RECEIVED FROM ACCELERATOR

The total number of bytes received from the accelerator.

Field Name: Q8STBYTR

MESSAGES SENT TO ACCELERATOR

The total number of messages sent to the accelerator.

Field Name: Q8STMSGS

MESSAGES RECEIVED FROM ACCELERATOR

The total number of messages received from the accelerator.

Field Name: Q8STMSGR

ROWS SENT TO ACCELERATOR

The total number of rows sent to the accelerator.

Field Name: Q8STROWS

ROWS RECEIVED FROM ACCELERATOR

The total number of rows received from the accelerator.
FIELD NAME: Q8STROWR

ELAPSED TIME IN ACCELERATOR
The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

FIELD NAME: Q8STAELA

CPU TIME IN ACCELERATOR
The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

FIELD NAME: Q8STACPU

WAIT TIME IN ACCELERATOR
The wait time spent in the accelerator when executing requests from the DB2 subsystem.

FIELD NAME: Q8STAWAT

INSERT ROWS FOR ACCELERATOR TABLES
The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

FIELD NAME: Q8STNIS

UPDATE ROWS FOR ACCELERATOR TABLES
The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

FIELD NAME: Q8STNUS

DELETE ROWS FOR ACCELERATOR TABLES
The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system.

FIELD NAME: Q8STNDS

REPLICATION LATENCY
The current replication latency for this DB2 system. Latency is defined as the time difference between the timestamp, when the last log record was applied to the target, compared to the current time.

FIELD NAME: Q8STCRL

IFCID 002 - Accelerator Data - Subsystem Perspective - V4 or later:

This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later”.

Note: This topic only refers to IBM DB2 Analytics Accelerator for z/OS version 4 or later.

A value of -1 in the following fields indicates that the status of the acceleration or replication server is unknown:

• CPU TIME EXECUTING QUERIES
• CPU TIME LOAD/ARCHIVE/RESTORE
• AVG QUEUE WAIT ELAPSED TIME
• MAX QUEUE WAIT ELAPSED TIME
IFCID 002 - Accelerator Data - Accelerator Perspective - V4 or later

- WORKER NODES DISK UTILIZATION (%)
- WORKER NODES AVG CPU UTILIZATION (%)
- COORDINATOR CPU UTILIZATION (%)
- CPU TIME FOR REPLICATION

Note: The descriptions of the fields labelled with QUERIES refer to SQL statements passed to the accelerator. For product identifiers of IBM DB2 Analytics Accelerator for z/OS prior to AQT04015, the SQL statements are SELECT queries passed to the accelerator and the fields INSERT STMTS to ROLLBACK STMTS are N/A.

Record trace - IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator Data - Accelerator Perspective V4 or later” are described in the following section.

**QUERIES SUCCESSFULLY EXECUTED**

The number of SQL statements (sent by all DB2 systems since accelerator start) that successfully executed in the accelerator.

Field Name: Q8STNQSA

**CURRENTLY EXECUTING QUERIES**

The number of currently (actively) executing SQL statements in the accelerator on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STACTV_64).

Field Name: Q8STACTV

**MAXIMUM EXECUTING QUERIES**

The maximum number of SQL statements actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXA_64).

Field Name: Q8STMAXA

**ACCELERATOR SERVER START**

The timestamp when the accelerator server process started last time.

Field Name: Q8STTART

**ACCELERATOR STATUS CHANGE**

...
The timestamp when the last change of the accelerator occurred.

Field Name: Q8STTATC

**CURRENT QUEUE LENGTH**

The current queue length at the accelerator.

Field Name: Q8STCQL

**MAXIMUM QUEUE LENGTH**

The high watermark of the queue length at the accelerator (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STMAXQ_64).

Field Name: Q8STMAXQ

**AVG QUEUE WAIT ELAPSED TIME**

The average wait time at the accelerator queue.

Field Name: Q8STQUEW

**MAX QUEUE WAIT ELAPSED TIME**

The maximum wait time at the accelerator queue.

Field Name: Q8STQUEM

**WORKER NODES DISK UTILIZATION (%)**

The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources.

Field Name: Q8STDSKU

**WORKER NODES AVG CPU UTILIZATION (%)**

The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWCPU_64).

Field Name: Q8STWCPU

**COORDINATOR CPU UTILIZATION (%)**

The current CPU utilization on the accelerator coordinator node (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STCCPU_64).

Field Name: Q8STCCPU

**LOG RECORDS READ**

The number of log records read by the replication capture agents for all DB2 systems.

Field Name: Q8STNLRA

**LOG RECORDS FOR ACCELERATOR TABLES**

The number of log records read by the replication capture agents for all DB2 systems that are applicable to tables in this accelerator.

Field Name: Q8STNLTA

**LOG RECORD Bytes PROCESSED**

The number of log record bytes processed by the replication capture agents for all DB2 systems.
CPU TIME FOR REPLICATION

The total CPU cost associated with the replication apply process for all DB2 systems.

Field Name: Q8STNBA

QUERIES FAILED TO EXECUTE

Shows the number of SQL statements (sent by all DB2 systems since accelerator start) that were not successfully executed for any reason.

Field Name: Q8STTCCA

CPU TIME EXECUTING QUERIES

The total CPU cost associated with executing SQL statements in the accelerator on behalf of all DB2 systems.

Field Name: Q8STTCQA

CPU TIME LOAD/ARCHIVE/RESTORE

The total CPU cost spent in the accelerator for data maintenance operations from all DB2 systems. Replication-related operations are not included.

Field Name: Q8STTCMA

DISK STORAGE AVAILABLE (MB)

The disk storage (MB) available at the accelerator.

Field Name: Q8STDSKA

DISK STOR IN USE - THIS DB2 SYS (MB)

The disk storage in-use for accelerator databases for this DB2 system.

Field Name: Q8STDSKB

DISK STOR IN USE - ALL DB2 SYS (MB)

The disk storage (MB) in-use for accelerator databases for all DB2 systems.

Field Name: Q8STDSA

WORKER NODES

The number of active worker nodes (Field name for DB2 Analytics Accelerator for z/OS Version 4: Q8STWNOD_64).

Field Name: Q8STWNOD

AVAILABLE CPU CORES

The number of CPU cores available on all worker nodes.

Field Name: Q8STCORS

DATA SLICES

The number of data slices at the accelerator. This equals the degree of parallel I/O channels.

Field Name: Q8STNMDS

INSERT ROWS FOR ACCELERATOR TABLES

The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.
Field Name: Q8STNIA

**UPDATE ROWS FOR ACCELERATOR TABLES**

The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNUA

**DELETE ROWS FOR ACCELERATOR TABLES**

The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems.

Field Name: Q8STNDA

**IFCID 002 - Accelerator SQL Call Data V4 or later:**

This topic shows detailed information about “Record Trace - IFCID 002 - Accelerator SQL Call Data V4 or later”.

**Record trace - IFCID 002 - Accelerator SQL Call Data V4 or later**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Accelerator SQL Call Data V4 or later” are described in the following section.

<table>
<thead>
<tr>
<th>ACCELERATOR SQL CALL DATA</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSERT STMTS SENT TO ACCELERATOR ...: 3 UPDATE STMTS SENT TO ACCELERATOR ...: 7</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**INSERT STMTS SENT TO ACCELERATOR**

The number of INSERT statements sent by the DB2 system to the accelerator.

Field Name: Q8STINSC

**DELETE STMTS SENT TO ACCELERATOR**

The number of DELETE statements sent by the DB2 system to the accelerator.

Field Name: Q8STDELC

**CREATE STMTS SENT TO ACCELERATOR**

The number of CREATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STCRTC

**ROLLBACK STMTS SENT TO ACCELERATOR**

The number of ROLLBACK statements sent by the DB2 system to the accelerator.

Field Name: Q8STRBKC

**UPDATE STMTS SENT TO ACCELERATOR**

The number of UPDATE statements sent by the DB2 system to the accelerator.

Field Name: Q8STUPDC

**DROP STMTS SENT TO ACCELERATOR**
IFCID 002 - Accelerator SQL Call Data V4 or later

The number of DROP statements sent by the DB2 system to the accelerator.

Field Name: Q8STDRPC

COMMIT STMTS SENT TO ACCELERATOR

The number of COMMIT statements sent by the DB2 system to the accelerator.

Field Name: Q8STCMTC

OPEN STMTS SENT TO ACCELERATOR

The number of OPEN statements sent by the DB2 system to the accelerator.

Field Name: Q8STOPNC

IFCID 002 - Buffer pool activity:

This topic shows detailed information about “Record Trace - IFCID 002 - Buffer Pool Activity”.

This block shows buffer pool activity at thread level.

For details on buffer pool activities, refer to the documentation of Performance Expert Buffer Pool Analyzer.

This report has the same layout as “IFCID 002 - Miscellaneous” on page 3628.

Record trace - IFCID 002 - Buffer Pool Activity

The flag byte shows if more QBST data is following or if this is the last of the QBST repeating groups.

**Field Name:** QBSTFLG

**CURRENT ACTIVE BUFFERS**

The total number of currently active (nonstealable) buffers. This field is an instantaneous sample of the number of buffers in the buffer pool that were updated or in use at the time this monitor data was requested. Because this field gives a snapshot value at statistics collection time, it only shows a problem if it happens at this time.

**Background and Tuning Information**

The buffer pool might be too small if the percentage of active pages in the buffer pool is beyond the deferred write threshold (DWQT).

**Field Name:** QBSTCBA

**GETPAGE REQUESTS**

The number of Getpage requests including conditional and unconditional requests.

**Field Name:** QBSTGET

**BUFFER UPDATES**

The number of times buffer updates were requested against pages in the buffer pool.

**Background and Tuning Information**

The ratio of Buffer Updates to Pages Written (QBSTPWS) suggests a high level of efficiency as it increases, because more updates are being externalized per physical write.

Buffer updates per pages written depends strongly on the type of application. For example, a batch program that processes a table in skip sequential mode with a high row update frequency in a dedicated environment can achieve very good update efficiency. In contrast, update efficiency tends to be lower for transaction processing applications, because transaction processing tends to be random.

The following can influence the number of updates per page:

**Number of rows per page**

A small PCTFREE value gathers more rows on the same page. However, at the same time this can impact concurrency.

**Buffer pool size and deferred write thresholds**

Increase DWQT and VDWQT or the size of the buffer pool. This causes DB2 to let page updates accumulate in the buffer pool. Therefore, the probability that more updates per page get captured increases. This effect is less significant if the buffer pool is concurrently used by several transactions, it also depends on the type of transaction.

**Field Name:** QBSTSWS

This is an exception field.

**UNAVAILABLE BUFFER-VPOOL FULL**
The number of times a usable buffer could not be located in the virtual buffer pool because the virtual buffer pool was full.

**Background and Tuning Information**

Ideally, this value should be 0. Any other value indicates that the buffer pool is underallocated. In this case, use the ALTER BUFFERPOOL command to increase the virtual buffer pool size until this value remains at 0.

**Field Name:** QBSTXFL

This is an *exception* field.

**GETPAGE REQUESTS-SEQUENTIAL**

The number of Getpage requests issued by sequential access requesters.

**Field Name:** QBSTSGT

**PAGES WRITTEN**

The number of pages in the buffer pool written to DASD.

**Background and Tuning Information**

Consider the ratio of Pages Written per write I/O. The number of write I/O operations includes Asynchronous Writes (QBSTWIO) and Synchronous Writes (QBSTIMW).

The ratio of pages per write I/O suggests a high level of efficiency as the ratio increases, because more pages are being externalized per physical write.

The following factors impact the ratio of pages written per write I/O:

**Checkpoint frequency**

At checkpoint time, I/Os are scheduled to write all updated pages on the deferred write queue to DASD. If this occurs too frequently, the deferred write queue does not grow large enough to achieve a high ratio of pages written per write I/O.

The checkpoint frequency depends on the number of logs written between two consecutive checkpoints. This number is set at installation time; see the field CHECKPOINT FREQ of installation panel DSNTIPN.

**Frequency of active log switch**

DB2 takes a system checkpoint each time the active log is switched. High frequency of active log switches causes the problem described under checkpoint frequency.

**Buffer pool size and deferred write thresholds**

The deferred write thresholds (VDWQT and DWQT) are a function of buffer pool size. If the buffer pool size is decreased, these thresholds are reached more frequently, causing I/Os to be scheduled more often to write some of the pages on the deferred write queue to DASD. This prevents the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O.

**Number of data sets, and the spread of updated pages across them**

The efficiency of write I/O also depends on the number of data sets associated with the buffer pool and spread of updated pages across them. Because of the nature of batch processing, the ratio of
pages written to write I/Os can be expected to be higher than that expected for transaction type workloads.

To determine update efficiency, use also the value in the Buffer Updates field (QBSTWS) to check the number of buffer updates per page written.

**Field Name:** QBSTPWS

This is an *exception* field.

**NUMBER OF DATA SET OPENS**

The number of data sets physically opened successfully. This value is cumulative from the start of the DB2 statistics interval.

**Field Name:** QBSTDSO

This is an *exception* field.

**SYNCHRONOUS READS**

The number of synchronous read I/O operations performed by DB2 for applications and utilities.

**Background and Tuning Information**

This number includes both Synchronous Reads Sequential Access Only (QBSTSIO) and synchronous read operations for non-sequential access.

You can use this value and the value of Synchronous Reads Sequential Access Only to calculate the number of Non-Sequential Synchronous Reads.

Check the buffer pool hit ratio if the number of non-sequential synchronous reads is larger than expected.

**Field Name:** QBSTRIO

This is an *exception* field.

**SYNCHRONOUS WRITES**

The total number of immediate writes.

Immediate writes occur when:

- An immediate write threshold (IWTH) is reached
- No deferred write engines are available
- More than two checkpoints pass without a page being written.

Sometimes DB2 uses synchronous writes even when the IWTH is not exceeded. As an example, when more than two checkpoints pass without a page being written. This type of situation does not indicate a buffer shortage.

**Background and Tuning Information**

A small number of immediate writes can be expected. Synchronous writes occur if there are too many checkpoints and/or the buffer pool is too small.

If a large number of synchronous writes occur, monitor the DM Critical Threshold Reached (QBSTDMC) field. Reaching Immediate Write Threshold (IWTH-97.5%) implies that the Data Management Threshold (DMTH-95%) has been crossed. You can ignore the value in the immediate
write field when DM Critical Threshold Reached is zero. Otherwise consider increasing the size of the buffer pool. You can use the ALTER BUFFERPOOL command.

Check also the System Event Checkpoint field (QWSDCKPT) in the Subsystem Services block to see whether the frequency of DB2 checkpoints should be reduced. To do this, increase the value of ZPARM LOGLOAD.

Field Name: QBSTIMW
This is an exception field.

BUFFERS ALLOCATED-VPOOL
The number of buffers allocated for a virtual buffer pool.

Note: In DB2 10, the buffer pool size can increase continuously by up to 25% for each DB2 restart. In DB2 11, the AUTOSIZE option of the ALTER BUFFERPOOL command can limit the range within VPSIZEMIN and VPSIZEMAX.

Background and Tuning Information
You should monitor the buffer pool hit ratio field to find the optimum size of the buffer pool. Usually the buffer pool hit ratio is improved by increasing the size of the buffer pool. However, paging the buffer pool storage impacts DB2 performance if the virtual buffer pool is too large.

Page-ins Required for Read I/O (QBSTRPI) and Page-ins Required for Write I/O (QBSTWPI) are useful when determining whether paging affects the performance of a certain buffer pool. The Resource Measurement Facility (RMF) also provides reports on MVS paging activity:

Storage Paging
When the virtual buffer pool is extended into expanded storage, MVS storage paging activity occurs. If a large buffer pool size results in excessive storage paging, consider allocating more real storage to the LPAR.

Paging to Auxiliary Storage
If the virtual buffer pool size requirements exceed the central storage and expanded storage available, the oldest buffer pool pages migrate to auxiliary paging storage. When these pages are accessed subsequently, I/O must bring them back into real storage. This should be avoided. You could have a smaller buffer pool and let DB2 do the I/O rather than use MVS paging with its I/O CPU overhead. This is a situation that you (as the system programmer) should monitor.

You can use the ALTER BUFFERPOOL command to alter the size of the virtual buffer pool.

Changing the size of the virtual buffer pool implicitly changes the buffer pool thresholds. See the Deferred Write Threshold Reached field (QBSTDWT).

Field Name: QBSTVPL

SYNCHRONOUS READS-SEQUENTIAL
The number of synchronous read I/O requests issued by sequential access requesters.

Background and Tuning Information
Sequential synchronous read I/Os can occur because:

- Prefetch is disabled (QBSTSPD).
- Prefetch pages could have been stolen from the buffer pool before the Getpage request is issued for those pages. Subsequently the pages are reread synchronously. A negative buffer pool hit ratio can indicate the same problem.
- The pages requested are not consecutive: DB2 estimated the selected range of pages to be so small that prefetch would make no sense. See also Sequential Prefetch Requested (QBSTSEQ).

It is normal to have a small value for SYNC READ I/O (SEQUENTIAL) because before the sequential prefetch is scheduled, the first page of a prefetch is read by SYNC READ I/O. However, if this number is large, consider increasing the size of the buffer pool or reviewing the sequential steal thresholds (VPSEQT and HPSEQT).

**Field Name:** QBSTSIO

This is an *exception* field.

**ASYNCHRONOUS WRITES**

The number of asynchronous write I/O operations performed by media manager to a direct access storage device.

**Field Name:** QBSTWIO

This is an *exception* field.

**DFHSM MIGRATED DATA SETS**

The number of times migrated data sets were encountered.

**Field Name:** QBSTMIG

This is an *exception* field.

**SEQUENTIAL PREFETCH REQUESTS**

The number of sequential prefetch requests. This counter is incremented for each PREFETCH request (which can result in an I/O read). If the prefetch results in an I/O read, up to 64 pages may be read for SQL, and up to 128 pages for utilities. A request does not result in an I/O read if all pages to be prefetched are already in the buffer pool.

This counter does not include sequential detection, which is recorded in the Dynamic Prefetch - Requested field.

**Background and Tuning Information**

Sequential prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. DB2 determines at BIND time whether sequential prefetch is used or not.

Sequential prefetch is generally used for a table space scan.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching:

- At run time not every prefetch request results in read I/O: the Sequential Prefetch Reads field (QBSTPIO) shows the number of read I/O operations caused by sequential prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine fields (QBSTREE) show the number of times prefetch was disabled because buffers and read engines had not been available.
ICCID 002 - Buffer Pool Activity

- Check the value in the buffer pool hit ratio. A negative value indicates that prefetched pages are stolen from the buffer pool before they are read. The pages are subsequently reread synchronously. There will be also a large value in the Synchronous Reads Total (QBSTRIO) field.
- Decreasing the size of the buffer pool can reduce the prefetch quantity, leading to a larger number of prefetch requests. See also the Sequential Prefetch Pages Read field (QBSTSP).

Field Name: QBSTSEQ
This is an exception field.

HORIZONTAL DEFERRED WRITE THRESHOLD

The number of times the deferred write threshold (DWTH) was reached.

This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

Background and Tuning Information

The default value for this threshold is 30%. You can change that to any value from 0% to 90% by using the DWQT option on the ALTER BUFFERPOOL command.

The deferred write thresholds, DWQT and VDWQT, are specified as a percentage, their absolute value depends on the size of the virtual buffer pool.

Consider the following aspects when changing the deferred write thresholds:

Optimize the ratio of pages written per write I/O
The ratio can be monitored using the Pages Written (QBSTPWS) field.

When the buffer pool is relatively small, the default thresholds could prevent the deferred write queue from growing large enough to achieve a high ratio of pages written per write I/O. Raising these thresholds will, in this instance, reduce the I/O write frequency, increasing the number of pages written per I/O.

Distribute I/O evenly over time
If a virtual buffer pool is very large, it is unlikely that the default values of either DWQT or VDWQT will ever be reached. In this case, write I/Os tend to occur in surges, triggered by DB2 checkpoints. Lowering the VDWQT and the DWQT could improve performance by distributing the write I/Os more evenly over time.

Impact on other buffer pool thresholds
Increasing DWQT and VDWQT allows updated pages to use a larger portion of the virtual buffer pool. Large DWQT and VDWQT can have a significant effect on the other thresholds. For example, in work load where pages are frequently updated, and the updated pages exceed the size of the virtual buffer pool, setting both DWQT and VDWQT to 90% would probably cause frequent
threshold-reached events for sequential prefetch (and possibly the data management and immediate write).

**Field Name:** QBSTDWT

This is an *exception* field.

**DFHSM RECALL TIMEOUTS**

The number of recall timeouts.

**Field Name:** QBSTRTO

**SEQUENTIAL PREFETCH READS**

The number of asynchronous read I/O operations due to normal sequential prefetch (applications and utilities).

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions applies:

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (QBSTSPD).

This means that the value in this field is usually smaller than the number of sequential prefetch requests (QBSTSEQ).

**Field Name:** QBSTPIO

This is an *exception* field.

**VERTICAL DEFERRED WRITE THRESHOLD**

The number of times the vertical deferred write threshold (VDWQT) was reached. This threshold is similar to the deferred write threshold but it applies to the number of updated pages for one single page set in the buffer pool. If the percentage or number of updated pages for the data set exceeds the threshold, writes up to 128 pages are scheduled for that data set.

**Field Name:** QBSTDWV

This is an *exception* field.

**VPOOL EXPANSION OR CONTRACT**

The number of successful virtual buffer pool expansions or contractions due to the ALTER BUFFERPOOL command. An increase in this counter indicates that buffer-pool-related system parameters have been changed.

**Field Name:** QBSTVPA

This is an *exception* field.

**PAGES READ VIA SEQUENTIAL PREFETCH**

The total number of pages read due to a normal sequential prefetch. A sequential prefetch request does not result in a read I/O if all the pages you want are found in the buffer pool.

**Background and Tuning Information**

For requests issued by application programs, the number of pages per READ I/O primarily depends on the page size and the size of the buffer pool. Normally sixty-four 4 KB pages (or eight 32 KB pages) is the
maximum prefetch quantity for table space scans, whether data or index. Utilities use a prefetch quantity of up to 64 pages.

The number of pages per READ I/O can be lower because:
- Pages within the prefetch range may already be in the buffer pool.
- Not enough pages are available because of a buffer shortage.
- A prefetch quantity of 8 pages or less is used for work files.

A small value for this ratio can indicate:
- A good performing buffer pool being so large that most of the pages, which had otherwise to be prefetched, are cached in the buffer pool. In this case, the buffer pool hit ratio should be high.
- A buffer shortage condition, reducing the efficiency of sequential prefetch. This could mean, for example, work-file prefetch quantity reduction from 8 to 4 to 2, as the number of available buffers shrinks. In this case, you should consider tuning the buffer pool.

Field Name: QBSTSP

This is an exception field.

DATA MANAGER BUF CRITICAL THRESHOLD

The number of times the data manager critical threshold (DMTH-95%) was reached.

This field shows how many times a page was immediately released because the data management threshold was reached.

The threshold is checked before a page is read or updated. If the threshold has not been exceeded, DB2 accesses the page in the virtual buffer pool once for each page, no matter how many rows are retrieved or updated in that page. If the threshold has been exceeded, Getpage requests and RELEASEs apply to rows instead of pages. That is, if more than one row is retrieved or updated in a page, more than one Getpage request and RELEASE is performed on that page.

Background and Tuning Information

Avoid reaching this threshold wherever possible because it significantly affects CPU usage. Set virtual buffer pool sizes large enough or reduce the workload on the buffer pool.

Field Name: QBSTDNC

This is an exception field.

VPOOL EXPANSION FAILURE

The total number of virtual buffer pool expansion failures due to the lack of virtual storage space.

Background and Tuning Information

Ideally, this value should be 0. If it is not, check the virtual storage allocation of the DB2 database address space for areas that can be reduced. For example, you can reduce the size of other buffer pools.

Field Name: QBSTXFV

This is an exception field.

LIST PREFETCH REQUESTS

The number of list prefetch requests.
List prefetch allows DB2 to access data pages efficiently even when the required data pages are not contiguous. It allows CP and I/O operations to be overlapped.

**Background and Tuning Information**

DB2 determines at BIND time whether sequential prefetch is used. List prefetch is chosen as follows:

- Usually with a single index that has a cluster ratio lower than 80%.
- Sometimes on a single index with a high cluster ratio, if the estimated amount of data to be accessed is too small to make sequential prefetch efficient.
- Always to access data by multiple index access.
- Always to access data from the inner table during a hybrid join.

DB2 never chooses list prefetch if the estimated number of RIDs to be processed takes more than 50% of the RID pool. During execution time, list prefetch processing terminates if more than 25% of the rows (with a minimum of 4075) in the table must be accessed.

Data pages are read in quantities equal to the sequential prefetch quantity (QBSTSEQ), which depends on buffer pool size and is usually 64 pages.

**Field Name:** QBSTLPF

This is an *exception* field.

**CONCURRENT PREFETCH I/O STREAMS-HWM**

The highest number of concurrent prefetch I/O streams allocated to support a parallel I/O or CP query in this buffer pool. It reflects prefetch activities for non-workfile page sets.

This number only applies to query I/O and CP parallelism.

**Field Name:** QBSTXIS

This is an *exception* field.

**LIST PREFETCH READS**

The number of asynchronous read I/O operations caused by the list prefetch.

The number of pages read is shown by the List Prefetch Pages Read (QBSTLPP) field.

**Background and Tuning Information**

Prefetch Read I/O is not activated if one of the following conditions apply:

- All pages in the prefetch range are already in the buffer pool.
- Prefetch is disabled (Prefetch Disabled No Read Engine - QBSTREE).

This means that the value in this field is usually less than the number of list prefetch requests (QBSTLPF).

**Field Name:** QBSTLIO

This is an *exception* field.

**PAGE-INS REQUIRED FOR WRITE**

The number of page-ins required for a write I/O.

**Field Name:** QBSTWPI
PREFETCH I/O STREAMS REDUCTION

The total number of requested prefetch I/O streams that were denied because of a lack of buffer pool storage space.

It only applies to query I/O and CP parallelism.

For example, if 100 prefetch I/O streams are requested and only 80 are granted, then 20 is added to the number in this field.

Background and Tuning Information

Consider increasing the size of the buffer pool if this value is not 0.

The ratio of this field and the Reduced parallel query requests field gives the average degree of parallel query processing that was reduced because of insufficient buffer pool space. The Prefetch I/O streams - Concurrent streams - high-water mark field gives the highest degree of parallel query processing that was reduced for one or more queries processed in parallel.

The number in this field reflects the prefetch activities for non-workfile page sets.

Field Name: QBSTJIS

This is an exception field.

PAGES READ VIA LIST PREFETCH

The number of pages read via list prefetch.

Field Name: QBSTLPP

MAX WORKFILES CONCURRENTLY USED

The maximum number of work files concurrently used during merge processing within this statistics period.

Ideally, each work file needs 16 buffers to allow DB2 to perform a sequential prefetch for work files.

Field Name: QBSTWFM

This is an exception field.

PARALLEL QUERY REQUESTS

The total number of requests made for parallel query support in this buffer pool. This field only applies to non-workfile page sets in query I/O and CP parallelism.

Field Name: QBSTPQO

DYNAMIC PREFETCH REQUESTS

The number of dynamic prefetch requests. Dynamic prefetch is the process that is triggered because of sequential detection. If the prefetch request results in an I/O read, up to 32 advancing pages can be read at a time.

Background and Tuning Information

Dynamic prefetch reads a sequential set of pages. It allows CP and I/O operations to be overlapped. If DB2 does not choose prefetch at bind time it can sometimes use it at execution time. The method is called sequential detection.

The number of prefetch requests by itself is not a good indicator for efficiency of prefetching because:
At run time not every prefetch request results in read I/O: the Dynamic Prefetch Reads field shows the number of read I/O operations caused by dynamic prefetch. The Prefetch Disabled No Buffer (QBSTSPD) and Prefetch Disabled No Read Engine (QBSTREE) fields show the number of times prefetch was disabled because buffers and read engines had not been available.

Prefetch pages can be stolen from the buffer pool before they are read. This is indicated by a negative buffer pool hit ratio. The pages are subsequently reread synchronously. This will also cause an unexpectedly large value for total synchronous reads (QBSTRIO).

Decreasing the size of the buffer pool can reduce the prefetch quantity (QBSTDPP), leading to a larger number of prefetch requests.

Field Name: QBSTDPP
This is an exception field.

MERGE PASSES REQUESTED
The total number of merge passes for DB2 sort activities. This value reflects how many merge passes were requested for DB2 to determine the number of work files permitted to support each merge pass.

Field Name: QBSTWFR

DYNAMIC PREFETCH READS
The number of asynchronous read I/Os because of dynamic prefetch. The number of pages read is recorded in the Dynamic Prefetch Pages Read field.

Background and Tuning Information
A prefetch request does not result in an I/O if one of the following conditions apply:
• All pages to be prefetched are already in the buffer pool.
• The prefetch is canceled.

This means that the value in this field is usually smaller than the number of dynamic prefetch requests.

Field Name: QBSTDIO
This is an exception field.

MERGE PASS DEGRADED-LOW BUFFER
The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work-files requested.

Background and Tuning Information
The maximum number of work files allowed is calculated as follows:
• Buffers consumed = 2 * (work files already allocated)
• Buffers available = (sequential steal threshold * buffer pool size - buffers consumed)
• Maximum work files allowed = buffers available / (2 * 8)

The default for the sequential steal threshold is 0.8.
Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the buffer pool size using the ALTER BUFFERPOOL command.

Field Name: QBSTWFF

This is an exception field.

PAGES READ VIA DYNAMIC PREFETCH

The number of pages read because of dynamic prefetch. Dynamic prefetch is the process that is triggered by sequential detection.

Background and Tuning Information

The ratio of Dynamic Prefetch Pages Read to Dynamic Prefetch Reads is between 0 and 32.

DB2 can fetch up to 32 pages per prefetch.

The number of pages per READ I/O can be lower because:

• Pages within the prefetch range are already in the buffer pool.
• Not as many pages are available due to a buffer shortage.

A small value for this ratio can indicate:

• A good performing buffer pool being large enough to contain pages that would otherwise be prefetched. This is indicated by a high buffer pool hit ratio.
• A buffer shortage condition, which reduces the efficiency of dynamic prefetch. In this instance the buffer pool hit ratio will be low. Consider tuning the buffer pool.

Field Name: QBSTDPP

This is an exception field.

WORKFILE REQUEST REJECTED-LOW BUFFER

The total number of work files that were rejected during all merge passes because of insufficient buffer resources.

Background and Tuning Information

This field and the degraded low buffers field determine the average number of work files that cannot be honored at each merge pass because of insufficient buffer pool space.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the size of the buffer pool using the ALTER BUFFERPOOL command.

Note that, when there are many concurrent sorts or large sorts, it is a good idea to dedicate a separate buffer pool for sort work files. This will greatly facilitate work-file performance tuning.

Field Name: QBSTWFD

This is an exception field.

WORKFILE REQUESTED-ALL MERGE PASS
The total number of work files requested for all merge passes.

This field and the Merge Passes Requested field determine the average number of work files requested in a single merge pass.

For DB2 to perform an efficient prefetch for work files, each workfile should have at least 16 dedicated buffers. Work files used during sort phase processing or other non-sort-related processing are not included in this number.

Field Name: QBSTWFT

WORKFILE NOT CREATED-NO BUFFER

This field is only applicable if DB2 is running under MVS/XA.

The number of times a work file could not be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use.

Background and Tuning Information

Ideally, this should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of open cursors that require sorting.

Generally, sorts are performed more efficiently with additional work files, but there are internal DB2 limits on the number of work files a transaction can have. It is possible that at run time a transaction cannot use as many work files as it had planned. You can control this by increasing the buffer pool size (ALTER BUFFERPOOL), or changing the transaction so it requires fewer concurrent work files.

Field Name: QBSTMAX

This is an exception field.

PREFETCH QUANTITY REDUCED TO HALF

The total number of times prefetch quantity is reduced from normal to 50% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

Background and Tuning Information

The number in this field indicates when DB2 had to reduce the sequential prefetch quantity to continue executing concurrently with parallel queries in the system. If the number is small, it may be tolerable.

Field Name: QBSTPL1

This is an exception field.

PREFETCH DISABLED-NO BUFFER

The total number of times sequential prefetch was disabled because buffers were not available.

Field Name: QBSTSPD

This is an exception field.

WORKFILE PREFETCH NOT SCHEDULED

The number of times a sequential prefetch was not scheduled for a work file because the dynamic prefetch quantity is zero.
Background and Tuning Information

The work-file prefetch checks the dynamic prefetch quantity (normally 1 to 8 pages). When the quantity is zero, the value in this field is incremented. A high number in this field implies that the buffer pool is too small.

Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting.

Consider increasing the size of the buffer pool or allocating a buffer pool specifically for DSNDB07 usage. This can be especially effective with high-use query systems whose reports make extensive use of sort activity.

Field Name: QBSTWKPD

This is an exception field.

PREFETCH QUANTITY REDUCED TO QUARTER

The total number of times prefetch quantity is reduced from 50% to 25% of normal. The normal size depends on the page size of the buffer pool.

This field only applies to query I/O and CP parallelism.

Background and Tuning Information

The query response for parallel queries can be significantly degraded if the value in this field is not 0.

Field Name: QBSTPL2

This is an exception field.

PREFETCH DISABLED-NO READ ENGINE

The total number of times a prefetch is disabled because of an unavailable read engine.

Background and Tuning Information

Because there are 600 read engines, a maximum of 600 concurrent prefetch operations can be processed at a time. When this maximum is reached, prefetching is disabled and this count is incremented. The value in this field should be close to 0.

Field Name: QBSTREE

This is an exception field.

WORKFILE PAGES TO DESTRUCT

The number of pages for which destructive read was requested.

Field Name: QBSTWDRP

FAILED COND SEQ&RDM GETPAGE REQUEST

The number of sequential and random Getpage requests which failed because the page was not in the buffer pool. Failed conditional requests do not initiate I/O operations.

Field Name: QBSTNGT

PAGE-INS REQUIRED FOR READ

The number of page-ins required for a read I/O.
**Note:** A non-zero value can be accepted if a buffer pool expansion via ALTER BPSIZE occurs. In other situations, a non-zero value indicates a shortage of real storage relative to the buffer pool size.

**Field Name:** QBSTRPI

This is an *exception* field.

**WORKFILE PAGES NOT WRITTEN**

The number of pages dequeued from VDWQ for destructive read requests.

**Field Name:** QBSTWBVQ

**FAILED COND SEQ GETPAGE REQUEST**

The number of conditional sequential Getpage requests which failed because the page was not in the buffer pool. Failed conditional requests do not initiate I/O operations.

**Field Name:** QBSTNSG

**MINIMUM BUFFERS ON SLRU (LWM)**

The minimum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval.

**Field Name:** QBSTSMIN

**PAGES ADDED TO LPL**

The number of times that one or more pages were added to the logical page list (LPL).

**Field Name:** QBSTLPL

**MAXIMUM BUFFERS ON SLRU (HWM)**

The maximum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the high-water mark (HWM) within an interval.

**Field Name:** QBSTSMAX

**LENGTH OF SLRU = VPSEQT**

The number of times when the length of the sequential least-recently-used (SLRU) chain equals the sequential steal threshold VPSEQT.

**Field Name:** QBSTHST

**IN-MEM OVL RND REQUESTS**

The number of non-sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.

**Field Name:** QBSTAGET

This is an *exception* field.

**IN-MEM OVL SEQ REQUESTS**

The number of sequential GETPAGE requests using overflowed buffers.

If this counter has a non-zero value, the buffer pool size should be increased.
Field Name: QBSTASGE
This is an exception field.

IN-MEM OVL RND SYNC READS
The number of synchronous read I/O operations for non-sequential GETPAGE requests using overflowed buffers.
If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTASYN
This is an exception field.

IN-MEM OVL SEQ SYNC READS
The number of synchronous read I/O operations for sequential GETPAGE requests using overflowed buffers.
If this counter has a non-zero value, the buffer pool size should be increased.

Field Name: QBSTASSE
This is an exception field.

RANDOM GETPAGE BUFFER HIT
The number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain.

Field Name: QBSTRHS

DASD CACHE READ HITS
The number of I/Os where the requested pages were found in the DASD subsystem cache. These I/Os could have potentially been successful if zHyperLink was used.

Field Name: QBSTSYOC

SUCCESSFUL ZHYPERLINK READS
The number of DASD reads successfully completed using zHyperLink.

Field Name: QBSTSYIO

IFCID 002 - Data Manager Data:
This topic shows detailed information about “Record Trace - IFCID 002 - Data Manager Data”.

Record trace - IFCID 002 - Data Manager Data
The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Data Manager Data” are described in the following section.

| MAX Active (SORT) IN-MEMORY      | 1 MAX STORAGE (SORT) IN-MEMORY | 24
CUR RIDLIST BLOCKS

The number of RID blocks currently in use (snapshot value).

Field Name: QISTRCUR

CUR RIDLIST BLOCKS OVERFLOWED

This field is currently not set by DB2.

Field Name: QISTWFRCUR

MAX RIDLIST BLOCKS

The highest number of RID blocks in use at any time since DB2 startup. This is a high-water mark.

Field Name: QISTRHIG

This is an exception field.

MAX RIDLIST BLOCKS OVERFLOWED

This field is currently not set by DB2.

Field Name: QISTWFRHIG

RL PROCESSING-RDS LIMIT EXCEEDED

The number of times when the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size).

Background and Tuning Information

Ideally, this value should be 0.

The matching index scan part of the RID list processing scanned more than 25% of the index. RID list processing is then terminated, the index scan is abandoned and normally replaced by a tablespace scan.

Reasons for this are:

- Inaccurate or incomplete RUNSTATS statistics. To avoid this, you should collect all statistics on a regular basis, especially simple and correlated column statistics. Using RUNSTATS with SHRLEVEL(CHANGE) does not prevent access to data.

- Optimizer error. In this instance, you could disable RID list processing by adding the clause OPTIMIZE FOR 1 ROW to the SQL statement, or force the access path to index only by adding the necessary columns to the index.

Field Name: QISTRLLM

This is an exception field.

RL PROCESSING-DM LIMIT EXCEEDED

The number of times when the number of RID entries was greater than the physical limit of approximately 26 million RIDs.
Field Name: QISTRPLM
This is an exception field.

RL PROCESSING-NO STORAGE
The number of times the DBM1 storage was exhausted during RID list processing.

Background and Tuning Information
This failure occurs when the DBM1 storage limit is reached.

Field Name: QISTRSTG
This is an exception field.

RL PROCESSING-PROC.LIMIT EXCEEDED
The number of times the maximum RID pool storage was exceeded.

The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:
(Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

Field Name: QISTRMAX
This is an exception field.

COLUMNS BYPASSED
The total number of columns (rows x columns) for which an invalid select procedure was encountered.
DB2 bypasses invalid select procedures which can cause some degradation in performance.

Field Name: QISTCOLS
This is an exception field.

CUR TOTAL STORAGE USED (KB)
The total amount of storage (KB) currently used in the Workfile Database at system level.

Field Name: QISTWCTO
DB2 V11 and above.

MAX AGENT STORAGE LIMIT (KB)
The maximum amount of storage (KB) in the Workfile Database that can be used by each agent (derived from ZPARM MAXTEMPS).

Field Name: QISTWMXA

MAX TOTAL STORAGE USED (KB)
The maximum total amount of storage (KB) ever used in the Workfile Database at system level since DB2 startup.

Field Name: QISTWMXU
DB2 V11 and above.

MAX STORAGE USAGE LIMIT EXCEEDED
The number of times the maximum amount of storage that an agent can use in the Workfile database was exceeded.

Field Name: QISTWFNE

CUR 4K TABSPACE STORAGE USED (KB)

The total amount of storage (KB) currently used for 4 KB table spaces in the Workfile Database.

Field Name: QISTW4K

CUR 32K TABSPACE STORAGE USED (KB)

The total amount of storage (KB) currently used for 32 KB table spaces in the Workfile Database.

Field Name: QISTW32K

4K INSTEAD OF 32K TABSPACE USED

The number of times that space in a 4 KB page table space was used because space in a 32 KB page table space was preferred but not available in the Workfile Database.

Field Name: QISTWF2

32K INSTEAD OF 4K TABSPACE USED

The number of times that space in a 32 KB page table space was used because space in a 4 KB page table space was preferred but not available in the Workfile Database.

Field Name: QISTWF1

CUR ACTIVE (DM) IN-MEMORY

The number of currently active in-memory work files created by the Data Manager.

Field Name: QISTIMAC

CUR STORAGE (DM) IN-MEMORY (KB)

The total space used for currently active in-memory work files created by the Data Manager.

Field Name: QISTIMSC

MAX ACTIVE (DM) IN-MEMORY

The maximum number of in-memory work files (created by the Data Manager) that were active at any point in time since DB2 startup. This is a high-water mark count.

Field Name: QISTIMAH

MAX STORAGE (DM) IN-MEMORY (KB)

The maximum space used for active in-memory work files created by the Data Manager at any point in time since DB2 startup. This is a high-water mark count.

Field Name: QISTIMSH

CUR ACTIVE (SORT) IN-MEMORY

The number of currently active in-memory work files created by the SORT component.
**Field Name:** QISTSIAAC

**CUR STORAGE (SORT) IN-MEMORY (KB)**

The total space used for currently active in-memory work files created by the SORT component.

**Field Name:** QISTSISC

**MAX ACTIVE (SORT) IN-MEMORY**

The maximum number of in-memory work files created by the SORT component that were active at any point in time since DB2 start. This is a high-water mark count.

**Field Name:** QISTSIAH

**MAX STORAGE (SORT) IN-MEMORY (KB)**

The maximum space used for active in-memory work files created by the SORT component at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTI2AC

DB2 V11 and above.

**CUR DGTT STORAGE USED (KB)**

The total amount of storage (KB) currently used for DGTTs in the Workfile Database by all agents on the system.

**Field Name:** QISTDGTTCTO

DB2 V11 and above.

**MAX ACTIVE (NONSORT) IN-MEMORY**

The maximum number of non-SORT related in-memory work files created by the Data Manager that were active at any point in time since DB2 startup. This is a high-water mark count.

**Field Name:** QISTSIAH

**MAX DGTT STORAGE USED (KB)**

The maximum total amount of storage (KB) ever used for DGTTs in the Workfile Database by all agents on the system since DB2 startup.

**Field Name:** QISTDGTTMXU

DB2 V11 and above.

**IN-MEMORY (NONSORT) OVERFLOWED**

The number of times non-SORT related in-memory work files overflowed into a physical table space.

**Field Name:** QISTI2OF

DB2 V11 and above.
CUR WORKFILE STORAGE USED (KB)
The total amount of storage (KB) currently used for non-DGTT work files in the Workfile Database by all agents on the system.

Field Name: QISTWFCT
DB2 V11 and above.

IN-MEMORY WORKFILE NOT CREATED
The number of times an in-memory work file was not created due to critical storage conditions.

Field Name: QISTIMNC
DB2 V11 and above.

MAX WORKFILE STORAGE USED
The maximum total amount of storage (KB) ever used for non-DGTT work files in the Workfile Database by all agents on the system since DB2 startup.

Field Name: QISTWFMXU
DB2 V11 and above.

TOTAL STORAGE CONFIG (KB)
The total storage (KB) configured for all table spaces in the Workfile Database.

Field Name: QISTWSTG
DB2 V11 and above.

MAX AGENT STORAGE USED (KB)
The maximum amount of storage (KB) ever used in the Workfile Database by any thread since DB2 startup.

Field Name: QISTAMXU
DB2 V11 and above.

TOTAL DGTT STORAGE CONFIG (KB)
The total preferred storage (KB) configured for DGTTs in the Workfile Database.

Field Name: QISTDGTTSTG
DB2 V11 and above.

AGENT STORAGE THRESHOLD (%)
The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database by an agent (derived from ZPARM WFSTGUSE_AGENT_THRESHOLD).

Field Name: QISTASTH
DB2 V11 and above.

TOTAL WORKFILE STORAGE CONFIG (KB)
The total preferred storage (KB) configured for non-DGTT work files in the Workfile Database.

Field Name: QISTWFSTG
DB2 V11 and above.

**TOTAL STORAGE THRESHOLD (%)**

The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database (derived from zparm WFSTGUSE_SYSTEM_THRESHOLD).

**Field Name:** QISTSTH

DB2 V11 and above.

**INSERT ROWS SKIPPED**

The number of rows skipped by read transactions because of uncommitted INSERT operations (using currently committed semantic for FETCH).

**Field Name:** QISTRCCI

**DELETE ROWS ACCESSED**

The number of rows accessed by read transactions because of uncommitted DELETE operations (using currently committed semantic for FETCH).

**Field Name:** QISTRCCD

**UPDATE ROWS ACCESSED**

The number of rows accessed by read transactions because of uncommitted UPDATE operations (using currently committed semantic for FETCH).

**Field Name:** QISTRCCU

**NUMBER OF FAST INSERT PIPES**

The number of Data Manager (DM) fast insert pipes that were allocated since DB2 restart.

**Field Name:** QISTINPA

**NUMBER OF FAST INSERT PIPES DISABLED**

The number of DM fast insert pipes that have been disabled since DB2 restart.

**Field Name:** QISTINPD

**IFCID 002 - Data Manager Data**

This topic shows detailed information about “Record Trace - IFCID 002 - Data Sharing Locking Data”.

**Record trace - IFCID 002 - Data Sharing Locking Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Data Sharing Locking Data” are described in the following section.

```
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Data Sharing Locking Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCK REQ (P-LOCKS)</td>
<td>60865 SYNCH.XES - LOCK REQ</td>

<tr>
<td>P-LOCK CHANGE DURING REG.</td>
<td>2433 FALSE CONTENTIONS</td>
</tr>
<tr>
<td>SYNC-ASYNC XES CONV</td>
<td>37563 FLMG COUNTS PER</td>
</tr>
</tbody>
</table>
```

**LOCK REQ (P-LOCKS)**

The number of lock requests for P-locks.
Field Name: QTGSLPLK

SYNCH.XES - LOCK REQ

The number of P/L-lock requests propagated to z/OS XES synchronously. This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSLSLM

SUSPENDS - IRLM GLBL CONT

The number of suspensions due to IRLM global resource contention. All IRLM lock states were in conflict on the same resource.

Global contention requires intersystem communication to resolve the lock conflict whereas local contention does not.

Field Name: QTGSIGLO

UNLOCK REQ (P-LOCKS)

The number of unlock requests for P-locks.

Field Name: QTGSUPLK

SYNCH.XES - CHANGE REQ

The number of change requests propagated to z/OS XES synchronously, including logical and physical locks. This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSCSLM

SUSPENDS - XES GLBLL CONT

The number of suspensions due to z/OS XES global resource contention. The z/OS XES lock states were in conflict but the IRLM lock states were not.

IRLM has many lock states but XES is only aware of the exclusive and shared lock states.

Field Name: QTGSSGLO

CHANGE REQ (P-LOCKS)

The number of change requests for P-locks.

Field Name: QTGSCPLK

SYNCH.XES - UNLOCK REQ

The number of unlock requests propagated to z/OS XES synchronously, including logical and physical locks. This number is not incremented if the request is suspended before going to XES.

Field Name: QTGSUSLM

NOTIFY MESSAGES SENT

The number of notify messages sent.

Field Name: QTGSNTFY

ASYNCH.XES - RESOURCES
The number of resources propagated by IRLM to z/OS XES asynchronously, including logical and physical locks.

This can happen when new inter-DB2 interest occurs on a parent resource or when a request completes after the requester’s execution unit was suspended.

Field Name: QTGSKIDS

**INCOMPAT RETAINED LOCK**

The number of global lock or change requests denied or suspended due to an incompatible retained lock.

Field Name: QTGSDRTA

**NOTIFY MESSAGES RECEIVED**

The number of notify messages received.

Field Name: QTGSNTFR

**P-LOCK/NOTIFY EXITS ENGINES**

The maximum number of engines available for physical lock exit or notify exit requests.

Field Name: QTGSPEMX

**P-LOCK/NFY EX.ENGINE N/A**

The number of times an engine is not available for physical lock exit or notify exit requests.

Field Name: QTGSPEQW

**PSET/PART P-LOCK NEGOTIAT.**

The number of times this DB2 was driven to negotiate a partition or page set physical lock due to changing inter-DB2 interest levels on the partition or page set.

Field Name: QTGSPPPE

**PAGE P-LOCK NEGOTIAT.**

The number of times this DB2 negotiated a page physical lock because of physical lock contention within DB2.

Field Name: QTGSPGPE

**OTHER P-LOCK NEGOTIAT.**

The number of times this DB2 was driven to negotiate a physical lock type other than page set, partition, or page.

Field Name: QTGSOTPE

**P-LOCK CHANGE DURING NEG.**

The number of times a physical lock change request was issued during physical lock negotiation.

Field Name: QTGSCCHNP

**FALSE CONTENTIONS**

The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention
within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

**Note:** The QTGFSFCON flag indicates whether the false contention is reported at subsystem(=1) or LPAR level (=0).

**Field Name:** QTGFSFLMG  
**SYNC-ASYNC XES CONV**  
The number of synchronous to asynchronous heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

**Field Name:** QTGFSFLSE

**FLMG COUNTS PER**  
Flags describing QTGS counters:
- **ON**     QTGFSFLMG counts per subsystem (SUBSYS)
- **OFF**    QTGFSFLMG counts per LPAR

**Field Name:** QTGFSFLGS

**NO DELAY LOCK REQ REJECTS**  
The total number of failed DB2 lock requests to XES to process without delay. XES rejects the lock request because it could not process it synchronously.

**Field Name:** QTGSCREJ

**IFCID 002 - Dynamic SQL Statement**:

This topic shows detailed information about “Record Trace - IFCID 002 - Dynamic SQL Statement”.

**Record trace - IFCID 002 - Dynamic SQL Statement**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Dynamic SQL Statement” are described in the following section.

**REOPTIMIZATION**

The total number of times reoptimization occurs because the value of the host variable or parameter marker changes.

**Field Name:** QXSTREOP

**FOUND IN CACHE**

The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.

**Field Name:** QXSTFND

**IMPLICIT PREPARES**
An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES.

If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Field Name: QXSTIPRP

STMT INVALID (MAX)

The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDEXP

NOT FOUND IN CACHE

The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.

Field Name: QXSTNFND

PREPARES AVOIDED

This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.

An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Field Name: QXSTNPRP

STMT INVALID (DDL)

The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDINV

CSWL STMTS PARSED

The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior was used for the prepare of the statement for the dynamic statement cache.

Field Name: QXSTCWLP

CSWL LITS REPLACED

The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS was used for the prepare of the statement for dynamic statement cache.

Field Name: QXSTCWLR
CSWL MATCHES FOUND

The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE STATEMENTS WITH LITERALS.

Field Name: QXSTCWLM

CSWL DUPLS CREATED

The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Field Name: QXSTCWLD

LOAD FROM CATALOG

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

Field Name: QXSTSFND

IFCID 002 - EDM Pool Data

This topic shows detailed information about “Record Trace - IFCID 002 - EDM Pool Data”.

Record trace - IFCID 002 - EDM Pool Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - EDM Pool Data” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAGES IN POOL</td>
<td>This field shows the sum of the values for the following counters:</td>
</tr>
<tr>
<td>FREE PAGES</td>
<td></td>
</tr>
<tr>
<td>EDM POOL FULL</td>
<td></td>
</tr>
<tr>
<td>EDW POOL DATA</td>
<td></td>
</tr>
<tr>
<td>IFCID 002 - Dynamic SQL Statement</td>
<td></td>
</tr>
</tbody>
</table>

This field shows the sum of the values for the following counters:
IFCID 002 - EDM Pool Data

- HELD BY CT
- HELD BY PT
- FREE PAGES

Field Name: QISEPAGE

CT PAGES

The current number of pages used for the cursor tables (CTs). This is a snapshot value.

Field Name: QISECT

PT PAGES

The current number of pages used for package tables (PTs). This is a snapshot value.

Field Name: QISEKT

FREE PAGES

The number of pages currently not used by any object in the EDM pool, in the EDM pool (below), or in the RDS pool (below). This is a snapshot value.

Field Name: QISEFREE

CT REQUESTS

The number of requests for cursor table (CT) sections.

Field Name: QISECTG

PT REQUESTS

The number of requests for package table (PT) sections.

Field Name: QISEKTG

DBD REQUESTS

The number of requests for database descriptors (DBDs).

Field Name: QISEDBDG

EDM POOL FULL

The total number of failures because the EDM pool or EDM pool (below) was full.

Field Name: QISEFAIL

This is an exception field.

CT NOT IN POOL

The number of times a cursor table section was loaded from DASD.

To find the number of times the CT was found in the EDM pool, subtract this value from the value of the Requests for sections - CT field.

Field Name: QISECTL

This is an exception field.

PT NOT IN POOL

The number of times a package table section was loaded from DASD.
To find the number of times the PT was already in the EDM pool, subtract this value from the value of the Requests for sections - PT field.

Field Name: QISEKTL

This is an exception field.

DBD NOT IN POOL

The total number of times database descriptors were loaded from DASD.

To find the number of times the DBD was already in the EDM pool, subtract this value from the value of Requests for sections - DBD field.

Field Name: QISEDBDL

This is an exception field.

CACHE INSERTS

The number of full prepare requests.

A Full Prepare occurs for both Explicit Prepare and Implicit Prepare requests when the skeleton copy of the prepared SQL statement is not found in global dynamic SQL cache in the EDM pool.

Field Name: QISEDSI

This is an exception field.

CACHE REQUESTS

The number of requests for prepared statement cache sections.

Field Name: QISEDSG

LOAD FROM CATALOG

The number of times a dynamic SQL statement is found in a catalog.

Field Name: QISEDPSF

LOOK-UP IN CATALOG

The number of look-ups in a catalog to satisfy a dynamic SQL statement prepare request.

This field is updated when a statement is not found in the cache and the criteria is met to look for it in the catalog table. It is only incremented on the first look up and not if there are multiple rows that might be a match. This is a system level value so it will be the number of times it has been checked since DB2 was started. It is incremented even if no copies of the statement have been captured.

Field Name: QISEDPSL

POSSIBLE ROW FOUND

The number indicates duplicated statement hash (stmt hash) entries. It shows the number of times rows are read from the catalog before a match is found.

This field is incremented each time a row is read that might be a match. This is a serviceability field.

Field Name: QISEDPCS

MATCH THR TXT/BND OPT
The number of times a catalog match is found without checking the authentication ID (authid). This number indicates whether statements are monitored by multiple authids.

This field is incremented each time a row is read and everything is matched, but before the authids are checked. This is a serviceability field.

**Field Name:** QISEDPSM

**PKG SEARCH NOT FOUND**

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*, COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a cached record was located during package binding.

**Field Name:** QISEKNFM

**PKG SEARCH NOT FOUND INSERT**

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*, COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was added to the cache during package binding.

**Field Name:** QISEKNFA

**PKG SEARCH NOT FOUND DELETE**

When a package is bound with a wild card (*) for package names, in the form of PKLIST(COL1.*, COL2.*.....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was removed from the cache during package binding.

**Field Name:** QISEKNFR

**STATEMENTS IN GLOBAL CACHE**

Number of statements in the global cache.

**Field Name:** QISESTMT

**PAGES IN STMT POOl (ABOVE)**

The current number of pages in the EDM Statement pool above the 2 GB bar. This is a snapshot value. For DB2 12 this field shows N/A.

**Field Name:** QISECPGE

**PAGES IN DBD POOL (ABOVE) (Prior to DB2 12)**

This field shows the number of pages in the DBD pool above the 2 GB bar.

**Field Name:** QISEDPGE

**HELD BY STATEMENTS**

The number of pages in the EDM Statement pool above the 2 GB bar that is used for cached dynamic SQL statements. This is a snapshot value.
Field Name: QISEDYNP

HELD BY DBD

The current number of pages used for database descriptors (DBDs). This is a snapshot value.

Field Name: QISEDDBD

FREE PAGES (Prior to DB2 12)

This field shows the number of free pages in the DBD pool above the 2 GB bar.

Field Name: QISEDFFRE

This is an exception field.

STEALABLE PAGES

The current number of stealable pages used for skeleton cursor and package tables.

Field Name: QISEKLRU

FAILS DUE TO STMT POOL FULL

The total number of failures because the EDM Statement pool above the 2 GB bar was full. For DB2 12 this field shows N/A.

Field Name: QISECFAL

FREE PAGES

The number of pages currently not used by any object in the EDM Statement pool above the 2 GB bar. For DB2 12 this field shows N/A.

Field Name: QISECFRE

FAILS DUE TO DBD POOL FULL

This field shows the total number of failures because the DBD pool above the 2 GB bar was full.

Field Name: QISEDFFAL

This is an exception field.

PAGES IN RDS POOL (ABOVE)

The number of pages in the RDS pool above the 2 GB bar.

Field Name: QISESPGE

PAGES IN SKEL POOL (ABOVE) (Prior to DB2 12)

The current number of pages in the EDM skeleton pool above the 2 GB bar.

Field Name: QISEKPGE

HELD BY CT

The number of pages in the RDS pool above the 2 GB bar used for the cursor tables (CTs). This is a snapshot value.

Field Name: QISECTA

HELD BY SKCT
IFCID 002 - EDM Pool Data

The current number of pages used for skeleton cursor tables (SKCTs). This is a snapshot value.
Field Name: QISESKCT

HELD BY PT
The number of pages in the RDS pool above the 2 GB bar used for the package tables (PTs). This is a snapshot value.
Field Name: QISEKTA

HELD BY SKPT
The current number of pages used for skeleton package tables (SKPTs). This is a snapshot value.
Field Name: QISESKPT

FREE PAGES (Prior to DB2 12)
The number of pages currently not used by any object in the EDM skeleton pool above the 2 GB bar.
Field Name: QISEKFRE

STEALABLE PAGES
The current number of stealable pages used for database descriptors (DBDs).
Field Name: QISEDLRU

FAILS DUE TO RDS POOL FULL
The number of failures because the RDS pool above the 2 GB bar was full.
Field Name: QISESFAL

FREE PAGES
The number of free pages in the RDS pool above the 2 GB bar.
Field Name: QISESFRE

FAILS DUE TO SKEL POOL FULL
The total number of failures because the EDM skeleton pool above the 2 GB bar was full.
Field Name: QISEKFAL

SHAREABLE STATIC SQL STMT REQUESTS
The number of shareable static SQL statement requests. Prior to DB2 11, the field is used for the number of requests of executable code sequences (xPROC).
Field Name: QISEKSPG

XPROC ALLOC STOR
The total storage allocated to executable code sequences (xPROC).
Field Name: QISEKSPA

PLAN BTB STORAGE
The storage allocated to plans below the bar.
Field Name: QISESQCB
PKG BTB STORAGE

The storage allocated to packages below the bar.

Field Name: QISESQKB

PLAN ATB STORAGE

The storage allocated to plans above the bar.

Field Name: QISESQCA

PKG ATB STORAGE

The storage allocated to packages above the bar.

Field Name: QISESQKA

REQ STOR FOR STATIC STMTS

The total storage requested for shareable static SQL statements.

Field Name: QISEKSPA8

IFCID 002 - Group Buffer Pools Activity Data:

This topic shows detailed information about “Record Trace - IFCID 002 - Group Buffer Pools Activity Data”.

Record trace - IFCID 002 - Group Buffer Pools Activity Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Group Buffer Pools Activity Data” are described in the following section.

GROUP BUFFER POOL ID

The group buffer pool identifier.

Field Name: QBGLGN

FLAGS

The flag byte shows if more QBGL data is following or if this is the last of the QBGL repeating groups.

Field Name: QBGLFLG

SYN.READS(XI)-DATA RETURNED
The number of requests made to read a page from the group buffer pool because the page was invalidated in the member's buffer pool. The member found the required page in the group buffer pool.

**Background and Tuning Information**

When you increase the size of the group buffer pool (GBP), the number of pages returned from the GBP can increase. Conversely, decreasing the size of the GBP can cause DB2 to return fewer pages because the GBP cannot hold pages long enough to allow them to be retrieved again.

**Field Name:** QBGLXD

This is an *exception* field.

**SYN.READS(NF)-DATA RETURNED**

The number of requests made to read a page from the group buffer pool because the page was not in the buffer pool of the member. The member found the page in the group buffer pool.

**Background and Tuning Information**

The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).

**Field Name:** QBGLMD

This is an *exception* field.

**SYN.READS(XI)-NO DATA RET.**

The number of requests to read a page from the group buffer pool made because the page was invalidated in the member's buffer pool. The page was not found in the GBP and the page was recovered from DASD.

**Field Name:** QBGLGXR

**SYN.READS(NF)-NO DATA RET.**

The number of requests made to read a page from the group buffer pool because the page was not in the member's buffer pool. The member did not find the required data in the group buffer pool and had to retrieve the page from DASD.

**Background and Tuning Information**

The requesting member needs a page from a table space or index that is GBP-dependent or has GBPCACHE ALL defined. To get that page, the group buffer pool is checked before the page set on DASD.

You can compare the value in this counter with the number of pages that were returned from the group buffer pool, see Sync.Read (Not Found) - Data Returned. If the group buffer pool is used to cache both clean and changed pages (GBPCACHE ALL is used for all data), you can try to get more pages returned from the group buffer pool by increasing the size of the group buffer pool. Do not tune the GBP based on this counter if it is used for caching changed pages only (GBPCACHE CHANGED).
Field Name: QBGLMR
READ FOR CASTOUT MULT
The number of Read For Castout Multiple requests.

Field Name: QBGLCM
WRITE AND REGISTER MULT
The number of Write and Register Multiple requests.

Field Name: QBGLWM
READ FOR CASTOUT
The number of Read For Castout requests. One page read per request.

Field Name: QBGLCR
WRITE AND REGISTER
The number of Write and Register requests.

Field Name: QBGLWS
CLEAN PAGES WRITTEN
The number of clean pages that were synchronously written to the group buffer pool from the virtual pool.

Background and Tuning Information
Only GBPCACHE ALL causes clean (unchanged) pages to be written to the coupling facility. The pages are written to the coupling facility even if the page set is not GBP-dependent. If group buffer pool caching works effectively for prefetch, the value in this field should be much smaller than the value in Synchronous Read (Not Found) - Data Returned.

Field Name: QBGLWC
This is an exception field.

PAGES WRITE & REG MULT
The number of pages written using Write and Register Multiple (WARM) requests.

Field Name: QBGLWP
CHANGED PAGES SYNC.WRITTEN
The number of changed pages written synchronously to the group buffer pool.

Pages are written with Write and Register (WAR) requests or Write and Register Multiple (WARM) requests.

At commit time changed pages are forced from the virtual buffer pool of the member to the coupling facility.

Background and Tuning Information
In data sharing, changed pages must have been written to the group buffer pool by the time a transaction commits. The pages are written either synchronously (force at commit) or asynchronously, for example, when a local buffer pool threshold is reached or at a member's checkpoint. The
number of pages that have to be forced out synchronously (in “burst mode”) at commit time can be reduced if asynchronous writes are triggered more frequently.

You can use the vertical deferred write threshold (VDWQT) to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. You can cause changed pages to be written out quicker and in smaller increments, by reducing the vertical deferred write threshold (VDWQT).

Field Name: QBGLSW
This is an exception field.

PAGES CASTOUT
The number of data pages that were cast out of the group buffer pool of the member.

Castout to a page set or partition is done by the castout owner of the page set or partition. This is normally the DB2 subsystem that had the first update intent on the page set or partition.

Background and Tuning Information
The number of pages written per I/O is normally close to the value of this field divided by the value in Unlock Castout.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the number in this field.

Because DB2 usually includes more than one page in the request to write pages to DASD, the number in this field should always be significantly more than Unlock Castout. If it is not (for example, when “unlock castout” is more than half of “pages castout”), the castout write I/O is inefficient; probably because you have random update patterns on the DB2 data or a low castout threshold.

Field Name: QBGLRC
This is an exception field.

CHANGED PAGES ASYNC.WRITTEN
The number of changed pages written asynchronously to the group buffer pool.

Pages are written in response to Write and Register (WAR) and Write and Register Multiple (WARM) requests.

Changed pages can be written from the member’s virtual buffer pool to the group coupling facility before the application commits. This happens when, for example, a local buffer pool threshold is reached, or when P-lock negotiation forces the pages on the vertical deferred write queue to be written to the group buffer pool.

Background and Tuning Information
In data sharing, changed pages must have been written to the group buffer pool before a transaction commits. The pages are written either synchronously during commit processing or asynchronously before the transaction commits when, for example, a local buffer pool threshold is
reached or at a member’s checkpoint. See Changed Pages - Written Synchronously for the number of changed pages synchronously written to the group buffer pool.

The vertical deferred write threshold (VDWQT) can be used to reduce the number of pages that have to be forced out synchronously and to increase the number of pages that are asynchronously written before the transaction commits. For GBP-dependent page sets, writes triggered by the vertical deferred write threshold go to the coupling facility. If you want changed pages to be written out quicker and in smaller increments, you can lower the vertical deferred write threshold (VDWQT).

**Field Name:** QBGLAW

This is an *exception* field.

**CASTOUT CLASS THRESHOLD**

The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected.

**Background and Tuning Information**

The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (5 percent) is a good choice. Depending on your workload, altering this value can reduce DASD contention during castout.

**Field Name:** QBGLCT

This is an *exception* field.

**WRITE FAILED-NO STORAGE**

The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources.

**Background and Tuning Information**

A value greater than zero indicates that the data page resources of the coupling facility are being consumed faster than the DB2 castout processes can free them.

On write failure, the affected DB2 member initiates castout and retries several times, and finally, if it is a changed page, it will be added to the logical page list (LPL) requiring recovery.

If the problem is not simply due to a momentary surge in activity, you need either to decrease the group buffer pool castout thresholds, or to increase the number of data entries in the group buffer pool. To increase the number of data entries, you can do one of the following:

- Increase the total size of the group buffer pool.
- Adjust the ratio of directory entries to data entries in favor of data entries.

**Field Name:** QBGLWF

This is an *exception* field.

**GROUP BP CASTOUT THRESHOLD**

The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected.

**Background and Tuning Information**
The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool.

You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications.

In most situations, the default value for the group buffer pool castout threshold of 30 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

**Field Name:** QBGLGT

This is an *exception* field.

**REG.PAGE LIST (RPL) REQ.**

The number of register page list (RPL) requests made by prefetch. The group buffer pool must be allocated in a group coupling facility with CFLEVEL=2 or higher.

**Background and Tuning Information**

Performance might be improved by enabling RPL.

**Field Name:** QBGLAX

This is an *exception* field.

**DELETE NAME LIST SEC-GBP**

The number of DELETE NAME LIST requests to delete pages from the secondary group buffer pool that have just been cast out from the primary.

**Field Name:** QBGL2D

This is an *exception* field.

**GBP CHECKPOINTS TRIGGERED**

The number of group buffer pool checkpoints triggered by this member.

**Background and Tuning Information**

The value of this counter depends on the length of the group buffer pool checkpoint interval.

**Field Name:** QBGLCK

**DELETE PAGE FROM SEC-GBP**

The number of group buffer pool requests to delete a page from the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to delete orphaned data entries in the secondary GBP as part of the garbage collection logic.

**Field Name:** QBGL2N

**PAGES RETRIEVED FROM GBP**

The number of coupling facility reads performed by prefetch to retrieve a changed page from the group buffer pool.

**Field Name:** QBGLAY

This is an *exception* field.

**READ CASTOUT STATS SEC-GBP**
The number of coupling facility requests to read the castout statistics for the secondary group buffer pool. These requests are issued by the group buffer pool structure owner to check for orphaned data entries in the secondary group buffer pool.

**Field Name:** QBGL2R

This is an *exception* field.

**READ STORAGE STATS**

The number of times DB2 requested statistics information from the group buffer pool. It is issued by the group buffer pool structure owner at timed intervals to determine whether the group buffer pool castout threshold (GBPOOLT) has been reached.

**Field Name:** QBGLOS

**UNLOCK CASTOUT**

The number of times DB2 issued an unlock request to the coupling facility for completed castout I/Os.

When pages are cast out to DASD, they are locked for castout in the coupling facility. This castout lock is not an IRLM lock; it is to ensure that only one system can cast out a given page at a time.

**Background and Tuning Information**

The number of pages written per I/O is normally close to the value of pages castout divided by the value of this field.

For example, if an average of four pages is written per castout write I/O, the number of pages cast out should be four times the value in this field.

Because DB2 usually includes more than one page in a write request, the number in this field should always be significantly less than pages castout. If it is not (for example, when "unlock castout" is more than half of "pages castout"), the castout write I/O is inefficient; possibly because you have random update patterns on the DB2 data or a low castout threshold.

**Field Name:** QBGLUN

**DELETE NAME**

The number of requests made by DB2 to delete directory and data entries associated with a particular page set or partition from the group buffer pool.

DB2 issues this request when it changes a page set or partition from GBP-dependent to non GBP-dependent. DB2 also issues this request for objects that are defined with GBPCACHE ALL when those objects are first opened.

**Background and Tuning Information**

This counter is a measure of how often page sets or partitions change between being and not being dependent on the group buffer pool.

You can prevent DB2 going in and out of GBP dependency too often by tuning the following subsystem parameters that affect data sets when they are switched to a different state:

**PCLOSEN**

Pseudoclose frequency. The number of checkpoints required before a data set that was not updated can be a pseudoclose candidate.
IFCID 002 - Group Buffer Pools Activity Data

If the PCLOSEN condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

PCLOSET
Pseudoclose time. The amount of time (in minutes) that must elapse before a data set can be a pseudoclose candidate.

If the PCLOSEN or PCLOSET condition is met, the page set or partition is converted from read-write to read-only state. Depending on other concurrent users, this could raise the chance for the page set or partition to go out of GBP dependency.

LOGLOAD
The number of log records that DB2 writes between successive checkpoints.

These parameters are specified in the CHECKPOINT FREQ field in panel DSNTIPN.

Field Name: QBGLDN

READ CASTOUT CLASS
The number of requests made to the group buffer pool to determine which pages, from a particular page set or partition, must be cast out because they are cached as changed pages.

This request is issued either by the page set or partition castout owner, or, when the group buffer pool castout threshold is reached, by the group buffer pool structure owner.

Field Name: QBGLCC

UNREGISTER PAGE
The number of times DB2 unregistered interest for a single page. This happens when DB2 steals pages from the member’s buffer pool that belong to GBP-dependent page sets or partitions.

Background and Tuning Information
A large value here indicates that the local buffer pool contains a mixture of GBP-dependent data and non-GBP-dependent data.

The page stolen from the local buffer pool is replaced by a new one. This counter makes a distinction on whether the new page depends on the group buffer pool or not.

Usually a page of a GBP-dependent page set or partition is replaced by a page that is also GBP-dependent. In this instance, the unregister request for the page being stolen is combined with the read and register request for the new page. These combined requests do not contribute to this counter.

If, however, a page of a GBP-dependent page set or partition is replaced by a page that is not GBP-dependent, then only an unregister request is sent to the coupling facility. These separate requests are counted here.

Field Name: QBGLDG

NR.OF READ FOR CASTOUT REQ.
The number of requests issued by the group buffer pool structure owner to determine which castout classes have changed pages.
This request is made by the group buffer pool structure owner when the group buffer pool threshold is reached. Normally, you would expect only one or two requests each time the group buffer pool threshold is reached.

**Field Name:** QBGLCS

**REGISTER PAGE**

The number of times DB2 registered interest in a single page.

These are “register-only” requests, which means that DB2 is not requesting any data back from the request.

This request is made only to create a directory entry for the page to be used for cross-invalidation when the page set or partition P-lock is downgraded from S to IS mode, or from SIX to IX mode.

**Field Name:** QBGLRG

**READ DIRECTORY INFO**

The number of requests issued by the group buffer pool structure owner to read the directory entries of all changed pages in the group buffer pool.

This request is issued at group buffer pool checkpoints to record the oldest recovery log record sequence number (LRSN). It is used as a basis for recovery if the group buffer pool fails.

Such requests might have to be issued several times for each group buffer pool checkpoint to read the directory entries for all changed pages.

**Background and Tuning Information**

If the value of this counter appears to be abnormally high, consider upgrading the coupling facility to CFLEVEL=2 or higher to raise the number of directory entries that can be read with one request. You can also increase the group buffer pool checkpoint interval, but this can lengthen the recovery for the group buffer pool.

**Field Name:** QBGLRD

**EXPLICIT X-INVALID**

The number of times an explicit coupling facility cross-invalidation request was issued.

**Field Name:** QBGLEX

**GBP-DEPENDENT GETPAGES**

The number of Getpages made for GBP-dependent objects.

**Field Name:** QBGLGG

**PG P-LOCK UNLOCK REQ**

The number of page P-lock unlock requests.

**Field Name:** QBGLU1

**ASYNCH GBP REQUESTS**

The number of asynchronous IXLCACHE invocations for the primary group buffer pool.

**Field Name:** QBGAHS

**PG P-LOCK LOCK REQ SP MAP PG**
IFCID 002 - Group Buffer Pools Activity Data

The number of page P-lock lock requests for space map pages.
Field Name: QBGLP1

ASYNCH SEC-GBP REQUESTS
The number of IXLCACHE invocations for the secondary group buffer pool.
Field Name: QBGA2H

PG P-LOCK LOCK SUSP SP MAP PG
The number of page P-lock suspensions for space map pages.
Field Name: QBGLS1

WRITE SEC-GBP FAILED
The number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing that failed because of a lack of storage in the coupling facility.
Field Name: QBGL2F
This is an exception field.

PG P-LOCK LOCK NEG SP MAP PG
The number of page P-lock negotiations for space map pages.
Field Name: QBGLN1

PG P-LOCK LOCK REQ DATA PG
The number of page P-lock requests for data pages.
Field Name: QBGLP2

PG P-LOCK LOCK REQ IX LEAF PG
The number of page P-lock requests for index leaf pages.
Field Name: QBGLP3

PG P-LOCK LOCK SUSP DATA PG
The number of page P-lock suspensions for data pages.
Field Name: QBGLS2

PG P-LOCK LOCK SUSP IX LEAF PG
The number of page P-lock suspensions for index leaf pages.
Field Name: QBGLS3

PG P-LOCK LOCK NEG DATA PG
The number of page P-lock negotiations for data pages.
Field Name: QBGLN2

PG P-LOCK LOCK NEG IX LEAF PG
The number of page P-lock negotiations for index leaf pages.
Field Name: QBGLN3

PAGES IN WRITE AROUND
The number of changed pages that were written to disk through group buffer pool write-around due to condition write failures to the group buffer pool.

**Field Name:** QBGLWA

**IFCID 002 - Locking Data:**

This topic shows detailed information about “Record Trace - IFCID 002 - Locking Data”.

**Record trace - IFCID 002 - Locking Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Locking Data” are described in the following section.

<table>
<thead>

</tr>
</tbody>
</table>

**DEADLOCKS**

The number of times deadlocks were detected. This number should be low, ideally 0.

**Background and Tuning Information**

Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.

This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an *exception* field.

**LOCK REQUEST**

The number of requests to lock a resource.

**Field Name:** QTXALOCK

This is an *exception* field.
LOCK SUSPENSIONS
The number of times a lock could not be obtained and the unit of work was suspended.

Background and Tuning Information
This number should be low, ideally 0.
The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.
Suspensions are highly dependent on the application and table space locking protocols.
Field Name: QTXASLOC
This is an exception field.

CLAIM REQUESTS
The number of claim requests.
Field Name: QTXACLNO
This is an exception field.

TIMEOUTS
The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.
Field Name: QTXATIM
This is an exception field.

UNLOCK REQUEST
The number of requests to unlock a resource.
This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.
Field Name: QTXAUNLK

IRLM LATCH SUSPENS.
The number of latch suspensions.
Field Name: QTXASLAT

CLAIM REQ. FAILED
The number of unsuccessful claim requests.
Field Name: QTXACLUN

ESCALATIONS(SHR)
The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

Background and Tuning Information
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES
This is an *exception* field.

**QUERY REQUEST**
The number of query requests.

**Field Name:** QTXAQRY
This is an *exception* field.

**OTHER SUSPENSIONS**
The number of suspensions caused by something other than lock or latch.

**Field Name:** QTXASOTH
This is an *exception* field.

**DRAIN REQUESTS**
The number of drain requests.

**Field Name:** QTXADRNO
This is an *exception* field.

**ESCALATIONS(EXC)**
The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

**Background and Tuning Information**
Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.

If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a tablespace.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

**Field Name:** QTXALEX
This is an *exception* field.

**CHANGE REQUEST**
The number of change requests.

**Field Name:** QTXACHG
This is an *exception* field.
IFCID 002 - Locking Data

DRAIN REQ. FAILED

The number of unsuccessful drain requests.

Field Name: QTXADRUN

This is an exception field.

MAXIMUM PAGE/ROW LOCKS HELD

The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

Field Name: QTXANPL

This is an exception field.

OTHER REQUEST

The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

Field Name: QTXAIRLM

This is an exception field.

IFCID 002 - Miscellaneous:

This topic shows detailed information about “Record Trace - IFCID 002 - Miscellaneous”.

Record trace - IFCID 002 - Miscellaneous

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Miscellaneous” are described in the following section.

ARRAY EXPANSIONS

The number of times an array variable is expanded beyond 32 KB.

Field Name: QXSTARRAY_EXPANSIONS

SPARSE IX DISABLED

The number of times that sparse index was disabled because of insufficient storage.

Field Name: QXSISTOR
SPARSE IX BUILT WF
The number of times that sparse-index built a physical work file for probing.

Field Name: QXSIWF

REFRESH TABLE
The number of REFRESH TABLE statements.

Field Name: QXREFTBL

TRANSFER OWNERSHIP
The number of TRANSFER OWNERSHIP statements.

Field Name: QXTRNOWN

NO DM CALL RID/LPF
The number of times that RDS did not call data manager for RID list retrieval for multiple index access or list prefetch because runtime adaptive index processing was able to determine the outcome.

Field Name: QXRSDMAD

FETCH 1 BLOCK ONLY
The number of times that RDS fetched one block and made no subsequent requests for additional blocks.

Field Name: QXR1BOAD

QXPFSLNUM
This field is for IBM service use.

Field Name: QXPFSLNUM

QXPFSENUM
This field is for IBM service use.

Field Name: QXPFSENUM

QXPFSENUMG
This field is for IBM service use.

Field Name: QXPFSENUMG

QXPFMAXU
This field is for IBM service use.

Field Name: QXPFMAXU

QXPFMAXUG
This field is for IBM service use.

Field Name: QXPFMAXUG

QXN1093A
This field is for IBM service.

Field Name: QXN1093A

QXN1093B
This field is for IBM service.
IFCID 002 - Miscellaneous

Field Name: QXN1093B

IFCID 002 - Nested SQL Activity:

This topic shows detailed information about “Record Trace - IFCID 002 - Nested SQL Activity”.

Record trace - IFCID 002 - Nested SQL Activity

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Nested SQL Activity” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX CASCAD LVL</td>
<td>The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.</td>
</tr>
<tr>
<td>CALL STATEMENTS</td>
<td>The number of SQL CALL statements executed.</td>
</tr>
<tr>
<td>PROCEDURE ABENDS</td>
<td>The number of times a stored procedure terminated abnormally.</td>
</tr>
<tr>
<td>CALL TIMEOUTS</td>
<td>The number of times an SQL call timed out waiting to be scheduled.</td>
</tr>
<tr>
<td>CALL REJECTS</td>
<td>The number of times an SQL CALL statement was rejected due to the procedure being in the STOP ACTION(REJECT) state.</td>
</tr>
<tr>
<td>UDF EXECUTED</td>
<td>The number of user-defined functions executed.</td>
</tr>
<tr>
<td>UDF ABENDS</td>
<td>The number of times a user-defined function abended.</td>
</tr>
</tbody>
</table>
UDF TIMEOUTS
The number of times a user-defined function timed out while waiting to be scheduled.

Field Name: QXCAUDTO
This is an exception field.

UDF REJECTS
The number of times a user-defined function was rejected.

Field Name: QXCAUDRJ
This is an exception field.

STMT TRIGGER
The number of times a statement trigger was activated.

Field Name: QXSTTRG
This is an exception field.

ROW TRIGGER
The number of times a row trigger was activated.

Field Name: QXROWTRG
This is an exception field.

SQL ERROR TRIGGER
The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Field Name: QXTRGERR
This is an exception field.

IFCID 002 - Query Parallelism:
This topic shows detailed information about “Record Trace - IFCID 002 - Query Parallelism”.

Record trace - IFCID 002 - Query Parallelism
The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Query Parallelism” are described in the following section.

IFCID 002 - Nested SQL Activity
The maximum degree of parallelism estimated for a parallel group at bind time based on the cost formula. If the parallel group contains a host variable or parameter marker, then bind time will estimate the parallel group degree based on a valid assumption value.

Field Name: QXMAXESTIDG

MEMBERS SKIPPED

The number of times the parallelism coordinator had to bypass a DB2 when distributing tasks because one or more DB2 members did not have enough buffer pool storage. The number in this field is only incremented at the parallelism coordinator once per parallel group, even though more than one DB2 might have lacked buffer pool storage for that parallel group. It is also only incremented when the buffer pool is defined to allow for parallelism. For example, if VPXPSEQT=0 on an assistant, DB2 does not send parallel work there and the number in this field is not incremented.

Field Name: QQXCSKIP

PARALL. DISABLED

Indicates whether query parallelism is disabled by the Resource Limit Facility for at least one dynamic select statement in this thread. A non-zero value means that query parallelism is disabled.

Field Name: QQXRLFDPA

MAX DEG PLANNED

The maximum degree of parallelism planned for a parallel group. It is the ideal parallel group degree obtained at execution time after the host variable or parameter marker value is "plug-in" and before buffer pool negotiation and system negotiation are performed.

Field Name: QXMAXPLANDG

MAX DEG EXECUTED

The maximum degree of parallelism executed among all parallel groups to indicate the extent to which queries were processed in parallel.

Field Name: QXMAXDEG

FALL TO SEQ-CURSOR

The total number of parallel groups that fell back to sequential mode due to a cursor that can be used by UPDATE or DELETE.

Field Name: QXDEGCUR

GROUPS EXECUTED

The total number of parallel groups executed.

Field Name: QXTOTGRP

ONE DB2-COORD=NO

The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Field Name: QXCOORNO
FALL TO SEQ-NOESA

The total number of parallel groups that fell back to sequential mode due to a lack of ESA sort support.

Field Name: QXDEGESAA

PARALL.GROUPS

The total number of parallel groups that DB2 intended to run across the data sharing group. This number is only incremented at the parallelism coordinator at run time.

Field Name: QXXCBPNX

ONE DB2-ISO LVL

The total number of parallel groups executed on a single DB2 subsystem due to repeatable-read or read-stability isolation.

Field Name: QXISORR

FALL TO SEQ-STOR

The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

The exception field name is QXDEGBUF.

Field Name: QXDEGBUF

RAN REDUCED-STOR

The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool.

The exception field name is QXREDGRP.

Background and Tuning Information

If this field is not 0, increase the size of the current buffer pool using the ALTER BUFFERPOOL command or use the ALTER TABLESPACE command to assign table spaces accessed by this query to a different buffer pool.

Field Name: QXREDGRP

This is an exception field.

ONE DB2-DCL TTAB

The number of parallel groups in a query block that were downgraded to CPU parallelism because they referenced a UDF and a declared temporary table was detected at execution time.

DB2 enforces execution on a single DB2 (CPU parallelism), in this instance, because it cannot determine at incremental bind time for the statement whether the UDF will reference the declared temporary table. Other parallel groups in the same statement are not necessarily downgraded.

Field Name: QXDEGDTT

FALL TO SEQ-NEGOTN

The total number of parallel groups that fell back to sequential mode due to system negotiation result of system stress level.

Field Name: QXSTODGNGRP
RAN REDUCED-NEGOTN
The total number of parallel groups that did not reach the planned parallel degree due to system negotiation result of system stress level.

Field Name: QXSTOREDGRP

REFORM PARAL-CFG
The total number of parallel groups where DB2 reformulated the parallel portion of the access path because of a change in the number of active members, or because of a change of processor models on which they run, from bind time to run time. This counter is incremented only on the parallelism coordinator at run time.

Field Name: QXREPOP1

FALL TO SEQ-A.PROC
The total number of parallel groups that fell back to sequential mode under an autonomous procedure.

Field Name: QXDEGAT

RAN AS PLANNED
The total number of parallel groups that executed in the planned parallel degree. This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Field Name: QXNORGRP

REFORM PARAL-BUF
The total number of parallel groups in which DB2 reformulated the parallel portion of the access path because there were insufficient buffer-pool resources. This counter is incremented only at the parallelism coordinator at run time.

Field Name: QXREPOP2

QXPAROPT
This field is for IBM service.

Field Name: QXPAROPT

IFCID 002 - RID List Processing:
This topic shows detailed information about “Record Trace - IFCID 002 - RID List Processing”.

Record trace - IFCID 002 - RID List Processing
The field labels shown in the following sample layout of “Record Trace - IFCID 002 - RID List Processing” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>RL PROCESSING USED</td>
<td>73361</td>
</tr>
<tr>
<td>RL PROCESSING NOT USED-LIMIT EXCEEDED</td>
<td>0</td>
</tr>
<tr>
<td>RL OVERFLOWED-MAX LIMIT</td>
<td>0</td>
</tr>
<tr>
<td>RL PROCESSING NOT USED-NO STORAGE</td>
<td>11610</td>
</tr>
<tr>
<td>RL OVERFLOWED-MAX LIMIT</td>
<td>11610</td>
</tr>
</tbody>
</table>

RL PROCESSING USED
The number of times RID list (also called RID pool) processing is used.

During RID (RECORD ID) list processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted
and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

This field is incremented once for a given table access when RID list processing is used for index access with list prefetch, for multiple index access, or for both. For multiple index access, if a final RID list is obtained through ANDing and ORing of RID lists, the counter is incremented once, even if not all indexes were used by the RIDs in the multiple index access.

**Background and Tuning Information**

A nonzero value in this field indicates that DB2 has used list prefetch. If this is the case, check the access path selection.

**Field Name:** QXMIAP

This is an *exception* field.

### RL PROCESSING NOT USED-NO STORAGE

The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID list process involving one index (single index access with list prefetch) or multiple indexes (multiple index access).

This field can be incremented during retrieval, sorting, ANDing, and ORing of RID lists for index access with list prefetch (single index). For single index access, this field can only be incremented once per access. For multiple index access, it can be incremented for every index involved in the ANDing and ORing of RID lists.

**Field Name:** QXNSMIAP

This is an *exception* field.

### RL PROCESSING NOT USED-LIMIT EXCEEDED

The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

For index access with list prefetch (single index), this field can only be incremented during RID list retrieval. For multiple index access, this field can be incremented during RID list retrieval, ANDing, and ORing. This counter reflects the number of times internal limits or threshold values were exceeded for the RID lists obtained directly from an index as well as for RID lists derived during the ANDing and ORing process.

**Background and Tuning Information**

Before you increase the RID list storage size, investigate the cause of the failure using the statistics record or the performance trace. You can specify the size for the RID list on the DB2 installation panel DSNTIPC.

**Field Name:** QXMRMIAP

This is an *exception* field.

### RL SKIPPED-INDEX KNOWN

IFCID 002 - RID List Processing

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

**Field Name:** QXRSMIAP

**RL OVERFLOWED-NO STORAGE**

The number of times a RID list was overflowed to a work file because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXWFRIDS

**RL INTERRUPTED (HJ)-NO STORAGE**

The number of times a RID list append for a hybrid join was interrupted because no RID pool storage was available to hold the list of RIDs.

**Field Name:** QXHJINCS

**RL OVERFLOWED-MAX LIMIT**

The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXWFRIDT

**RL INTERRUPTED (HJ)-MAX LIMIT**

The number of times a RID list append for a hybrid join was interrupted because the number of RIDs exceeded one or more internal limits.

**Field Name:** QXHJINCT

*IFCID 002 - ROWID:*

This topic shows detailed information about “Record Trace - IFCID 002 - ROWID”.

**Record trace - IFCID 002 - ROWID**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - ROWID” are described in the following section.

<table>
<thead>
<tr>
<th>ROWID</th>
<th>DIRECT ACCESS</th>
<th>INDEX USED</th>
<th>TABLE SPACE SCAN USED</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**DIRECT ACCESS**

The number of times that direct row access was successful.

**Field Name:** QXROIMAT

**INDEX USED**

The number of times an index was used to find a record.

**Field Name:** QXROIINX

**TABLE SPACE SCAN USED**

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

**Background and Tuning Information**

Ideally, this value should be 0.
Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. .... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK ....

**Field Name:** QXROITS

**IFCID 002 - Service Controller Data:**

This topic shows detailed information about “Record Trace - IFCID 002 - Service Controller Data”.

**Record trace - IFCID 002 - Service Controller Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Service Controller Data” are described in the following section.

### Field Name: QXROITS

**IFCID 002 - Service Controller Data:**

This topic shows detailed information about “Record Trace - IFCID 002 - Service Controller Data”.

**Field name:** QTPKALLA

**OPEN DATASETS - HWM**

The maximum number of data sets concurrently open since the last time DB2 was started. This is a high-water mark (HWM).

### Background and Tuning Information

Monitor this field to see whether you are reaching the maximum number of open data sets permissible.
**IFCID 002 - Service Controller Data**

**Note:** The maximum number of open data sets is 200,000. The default is 20,000.

**Field Name: QTMAXDS**
This is an *exception* field.

**AUTHORIZ.ATTEMPTS**
The number of authorization checks performed for plans, packages, and stored procedures since DB2 was started. This includes successful and failed checks.

**Field Name: QTAUCHK**
This is an *exception* field.

**PLAN ALLOC.SUCC.**
The number of successful plan allocation attempts.
The cause of plan allocation failure could be plan unavailability or attempting to allocate a nonexistent plan.

**Field Name: QTALLOC**

**PACK.ALLOC.SUCC.**
The number of successful package allocation attempts.

**Background and Tuning Information**
Package allocation failure can occur when a package is unavailable or does not exist.

A high count of the number of packages unsuccessfully allocated (QTPKALLA - QTPKALL) typically occurs when a package list with multiple collections is used and frequently-used packages are found in the back end rather than in the front end of a package list. For example, when a package is found in the tenth collection, QTPKALLA is incremented by 10, one for each collection searched, but QTPKALL is incremented by 1.

A high number of packages unsuccessfully allocated can be accompanied by a high count of the number of unsuccessful checks for package execute authority made using the package authorization check because an application entry was not found in the cache (QTPACNOT). In this case, placing frequently used packages in the front end of a package list would reduce the number of Buffer Manager Getpages to the catalog/directory tablespaces.

**Field Name: QTPKALL**

**OPEN DATASETS - CURR.**
The number of data sets concurrently open (snapshot).

**Field Name: QTDSOPN**

**AUTHORIZ.SUCCESS.**
The number of successful authorization checks performed on plans, packages, and stored procedures, since DB2 was started.

**Field Name: QTAUSUC**
This is an *exception* field.

**PLANS BOUND**
The number of plans successfully bound and kept for future agent allocations.

This field represents the sum of successful BIND ADD (QTBINDA) and successful BIND REPLACE (QTBINDR) commands. This counter is not incremented for BIND subcommands with no plan ID specified, as identified by QTTESTB. Note that QTBINDA + QTBINDR is not necessarily equal to this field. It is equal only if all BIND ADD and BIND REPLACE subcommands issued are successful.

Field Name: QTPLNBD
This is an exception field.

PACKAGES BOUND
The number of packages bound and kept for future package allocations.
It is the sum of successful BIND ADD PACKAGE and BIND REPLACE PACKAGE subcommands, but only if all these commands are really issued successfully.

Field Name: QTPKGBD

DS NOUSE,NOCLOSE-HWM
The maximum number of data sets on the deferred close queue. It is a high-water mark representing the maximum number of data sets that are not in use but have not been physically closed yet.

Field Name: QTMAXPB
This is an exception field.

AUTH.SUCC-NO CAT.
The number of successful authorization checks that do not use the DB2 catalog (including plan cache checks and public checks).

Background and Tuning Information
For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public should be adequate.

Field Name: QTAUCCH

BIND PLAN (ADD)
The number of successful and unsuccessful BIND ADD subcommands issued.
The sum of QTBINDA, QTBINDR, and QTTESTB equals the total number of BIND subcommands.

Field Name: QTBINDA

BIND PACK (ADD)
The number of successful and unsuccessful BIND ADD PACKAGE subcommands issued.

Field Name: QTBINDPA

DS NOUSE,NOCLOSE-CURR.
The number of data sets that are not currently used, but are not closed due to a deferred close (snapshot).
Field Name: QTSLWDD
This is an exception field.

AUTH.SUCC-PUBLIC
The number of successful authorization checks based on EXECUTE authority granted to PUBLIC.

Field Name: QTAUPUB
This is an exception field.

BIND PLAN (REPL)
The number of successful and unsuccessful BIND REPLACE subcommands issued.

Field Name: QTBINDR
This is an exception field.

BIND PACK (REPL)
The number of successful and unsuccessful BIND REPLACE PACKAGE subcommands issued.

Field Name: QTBINDPR
This is an exception field.

DS CLOSED-THRESH.REACH
The number of data sets that were closed because the total number of open data sets reached the deferred close threshold value. The deferred close value is based on the value of DSMAX or the MVS DD limit ( whichever is smaller).

Field Name: QTDSDRN
This is an exception field.

PKG-AUTH.SUCC
The number of successful package EXECUTE authorization checks without accessing the DB2 catalog.

Field Name: QTPACAUT

AUTOB.PLAN ATTMP
The number of attempts to autobind a plan. This occurs when the plan was invalidated by modifications to the declarations of the data referenced by the programs bound as part of the plan. For example, dropping an index when it is used in the plan results in automatic bind.

Field Name: QTABINDA

AUTOB.PACK ATTMP
The number of attempts to autobind a package.

Background and Tuning Information
If YES was specified, or defaulted, for autobind on DB2 install panel DSNTIPB, an autobind occurs when a plan or package:
- Is invalid because declarations of the data referenced by the program or package were modified. For example, when an index used in a package
is dropped, an automatic bind occurs when the package is run for the first time after the index was dropped.

- Was bound in a later release and is used in a previous release for the first time.
- Was used in a previous release but is later remigrated and used in a later release for the first time.

Field Name: QTAUTOBA

This is an exception field.

R/W TO R/O CONVERSIONS

The number of infrequently updated data sets that are converted from R/W to R/O state. An updated data set is considered infrequently updated when it has not been updated for either 5 consecutive DB2 checkpoints or 60 minutes. For tablespace data sets, the switching from R/W to R/O state means the SYSLGRNG entry is closed.

Field Name: QTPCCT

This is an exception field.

PKG-AUTH.SUCC-PUB

The number of successful package EXECUTE authorization checks without accessing the DB2 catalog. Package EXECUTE authority was granted to PUBLIC in the package authorization cache.

Field Name: QTPACPUB

AUTOB.PLAN SUCC.

The number of plans successfully autobound.

Field Name: QTABIND

AUTOB.PACK SUCC.

The number of packages successfully autobound.

Field Name: QTPKABND

PKG-AUTH.UNSUCC

The number of unsuccessful package EXECUTE authorization checks in the package authorization cache. No applicable entry was found in the cache and DB2 catalog access was used.

Field Name: QTPACNOT

REBIND PLAN COMM

The number of REBIND subcommands issued. More than one plan can be rebound with a single REBIND subcommand. If the value in this field is 1, the number of plans you are attempting to rebind is shown in the Rebind - plan attempts field.

Field Name: QTREBIND

REBIND PACK COMM

The number of REBIND PACKAGE subcommands issued. More than one package can be rebound with a single subcommand. If the value in this field is 1, Rebind - package attempts shows the number of packages you are attempting to rebind.
Field Name: QTRBINDP

PKG-AUTHID OWRTN
The number of times an authorization ID was overwritten to add another one to the package authorization cache.

Field Name: QTPACOW1

REBIND PLAN ATTM
The number of attempts to rebind a plan. This number can be larger than the value shown in the Rebind - plan subcommands field because you can specify more than one plan in a single REBIND subcommand.

Field Name: QTRBINDA

REBIND PACK ATTM
The number of attempts to rebind a package. This can be larger than the value shown in Rebind package subcommands because you can rebind more than one package with a single command.

Field Name: QTRBNDPA

PKG-ENTRY OWRTN
The number of times an entry for a collection-ID or package-ID was overwritten to add another one to the package authorization cache.

Field Name: QTPACOW2

PLANS REBOUND
The number of rebind attempts that completed successfully. This field is equal to the Rebind - Plan attempts field if all specified plans rebound successfully.

Field Name: QTPLNRBD

PACKAGES REBOUND
The number of packages successfully rebound. If all specified packages were rebound successfully, this field is equal to Rebind package attempts.

Field Name: QTPKGRBD

RTN-AUTH.SUCC
The number of times the routine authorization cache was checked successfully of EXECUTE authority on a stored procedure or user-defined function. The DB2 catalog was not accessed. This counter includes the number of PUBLIC authorization checks.

Field Name: QTRACAUT

FREE PLAN COMMND
The number of FREE subcommands issued.
More than one plan can be freed with a single FREE subcommand. If this field is 1, then the number of plans you are trying to free is shown in ATTEMPTS TO FREE A PLAN.

Field Name: QTFREE

FREE PACKAGE COM
The number of FREE PACKAGE subcommands issued.
More than one package can be freed with a single FREE subcommand. If the value in this field is 1, then the number of packages you are attempting to free is shown in ATTEMPTS TO FREE A PACKAGE.

**Field Name:** QTFREEP

**RTN-AUTH.SUCC-PUB**

Number of successful authorization checks for user-defined function or stored procedure execution authority when that authority is held by PUBLIC. The DB2 catalog was not checked.

**Field Name:** QTRACPUB

**FREE PLAN ATTEMPT**

The number of attempts to free a plan.

This value can be larger than FREE PLAN SUBCOMMANDS because multiple plan IDs can be specified in a single FREE subcommand.

**Field Name:** QTFREEA

**FREE PACK ATTEMPT**

The number of attempts to free a package. This number can be larger than FREE PACKAGE SUBCOMMANDS because you can free several packages with a single command.

**Field Name:** QTFREEAP

**RTN-AUTH.UNSUCC**

Number of unsuccessful authorization checks for user-defined function or stored procedure EXECUTE authority because no applicable entry was found in the routine authorization cache.

**Field Name:** QTRACNOT

**PLANS FREED**

The number of times a plan was successfully freed.

Freeing a plan can fail if someone else is using the plan and holds a lock on it.

**Field Name:** QTPLNFRD

**PACKAGES FREED**

The number of times a package was successfully freed. If all the specified packages were freed successfully, the value of this field is equal to ATTEMPTS TO FREE A PACKAGE.

**Field Name:** QTPKGFRD

**RTN-AUTHID OWRRTN**

Number of times an individual authorization ID was overwritten in an entry of the routine authorization cache.

**Field Name:** QTACOW1

**TEST BINDS**

The number of BIND subcommands issued without a plan ID.

**Field Name:** QTTESTB

**AUTOB.INV.RES.ID**
IFCID 002 - Service Controller Data

The number of requests to allocate a nonexistent plan or package. This is the number of all plan and package allocation attempts that failed because the resource was unavailable or the object did not exist.

Field Name: QTINVRID

RTN-ENTRY OWRTN

Number of times that DB2 overwrote a routine entry in the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

Field Name: QTRACOW2

RTN-CACHE NO ADD

Number of times that DB2 could not add an entry to the routine authorization cache.

An entry in the routine authorization cache can refer to a function or procedure or to all functions or procedures within a specific schema.

Field Name: QTRACNAC

**IFCID 002 - Simulated Buffer Pool Activity:**

This topic shows detailed information about “Record Trace - IFCID 002 - Simulated Buffer Pool Activity”.

This block is provided for each simulated buffer pool.

**Record trace - IFCID 002 - Simulated Buffer Pool Activity**

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - Simulated Buffer Pool Activity” are described in the following section.

<table>

**BUFFER POOL ID**

The buffer pool ID.

Field Name: QBSPBPID

**CURRENT PAGES IN USE**

The number of simulated buffers currently in use in the simulated buffer pool.

Field Name: QBSPIU

**MAX PAGES IN USE**

The highest number of simulated buffers that were in use in the simulated buffer pool.

Field Name: QBSPHU

**CURRENT SEQ PAGES IN USE**
The number of simulated buffers currently in use for sequential pages in the simulated buffer pool.

Field Name: QBSPSUS

**MAX SEQ PAGES IN USE**

The highest number of simulated buffers that were in use for sequential pages in the simulated buffer pool.

Field Name: QBSPHSU

**PAGES MOVED INTO SIMULATED BP**

The number of pages logically moved into the simulated buffer pool from the virtual buffer pool.

Field Name: QBSPMVI

**TOTAL AVOIDABLE SYNC I/O DELAY**

The total time waiting for synchronous read I/O from disk for pages found in the simulated buffer pool.

Field Name: QBSPDTM

**FLAGS**

The flag byte shows if more QBSP data is following or if this is the last of the QBSP repeating groups.

Field Name: QBSPFLG

**AVOIDABLE READ I/O - SYNC READ I/O (R)**

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read I/O from disk.

Field Name: QBSPDRR

**AVOIDABLE READ I/O - SYNC READ I/O (S)**

The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read I/O from disk.

Field Name: QBSPDRS

**AVOIDABLE READ I/O - ASYNC READ I/O**

The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read I/O from disk.

Field Name: QBSPDRA

**AVOIDABLE READ I/O - SYNC GBP READS (R)**

The number of pages found in the simulated buffer pool for a random request that could have avoided a synchronous read from GBP.

Field Name: QBSPGRR

**AVOIDABLE READ I/O - SYNC GBP READS (S)**

The number of pages found in the simulated buffer pool for a sequential request that could have avoided a synchronous read from GBP.

Field Name: QBSPGRS

**AVOIDABLE READ I/O - ASYNC GBP READS**
IFCID 002 - Simulated Buffer Pool Activity

The number of pages found in the simulated buffer pool for a prefetch request that could have avoided an asynchronous read from GBP.

Field Name: QBSPGRA

IFCID 002 - SQL Call Data:

This topic shows detailed information about “Record Trace - IFCID 002 - SQL Call Data”.

Record trace - IFCID 002 - SQL Call Data

The field labels shown in the following sample layout of “Record Trace - IFCID 002 - SQL Call Data” are described in the following section.

<table>
<thead>
<tr>
<th>SQL CALL DATA</th>

</tbody>
</table>

SELECT

The number of SQL SELECT statements executed.

Field Name: QBXSELECT

INSERT

The number of INSERT statements executed.

Field Name: QBXINSRT

UPDATE

The number of UPDATE statements executed.

Field Name: QBXUPDTE

DELETE

The number of DELETE statements executed.

Field Name: QBXDELETE
The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXDESC

The number of SQL PREPARE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXPREP

The number of OPEN statements executed.

Field Name: QXOPEN

The number of CLOSE statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXCLOSE

The number of FETCH statements executed. This number at the server location might not match the number at the user application because of the internal processing of the Distributed Data Facility (DDF).

Field Name: QXFETCH

The number of COMMENT ON statements executed.

Field Name: QXCMTON

The number of LOCK TABLE statements executed.

Field Name: QXLOCK

The number of GRANT statements executed.

Field Name: QXGRANT

The number of REVOKE statements executed.

Field Name: QXREVOK

The number of incremental binds (excluding prepare). It is incremented by:

- SQL statements with BIND VALIDATE(RUN) that fail at bind time and are bound again at execution time
• Static DDL statements (such as CREATE TABLE, DROP TABLE, LOCK TABLE) that use DB2 private protocol

**Background and Tuning Information**

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) if possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

**Field Name:** QXINCRB
This is an exception field.

**LABEL ON**
The number of LABEL ON statements executed.

**Field Name:** QXLABON
This is an exception field.

**DESCRIBE TABLE**
The number of DESCRIBE TABLE statements executed.

**Field Name:** QXDSCRTB
This is an exception field.

**CONNECT TYPE 1**
The number of CONNECT type 1 statements executed.

**Field Name:** QXCON1
This is an exception field.

**CONNECT TYPE 2**
The number of CONNECT type 2 statements executed.

**Field Name:** QXCON2
This is an exception field.

**RELEASE**
The number of RELEASE statements executed.

**Field Name:** QXREL
This is an exception field.

**ASSOCIATE LOCATOR**
The number of SQL ASSOCIATE LOCATORS statements executed.

**Field Name:** QXALOCL
This is an exception field.

**ALLOCATE CURSOR**
The number of SQL ALLOCATE CURSOR statements executed.

**Field Name:** QXALOCC
This is an exception field.
RENAME TABLE
The number of RENAME TABLE statements executed.
Field Name: QXRNTAB
This is an exception field.

HOLD LOCATOR
The number of SQL HOLD LOCATOR statements executed.
Field Name: QXHOLDL

FREE LOCATOR
The number of SQL FREE LOCATOR statements executed.
Field Name: QXFREEL

MERGE
The number of times a MERGE statement was executed.
Field Name: QXMERGE

TRUNCATE TABLE
The number of TRUNCATE TABLE statements issued.
Field Name: QXTRTBL

RENAME INDEX
The number of RENAME INDEX statements issued.
Field Name: QXRNIX

CREATE DATABASE
The number of CREATE DATABASE statements executed.
Field Name: QXCRDAB

DROP DATABASE
The number of DROP DATABASE statements executed.
Field Name: QXDRPDB

ALTER DATABASE
The number of ALTER DATABASE statements executed.
Field Name: QXALDAB

CREATE STOGROUP
The number of CREATE STOGROUP statements executed.
Field Name: QXCRSTG

DROP STOGROUP
The number of DROP STOGROUP statements executed.
Field Name: QXDRPST

ALTER STOGROUP
The number of ALTER STOGROUP statements executed.
Field Name: QXALTST
IFCID 002 - SQL Call Data

CREATE TABSPACE
The number of CREATE TABLESPACE statements executed.
Field Name: QXCTABS

DROP TABSPACE
The number of DROP TABLESPACE statements executed.
Field Name: QXDRPTS

ALTER TABSPACE
The number of ALTER TABLESPACE statements executed.
Field Name: QXALTTS

CREATE TABLE
The number of CREATE TABLE statements executed.
Field Name: QXCRTAB

DROP TABLE
The number of DROP TABLE statements executed.
Field Name: QXDRPTA

ALTER TABLE
The number of ALTER TABLE statements executed.
Field Name: QXALTTA

CREATE AUX TABLE
The number of CREATE AUXILIARY TABLE statements executed.
Field Name: QXALTAB

CREATE TMP TABLE
The number of CREATE GLOBAL TEMPORARY TABLE statements executed.
Field Name: QXCRGTT

DECLARE TMP TABLE
The number of DECLARE GLOBAL TEMPORARY TABLE statements executed.
Field Name: QXDCLGTT

CREATE INDEX
The number of CREATE INDEX statements executed.
Field Name: QXCRINX

DROP INDEX
The number of DROP INDEX statements executed.
Field Name: QXDRPIX

ALTER INDEX
The number of ALTER INDEX statements executed.
Field Name: QXALTIX
CREATE VIEW
The number of CREATE VIEW statements executed.
Field Name: QXDEFVU

DROP VIEW
The number of DROP VIEW statements executed.
Field Name: QXDRPVU

ALTER VIEW
The number of ALTER VIEW statements issued.
Field Name: QXALTVW

CREATE SYNONYM
The number of CREATE SYNONYM statements executed.
Field Name: QXCRSYN

DROP SYNONYM
The number of DROP SYNONYM statements executed.
Field Name: QXDRPSY

CREATE ALIAS
The number of CREATE ALIAS statements executed.
Field Name: QXCRALS

DROP ALIAS
The number of SQL DROP ALIAS statements executed.
Field Name: QXDRPAL

CREATE SEQUENCE
The number of CREATE SEQUENCE statements.
Field Name: QXCRESEQ

DROP SEQUENCE
The number of ALTER SEQUENCE statements.
Field Name: QXALTSEQ

ALTER SEQUENCE
The number of DROP SEQUENCE statements.
Field Name: QXDROSEQ

CREATE TRIGGER
The number of SQL CREATE TRIGGER statements.
Field Name: QXCRTRIG

DROP TRIGGER
The number of DROP TRIGGER statements executed.
Field Name: QXDRPTR

CREATE DIST TYPE
The number of CREATE DISTINCT TYPE statements executed.
Field Name: QXCDIST

DROP DIST TYPE
The number of DROP DISTINCT TYPE statements executed.
Field Name: QXDDIST

CREATE FUNCTION
The number of CREATE FUNCTION statements executed.
Field Name: QXCRUDF

DROP FUNCTION
The number of DROP FUNCTION statements executed.
Field Name: QXDRPFN

ALTER FUNCTION
The number of DROP DISTINCT TYPE statements executed.
Field Name: QXDDIST

CREATE PROCEDURE
The number of CREATE PROCEDURE statements issued.
Field Name: QXCRPRO

DROP PROCEDURE
The number of DROP PROCEDURE statements executed.
Field Name: QXDRPPR

ALTER PROCEDURE
The number of ALTER PROCEDURE statements executed.
Field Name: QXALPRO

CREATE ROLE
The number of CREATE ROLE statements executed.
Field Name: QXCRROL

DROP ROLE
The number of DROP ROLE statements issued.
Field Name: QXDRPROL

CREATE TRUST CONT
The number of CREATE TRUSTED CONTEXT statements issued.
Field Name: QXCRCTX

DROP TRUST CONT
The number of DROP TRUSTED CONTEXT statements issued.
Field Name: QXDRPCTX

ALTER TRUST CONT
The number of ALTER TRUSTED CONTEXT statements issued.
Field Name: QXALTCTX

CREATE MASK/PERM
The number of CREATE MASK and CREATE PERMISSION statements executed.
Field Name: QXCREMP

DROP MASK/PERM
The number of DROP MASK and DROP PERMISSION statements executed.
Field Name: QXDRPMP

ALTER MASK/PERM
The number of ALTER MASK and ALTER PERMISSION statements executed.
Field Name: QXALTMP

CREATE VARIABLE
The number of CREATE VARIABLE statements.
Field Name: QXCRTSV

DROP VARIABLE
The number of DROP VARIABLE statements.
Field Name: QXDRPSV

DROP PACKAGE
The number of SQL DROP PACKAGE statements executed.
Field Name: QXDRPPKG

ALTER JAR
The number of ALTER JAR statements issued.
Field Name: QXALTJR

SET CUR SQL ID
The number of SET CURRENT SQLID statements executed.
Field Name: QXSETSQL

SET HOST VAR
The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked.
Field Name: QXSETHV

SET CONNECTION
The number of SET CONNECTION statements executed.
Field Name: QXSETCON

SET CUR DEGREE
The number of SET CURRENT DEGREE statements executed.
Field Name: QXSETCDG

SET CUR RULES
The number of SET CURRENT RULES statements executed.

Field Name: QXSETCRL

SET CUR PATH
The number of SET CURRENT PATH statements executed.

Field Name: QXSETPTH

SET CUR PRECISION
The number of SET CURRENT PRECISION statements executed.

Field Name: QXSETCPR

ROWS Fetched
The number of rows fetched.

Field Name: QXRWSFETCHD

ROWS INSERTED
The number of rows inserted.

Field Name: QXRWSINSRTD

ROWS UPDATED
The number of rows updated.

Field Name: QXRWSUPDTD

ROWS DELETED
The number of rows deleted.

Field Name: QXRWSDELETED

IFCID 003 - Accounting: Accounting shows the data from IFCID 003.

IFCID 003 - Accelerator Data:
This topic shows detailed information about “Record Trace - IFCID 003 - Accelerator Data”.

Record trace - IFCID 003 - Accelerator Data
The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Accelerator Data” are described in the following section.

</tbody>
</table>

SERVER ID
The accelerator server identifier.

Field Name: Q8ACNAME
PRODUCT ID

The accelerator product identifier.

Field Name: Q8ACPRID

CONNECTS TO ACCELERATOR

The number of accelerator connects.

Field Name: Q8ACCONN

REQUESTS SENT TO ACCELERATOR

The number of accelerator requests.

Field Name: Q8ACREQ

REQUESTS SENT TO ACCELERATOR - TIMED OUT

The number of timed out requests.

Field Name: Q8ACTOUT

REQUESTS SENT TO ACCELERATOR - FAILED

The number of failed requests.

Field Name: Q8ACFAIL

BYTES SENT TO ACCELERATOR

The number of bytes sent.

Field Name: Q8ACBYTES

MESSAGES SENT TO ACCELERATOR

The number of messages sent.

Field Name: Q8ACMSGS

BLOCKS SENT TO ACCELERATOR

The number of blocks sent.

Field Name: Q8ACBLKS

ROWS SENT TO ACCELERATOR

The number of rows sent.

Field Name: Q8ACROWS

BYTES RECEIVED FROM ACCELERATOR

The number of bytes returned.

Field Name: Q8ACBYTR

MESSAGES RECEIVED FROM ACCELERATOR

The number of messages returned.

Field Name: Q8ACMSGR

BLOCKS RECEIVED FROM ACCELERATOR

The number of blocks returned.

Field Name: Q8ACBLKR

ROWS RECEIVED FROM ACCELERATOR
IFCID 003 - Accelerator Data

The number of rows returned.

**Field Name:** Q8ACROWR

**ACCELERATOR SVCS TCPIP CPU TIME**

The accelerator services TCP/IP CPU time measured in DB2 for the amount of CPU consumed by the DDF service task to perform the SEND and RECEIVE to an accelerator service. It does not account for the TCP/IP address CPU to route the message on to the network and receive the reply into the DDF task.

**Field Name:** Q8ACTCPU

**ACCUMULATED ACCELERATOR CPU TIME**

The CPU time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name:** Q8ACACPU

**ACCUMULATED ACCELERATOR WAIT TIME**

The wait time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name:** Q8ACA Wat

**ACCELERATOR SVCS TCPIP ELAPSED TIME**

The accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator.

**Field Name:** Q8ACTE LA

**ACCUMULATED ACCELERATOR ELAPSED TIME**

The elapsed time spent in the accelerator when executing requests from the DB2 subsystem.

**Field Name:** Q8ACAE LA

**IFCID 003 - Accelerator SQL Call Data V4 or later:**

This topic shows detailed information about “Record Trace - IFCID 003 - Accelerator SQL Call Data V4 or later”.

**Record trace - IFCID 003 - Accelerator SQL Call Data V4 or later**

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Accelerator SQL Call Data V4 or later” are described in the following section.

```sql
 INSERT STMTS SENT TO ACCELERATOR .....: 7 ROWS INSERTED ........................: 1080005
 DELETE STMTS SENT TO ACCELERATOR .....: 0 ROWS DELETED ............................: 0
 UPDATE STMTS SENT TO ACCELERATOR .....: 0 ROWS UPDATED ............................: 0
 OPEN STMTS SENT TO ACCELERATOR .....: 0 ROWS FETCHED .............................: 0
 CREATE STMTS SENT TO ACCELERATOR .....: 0 DROP STMTS SENT TO ACCELERATOR .....: 0
 COMMIT STMTS SENT TO ACCELERATOR .....: 1 ROLLBACK STMTS SENT TO ACCELERATOR .....: 0
```

**INSERT STMTS SENT TO ACCELERATOR**

The accumulated number of INSERT statements sent to the accelerator from DB2.

**Field Name:** Q8ACINSC

**DELETE STMTS SENT TO ACCELERATOR**

IBM Db2 Performance Expert on z/OS
The accumulated number of DELETE statements sent to the accelerator from DB2.

Field Name: Q8ACDELC

**UPDATE STMTS SENT TO ACCELERATOR**

The accumulated number of UPDATE statements sent to the accelerator from DB2.

Field Name: Q8ACUPDC

**OPEN STMTS SENT TO ACCELERATOR**

The accumulated number of OPEN statements sent to the accelerator from DB2.

Field Name: Q8ACOPNC

**CREATE STMTS SENT TO ACCELERATOR**

The accumulated number of CREATE statements sent to the accelerator from DB2.

Field Name: Q8ACCRTC

**COMMIT STMTS SENT TO ACCELERATOR**

The accumulated number of COMMIT statements sent to the accelerator from DB2.

Field Name: Q8ACCRTC

**ROWS INSERTED**

The accumulated number of rows inserted to the accelerator by DB2.

Field Name: Q8ACROWI

**ROWS DELETED**

The accumulated number of rows deleted on the accelerator by DB2.

Field Name: Q8ACROWD

**ROWS UPDATED**

The accumulated number of rows updated on the accelerator by DB2.

Field Name: Q8ACROWU

**ROWS FETCHED**

The accumulated number of rows returned by the accelerator to DB2.

Note: For completed queries, this is the total number of rows returned to DB2. For in-process queries, this is the number of rows that have been sent so far (and more rows may still be coming).

Field Name: Q8ACROWC

**DROP STMTS SENT TO ACCELERATOR**

The accumulated number of DROP statements sent to the accelerator from DB2.

Field Name: Q8ACDRPC

**ROLLBACK STMTS SENT TO ACCELERATOR**
The accumulated number of ROLLBACK statements sent to the accelerator from DB2.

Field Name: Q8ACRBKC

IFCID 003 - Buffer Manager Accounting Data:

This topic shows detailed information about “Record Trace - IFCID 003 - Buffer Manager Accounting Data”.

Record trace - IFCID 003 - Buffer Manager Accounting Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Buffer Manager Accounting Data” are described in the following section.

<table>
<thead>
<tr>
<th>BUFFER MANAGER ACCOUNTING DATA</th>

<tr>
<td>ZHYPERLINK READ</td>
<td>243</td>
<td>ZHYPERLINK CPU TIME 10167</td>
</tr>
<tr>
<td>DASD CACHE READ HITS</td>
<td>18</td>
<td></td>
</tr>
</tbody>
</table>

BUFFER POOL ID

The buffer pool ID used by this thread.

Field Name: QBACPID

SYNCHRON. READ

The number of synchronous read I/O operations. DB2 increments this counter for each media manager synchronous physical read. Asynchronous I/O requests are not counted.

Field Name: QBACRIO

GETPAGES

The number of Getpage requests. This counter is incremented by successful Getpage requests for queries processed in parallel for each thread and for all successful and unsuccessful Getpage requests for queries that are not processed in parallel.

Background and Tuning Information

Reducing the number of Getpages can improve DB2 performance by reducing the number of synchronous page reads. With fewer Getpages, the requested page is more likely to be returned from the buffer pool. CPU usage is also reduced.

Check the ratio of Getpages to SQL DML statements, as a rule of thumb, try and keep this ratio below six for a typical online transaction SQL.

You might need to modify the database and query design, for example:

- Add indexes to tables to reduce the number of pages scanned.
- Reassess the number of tables used and denormalize them, if necessary.
- As an example, a large table with many columns can result in several pages being fetched to satisfy a simple query requesting just a few columns. Splitting such a table into several tables with fewer columns, tailored to queries, will result in fewer pages returned for each query.
- Use correlated rather than non-correlated queries to force the use of an index.
Field Name: QBACGET

This is an exception field.

SEQ. PREFETCH

The number of SEQUENTIAL PREFETCH requests. This is incremented for each PREFETCH request. Each request can result in an I/O read. If it does, up to 64 pages can be read for SQL and up to 128 pages for utilities. For SQL, depending on the buffer pool size, a request does not result in an I/O if all the requested pages are already in the buffer pool.

DB2 can use sequential prefetch if the data is accessed in sequential order even though sequential prefetch was not requested at bind time. This is known as sequential detection and is not included in the sequential prefetch count. Sequential detection is included in dynamic prefetch requests field.

Background and Tuning Information

Table space scans and nonmatching index scans generally use sequential prefetch.

Field Name: QBACSEQ

This is an exception field.

GETPAGES FAILED

The number of times that a page requested for a query processed in parallel was unavailable because an I/O was in progress or the page was not found in the buffer pool. The agent does not wait, but control returns to the agent.

This counter is used only when queries are processed in parallel.

Background and Tuning Information

If this value is close to zero, most pages are already in the buffer pool, and wait time for synchronous I/O is small.

This counter can be high when, for example, there is a cluster index scan and the data is not truly clustered by the index key. In this instance, data pages are not accessed in their true order and the cluster ratio is not valid. Use the Runstats utility to update it.

The value of this field is also used to determine how many sequential prefetches of one page were scheduled.

Field Name: QBACNGT

LIST PREFETCH

The number of LIST PREFETCH requests.

Special Considerations:

1. List prefetch allows DB2 to access data pages efficiently even if the needed data pages are not contiguous. It can be used with single index access and is always used with multiple index access.
2. List prefetch is always used to access data from the inner table during a hybrid join.
3. Data pages are read in quantities equal to the sequential prefetch quantity, which depends on the buffer pool size and is usually 64 pages.
4. During bind time DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table need to be accessed. If list prefetch is terminated, it is indicated in IFCID 125.

**Field Name:** QBACLPF

This is an exception field.

**BUFFER UPDATES**

The number of times a buffer update occurs. This is incremented every time a page is updated and is ready to be written to DASD. If the same page is updated twice, for example, the number is incremented by 2.

This number is kept for all types of pages including data pages and work-file pages.

**Background and Tuning Information**

A nonzero value indicates any of the following activities:

- SQL INSERT, UPDATE, or DELETE
- Merge scan join
- Internal sort activity on the work files

Check the access path to determine whether sort activity can be minimized or avoided.

**Field Name:** QBACSW

This is an exception field.

**DYNAMIC PREFETCH**

The number of (dynamic) PREFETCH requests. This is triggered by sequential detection. This includes prefetches for segmented table spaces.

**Background and Tuning Information**

Dynamic prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.

If sequential prefetch, list prefetch, and dynamic prefetch reads have large values, check whether the access path can be improved.

**Field Name:** QBACDPF

This is an exception field.

**SYNCHRON. WRITE**

The number of immediate (synchronous) write I/O operations.

**Background and Tuning Information**

Although an immediate write is rare, a small nonzero value is acceptable. A large value indicates that the system needs tuning.

**Field Name:** QBACIMW

This is an exception field.

**PAGES READ ASYN-PAR**

The number of asynchronous pages read by prefetch that the agent triggered.
Background and Tuning Information

This is used to determine the buffer pool hit ratio: (Getpage requests - Synchronous reads - Asynchronous pages read) / Getpage requests.

**Field Name:** QBACSIO

This is an exception field.

**ZHYPERLINK READ**

The number of DASD reads done using zHyperLink.

**Field Name:** QBACSYI

**ZHYPERLINK CPU TIME**

The amount of CPU time used for successful zHyperLink reads.

zHyperLink I/O is synchronous with respect to the CPU, thus CPU time accumulates from the beginning of the I/O until it completes.

**Field Name:** QBACSYIT

**DASD CACHE READ HITS**

The number of I/Os where the requested pages were found in the DASD subsystem cache. These I/Os could have potentially been successful if zHyperLink was used to do the I/O.

**Field Name:** QBACIOC

**IFCID 003 - Data Sharing Accounting Data:**

This topic shows detailed information about “Record Trace - IFCID 003 - Data Sharing Accounting Data”.

**Record trace - IFCID 003 - Data Sharing Accounting Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Data Sharing Accounting Data” are described in the following section.

**DATA SHARING ACCOUNTING DATA**

**MEMBER NAMES:**

For an assisting task, the name of the parallelism coordinator. For a coordinating task, the name of each assisting member.

**Field Name:** QWDAXCQO

**IFCID 003 - Data Sharing Locking Data:**

This topic shows detailed information about “Record Trace - IFCID 003 - Data Sharing Locking Data”.

**Record trace - IFCID 003 - Data Sharing Locking Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Data Sharing Locking Data” are described in the following section.

**DATA SHARING LOCKING DATA**

**LOCK REQUESTS**

The number of lock requests for P-locks.
Field Name: QTGALPLK

LOCK - XES
The number of P/L-lock requests propagated to z/OS XES synchronously.
This number is not incremented if the request is suspended before going to XES.

Field Name: QTGALSLM

SUSPENSIONS - IRLM
The number of suspensions due to IRLM global resource contention (IRLM lock states were in conflict).

Field Name: QTGAIGLO

UNLOCK REQUESTS
The number of unlock requests for P-locks.

Field Name: QTGAUPLK

UNLOCK - XES
The number of unlock requests propagated to z/OS XES.

Field Name: QTGAUSLM

SUSPENSIONS - XES
The number of suspensions due to z/OS XES global resource contention (z/OS XES lock states were in conflict whereas IRLM lock states were not).

Field Name: QTGASGLO

CHANGE REQUESTS
The number of change requests for P-locks.

Field Name: QTGACPLK

CHANGE - XES
The number of change requests propagated to z/OS XES.

Field Name: QTGACSLM

INCOMPATIBLE LOCKS
The number of global lock or change requests denied or suspended due to an incompatible retained lock.

Field Name: QTGADRTA

NOTIFY SENT
The number of notify messages sent.

Field Name: QTGANTFY

SYNC-ASYNC XES CONV
The total number of sync-to-async heuristic conversions for LOCK requests in XES. This conversion is done when XES determines that it is more efficient to drive the request asynchronously to the coupling facility (CF).

Field Name: QTGAFLSE

FALSE CONTENTIONS
The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

Field Name: QTGAFCNT

IFCID 003 - DDF Data by Location:

This topic shows detailed information about “Record Trace - IFCID 003 - DDF Data by Location”.

Record trace - IFCID 003 - DDF Data by Location

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - DDF Data by Location” are described in the following section.

DDF DATA BY LOCATION

<table>

</table>

TYPE (Either ROLLUP, ROLSUM OR PACKAGE)

The flag byte:

X'20' This value is shown if DRDA is used to communicate with the server.

X'40' This value is shown if DB2 private protocol is used to communicate with the server.

All other values shown in this field are serviceability.

Field Name: QLACFLGS

LOCATION NAME (LONG)

The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to ROLSUM.

Field Name: QLACLOCN

This is an exception field.

LOCATION NAME (SHORT)
The name of the remote location with which this information is associated. If the local location is the requester, this field is a server location. If the local location is a server location, this field is the requester location. An allied thread is created at a DB2 requester, and a database access thread is created at a DB2 server. An accounting record is for either a requester or a server, but not for both.

This field is invalid if summary rollup data is present. In Accounting this field is set to *ROLSUM*.

**Field Name:** QLACLOCN

This is an exception field.

**ABORT REQUESTS RECEIVED**

The number of abort requests received from the requester (single-phase commit protocol) and backout requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLACABRR

This is an exception field.

**BLKS RECV USING BLK FETCH**

The number of blocks received using block fetch. This value is maintained at the requester location.

**Field Name:** QLACBRBF

This is an exception field.

**BYTES RECV FROM REMOTE**

The number of bytes the server location received from the requester location.

More bytes of data might be sent from the server location than are received by the requester, because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACBYTR

This is an exception field.

**CONV REQS QUEUED BY DDF**

A number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requester location.

If the value is a large number, you might want to increase the limit for the number of conversations.

**Field Name:** QLACCNVQ

This is an exception field.

**CONV INITIATED FR LOCAL**

The number of conversations (both successful and unsuccessful) initiated by the requester location to be executed at the server location. This number is maintained at the requester.

**Field Name:** QLACCNVS

This is an exception field.

**COMMIT REQS RECV FR REQ/COO**
The number of commit requests received from the requester (single-phase commit protocol) and committed requests received from the coordinator (two-phase commit protocol).

**Field Name:** QLACCOMR

This is an *exception* field.

**MSGS RECV FR REMOTE**

The number of messages received from the location. This value is maintained at the location where the messages were received.

More messages might be sent from the server location than are received by the requester because of the way in which distributed SQL statements are processed internally.

**Field Name:** QLACMSGR

This is an *exception* field.

**ROWS OF DATA RETR FR REMOTE**

The number of rows of data retrieved from the server location. This value is maintained at the requester location.

**Special Considerations:**

1. The number of rows received from the server location does not include either the SQLDA or SQLCA.

2. Block fetch can significantly affect the number of rows sent across the network. When used with non-UPDATE cursors, block fetch puts as many rows as possible into the message buffer, and transmits the buffer across the network without requiring a VTAM message. Consequently, more rows of data might be sent from the server location than are received by the reporting (requester) location. This is especially true when DB2 private protocol is used because multiple blocks can be transmitted from the server with no intervening messages sent by the requester.

**Field Name:** QLACROWR

This is an *exception* field.

**SQL STMT RECEIVED FR REMOTE**

The number of SQL statements received from the requester location.

**Field Name:** QLACSQLR

This is an *exception* field.

**LOCAL ELAPSED TIME**

The elapsed time at the requester location until the database access agent completed its work, including DB2 processing time and network time. This value is maintained at the requester location and is calculated by accumulating the difference between the store clock values obtained before and after each network request.

**Field Name:** QLACCPUL

**ROLLED NBR THREADS**

The number of threads to roll data into this QLAC data section. Non-rollup QLACs have a value of 1 and rollup QLACs have a value of 1 or more.
Field Name: QLACRLNU

FLAGS

The flag byte:

X'20'  This value is shown if DRDA is used to communicate with the server.

X'40'  This value is shown if DB2 private protocol is used to communicate with the server.

All other values shown in this field are serviceability.

Field Name: QLACFLGS

ABORT REQUESTS SENT

The number of abort requests sent to the server (single-phase commit protocol) and backout requests sent to the participant (two-phase commit protocol).

Field Name: QLACABRS

This is an exception field.

BLKS TRANS USING BLK FETCH

The number of blocks transmitted using block fetch. This value is maintained at the server location.

Field Name: QLACBTBF

This is an exception field.

BYTES SENT TO REMOTE

The number of bytes the server location sent to the requester location. This value is maintained at the server location.

More bytes of data might be sent from the server location than are received by the requester due to the way in which distributed SQL statements are processed internally.

Field Name: QLACBYTS

This is an exception field.

CONV INITIATED FR REMOTE

A count of conversations initiated by the requester.

This number is updated at the server location.

Field Name: QLACCNVR

This is an exception field.

CONV TERMINATED FR LOCAL

The number of terminated conversations in the server block (DB2 private protocol only). It is maintained at the requester location.

This number can be different from the number of successful conversation allocations, because some conversations might not have been terminated when the accounting record was written.

Field Name: QLACCNVT

This is an exception field.
COMMIT REQS SENT TO SRV/PAR
The number of commit requests sent to the server (single-phase commit protocol) and committed requests sent to the participant (two-phase commit protocol).
Field Name: QLACCOMS
This is an exception field.

MSGS SENT TO REMOTE
The number of messages sent to the location. It is maintained at the location where the messages originated.
Field Name: QLACMSGS
This is an exception field.

ROWS OF DATA SENT TO REMOTE
The number of rows sent from the server location to the requester location. The value includes SQLDA and is maintained at the server location.
Field Name: QLACROWS
This is an exception field.

SQL STMT SENT TO REMOTE
The number of SQL statements sent to the server location. This value is maintained at the requesting location.
Field Name: QLACSQLS
This is an exception field.

INDOUBT THREADS
The number of threads that went indoubt with the remote location as coordinator (two-phase commit operations only). It is maintained at the participant and indicates that the communication with the coordinator was lost.
Field Name: QLACINDT
This is an exception field.

PRID REMOTE SITE
The original DB2 field specifies the information in the following field names of the remote requester or server location:

PRODUCT ID
It consists of 3 characters and can have the following values:

<table>
<thead>
<tr>
<th>Original ID from DB2</th>
<th>Shown as</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSN</td>
<td>DB2</td>
</tr>
<tr>
<td>ARI</td>
<td>SQL/DS</td>
</tr>
<tr>
<td>QSQ</td>
<td>DB2/400</td>
</tr>
<tr>
<td>SQL</td>
<td>COMMON SERV</td>
</tr>
<tr>
<td>JCC</td>
<td>JDBC DRIVER</td>
</tr>
<tr>
<td>'000000'X, '404040'X</td>
<td>N/P</td>
</tr>
<tr>
<td>Other</td>
<td>Original ID from DB2</td>
</tr>
</tbody>
</table>
Note:
- If the record is written at the application requester location, or if summary rollup data is available, N/P is shown in Accounting TRACE and REPORT.
- In Accounting FILE and SAVE DDF tables, BLANK is shown.

PRODUCT VERSION (PROD VERSION)
It consists of 5 digits and is shown as VvvRrrMm, where:
- vV Version level
- rr Release level
- m Modification level

Note: For DDF/RRSAF rollup records, the product ID and product version contain a value derived from the last thread to rollup. For query parallelism rollup threads, the value is derived from the parent record.

Field Name: QLACPRID

IFCID 003 - Dynamic SQL Statement:

This topic shows detailed information about “Record Trace - IFCID 003 - Dynamic SQL Statement”.

Record trace - IFCID 003 - Dynamic SQL Statement

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Dynamic SQL Statement” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REOPTIMIZATION</td>
<td>The total number of times reoptimization occurs because the value of the host variable or parameter marker changes.</td>
</tr>
<tr>
<td>FOUND IN CACHE</td>
<td>The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.</td>
</tr>
<tr>
<td>IMPLICIT PREPARES</td>
<td>An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEP_DYNAMIC YES. If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.</td>
</tr>
</tbody>
</table>
The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDEXP

NOT FOUND IN CACHE
The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement.

Field Name: QXSTNFND

PREPARES AVOIDED
This field indicates the number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache.

When an application plan or package is bound with KEEP_DYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary.

An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Field Name: QXSTNPRP

STMT INVALID (DDL)
The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed.

Field Name: QXSTDINV

CSWL STMTS PARSED
The number of times DB2 parsed dynamic statements because CONCENTRATE_STATEMENTS_WITH_LITERAL behavior was used for the prepare of the statement for the dynamic statement cache.

Field Name: QXSTCWLP

CSWL LITS REPLACED
The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE_STATEMENTS_WITH_LITERAL behavior was used for the prepare of the statement for dynamic statement cache.

Field Name: QXSTCWLR

CSWL MATCHES FOUND
The number of times DB2 found a matching reusable copy of a dynamic statement in cache during prepare of a statement that had literals replaced because of CONCENTRATE_STATEMENTS_WITH_LITERAL behavior.

Field Name: QXSTCWLW

CSWL DUPLS CREATED
The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by
CONCENTRATE STATEMENTS WITH LITERALS behavior. The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

**Field Name:** QXSTCWLD

LOAD FROM CATALOG

The number of loads from the catalog.

It shows the number of times a PREPARE request was satisfied by making a copy from the stabilized statement in the SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement was found in the prepared statement cache. This field should be identical to QISEDPSL, but it is reported from the QXST section (SQL Statement Execution).

**Field Name:** QXSTSFND

**IFCID 003 - Dynamic SQL Statement**

This topic shows detailed information about “Record Trace - IFCID 003 - Group Buffer Pools Activity Data”.

**Record trace - IFCID 003 - Group Buffer Pools Activity Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Group Buffer Pools Activity Data” are described in the following section.

**GROUP BUFFER POOL ID**

The group buffer pool identifier.

**Field Name:** QBGAGN

**READ(XI)-DATA RETURNED**

The number of coupling facility read requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

**Field Name:** QBGAXD

**READ(XI)-NO DATA RET.**

The number of group buffer pool read requests due to buffer XI where no data was returned.

**Field Name:** QBGAXR

**EXPRESSIT X-INVALID**

The number of times an explicit coupling facility cross-invalidation request was issued.

**Field Name:** QBGAEX

**GBP-DEPENDENT GETPAGES**
The number of coupling facility READ requests required because the buffer was marked invalid. Data is returned from the group buffer pool.

**Field Name:** QBGAGG

**PG P-LOCK LOCK REQ SP M**
The number of page P-lock lock requests for space map pages.

**Field Name:** QBGAP1

**PG P-LOCK LOCK SUSP SP**
The number of page P-lock suspensions for space-map pages.

**Field Name:** QBGAS1

**PG P-LOCK UNLOCK REQ**
The number of page P-lock unlock requests.

**Field Name:** QBGAU1

**WRITE & REGISTER MULT**
The number of write and register multiple (warm) requests.

**Field Name:** QBGAWM

**READ(NF)-DATA RETURNED**
The number of coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is returned from the coupling facility.

**Field Name:** QBGAMD

**READ(NF)-NO DATA RET.**
The number of group-buffer-pool reads due to local buffer-pool miss where no data was returned.

**Field Name:** QBGAMR

**READ PREFETCH**
The number of pages read from the group buffer pool due to prefetch under the control of the agent.

**Field Name:** QBGAMN

**ASYNCH GBP REQUESTS**
The number of asynchronous IXLCACHE invocations for the primary group buffer pool.

**Field Name:** QBGAHS

**PG P-LOCK LOCK REQ DATA**
The number of page P-lock lock requests for data pages.

**Field Name:** QBGAP2

**PG P-LOCK LOCK SUSP DAT**
The number of page P-lock lock suspensions for data pages.

**Field Name:** QBGAS2

This is an *exception* field.
WRITE AND REGISTER
The number of Write and Register (WAR) requests.
Field Name: QBGAWS

CLEAN PAGES WRITTEN
The number of clean pages written to the group buffer pool.
Field Name: QBGAWC

CHANGED PAGES WRITTEN
The number of changed pages written to the group buffer pool as a result of write and register (WAR), or write and register multiple (WARM) requests.
Field Name: QBGASW
This is an exception field.

UNREGISTER PAGE
The number of coupling facility requests to unregister a page.
Field Name: QBGADG
This is an exception field.

ASYNCH SEC-GBP REQUESTS
The number of IXLCACHE invocations for the secondary group buffer pool.
Field Name: QBGA2H

PG P-LOCK LOCK REQ IX L
The number of page P-lock lock requests for index-leaf pages.
Field Name: QBGAP3

PG P-LOCK LOCK SUSP IX
The number of page P-lock lock suspensions for index-leaf pages.
Field Name: QBGAS3

IFI CALL ELAPSED TIME
The accumulated elapsed time for processing IFI calls. This field is only calculated if accounting class 5 is active.
Field Name: QIFAAIET
IFI CALL TCB CPU TIME

The accumulated CPU time spent processing IFI calls. This is the same as the TCB time (class 5).
This field is only calculated if accounting class 5 is active.

Field Name: QIFAAITT
This is an exception field.

DESCRIPTES ELAPSED

The accumulated elapsed time for processing data capture describes. Data capture describes occur only during IFI read requests for IFCID 185. This time is a subset of the log extraction time.

Field Name: QIFAAAMBT
This is an exception field.

LOG EXTRACT ELAPSED

The accumulated elapsed time for extracting log records for tables defined with DATA CAPTURE CHANGES. This time is a subset of the class 5 elapsed time.

Field Name: QIFAAAMLT
This is an exception field.

IFI CALLS

The number of IFI calls.

Field Name: QIFAAANIF

LOG READS PERFORMED

The number of log reads performed for processing IFI READS requests for IFCID 185.

Field Name: QIFAAANLR

LOG RECS CAPTURED

The number of retrievable log records that were written for tables defined with DATA CAPTURE CHANGES. This number includes only those log records that can be retrieved by an IFI READS call for IFCID 185. Some records can be written but not retrieved, for example if monitor trace class 6 is not active.

Field Name: QIFAAANRC

DATA DESCRIPT. RETURNED

The number of data descriptions returned in IFCID 185. The data descriptions are mapped in IFCID 185.

Field Name: QIFAAANDD

DESCRIPTES

The number of data capture describes for processing READS requests for IFCID 185 data.

Field Name: QIFAAANMB

DATA ROWS RETURNED
IFCID 003 - IFI Class 5 Times and Data Capture

The number of data rows returned in IFCID 185. Two rows are returned for each row altered by an SQL UPDATE statement.

**Field Name:** QIFAANDR

**LOG RECS RETURNED**

The number of log records returned to the caller of the IFI READS call for IFCID 185.

**Field Name:** QIFAANRR

**TABLES RETURNED**

The total number of tables returned to the caller of IFI READS call for IFCID 185.

**Field Name:** QIFAANTB

**IFCID 003 - Initial Client/Server Correlation Data:**

This topic shows detailed information about “Record Trace - IFCID 003 - Initial Client/Server Correlation Data”.

This topic also shows detailed information about “Initial Other Requester Correlation Data”.

**Record trace - IFCID 003 - Initial Client/Server Correlation Data**

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Initial Client/Server Correlation Data” are described in the following section.

**BYTES:**

The length of the product ID and accounting string.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

**Field Name:** QMDAASLN

**PRODUCT ID**

Shows the product identifier (ID) of the requester. It can have the following values:

- **DB2** For DB2 UDB for z/OS
- **SQL/DS** For DB2 UDB for VSE and VM
- **JDBC DRIVER** For Universal JDBC driver
- **COMMON SERV** For DB2 UDB for Linux, UNIX, Windows
- **DB2/400** For DB2 UDB for iSeries
Otherwise, it shows the first 3 characters of the product ID, or N/P if the
record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from
the last thread to rollup.

**Field Name:** QMDAPRID

**PRODUCT VERSION**

The version, release, and modification level of the product, which
generated the accounting information. It has the following format: \textit{vv rr m},
where:

- \textit{vv}   Version level
- \textit{rr}   Release level
- \textit{m}    Modification level

N/P is shown if the record was written at the application requester
location.

For DDF/RRSAF rollup records, the field will contain a value derived from
the last thread to rollup.

**Field Name:** QMDAPMOD

**CLIENT PLATFORM**

The client platform, such as AIX. This is a 1 to 18 character field padded
with blanks.

For DDF/RRSAF rollup records, the field will contain a value derived from
the last thread to rollup.

**Field Name:** QMDAPLAT

**CLIENT APPLICATION NAME**

The name of the client application. This is a 1 to 20 character field padded
with blanks. An example is "PAYROLL".

For DDF/RRSAF rollup records, the field will contain a value derived from
the last thread to rollup.

**Field Name:** QMDAAPPL

**CLIENT AUTHID**

The client authorization ID of an application process. This is a 1 to 8
character field padded with blanks. An example is "SMITH".

For DDF/RRSAF rollup records, the field will contain a value derived from
the last thread to rollup.

**Field Name:** QMDAAATID

**DDCS ACCOUNT SUFFIX**

The account suffix. The maximum length of this field is 200 bytes. This
field is the user-supplied portion (suffix) of the accounting string. An
example is "DEFAULT_DRDA". A value of zero in QMDASFLN Indicates
there is no account suffix.

For DDF/RRSAF rollup records, the field will contain a value derived from
the last thread to rollup.

**Field Name:** QMDASUFX
ACCOUNTING STRING

The accounting string:
- For local DB2 threads, the format of the accounting string is shown in QMDAINFO.
- For database access threads, the accounting string contains the accounting string sent by the requester.
- The QMDAPRID value identifies which product generated the accounting string.
  - If the requester is DB2, the accounting string is defined in QMDAINFO.
  - If QMDAPTYP is DSN, QMDAINFO defines the format.
  - If QMDAPTYP is SQL or JCC, QMDASQLI defines the format.
  - Otherwise, the format is undefined.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAASTR

IFCID 003 - Initial DB2 Requester and MVS Correlation Data:

This topic shows detailed information about “Record Trace - IFCID 003 - Initial DB2 Requester and MVS Correlation Data”.

Record trace - IFCID 003 - Initial DB2 Requester and MVS Correlation Data

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Initial DB2 Requester and MVS Correlation Data” are described in the following section.

BYTES: 226
PRODUCT ID: 082
PRODUCT VERSION: V11R01M5
LOCATION: PMODB1H
LU NAME: IPSAQB1H
CONNECTION: DB2CALL
PLANNAME: DB1HEXC1
MVS ACCOUNTING DATA:
  ACCOUNTING-ASTR0-1234567890ABCDEDGHIJKLMNOPQRSTUVWXYZ
  ACCOUNTING-ASTR1-1234567890ABCDEDGHIJKLMNOPQRSTUVWXYZ
  ACCOUNTING-ASTR2-1234567890ABCDEDGHIJKLMNOPQRSTUVWXYZ

*** Long name section:
LOCATION : PMODB1H
*** End of long names

BYTES

The length of the product ID and accounting string.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAASLN

PRODUCT ID

Shows the product identifier (ID) of the requester. It can have the following values:
- DB2 For DB2 UDB for z/OS
- SQL/DS For DB2 UDB for VSE and VM
- JDBC DRIVER For Universal JDBC driver
COMMON SERV
For DB2 UDB for Linux, UNIX, Windows

DB2/400
For DB2 UDB for iSeries
Otherwise, it shows the first 3 characters of the product ID, or N/P if the record was written at the application requester location.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPRID

PRODUCT VERSION
The version, release, and modification level of the product, which generated the accounting information. It has the following format: vv rr m, where:

vv Version level
rr Release level
m Modification level
N/P is shown if the record was written at the application requester location.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPMOD

LOCATION
The location name for the DB2 subsystem that created the QMDAINFO values.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.
This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report.

Field Name: QMDALOCN

NET ID
The NETID of the DB2 subsystem that created the QMDAINFO values.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDANETN

LU NAME
The SNA LU name of the DB2 subsystem that created the QMDAINFO values.
For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDALUNM

CONNECT
IFCID 003 - Initial DB2 Requester and MVS Correlation Data

The connection name of the DB2 system that created the MVS and DDF accounting values.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACNAM

CONNTYPE

The type of subsystem connection at the DB2 system where the SQL application is running. Possible values and their descriptions are:

BATCH
  TSO or call attach

SASS  CICS

MASS  IMS

DIST  Distributed

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACTYP

CORRNAME

The first 8 bytes of the correlation ID at the DB2 system running the SQL.

The last 4 bytes of the correlation ID at the DB2 system running the SQL.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDACORR

AUTHID

The DB2 authorization ID that the SQL application used before name translation and before driving the connection exit at the DB2 site where the SQL application is running.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAAUTH

PLANNAME

The DB2 plan used at the DB2 system running the SQL.

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAPLAN

MVS ACCOUNTING DATA

The MVS accounting string associated with the MVS address space of the SQL application. It is filled if PROD_TYP=D; otherwise X'00' is used.

This information comes from the ACCT= parameter on the job statement. If the ACCT= parameter is blank, the information on the EXEC statement is used. TSO logon Accounting information is used only if there is a value in the account field on the TSO Logon panel. Do not confuse this field with the Accounting correlation token.
ICFID 003 - Initial DB2 Requester and MVS Correlation Data

For DDF/RRSAF rollup records, the field will contain a value derived from the last thread to rollup.

Field Name: QMDAACCT

ICFID 003 - Instrumentation Accounting Data:

This topic shows detailed information about “Record Trace - ICFID 003 - Instrumentation Accounting Data”.

Note: ICFID 003 and ICFID 147 have the same layout.

Record trace - ICFID 003 - Instrumentation Accounting Data

The field labels shown in the following sample layout of “Record Trace - ICFID 003 - Instrumentation Accounting Data” are described in the following section.

CLASS 1: BEGINNING STORE CLOCK TIME

The beginning store clock value for the period covered by the accounting record. You can determine the elapsed time of the application by subtracting this field from the ending store clock value (QWACESC). Threads that do not terminate (such as CICS primed threads and IMS
wait-for-input message regions) can have an ending clock value that includes the time during which the thread was inactive and waiting for work.

If a roll-up trace record is written with accumulated counter data, QWACBSC represents the earliest begin store clock value for a thread that has rolled data into the record. In this case, QWACESC shows the accumulated elapsed time.

**Field Name:** QWACBSC

**CLASS 1: ENDING STORE CLOCK TIME**

The ending store clock value. You can use this field with the beginning store clock value (QWACBSC) to determine the elapsed time of an application.

If a roll-up record is written with accumulated accounting data, QWACESC contains the accumulated elapsed time. In Accounting Trace reports, the elapsed time is shown under **CLASS 1: NONNESTED ELAPSED TIME** and the **END TIME** is reported as N/P, because QWACESC does not contain a timestamp. In the Accounting FILE GENERAL table, the accumulated elapsed time QWACESC is stored in column **CLASS1_ELAPSED** and column **CLASS1_TIME_END** contains a timestamp 1900-01-01-00:00:00.000000.

**Field Name:** QWACESC

**CLASS 1: ELAPSED TIME**

The time covered by this accounting record. If the time cannot be calculated or the value is negative, N/C is printed in this field. Calculated from the DB2 field QWACESC - QWACBSC.

**Field Name:** RT0003ET

**CLASS 1: MVS TCB TIME**

The amount of MVS CPU time used. If the time cannot be calculated or the value is negative, N/C is printed in this field. Calculated from the DB2 field QWACEJST - QWACBJST.

**Field Name:** RT0003TT

**CLASS 1: BEGINNING MVS TCB TIME**

The beginning MVS CPU time for all environments (such as: CICS, IMS, RRSAF, or TSO). This CPU time is not affected by an IBM specialty engine. Binary zero means that no time value is available.

**Field Name:** QWACBJST

**CLASS 1: ENDING MVS TCB TIME**

The ending MVS CPU time. This CPU time is not affected by an IBM specialty engine. Binary zero means that no time value is available.

**Field Name:** QWACEJST

**CLASS 1: STORED PROC ELAPSED TIME**

The total elapsed time spent by the allied agent in stored procedures. A stored procedure may initiate a trigger or invoke a user-defined function. The time spent there is not included in this counter.
CLASS 1: CONVERSION FACTOR

The CPU service unit conversion factor allows for converting CPU time to a common unit, which is called service unit (SU). The conversion factor depends on the machine being used. With the SU, you can add up CPU execution times across multiple DB2 systems running on different machines. It is a raw value for RECORDTRACE and Accounting FILE data. For Accounting SAVE data it cannot be determined.

Field Name: QWACSPEA

CLASS 1: STORED PROCEDURE TCB TIME

The TCB time accumulated in DB2 for processing SQL CALL statements in the stored procedures or WLM address space. This time is only calculated if accounting class 1 is active.

SQL procedure times are included in this time if the SQL procedure was called on a nested task and was not invoked by the main application execution unit. This time does not include CPU time consumed on an IBM specialty engine.

Field Name: QWACSUCV

CLASS 1: PAR.TASKS

The number of parallel child agents, or Accounting intervals rolled up, or autonomous procedures rolled up. The value depends on the record type:

- For a non-rollup parent record, this value is the number of parallel child agents that were created.
- For a non-rollup child agent record, this value is 0.
- For a parallel query rollup record, this value is the number of parallel child agents rolled into the record.
- For a DDF/RRSAF rollup record, this value is the number of Accounting intervals that were rolled into the record for the corresponding end user.
- For an autonomous procedure rollup record, this value is the number of autonomous procedures rolled into the record.

Field Name: QWACSPCP

CLASS 1: PAR.TOKEN

Token used to correlate parallel task, utility task records, or autonomous procedure rollup records with the records of the originating task or main utility task.

Field Name: QWACPCNT

CLASS 1: UDF ELAPSED TIME

The total elapsed time spent by the allied agent in UDF functions processed in a DB2 stored procedure or WLM address space. A user-defined function may initiate a trigger or invoke a stored procedure. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time includes time executing SQL.
ICCID 003 - Instrumentation Accounting Data

Note: With user-tailored reporting (UTR) you can include this field in the short layouts of Accounting.

Field Name: QWACUDEA

CLASS 1: COMMITS

The number of successful two-phase (units of recovery) or single-phase (syncs) commit requests. It indicates the number of units of recovery that are completed successfully, and for which the associated commit duration locks were released. It represents the total number of commit requests processed by the DB2 subsystem, whether the request was an explicit or implicit external request from an IMS or a CICS connection, or an implicit internal request within DB2 when DB2 was the commit coordinator or conducted read-only commit processing as a commit participant on phase-1 calls from an IMS or CICS connection.

For parallel queries, only the commits from the initiating (parent) thread are recorded by this counter.

Field Name: QWACCOMM

This is an exception field.

CLASS 1: SVPT REQ.

The number of named SAVEPOINTs set within a transaction.

Field Name: QWACSVPT

CLASS 1: UDF TCB TIME

The accumulated CPU time used to satisfy UDF requests processed in a DB2 stored procedure or WLM address space. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time is only calculated if accounting class 1 is active.

This time does not include the CPU time consumed on an IBM specialty engine.

Field Name: QWACUDCP

CLASS 1: ROLLBACKS

The number of rollback requests. This is the number of units that were backed out, including rollbacks from attaches.

Special Considerations: This field contains the number of:
- Application program abends
- Application rollback requests
- Application deadlocks on database records
- Applications canceled by operator
- Thread abends due to resource shortage

Field Name: QWACABRT

This is an exception field.

CLASS 1: SVPT RLB.

The number of ROLLBACK TO SAVEPOINT statements executed.

Field Name: QWACRBSV
CLASS 1: NETWORK ID VALUE

The network ID. It is used with IMS and CICS.

Field Name: QWACNID

CLASS 1: PROGRAMS

The number of packages or DBRMs for which accounting data was collected.

Field Name: QWACPKGN

CLASS 1: SVPT REL.

The number of RELEASE SAVEPOINT statements executed.

Background and Tuning Information

Release savepoints as soon as possible. Outstanding savepoints block SQL operations that resolve remote locations. DB2 always releases outstanding savepoints when a transaction ends.

Field Name: QWACRLSV

This is an exception field.

CLASS 1: REASON ACCT INVOKED

The reason for termination, that is, for producing a DB2 accounting record.

Field Name: QWACRINV

This is an exception field.

CLASS 1: SE CPU TIME

The accumulated CPU time that is consumed while running on an IBM specialty engine in all environments. This value may be 0 when QWACRINV is greater than or equal to 20.

Field Name: QWACCLS1_ZIIP

CLASS 1/2 STORED PROC SE TCB TIME

The accumulated CPU time that is consumed while running stored procedure requests on the main application execution unit on an IBM specialty engine. As these SPs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACSPNF_ZIIP

CLASS 1/2 STORED PROC ELAPSED TIME

The accumulated elapsed time that is consumed on an IBM specialty engine for executing stored procedure requests on the main application execution unit. As these stored procedures run entirely in DB2, this time represents class 1 and class 2 time.

Field Name: QWACSPNF_ELAP

CLASS 1/2 STORED PROC CP ELAPSED TIME

The accumulated CPU time that is used for executing stored procedure requests on the main application execution unit. This time does not include the time that is consumed on an IBM specialty engine. As these stored procedures run entirely in DB2, this time represents class 1 and class 2 time.
Field Name: QWACSPNF_CP

CLASS 1/2 UDF NF SE CPU TIME

Accumulated CPU time consumed executing user-defined functions on the main application execution unit on an IBM specialty engine. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACUDFNF_ZIIP

CLASS 1/2 UDF NF ELAPSED TIME

Accumulated elapsed time consumed executing user-defined functions on the main application execution unit. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACUDFNF_ELAP

CLASS 1/2 UDF NF CP CPU TIME

Accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time does not include CPU consumed on an IBM specialty engine. Since these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

Field Name: QWACUDFNF_CP

CLASS 2: DB2 ELAPSED TIME

The class 2 elapsed time for nonnested activity accumulated in DB2 for the allied agent. This time does not include the time spent in DB2 processing SQL statements issued by stored procedures, user-defined functions, or triggers.

Special Considerations

- The time for most thread allocation and certain abend conditions is not reflected in this time.
- The elapsed time for distributed processing is included in the elapsed time of allied-distributed threads.
- In query CP, sysplex query, or utility parallelism, this is the time shown in the originating record, which overlaps the elapsed times shown in the parallel records.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: QWACASC

CLASS 2: DB2 ENTRY/EXIT EVENTS

The total number of DB2 entry and exit events processed by the allied address space to calculate the elapsed time in DB2 and the processor time.

This counter does not include the SQL entry and exit events processed by stored procedures.

Field Name: QWACARNA

This is an exception field.

CLASS 2: TCB TIME

The accumulated MVS CPU time that is spent in DB2. This CPU time does not include the:

- CPU time that is consumed on an IBM specialty engine
• CPU time that is consumed while processing SQL statements in a stored procedure

Field Name: QWCAJST

CLASS 2: NON-ZERO CLASS 2

This data section shows whether there is nonzero accounting class 2 data. Yes indicates that accounting class 2 or 7 was active during the life of the agent when a class 2 event occurred.

Field Name: QWACCLS2

CLASS 2: STORED PROC ELAPSED TIME

The total elapsed time that the allied agent spent executing SQL in the stored procedures or WLM address space.

A stored procedure may initiate a trigger or invoke a user-defined function this time is not included in this counter.

Note: This field is not normally shown in the short layouts but can be included with UTR.

Field Name: QWACSPEB

CLASS 2: DATA COLLECTED

The accounting class 2 data was being collected when this accounting record was written.

Field Name: QWACCL2O

CLASS 2: STORED PROCEDURE TCB TIME

The TCB time accumulated in DB2 for processing SQL statements issued by stored procedures. This time is only calculated if accounting class 2 is active.

Field Name: QWACSPTT

CLASS 2: STORED PROC. ENTRY/EXITS

The number of SQL entry or exit events performed by stored procedures. This number is only calculated if accounting class 2 is active.

Field Name: QWACSPNE

CLASS 2: UDF ELAPSED TIME

The total elapsed time spent by the allied agent executing SQL using UDF requests processed in a DB2 stored procedure or WLM address space. A user-defined function may initiate a trigger or invoke a stored procedure. Any time spent there is not included in this counter. This time includes time needed to connect and disconnect the UDF task. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

Note: With user-tailored reporting (UTR) you can include this field in the short layouts of Accounting.

Field Name: QWACUDEB

CLASS 2: UDF SQL ENTRY/EXITS EVENTS

The number of SQL entry/exit events performed by user-defined functions.
This is only calculated if accounting class 2 is active.

Field Name: QWACUDNE

CLASS 2: CP CPU TIME UDF

The accumulated CPU time consumed in DB2 when processing SQL statements that were issued by UDF(s) processed in a DB2 stored procedure or WLM address space.

This time also includes the DB2 time required to connect and disconnect the UDF task. Non-inline UDF times are included in this time if the native UDF was called on a nested task and was not invoked by the main application execution unit.

This time is a subset of QWACUDCP and is only calculated if accounting class 2 is active.

This time does not include CPU consumed on an IBM specialty engine.

Field Name: QWACUDTT

CLASS 2: SE CPU TIME

The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

Note: All CPU times of an IBM specialty engine that are reported in DB2 trace records are already normalized by DB2 to the speed of the general purpose processor.

Field Name: QWACCLS2_ZIIP

CLASS 2: TRIG ELAP TIME UNDER ENCLAVE

The accumulated elapsed time used for executing triggers under an enclave.

Field Name: QWACTREE

CLASS 2: SE ELIGIBLE CP CPU TIME

The accumulated CPU time that is consumed on a standard CP for work eligible on an IBM specialty engine.

For records for the parent tasks in parallel queries, this value reflects zIIP-eligible time for the parent and the child tasks. Child task records have a value of 0.

Field Name: QWACZIIP_ELIGIBLE

CLASS 2: TRIG TCB TIME UNDER ENCLAVE

The accumulated CPU time used for executing triggers on a nested task. This time does not include CPU consumed on an IBM specialty engine.

Field Name: QWACTRTE

CLASS 2: QWACTRRT_ZIIP

The accumulated CPU time consumed on an IBM specialty engine while running triggers on a nested task or on the main application execution unit.

Field Name: QWACTRRT_ZIIP

CLASS 2: TRIG ELAP TIME NOT UNDER ENCLAVE
The accumulated elapsed time used when executing under the control of a trigger. This does not include the time used while in user-defined functions or stored procedures that are called from the trigger.

**Field Name:** QWACTRET

### CLASS 2: ELAPSED TIME ELIGIBLE FOR ACCEL

The accumulated elapsed time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** QWACCEL_ELIG_ELA

### CLASS 2: TRIG TCB TIME NOT UNDER ENCLAVE

The accumulated TCB time that is used when running under the control of a trigger. This does not include the time that is used while running in user-defined functions or stored procedures that are called from the trigger. This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

**Field Name:** QWACTRTT

This is an *exception* field.

### CLASS 2: CP CPU TIME ELIGIBLE FOR ACCEL

The accumulated CPU time spent processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** QWACCEL_ELIG_CP

### CLASS 2: SE CPU TIME ELIGIBLE FOR ACCEL

The accumulated CPU time consumed on an IBM specialty engine while processing SQL in DB2 that may be eligible for execution on an accelerator.

**Field Name:** QWACCEL_ELIG_SE

### CLASS 2: TRIG TCB TIME NOT UNDER ENCLAVE

The accumulated TCB time that is used when running under the control of a trigger. This does not include the time that is used while running in user-defined functions or stored procedures that are called from the trigger. This CPU time does not include the CPU time that is consumed on an IBM specialty engine.

**Field Name:** QWACTRTT

This is an *exception* field.

### CLASS 3: ACCU LOCK ELAPSED TIME

The accumulated wait time because of local contention for locks. The term *local contention* is used to differentiate from *global contention* (which is reported in QWACAWTL). Local contention does not require intersystem communication. The contention is detected and resolved entirely within this subsystem.

**Field Name:** QWACAWTL

This is an *exception* field.

### CLASS 3: WAIT TRACE EVENTS

The number of wait trace events processed for waits for local contention for locks.
Field Name: QWACARNL

**CLASS 3: DB2 LATCH SUSP TIME**

The accumulated wait time because of latch contention.

Field Name: QWACAWLH

**CLASS 3: LATCH WAIT TRACE EVENTS**

The number of wait trace events processed for waits for latch contention.

Field Name: QWACARLH

**CLASS 3: SYNCHRONOUS I/O SUSP TIME**

The accumulated I/O elapsed wait time for database I/O done under this thread. This field is for synchronous I/O only. It includes synchronous read and write I/O. This value is an average.

Field Name: QWACAWTI

**CLASS 3: SYNCHRONOUS I/O SUSP EVENTS**

The number of wait trace events processed for I/O.

Field Name: QWACARNE

**CLASS 3: LOG WRITE I/O SUSP TIME**

The accumulated wait time for log write I/O.

This value is an average.

Field Name: QWACAWLG

**CLASS 3: LOG WRITE I/O SUSP EVENTS**

The number of log I/O suspensions.

Field Name: QWACARLG

**CLASS 3: OTHER READ SUSP TIME**

The accumulated waiting time due to a read I/O that performed under a thread other than the one being reported. The time does not represent the total duration of the subject read I/O. It includes:

- Sequential prefetch
- List prefetch
- Dynamic Prefetch
- Synchronous read I/O performed by a thread other than the one being reported

Field Name: QWACAWTR

This is an *exception* field.

**CLASS 3: OTHER READ SUSP EVENTS**

The number of suspensions due to read I/O.

Field Name: QWACARNR

**CLASS 3: OTHER WRITE SUSP TIME**

The accumulated waiting time due to a write I/O that performed under a thread other than the one being reported. This time does not represent the total duration of the subject write I/O. It includes:

- An asynchronous write I/O
A synchronous write I/O performed by a thread other than the one being reported

- Frequent system checkpoints and low settings for deferred write thresholds
- When updating a page that is being written, the first thread wait is captured under Other Write I/O
- Other concurrent threads on the same DB2 subsystem will encounter Page latch suspension.

Field Name: QWACAWTW

This is an exception field.

CLASS 3: OTHER WRITE SUSP EVENTS

The number of suspensions due to write I/O.

Field Name: QWACARNW

CLASS 3: UPDATE COMMIT SUSP TIME

The accumulated wait time because of synchronous execution unit switch for DB2 Phase 2 commit, abort, or deallocation. This includes wait time for Phase 2 commit Log writes and database writes for LOB with LOG NO. For data sharing environment Page P-locks unlocks for updated pages and GBP writes.

Field Name: QWACAWTE

CLASS 3: UPDATE COMMIT SUSP EVENTS

The number of update commit suspensions.

Field Name: QWACARNS

CLASS 3: PAGE LATCH (DB2+IRLM) SUSP TIME

Page latch suspension could be due to concurrent threads that try to update a hot page that is frequently written because of a low deferred write threshold.

In the data sharing environment, within the same member, the first thread gets a P-lock (such as: Index leaf page P-Lock or P-Lock for Space map page or data page P-Lock for Row level locking) during high INSERT activity. Performance trace for IFCID 226 and 227 provide more information for detailed analysis.

With a high number of concurrent threads, for subsequent threads in the same member for the same resource, contention is reported as encountering a page latch contention. Randomizing the Index key helps minimizing page latch contentions for the Index leaf page.

If the page latch is for a space map page and an incremental image copy is not used, use the DDL TRACKMOD NO option to avoid frequent updates to the space map page. The Member Cluster option reduces page latch contention for a space map page.

Field Name: QWACAWTP

CLASS 3: PAGE LATCH (DB2+IRLM) SUSP EVENTS

The number of page latch wait trace events processed.

Field Name: QWACARNH

CLASS 3: NOTIFY MESSAGES SUSP TIME
The accumulated elapsed waiting time due to suspensions caused by sending notify messages to other members in the data sharing group. Messages are sent, for example, when the database descriptors are changed due to DDL.

Field Name: QWACAWTG

CLASS 3: NOTIFY MESSAGES EVENTS

The number of wait trace events processed for sending notify messages to other members in the data sharing group.

Field Name: QWACARNG

CLASS 3: GLOB CONT PARENT L-LOCK TIME

The accumulated global contention wait time for parent L-locks.

A parent L-lock can be one of the following types:
- Database
- Tablespace
- Table
- Partition

Background and Tuning Information

Performance Expert might adjust this value if the thread was suspended when performance data was gathered.

Field Name: QWACAWTJ

CLASS 3: GLOB CONT PARENT L-LOCK EVENTS

The number of wait trace events processed for group-level contentions in a data sharing environment.

Field Name: QWACARNJ

CLASS 3: GLOB CONT CHILD L-LOCK TIME

The accumulated global contention wait time for child L-locks.

A child L-lock type can be:
- Page
- Row

Field Name: QWACAWTK

CLASS 3: GLOB CONT CHILD L-LOCK EVENTS

The number of wait trace events processed for waits due to global contention for child L-locks.

Field Name: QWACARNK

CLASS 3: GLOB CONT OTHER L-LOCK TIME

The accumulated global contention wait time for other L-locks. Global extend lock is acquired in exclusive mode by Inserters before an extend service task switch.

Field Name: QWACAWTM

CLASS 3: GLOB CONT OTHER L-LOCK EVENTS

The number of wait trace events processed for waits due to global contention for other L-locks.
FIELD NAME: QWACARNM

CLASS 3: GLOB CONT PGSET/PART P-LOCK TIME
The accumulated global contention time for pageset and partition P-locks.

FIELD NAME: QWACAWTN

CLASS 3: GLOB CONT PGSET/PART P-LOCK EVENTS
The number of wait trace events processed for waits due to global contention for page set or partition P-locks.

FIELD NAME: QWACARNN

CLASS 3: GLOB CONT PAGE P-LOCK TIME
The accumulated global contention wait time for page P-locks.

FIELD NAME: QWACAWTO

CLASS 3: GLOB CONT PAGE P-LOCK EVENTS
The number of wait trace events processed for waits due to global contention for page P-locks.

FIELD NAME: QWACARNO

CLASS 3: GLOB CONT OTHER P-LOCK TIME
The accumulated global contention wait time for other P-locks. Includes suspension for Castout P-Locks and DBET locks. It could be because of Index Split processing which can be minimized if the Index key size is not large. If you can minimize the number of Index Keys in the Index, it will help to reduce the number of Index splits.

FIELD NAME: QWACAWTQ

CLASS 3: GLOB CONT OTHER P-LOCK EVENTS
The number of wait trace events processed for waits due to global contention for other P-locks.

FIELD NAME: QWACARNQ

CLASS 3: SCHED. STOR PROC SUSP TIME
The total elapsed waiting time for an available TCB before the stored procedure could be scheduled.

FIELD NAME: QWACCAST

CLASS 3: STORED PROCEDURE EVENTS
The number of wait trace events processed for an unavailable TCB needed for a stored procedure.

FIELD NAME: QWACCANM

CLASS 3: SCHED. UDF SUSP TIME
The total elapsed time spent waiting for an available TCB before the user-defined function could be scheduled.

FIELD NAME: QWACUDST

CLASS 3: NON-ZERO CLASS 3
CLASS 3 DATA IN THIS RECORD: Y/N

FIELD NAME: QWACCLS3
CLASS 3: TCP/IP LOB XML TIME
The accumulated wait time for TCP/IP LOB and XML (storing large object and XML) materialization.
Field Name: QWACALBW

CLASS 3: TCP/IP LOB XML EVENTS
The number of wait trace events that were processed for waits for TCP/IP LOB and XML materialization.
Field Name: QWACALBC

CLASS 3: ACCELERATOR SUSP TIME
The accumulated wait time for requests to an accelerator.
Field Name: QWACAACW

CLASS 3: ACCELERATOR EVENTS
The number of wait trace events processed for requests to an accelerator.
Field Name: QWACAACC

CLASS 3: AUTON PROC WAIT TIME
The accumulated time waiting for autonomous procedures to complete.
Field Name: QWAC_AT_WAIT

CLASS 3: AUTON PROC EVENTS
The number of autonomous procedures that were executed:
1. For non-rollup records, this value is the number of autonomous procedures that were executed.
2. For a parallel query rollup record, this value is 0.
3. For a DDF or RRSAF rollup record, this value is the number of autonomous procedures that were executed. These procedures are NOT counted in QWACPCNT.
4. For autonomous procedures rollup records, this value is 0.
Field Name: QWAC_AT_COUNT

CLASS 3: PARALLEL QUERY SYNC WAIT TIME
The accumulated time waiting for parallel queries to synchronize between parent and child tasks.
Field Name: QWAC_PQS_WAIT

CLASS 3: PARALLEL QUERY SYNC WAIT EVENTS
The number of times the parallel query processing had to suspend because it was waiting for the synchronization of parent or child.
Field Name: QWAC_PQS_COUNT

CLASS 3: CLASS 3 DATA COLLECTED
The accounting class 3 data was being collected when this accounting record was written.
Field Name: QWACCL3O

CLASS 7: DATA COLLECTED
The accounting class 7 data was being collected when this accounting record was written.

Field Name: QWACCL7O

CLASS 8: DATA COLLECTED

The accounting class 8 data was being collected when this accounting record was written.

Field Name: QWACCL8O

MAX WORKFILE BLOCKS

The maximum number of work-file blocks that are used by this agent at any given point in time (traditional work-file blocks, declared global temporary tables (DGTT) and DGTT indexes) (DB2 field QWAC_WORKFILE_MAX).

Field Name: QWAC_WORKFILE_MAX

CURR WORKFILE BLOCKS

The current number of work-file blocks that are used by this agent (traditional workfile use, declared global temporary tables (DGTT) and DGTT indexes).

Field Name: QWAC_WORKFILE_CURR

WLM SERVICE CLASS

The MVS workload manager service class name. This field is used for database access threads on MVS 5.2 or later.

Field Name: QWACWLME

PARALLEL CHILDS ROLLED INTO RECORD

The number of parallel child agents rolled into this record. The value depends on the record type:
1. For all non-rollup records, this value is 0.
2. For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.
3. For a DDF/RRSAF rollup record, this value is the number of parallel query child agents rolled into this record. These agents are NOT counted in QWACPCNT.
4. For an autonomous procedure rollup record, this value is 0.

Field Name: QWAC_PT_COUNT

ROLLUP DATA FOR PARALLEL CHILD TASKS

The field indicates whether to roll up accumulate query parallel task’s accounting trace into originating task’s accounting trace. Possible values are:

YES Originating task cut an additional accounting trace record with all roll-up values from parallel tasks.

NO Each parallel task will produce its own accounting trace record.

Field Name: QWACPARR

PARALLEL QUERY ROLLUP DATA

This record contains parallel query rollup data.
IFCID 003 - Instrumentation Accounting Data

Field Name: QWAC_RU_PARQRY

AUTON PROC ROLLUP DATA

This record contains autonomous procedure rollup data.

Field Name: QWAC_RU_AT

IFCID 003 - Instrumentation Accounting Data Overflow:

This topic shows detailed information about “Record Trace - IFCID 003 - Instrumentation Accounting Data Overflow”.

Record trace - IFCID 003 - Instrumentation Accounting Data Overflow

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Instrumentation Accounting Data Overflow” are described in the following section.

INSTRUMENTATION ACCOUNTING DATA OVERFLOW

</table>

ARCH.LOG(QUIES) SUSP TIME

The accumulated waiting time due to the processing of ARCHIVE LOG MODE(QUIESCE) commands.

This time does not represent the time required to perform the entire command.

Field Name: QWAXALOG

This is an exception field.

ARCH.LOG(QUIES) SUSP EVENTS

The number of ARCHIVE LOG MODE (QUIESCE) commands issued.

Field Name: QWAXALCT

ACCUM. READ SUSP TIME

The accumulated wait time for:

- Archive Log reads
- Active Log reads
- Active Log prefetch reads
- Fast Log apply log reads

Field Name: QWAXAWAR

WAIT TRACE READ EVENTS

DB2 V8: The number of wait trace events processed for archive reads, active reads, and active log prefetch reads.

Field Name: QWAXANAR
DRAIN LOCK SUSP TIME
   The accumulated waiting time for a drain lock. This is the time the
   requester is suspended while waiting to acquire the drain lock.
   Field Name: QWAXAWDR
   This is an exception field.

DRAIN LOCK SUSP EVENTS
   The number of wait trace events processed for waits for drain locks.
   Field Name: QWAXARND

CLAIM RELEASE SUSP TIME
   The accumulated waiting time for a drain waiting for claims to be released.
   After the drain lock is acquired, the drainer must wait for claim holders to
   release the object.
   Field Name: QWAXAWCL
   This is an exception field.

CLAIM RELEASE SUSP EVENTS
   The number of wait trace events processed for waits for claims to be
   released.
   Field Name: QWAXARNC

I/O SERVICE TASK SUSP TIME
   Accumulated waiting time for a synchronous execution unit switch to the
   DB2 OPEN/CLOSE data set service for the HSM recall service.
   This value is an average.
   Field Name: QWAXOCSE

I/O SERVICE TASK SUSP EVENTS
   Number of wait trace events processed of waits for synchronous execution
   unit switching to the Open/Close service.
   Field Name: QWAXOCNS

SYSLGRNG SUSP TIME
   Accumulated wait time for a synchronous execution unit switch to the DB2
   SYSLGRNG recording service. This service is sometimes used for Level ID
   checking for downlevel detection.
   This value is an average.
   Field Name: QWAXSLSE

SYSLGRNG SUSP EVENTS
   Number of wait trace events for a synchronous execution unit switch to
   the DB2 SYSLGRNG recording service.
   Field Name: QWAXSLNS

DS MANAGER SUSP TIME
IFCID 003 - Instrumentation Accounting Data Overflow

Accumulated wait time for a synchronous execution unit switch to the DB2 data space manager services. This includes DEFINE DATA SET, EXTEND DATA SET, DELETE DATA SET, RESET DATA SET, and VSAM CATALOG ACCESS.

This value is an average.

Field Name: QWAXDSSE

DS MANAGER SUSP Events

Number of wait trace events for waits for synchronous execution unit switching to the DB2 data space manager services.

Field Name: QWAXDSNS

OTHER SERVICE SUSP TIME

Could be due to a VSAM catalog update. In the distributed environment, it includes the waiting time for the response from the server system. Performance trace for IFCID 46 to 50, 170, and 171 provide more detailed information for analysis.

Field Name: QWAXOTSE

OTHER SERVICE SUSP EVENTS

Number of wait trace events for a synchronous execution unit switch to other DB2 service tasks.

Field Name: QWAXOTNS

COMMIT PH1 WRITE I/O TIME

The accumulated time waiting for phase 1 commit write I/O. An example for this suspension is LOB Table Space with LOG NO Phase 1 commit database synchronous write I/O processing.

Field Name: QWAXAWFC

COMMIT PH1 WRITE I/O EVENTS

The total number of wait trace events for commit phase 1 I/O.

Field Name: ADFCSUSC

ASYNC. IXL REQ. TIME

The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Field Name: QWAXIXLT

ASYNC. IXL EVENTS

Number of wait trace events processed for asynchronous IXLCACHE or IXLFCOMP invocations.

Field Name: QWAXIXLE

LOB COMPRESSION SUSP TIME

The accumulated time waiting for a compression of DB2 large objects (LOB) (DB2 field QWAX_LOBCOMP_WAIT).

Field Name: QWAX_LOBCOMP_WAIT

LOB COMPRESSION SUSP EVENTS

The number of wait trace events processed for DB2 large object (LOB) compressions.
Field Name: QWAX_LOBCOMP_COUNT

FAST INSERT PIPE WAIT TIME
The accumulated wait time for pipe wait (DB2 field QWAX_PIPE_WAIT).

Field Name: QWAX_PIPE_WAIT

FAST INSERT PIPE WAIT EVENTS
The number of wait trace events that were processed for pipe wait (DB2 field QWAX_PIPE_WAIT_COUNT).

Field Name: QWAX_PIPE_WAIT_COUNT

SYNC READ DASD CACHE HIT WAIT TIME
The amount of time spent waiting for synchronous database reads where the requested pages were found in the DASD subsystem’s cache.

Field Name: QWACAWTD

SYNC READ WAIT DASD CACHE HIT EVENTS
The number of times the thread waited for synchronous database reads where the requested pages were found in the DASD subsystem’s cache.

Field Name: QWACAWCD

IFCID 003 - Locking Data:
This topic shows detailed information about “Record Trace - IFCID 003 - Locking Data”.

Record trace - IFCID 003 - Locking Data
The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Locking Data” are described in the following section.

| LOCKING DATA | | | |
| DEADLOCKS | LOCK REQUEST | LOCK SUSPENSIONS | CLAIM REQUESTS | |
| TIMEOUTS | UNLOCK REQUEST | IRLM LATCH SUSPENS. | CLAIM REQ. FAILED | |
| ESCALATIONS{SHR} | QUERY REQUEST | OTHER SUSPENSIONS | DRAIN REQUESTS | |
| ESCALATIONS{EXC} | CHANGE REQUEST | | DRAIN REQ. FAILED | |
| MAXIMUM PAGE/ROW LOCKS HELD | OTHER REQUEST | | | |

DEADLOCKS
The number of times deadlocks were detected. This number should be low, ideally 0.

Background and Tuning Information
Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order.

To improve concurrency:
- Use row level locking instead of page level locking to minimize deadlocks.
- For small tables use page level locking with MAXROWS 1.

To minimize deadlocks:
- Delay updates to just before commit.
- Use SELECT with the FOR UPDATE clause to use U lock.
- Adjust the deadlock detection cycle parameter DEADLOK in the IRLM procedure.
This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

**Field Name:** QTXADEA

This is an *exception* field.

**LOCK REQUEST**

The number of requests to lock a resource.

**Field Name:** QTXALOCK

This is an *exception* field.

**LOCK SUSPENSIONS**

The number of times a lock could not be obtained and the unit of work was suspended.

**Background and Tuning Information**

This number should be low, ideally 0.

The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can happen on either LOCK REQUEST or CHANGE REQUEST.

Suspensions are highly dependent on the application and table space locking protocols.

**Field Name:** QTXASLOC

This is an *exception* field.

**CLAIM REQUESTS**

The number of claim requests.

**Field Name:** QTXACLNO

This is an *exception* field.

**TIMEOUTS**

The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Field Name:** QTXATIM

This is an *exception* field.

**UNLOCK REQUEST**

The number of requests to unlock a resource.

This value can be less than the number of lock requests because DB2 can release several locks with a single unlock request.

**Field Name:** QTXAUNLK

**IRLM LATCH SUSPENS.**

The number of latch suspensions.

**Field Name:** QTXASLAT
CLAIM REQ. FAILED

The number of unsuccessful claim requests.

**Field Name:** QTXACLUN

ESCALATIONS(SHR)

The number of times the maximum page locks per table space are exceeded, and the table space lock escalates from a page lock (IS) to a table space lock (S) for this thread. You can specify the number of locks allowed per table space with the LOCKS PER TABLE(SPACE) parameter on the DB2 install panel DSNTIPJ.

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than normal.

**Field Name:** QTXALES

This is an exception field.

QUERY REQUEST

The number of query requests.

**Field Name:** QTXAQRY

This is an exception field.

OTHER SUSPENSIONS

The number of suspensions caused by something other than lock or latch.

**Field Name:** QTXASOTH

This is an exception field.

DRAIN REQUESTS

The number of drain requests.

**Field Name:** QTXADRNO

This is an exception field.

ESCALATIONS(EXC)

The number of times the maximum page locks per table space are exceeded and the table space lock escalates from a page lock (IX) to a table space lock (X).

**Background and Tuning Information**

Escalations can cause unpredictable response times. Lock escalations should only happen when an application process updates or references (if repeatable read is used) more pages than it normally does.

A useful rule of thumb is to compare the number of escalations (shared and exclusive) to the successful escalations (those that did not cause deadlocks and timeouts). If this value, or the number Lock escalations - shared and if the number of timeouts or deadlocks is also not 0, the timeout or deadlock is probably caused by the escalation.
If many escalations cause deadlocks and timeouts, the recommendation is to change the escalation threshold value. Use of ANY is extremely useful to prevent unnecessary and expensive page locks, for example locking all pages in a table space.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

**Field Name:** QTXALEX
This is an *exception* field.

**CHANGE REQUEST**
The number of change requests.

**Field Name:** QTXACHG
This is an *exception* field.

**DRAIN REQ. FAILED**
The number of unsuccessful drain requests.

**Field Name:** QTXADRUN
This is an *exception* field.

**MAXIMUM PAGE/ROW LOCKS HELD**
The maximum number of page or row locks concurrently held against all table spaces by a single application during its execution. This count is a high-water mark. It cannot exceed the LOCKS PER USER parameter on panel DSNTIPJ.

**Field Name:** QTXANPL
This is an *exception* field.

**OTHER REQUEST**
The number of requests to IRLM to perform a function other than LOCK, UNLOCK, QUERY, or CHANGE.

**Field Name:** QTXAIRLM
This is an *exception* field.

**IFCID 003 - Logging:**
This topic shows detailed information about “Record Trace - IFCID 003 - Logging”.

**Record trace - IFCID 003 - Logging**
The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Logging” are described in the following section.

### LOGGING

| NUMBER OF LOG RECORDS WRITTEN | 0 | TOTAL BYTES WRITTEN | X'000000000000' |

**NUMBER OF LOG RECORDS WRITTEN**
The number of log records written.

**Field Name:** QWACLRN

**TOTAL BYTES WRITTEN**
The total number of log record bytes written.
Field Name: QWACLRAB

IFCID 003 - Miscellaneous:

This topic shows detailed information about “Record Trace - IFCID 003 - Miscellaneous”.

This report has the same layout as “IFCID 002 - Miscellaneous” on page 3628.

IFCID 003 - Nested SQL Activity:

This topic shows detailed information about “Record Trace - IFCID 003 - Nested SQL Activity”.

Record trace - IFCID 003 - Nested SQL Activity

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Nested SQL Activity” are described in the following section.

```
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX CASCADE LVL</td>
<td>0</td>
<td>The maximum level of indirect SQL cascading. This includes cascading because of triggers, UDFs, or stored procedures.</td>
</tr>
<tr>
<td>CALL STATEMENTS</td>
<td>0</td>
<td>The number of SQL CALL statements executed.</td>
</tr>
<tr>
<td>UDF EXECUTED</td>
<td>0</td>
<td>The number of user-defined functions executed.</td>
</tr>
<tr>
<td>STMT TRIGGER</td>
<td>0</td>
<td>The number of statements executed.</td>
</tr>
</tbody>
</table>
```

CALL STATEMENTS

The number of SQL CALL statements executed.

Field Name: QXCALL

This is an exception field.

PROCEDURE ABENDS

The number of times a stored procedure terminated abnormally.

Field Name: QXCALLLAB

This is an exception field.

CALL TIMEOUTS

The number of times an SQL call timed out waiting to be scheduled.

Field Name: QXCALLOTO

This is an exception field.

CALL REJECTS

The number of times an SQL CALL statement was rejected due to the procedure being in the STOP ACTION(REJECT) state.

Field Name: QXCALLRJ

This is an exception field.

UDF EXECUTED

The number of user-defined functions executed.
IFCID 003 - Nested SQL Activity

Field Name: QXCAUD
This is an exception field.

UDF ABENDS
The number of times a user-defined function abended.
Field Name: QXCAUDAB
This is an exception field.

UDF TIMEOUTS
The number of times a user-defined function timed out while waiting to be scheduled.
Field Name: QXCAUDTO
This is an exception field.

UDF REJECTS
The number of times a user-defined function was rejected.
Field Name: QXCAUDRJ
This is an exception field.

STMT TRIGGER
The number of times a statement trigger was activated.
Field Name: QXSTTRG
This is an exception field.

ROW TRIGGER
The number of times a row trigger was activated.
Field Name: QXROWTRG
This is an exception field.

SQL ERROR TRIGGER
The number of times an SQL error occurred during the execution of a triggered action. This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.
Field Name: QXTRGERR
This is an exception field.

IFCID 003 - Query Parallelism:
This topic shows detailed information about “Record Trace - IFCID 003 - Query Parallelism”.

This report has the same layout as IFCID 002 - Query Parallelism” on page 3631.

IFCID 003 - Resource Limit Facility:
This topic shows detailed information about “Record Trace - IFCID 003 - Resource Limit Facility”.
RES LIMIT SCOPE

Indicates how the resource limit was established. A value of 0 shows that the resource limit facility was not started.

Field Name: QTXAPREC

RLF TABLE ID

The identifier of the resource limit specification table.

Field Name: QTXARLID

LIMIT IN CPU 16 MICROSEC

The CPU time limit, in microseconds, set by the resource limit facility.

Field Name: QTXACLMT

RES LIMIT TYPE

Indicates how the type of resource limit was established: infinite, zero, or limit.

Note: Label QTXAFLG1 presents the first flag byte in hexadecimal:

- X'80'  Infinite limit
- X'40'  No run or zero limit

Field Name: QTXAFLG1

LIMIT IN SERVICE UNITS

The maximum number of CPU service units to be used. Normally, the value is not 0 if the RES LIMIT TYPE is LIMIT. A value of 0 indicates no limit.

Field Name: QTXASLMT

HIGHEST CPU 16 MICROSEC USED

The highest CPU time used by a single DB2 call, in microseconds. Note that there can be many DB2 calls for one SQL statement.

Field Name: QTXACHUS

QTXAFLG1 (S)

Indicates how the type of resource limit was established: infinite, zero, or limit.

Note: Label QTXAFLG1 presents the first flag byte in hexadecimal:

- X'80'  Infinite limit
- X'40'  No run or zero limit

Field Name: QTXAFLG1
IFCID 003 - RID List Processing

IFCID 003 - RID List Processing:

This topic shows detailed information about “Record Trace - IFCID 003 - RID List Processing”.

This report has the same layout as “IFCID 002 - RID List Processing” on page 3634.

IFCID 003 - Rollup Accounting Correlation Block:

This topic shows detailed information about “Record Trace - IFCID 003 - Rollup Accounting Correlation Block”.

Record trace - IFCID 003 - Rollup Accounting Correlation Block

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - Rollup Accounting Correlation Block” are described in the following section.

TOKEN

The agent token for the transaction rolled into the record. This can be used to correlate to records written with the same QWHSACE value during the time of the transaction (QWARBSC to QWARESC).

Field Name: QWARACE

START

The beginning time for the transaction.

Field Name: QWARBSC

END

The end time for the transaction.

Field Name: QWARESC

IFCID 003 - ROWID:

This topic shows detailed information about “Record Trace - IFCID 003 - ROWID”.

Record trace - IFCID 003 - ROWID

The field labels shown in the following sample layout of “Record Trace - IFCID 003 - ROWID” are described in the following section.

DIRECT ACCESS

The number of times that direct row access was successful.

Field Name: QXROIMAT

INDEX USED
The number of times an index was used to find a record.

**Field Name:** QXROIINX

**TABLE SPACE SCAN USED**

The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was unable to use a matching index scan.

**Background and Tuning Information**

Ideally, this value should be 0.

Table-space scans can happen, for example, when a REORG is performed between the read of the ROWID column and the use of the host variable in the WHERE clause of the SQL statement. This causes the RID value in the host variable to be incorrect. DB2 first tries a matching-index scan before using a table-space scan.

To avoid table space scans, you can force the access path of an unsuccessful direct row access to use a matching index scan on the primary-index key by adding PKCOL to the WHERE clause in the SQL statement. .... WHERE ROWIDCOL=:HVROWID AND PKCOL=:HVPK

**Field Name:** QXROITS

**IFCID 003 - SQL Call Data:**

This topic shows detailed information about “Record Trace - IFCID 003 - SQL Call Data”.

This report has the same layout as [“IFCID 002 - SQL Call Data” on page 3646](#).

**IFCID 004 - Trace Start:**

This topic shows detailed information about “Record Trace - IFCID 004 - Trace Start”.

**Record trace - IFCID 004 - Trace Start**

The field labels shown in the following sample layout of “Record Trace - IFCID 004 - Trace Start” are described in the following section.

**MESSAGE:**

The start trace message.

**Field Name:** QW0004MS

**IFCID 005 - Trace Stop:**

This topic shows detailed information about “Record Trace - IFCID 005 - Trace Stop”.

IFCID 005 - Trace Stop

Record trace - IFCID 005 - Trace Stop

The field labels shown in the following sample layout of “Record Trace - IFCID 005 - Trace Stop” are described in the following section.

MESSAGE: -STOP TRACE(*) CLASS(*) RMID(*) PLAN(*)
AUTHID(*) TNO(*)
QW0005CM 00000000

MESSAGE

The stop trace message.

Field Name: QW0005MS

IFCID 006 - Read I/O Start:

This topic shows detailed information about “Record Trace - IFCID 006 - Read I/O Start”.

Record trace - IFCID 006 - Read I/O Start

The field labels shown in the following sample layout of “Record Trace - IFCID 006 - Read I/O Start” are described in the following section.

DBID: 6 POOL ID: 0 ACE: 2
OBID: 112 FIRST : X’000000’ READTYPE: D
PAGE NUMBERING : ABS PARTITION NUMBER : 0
TABLE_SPACE_TYPE: X’00’ ZHYPERLINK REQUEST: N

DBID

The page set ID. This page set can be either a table space or an index space. If it is a table space, use this value to match column PSID in SYSIBM.SYSTABLESPACE to find the name of the table space. If it is an index space, use this value to match column ISOBID SYSIBM.SYSINDEXES to find the internal name of the index space. This is deduced from the DB2 fields QW0006OB, and QW0105TN or QW0107TN.

When present, the database name is shown, otherwise the decimal identifier from QW0006DB is shown, or N/A when this value is 0.

Field Name: RT0006DB

POOL ID

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0006BP

ACE

The agent control element (ACE) token of the requester.

The relative number of the agent control element address in the ACE cross-reference table. This table is printed at the end of each location for every trace specified.

Field Name: QW0006AC

OBID

The page set ID. This page set can be either a table space or an index space. If it is a table space, use this value to match column PSID in SYSIBM.SYSTABLESPACE to find the name of the table space. If it is an
index space, use this value to match column ISOBID SYSIBM.SYSINDEXES to find the internal name of the index space. This is deduced from the DB2 fields QW0006OB, and QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0006OB is shown, or N/A when this value is 0.

Field Name: RT0006OB

FIRST

The hexadecimal number of the first page to be read for a table space that is not defined as large.

Field Name: QW0006PN

READTYPE

The type of read performed:
S  Sequential prefetch request
L  List prefetch request
D  Dynamic sequential prefetch request
R  Synchronous read request

Field Name: QW0006F

PAGE NUMBERING

Indicates how page numbers are shown for partitioned tables:
REL  Indicates that relative page numbers are shown in the partition.
ABS  Indicates that absolute page numbers are shown in the partition.
N/A  Not applicable.

Field Name: QW0006P1

TABLE_SPACE_TYPE

The type of the table space:
L  Non-EA large table
N  Non-large table
V  EA-enabled large table

Field Name: QW0006FG

PARTITION NUMBER

The partition number. This value is 0 if the table space is not partitioned.

Field Name: QW0006PT

ZHYPERLINK REQUEST

Indicates whether or not the I/O is using zHyperLink (synchronous) I/O.

Field Name: QW0006SI

IFCID 007 - Read I/O Stop:

This topic shows detailed information about “Record Trace - IFCID 007 - Read I/O Stop”.
## IFCID 007 - Read I/O Stop

The field labels shown in the following sample layout of “Record Trace - IFCID 007 - Read I/O Stop” are described in the following section.

```
Field Name: QW0007PT

DASD CACHE HIT
Indicates whether or not the requested data was found in the DASD subsystem cache. A value of N/A indicates that the I/O failed (RETCODE is not 0). zHyperLink I/O requires the requested data to be in the DASD subsystem cache for the I/O to be successful. If the requested data was in cache and the I/O was not done with zHyperLink, use of zHyperLink for this I/O operation might have been successful.

Field Name: QW0007DC

ZHYPERLINK REQUEST
Indicates whether or not the I/O is using zHyperLink (synchronous) I/O.

Field Name: QW0007SI

PAGE PREFETCHED VIA IO OPERATION
The page number that was prefetched during an I/O operation.

Field Name: QW0007PF

IFCID 008 - Write I/O Synch:

This topic shows detailed information about “Record Trace - IFCID 008 - Write I/O Synch”.

Record trace - IFCID 008 - Write I/O Synch

The field labels shown in the following sample layout of “Record Trace - IFCID 008 - Write I/O Synch” are described in the following section.

| DBID:     | DBHSR01  | ACTIVE: | 218 |
| OBID:     | HSRPSDFP | UPDATED: | 264 |
| POOL ID:  | 0        | WRITTEN: | 1   |
| WRITE TYPE: | NORMAL | PAGE FAULTS: | 0   |
| PARTITION NUMBER: | 0       |

DBID
The database ID. This is deduced from the DB2 fields QW0008DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0008DB is shown, or N/A when this value is 0.

Field Name: RT0008DB

ACTIVE
The number of active buffers in the pool.

Field Name: QW0008AB

OBID
The object ID. This is deduced from the DB2 fields QW0008OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0008OB is shown, or N/A when this value is 0.

Field Name: RT0008OB

UPDATED
IFCID 008 - Write I/O Synch

The number of updated pages in the deferred write queue for the buffer pool that is identified in field QW0008BP.

Field Name: QW0008DW

POOL ID

The internal buffer pool identifier. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0008BP

WRITTEN

The number of pages to be written.

Field Name: QW0008WR

WRITE TYPE

The type of write:

NORMAL Normal write to disk

CASTOUT Write to disk initiated by a castout from the coupling facility

Field Name: QW0008FC

PAGE FAULTS

The number of anticipated page faults. Real storage frames are tested before issuing write.

Field Name: QW0008PI

PARTITION NUMBER

The partition number. This value is 0 if the table space is not partitioned.

Field Name: QW0008PT

IFCID 009 - Write I/O:

This topic shows detailed information about “Record Trace - IFCID 009 - Write I/O”.

Record trace - IFCID 009 - Write I/O

The field labels shown in the following sample layout of “Record Trace - IFCID 009 - Write I/O” are described in the following section.

RETURN 0

RETURN

The return code from the media manager.

Field Name: QW0009MM

IFCID 010 - Write I/O Asynch:

This topic shows detailed information about “Record Trace - IFCID 010 - Write I/O Asynch”.

IFCID 008 - Write I/O Synch
Record trace - IFCID 010 - Write I/O Asynch

The field labels shown in the following sample layout of “Record Trace - IFCID 010 - Write I/O Asynch” are described in the following section.

<table>

</table>

DBID

The database ID. Deduced from the DB2 fields QW0010DB, and QW0105DN or QW0107DN.

When present the database name is shown, otherwise the decimal identifier from QW0010DB is shown, or N/A when this value is 0.

Field Name: RT0010DB

ACTIVE

The number of active buffers in the pool.

Field Name: QW0010AB

OBID

The object ID. Deduced from the DB2 fields QW0010OB, and QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0010OB is shown or N/A when this value is 0.

Field Name: RT0010OB

UPDATED

The number of updated pages in the deferred write queue for the buffer pool that is identified in field QW0010BP.

Field Name: QW0010DW

POOL ID

The internal identifier of the buffer pool. The values 0 through 49 are the identifiers for BP0 through BP49. The values 80 through 89 are the identifiers for BP32K through BP32K9.

Field Name: QW0010BP

WRITTEN

The number of pages to be written.

Field Name: QW0010WR

WRITE TYPE

The type of write:

NORMAL

Normal write to disk

CASTOUT

Write to disk initiated by a castout from the coupling facility

Field Name: QW0010FC
IFCID 010 - Write I/O Asynch

PAGE FAULTS

The number of anticipated page faults. Real storage frames are tested before issuing write.

Field Name: QW0010PI

PARTITION NUMBER

The partition number. This value is 0 if the table space is not partitioned.

Field Name: QW0010PT

IFCID 011 - Validate Exit:

This topic shows detailed information about “Record Trace - IFCID 011 - Validate Exit”.

Record trace - IFCID 011 - Validate Exit

The field labels shown in the following sample layout of “Record Trace - IFCID 011 - Validate Exit” are described in the following section.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

DBID

The database ID. Deduced from the DB2 fields QW0011DB, and QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0011DB is shown, or N/A when this value is 0.

Field Name: RT0011DB

REC ID

The decimal identifier of the DB2 table OBID.

Field Name: QW0011OB

OBID

The object ID. Deduced from the DB2 fields QW0011OB, and QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0011OB is shown or N/A when this value is 0.

Field Name: RT0011OB

TIME

The time at which the exit was called.

Field Name: QW0011TM

RETURN

The return code (EXPLRC1) from the exit.

Field Name: QW0011RT

REASON

The reason code (EXPLRC2) from the exit.

Field Name: QW0011RE
IFCID 012 - Edit Exit to Encode:

This topic shows detailed information about “Record Trace - IFCID 012 - Edit Exit to Encode”.

Record trace - IFCID 012 - Edit Exit to Encode

The field labels shown in the following sample layout of “Record Trace - IFCID 012 - Edit Exit to Encode” are described in the following section.

DBID

The database ID. Deduced from the DB2 fields QW0012DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0012DB is shown, or N/A when this value is 0.

Field Name: RT0012DB

REC ID

The decimal identifier of the DB2 table OBID.

Field Name: QW0012OB

OBID

The object ID. Deduced from the DB2 fields QW0010OB, and QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0010OB is shown or N/A when this value is 0.

Field Name: RT0010OB

TIME

The time at which the exit was called.

Field Name: QW0012TM

RETURN

The return code (EXPLRC1) from the exit.

Field Name: QW0012RT

REASON

The reason code (EXPLRC2) from the exit.

Field Name: QW0012RE

IFCID 013 - Hash Scan Input Start:

This topic shows detailed information about “Record Trace - IFCID 013 - Hash Scan Input Start”.

Record trace - IFCID 013 - Hash Scan Input Start

The field labels shown in the following sample layout of “Record Trace - IFCID 013 - Hash Scan Input Start” are described in the following section.
### DBID

The database ID. Deduced from the DB2 fields QW0010DB, and QW0105DN or QW0107DN.

When present the database name is shown, otherwise the decimal identifier from QW0010DB is shown, or N/A when this value is 0.

**Field Name:** RT0010DB

### REC ID

The decimal identifier of the DB2 table OBID.

**Field Name:** QW0013OB

### OBID

The object ID. Deduced from the DB2 fields QW0013OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0013OB is shown or N/A when this value is 0.

**Field Name:** RT0013OB

### COLUMN1

The first column number.

**Field Name:** QW0013C1

### OPER

The logical operator:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NE</td>
<td>Not equal to</td>
</tr>
<tr>
<td>GT</td>
<td>Greater than</td>

<td>Less than</td>
</tr>
<tr>
<td>LI</td>
<td>Like</td>
</tr>
<tr>
<td>NL</td>
<td>Not like</td>
</tr>
<tr>
<td>??</td>
<td>Unknown operator</td>
</tr>
</tbody>
</table>

**Field Name:** QW0013OP

### COL/VAL

Column data is printed in decimal. Value data is printed in hexadecimal.

**Field Name:** QW0013VA

### CONN

The connector value:
IFCID 013 - Hash Scan Input Start

A And
0 Or

NONE Not specified

Field Name: QW0013CO

TRUE/FALSE

Indicates whether the comparison is true:
T True
F False

NONE Not specified

Field Name: QW0013TF

IFCID 014 - Hash Scan End:

This topic shows detailed information about “Record Trace - IFCID 014 - Hash Scan End”.

Record trace - IFCID 014 - Hash Scan End

The field labels shown in the following sample layout of “Record Trace - IFCID 014 - Hash Scan End” are described in the following section.

RETURN 0
QW0014RE 0

RETURN

The return code.

Field Name: QW0014RT

IFCID 015 - Index Scan Begin:

This topic shows detailed information about “Record Trace - IFCID 015 - Index Scan Begin”.

Record trace - IFCID 015 - Index Scan Begin

The field labels shown in the following sample layout of “Record Trace - IFCID 015 - Index Scan Begin” are described in the following section.

DBID DSNDDB6 REC ID 37 CUB 00F34BC5
OBID DSNSDX01 INDEX ID 5
COLUMN1 OPER COL/VAL CONN TRUE/FALSE
10 NE 4000000000000000 A 'NONE'
15 NE 4000000000000000 'NONE'

DBID

The database ID. Deduced from the DB2 fields QW0015DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0015DB is shown, or N/A when this value is 0.

Field Name: RT0015DB

REC ID

The decimal identifier of the DB2 table OBID.
IFCID 015 - Index Scan Begin

Field Name: QW0015OB

CUB
The hexadecimal address of the CUB token.

Field Name: QW0015AC

OBID
The object ID. Deduced from the DB2 fields QW0015OB, QW0105TN or QW0107TN.
When present, the name of the object is shown, otherwise the decimal identifier from QW0015OB is shown, or N/A when this value is 0.

Field Name: RT0015OB

INDX ID
The index identifier.

Field Name: QW0015IB

COLUMN1
The first column number.

Field Name: QW0015C1

OPER
The logical operator:
NE Not equal to
GT Greater than
GE Greater than or equal to
LE Less than or equal to
E Equal
L Less than
LT Less than
LI Like
NL Not like
?? Unknown operator

Field Name: QW0015OP

</tbody>
</table>

**DBID**

The database ID. Deduced from the DB2 fields QW0016DB, QW0105DN, or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0016DB is shown, or N/A when this value is 0.

Field Name: RT0016DB

**REC ID**

The decimal identifier of the DB2 table OBID.

Field Name: QW0016OB

**SQL TYPE**

Possible values are:

I    INSERT
U    UPDATE
    Insert into a transition table for an UPDATE.
D    DELETE
    Insert into a transition table for a DELETE.
R    RI
    Insert into a transition table for a DELETE SET NULL for referential integrity.

Field Name: QW0016ST

**OBID**

The object ID. Deduced from the DB2 fields QW0016OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0016OB is shown, or N/A when this value is 0.
IFCID 016 - Insert Scan Begin

Field Name: RT0016OB

TRIGGER LEVEL
Depth of the trigger in the range 0 (no triggers) through 16.
Field Name: QW0016TL

WORKFILE TYPE
Possible values are:
WF Workfile
TT Temporary Table
TR Transition table
NW Non-workfile
Field Name: QW0016WT

CUB
The hexadecimal address of the CUB token.
Field Name: QW0016AC

INTEGRITY TYPE
BLANK
S SET NULL
This can occur when SQL TYPE=U
C CASCADE DELETE
This can occur when SQL TYPE=D
Field Name: QW0016RI

IFCID 017 - Sequential Scan Begin:

This topic shows detailed information about “Record Trace - IFCID 017 - Sequential Scan Begin”.

Record trace - IFCID 017 - Sequential Scan Begin

The field labels shown in the following sample layout of “Record Trace - IFCID 017 - Sequential Scan Begin” are described in the following section.

```
DBID DSN0006   REC ID   42

DBID
The database ID. Deduced from the DB2 fields QW0017DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0017DB is shown, or N/A when this value is 0.
Field Name: RT0017DB

REC ID
The decimal identifier of the DB2 table OBID.
```
Field Name: QW0017OB

CUB
The hexadecimal address of the CUB token.

Field Name: QW0017AC

OBID
The object ID. Deduced from the DB2 fields QW0017OB, QW0105TN or QW0107TN.
When present, the name of the object is shown, otherwise the decimal identifier from QW0017OB is shown, or N/A when this value is 0.

Field Name: RT0017OB

SCAN TYPE
Possible values are:
- SQ  Sequential scan.
- WF  Work-file scan.
- TT  Temporary table scan.
- TR  Transition table scan for a trigger.

Field Name: QW0017TY

COL1
The first column number.

Field Name: QW0017C1

OP
The logical operator:
- NE  Not equal to
- GT  Greater than
- GE  Greater than or equal to
- LE  Less than or equal to
- E   Equal
- L   Less than
- LT  Less than
- LI  Like
- NL  Not like
- ??  Unknown operator

Field Name: QW0017OP

COL/VAL
Column data is printed in decimal. Value data is printed in hexadecimal.

Field Name: QW0017VA

CONN
The connector type:
IFCID 017 - Sequential Scan Begin

A And
0 Or
NONE Not specified

Field Name: QW0017CO

TRUE/FALSE

Indicates whether the comparison is true:
T True
F False
NONE Not specified

Field Name: QW0017TF

IFCID 018 - Scan End:

This topic shows detailed information about “Record Trace - IFCID 018 - Scan End”.

Record trace - IFCID 018 - Scan End

The field labels shown in the following sample layout of “Record Trace - IFCID 018 - Scan End” are described in the following section.

22.CKPA 'BLANK' 09:38:13.61943014 10 18 SCAN END <-- NETWORKID: DEIBMIPS LUNAME: IPSAQC11 LUWSEQ: 1
201 0.00005981

-------------------------------------------------------------------------------------------------------------------------
CUB X'00000000' QW0018RT 4 QW0018RE 13172737

DATA TYPE  INDEX ROW PROC  0 ROW EXAM  0 STG1-QUAL  0 STG2-QUAL  0 ROW INSRT  0
ROW UPDATE  0 ROW DELET  0 PAGES  2 R I SCAN  0 R I DELET  0 ROW SKIP  0
FST INSRT  0 N-PIPE IN  0 PIPE RE  0 INS WAIT  0

CUB

The hexadecimal address of the cursor block token of the caller.

Field Name: QW0018AC

DATA TYPE

The scan type identification:

INDEX Index scan
SEQD Sequential data scan
SEQR Transition table sequential data scan
SEQT Temporary table sequential data scan
SEQW Work-file sequential data scan

Field Name: QW0018ID

ROW PROC

The number of rows processed.

Field Name: QW0018RP

ROW EXAM

The number of rows examined. If DATA TYPE shows INDEX, this number is the number of index entries (not rows) scanned.
Field Name: QW0018LA
STG1-QUAL
The number of rows qualified at stage 1.
Field Name: QW0018DQ
STG2-QUAL
The number of rows qualified at stage 2.
Field Name: QW0018RQ
ROW INSRT
The number of rows inserted.
Field Name: QW0018IN
ROW UPDTE
The number of rows updated.
Field Name: QW0018UP
ROW DELET
The number of rows deleted. If the delete was a mass delete, the indicator MASS is printed.
Field Name: QW0018DE
PAGES
The number of get page requests issued by the data manager to the buffer manager. Note that for an index scan the value includes the number of index pages scanned.
Field Name: QW0018PS
RI SCAN
The number of additional pages scanned for referential integrity.
Field Name: QW0018PR
RI DELET
The number of additional rows deleted for referential integrity.
Field Name: QW0018DR
ROW SKIP
The number of rows skipped due to an incompatible hold lock.
Field Name: QW0018SK
FST INSRT
The number of rows inserted using the fast insert algorithm. This value is usually 1, but it is more than 1 for insert with subselect.
Field Name: QW0018FI
N-PIPE IN
The number of times that fast insert could not be used for the insert operation, so a non-pipe insert algorithm was used instead.
Field Name: QW0018FS
PIPE RE

The number of times that the fast insert pipe was refilled for the insert operation.

Field Name: QW0018FA

INS WAIT

The number of times that the insert operation waited for the fast insert pipe to fill.

Field Name: QW0018FW

IFCID 019 - Edit Exit to Decode:

This topic shows detailed information about “Record Trace - IFCID 019 - Edit Exit to Decode”.

Record trace - IFCID 019 - Edit Exit to Decode

The field labels shown in the following sample layout of “Record Trace - IFCID 019 - Edit Exit to Decode” are described in the following section.

<table>

</tbody>
</table>

DBID

The database ID. Deduced from the DB2 fields QW0019DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0019DB is shown, or N/A when this value is 0.

Field Name: RT0019DB

REC ID

The decimal identifier of the DB2 table OBID.

Field Name: QW0019OB

OBID

The object ID. Deduced from the DB2 fields QW0019OB, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0019OB is shown, or N/A when this value is 0.

Field Name: RT0019OB

TIME

The time at which the exit was called.

Field Name: QW0019TM

RETURN

The return code (EXPLRC1) from the user edit exit.

Field Name: QW0019RT

REASON

The reason code (EXPLRC2) from the user edit exit.
Field Name: QW0019RE

IFCID 020 - Lock Summary:

This topic shows detailed information about “Record Trace - IFCID 020 - Lock Summary”.

This record has a variable format. It contains one data section for each table table space section present in the record.

Record trace - IFCID 020 - Lock Summary

The field labels shown in the following sample layout of “Record Trace - IFCID 020 - Lock Summary” are described in the following section.

MAXNO: 12 SHARED: 0 EXCL: 0
DBID : FIJ1DB01 OBID : FIJS0010 MAX LOCK: 0
TABLESPACE TYPE: PARTIT.-SPL ESCALATED: 0
LOCK SIZE : TABLESPACE OR TABLE
HISTATE: INTENT SHARE PRESTATE: NO LOCK ESCALATION

MAXNO
The maximum number of page, row and LOB locks held concurrently for the thread across all tables spaces and index spaces.

Field Name: QW0020TP

SHARED
The number of escalations to shared mode for the thread:
• For segmented table spaces, the number of tables that have escalated
• For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
• For simple and partitioned table spaces, the number of table spaces that have escalated

Field Name: QW0020TS

EXCL
The number of escalations to exclusive mode for the thread:
• For segmented table spaces, the number of tables that have escalated
• For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
• For simple and partitioned table spaces, the number of table spaces that have escalated

Field Name: QW0020TX

Table space sections
The record contains one data section for each relevant table space. These sections are only printed if they are present in the record.

Field Name: QW0020N

DBID
The database ID. Deduced from the DB2 fields QW0020PD, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0020PD is shown, or N/A when this value is 0.
IFCID 020 - Lock Summary

**Field Name:** RT0020DB

**OBID**

The object ID. Deduced from the DB2 fields QW0020PP, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0020PP is shown, or N/A when this value is 0.

**Field Name:** RT0020OB

**MAX LOCK**

The maximum number of either page, row or LOB locks held by the thread.

**Field Name:** QW0020PL

**ESCALATED**

The number of escalations:

- For segmented table spaces, the number of tables that have escalated within the table space
- For partitioned table spaces using selective partition locking (SPL), the number of partitions that have escalated
- For table spaces using SPL, the number of partitions that have escalated

If the value in TABLESPACE TYPE is SIMPLE or PARTITIONED, this field is not printed.

**Field Name:** QW0020PC

**LOCK SIZE**

The lock size used.

**Field Name:** QW0020PR

**HISTATE**

The highest table space lock state. This field is printed for simple table spaces and partitioned table spaces not using SPL.

**Field Name:** QW0020PS

**PRESTATE**

The table space lock state before escalation. This field is printed for simple table spaces and partitioned table spaces not using SPL.

**Field Name:** QW0020PE

**IFCID 021 - Lock Detail:**

This topic shows detailed information about “Record Trace - IFCID 021 - Lock Detail”.

Record trace - IFCID 021 - Lock Detail

The field labels shown in the following sample layout of “Record Trace - IFCID 021 - Lock Detail” are described in the following section.
LOCK DURATION : MANUAL
REQUEST TYPE: L-LOCK
IRLM RETURN SUBCODE: B'0000000000000000'
PARENT TOKEN : X'7F68F3F0'
GLOBAL/LOCAL: GLOBAL
OWNER : 'BLANK'
CACHED STATE : N/A
LOCK HASH VALUE : X'0C4C3603'

LOCK RES TYPE

The locked resource type.

Note: For data sharing, SKELETON CURSOR TABLE LOCKING and SKELETON PACKAGE TABLE LOCK are LP-locks (an LP-lock has an L-lock component and a P-lock component).

Field Name: QW0021KT

DBID

The database ID. This field is not applicable if the value in LOCK RES TYPE is:

- SKELETON CURSOR TABLE LOCKING
- UTILITY SERIALIZATION LOCK
- SKELETON PACKAGE TABLE LOCK
- COLLECTION
- BINDLOCK
- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- GROUP BUFFER POOL LEV CASTOUT P-LOCK
- CATMAINT MIGRATION LOCK
- CATMAINT CONVERT CATALOG LOCK
- CATMAINT CONVERT DIRECTORY LOCK

Field Name: QW0021KD

OBID

The object ID. This field is not applicable if the value in LOCK RES TYPE is:

- SKELETON CURSOR TABLE LOCKING
- UTILITY SERIALIZATION LOCK
- SKELETON PACKAGE TABLE LOCK
- COLLECTION
- BINDLOCK
- ALTER BUFFER POOL
- GROUP BUFFERPOOL START/STOP LOCK
- DDF CDB P-LOCK
- GROUP BUFFER POOL LEV CASTOUT P-LOCK
- DBD P-LOCK
- CATMAINT MIGRATION LOCK
- CATMAINT CONVERT CATALOG LOCK
- CATMAINT CONVERT DIRECTORY LOCK

Field Name: QW0021KP

RESOURCE ID

The hexadecimal identifier of the small resource. If LOCK RES TYPE is:

**DATA PAGE LOCKING**
First 3 bytes are the page number

**PARTITION LOCKING**
Last byte is the partition number

**INDEX PAGE LOCKING**
First 3 bytes are the page number

**HASH ANCHOR LOCK**
First 3 bytes are the page number and the last byte is the anchor point ID
IFCID 021 - Lock Detail

**CS-READ DRAIN**
Last byte is the partition number (optional)

**RR-READ DRAIN**
Last byte is the partition number (optional)

**WRITE DRAIN**
Last byte is the partition number (optional)

**ROW LOCK**
First 3 bytes are the page number and the last byte is the row ID of the record

**INDEX END OF FILE LOCK**
Last byte is the partition number (optional)

**PAGESET/PARTITION P-LOCK**
First byte is the 1-based partition number (optional)

**PAGE P-LOCK**
First byte is the 1-based partition number (optional) and the last 3 bytes are the relative page number

**PAGESET/PARTITION LEVEL CASTOUT P-LOCK**
First byte is the 1-based partition number (optional)

**Note:**
- In large partitioned table spaces, the page number covers 4 bytes instead of 3.
- If table spaces use relative page numbers, the resource ID covers 7 bytes. It contains the partition number in the first 2 bytes, the page number in the next 4 bytes, and the record ID in the seventh byte.

For all other lock resource types, the resource ID is not applicable.

**Field Name:** QW0021KR

**NAME**
The plan name or collection name. This field is only printed if the value in LOCK RES TYPE is SKELETON CURSOR TABLE LOCKING or COLLECTION.

Deduced from the DB2 field QW0021KD, QW0021KP, and QW0021KR when the locked resource type is skeleton cursor table locking.

**Field Name:** RT21NAME

**COLL**
The collection identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCK.

The package identifier. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCK.

The consistency token. This field is only printed if the value in LOCK RES TYPE is SKELETON PACKAGE TABLE LOCK.

**Field Name:** QW0021RN

**BPID**
The buffer pool ID. This field is only printed if the value in LOCK RES TYPE is:
ALTER BUFFER POOL
GROUP BUFFERPOOL START/STOP LOCK
PAGESET/PARTITION P-LOCK
PAGE P-LOCK
GROUP BUFFERPOOL LEV CASTOUT P-LOCK
PAGESET/PARTITION LEV CASTOUT P-LOCK

For ALTER BUFFER POOL, deduced from QW0021KD || QW0021KP.
For GROUP BUFFERPOOL START/STOP LOCK, deduced from QW0021KD || QW0021KP.
For PAGESET/PARTITION P-LOCK, deduced from QW0021P1.
For PAGE P-LOCK, deduced from QW0021P1.
For GROUP BUFFERPOOL LEV CASTOUT P-LOCK deduced from QW0021P1.
For PAGESET/PARTITION LEV CASTOUT P-LOCK, deduced from QW0021P1.

Field Name: RT21BPID

IRLM FUNC CODE
The IRLM function code.

Field Name: QW0021FC

RETURN TOKEN
The IRLM returned token.

Field Name: QW0021FT

REQUEST TOKEN
The lock request token. If the value in IRLM FUNC CODE is LOCK, this field shows "BLANK". If the value in IRLM FUNC CODE is UNLOCK or CHANGE, this field contains a 0 or a non-zero value. A 0 indicates that the lock name is used to identify the object that is to be unlocked or changed. A non-zero value is the same as the value in RETURN TOKEN. It associates the unlock or change request with the locked object.

Field Name: QW0021RT

LOCK STATE
The lock state.

Field Name: QW0021ST

DB2 TOKEN
The DB2 token which identifies the subsystem.

Field Name: QW0021TK

IRLM RETURN CODE
The return code from IRLM:
0: The request completed successfully.
4: The request completed successfully, but the lock state remained unchanged.
8: The request completed unsuccessfully because of a system error or condition.
12 The request completed unsuccessfully because of a logic error in the request.
16 The request completed unsuccessfully because of an invalid request specification.
20 The request completed unsuccessfully because IRLM resources are not available.

Field Name: QW0021RC

LOCK ATTRIBUTES
This field shows various lock attributes.
Field Name: QW0021FL

PROP TO XES
Indicates whether the request was propagated to XES by IRLM.
Field Name: QW0021Y1

ASYN TO XES
Indicates whether IRLM sent the request to XES asynchronously.
Field Name: QW0021Y2

LOCK DURATION
The lock duration:

MANUAL Varies depending on the ISOLATION parameter (QW0021DR= x'20')

MANUAL+1 Temporary change of consistency level from CS to RR during bind and DDL (QW0021DR= x'21')

COMMIT Until commit (QW0021DR=x '40')
COMMIT+1 Past commit; applies to locks needed to maintain the position for a cursor opened WITH HOLD (QW0021DR=x '41')

ALLOCATION Until deallocation (QW0021DR=x '60')

PLAN For the duration of the plan (QW0021DR=x '80')

UTIL For the duration of the utility execution (QW0021DR=x '81')

INTEREST Duration used for P-locks (QW0021DR=x 'FE')

FREE ALL Until all locks are freed (QW0021DR=x 'FF')

N/A Not applicable for NOTIFY SUSPEND

Field Name: QW0021DR

REQUEST TYPE
Indicates whether it was a P-lock or L-lock request.
Field Name: QW0021Z1

IRLM RETURN SUBCODE
The IRLM return subcode.

Field Name: QW0021SC

PARENT TOKEN

The parent lock token for explicit hierarchical locking. This token is only significant when DB2 is a member of a data sharing group. If the value in this field is not 0, then this request is for a child of a parent that has already been locked. This value must match the RETURN TOKEN field of the previously locked parent. This field is only applicable if the value in IRLM FUNC CODE is LOCK.

Field Name: QW0021PT

GLOBAL/LOCAL

Indicates whether this is a global or local lock.

Field Name: QW0021GF

OWNER

The DB2 member name of either of the following:

- The owner of an incompatible retained lock on this resource that caused this request to be denied
- The owner of an incompatible held lock on this resource that caused this request to timeout

Field Name: QW0021SN

CACHED STATE

The cached state of the P-lock. This field is only applicable if the value in REQUEST TYPE is P-LOCK, and the value in LOCK RES TYPE is PAGESET/PARTITION P-LOCK.

Field Name: QW0021CS

LOCK HASH VALUE

The hash value of the locked resource.

Field Name: QW0021LH

IFCID 022 - Minibind:

This topic shows detailed information about “Record Trace - IFCID 022 - Minibind”.

Minibind record shows information about mini plans, which are generated by the optimizer at bind and SQL prepare time. One mini plan is generated for each table and for each subselect block in the query. This means that if your query uses subqueries, more than one mini plan record is written.

Note:

- When interpreting this record, relate table and mini plans by table name.
- The order of the mini plans might not be the same as the order of the table as written in the SQL statement.
- When you are not sure about the accessing order of the tables, use EXPLAIN to get the query block number and plan number.
- This IFCID shows whether sequential prefetch is used.
IFCID 022 - Minibind

- This mini plan block is written for each query and repeated for each subsequent subquery.
- If the query or subquery uses index scan (INDEX_NUMBER > 0), information is provided for each index used.

Record trace - IFCID 022 - Minibind

The field labels shown in the following sample layout of “Record Trace - IFCID 022 - Minibind” are described in the following section.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>The number identifying the statement to be prepared.</td>
</tr>
<tr>
<td>PLANNAME</td>
<td>The plan name or package ID.</td>
</tr>
<tr>
<td>COST</td>
<td>The relative cost of the SQL statement. It might not relate to the actual CPU or elapsed time for the query.</td>
</tr>
<tr>
<td>PARALLELISM_DISABLED</td>
<td>Indicates whether query parallelism is disabled by the resource limit facility (RLF) for dynamic queries:</td>
</tr>
<tr>
<td>I/O ONLY</td>
<td>Query I/O parallelism is disabled. (QW0022RP=x '01')</td>
</tr>
<tr>
<td>CP ONLY</td>
<td>Query CP parallelism is disabled. (QW0022RP=x '02')</td>
</tr>
<tr>
<td>CP + I/O</td>
<td>Query I/O and CP parallelism is disabled. (QW0022RP=x '03')</td>
</tr>
</tbody>
</table>

Field Name: QW0022QN

The plan name or package ID.

Field Name: QW0022PN

The number identifying the statement to be prepared.

Field Name: QW0022OS

Indicates whether query parallelism is disabled by the resource limit facility (RLF) for dynamic queries:

<table>
<thead>
<tr>
<th>No Value (QW0022RP=x '00')</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I/O Only</td>
<td>Query I/O parallelism is disabled. (QW0022RP=x '01')</td>
</tr>
<tr>
<td>CP Only</td>
<td>Query CP parallelism is disabled. (QW0022RP=x '02')</td>
</tr>
<tr>
<td>CP + I/O</td>
<td>Query I/O and CP parallelism is disabled. (QW0022RP=x '03')</td>
</tr>
</tbody>
</table>
Sysplex query parallelism is disabled. (QW0022RP=x '04')

Sysplex query and query I/O parallelism is disabled. (QW0022RP=x '05')

Sysplex query and query CP parallelism is disabled. (QW0022RP=x '06')

The entire query parallelism (I/O, CP, and sysplex) is disabled. (QW0022RP=x '07')

Query parallelism does not apply to this statement. (QW0022RP=x 'FF')

Field Name: QW0022RP

QBLOCNO
The position of the query in the statement.
Field Name: QW0022QB

COLLID
The collection ID of the package.
Field Name: QW0022CI

PROGNAME
The name of the package containing the statement to be prepared.
Field Name: QW0022PG

CONSISTENCY_TOKEN
The consistency token.
Field Name: QW0022CT

APPLNAME
The name of the application plan.
Field Name: QW0022AL

WHEN_OPTIMIZE
Indicates when the access path of the SQL statement is optimized:

DEFAULT
The access path is determined at bind time using default values.

BIND
The access path is determined at bind time using default values, but it is reoptimized at runtime using values of input variables.

RUN
The access path is determined at runtime using values of input variables.

REOPT
The access path is reoptimized at runtime because the value of the host variable or parameter marker changes.

Field Name: QW0022RX

OPT_HINT_IDENT
Access path hint value.
Field Name: QW0022QO
IFCID 022 - Minibind

OPTIMIZE_HINTS_USED
Indicates whether the query used access path hints.
Field Name: QW0022HT

UNITS
Estimated processor cost in service units for the SQL statement.
Field Name: QW0022AS

MILLI_SEC
Estimated processor cost in milliseconds for the SQL statement.
Field Name: QW0022CE

COSTCATEGORY
The cost category for the statement can be one of the following:
A This SQL statement is a category A statement.
B This SQL statement is a category B statement.
'BLANK' Indicates that there is no processor cost estimate for this trace record.
Field Name: QW0022CC

PARENT_Q_BLOCKNO
Parent query block number.
Field Name: QW0022PQ

MEMBER
The member name of the DB2 that executed EXPLAIN. The column is blank if the DB2 subsystem was not in a data sharing environment when EXPLAIN was executed.
Field Name: QW0022GM

STATEMENT_TYPE
For each query block, the type of operation performed. For the outermost query, the statement type. Possible values:

SELECT
   SELECT

INSERT
   INSERT

UPDATE
   UPDATE

DELETE
   DELETE

SELUPD
   SELECT for UPDATE

DELCUR
   DELETE current of cursor
UPDCUR
  UPDATE current of cursor
CORSUB
  Correlated subquery
NCOSUB
  Noncorrelated subquery
Field Name: QW0022QT

TIMESTAMP
  The timestamp at which the row is processed.
Field Name: QW0022TS

BIND_TIME
  The date and time at which the plan or package to which this statement belongs was bound.
Field Name: QW0022BT

VERSION
  The version ID of the package.
Field Name: QW0022VN

PREDICATE #
  If the REASON field has a value of REOPT, the predicate number that triggers the REOPT decision is shown.
Field Name: QW0022PD

REASON
  Reason code for cost category B. This value is blank if the cost category is not B. Possible values are:

HOST VARIABLES
  If there are host variables, parameter markers, or special registers in range or between predicates.

TABLE CARDINALITY
  If the table cardinality is missing for one or more tables.

TRIGGERS
  If there are insert, update, or delete triggers defined on the target table.

UDF
  If there are user-defined functions referenced in the SQL statement.

REFERENTIAL CONSTRAINTS
  If a table that is the target of a delete has referential constraints defined on it.

HAVING CLAUSE
  If a having clause causes an SQL statement to be assigned to cost category B.
Field Name: QW0022RS

PLANNO
  The plan number of the step in which the query is processed.
Field Name: QW0022PL

**METHOD or NEXTSTEP**

The join method used for the step.

**Note:** NEXTSTEP is shown if this field has one of the following values 0, 4, 8, 12, 1, 5, 9, 13, 2, 6, 10, 14, 3, 7, 11, or 15. Otherwise, METHOD is displayed.

Field Name: QW0022OD

**SORTN_UNIQ**

Indicates whether the new table is sorted to remove duplicate rows.

Field Name: QW0022UN

**SORTC_UNIQ**

Indicates whether the composite table is sorted to remove duplicate rows.

Field Name: QW0022N

**DATABASE**

The database ID.

Field Name: QW0022DD

**SORTN_JOIN**

Indicates whether the new table is sorted for a merge scan join or hybrid join. For a hybrid join, this is a sort of the RID list.

Field Name: QW0022IN

**SORTC_JOIN**

Indicates whether the composite table is sorted for a nested loop join, merge scan join, or hybrid join.

Field Name: QW0022J

**OBJECT**

The internal ID of the table in hexadecimal (2 bytes). Use this value to match column “OBID” in SYSIBM.SYSTABLES to find the name of the table. For example, X'2A' is 42, which is table SYSDATABASE.

Field Name: QW0022OB

**ACCESSTYPE**

The method of accessing the new table. N/P is printed if there is no access type.

Field Name: QW0022YP

**SORTN_ORDERBY**

Indicates whether the new table is sorted for ORDER BY.

Field Name: QW0022DB

**SORTC_ORDERBY**

Indicates whether the composite table is sorted for ORDER BY.

Field Name: QW0022O
CREATOR

The creator of the new table accessed in this step.

Field Name: QW0022CR

PAGE_RANGE

Whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. Y = Yes; N = No.

Field Name: QW0022PR

SORTN_GROUPBY

Indicates whether the new table is sorted for GROUP BY.

Field Name: QW0022PB

SORTC_GROUPBY

Indicates whether the composite table is sorted for GROUP BY.

Field Name: QW0022G

TNAME

The name of the table accessed in this step, without qualifier. This field is blank if a view is used instead of a real table.

Field Name: QW0022TN

JOIN_TYPE

The type of join:

F    FULL OUTER JOIN
L    LEFT OUTER JOIN
S    STAR JOIN
blank INNER JOIN or no join

RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.

Field Name: QW0022JT

SORTN_PGROUP_ID

The parallel group identifier for the parallel sort of the new table.

Field Name: QW0022P6

SORTC_PGROUP_ID

The parallel group identifier for the parallel sort of the composite table.

Field Name: QW0022P7

CORRELATION_NAME

The correlation name of a table or view that is specified in the statement. If there is no correlation name, then the column is blank.

Field Name: QW0022CN

MERGE_JOIN_COLS

The number of columns that are joined during a merge scan join (Method=2).
**IFCID 022 - Minibind**

**Field Name:** QW0022JC

**ACCESS_DEGREE**
The number of parallel tasks or operations activated by a query.

**Field Name:** QW0022P1

**JOIN_DEGREE**
The number of parallel tasks or operations used in joining the composite table with the new table.

**Field Name:** QW0022P3

**TSLOCKMODE**
Indicates the lock mode to be acquired on the new table or its table space.
If the isolation can be determined at bind time, possible values are:

- **IS** Intent share lock
- **IX** Intent exclusive lock
- **S** Share lock
- **U** Update lock
- **X** Exclusive lock
- **SIX** Share with intent exclusive lock
- **N** UR isolation, no lock

If the isolation cannot be determined at bind time, the lock mode determined by the isolation at run time is shown by the following values:

- **NS** For UR isolation: no lock. For CS or RR isolation: an S lock.
- **NIS** For UR isolation: no lock. For CS or RR isolation: an IS lock.
- **NSS** For UR isolation: no lock. For CS isolation: an IS lock. For RR isolation: an S lock.
- **SS** For UR or CS isolation: no lock. For RR isolation: an S lock.

The data in this column is right-justified.

**Field Name:** QW0022LM

**PARALLELISM_MODE**
The kind of parallelism, if any, that is used at bind time:

- **I** Query I/O parallelism
- **C** Query CP parallelism
- **X** Sysplex query parallelism

**Field Name:** QW0022PM

**ACCESS_PGROUP_ID**
The ID of the parallel group for accessing the new table.

**Field Name:** QW0022P2

**JOIN_PGROUP_ID**
The ID of the parallel group for joining the composite table with the new table.
Field Name: QW0022P4

AGGREGATE_FUNCT

Indicates when an SQL column function is evaluated. Possible values are:

R  Column function is evaluated during data retrieval.
S  Column function is evaluated during SORT.

Field Name: QW0022Z

INDEX_NUMBER

Number of index access operations.

Field Name: QW0022MN

PREFETCH

The number of PREFETCH requests.

Field Name: QW0022EF

DIRECT_ROW_ACC

Indicates whether DB2 can use direct row access to a table row without a table space or index scan:

YES  Direct row access was used
NO   Direct row access was not used

Field Name: QW0022PA

PAGES_FOR_TABLE

The number of pages for the table. A value of "-1" indicates that statistics are not available.

Field Name: QW0022NP

TAB_CARDINALITY

Table cardinality in floating point.

Field Name: QW0022CY

STARJOIN

Indicates whether star join was used, possible values are:

YES  Star join was used
NO   Star join was not used

Field Name: QW0022SJ

TABLE_TYPE

The table type can be:

T  Table
F  Table function
W  Workfile
Q  Table queue (not materialized)

Field Name: QW0022TT

INDEXONLY
Indicates what kind of prefetch of the data is used:

- **SEQ**  Sequential prefetch
- **LIST**  List prefetch
- **NO**  No prefetch

**Field Name:** QW0022XO

**MATCHCOLS**

The number of index keys used in an index scan. This field is 0 if either no index is used or an index is used that has no matching columns.

**Field Name:** QW0022XM

**MIXOPSEQ**

The sequence number of a step in a multiple index operation.

**Field Name:** QW0022MS

**PREFETCH_INDEX**

Indicates whether data pages are to be read in advance by a prefetch.

**Field Name:** QW0022XF

**OPERATION**

The type of index access operation.

**Field Name:** QW0022MO

**ACCESS_NAME**

The index name. This field applies only to index scans. N/A is printed for table space scans or when no index is used.

**Field Name:** QW0022XC

**ACCESS_CREATOR**

The index creator.

**Field Name:** QW0022XN

**IFCID 023 - Utility Start:**

This topic shows detailed information about “Record Trace - IFCID 023 - Utility Start”.

**Record trace - IFCID 023 - Utility Start**

The field labels shown in the following sample layout of “Record Trace - IFCID 023 - Utility Start” are described in the following section.
DBID
The database ID. Deduced from the DB2 fields QW0023DB, QW0105DN or QW0107DN.
When present, the database name is shown, otherwise the decimal identifier from QW0023DB is shown, or N/A when this value is 0.
Field Name: RT0023DB

UTILITY NAME
The utility name.
Field Name: QW0023NM

OBID
The object ID. Deduced from the DB2 fields QW0023PD, QW0105TN or QW0107TN.
When present, the name of the object is shown, otherwise the decimal identifier from QW0023OB is shown, or N/A when this value is 0.
Field Name: RT0023OB

UTILITY PHASE
The phase name of the utility.
Field Name: QW0023PH

RQSTASK
The number of requested subtasks.
Field Name: QW0023R1

UTILITY ID
The identifier of the utility.
Field Name: QW0023ID

DBNAME
The database name.
Field Name: QW0023DB

OBJECT NAME
The object name.
Field Name: QW0023PD

REORG KEEPDICTIONARY
The reorg utility is specified with the KEEPDICTIONARY keyword.
Field Name: QW0023D1

LOAD KEEPDICTIONARY
The load utility is specified with the KEEPDICTIONARY keyword.
Field Name: QW0023B1

COPY CONCURRENT
The copy utility is specified with the CONCURRENT keyword.
Field Name: QW0023A1
The rebuild utility is specified with the REUSE keyword.
Field Name: QW0023F1

The reorg utility is specified with the REUSE keyword.
Field Name: QW0023D2

The load utility is specified with the REUSE keyword.
Field Name: QW0023B2

The copy utility is specified with the SHRLEVEL(CHANGE) keyword.
Field Name: QW0023A2

The rebuild utility is specified with the SORTKEYS keyword.
Field Name: QW0023F2

The reorg utility is specified with the LOG(NO) keyword.
Field Name: QW0023D3

The load utility is specified with the LOG(NO) keyword.
Field Name: QW0023B3

The copy utility is specified with the PARALLEL keyword.
Field Name: QW0023A3

The rebuild utility is specified with the STATISTICS keyword.
Field Name: QW0023F3

The reorg utility is specified with the SORTKEYS keyword.
Field Name: QW0023D4

The load utility is specified with the SORTKEYS keyword.
Field Name: QW0023B4

The copy utility is specified with the CHECKPAGE keyword.
Field Name: QW0023A4

IFCID 023 - Utility Start
The rebuild utility is specified with the WORKDDN keyword.

**Field Name:** QW0023F4

**REORG SORDDATA**

The reorg utility is specified with the SORDDATA keyword.

**Field Name:** QW0023D5

**LOAD SHRLEVEL CHANGE**

The load utility is specified with the SHRLEVEL(CHANGE) keyword.

**Field Name:** QW0023B5

**REORG NOSYSREC**

The reorg utility is specified with the NOSYSREC keyword.

**Field Name:** QW0023D6

**LOAD COPYDDN**

The load utility is specified with the COPYDDN keyword.

**Field Name:** QW0023B6

**RECOVER REUSE**

The recover utility is specified with the REUSE keyword.

**Field Name:** QW0023A7

**RUNSTATS SAMPLE**

The runstats utility is specified with the SAMPLE keyword.

**Field Name:** QW0023G1

**REORG SHRLEVEL CHANGE**

The reorg utility is specified with the SHRLEVEL(CHANGE) keyword.

**Field Name:** QW0023D7

**LOAD STATISTICS**

The load utility is specified with the STATISTICS keyword.

**Field Name:** QW0023B7

**RECOVER PARALLEL**

The recover utility is specified with the PARALLEL keyword.

**Field Name:** QW0023A8

**RUNSTATS SHRLEVEL CHANGE**

The runstats utility is specified with the SHRLEVEL(CHANGE) keyword.

**Field Name:** QW0023G2

**REORG SHRLEVEL REFERENCE**

The reorg utility is specified with the SHRLEVEL(REFERENCE) keyword.

**Field Name:** QW0023D8

**LOAD PART INDDN**

The load utility is specified with the PART(INDDN) keyword.
FIELD NAME: QW0023B8

REORG COPYDDN

The reorg utility is specified with the COPYDDN keyword.

FIELD NAME: QW0023E1

UNLOAD SHRLEVEL REFERENCE

The unload utility is specified with the SHRLEVEL(REFERENCE) keyword.

FIELD NAME: QW0023H1

REORG STATISTICS

The reorg utility is specified with the STATISTICS keyword.

FIELD NAME: QW0023E2

UNLOAD SHRLEVEL CHANGE ISOLATION CS

The unload utility is specified with the SHRLEVEL(CHANGE ISOLATION CS) keyword.

FIELD NAME: QW0023H2

REORG FASTSWITCH

The reorg utility is specified with the FASTSWITCH keyword.

FIELD NAME: QW0023E3

UNLOAD SHRLEVEL CHANGE ISOLATION UR

The unload utility is specified with the SHRLEVEL(CHANGE ISOLATION UR) keyword.

FIELD NAME: QW0023H3

IFCID 023 - Utility Start

FIELD NAME: RT0024DB

UTILITY NAME

The utility name.

FIELD NAME: QW0024NM

IFCID 024 - Utility Change:

This topic shows detailed information about “Record Trace - IFCID 024 - Utility Change”.

Record trace - IFCID 024 - Utility Change

The field labels shown in the following sample layout of “Record Trace - IFCID 024 - Utility Change” are described in the following section.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBID</td>
<td>The database ID. Deduced from the DB2 fields QW0024DB, QW0105DN or QW0107DN. When present, the database name is shown, otherwise the decimal identifier from QW0024DB is shown, or N/A when this value is 0.</td>
</tr>
<tr>
<td>UTILITY NAME</td>
<td>The utility name.</td>
</tr>
</tbody>
</table>

FIELD NAME: RT0024DB

UTILITY NAME

The utility name.

FIELD NAME: QW0024NM
OBID
The object ID. Deduced from the DB2 fields QW0023PD, QW0105TN or QW0107TN.
When present, the name of the object is shown, otherwise the decimal identifier from QW0024OB is shown, or N/A when this value is 0.

Field Name: RT0024OB

UTILITY PHASE
The phase name of the utility.
Field Name: QW0024PH

ITEMS
The number of items processed by the utility.
Field Name: QW0024DN

UTILITY ID
The identifier of the utility.
Field Name: QW0024ID

DBNAME
The database name.
Field Name: QW0024NA

OBJECT NAME
The table space name or index name.
Field Name: QW0024PN

PART/DATASET#
The number of the partition or data set if the utility is operating on one partition or data set. Otherwise, the value in this field is 0.
Field Name: QW0024PT

IFCID 025 - Utility End:
This topic shows detailed information about “Record Trace - IFCID 025 - Utility End”.

Record trace - IFCID 025 - Utility End
The field labels shown in the following sample layout of “Record Trace - IFCID 025 - Utility End” are described in the following section.
The database ID. Deduced from the DB2 fields QW0025DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0025DB is shown, or N/A when this value is 0.

Field Name: RT0025DB

UTILITY NAME

The utility name.

Field Name: QW0025NM

OBID

The object ID. Deduced from the DB2 fields QW0025PD, QW0105TN or QW0107TN.

When present, the name of the object is shown, otherwise the decimal identifier from QW0025OB is shown, or N/A when this value is 0.

Field Name: RT0025OB

UTILITY PHASE

The phase name of the utility.

Field Name: QW0025PH

ITEMS

The phase name of the utility.

Field Name: QW0025DN

UTILITY ID

The identifier of the utility.

Field Name: QW0025ID

JOBNAME

The job name of the utility.

Field Name: QW0025JN

STEPNAME

The step name of the utility job.

Field Name: QW0025JS

ELAPSED TIME

The utility elapsed time at termination. This field and the following time fields are in time-of-day format. If this field contains binary zeroes, no data is available for this field or for the following time fields. For example, this is the case for subphase termination records.

Field Name: QW0025UE

SUBTASKS

The final subtask count.

Field Name: QW0025R1

DFSORT

DFSORT was invoked at least once. Possible values are Y or N.
Field Name: QW0025DF

DB2SORT
DB2 SORT was invoked at least once. Possible values are Y or N.
Field Name: QW0025DS

DATA SORTS
The number of parallel data sorts.
Field Name: QW0025DA

INDEX SORTS
The number of parallel index sorts.
Field Name: QW0025IX

OTHER SORTS
The number of other sorts.
Field Name: QW0025OS

SHRLEVEL
The SHRLEVEL value of the utility. Possible values are: NONE, REFERENCE, CHANGE, or N/A.
Field Name: QW0025SL

CPU TIME
The CPU time of the utility.
Field Name: QW0025UC

ZIIP TIME
The total utility ZIIP time (if Accounting class 1 trace is activated).
Field Name: QW0025UZ

SORT CPU
The Sort CPU time.
Field Name: QW0025SC

SORT ZIIP
The Sort ZIIP time (if provided by the Sort program).
Field Name: QW0025SZ

IFCID 026 - IBM Service Record:
This topic shows detailed information about “Record Trace - IFCID 026 - IBM Service Record”.

This record is for IBM service use.

IFCID 027 - Sort Workfile Records:
This topic shows detailed information about “Record Trace - IFCID 027 - Sort Workfile Records”.

Chapter 6. Batch reporting 3745
IFCID 027 - Sort Workfile Records

The field labels shown in the following sample layout of “Record Trace - IFCID 027 - Sort Workfile Records” are described in the following section.

RECORDS IN NEW WORKFILE

The number of records in the new work file.

Field Name: QW0027NR

SPARSE INDEX SPACE USED (KB)

The size of the in-memory work file in kilobytes (KB).

Field Name: QW0027OZ

ESTIMATED SIZE ALL IN-MEM (KB)

The APS estimated size of all sparse indexes in a query if they are all in the in-memory part (in KB).

Field Name: QW0027TZ

ESTIMATED RECORDS IN SP INDEX

The APS estimated number of records in the current sparse index.

Field Name: QW0027IR

SKIP FACTOR

The skip factor if sparse index records are found in the work file. It shows a value of 1 if found in the in-memory part.

Field Name: QW0027SF

RECORDS IN IN-MEMORY PART

The number of records in the in-memory part of the sparse index.

Field Name: QW0027IE

RECORDS IN WORKFILE PART

The number of records in the work-file part of the sparse index.

Field Name: QW0027WE

DATA AREA SIZE (BYTES)

The data area size for a sparse index (in bytes).

Field Name: QW0027DS

KEY SIZE SP IDX (BYTES)

The key size for a sparse index (in bytes).

Field Name: QW0027KS

TOTAL NR OF IDX IN QUERY

The total number of indexes in the query.
The total number of sparse indexes in the query.

**Field Name:** QW0027TS

**CURRENT IDX IN PROCESS**

The current sparse index that is processed.

**Field Name:** QW0027SC

**TYPE OF RECORD**

The type of record. Possible values are:

- **B** Indicates that a sparse index combination of hash and work file is used (both in-memory and physical work file).
- **H** Indicates a sparse index hash is used (in-memory work file only).
- **O** Indicates that a sparse index binary is used (in-memory work file only).
- **S** Indicates that no sparse index is used because of storage constraints.
- **T** Indicates that a sparse index work-file is used.
- **W** Indicates that no sparse index is used.

**Field Name:** QW0027SP

**IFCID 028 - Sort Phase Detail:**

This topic shows detailed information about “Record Trace - IFCID 028 - Sort Phase Detail”.

**Record trace - IFCID 028 - Sort Phase Detail**

The field labels shown in the following sample layout of “Record Trace - IFCID 028 - Sort Phase Detail” are described in the following section.

| OMPEUSER 'BLANK' | RRS | KOPLAN 'BLANK' | N/P | 15:15:38.81346278 | 991294 | 28 SORT PHASE DETAIL | NETWORKID: DEIBMIPS | LUNAME: IPSAQB11 | LUSEQ: 5 | IWORK | 0 WORKFILES REQ | 0 TYPE I | PASS | 0 WORKFILES ACQ | 0 | PARALLELISM DEGREE | 0 | WORKFILE RECORDS | 0 | MULTIPLE DISTINCT SORTS | 0 | CURRENT MULTIPLE DISTINCT SORT | 0 |

**IWORK**

The number of work files created during the sort input phase. If the rows to be sorted are already in order, there is one work file. The number of work files needed depends on the distribution of the sort key. The maximum number of work files is limited by the buffer pool size. This field is valid if TYPE equals I.

**Field Name:** QW0028NP

**WORKFILES REQ**

The number of work files requested from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals S.

If this field is greater than WORKFILES ACQ, there is another merge pass. If both fields are equal, this is the last or only merge pass.
Field Name: QW0028WA

**TYPE**

The type of IFCID 28. It indicates the phase when the IFCID 28 record is issued. Valid values are:

- **I**  The end of the input phase
- **S**  The start of a merge pass
- **E**  The end of a merge pass
- **Z**  The start of output work file partitioning
- **W**  During the output work file partitioning
- **X**  The end of output work file partitioning
- **K**  The start of last merge pass partitioning
- **M**  During last merge pass partitioning
- **L**  The end of last merge pass partitioning
- **T**  The start of one record partitioning
- **O**  During one record partitioning
- **U**  The end of one record partitioning
- **V**  The start of presorted records partitioning
- **P**  During presorted records partitioning
- **Y**  The end of presorted records partitioning

Field Name: QW0028TY

**PASS**

The current merge pass. It is issued at the end of the merge pass and, therefore, valid if TYPE equals **E**.

Field Name: QW0028MP

**WORKFILES ACQ**

The number of work files actually acquired from the buffer manager at the beginning of each merge pass (MVS/ESA 3.1.3). It is valid if TYPE equals **S**.

Field Name: QW0028WG

**PARALLELISM DEGREE**

The partition work file number. The value in this field is 0 if partitioning is not requested. If partitioning is requested, the value can be from 1 to \( n \), where \( n \) is the degree of parallelism. It is valid if TYPE equals **Z**, **W**, **X**, **K**, **M**, **L**, **T**, **O**, **U**, **V**, **P**, or **Y**.

Field Name: QW0028PW

**WORKFILE RECORDS**

The number of records in the partition work file. It is valid if TYPE equals **Z**, **W**, **X**, **K**, **M**, **L**, **T**, **O**, **U**, **V**, **P**, or **Y**.

Field Name: QW0028PN

**RECS SORTED AFT INS PHASE**
The number of records sorted into work files after the sort input phase.

Field Name: QW0028NR

MULTIPLE DISTINCT SortS

Total number of multiple distinct sorts.

Field Name: QW0028DS

MULTIPLE DISTINCT READ

The number of records read into a group at the start of the GROUPBY phase for a multiple distinct sort.

Field Name: QW0028DR

MULTIPLE DISTINCT GROUPS

The total number of multiple distinct sort groups.

Field Name: QW0028DG

CURRENT MULTIPLE DISTINCT SORT

The multiple distinct sort currently being processed.

Field Name: QW0028DC

IFCID 029 - EDM Request Start:

This topic shows detailed information about “Record Trace - IFCID 029 - EDM Request Start”.

Record Trace - IFCID 029 - EDM Request Start

The field labels shown in the following sample layout of “Record Trace - IFCID 029 - EDM Request Start” are described in the following section.

EDMID

The type of request:
IFCID 029 - EDM Request Start

**DB**  Database descriptor

**DY**  SYSDYNQRY table

**CT**  Cursor table

**PT**  Package table

Field Name: QW0029ID

**DBID**

The database ID. Deduced from the DB2 fields QW0029DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0029DB is shown, or N/A when this value is 0.

Field Name: RT0029DB

**DB LGTH**

The length of the section associated with this DBD.

Field Name: QW0029DL

**PLAN**

The plan name for the CT or XT request.

Field Name: QW0029PL

**RDS**

The RDS identifier number. Special cases are:

- `x'00000001'`
  - SKCT header
- `x'FFFFFFFE'`
  - SKCT directory

Field Name: QW0029KN

**SEQNO**

The sequence number within the RDS number. This is QW0029SN for CT or QW0029GN for PT.

Field Name: RT0029SN

**CT LGTH**

The length of the CT or XT sections in bytes.

Field Name: QW0029CL

**LOCATION**

The name of the package location. This field shows 'BLANK' if the local location name is not defined.

Field Name: QW0029LN

**COLLECTN**

The collection identifier of the package.

Field Name: QW0029CI

**PCKG ID**
The package identifier.
Field Name: QW0029PI

CONSISTENCY TOKEN
The consistency token of the package.
Field Name: QW0029CT

PT LGTH
The length of the PT section in bytes.
Field Name: QW0029GL

SCHEMA NAME
The name of the schema.
Field Name: QW0029SC

HASH ID
The hash ID.
Field Name: QW0029QH

COPY ID
The Copy ID.
Field Name: QW0029CP

DPS QUERY ID
The identifier of the stabilized dynamic query.
Field Name: QW0029QD

RELEASE BOUND
The release bound.
Field Name: QW0029RB

IFCID 030 - EDM Request End:
This topic shows detailed information about “Record Trace - IFCID 030 - EDM Request End”.

Record trace - IFCID 030 - EDM Request End
The field labels shown in the following sample layout of “Record Trace - IFCID 030 - EDM Request End” are described in the following section.

IFCID 029 - EDM Request Start
<table>
<thead>

The type of request:

- **DB** Database descriptor
- **DY** SYSDYNQRY table
- **CT** Cursor table
- **PT** Package table

The database ID. Deduced from the DB2 fields QW0030DB, QW0105DN, or QW0107DN. When present, the database name is shown, otherwise the decimal identifier from QW0030DB is shown, or N/A when this value is 0.

The number of calls to the data manager for the DBD.

The plan name for the CT or XT request.

The RDS identifier number for CT. Special cases are:

- **x'00000001'** SKCT header
- **x'FFFFFFFE'** SKCT directory

The RDS identifier number for PT. Special cases are:

- **x'00000001'** SKCT header
- **x'FFFFFFFE'** SKCT directory
Field Name: QW0030KN

SEQNO
The sequence number within the RDS number. This is QW0030SN for CT or QW0030GN for PT.

Field Name: RT0030SN

CT CALLS
The number of calls to the data manager for CT.

Field Name: QW0030CC

LOCATION
The name of the package location. This field shows "BLANK" if the local location name is not defined.

Field Name: QW0030LN

COLLCTN
The collection identifier of the package.

Field Name: QW0030CI

PCKG ID
The package identifier.

Field Name: QW0030PI

CONSISTENCY TOKEN
The consistency token of the package.

Field Name: QW0030CT

PT CALLS
The number of calls to the data manager for PT.

Field Name: QW0030GC

SCHEMA NAME
The name of the schema.

Field Name: QW0030SC

HASH ID
The hash ID.

Field Name: QW0030QH

COPY ID
The Copy ID.

Field Name: QW0030CP

DPS QUERY ID
The identifier of the stabilized dynamic query.

Field Name: QW0030QD

RELEASE BOUND
The release bound.
Field Name: QW0030RB

RECORDS READ

The number of records read.

Field Name: QW0030QC

EDMID

The type of request:

DB   Database
CT   Cursor
XT   DBD extension
PT  Package table

Field Name: QW0031ID

DBID

The database ID. Deduced from the DB2 fields QW0031DB, QW0105DN or QW0107DN.

When present, the database name is shown, otherwise the decimal identifier from QW0031DB is shown, or N/A when this value is 0.

Field Name: RT0031DB

DB LGTH

The length of the section associated with this DBD.

Field Name: QW0031DL

PLAN

The plan name for the CT or XT request.

Field Name: QW0031PL

RDS

The RDS identifier number for CT. Special cases are:

x'00000001'
    SKCT header

x'FFFFFFFE'
    SKCT directory

Field Name: QW0031RN

RDS

The RDS identifier number for PT. Special cases are:

x'00000001'
    SKCT header

x'FFFFFFFE'
    SKCT directory

Field Name: QW0031KN

SEQNO

The sequence number within the RDS number. This is QW0031SN for CT or QW0031GN for PT.

Field Name: R0031SN

CT LGTH

The length of the CT or XT sections in bytes.

Field Name: QW0031CL

LOCATION

The name of the package location. This field shows "BLANK" if the local location name is not defined.

Field Name: QW0031LN

COLLCTN
IFCID 031 - EDM Full

The collection identifier of the package.
Field Name: QW0031CI

PCKG ID
The package identifier.
Field Name: QW0031PI

CONSISTENCY TOKEN
The consistency token of the package.
Field Name: QW0031CT

PT LGTH
The length of the PT section in bytes.
Field Name: QW0031GL

IFCID 032 - Log Wait Start:

This topic shows detailed information about “Record Trace - IFCID 032 - Log Wait Start”.

Record trace - IFCID 032 - Log Wait Start

The field labels shown in the following sample layout of “Record Trace - IFCID 032 - Log Wait Start” are described in the following section.

FUNC TYPE: WFRC
QW0032RB 155344864

FUNC TYPE
The function type or request type:

WFRC Write force request
