About this information

IBM® OMEGAMON for DB2® Performance Expert on z/OS (also referred to as Db2 Performance Expert) is a query analysis tool that you can use to fine-tune complicated queries so that they run as efficiently as possible.

These topics provide instructions for installing, configuring, and using Db2 Performance Expert and are designed to help database administrators, system programmers, application programmers, and system operators perform these tasks:

- Plan for the installation of Db2 Performance Expert
- Install and operate Db2 Performance Expert
- Customize your Db2 Performance Expert environment
- Diagnose and recover from Db2 Performance Expert problems
- Design and write applications for Db2 Performance Expert
- Use Db2 Performance Expert with other DB2 products

Tip: To find the most current version of this information, always use IBM Knowledge Center, which is updated more frequently than PDF books.
Chapter 1. Db2 Performance Expert overview

Db2 Performance Expert is a performance analysis, monitoring, and tuning tool for Db2 on z/OS® environments.

This product is part of the integrated and complete cross zSeries monitoring solution of the IBM OMEGAMON family that monitors all Db2 subsystems on z/OS and other resources, such as IMS™, MVS™, or CICS®. Db2 Performance Expert simplifies and supports system and application performance monitoring, reporting, trend analysis, charge back usage, and buffer pool analysis. If problems are encountered you are notified and advised how to continue.

What's new in Db2 Performance Expert

This section describes recent technical changes to Db2 Performance Expert.

New and changed information is marked like this paragraph, with a vertical bar to the left of a change. Editorial changes that have no technical significance are not marked.

Older changes and enhancements are described in “What's new in previous editions” on page 4833.

### Function overview

OMEGAMON® for DB2 PE has three main functions: analyzing a current problem, collecting historical data, and tuning buffer pools.

This product offers several components to help you achieve these goals. The sections below introduce you to the main components used for each goal. For a description of each OMEGAMON for DB2 PE component and for an overview of the relationships between the components, see “Components of OMEGAMON XE for DB2 PE” on page 5.

#### Analyzing a current problem

You can use OMEGAMON for DB2 PE to analyze current application and system problems. For example, an employee has complained that the system is running slow this morning. You can use one of the following components to analyze and identify bottlenecks and other performance problems:

**Classic Interface**

A VTAM® interface for OMEGAMON for DB2 PE with conventional menus and panels. Like Performance Expert Client, Classic Interface shows you all of the information necessary to analyze a problem using a fast and reliable VTAM interface. You can monitor and solve a DB2 problem even if the whole LPAR is impacted and a logon to TSO is no longer possible. It includes a realtime and a near-term history monitoring component to give you a comprehensive view of your DB2 subsystem.

**OMEGAMON enhanced 3270 user interface**

An enhanced 3270 user interface for OMEGAMON for DB2 PE with predefined workspaces that enable you to quickly and easily diagnose problems with monitored resources and take action to correct them. You can customize the workspaces to suit your requirements, even design and create your own workspaces and navigation.

**Tivoli® Enterprise Portal**

A Java-based interface for OMEGAMON for DB2 PE that is flexible and customizable. You can install Tivoli Enterprise Portal on the local machine or you can access it through a web browser. Tivoli Enterprise Portal provides information similar to that provided by Performance Expert Client and Classic Interface.
Interface. When installed in conjunction with the appropriate OMEGAMON products, Tivoli Enterprise Portal can also monitor other products and display the information in the same user interface.

**Performance Expert Client**
A graphical user interface for OMEGAMON for DB2 PE that runs on the Windows operating system. Performance Expert Client provides all of the functions that are necessary to analyze the system or to analyze a specific application. It shows you all the details about the activity on the DB2 subsystem, plus information about resource utilization and processing times. It also automatically informs you about problems or resource constraints such as deadlock, timeout, or CF structure resize.

**Collecting and evaluating historical data**
You can also use OMEGAMON for DB2 PE to collect and evaluate historical data for different tasks. Historical data is useful for tuning, for problem analysis, for trend analysis, and for capacity planning. For example, you can use historical data to predict resource usage for trend analysis and capacity planning. Historical data also allows you to analyze a problem over a long period of time. This is helpful when current data is not sufficient to analyze the problem, for example when you want to check the size of a DB2 resource, such as an EDM pool, for cursor tables or package tables. You can also use historical data to establish a baseline performance record that can be used to detect deviations. For example, you could collect Accounting data for several months and then compare the current CPU usage time of a static SQL package to the average CPU usage time stored in the history. If the current time is well above the average time, then you know that you need to investigate the change. You can use the following components to store and evaluate historical data:

**Performance Database**
A set of tables that can be filled with DB2 performance information collected via SMF or via a batch job using the FPEZCRD program. You can then retrieve, aggregate, or filter the information using SQL. To load the collected DB2 information into the performance database, functions of the reporter component (batch engine) have to be used.

**Performance Warehouse**
An automated version of Performance Database. The database is maintained and controlled by the OMEGAMON Collector and you can use a GUI to define the ETL process and to evaluate the information in the tables.

**Reporter**
Generates reports that reflect the activity on different levels, for example, subsystem, application, SQL statements, locking, and utility. The Reporter does not store the information in a database. This component helps you identify related problems and charges back the DB2 usage to your users. You can use a command language to filter, sort, and aggregate the reported information.

**Spreadsheet Input-Data Generator**
Creates a comma-separated value (CSV) data set using DB2 trace data processed and formatted by the Reporter and field selection lists. This CSV data can then be transferred to workstations and imported into spreadsheets to improve DB2 performance analysis using graphical representations or pivot tables.
Tuning buffer pools

OMEGAMON for DB2 PE can also be used to tune buffer pools. If you want to find the optimal use of buffer pool resources and to simulate the effects of possible changes, you can use the following component:

Buffer Pool Analyzer
A suite of tools that can be used to monitor, analyze, and tune buffer pools.

Components of OMEGAMON XE for DB2 PE

OMEGAMON XE for DB2 PE is made up of several components, some required and some optional.

Before you can install the product, you must decide which components are necessary for your environment. This section demonstrates the relationships between the components of the products and also gives you a brief introduction to each component.

Relationships between components
The components of OMEGAMON for DB2 PE work in combination with each other to help you monitor, analyze, and tune your DB2 performance. You need to understand how the components work together in order to decide which components you want to install.

The following graphic demonstrates the relationship between the components of OMEGAMON for DB2 PE.
The following table shows which prerequisite components and optional subcomponents are associated with each main component of OMEGAMON for DB2 PE.

Figure 1. Overview of OMEGAMON for DB2 PE components

The following table shows which prerequisite components and optional subcomponents are associated with each main component of OMEGAMON for DB2 PE.
Table 2. Main Components, prerequisite components, and optional subcomponents for OMEGAMON for DB2 PE

**Main components**

The components in this section are the main OMEGAMON XE for DB2 PE components.

**Buffer Pool Analyzer**

Buffer Pool Analyzer for z/OS helps database administrators manage buffer pools more efficiently by providing information about current buffer pool behavior and by using simulation to anticipate future behavior.
You can use Buffer Pool Analyzer to analyze the performance data from DB2 for z/OS systems, to simulate changes in the buffer pool settings, to move DB2 objects to a different buffer pool, or to generate reports. The product provides the following functions:

- Comprehensive reporting of the buffer pool activity, including:
  - Ordering by various identifiers (for example, buffer pool, plan, object, primary authorization ID)
  - Sorting by, for example, getpage, sequential prefetch, and synchronous read
  - Filtering capability
  - Loading into DB2 tables

- Simulation of buffer pool usage for:
  - Optimizing the usage of available buffer pool memory
  - Adjusting buffer pool thresholds by grouping objects with like characteristics in the same buffer pools.

For installation instructions, see [Buffer Pool Analyzer Configuration Guide](#).

**OMEGAMON Classic Interface**

The OMEGAMON Classic Interface is a user interface on the host that provides real-time information about a DB2 subsystem.

It is a Virtual Telecommunications Access Method (VTAM) application. It is part of the OMEGAMON Collector. You can use the OMEGAMON Classic Interface to:

- Review the current DB2 activity, such as threads or statistics
- View enclave information from the Work Load Manager (WLM)
- Monitor activity on DB2 gateways using DB2 Connect, and receive enhanced information about DBAs connected by a DB2 gateway.
- Observe counter thresholds
- Review information about terminated DB2 threads using the Near-Term History function
- Analyze objects and drill down into object allocation and usage of thread activities, as well as volume allocation and activities
- Receive detailed runtime performance information at the thread, unit of work, program, and SQL statement level using Application Trace Facility

OMEGAMON Classic Interface includes a real-time and a near-term history monitoring component to give you a comprehensive view of your DB2 subsystem:

**Realtime component**

The realtime component consists of a realtime monitor that you can use to monitor DB2.

It provides a classic user interface, with conventional menus and panels to facilitate navigation through the product. Through these menus and panels you can access the most current DB2 performance data, like thread use, locking conflicts, SQL calls, and so on. They also enable you to start and view an application trace to obtain realtime information about application flow and resource consumption.

**Near-term history component**

The near-term history component consists of the Near-Term History Data Collector, which gathers statistical and accounting information (including distributed database information), DSNZPARM information, and limited
performance information from a DB2 subsystem and stores it in VSAM data sets or sequential files, as the activities occur.

Use the near-term history panels to view statistics and thread information that was gathered a few minutes or a few hours ago and to view the current Near-Term History Data Collector specifications.

For more information on how to use OMEGAMON Classic Interface refer to Monitoring Performance from the OMEGAMON Classic Interface.

**OMEGAMON enhanced 3270 user interface**
The OMEGAMON enhanced 3270 user interface is a user interface on the host that provides predefined workspaces that enable you to quickly and easily diagnose and solve problems.

The OMEGAMON enhanced 3270 user interface is the latest generation of 3270 user interfaces for the OMEGAMON family of monitoring products. The OMEGAMON enhanced 3270 user interface is developed upon the common OMNIMON base component and provides DB2 Data Sharing Group reporting. The OMEGAMON enhanced 3270 user interface component enables you to monitor the performance of your z/OS systems, applications, and devices in your environment and helps you to identify and troubleshoot problems with those monitored resources. OMEGAMON enhanced 3270 user interface offers the following features:

- Plex-wide as well as single system views of data
- Autodiscovery of and autoconnection to data sources
- Dynamic behavior and operation
- User-customizable workspaces
- Fastpath navigation
- Lateral and vertical scrolling
- Sorting by column

For installation and configuration instructions, see the IBM® OMEGAMON and Tivoli Management Services on z/OS shared documentation.

**Performance Expert Client**
The Performance Expert Client is a graphical user interface that supports online monitoring and reporting, Performance Warehouse management, and buffer pool analysis on the workstation.

The following list shows what the client comprises when you install the different products:

- If you install OMEGAMON XE for DB2 PE, the client consists of online monitoring, Performance Warehouse with extended Rules-of-Thumb, and buffer pool analysis.
- If you install OMEGAMON XE for DB2 PM, the client consists of online monitoring and Performance Warehouse with limited Rules-of-Thumb.

**Online monitoring and reporting**
The PE Client online monitor function allows you to identify bottlenecks, applications that are performing poorly, and areas for tuning improvements. You can review all of the defaults of the current activity at the system and application levels. Snapshot History, an optional subcomponent, allows you to look at historical data. This helps you compare information at various timestamps and to
analyze problems that occurred in the past. In addition to these monitoring capabilities, the tool can inform you of specific DB2 situations, such as deadlocks, timeouts, lock escalations, and CF structure rebuilds. Another function called threshold exception processing checks the system or application information for threshold violations. This can help you detect increased usage or unusual usage patterns. The product then uses exits to automatically record this information even if you are not logged on to the Performance Expert Client. The exit writes the information to a system log where it can be picked up by system automation or where it can invoke a batch job that initiates further processing.

**Performance Warehouse management**

The Performance Warehouse GUI allows you to control the Performance Warehouse database. You can use it to perform tasks such as defining the Extract-Transfer-Load (ETL) process for collecting and loading data or for creating reports from the collected data. For more information about this component, see “Performance Warehouse” on page 11.

**Buffer pool analysis**

The buffer pool analysis GUI lets you control the Buffer Pool Analyzer. You can use it to simulate buffer pool changes so that you can optimize buffer pool memory. For more information about this component, see “Buffer Pool Analyzer” on page 7.

For installation and configuration instructions, see “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373 and “Installing and configuring Performance Expert Client” on page 436.

**Performance Database**

The Performance Database is a DB2 database, which can hold aggregated DB2 activity information spanning a long period of time. This long-term history can help you with performance tuning activities, with trend analysis, and with capacity planning.

You can store performance data from the following data groups:

- Accounting
- Audit
- Locking
- Record traces (IFCID 22, 63, 96, 125, 172, 196, 316, 365 and 401)
- Statistics and System parameters

You must build, load and maintain the DB2 tables for the Performance Database manually. This allows for greater flexibility. To help you get started, sample library &rhilev.&rete.RKO2SAMP (where &rhilev.&rete is the runtime high-level qualifier) is included in the product. The library contains the following items:

- The definitions of the Data Definition Language (DDL)
- The definitions of the Data Manipulation Language (DML)
- The DB2 LOAD Statements

You must also prepare the performance data with the Reporter functions before you can load it into the Performance Database. The Reporter component provides the data either in timestamp sequence (FILE format) or as reduced data (aggregated data or summary data, called SAVE format).
For installation and configuration instructions, see “Adding a Performance Database” on page 398.

Performance Warehouse
The Performance Warehouse is a fully automated Performance Database that consists of DB2 tables to save Accounting and Statistics performance counters and internal control tables.

You can perform tasks such as defining the ETL process for collecting and loading data into the database and creating reports from the collected data. You can perform such tasks immediately or you can schedule them to happen automatically after a certain event. For example, you can schedule a task so that reports of the activity are automatically created each morning.

You can use this feature with a database that is created for each monitored DB2 subsystem or with one database for all DB2 subsystems, including subsystems in other LPARs or on different sysplexes. The Performance Warehouse database is automatically maintained by the OMEGAMON Collector. In other words, mandatory changes to the structure of the Performance Warehouse database are automatically performed by the OMEGAMON Collector.

You can evaluate the performance information in the Performance Warehouse databases using a built-in query tool, an external SQL query interface, or Rules-of-Thumb analysis tool. With Rules-of-Thumb you can analyze historical data, identify bottlenecks, resource constraints, and predict trends.

Predefined Rules-of-Thumb are included with the Performance Warehouse, but you can also create your own.

For installation and configuration instructions, see “Enabling Performance Warehouse” on page 395.

Tivoli Enterprise Portal (TEP)
Tivoli Enterprise Portal is a Java-based browser user interface for viewing and monitoring your enterprise.

The Tivoli Enterprise Portal is a user interface on the workstation that offers a single point of view for online monitoring and analysis. You can view information about all the resources in your IT environment. For example, you can view information about your operating systems, hardware such as routers, applications such as WebSphere®, IMS, and CICS, and custom applications. It can run as a browser applet or as a Java™ application. OMEGAMON XE for DB2 PE gathers data from remote agents residing on the managed systems of your DB2 network and stores this data in system elements called attributes.

The monitoring data is received via the Tivoli Enterprise Portal Server (TEPS) and the Tivoli Enterprise Monitoring Server from the Tivoli Enterprise Monitoring Agents (TEMA). Information is then displayed in named workspaces.

The Tivoli Enterprise Portal is a customizable interface. For example, you can:
- Configure the workspaces and attributes according to your requirements. The Tivoli Enterprise Portal comes with a set of predefined workspaces for each item in the navigation tree, but you can edit any of them to suit your needs.
- Filter the information presented in a workspace by moving from the top-level workspace to lower-level workspaces.
Note: A workspace is not refreshed automatically, however, you can choose to automate the refresh of a workspace at specified intervals.

The Tivoli Enterprise Portal allows you to view a wealth of information, including the following:

- Detailed thread activity information about your DB2 threads, including Workload Manager information
- The interaction of a DB2 system with MVS, CICS, IMS, z/OS, and other systems, databases and applications within a single interface from any location
- Database lock activities and detailed lock conflict information about your database locks
- Information about DB2 resources such as buffer pools, EDM pools, group buffer pools, and dynamic statement caches
- Enhanced information for database access threads (DBATs) at DB2 Connect gateways
- DB2 log manager active logging and archiving activities
- Distributed Database Facility statistics, including send and receive counts
- Detailed information about threads and thread exceptions connected to DB2
- Information about the performance of volumes that contain DB2 objects so that you can monitor the DASD performance by volume (Group Object Analysis (GOA) Volume workspace group)
- Information about a data sharing group and its coupling facility structures
- Active utility jobs
- DB2 Connect gateway activities

You can use the Tivoli Enterprise Portal to perform the following analysis activities:

- Detecting I/O related bottlenecks such as heavily used volumes
- Analyzing system-wide or application-specific resource usage to tune DB2 resources or to identify applications that are performing poorly
- Using historical information in the short-term history to detect and analyze problems in the past
- Using situations to automatically inform you about problems. You can use predefined situations or you can create your own situations
- Automating problem resolution by taking automatic action when certain events are detected. For example, you can run an MVS job, send a message to a system automation tool, or cancel a thread
- Managing problems detected by your team by using a built-in trouble ticket system or by forwarding the alert to an external event console

For installation and configuration instructions, see “Installing and configuring Tivoli Enterprise Portal” on page 851.

Prerequisite components

The components described in this section are required for one or more of the main components.

ISPF Monitoring Dialogs

The ISPF Monitoring Dialogs are a user interface on the host that provide access to the main functions or components of OMEGAMON XE for DB2 PE when running under TSO/ISPF.
You can:
- Create and run reporting commands using the Interactive Report Facility (IRF).
  Here you select the report specification and input data. You create and run reporting commands to generate batch reports.
- View online DB2 activity using the OMEGAMON Classic Interface for real-time monitoring as described in "OMEGAMON Classic Interface" on page 8.
  From ISPF Monitoring Dialogs, you can access this application through TSO.
- Customize report and trace layouts using the User-Tailored Reporting function (UTR).
  You can customize batch report and trace layouts according to your requirements using User-Tailored Reporting (UTR). This function gives you full control over the volume, contents, and layout of your traces and reports.

OMEGAMON Collector
The OMEGAMON Collector is the central access point for the clients that request to retrieve performance data. It collects history data, exception processing data, trace data, and snapshot data and controls and submits jobs to generate reports and load data into the Performance Warehouse.

The OMEGAMON Collector started task is started with the parameters retrieved from the RKD2PAR library. You can use the MVS operator commands to make changes to the configuration that are effective immediately. For example, you can start or stop specific functions or you can stop the OMEGAMON Collector.

The OMEGAMON Collector hosts the following components:
- OMEGAMON Classic Interface
- OMEGAMON enhanced 3270 user interface
- Tivoli Enterprise Portal
- Performance Expert Client
- Performance Warehouse

It also provides the following services to the components:
- Periodic and event exception processing
- Event Collection Manager to analyze object and volume data

Note: You must run this service in a separate address space if you have more than one OMEGAMON Collector or more than one LPAR.
- Near-Term History
- Application Trace Facility
- Snapshot History

Performance Expert Client as a prerequisite component
Performance Expert Client supports online monitoring and reporting, Performance Warehouse management, and buffer pool analysis on the workstation.

The Performance Expert Client is a prerequisite component for the Performance Warehouse and for the Buffer Pool Analyzer because it provides the user interfaces, or clients, for these components. For more information, see "Performance Warehouse" on page 11 and "Buffer Pool Analyzer" on page 7.

The Performance Expert Client is also a main component. See "Performance Expert Client" on page 9 for more information.
**Reporter**
The Reporter generates predefined reports to help you collect and analyze historical performance data. It also enables you to prepare performance data before you load it into the Performance Warehouse or into the Performance Database.

The Reporter comes with the following predefined reports:
- Accounting
- Statistics
- System Parameters
- Utility
- Locking, Audit
- I/O Activity
- Record Trace
- SQL Activity

You can also use a report language to filter, sort, and group the data in the reports according to your preferences. For example, you can include or exclude specific data, sort or summarize by various options, and enable or disable reporting about specific performance data. You can use the User-Tailored Reporting (UTR) function to even further customize the reports.

You can use the Reporter to generate reports in the following ways:
- by submitting a batch job.
- by using the Interactive Report Facility (IRF). You can define the report commands and input data through ISPF panels. You can also submit the reports to run in the background.
- by using the Performance Warehouse Client. You can specify the report commands and input data through a graphical user interface. You can also submit the jobs immediately or schedule them to run later. This only applies to ACCOUNTING and STATISTICS reports.

When you want to load data into the Performance Warehouse or the Performance Database, you can use the command language in the Reporter to indicate which data should be prepared and to indicate how the data should be summarized. You can process the data in the following ways:
- by submitting a batch job.
- by using the Performance Warehouse Client to either submit the job immediately or to schedule the job to run later.

You can use one of the following methods to collect the data that the Reporter uses:
- A batch job. In this case, you use the FPEZCRD program to collect performance data from a DB2 subsystem.
- The Performance Warehouse Client. In this case, you can use a graphical user interface to configure the job and to either submit it or to schedule it to run later.
- The Collect Report Data function in the ISPF Monitoring Dialogs. In this case, you can use ISPF panels to configure the job and to submit it.
- SMF or GTF data sets.
- Sequential data sets generated by Near-Term History Data Collector configured to store trace data to VSAM data sets and sequential data sets (VSAMSEQ).
The Reporter is added when you download the program files from SMP/E. You do not need to perform any additional installation or configuration activities.

**Tivoli Enterprise Monitoring Agent (TEMA)**

A Tivoli Enterprise Monitoring Agent retrieves performance information from the OMEGAMON Collector for the Tivoli Enterprise Monitoring Server.

A Tivoli Enterprise Monitoring Agent is called by a Tivoli Enterprise Monitoring Server to retrieve data from a monitored resource. These agents then test attribute values against a threshold and report these results to the monitoring servers. The Tivoli Enterprise Portal displays an alert icon when a threshold is exceeded or a value is matched. These tests are called situations.

For installation and configuration instructions, see [“Enabling Tivoli Enterprise Monitoring Agent” on page 375](#).

**Tivoli Enterprise Monitoring Server (TEMS)**

The Tivoli Enterprise Monitoring Server collects and prepares performance information for the Tivoli Enterprise Server.

The Tivoli Enterprise Monitoring Server retrieves information from all of the connected Tivoli Enterprise Monitoring Agents and checks the information for situations. It also keeps a short history that you can view in the Tivoli Enterprise Portal. The history shows you how information has changed over time and allows you to perform actions such as running a batch job on the host when the Tivoli Enterprise Monitoring Server detects a situation.

For installation and configuration instructions, see [“Configuring Tivoli Enterprise Monitoring Server” on page 375](#).

**Tivoli Enterprise Portal Server (TEPS)**

Tivoli Enterprise Portal Server, a gateway between the Hub TEMS and the Tivoli Enterprise Portal, stores user data, workspaces, and queries.

The Tivoli Enterprise Portal uses the Tivoli Enterprise Portal Server to visualize the collected performance information. The Tivoli Enterprise Portal Server works as an application server allowing the Tivoli Enterprise Portal to store configuration data and meta information.

For installation and configuration instructions, see [“Installing and configuring Tivoli Enterprise Portal” on page 851](#).

**Optional subcomponents**

The components described in this section are optional subcomponents that can be used with the main components.

**Application Trace Facility (ATF)**

Application Trace Facility (ATF) traces the execution of a DB2 thread so that you can improve application flow and resource consumption.

The Application Trace Facility collects information about the DB2 thread and shows you the performed operations in a report. It traces the following DB2 thread operations:

- Executed SQL statements.
- Performed sorts.
• Pageset access and scan information.
• Obtained locks.
• Application times, such as in-DB2 Time and in-DB2 CPU Time.

It can be invoked from the Classic Interface: The Application Trace Facility Menu panel provides access to panels from which you can start an application trace, store trace data, review the data collected by an application trace, stop an application trace, and release the storage data set. You can specify the criteria for the application to be traced and to store the trace output. Trace output can have the following formats:

**In memory trace**

Trace data is stored in the virtual storage of the OMEGAMON for Db2 PE address space. It is limited to the total amount of storage that is available. The storage is owned by the VTAM session that started the trace. The trace starts as soon as you are completing the start request. If the VTAM session terminates while the trace is running, the trace is terminated and the trace output is lost. When the trace is completed, the data is only available to the VTAM session that started the trace. If the VTAM session terminates, or if you request another in memory application trace, the trace is discarded.

To control the TRACE request, select option B - VIEW TRACE. To terminate the trace or to view the trace contents, select option C - Stop Trace.

**VSAM Dataset Trace**

The trace is written to a VSAM dataset. It is limited by the size of the dataset. You can define whether the trace is to run immediately or to be deferred (scheduled) for execution at a later time. If the trace is started or scheduled, the VTAM session that requests the trace does not need to stay active for the trace to complete successfully. Information about the trace is maintained for the duration of the OMEGAMON for Db2 PE address space, unless it is manually deleted. You can view the trace data from any VTAM session.

To control the trace, select option H - QUEUED Traces and select the appropriate element.

The data that is collected by the Application Trace Facility is stored in a VSAM file or resident in memory. If the data is not stored in a VSAM file, it is only available for the current OMEGAMON for Db2 PE session.

Stopping trace collection does not delete trace information collected. It simply stops the active trace request. All data collected before trace termination is still available for viewing.

All Application Trace Facility (ATF) panels show the current state of an application trace, including a possible trace data set full condition, as ABENDED, ACTIVE, INACTIVE, or DSN FULL. A state of INIT-XXX might be shown briefly during early stages of initialization.

For installation and configuration instructions, see “Enabling Application Trace Facility” on page 398.
**DB2 Event Exception Processing**

DB2 Event Exception Processing alerts you when specific system events occur. These events include deadlocks, timeouts, locks, escalations, and starts and stops of a coupling facility structure rebuild. This component is also sometimes called DB2 Event Observation.

You can use the Performance Expert Client to see the events and the details of the events.

For installation and configuration instructions, see “Enabling DB2 Event Exception Processing” on page 324.

**Explain**

Explain functions provide an easy-to-read representation of access plan information for your SQL queries and statements. You can use this information to decide how to tune your queries.

The built-in explain functions are Easy Explain and the EXPLAIN report. You can use them as follows:

- You can use the Easy Explain function to view the information while browsing or editing a data set containing SQL statements.
- You can generate an EXPLAIN report that shows access plan information for all of the SQL statements found in the collected performance information.

The following explain functions are optional. They provide access plan information for an individual SQL statement.

- **IBM DB2 SQL Performance Analyzer.** You can use this function through the Classic Interface.
- **Query Workload Tuner.** You can use this function through the Performance Expert Client.

For installation and configuration instructions, see “Enabling DB2 EXPLAIN” on page 392.

**IBM DB2 SQL Performance Analyzer (SQL PA):**

IBM DB2 SQL Performance Analyzer provides resource usage information and costs associated with SQL queries without having to run them in DB2. This analysis helps you tune your queries to achieve maximum performance.

SQL PA calculates the cost of queries before you start them, so that you can tune them before implementation. With SQL PA, you find out how long queries will take before you run them, before resources are consumed, and before the query is terminated by a governor. You are able to determine the cost of running a query under the attach facilities of IMS, CICS, and batch, as well as TSO, SPUFI, and QMF™. The cost estimate is given in familiar units: CPU time, I/O count, and elapsed time, and, in even simpler terms, as QUNITS (a single number representing the overall cost). The monetary cost of each query is also presented.

**Note:** With SQL PA, OMEGAMON XE for DB2 PE enables the user to analyze SQL statements that are displayed in certain VTAM panels. SQL PA analyzes former and current SQL queries and report the results. The results from SQL PA are SQL Enhanced Explain reports, SQL Query Limits reports, and SQL Trace information.
The output provided by SQL PA reports is based on SQL PA configuration parameters specified in PARMGEN. During the customization the affected DB2 subsystems and Performance Warehouse options to be used by SQL PA are determined.

When an SQL performance analysis is requested, the OMEGAMON Collector silently submits a batch job that captures the analysis data and puts it into appropriate Performance Warehouse tables, from where it is retrieved and reassembled and presented as an SQL PA report.

SQL PA reports might be long. If you cannot page down to the end of a report, the "logical rows" session parameter value might be too low. Log on again, with the session parameter set to a higher value. You can set this parameter either on the OMEGAMON XE for DB2 PE Classic Interface panel or as a logon command parameter, for example logon applid(ipobd2c) data(lrows=9999).

**IBM Eclipse Help Server**
This feature allows you to use the online help in the Tivoli Enterprise Portal.

For installation and configuration instructions, see "Installing and configuring Tivoli Enterprise Portal" on page 851.

**Near-Term History Data Collector**
Near-Term History captures and stores recent DB2 instrumentation data so that you can review thread performance after the threads have ended.

Data captured includes all statistics and accounting records written by DB2. Near-Term History might also collect certain performance data at the thread level, such as dynamic SQL or sorting, locking, and scanning information.

Many events are too short lived to be viewed in real time. Near-term history collection identifies threads that have experienced problems in the past few hours. These threads can then be examined in more detail to help identify the cause of the problem. Some of the types of thread problems that can be identified in this way are:

- Excessive CPU or elapsed time
- Threads that have had timeouts or deadlocks
- Threads committing too infrequently
- Threads that have aborted
- Threads with excessive lock waiting time
- Threads with excessive DB2 wait time for I/O

You can also use the filter options to identify these types of problem threads more quickly.

For installation and configuration instructions, see "Enabling Near-Term History" on page 389.

**Object Analysis**
The Object Analysis function reveals the affect of an application on overall disk access. This can help you balance the load and determine where DB2 data sets should be placed to evenly spread I/O over available disks.

Object Analysis helps you analyze DB2 object allocations, linear VSAM data set extend activity, I/O activity at the DASD volume level, and object activity from a
DB2 perspective. Often the first indicator of a DB2 performance problem is the I/O activity being performed on a particular DASD volume or a DB2 table space or index space. Object Analysis enables you to isolate this activity at a granular level. This can often lead to an understanding of a specific workload or external event that might be contributing to an I/O related DB2 problem.

You can use Object Analysis through the Classic Interface or the Tivoli Enterprise Portal.

For installation and configuration instructions, see “Enabling Object Volume Analysis” on page 387.

Performance Expert Agent for DB2 Connect Monitoring
The Performance Expert Agent for DB2 Connect Monitoring monitors connections of remote applications within the Distributed Relational Database Architecture™ (DRDA) of DB2 that are connected through DB2. It is installed on the DB2 Connect Server gateway and provides DB2 Connect data for the OMEGAMON Collector.

When Performance Expert Agent for DB2 Connect Monitoring is installed on a DB2 Connect gateway, it collects connection-related data, such as the connection status of a remote application. It also collects statistics about DB2 Connect activities. The collected snapshot data is then stored periodically and can be examined using the user interfaces.

DB2 administrators can use the collected data, for example, to find out whether the connection of the remote application is working. They can also use this data to identify network problems between DB2 Connect and the DB2 server.

For installation and configuration instructions, see “Installing and configuring Performance Expert Agent for DB2 Connect Monitoring” on page 406.

Periodic Exception Processing
Periodic Exception Processing is an OMEGAMON feature that analyzes system metrics and compares them against predefined thresholds, user-defined thresholds, and application metrics.

When a threshold is exceeded, an exception event is shown. This event is commonly called an exception. This function is available in Performance Expert Client.

You can start Periodic Exception Processing manually after you start Performance Expert Client. In this case, you can define a set of thresholds for each user ID. Alternatively you can configure Periodic Exception Processing to automatically start one user's threshold definitions when the server starts. In this case, the threshold definitions are already started when the user logs on to the client.

For installation and configuration instructions, see “Enabling Periodic Exception Processing” on page 388.

Snapshot History
Snapshot history data is useful, for example, if you want to examine activities leading to, and following, an exception without recreating the situation.

The data is periodically stored by the OMEGAMON Collector in a wrap-around-managed snapshot history data set. You can define how often the
snapshots are stored and how many snapshots are stored. When the defined maximum number of snapshots is exceeded, the oldest snapshot is deleted and the newest snapshot is added.

You can view this information through the history mode in the Performance Expert Client. This mode allows you to display recently stored snapshots at a specified point-in-time. You can then scroll forward and backward through the history of snapshot data to get a better understanding of what happened and to identify what caused the problem (for example, detected situations, bottlenecks, deadlocks, timeouts).

For installation and configuration instructions, see “Enabling Snapshot History” on page 391.

**Tivoli Data Warehouse (TDW)**

You can use the Tivoli Data Warehouse to store collected performance information for a long time. This is helpful when you want to compare DB2 activity that occurred in the past or when you want to review trends.

Other Tivoli products also use this information. For example, IBM Tivoli Performance Analyzer uses this information to predict trends and IBM Tivoli Usage and Accounts Manager uses it to charge back the usage of a system.

For installation and configuration instructions, see “Adding Tivoli Data Warehouse” on page 851.

**InfoSphere Optim Performance Manager**

InfoSphere Optim Performance Manager is a performance analysis and tuning tool for managing DB2 systems by using a web interface. The new web interface, which is provided by InfoSphere Optim Performance Manager, provides system health overviews and a guided workflow to problematic areas with detailed displays.

The InfoSphere Optim Performance Manager end-to-end SQL or stored procedure monitoring dashboard displays end-to-end data about the entire database application system, which includes clients, application servers, data servers, and the network. With this optional end-to-end SQL or stored procedure monitoring feature, you can monitor and analyze the performance of the entire database application system. If you install the optional plug-in for Tivoli Enterprise Portal (TEP) you can get extended operating system performance data and view this data on the System dashboard. You can also run end-to-end SQL or stored procedure monitoring from within the TEP console.

For installation and configuration instructions, see “Installing and configuring end-to-end SQL or stored procedure monitoring” on page 851.

**User interfaces**

OMEGAMON XE for DB2 PE provides user interfaces for DB2 performance analysis on the host and on the workstation.

**User interfaces on the host**

OMEGAMON XE for DB2 PE provides user interfaces for DB2 performance analysis on the host.

To monitor and analyze DB2 performance on the host you can use the Classic Interface for real-time monitoring or you can use ISPF Monitoring Dialogs. See the following sections for more information:
User interfaces on the workstation

OMEGAMON XE for DB2 PE provides graphical user interfaces for DB2 performance analysis on the workstation.

You can use the Tivoli Enterprise Portal, Performance Expert Client, or InfoSphere Optim Performance Manager. See the following sections for more information:

- “Tivoli Enterprise Portal (TEP)” on page 11
- “Performance Expert Client” on page 9
- “InfoSphere Optim Performance Manager” on page 20

Conventions used in the OMEGAMON documentation

This information uses several conventions for special terms and actions, and operating system-dependent commands and paths.

Panels and figures

The panels and figures in this document are representations. Actual product panels might differ.

Symbols

The following symbols might appear in command syntax:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Usage</th>
</tr>
</thead>
</table>
| | The or symbol is used to denote a choice. You can use the argument on the left or the argument on the right. For example: YES | NO
| In this example, you can specify YES or NO. |
| ( ) | Denotes optional arguments. Arguments that are not enclosed in square brackets are required. For example: APPDESTR DEST (ALIDEST) |
| In this example, DEST is a required argument and ALIDEST is optional. |
| { } | Some documents use braces to denote mandatory arguments, or to group arguments for clarity. For example: COMPARE {workload} - REPORT={SUMMARY | HISTOGRAM} |
| In this example, the workload variable is mandatory. The REPORT keyword must be specified with a value of SUMMARY or HISTOGRAM. |
| _ | Default values are underscored. For example: COPY infile outfile - [COMPRESS={YES | NO}] |
| In this example, the COMPRESS keyword is optional. If specified, the only valid values are YES or NO. If omitted, the default is YES. |
Notation conventions

The following conventions are used when referring to high-level qualifiers:

*hilev*  A high-level qualifier. The high-level qualifier is the first prefix or set of prefixes in the data set name. Site-specific high-level qualifiers are shown in italics.

For example:
- *thilev* refers to the high-level qualifier for your target data set.
- *rhilev* refers to the high-level qualifier for your runtime data set.
  For members in target libraries, the high-level qualifier is *thilev* rather than *rhilev*.
- *shilev* refers to the SMP/E library high-level qualifier.

Typeface conventions

This information uses the following typeface conventions:

**Bold**
- Interface controls (check boxes, push buttons, radio buttons, spin buttons, fields, folders, icons, list boxes, items inside list boxes, multicolumn lists, containers, menu choices, menu names, tabs, property sheets), labels (such as *Note:*)
- Keywords and parameters in text

**Italic**
- Words defined in text
- Emphasis of words (for example: Use the word *that* to introduce a restrictive clause.)
- New terms in text (except in a definition list)

**Monospaced**
- Examples and code examples
- File names, programming keywords, and other elements that are difficult to distinguish from surrounding text
- Message text and prompts addressed to the user
- Text that the user must type
- Values for arguments or command options

**Significant elements**

**Recommendation**
- Provides guidance when more than one option is available.

**Related reading**
- Refers you to other publications that contain relevant information.

**Requirement**
- Identifies a condition that must be met to ensure that the product is functional.

**Restriction**
- Identifies a restriction or limitation with this product or an associated procedure.
Terminology used

IBM OMEGAMON for Db2 Performance Monitor on z/OS can be considered as a functional subset of IBM OMEGAMON for Db2 Performance Expert on z/OS. Therefore the abbreviation OMEGAMON for Db2 PE or DB2 PE is used for both products. If a distinction is required, OMEGAMON for Db2 PM or DB2 PM is used explicitly.

The following table shows the products that are described in this publication and the short names with which they are referred to throughout this publication:

<table>
<thead>
<tr>
<th>Product name</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM OMEGAMON for Db2 Performance Expert on z/OS</td>
<td>OMEGAMON for Db2 PE or DB2 PE</td>
</tr>
<tr>
<td>IBM OMEGAMON for Db2 Performance Monitor on z/OS</td>
<td>OMEGAMON for Db2 PM or DB2 PM</td>
</tr>
<tr>
<td>Buffer Pool Analyzer for z/OS or a particular subsystem</td>
<td>Buffer Pool Analyzer</td>
</tr>
<tr>
<td>IBM Db2 database for z/OS</td>
<td>Db2</td>
</tr>
</tbody>
</table>

- Performance Expert Client and Workstation Online Monitor designate the client component of DB2 PE.
  Prior to Version 5.4.0 the client component of DB2 PE also designated the end-user interface of Performance Expert for Multiplatforms, Performance Expert for Workgroups, and DB2 PE.
- OMEGAMON Collector designates the server component of DB2 PE.

How to read syntax diagrams

The rules in this section apply to the syntax diagrams that are used in this publication.

Arrow symbols

Read the syntax diagrams from left to right, from top to bottom, following the path of the line.

- Two right arrows followed by a line indicate the beginning of a statement.
- One right arrow at the end of a line indicates that the statement syntax is continued on the next line.
- One right arrow followed by a line indicates that a statement is continued from the previous line.
- A line followed by a right arrow and a left error indicates the end of a statement.

Conventions

- SQL commands appear in uppercase.
- Variables appear in italics (for example, column-name). They represent user-defined parameters or suboptions.
- When entering commands, separate parameters and keywords by at least one blank if there is no intervening punctuation.
• Enter punctuation marks (slashes, commas, periods, parentheses, quotation marks, equal signs) and numbers exactly as given.
• Footnotes are shown by a number in parentheses, for example, (1).

**Required items**
Required items appear on the horizontal line (the main path).

**Optional items**
Optional items appear below the main path.

If an optional item appears above the main path, that item has no effect on the execution of the statement and is used only for readability.

**Multiple required or optional items**
If you can choose from two or more items, they appear vertically in a stack. If you must choose one of the items, one item of the stack appears on the stack main path.

If choosing one of the items is optional, the entire stack appears below the main path.

**Repeatable items**
An arrow returning to the left above the main line indicates that an item can be repeated.

If the repeat arrow contains a comma, you must separate repeated items with a comma.
If the repeat arrow contains a number in parenthesis, the number represents the maximum number of times that the item can be repeated.

A repeat arrow above a stack indicates that you can specify more than one of the choices in the stack.

**Default keywords**

IBM-supplied default keywords appear above the main path, and the remaining choices are shown below the main path. In the parameter list following the syntax diagram, the default choices are underlined.

---

**Where to find information**

You can access the documentation in several ways.

The documentation for this product is provided in PDF and in HTML format at the following websites:

- [OMEGAMON for Db2 Performance Expert on z/OS](#)
- [OMEGAMON for Db2 Performance Monitor on z/OS](#)

**Ordering publications**

You can order many IBM publications such as product manuals or IBM Redbooks® online at the [IBM Publications Center](#) website.

You can also order by telephone by calling one of the following numbers:

- In the United States: 800-879-2755
- In Canada: 800-426-4968

In other countries, contact your software account representative to order Tivoli publications.

**Accessing terminology online**

The [IBM Terminology](#) website consolidates the terminology from IBM product libraries in one convenient location.

**Service updates and support information**

You can access support information for IBM OMEGAMON for Db2 Performance Expert on z/OS and IBM OMEGAMON for Db2 Performance Monitor on z/OS on the Support home website, or you can use the IBM Support Assistant.
Support home

On the Support home website, you can find service updates and support information including software fix packs, PTFs, Frequently Asked Questions (FAQs), technical notes, troubleshooting information, and downloads.

Accessibility features

Accessibility features help people with a physical disability, such as restricted mobility or limited vision, or with other special needs, to use software products successfully. This Knowledge Center is developed to comply with the accessibility requirements of software products according to Section 508 of the Rehabilitation Act of the United States.

The accessibility features in this Knowledge Center enable users to do the following tasks:

- Use assistive technologies, such as screen-reader software and digital speech synthesizer, to hear what is displayed on the screen. In this Knowledge Center, all information is provided in HTML format. Consult the product documentation of the assistive technology for details on using assistive technologies with HTML-based information.
- Operate specific or equivalent features using only the keyboard.
- Magnify what is displayed on the screen.

In addition, all images are provided with alternative text so that users with vision impairments can understand the contents of the images.

Navigating the interface by using the keyboard

Standard shortcut and accelerator keys are used by the product and are documented by the operating system. Refer to the documentation provided by your operating system for more information.

Magnifying what is displayed on the screen

You can enlarge information in the product windows using facilities provided by the operating systems on which the product is run. For example, in a Microsoft Windows environment, you can lower the resolution of the screen to enlarge the font sizes of the text on the screen. Refer to the documentation provided by your operating system for more information.

How to send your comments

Your feedback is important in helping to provide the most accurate and high-quality information.

If you have any comments about this information or any other documentation, you can complete and submit the Reader Comment Form.
Chapter 2. Planning

Before you set up your system, plan what you need to configure and make sure that all the prerequisites are met.

“Planning the configuration”
“Worksheet for planning your configuration” on page 63

Planning the configuration

This information describes how to plan the configuration.

Gathering information

You will need a lot of information about your environment, your configuration, and your users while you configure the product. To simplify the configuration process, gather this information before you begin.

Deciding on your setup

Decide on your setup before you start the configuration.

About this task

The following planning activities help you gather the information required for your configuration:

Procedure

1. Decide what types of runtime environments you need for your configuration. See [IBM® OMEGAMON and Tivoli Management Services on z/OS shared documentation] for more information.
2. If you are installing OMEGAMON for DB2 PE in a data sharing environment, consider the applicable product restrictions. See “Special considerations for a data sharing environment” on page 33 for more information.
3. Grant all of the necessary authorizations. See “Prerequisites” on page 28 for more information.
4. If you are installing OMEGAMON for DB2 PE in a multihost environment, plan the VTPOOL sharing configuration. See “VTPOOL sharing in a multihost environment” on page 34 for more information.
5. Decide which security functions you will implement. See “Security” on page 37 for more information.
6. Decide which optional features and functions you want enable. See “Cost of optional features” for more information.
7. Complete the “Worksheet for planning your configuration” on page 63. This worksheet helps you understand what key parameters and values are required to configure the product and gives you the opportunity to plan the values that you will use during the configuration process.

Cost of optional features

Be aware of the fact that each optional feature or function that you add causes additional resource and CPU costs.
For best results, consider for each function whether it is really needed. If it is, decide whether you want to run it all the time or if you would rather save CPU costs and turn the feature on only when needed.

Following are additional tips for deciding which optional features and functions to add:

- Monitor traces for real-time are typically inexpensive. This includes Statistics and Accounting class (1) traces.
- Accounting trace class (3) and especially class (2) on the plan level as well as the equivalent classes (7 and 8) on the package level will generate additional overhead within the DB2 engine.
- SQL related traces (Dynamic SQL, NegSQL, sort, scan, and locking) can be very expensive. These traces should be used cautiously and only for a short period of time. For example, they are used as an option in Near-Term History.
- Object Analysis can be very expensive. Consider using the online function to switch this function on and off dynamically if you need it.
- For further information on resource and CPU consumption, see APAR 'II14438: Known issues causing high CPU utilization in OMEGAMON DB2 and performance tuning tips COMPID 5655OPE00' on the z/OS Communications Server.

Prerequisites

Before configuring the product, you must know what is required for the configuration process, such as hardware or software requirements, or access rights that you need for the configuration.

Hardware requirements

The product can be deployed on any zSeries system that is capable of running z/OS, version 1 release 8, or later.

Software requirements

For a detailed list of the software requirements, refer to the Announcement Letter.

OMEGAMON for DB2 PE installation

OMEGAMON for DB2 PE must be installed through SMP/E.

SMP/E is the basic tool for installing and maintaining software in z/OS systems and subsystems.

Related reading:

- The SMP/E installation of OMEGAMON for DB2 PE is described in the Program Directory for IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS.
- The SMP/E installation of OMEGAMON for DB2 PM is described in the Program Directory for IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS.

Authorization requirements

To set up the product and certain DB2 privileges, such as data set privileges, access privileges are required. You find these in the two tables below. Furthermore, several user IDs are required for the configuration. You must create the following new user IDs or assign existing user IDs to the tasks:
• DB2PM as user ID or group ID for the OMEGAMON Collector (For details, see “Setting up security for the OMEGAMON Collector address spaces” on page 311.)

• A user ID for the DB2 Connect Monitoring Agent (in case you want to use the function DB2 Connect Monitoring)

During the configuration process, the PARMGEN generates jobs that contain all the statements that grant the required DB2 privileges. After successful configuration, you find these jobs in your /&rhilev./&rte.RD2SAM library.

The following table lists the DB2 privileges you must grant to the different users and the respective grant jobs that must be submitted.

<table>
<thead>
<tr>
<th>Users</th>
<th>DB2 privileges/grant jobs</th>
</tr>
</thead>
</table>

| End users of DB2 z/OS subsystem/data sharing group in the InfoSphere Optim Performance Manager Web Console | To configure InfoSphere Optim Performance Manager:  
- Privileges described in row ‘End users of Performance Expert Client (including Performance Warehouse Client) or ISPF Monitoring Dialogs’.  
- The privilege to connect to the DB2 z/OS subsystem/data sharing group.  
- The necessary privileges to perform CREATE/DROP/ALTER on function or procedure, that is GRANT CREATEIN,DROPIN,ALTERIN ON SCHEMA OPM.  
- The system privilege GRANT BINDADD is also required, as well as the privileges to issue GRANT EXECUTE on all functions and stored procedures on schema OPM.  
- JDBC stored procedures that allow getMetaData() method call have to be installed and configured.

To view static SQL statement text:  
- The SELECT privilege on tables SYSIBM.SYSCOLUMNS, SYSIBM.SYSPACKSTMT, SYSIBM.SYSROUTINES, and SYSIBM.SYSPARMS.  

**Note:** In order to speed up performance of the static SQL statement text retrieval, create the following indices:  
- SYSIBM.SYSPACKSTMT (SECTNOI ASC, NAME ASC, CONTOKEN ASC, COLLID ASC, SEQNO ASC) for DB2 10 and DB2 11  
- SYSIBM.SYSPACKSTMT (STMT_ID ASC) for DB2 10 and DB2 11

**Note:** <ssid> denotes the DB2 subsystem ID.

- &thilev.TKNANMOD  
- &thilev.TKNANMODL |

### Special considerations for a data sharing environment

If you are installing or configuring OMEGAMON for DB2 PE in a data sharing environment, you might need to alter your configuration of certain components.

**Performance Expert Agent for DB2 Connect Monitoring**

The following configuration scenarios are possible with Performance Expert Agent for DB2 Connect Monitoring in a data-sharing environment:

- **Monitor one member of a data sharing group.** This configuration is sufficient in most data sharing environments, even when the members reside on different LPARS in a sysplex environment.

- **Monitor two or more members of a data sharing group.** To enable DB2 Connect Monitoring, you have to enable Snapshot History and activate the collection of DB2 Connect Monitoring data. You can enable that for two or more members of a data sharing group. However, consider the following effects:
DB2 Connect Monitoring data is collected and stored for only one member of the data sharing group. Monitoring is started first for this DB2 subsystem.

The user interfaces must connect to the member for which DB2 Connect Monitoring data is collected and stored. Otherwise, they cannot display DB2 Connect Monitoring data.

If the monitoring for the DB2 subsystem, for which the DB2 Connect Monitoring data was collected, is stopped, and you have enabled DB2 Connect Monitoring for two or more members of a data sharing group, then data collection for another member takes over. Ensure to reconnect the user interface to this member to display DB2 Connect Monitoring data.

**Performance Warehouse**

In a data-sharing environment, you can enable Performance Warehouse for only one member of a data sharing group.

**VTPOOL sharing in a multihost environment**

Virtual terminal pool (VTPOOL) defines the virtual terminal pool from which the virtual terminal manager VTM1 uses a virtual terminal for each OMEGAMON for DB2 PE session. Usually, each installation of VTM1 includes a VTPOOL definition. You can, however, also share a VTPOOL definition among several VTM1 installations.

**Requirement:** To provide support for OMEGAMON for DB2 PE sessions under more than one TSO or ISPF, you must install VTM1 in every VTAM domain that controls a TSO.

**Sample network**

For the VTPOOL sharing procedure that is described in this topic, it is assumed that the network looks like this:
In this example, there are two VTAM domains:
- Host Subarea A (HSAA)
- Host Subarea B (HSAB)

Host Subarea A runs OMEGAMON for DB2 PE and TSO (TSOA). Host Subarea B runs TSO (TSOB).

Assumptions are that:
- Users of OMEGAMON for DB2 PE who use ISPF or TSO mode must use the local TSO.
- A pool of ten virtual terminals is required for each host subarea.

This means that:
- Users whose terminals are controlled by VTAM domain HSAA must log on to TSOA.
- Users whose terminals are controlled by VTAM domain HSAB must log on to TSOB.

To share the VTPOOL definition, you must:
1. Define the VTPOOL to VMT1.
2. Define the VTPOOL to each VTAM.
3. Provide access to VTPOOL.

**Define the VTPOOL to VMT1**

To define the VTPOOL of ten virtual terminals to VTM1, use this `$VTAPPL` statement:

```
$VTAPPL APPL#=10,VTAPPL=OBVTM1
```
Define the VTPOOL to each VTAM

To define the virtual terminals to each VTAM domain, define the local name and the network name separately.

Both names are defined in the VTAM APPL definition statement:
- The ACBNAME keyword defines the local name.
- The name field defines the network name.

In the following sample VTAM APPL definition statements, the HSAA network names are different from the HSAB network names. The local names for each virtual terminal are identical in both host subareas.

This example shows HSAA VTAM definition statements for Host Subarea A that correspond to the $VTAPPL definition statement.

```
HSAAVTM1 VBUILD TYPE=APPL
HSAAVT01 APPL ACBNAME=OBVTM101,EAS=1
HSAAVT02 APPL ACBNAME=OBVTM102,EAS=1
HSAAVT03 APPL ACBNAME=OBVTM103,EAS=1
HSAAVT04 APPL ACBNAME=OBVTM104,EAS=1
HSAAVT05 APPL ACBNAME=OBVTM105,EAS=1
HSAAVT06 APPL ACBNAME=OBVTM106,EAS=1
HSAAVT07 APPL ACBNAME=OBVTM107,EAS=1
HSAAVT08 APPL ACBNAME=OBVTM108,EAS=1
HSAAVT09 APPL ACBNAME=OBVTM109,EAS=1
HSAAVT10 APPL ACBNAME=OBVTM110,EAS=1
```

This example shows HSAB VTAM definition statements for Host Subarea B that correspond to the $VTAPPL definition statement.

```
HSABVTM1 VBUILD TYPE=APPL
HSABVT01 APPL ACBNAME=OBVTM101,EAS=1
HSABVT02 APPL ACBNAME=OBVTM102,EAS=1
HSABVT03 APPL ACBNAME=OBVTM103,EAS=1
HSABVT04 APPL ACBNAME=OBVTM104,EAS=1
HSABVT05 APPL ACBNAME=OBVTM105,EAS=1
HSABVT06 APPL ACBNAME=OBVTM106,EAS=1
HSABVT07 APPL ACBNAME=OBVTM107,EAS=1
HSABVT08 APPL ACBNAME=OBVTM108,EAS=1
HSABVT09 APPL ACBNAME=OBVTM109,EAS=1
HSABVT10 APPL ACBNAME=OBVTM110,EAS=1
```

Provide access to VTPOOL

To provide access to VTPOOL, you must:

1. Assemble and link-edit the VTPOOL definition statements to produce the module `shilev.TKANSAM(KOBVTPL).`
   VTM1 uses this module at runtime to select a virtual terminal prior to starting a OMEGAMON for DB2 PE session.
2. Store the VTM1 execution-time modules including the link-edited module `shilev.TKANSAM(KOBVTPL)` in a library on DASD that is shared by TSOA and TSOb users.
   If this is not possible, you must use separate libraries with identical modules for both host subareas. You can, however, still perform VTPOOL maintenance from a single master library.
Modify VTPOOL definitions for TSO/ISPF mode

If you use TSO or ISPF mode and if your runtime environment does not share libraries with other runtime environments or with SMP/E, perform these steps:

1. Define your virtual terminals and LOGMODE names to the VTM1 program by updating RKANSAM data set member KOBVTPL.
2. Assemble and link the KOBVTPL source by using the JCL in RKANSAM data set member KOBVTPLX.
   The resulting load module KOBVTPL is stored in the RKANMOD data set.
3. Update the following member and controls accordingly if you modified the terminal names or the number of terminals:
   • VTAM node list member KOBVT1AP in the RKANSAM data set
   • VTAMLIST controls

Security

Plan your security strategy before you begin your configuration. You might need user IDs or special privileges during the configuration process. You might also want to consider optional security features before you begin to configure the product.

Contents of the security file listing

The security update program creates a list of the control statement modifications. By using the LIST control statement, you can produce an additional listing that contains all security information. It is called security file listing.

The security file listing consists of these parts:
• Header
• Control Statement Edit Listing
• Security File Listing
• Security Update Program Trace

Header

The header of the security file listing contains this information:
• The name of the data set where the load module resides
• The module name of the security table
• The OMEGAMON for DB2 PE version number in the format XnnnCOM, where nnn denotes the version number. For example, X540COM denotes OMEGAMON for DB2 PE V5.4.0.
• Messages indicating successful completion of the job or errors, such as a failure to open the SYSLIB data set or to read the security table.

This example shows a typical header:
Control Statement Edit Listing

The control statement edit listing contains a list of the control statements that have been edited. The list shows the previous contents and the new contents. It does not show previous passwords.

If the **UPDATE** control statement is specified as UPDATE=YES, date and time of the previous update is reported.

This example shows a typical control statement edit listing:

```
*** CONTROL STATEMENT EDIT ***

AUTHLIB=&rhilev.&rte.RKO2PROC,VOL=NOVOLUME
PREVIOUS CONTENTS =
NEW CONTENTS = &rhilev.&rte.RKO2PROC NOVOLUME

* CHANGE THE PASSWORD FOR LEVEL 3 COMMAND ACCESS
PASSWORD=IBM3,LEVEL=3
PREVIOUS CONTENTS = ******** NEW CONTENTS = IBM3

* DISPLAY SECURITY INFORMATION FOR THE PEEK COMMAND
COMMAND=PEEK
PREVIOUS CONTENTS = 3 B NEW CONTENTS = 3 B

* DISPLAY SECURITY INFORMATION FOR MINOR JOBS
MINOR=JOBS
PREVIOUS CONTENTS = OEW NEW CONTENTS = OEW

* PROTECT MZAP COMMAND
COMMAND=MZAP,LEVEL=3
PREVIOUS CONTENTS = 0 NEW CONTENTS = 3

* DISASTER CONS COMMAND
COMMAND=CONS,LEVEL=DISABLE,AUDIT=BOTH
PREVIOUS CONTENTS = 0 NEW CONTENTS = * B

*** END OF CONTROL STATEMENT INPUT ***
```

The codes for the previous and new contents of commands are positional. This list shows the valid positions:

1. The first position shows the number of the internal security level. If the command is not enabled, it shows an asterisk (*).
2. The second position shows the external security option.
   - **E** Use external security for this command.
   - **blank** A blank denotes no external security.
3. The third position shows the auditing option.
Audit this command by using WTO.
Audit this command by using SMF.
Audit this command by using WTO and SMF.

A blank denotes no auditing.

Security File Listing

If you specify LIST=YES anywhere in the input stream, the security update program generates this information:

- A complete listing of the security information
- The name of the authorized screen library and its volume serial number
- The name of the external security user exit module
- The SMF record number
- All commands and their security information

This example shows a typical security file listing:

```
OBSECUP 1.2-- SECURITY UPDATE PROGRAM--(c) IBM CORPORATION-- mm/dd/yy 16:41
   * * * SECURITY FILE LISTING * * *
   AUTHLIB=&rhitlev.&rte.RKO2PROC VOLUME=NOVOLUME
   LEVEL1=******* LEVEL2=******* LEVEL3=*******
   SMFNUM=233
   MODULE=MYSECURE
   COMMAND=/A 0 TYPE=S (ALIAS)
   COMMAND=/ABORT 0 TYPE=S
   COMMAND=/AUP 0 TYPE=S
   COMMAND=.AUP 0 TYPE= I
   COMMAND=.DSA 0 TYPE= I
   COMMAND=.SCC 0 TYPE= I
   COMMAND=OCMD 3EB TYPE= I

   SECURITY TABLE LAST UPDATED ON mm/dd/yy 06:00:10
```

The commands are succeeded by the security level. An asterisk (*) indicates that a command is not enabled. Minor commands are listed below their corresponding major commands.

The **TYPE** field shows the following kinds of Classic Interface commands:

C Major
I Immediate
S Slash (INFO-line)

Security Update Program Trace

The last part of the listing shows if an update has successfully completed.

This example shows a typical security update program trace:
Optional external security features
You can setup your user exit routine to use one of the following external security features.

The exit routine concepts are described in "Exit routine concepts" on page 49.

You can also use the control options that are supplied with the security package, such as SHIFT validation and SOURCE validation. To use them, specify the commands EXTERNAL=YES and implement the option as the security package directs.

Customization of error messages
To suit your individual requirements, you can create customized error messages if one of these conditions occur:
- The authority of the user is insufficient.
- The user enters a wrong user ID.
- The user enters a wrong password.

The customized error messages can be up to 120 bytes long, except for INFO-line messages. INFO-line messages, for example, /PWD relogon messages, can be up to 60 bytes long.

Members KO2RACFX and KOACF2X in the &rhilev.&rte.RKD2SAM data set contain sample exit routines.

Password update
You can give the user the ability of interactive communication when logging on to external security.

For example, if a user logs on by using an expired password, the security exit can prompt the user for a new password and update the security database.

Restriction: This option is not available when relogging on by using the /PWD command.

Audit suppression
You can suppress WTO or SMF auditing. To indicate suppression of WTO or SMF, your exit routine might set a flag in $UCHECK at initialization or relogon.

Audit supplement
In addition to the WTO and SMF audits that are available with the Classic Interface, you can use the audit features of the external security package to supplement command tracking. The RACF Report Writer and ACF2 ACFRPT
utility programs are examples of this supplemental audit capability.

**Locking feature**

The feature can prevent users from changing their internal security level by using the `/PWD` command. Their level of authority is set only once and only at logon. It can be set to one of four levels (level 0, 1, 2, or 3).

**Restrictions:**
- Because the feature locks the internal security level of a user, it affects only those commands that are marked as EXTERNAL=NO.
- The locking feature disables the `/PWD` command only for supplying internal passwords. The user can still use the `/PWD` command to relogon to an external user ID.
- You must define the security level of a user in ACF2 or RACF as an INITIAL\(n\) resource, where \(n\) is a number from 0 to 3.
- You must assign corresponding values to commands in the security update program by using the **LEVEL** keyword of the **COMMAND** control statement.
- The routine starts checking INITIAL\(n\) resources at the highest level. If you define users of INITIAL2, INITIAL3, and PERMIT to INITIAL3, the users are locked to level 3.
- Users who have INITIAL authority without an attached value from 0 to 3 are allowed to change their internal security level by using the `/PWD` command.

**User validation through RACF**

To validate a user, the user exit routine checks the RACF resource class that is defined by the ICHERCDE macro.

The resources that allow the startup of the Classic Interface include INITIAL, INITIAL0, INITIAL1, and INITIAL3.

This example shows these resources:

```
<Allows /PWD to work>
RDEFINE cccccccc INITIAL UACC(READ)
  <Defines security level 0 as unaccessible>
RDEFINE cccccccc INITIAL0 UACC(NONE)
  <Defines security level 1 as unaccessible>
RDEFINE cccccccc INITIAL1 UACC(NONE)
  <Defines security level 2 as unaccessible>
RDEFINE cccccccc INITIAL2 UACC(NONE)
  <Defines security level 3 as unaccessible>
RDEFINE cccccccc INITIAL3 UACC(NONE)
  <Locks USER02 to level 2 power>
PERMIT INITIAL2 CLASS(classname) ID(USER02) ACC(READ)
```

where `classname` is the resource class name that you define when you modify RACF security rules as described in “Modifying RACF security rules” on page 47.

**User validation through ACF2**

To validate a user, the user exit routine checks the ACF2 resource class.
The resources that allow the startup of the Classic Interface include INITIAL, INITIAL0, INITIAL1, and INITIAL3.

To allow users to change their authorization level with the `/PWD` command, use INITIAL.

This example shows sample definitions:

```plaintext
<Allows /PWD to work for USER01>
ACFNRULE KEY(INITIAL) TYPE(cls) ADD(uid(**************USER01) ALLOW)

<Locks USER02 to security level 0 commands>
ACFNRULE KEY(INITIAL0) TYPE(cls) ADD(uid(**************USER02) ALLOW)

<Locks USER03 to security level 1 commands>
ACFNRULE KEY(INITIAL1) TYPE(cls) ADD(uid(**************USER03) ALLOW)

<Locks USER04 to security level 2 commands>
ACFNRULE KEY(INITIAL2) TYPE(cls) ADD(uid(**************USER04) ALLOW)

<Locks USER05 to security level 3 commands>
ACFNRULE KEY(INITIAL3) TYPE(cls) ADD(uid(**************USER05) ALLOW)
```

where `cls` is the generalized resource class name that you define when you modify RACF security rules as described in “Modifying RACF security rules” on page 47.

**Customized security for the Classic Interface**

You can set up an interface between the Classic Interface and an external security package, such as RACF or ACF2. The product has no security feature set up as the default.

Whether you use internal security, external security, or a combination of the two, you can customize the Classic Interface security table to the needs of your installation.

**Terminology for security procedures:**

The following terms are used in the descriptions of the customization procedures for security:

**Update Program**
The KOBSUPDT member of `&rhilev.&rte`.RKANMOD is a utility program that performs the update to the security table of the Classic Interface.

**Control Statements**
The KO2SUPDI member of `&rhilev.&rte`.RKD2SAM contains control statements that you can edit to change the defaults for internal security or to specify external security. KO2SUPDI provides the input for the update program.

**JCL**
The KO2SUPD member of `&rhilev.&rte`.RKD2SAM contains the JCL to run the security update program.

**Exit Routine**
At start time, the Classic Interface accesses the security exit routine of the user that provides the interface to the external security package. The name of this routine must be specified by the administrator.
Internal versus external security:

When you start the Classic Interface, it checks if an exit routine for an external security package is installed.

You can use external security alone, internal security alone, or external security on some commands and internal on others.

Important: The use of the term *authorized* implies APF authorization.

- If the exit routine exists, it gets control for the commands that are marked for external security. It determines authorization through the external security package. If external security allows the command, the Classic Interface does not check internal security.
- If external security is not used for the command, internal security takes effect. The Classic Interface includes specific authorized commands. They require an internal security password for execution.

Authorized commands and their authorization level:

The Classic Interface includes specific authorized commands for which you can use internal security. Authorized commands have a security level of 3.

All Classic Interface commands (major, minor, immediate, and INFO-line) have a security level of 0, 1, 2, or 3. Level 3 provides the highest degree of protection. A setting of 0 means that any user can access the command.

All commands have a default security level of 0 except for authorized commands. By default, authorized commands have a security level of 3.

You must run the security update to prevent that specific commands that can potentially damage your system are available to all users.

The KO2SUPDI member in &rhilev.&erte.RKD2SAM contains instructions and the control statements for updating the authorization level of authorized commands as needed.

For the procedure to update the security level of Classic Interface commands, refer to "External security concepts" on page 44.

The following commands are the authorized commands for this product:

<table>
<thead>
<tr>
<th>CONS</th>
<th>DCMD</th>
<th>DCNS</th>
<th>DSA</th>
<th>MCHN</th>
<th>MLST</th>
<th>MSCN</th>
</tr>
</thead>
<tbody>
<tr>
<td>MZAP</td>
<td>OCMD</td>
<td>OSPC</td>
<td>PEEK</td>
<td>SCHN</td>
<td>SLST</td>
<td>SSCN</td>
</tr>
<tr>
<td>SZAP</td>
<td>TCMO</td>
<td>XMCH</td>
<td>XMLS</td>
<td>XMSC</td>
<td>XMZP</td>
<td></td>
</tr>
</tbody>
</table>

These commands are described in Monitoring Performance from the OMEGAMON Classic Interface

Important: The PEEK major command has the minor commands AMAP, DDNS, JOBS, MODS, STEP, SUBP, and TCBS. These minor commands also have default security level of 3.

The authorized commands require an internal password for execution. How to use these passwords is described in "Using passwords for authorized commands" on page 44.
Using passwords for authorized commands:

Each security level can have its own password.

About this task

The level 3 password accesses all levels. The level 2 password accesses levels 2, 1, and 0. The level 1 password accesses only levels 1 and 0. Level 0 commands execute without a password.

If you enter a command that requires higher authority than yours, the following message is displayed:

080921 Security check failed (Internal)

To get access to the authorized commands, use the /PWD command in the following way:

Procedure

1. Enter /PWD on the INFO-line.
   The Classic Interface shows the password prompt.
   
   _  
   <<== Please enter password

2. Enter your password on the INFO-line.
   The password does not display as you type it.
   The message PASSWORD ACCEPTED is displayed.
3. Press Enter again to get access to all authorized commands that are associated with that password and to lower command levels.

What to do next

To reset the security level to 0 after you complete the authorized functions, do one of the following:
- Press the PA1 or the ATTN key.
- Enter /PWD on the INFO-line and press Enter twice without entering a password.
  The Classic Interface shows:
  
  __________________________ Password level reset

Access to the authorized commands is restricted until you enter the password again.

If you use the Classic Interface with an external security package, you can prevent the use of the /PWD command. For details about this feature, see “Locking feature” on page 41.

External security concepts:

The Classic Interface supports external security for all modes of operation.

You can use external security for the logon and for commands. When using external security, you can log on to the Classic Interface only if you are allowed to access the INITIAL resource name.
You can use a resource name of INITIAL0, INITIAL1, INITIAL2, or INITIAL3 to allow logon to the Classic Interface and set the internal security level to 0, 1, 2, or 3, respectively.

When you issue a command, the Classic Interface performs an external security check to see if the following conditions are met:

- The name of the user exit module is specified in the security table.
- An external security exit routine is located and loaded.
- External security is specified for the issued command in the security table by using the COMMAND control statement with the EXTERNAL=YES keyword setting.
- For VTAM mode, the library that contains the KOBVTAM load module is APF-authorized.

If any commands are specified for external security checking and if an exit routine is not found, the Classic Interface recognizes a possible security exposure and disables those commands with an internal security level of 0 for the session. Commands with a level of 1, 2, or 3 run only after you enter the internal password. For more information about authorized commands and using passwords, see the following:

- "Authorized commands and their authorization level" on page 43
- "Using passwords for authorized commands" on page 44

Using the VTAM, TSO, or ISPF mode logon panel:

You can log on through the VTAM, TSO, or ISPF mode panel using the KOBVTAM logon panel.

About this task

Advantages of using the KOBVTAM logon panel are:

- The exit routine can cause the Classic Interface to stop an unauthorized logon.
- The exit routine makes all security checks based on the user logon ID and not on the authority for the Classic Interface address space.

Note: If you are in an active VTAM session and you want to change the external security level of authorization, you can use the relogon feature as described in "Logging on again to an active session."

To logon to the Classic Interface through the VTAM, TSO, or ISPF mode panel, perform the following step:

Procedure

Log on to VTAM. The logon panel for the Classic Interface VTAM application program (KOBVTAM) is displayed.

Logging on again to an active session:

You can use the relogon feature to logon to an active VTAM session without logging out first.
About this task

The relogon feature is a function of the /PWD command. You can use this feature to perform the following tasks:

- Enter your user ID and password for the external security package from an active Classic Interface session.
- Change the security level without having to close a current VTAM session.

When you work with the relogon feature, consider these issues:

- Do not mark the /PWD command as EXTERNAL=YES in the security table.
- In your user exit, you can determine the default action if the supplied user ID or logon password is not valid.
  
  For example, you can specify that all Classic Interface commands that are marked as EXTERNAL=YES are not enabled. You can also specify that the session reverts to the previous user ID. The available options are explained in the sample exit routines.
- If you use the relogon feature and your password has expired, you cannot enter a new one by using the /PWD command.

To use the relogon feature, perform the following step:

Procedure

Enter /PWD and your user ID on the INFO-line as seen in the following example:

/PWD user01_____O2INIT01 DED O2 V600.4P $DB2 mm/dd/yy 17:03:37

You are now logged on again to the active session using external security.

Implementing external security:

You must implement an external security package before the exit routine can refer to it for authorization. If external security is not implemented, internal security takes effect.

About this task

To implement external security, perform the following steps:

Procedure

1. Modify the rules in the external security package to interface with the Classic Interface as described in “Modifying RACF security rules” on page 47.
2. Customize the sample exit routine that is provided on the Classic Interface tape according to the procedure described in “Exit routine concepts” on page 49. For a description of options that you can use, refer to “Optional external security features” on page 40.
3. Assemble and link-edit the routine.
4. Modify and update the security table to specify the commands that are to be checked by RACF or ACF2 and the name of the module that contains the exit routine. Note that no default is supplied for the module name. Follow the steps in “Updating the security table” on page 60.
5. Ensure that your security package has authorized the started-task identifier for OMEGAMON for DB2 PE.
During configuration, OMEGAMON for DB2 PE generates the security jobs KO2ACF2A, KO2RACFA, and KO2SUPD. These jobs create exit programs for external security packages. The members are in &rhilev.&rte.RKD2SAM.

Modifying RACF security rules:

You must modify the RACF security rules to interface with the Classic Interface.

About this task

To modify RACF security rules, do the following:

Procedure

1. Update the resource class description table to define a class name, for example, O2IBM, by using the ICHERCDE macro call.

   **Requirement:** This must be the same name that you use when you define the resource class in the security exit routine.

   You should define the ICHERCDE macro as follows:

   ```
   ICHERCDE
       CLASS=classnme,
       ID=nnn,
       MAXLNTH=8,
       FIRST=ALPHANUM,
       OTHER=ANY,
       POSIT=nnn,
       DFTUACC=NONE
   ```

   where `classnme` and `nnn` are determined by your installation. Additional operands for this macro might also be required at your installation.

2. Define a resource profile for logging on to the Classic Interface by using the TSO RDEFINE command with a resource of INITIAL.

   The following example shows a definition that allows all users to sign on to the Classic Interface and use the /PWD command for internal security. It allows access to all commands that are marked EXTERNAL=NO.

   ```
   RDEFINE classnme INITIAL UACC(READ)
   ```

   where `classnme` is the name that is assigned in the previous step.

   This definition is the minimum required for logon. If you want to restrict the use of the /PWD command, refer to “Optional external security features” on page 40.

3. Define resource profiles for the commands that you want to protect by using external security. The commands are marked EXTERNAL=YES.

   a. Use the TSO RDEFINE to specify the Classic Interface command as the resource.

   ```
   Ensure that you define UACC(NONE) so that only specific users can execute the command.
   ```

   b. Use the PERMIT command to define the users who can access the resource, that is the users who can execute the command.

   c. Give the defined users READ access

   The following example shows how to authorize a user to run the PEEK command with RACF:

   ```
   RDEFINE classnme PEEK UACC(NONE)
   PERMIT PEEK CLASS(classnme) ID(USER01) ACCESS(READ)
   ```
4. Include the RACF macro libraries SYS1.MACLIB and SYS1.AMODGEN, and the macro library &thilev.TKANMAC in the assembly of the security exit routine.

What to do next

Important: When you authorize commands, the Classic Interface modifies the command name. For example, it makes the following replacements:

- It replaces the slash of the INFO-line commands with a dollar sign. For example, /cccc becomes $cccc and /LOGOUT is defined to RACF as $LOGOUT in CLASS(cccccc).
- It replaces the period of the immediate commands with @. For example, .cccc becomes @cccc.

Modifying ACF2 security rules:

You must modify the ACF2 security rules to interface with the Classic Interface.

About this task

To modify ACF2 security rules, do the following:

Procedure

1. If you run the Classic Interface in VTAM mode, define the name of its started task to ACF2.
   The started task name that you use for the Classic Interface in VTAM mode should have the MUSASS attribute assigned. This allows ACF2 to check the individual user authorization rather than using the address space ID of the Classic Interface. If STC(NO) is specified, you must run the Classic Interface in batch mode with a job name that has the MUSASS attribute.

2. To set up a resource class for ACF2, define a generalized resource class name, for example, O2S.
   Requirement: It must be the same name that you use when you define the resource class in the security exit routine.
   For generalized resources, the name consists of three characters but gets the letter R as prefix within the security exit.
   This allows the Classic Interface to make security checks.

3. Define an ACF2 rule for resource INITIAL.
   This allows VTAM users to log on to the Classic Interface as in the following example:
   
   **ACFNRULE KEY(INITIAL) TYPE(O2S) ADD(UID(*************uid) ALLOW)**
   
   Requirement: O2S must be identical to the resource class name that you define in the security exit routine.

   *uid is a user ID or a user ID mask. If you want to restrict the use of the /PWD command, refer to "Optional external security features" on page 40.

4. Define resource rules for the command that you want to protect by using the KEY operand of the ACF2 rule compiler.
   This authorizes a user to execute the PEEK command with ACF2 as in the following example:
   
   **ACFNRULE KEY(PEEK) TYPE(O2S) ADD(UID(*************USER01) ALLOW)**
   
   For information about the format of the string, ask your security administrator.
5. Include the ACF2 macro library and the IBM macro library &thilev.TKANMAC in the assembly of the security exit routine.

What to do next

Important: When you authorize commands, the Classic Interface modifies the command name. For example, it makes the following replacements:

- It replaces the slash of the INFO-line commands with a dollar sign. For example, /cccc becomes $cccc and /LOGOUT is defined to ACF2 as $LOGOUT in CLASS(ccccc).
- It replaces the period of the immediate commands with @. For example, .cccc becomes @cccc.

Modifying CA-TOP SECRET security rules:

You must modify the CA-TOP SECRET security rules to interface with the Classic Interface.

About this task

To modify CA-TOP SECRET security rules, do the following:

Procedure

1. Define the users who can access the resource by using the TSS PERMIT command.
2. Run the Classic Interface command.

Example

The following example shows how to authorize a user to execute the PEEK command with CA-TOP SECRET.

TSS PERMIT(userid) cccccccc(PEEK)

where cccccccc is the resource class name.

Exit routine concepts:

The exit routine provides an interface between the Classic Interface and the security product.

Concepts for exit routines are:

- You can specify any unique name for your exit routine.
  The name must be identical to the name in the control statements that update the security table. For more information, refer to the MODULE= control statement in "MODULE control statement" on page 57.
- You can share the exit routine between systems.
- You must define a resource class in the exit routine.
  The name of this resource class must be identical to the generalized resource class name that you define when you modify RACF or ACF2 rules.
- You can use the same exit routine to define security for several Classic Interfaces.
You must then use the same name on the **MODULE**= control statement for each Classic Interface.

You can use the value of the **B#DPRFX** field in the **$BIA** data area as part of a resource name that you want to use for the Classic Interface that is currently in use.

The **&rhilev.&rte.RKD2SAM** data set contains the following sample members:

- Members **KO2ACF2X** and **KO2RACFX** that contain models for ACF2 and RACF routines.

  Many configurations use these models without modification. They are, however, documented with comments so that you can modify them because security procedures are configuration-dependent.

  You can also use these models if you have a security system other than RACF or ACF2. In this case, use the sample RACF or ACF2 exits as guides to see the following:
  - Which information is passed to the exit routine
  - Which information is returned to the Classic Interface

- Members **KO2ACF2A** and **K02RACFA** that contain sample JCL to help you assemble and link-edit your routine.

External security features are described in "Optional external security features" on page 40.

**Calling conventions of the Classic Interface:**

The Classic Interface uses a single control block **$UCHECK** to pass information to the exit routine. The exit routine uses **$UCHECK** to pass information back to the Classic Interface.

The **$UCHECK** control block is mapped by the **$UCHECK** macro. The macro is defined in member **KOBGMAC** of **&rhilev.TKANMAC**.

The Classic Interface maintains the control block for the entire duration of the session.

**Restriction:** The **$UCHECK** work area for the configuration is limited to 512 bytes. If your installation requires a larger work area, perform these steps:

1. Perform a **GETMAIN** for the additional storage required.
2. Place the pointer to this **GETMAIN** area in **$UCHECK**.

**Note:** Do not try to enlarge the work area in another way because this causes an overlay of essential control blocks for the Classic Interface. Results are then unpredictable.

If you modify the RACF RACROUTE macro, you must perform a **GETMAIN** for at least 512 bytes for use as the **WORKA** parameter.

The Classic Interface calls the user exit module with these conventions:

**Register 1**
Address of parameter list

**Register 13**
Address of a standard save area
Register 14
Return address

Register 15
Entry point address (in)

Register 15
Return code (out)

Word 1
Address of control block

Calling flow between Classic Interface and user security exit:

Calling flow between the Classic Interface and your user security exit routine takes place at initialization, during command verification, at relogon, and at termination.

Calling flow at initialization

At initialization, the Classic Interface passes control to your user exit routine. The initialization call is indicated by an I in the U#CHTYP field. This indicates that the Classic Interface requires a logon validation.

This list shows the conditions that apply to the calling flow at initialization:

- If the user ID field length is nonzero, the user ID and password information are available.
- If additional information or some form of retry is required, the routine can request a reshown of the screen. It can also reset any field lengths to indicate that no data, such as user ID, password, group, or new password, is available.

To perform a reshown in VTAM mode, perform these steps:
1. Set a message of up to 120 bytes length in the U#CHMSG field.
2. Set the U@CHRSHO bit in the U#CHRESP field.
3. Return to the caller.

The message appears below the panel. Appropriate fields, such as original user ID and password, are filled in, unless overridden (length = 0).

- After validation is complete, a return code of 0 from the user exit indicates that the user is allowed to log on.
  Any other return code stops the session.
- After successful logon, the validation routine can perform resource validation. Optionally, it assigns a command security level (0, 1, 2, or 3) to the user. The default level is 0.

Place the appropriate number into the U#CHAUT4 field. To force the user to use only this level, you must also set the U@CH1LOK bit in the U#CHAUT1 field.

Calling flow during command verification

During command verification, the Classic Interface places a C in the U#CHTYP field. At this point, the user authorization can be checked.

If a command is allowed, the user can use this account on subsequent tries until security is reset with the /PWD command.

If a command is not allowed, the user cannot use this account on subsequent tries until security is reset with the /PWD command.
Each time the user attempts to use the command, the user exit is notified. Also, an audit record can be written, and a customized error message can be issued.

Return codes from the exit routine can be:

**RC = 0**
Indicates that the command is allowed.
For RACF and ACF.

**RC = 4**
Indicates that the command is unknown.
The Classic Interface allows the command to execute. For information about how to define a command to RACF, refer to “Modifying RACF security rules” on page 47.
For RACF only.

**RC = 8**
Indicates that the command is known to the security package and that access is denied.
For RACF and ACF.

*Important:* When you authorize commands, the Classic Interface modifies the command name. For example, it makes the following replacements:

- It replaces the slash of the INFO-line commands with a dollar sign. For example, `/cccc` becomes `$cccc`.
- It replaces the period of the immediate commands with @. For example, `.cccc` becomes `@cccc`.

**Calling flow at relogon**

At relogon, the Classic Interface places an `R` in the `U#CHTYP` field to indicate a logon validation.

The processing is identical to the one for initialization, except that users might not enter a new password or group because the Classic Interface does not display the logon panel.

**Calling flow at termination**

At termination, the Classic Interface passes a `T` to the user exit routine.

You can then do any termination cleanup required, such as freeing user control blocks, or perform a FREEMAIN for any GETMAIN areas.

**Security control statements:**

The security table consists of specific control statements and control keywords. You can edit these statements to update the security table for internal and external security.

**Overview**

This table provides a summary of available security control statements and their descriptions in alphabetical order.
For more information about the control statements and keywords, refer to the individual description of each statement.

Table 7. Security control statements

<table>
<thead>
<tr>
<th>Control statement</th>
<th>Purpose</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTHLIB</td>
<td>Specifies an authorized screen space (PROC) library for initialization that bypasses the security check.</td>
<td>“AUTHLIB control statement” on page 54</td>
</tr>
<tr>
<td>COMMAND</td>
<td>Sets the internal security levels of commands, marks them for external security, and requests an audit.</td>
<td>“COMMAND control statement” on page 55</td>
</tr>
<tr>
<td>LIST</td>
<td>Specifies whether a listing of the current security settings is to be produced on this run.</td>
<td>“LIST control statement” on page 56</td>
</tr>
<tr>
<td>MINOR</td>
<td>Specifies the security options for minor commands.</td>
<td>“MINOR control statement” on page 57</td>
</tr>
<tr>
<td>MODULE</td>
<td>Specifies the name of the module that contains the user external security exit routine.</td>
<td>“MODULE control statement” on page 57</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>Specifies the internal passwords.</td>
<td>“PASSWORD control statement” on page 58</td>
</tr>
<tr>
<td>RESET</td>
<td>Clears current settings.</td>
<td>“RESET control statement” on page 59</td>
</tr>
<tr>
<td>SMFNUM</td>
<td>Specifies the record ID number for SMF audit requests.</td>
<td>“SMFNUM control statement” on page 60</td>
</tr>
<tr>
<td>UPDATE</td>
<td>Specifies whether updating is to be performed on this run.</td>
<td>“UPDATE control statement” on page 60</td>
</tr>
</tbody>
</table>

Format rules for control statements

These format rules apply to all control statements.

- Control statements can begin anywhere in the input record but cannot extend beyond column 72.
- Statements can be in any order in the input stream. The update program processes the statements as it encounters them, with the exception of the LIST and UPDATE statements. These statements take effect after all other input is processed.
- All information for a particular control statement must fit in a single line.
- All input must be in uppercase letters.
- Statements must be in this format:

CONTROLSTATEMENT=cccccc,KEYWORD1=cccccc,KEYWORD2=cccccc,

Note: Blanks are not allowed because the update program treats data that follows a blank as a comment. The data prints on the edit listing but is ignored for processing purposes.
- To insert comment lines anywhere in the input stream, place an asterisk (*) in the first column of the input record.
- If the update program identifies statements as incorrect, correct the statements and resubmit them.
To correct the setting, specify a new one instead of deleting or replacing part of the old one, especially when changing a command from EXTERNAL=YES to EXTERNAL=NO.

- The Classic Interface does not recognize changes of control statements until the update job completes successfully and until a new Classic Interface session is started.
  
  Usually, the control statement edit listing indicates successful completion of the update.

**AUTHLIB control statement:**

This control statement specifies the data set name of an authorized screen space (PROC) library. The library contains commands that should be invoked without security checks at the Classic Interface initialization.

**Purpose**

It lets you execute protected commands as part of the initialization screen without entering a password.

**Recommendation:** You should restrict WRITE access to the AUTHLIB data set because security checking for screens from this data set is bypassed.

Concatenate the data set that contains the authorized screens in your O2PROC DD statement. Note that the data set that contains the authorized screen libraries is not an APF-authorized data set.

Security checking resumes if one of these conditions occurs:

- The Classic Interface fetches a screen from an unauthorized library
- A screen is loaded into memory
- A user enters any keystroke including a cursor movement

**Important:** If you create an authorized screen library and if you use the Classic Interface menu system, checking security causes initialization to fail if one of these conditions occurs:

- The Classic Interface fetches a screen that contains an authorized command. Therefore, the .FGO and .VAR commands should be unprotected.
- The Classic Interface fetches a screen space that is loaded into memory. Screen @ZCRNDF loads screen spaces into memory.

**Format**

The format of the AUTHLIB control statement is:

```
AUTHLIB=dsname,VOL={volume|NOVOLUME}
```

where *dsname* denotes the name of the authorized screen library that you have created.

**Keyword**

**VOL**

Always required.
Specifies the volume serial where the specified data set resides and serves as an additional security measure.

You can specify a volume serial number even if the data set is cataloged.

If you do not want the additional volume serial number checking to be performed, specify NOVOLUME.

**COMMAND control statement:**

This control statement protects the name of a major, immediate, or INFO-line command of the Classic Interface. Minor commands are protected at the major command level unless the MINOR control statement is specified.

**Purpose**

When you update an INFO-line command, you must use the actual command name and not its alias. The Classic Interface automatically assigns the same protection attributes to all aliases of the command.

The Classic Interface does not check for multiple COMMAND control statements for the same command in the same run. It processes the last COMMAND control statements for the command.

**Format**

The format of the COMMAND control statement is:

```
COMMAND= {cccc | .ccc | /cccccc}
[,LEVEL={0 | 1 | 2 | 3 | DISABLE}]
[,EXTERNAL={YES | NO}]
[,AUDIT={WTO | SMF | BOTH | NONE}]
```

where `cccc`, `.ccc`, or `/cccccc` is the name of the Classic Interface command that should be audited.

To have the control statement edit listing show the current security settings for a command, enter a COMMAND=`cccc`, `.ccc`, or `/cccccc` control statement without additional operands.

**Keywords**

**LEVEL**

Specifies the internal security level to be associated with this command.

- **Level 0**
  Allows the command to execute without an internal security check.

- **Levels 1, 2, and 3**
  Specify that the command executes only if you have previously entered the corresponding password for that level or for a higher level by using the /PWD INFO-line command.

**DISABLE**

Specifies that the Classic Interface should never execute the command. You can audit attempts to execute the command for the session, but you cannot specify internal or external security.

**EXTERNAL**

Specifies if an external security package checks this command.
YES  The external security package checks the command unless you specify
LEVEL=D\text{DISABLE}.

If no exit routine is available, the Classic Interface disables the
command for the session if the command security level is 0.

If the command security level is 1, 2, or 3, internal security is used by
default.

NO  The external security package does not check the command.

If you change EXTERNAL=\text{YES} to EXTERNAL=\text{NO}, you must run the
security update program before the change comes into effect.

\textbf{AUDIT}

Specifies if the Classic Interface audits the command when a user invokes it.

If you specify an audit for a disabled command, you are notified of attempts to
execute it.

Possible values are:

- \textbf{NONE}  Specifies that commands are not audited. This is the default setting.
- \textbf{WTO}   Produces a one-line message on the master console.
- \textbf{SMF}   Specifies that the Classic Interface writes an SMF record.
  The SMF record must be specified in the \texttt{SMNUM} control statement.
  If the SMF audit cannot be performed, the Classic Interface uses a
  WTO audit by default.
- \textbf{BOTH}  Specifies that the Classic Interface issues a WTO message to a console
  and writes an SMF record.

\textit{LIST control statement:}

This control statement specifies if the update program produces a security file
listing.

\textbf{Purpose}

A security file listing is a complete record of the security table.

It shows:
- The name of the authorized screen library
- Its volume serial number
- The name of the user exit module
- All command names along with their corresponding security information

You can specify only one \textbf{LIST} control statement per run.

\textbf{Format}

The format of the \textbf{LIST} control statement is:

\texttt{LIST=\{YES\mid NO\}}
Keywords

YES
Generates the security file listing independent of edits to the control statements when submitted as the only control statement in the command stream.

NO  This is the default setting. Generates a listing that shows what the control statements and security information would look like if the update had taken place.

For detailed information about the contents of a security file listing, refer to “Contents of the security file listing” on page 37.

MINOR control statement:

This control statement specifies the name of a Classic Interface minor command that should be protected.

Purpose

The Classic Interface protects the minor commands independently of the major commands. Therefore, any changes to minor commands apply to all minor commands with the same name and attributes, regardless of their major commands.

Access to a minor command requires access to the appropriate major command. If you do not specify an EXTERNAL keyword, the associated major controls access this minor command.

A minor command in a run is not checked for multiple MINOR control statements. The last MINOR control statement for the minor command takes effect.

Format

The format of the MINOR control statement is:

```
MINOR=cccc
[,,LEVEL={1|2|3|DISABLE}]
[,,EXTERNAL={YES|NO}]
[,,AUDIT={WTO|SMF|BOTH|NONE}]
```

Keywords

cccc denotes the name of the minor command that should be protected.

For an explanation of the keywords LEVEL, EXTERNAL, and AUDIT, refer to “COMMAND control statement” on page 55.

MODULE control statement:

This control statement specifies the name of the module that contains your external security exit routine.

Purpose

You must specify this control statement to use external security.
The name of the module must be identical to the name of the load module that you specify in KO2ACF2A or KO2RACFA.

**Format**

The format of the `MODULE` control statement is:

```plaintext
MODULE=cccccccc
```

where `cccccccc` denotes the name of the module that contains your external security exit routine.

**Usage notes**

- No default value exists.
- To remove control from external security:
  1. Delete the value of `MODULE=`
  2. Run the security update job.
  3. Restart the Classic Interface.

**PASSWORD control statement:**

This control statement specifies that the password for each internal security level must be used with the `/PWD` command.

**Purpose**

If you enter a valid password for a security level, the Classic Interface allows access to commands that have the same security level, and to commands that have a lower security level.

**Requirements:**

- The password must be one to eight characters long.
- Use a separate `PASSWORD` control statement for each security level.
- Use unique passwords for each security level.
  - If you assign the same password to more than one security level, the Classic Interface matches it at the lowest level and denies access to commands at higher levels.

The Classic Interface checks the password for a match in this order:

1. Level 1
2. Level 2
3. Level 3

**Format**

The format of the `PASSWORD` control statement is:

```plaintext
PASSWORD=password,LEVEL={1|2|3}
```

where `password` denotes the unique password for this level.
Keywords

LEVEL
  Always required.
  Specifies the security level that is associated with this password.
  Levels 1, 2, and 3 specify that the command executes only if you have
  previously entered the corresponding password for that level or for a higher
  level through the /PWD INFO-line command.

RESET control statement:

This control statement clears the current settings of the other control statements.

Purpose

Reset control statements remain unprotected unless you specify new settings with
the appropriate control statements and rerun the update program.

You can use the RESET control statement only once per run.

Format

The format of the RESET control statement is:

```
RESET=cccccccc
```

where cccccccc denotes one of the keywords.

Keywords

ALL | YES
  Clears settings for all control statements and all keywords in the security table
  for the Classic Interface.

AUTHLIB
  Clears the name and volume serial number of the authorized library.

INFO
  Clears settings for all INFO-line commands on the COMMAND control statement.
  For example, if you do not want to use the default security levels for
  INFO-line commands and if you want to start again, enter RESET=INFO. This
  resets all LEVEL settings to security level 0 and clears any existing EXTERNAL
  and AUDIT settings for the INFO-line commands.

MAJOR
  Clears settings for all major and immediate commands on the COMMAND control
  statement.
  For example, if you do not want to use the default security levels for major
  and immediate commands and if you want to start again, enter
  RESET=MAJOR. This resets all LEVEL settings to security level 0 and clears
  any existing EXTERNAL and AUDIT settings for major and immediate
  commands.

MINOR
  Clears settings for all minor commands.
**MODULE**
Clears the name of your exit routine module.

**PASSWORD**
Clears the internal passwords.

**SLASH**
Clears the record number for SMF audits.

**SMFNUM control statement:**
This control statement specifies the ID number of the SMF record.

**Purpose**
The Classic Interface uses this SMF record for its audit.

The record ID number must be a unique number from 128 to 255 that you do not use for other applications.

A default value does not exist.

**Format**
The format of the **SMFNUM** control statement is:

```
SMFNUM=nnn
```

where *nnn* denotes the SMF record ID number.

**UPDATE control statement:**
This control statement specifies if the Classic Interface updates the control statements during a run.

**Purpose**
The default is **UPDATE=YES**.

You can use the **UPDATE** control statement only once per run.

**Format**
The format of the **UPDATE** control statement is:

```
UPDATE={YES|NO}
```

**Updating the security table:**
You can update the security table for internal and external security.

**About this task**
To update the security table, perform these steps:
Procedure

1. Edit the control statements in the KO2SUPDI member of &rhilev.&rte.RKD2SAM.

   To edit the setting, specify a new one instead of blanking out the old one, especially when changing a command from EXTERNAL=YES to EXTERNAL=NO.

   If you implement external security, perform these steps:
   a. Enter the MODULE control statement.
      It denotes the load module that contains the exit routine.
   b. Indicate which commands should use external security by using the EXTERNAL=YES setting on the COMMAND control statements.

   To remove control from external security, perform these steps:
   a. Blank out the keyword of the MODULE control statement.
   b. Change commands that are marked with EXTERNAL=YES to EXTERNAL=NO.

      Otherwise, you cannot execute commands that are marked with an internal security level of 0.

2. Submit the job by using the KO2SUPD member of &rhilev.&rte.RKD2SAM.

   KO2SUPD contains the JCL to run KOBSUPDT, which is the security update utility program. KOBSUPDT performs the updates to the security table. It generates a list of the edits and, if requested, a complete list of security information.

   Successful completion of the job produces the message 0B9147 LOAD MODULE TEXT SUCCESSFULLY UPDATED

   If the update program flags statements as incorrect, correct the statements and resubmit them.

3. Stop all Classic Interface sessions in an address space.

   You must do this before the changed security table comes into effect because it is part of a reentrant load module. For example, if five Classic Interface sessions are active, you must stop them all before new Classic Interface sessions can use the updated security table.

4. Start a new Classic Interface session.

Results

The changes to the security table come into effect.

Examples

This example shows the provided sample JCL that you can modify according to the needs of your system.

It resides in the data set &rhilev.&rte.RKD2SAM(KOBSUPD), where &rhilev.&rte is the high-level qualifier of your runtime environment.

```plaintext
//SECURITY JOB
//STEPS EXEC PGM=KOBSUPDT,PARM=KO20CMDB
//STEP1 LIB DD DSN=&rhilev.&rte.RKANMOD,DISP=SHR
//SYSLIB DD DSN=&rhilev.&rte.RKANMOD,DISP=SHR
//SYSPRINT DD SYSOUT=*   //SYSIN DD DSN=&rhilev.&rte.RKD2SAM(KO2SUPDI),DISP=SHR
```
where:

**PARM=**  
Identifies the load module that contains the security table of the Classic Interface.

**STEPLIB**  
Specifies the name of the load library where KOBSUPDT resides.

**SYSLIB**  
Specifies the name of the library where KO2OCMDB resides.

**SYSPRINT**  
Specifies the print output for the reports that the security program produces.

**SYSIN**  
Specifies the name of the data set that contains the control statements.

This example shows the control statements that are used to update the security table.

Member O2SUPDI in the &rhlce.&rtc.RKD2SAM data set contains these control statements:

```
COMMAND=PEEK,LEVEL=1
COMMAND=.DSA,LEVEL=3,EXTERNAL=YES,AUDIT=WTO
COMMAND=MLST,EXTERNAL=YES
COMMAND=XMZP,LEVEL=DISABLE,AUDIT=BOTH
COMMAND=XMLS,LEVEL=2
MINOR=JOBS,LEVEL=2
COMMAND=/SAVE,LEVEL=1,AUDIT=NONE
MODULE=MYSECURE
SMFNUM=233
LIST=YES
UPDATE=NO
```

The command control statements in this example result in these settings for the commands of the Classic Interface:

**PEEK**  
A user who has specified the internal security level 1 password or higher can execute PEEK and its minor commands. The Classic Interface does not perform external security checking.

**.DSA**  
The Classic Interface performs external security checking and writes a message on the master console when .DSA is invoked. If external security is unavailable, only a user who specifies the internal security level 3 password can execute .DSA.

**MLST**  
The Classic Interface performs external security checking but no auditing.

**XMZP**  
The command cannot be executed. The Classic Interface writes a message on the master console and writes an SMF record when XMZP is issued. There is no external security checking.

**XMLS**  
A user who has specified either the level 2 or level 3 internal security password can execute XMLS.

**JOBS**  
This is a minor command of the **PEEK** command. In the example, the **PEEK** is specified as a level 1 authorized command. The LEVEL=2 setting on the **JOBS** command specifies that only level 2 or 3 users can access it.

**/SAVE**  
A user who has specified the level 1 password, the level 2 password, or the level 3 password can execute the **/SAVE** command. It is not audited.
The remaining command control statements in this example result in these settings:

**MODULE**
- MYSECURE is the name of the module that contains the security exit routine.

**SMFNUM**
- The SMF ID is set to 233.

**LIST**
- YES indicates that the Classic Interface produces a listing.

**UPDATE**
- NO indicates that the Classic Interface does not update the security table.
  This is a trial run.

### Worksheet for planning your configuration

The following worksheet describes key parameters for configuring OMEGAMON XE for DB2 PE.

#### Purpose

Use this worksheet in the following ways:

- To understand what key parameters and values are required to configure the product
- To record the values that you have provided for the configuration in the value field of the following tables.

The worksheet is not intended to be a complete list of all configuration parameters. It includes only the key parameters that you must determine before you configure the product.

**Tip:** Complete as much of this worksheet as you can before you begin installing the product. You might need to interact with several different roles to gather the information necessary to properly configure the product. Ensure that you have the necessary authorizations on the data sets as listed in "Prerequisites" on page 28.

#### User interfaces

Mark the user interfaces that you intend to use.

<table>
<thead>
<tr>
<th>User interfaces of OMEGAMON for DB2 PE</th>
<th>Use (Y/N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3270 user interfaces on the host</td>
<td></td>
</tr>
<tr>
<td>Classic Interface</td>
<td></td>

</tbody>
</table>
Data set naming conventions

Table 9. High-level qualifiers of the different data sets

<table>
<thead>
<tr>
<th>High-level qualifier</th>
<th>Description</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>High-level qualifier of Configuration Tool working libraries</td>
<td>Used for the Configuration Tool work libraries (for example, INSTLIB and INSTJOBS).</td>
<td></td>
</tr>
<tr>
<td>High-level qualifier for the SMP/E target libraries (ërthlev)</td>
<td>The name of the target libraries of your SMP/E installation of the product.</td>
<td></td>
</tr>
<tr>
<td>High-level qualifier for VSAM and non-VSAM runtime libraries</td>
<td>Used for allocating the runtime libraries. One set of runtime libraries contains the executable code (base libraries). A second set of libraries contains the configuration members that are unique for a particular LPAR. The runtime libraries are referenced by started tasks running on a z/OS image. You can specify two different high-level qualifiers for VSAM and non-VSAM data sets with a maximum length of 26 characters.</td>
<td></td>
</tr>
<tr>
<td>High-level qualifier for work data sets allocated by the OMEGAMON Collector</td>
<td>Used by the OMEGAMON Collector for the allocation of additional work data sets (for example for Event Exception Processing or Performance Warehouse). This high-level qualifier is also used to allocate operational data sets, for example for Near-Term History data collection. You can specify two different high-level qualifiers for VSAM and non-VSAM data sets with a maximum length of 18 characters.</td>
<td></td>
</tr>
</tbody>
</table>

Runtime environment variables

For a complete list of runtime environment parameters, refer to the IBM® OMEGAMON and Tivoli Management Services on z/OS shared documentation.

The following table lists the key variables that you specify for the runtime environment. The other values that you specify for the runtime environment are used to generate default values for the configuration of the product. You can overwrite the values during the configuration of your runtime environments.

Table 10. Variables required to configure a runtime environment

<table>
<thead>
<tr>
<th>Runtime environment variable</th>
<th>Description</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name of the runtime environment (mid-level qualifier)</td>
<td>Specify a name for your runtime environment. The runtime libraries that are allocated for this setup will use this name as mid-level qualifier in the data set names. If you enable system variable support, use the name of the LPAR that you run your initial tests on before rolling out the product(s) to other LPARs.</td>
<td></td>
</tr>
</tbody>
</table>
| Type of runtime environment                                      | Select the type of runtime environment that you want to use:  
  • FULL  
  • SHARING SMP/E  
  • SHARING BASE  
  • BASE                                                                                                                                                      |            |
| Started task prefix for OMEGAMON address spaces                  | Specify a 4-character prefix according to the naming conventions on your system. It will be used to generate default values for the started tasks.                                                            |            |
### Table 10. Variables required to configure a runtime environment (continued)

<table>
<thead>
<tr>
<th>Runtime environment variable</th>
<th>Description</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>JCL suffix for jobs generated by the Configuration Tool</td>
<td>Specify a 4-character suffix. It will be used as part of the names of the configuration jobs, which are generated in the course of the configuration and stored in the &amp;shilev;INSTJOBS work library. Ensure that you use a unique suffix for each runtime environment so that you can identify the configuration jobs that belong to one runtime environment in &amp;shilev;INSTJOBS.</td>
<td></td>
</tr>
<tr>
<td>Tivoli Enterprise Monitoring Server</td>
<td>You need Tivoli Enterprise Monitoring Server only if you want to use the Tivoli Enterprise Portal. If you want to configure a Tivoli Enterprise Monitoring Server in this runtime environment, specify Y. Your Tivoli Enterprise Monitoring Server can be configured in a different runtime environment on this LPAR, on a different LPAR or on one of the supported workstation platforms. For more information, see the <a href="https://www.ibm.com/support/knowledgecenter/SSEPEK_7.1.0/com.ibm.zos.r7.1/mtz/mtz_tivoli_comparing_types.htm">Tivoli Monitoring in the IBM Knowledge Center</a>.</td>
<td></td>
</tr>
<tr>
<td>System variable support</td>
<td>Specify whether you want to enable system variable support. If system variable support is enabled, the Configuration Tool allows z/OS system symbols as part of the VTAM applid names. Type readme sys on the command line for detailed information.</td>
<td></td>
</tr>
<tr>
<td>Fold password to upper case</td>
<td>Specify whether you want to enable mixed case password support. If you specify N, the passwords entered by the user will not be folded to upper case any more.</td>
<td></td>
</tr>
<tr>
<td>Network ID</td>
<td>Specify the network ID used for VTAM communication.</td>
<td></td>
</tr>
<tr>
<td>VTAM applid prefix</td>
<td>A four character prefix that is used for generating the VTAM applids.</td>
<td></td>
</tr>
</tbody>
</table>

### Basic configuration variables

### Table 11. Variables required for the basic configuration

<table>
<thead>
<tr>
<th>Basic configuration variable</th>
<th>Description</th>
<th>Your value</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMEGAMON Collector started task</td>
<td>Started task name for the OMEGAMON Collector.</td>

<td></td>
</tr>
</tbody>
</table>
Chapter 3. Installing and configuring

PARMGEN

PARMGEN was designed to deliver a more intuitive method for configuration. It replaces the former Configuration Tool (also known as ICAT).

With PARMGEN, the configuration of all available products follows exactly the same procedure:
1. Basic setup of an RTE.
2. Choosing the products and components to configure.
3. Preparing the environment.
4. Configuring all products and components.
5. Finishing with the deployment.

The differences in product configuration are mainly in the PARMGEN parameter profile. This is the reason why this documentation only covers OMEGAMON for DB2 PE topics. General information on how to use PARMGEN, migration from older versions, or from the Configuration Tool can be found in the following sources:

- PARMGEN Alternative Configuration for IBM OMEGAMON and other Tivoli Management Services technote
- The PARMGEN configuration method
- Common PARMGEN - Implementation scenarios
- Common parameters

In the Configuration Tool, the configuration of parameters and values was done in a product-specific user interface. In PARMGEN, all product-specific parameters are stored in one PARMGEN profile. Parameters are grouped into sections, and each section contains the parameters for only one product or component. Additionally, all parameters start with Kpp where pp is the product identifier. The components that make up OMEGAMON for DB2 PE are the following:

- D2 - OMEGAMON for DB2 PE/OMEGAMON for DB2 PM
- D5 - OMEGAMON XE for DB2 on z/OS Agent

For a comprehensive reference of the PARMGEN parameters for this product, see the Parameter Reference. This reference can be used to look up specific parameters to get the following information:

- Parameter description
- Required or optional parameter for running the OMEGAMON for DB2 PE server
- Default value
- Minimum value (if the parameter type is numeric)
- Maximum value (if the parameter type is numeric)
- Permissible values (if the parameter type is list)
- Locations where the parameter is stored (the configuration member and the data set it is generated to)
  - Parameter name (the line that is written to the configuration member to store the value)
• Panels in the Configuration Tool, which is especially helpful when you are moving from the Configuration Tool to PARMGEN. You can look up the following information:
  – Panel name
  – Panel ID
  – Panel field
  – Default value
  – Minimum value (if the parameter type is numeric)
  – Maximum value (if the parameter type is numeric)
  – Permissible values (if the parameter type is list)
• Batch parameter name (the name of the parameter when using batch installation)
• PARMGEN name (the name of the parameter in PARMGEN)
• PARMGEN classification

A list of all available parameters is available in the [Parameter Reference](#).

**Monitoring profiles and DB2 subsystems**

Monitoring profiles specify which monitoring functionality is to be used for the different DB2 subsystems. Each DB2 subsystem is associated with a monitoring profile.

OMEGamon for DB2 PE offers many functions that can be configured for each DB2 subsystem. In most cases however, the monitoring requirements for the different DB2 subsystems are not completely unique, which means that you can reuse one configuration for several DB2 subsystems. For example, in a development environment you might want to collect very detailed performance data to perform a sophisticated analysis, while in a production environment this level of detail is not needed and causes unnecessary overhead. So you would use one set of configuration values for the DB2 subsystems that are used for development and another set of configuration values for DB2 subsystems in production.

A monitoring profile is such a set of configuration values. It is independent of the DB2 subsystem. Each DB2 subsystem is associated with a monitoring profile to determine the monitoring functionality. Several DB2 subsystems can be associated with the same profile, independent of the LPAR they reside on. As a result, profiles are reusable for many different DB2 subsystems that have similar monitoring requirements across different LPARs, and you can do changes to monitoring profiles rather than re-configuring every single DB2 subsystem.

**Note:** The monitoring profile refers to the DB2 monitoring function parameters. This is not to be confused with the PARMGEN user profile that holds all product and component parameters.

In PARMGEN, DB2 subsystems and monitoring profiles can be distinguished by their parameter name, as follows:
• **KD2_DBnn** - Parameters for the DB2 subsystem configuration
• **KD2_PFnn** - Parameters for the monitoring profiles
nn is used to distinguish between different DB2 subsystem configurations and monitoring profiles. The first profile uses 01, the second 02, and so on. It is required to put all KD2_DBnn / KD2_PFnn parameters between starting and ending identifiers, as in the following examples:

```
KD2_DB   START
KD2_DB01...
...
KD2_DB02...
...
KD2_DBnn...
...
KD2_DB   END

KD2_PF   START
KD2_PF01...
...
KD2_PF02...
...
KD2_PFnn...
...
KD2_PF   END
```

### Basic product parameters

This section lists the basic parameters of OMEGAMON for Db2 PE.

The basic setup of OMEGAMON for Db2 PE covers the configuration of the OMEGAMON Collector, the configuration of the user interfaces, and the configuration of the monitoring functions that are enabled globally for all DB2 subsystems.

This section contains a number of parameters to configure the server and the user interfaces. The following table distinguishes between the server-related parameters and the user interface parameters. This information will help you to know which parameters need to be configured in order to use a specific user interface.

**GBL_DB2_KD2_CLASSIC_STC**

OMEGAMON Collector started task

**Description**

The name of the OMEGAMON Collector started task. This name should conform to any security facility in place in your installation.

**Required or optional**

Required

**Default value**

%RTE_STC_PREFIX%D2

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**In the Configuration Tool (ICAT)**

**Panel name**

OMEGAMON Collector Information

**Panel ID**

KD261PN
Panel field
  Started task

Default value
  &RTESTCP.O2

Batch parameter name
  KD2_CLA_STC

PARMGEN name
  GBL_DB2_KD2_CLASSIC_STC

PARMGEN classification
  CLA

**GBL_DSN_DB2_DSNEXIT**

DB2 exit library

**Description**

The name of the dataset in which the DB2 exit load modules reside that should be used by the OMEGAMON Collector.

**Required or optional**

Optional

Default value
  DSN.V9R1M0.DSNEXIT

**Location where the parameter value is stored**

**KD2_CLASSIC_DB2ID_DEFAULT**
Default DB2 ID

**Description**
Specify the default DB2 subsystem ID for real-time VTAM mode connection. When you log on to Classic Interface, this is the default DB2 subsystem to be monitored.

With datasharing group support, a new value for the default DB2 ID was introduced NONE. If you specify NONE and log on to Classic Interface, you are routed to the ZRLOG panel that lists all DB2 subsystems with status information and allows you to select the DB2 subsystems that you want to monitor. NONE is used as the default value.

**KD2_CLASSIC_LROWS**
Number of logical rows

**Description**
LROWS specifies the number of logical rows that are available for the output area on the Classic Interface. The number of logical rows should always be set to a number greater than the number of rows to be displayed on the terminal. The default for LROWS is 255.

Increasing the number of logical rows results in higher storage consumption.
Default value

KD2_CLASSIC_MVS_SYSID
z/OS system ID

Description
The name of the z/OS system that the DB2 subsystem runs on. The z/OS system name that you specify here is used to replace the %SY% variable in data set names. If you specify a data set name for a monitoring profile, for example the name of a Near-Term History VSAM log data set, you can use %SY% as a variable for the z/OS system name. If you enable 'Add JES2 JOBPARM SYSAFF to jobs' (KD2_OMPE_SYSAFF), the z/OS system name is used to generate the SYSAFF parameter in the jobcards of the BIND and GRANT jobs generated for the different DB2 subsystems.

Required or optional

**KD2_CLASSIC_USER_PROFILE**

Profile ID

Description
USER specifies the 2-character profile ID that is to be used for the Classic Interface session. A default profile with the profile ID #P is provided by IBM.

In the profile the configuration options for the ClassicInterface session are specified. You can create a customized profile. To create a new profile, log on to the Classic Interface, modify the selected profile options and save the adjusted profile specifying a 2-character profile ID. If the profile you specified for USER does not exist, the Classic Interface uses the default profile /C for the logon. So you can specify a profile ID for USER now and create the new profile at the first logon to Classic Interface.

**KD2_OMPE_AUTODETECT**
Enable autom. DB2 subsystem detection

**Description**
This feature is part of the OMEGAMON Collector PESERVER subtask. If activated, all active DB2 subsystems in the LPAR are detected automatically, regardless of whether the DB2 subsystem has been explicitly configured during the configuration process or not. You can activate or deactivate this feature:

| Y | Automatic detection is activated. Detection of all active DB2 subsystems starts automatically. |
| N | Automatic detection is deactivated. Only the DB2 subsystems that are explicitly configured are monitored. |

If a DB2 subsystem has been detected automatically but has not been configured so far, monitoring is not possible because required bind and grant jobs have not been submitted. Error messages are written to the job log. To enable monitoring the subsystem must be configured as usually with PARMGEN to create the required jobs. The configuration steps of Complete the Configuration must be executed.

**Required or optional**

KD2_OMPE_SYSAFF
Add JES2 JOBPARM SYSAFF to job

Description
Specify whether you want to have the JES2 JOBPARM SYSAFF added to the generated DB2 related jobs. These jobs perform BIND or GRANT SQL statements on a specific DB2 subsystem and therefore have to be executed on the z/OS system where the respective DB2 subsystem runs on. This can be useful, for example if you want to install OMEGamon XE for DB2 PE on several LPARs with shared DASD. See the Configuration and Customization Guide for details on different rollout scenarios. Furthermore if you set 'Use as model RTE for several LPARs' to 'Y' then the SYSAFF JOBPARM is also added to the 'Create DB2 related runtime members DB2 related' job.

KD2_OMPE_USE_MODEL
Use model definitions in this RTE

Description
Specify whether you want to use the DB2 subsystem definitions that are configured in a model RTE 'Use this RTE as a as a model' is set to Y different from this RTE. In the model RTE all the DB2 subsystems are configured that you want to monitor with the OMEGAMON Collector running from this RTE. All the configuration information that you need for the DB2 subsystem related runtime members is created in the profile library RKD2PRF of the model RTE. By submitting the job CRTDB2 in rhilev.midlev.rtename.RKD2SAM all runtime members needed for this RTE
KD2_OMPE_USE_MODEL

are created on the basis of the RKD2PRF library of the model RTE. The
CRTDB2 job is generated by the 'Create runtime members OMEGAMON
Collector/UI' job.

Required or optional

KD2_OMPE_VSAM_DSHLQ
Use the KD2_OMPE_VSAM_DSHLQ parameter to specify the high-level qualifier for the VSAM data sets that the thread history collector allocates.

Description
This parameter specifies the high-level qualifier for the VSAM data sets allocated by the OMEGAMON Collector.

The default value is generated from the high-level qualifier and the mid-level qualifier that you specified for your RTE.

This parameter is also the basis of the THRDDATASET() parameter in the RKD2PAR(COPT&dbid) for the Enhanced 3270UI thread history VSAM data sets.

**KD2_PFnn_HIS_SUSPCOLL**
Suspend data collection

**Description**
Specifies the option that controls memory usage by the Near-Term History Data Collector during times when no VSAM dataset is available. A VSAM file is considered unavailable from the time all allocated file space is used until the end of a successful flush job execution. The 'Y' option causes the collector to discard the collected trace data until a VSAM file becomes available for use. The 'N' option causes the Near-Term History Data Collector to accumulate trace data to memory until a VSAM file becomes available for use.

**Required or optional**
Optional (Required in case KD2_PF_HIS_START is set to Y)

**Default value**
Y

**Permissible values**
Y, N

**Location where the parameter value is stored**
In the COPTssid member of the rhilev.midlev.rtename.RKD2PAR library

**Output line**

KD2_PFnn_HIS_POSTPCT
Threshold for historical collection

Description
Specifies the option to tune the Near-Term History Data Collector if you often see the DSNW133I messages issued by DB2. This value is used to compute a “high water mark” or threshold for historical collection. This threshold is a percentage of the total number of bytes in the IFI buffer. When this threshold is exceeded, DB2 will post the Near-Term History Data Collector to drain the buffer. The Near-Term History Data Collector will allow any percentage value from 1-99. Start from the default value of 70 and test small increments up or down.

Required or optional
Optional (Required in case KD2_PF_HIS_START is set to Y)

Profile parameters
This section lists the profile parameters.

Monitoring profiles specify which monitoring functionality is to be used for the different DB2 subsystems. Each DB2 subsystem is associated with a monitoring profile.

OMEGAMON for Db2 PE offers many functions that can be configured for each DB2 subsystem. In most cases, however, the monitoring requirements for the different DB2 subsystems are not completely unique, which means that you can reuse one configuration for several DB2 subsystems. For example, in a development environment you might want to collect very detailed performance data to perform a sophisticated analysis, while in a production environment, this level of detail is not needed and causes unnecessary overhead. So you would use one set of configuration values for the DB2 subsystems that are used for development and another set of configuration values for DB2 subsystems in production.

A monitoring profile is such a set of configuration values. It is independent of the DB2 subsystem. Each DB2 subsystem is associated with a monitoring profile to determine the monitoring functionality. Several DB2 subsystems can be associated with the same profile, independent of the LPAR they reside on. As a result, profiles are reusable for many different DB2 subsystems that have similar monitoring requirements across different LPARs, and you can do changes to monitoring profiles rather than reconfiguring every single DB2 subsystem.

As the runtime members for a DB2 subsystem depend on the configuration values of the monitoring profile as well as the configuration values of the DB2 subsystem itself, the creation of the runtime members requires two steps. The first step creates the profile members, where all values that are specific to the DB2 subsystem are substituted by variables, and writes them to &rhilev.&rte.RKD2PRF. The second step replaces these variables with the actual configuration values of the DB2 subsystem and writes the members to &rhilev.&rte.RKD2SAM and &rhilev.&rte.RKD2PAR.

How to create DB2 profiles in PARMGEN user profiles
This section explains how to create DB2 profiles in PARMGEN user profiles.

DB2 profiles are configured along all other configuration parameters in the PARMGEN user profile. They are identified by KD2_PFxx where xx is the number that distinguishes different DB2 profiles. For example, KD2_PF01 refers to the first DB2 profile and KD2_PF02 refers to the second DB2 profile. You can create up to 99 DB2 profiles.

The section that holds DB2 profiles is structured as follows:
where \( xx \) and \( yy \) are the numbers of those two DB2 profiles. The parameter \( KD2_PFxx_PROFID \) contains the ID that is used to assign a DB2 subsystem configuration with a DB2 profile. You can choose your ID as you like but it is recommended to include the number that identifies the DB2 profile in the ID in order to easily identify the relationship between DB2 subsystems and DB2 profiles.

In order to assign a DB2 profile to a DB2 subsystem configuration, use the parameter \( KD2_DBzz_DB2_PROFID \). For example, to assign the DB2 profile \( P0xx \) to a DB2 subsystem configuration set, use the following parameter:

\[
KD2_DBzz_DB2_PROFID P0xx
\]

**Object/Volume analysis**

This section lists the parameters for object or volume analysis.

Object analysis provides information about DB2 object allocations, object activities, volume activities, and data set extend activities.

You can start object analysis in one of the following ways:

- Manually, using the START OBJECT ANALYSIS COLLECTORS panel.

  **Note:** If there are significant levels of I/O activity on monitored DASD volumes in your environment, you can start this function manually to measure specific workloads or help manage isolated performance situations.

- Automatically, when the OMEGAMON for Db2 PE server is activated.

  **Note:** It is recommended that you do not automatically start object analysis in the AUTOSTART configuration.

By default, the Object Analysis function is shipped with a security level of 3, and requires that you enter a level 3 password to successfully complete the startup. If you want to use external security, you must have the appropriate resource class definition attached to your OMEGAMON for Db2 PE logon identifier.

**Note:** To start Object Analysis, you must first start OMEGAMON for Db2 PE Event Collection Manager (EVENTMGR).

OMEGAMON for Db2 PE provides object analysis data only for active DB2 objects.

Object analysis can only be performed on a single DB2 subsystem, no matter whether the subsystem is a member of a data sharing group or not.
KD2_PFnn_OA_ECM:

Start Event collection manager

**Description**

The Event collection manager ECM provides an environment that is required for Object/Volume Analysis Collectors. The ECM does not cause much overhead. If you start the ECM at OMEGAMON Collector startup, then you can start Object/Volume Analysis from the Classic Interface later.

The Event Collection Manager must be active before Object/Volume Analysis can be started for a DB2 subsystem. The wait interval specifies the number of seconds that have to pass after ECM startup before the startup commands for Object/Volume Analysis are issued.

ECM is started implicitly when you configure Object Analysis to be auto-started at Common collector startup. If you specified a wait interval greater than 0 in several monitoring profiles that are used the maximum wait interval specified is used.

Periodic Exception Processing
This section lists the parameters for periodic exception processing.

Periodic Exception Processing analyzes system metrics and compares them against predefined thresholds, user-defined thresholds, and application metrics.

When a threshold is exceeded, a periodic exception is shown. This event is commonly called an exception. This function is available in Performance Expert Client.

You can start periodic exception processing in one of the following ways:
- Manually, after you start Performance Expert Client. In this case, you can define a set of thresholds for each user ID.
- Automatically, to start one user’s threshold definitions when the server starts. In this case, the threshold definitions are already started when the user logs on to the client.

Threshold data set name

**Description**

The Exception Threshold data set contains the exception thresholds for the Statistics and Accounting exception reports and traces. When exception processing is active, the instrumentation data is checked against these thresholds.

You can either use an existing threshold data set or let ICAT generate a new threshold data set. Specify a fully qualified data set name without quotes. If the specified threshold data set does not exist, ICAT generates an empty sequential data set using the following attributes:

- **RECFM**: VB
- **LRECL**: 255
- **BLKSIZE**: 6233

You need to specify thresholds in the specified data set. If the threshold data set is empty, Automatic Exception Processing is not started and the following message is written to the message log:

```
FPEV0263E D823 AUTOMATIC EXCP NOT STARTED - NO VALID THRESHOLD
```

To specify thresholds:

Use the thresholds in the supplied sample Threshold data set DGOETV41 in RKO2DATA or in case of an SMP/E Sharing RTE: TKO2DATA. The sample contains a selection of exception fields with predefined threshold values and can be used to get started with exception reporting. To use the sample threshold data set as input for Automatic Exception Processing, copy the contents of DGOETV41 to the threshold data set generated by ICAT.

Note: The sample Exception Threshold data set member DGOETV41 has a different record length. As a result, when you copy member DGOETV41 to your newly allocated data set, you see a warning that records are truncated. You can ignore this warning.

Refer to the Reporting User's Guide 'Specifying exceptions using the Exception Threshold data set editor' and 'Exception Threshold data set' for additional information.

**Required or optional**

Optional (Required in case KD2_PF_AEXCP_D2PYACT is set to Y)

**Parameter Reference - thread history**

This section lists the parameters added or updated for thread history. This includes several parameters introduced to support thread history in the Enhanced 3270 user interface.

**Note:** You can start thread history collection by default when you start OMEGAMON for Db2 PE, or you can use operator commands to start and stop thread history collection.

There are several new parameters introduced to support the Enhanced 3270UI thread history:
- KD2_PFnn_THRDHIS_LOG_NUM
- KD2_PFnn_THRDHIS_DYN_SQL
- KD2_PFnn_THRDHIS_LOCK_CNTN
- KD2_PFnn_THRDHIS_LOCK_SUSP
- KD2_PFnn_THRDHIS_SCAN_SUMM
- KD2_PFnn_THRDHIS_SORT_SUMM

**Note:** These parameters can be configured in PARMGEN, but they are not yet implemented for use with thread history in the Enhanced 3270UI.

**Change to KD2_PFnn_HIS_STORE parameter**

The following field has the same default value but now has additional options that support thread history:

KD2_PFnn_HIS_STORE now allows values with the THVSAM option (VSAMTHVSAM, VSAMSEQTHVSAM, SEQTHVSAM, THVSAM). This option activates Enhanced 3270UI thread history collection.

The following sections detail the parameters that have been updated to facilitate thread history in the Enhanced 3270UI.

**KD2_OMPE_VSAM_DSHLQ:**

Use the KD2_OMPE_VSAM_DSHLQ parameter to specify the high-level qualifier for the VSAM data sets that the thread history collector allocates.

**Description**

This parameter specifies the high-level qualifier for the VSAM data sets allocated by the OMEGAMON Collector.

The default value is generated from the high-level qualifier and the mid-level qualifier that you specified for your RTE.

This parameter is also the basis of the THRDDATASET() parameter in the RKD2PAR(COPT&dbid) for the Enhanced 3270UI thread history VSAM data sets.

KD2_PFnn_HIS_ACCTG_CLAS:

Use the KD2_PFnn_HIS_ACCTG_CLAS parameter to specify one or more types of accounting data to collect.

Description
Specifies the type of accounting data to collect.
Class 1 IFCID 3 no In-DB2 or I/O and lock wait times.
Class 2 IFCID 3 In-DB2 time.
Class 3 IFCID 3 I/O and lock wait times.
Class 7 IFCID 3,239 Package/DBRM In-DB2 time.
Class 8 IFCID 3,239 Package/DBRM I/O and lock wait times.
Class 10 IFCID 239 Package detail
Class 11 IFCID 3,200 No package info. For DB2 v11 and above only.
Enter a list of the accounting classes that you want to collect data from. For example "1 2 3"

NOTE: In order to reduce the number of IFCIDs collected and not collect the IFCID 239, class 11 should be requested without classes 7, 8 and 10. Class 11 supported in DB2 v11 and above.

KD2_PFnn_HIS_DYN_DSNAME:

This parameter lets you specify a base dataset name that is used to create the sequential datasets for storing Near-Term History trace data.

Description

Specify a base dataset name that is used to create the sequential datasets that store Near-Term History trace data. Use the following variables to construct the sequential dataset name. To ensure unique dataset names, you must use at least @DB2, @DATE and @TIME:

@DB2  Inserts the DB2 subsystem ID of the data being collected into the name of the dataset.

@DATE  Inserts the date of the first record in the dataset into the name of the dataset.

@TIME  Inserts the time of the first record in the dataset into the name of the dataset.

This field is applicable only if the storage type is VSAMSEQ, VSAMSEQTHVSAM, or SEQTHVSAM and the storage mechanism is DYNAMIC.
**Required or optional**

KD2_PFnn_HIS_DYN_SQL:

The KD2_PFnn_HIS_DYN_SQL parameter specifies whether to collect dynamic SQL data.

Valid values
   This specifies whether dynamic SQL text and access path information is collected.
   Y: the collector activates IFCIDs 22, 63, 105, and 107.
**KD2_PF_HIS_DYN_SQL**

F: the collector activates IFCIDs 22, 350, 105, and 107. IFCID 350 records the complete text of a parsed SQL statement, while IFCID 63 is limited to the first 5000 bytes of a SQL statement.

**Required or optional**  
Optional (Required if KD2_PF_HIS_START is set to Y.)

**Default value**  
N

**Valid values**

**KD2_PF_HIS_POSTPCT**

Threshold for historical collection

**Description**

Specifies the option to tune the Near-Term History Data Collector if you often see the DSNW133I messages issued by DB2. This value is used to compute a “high water mark” or threshold for historical collection. This threshold is a percentage of the total number of bytes in the IFI buffer. When this threshold is exceeded, DB2 will post the Near-Term History Data Collector to drain the buffer. The Near-Term History Data Collector will allow any percentage value from 1-99. Start from the default value of 70 and test small increments up or down.

**Required or optional**

Optional (Required in case KD2_PF_HIS_START is set to Y)

**Default value**

70

**Minimum**

1

**Maximum**

99

KD2_PFnn_HIS_SEQ_ARC_DS:
The KD2_PFnn_HIS_SEQ_ARC_DS parameter specifies the name of the archive data set.

Description
If you selected GDG, specify the following parameters:
Specify the name for the base data set of the Generation Data Group GDG. For the GDG type, the data set name can have a maximum of 35 characters.
If you selected DYN, specify the following parameters:
Use the following variables to construct the sequential data set name. To ensure unique data set names, you must use at least @DB2, @DATE and @TIME:
@DB2 Inserts the DB2 subsystem ID of the data being collected into the name of the data set.
@DATE Inserts the date of the first record in the data set into the name of the data set.
@TIME Inserts the time of the first record in the data set into the name of the data set.
This field is only applicable if the storage type is VSAMSEQ, VSAMSEQTHVSAM, SEQTHVSAM and the storage mechanism is STATIC SEQUENTIAL.

In the COPTssid member of the %RTE_HILEV%.%RTE_NAME %.RKD2PAR library

**Output line**
SPACE(CYL,<KD2_PFnn_HIS_SEQ_PRIMARY_CYL>,<value>)
Storage mechanism

Description
If you specified VSAMSEQ, VSAMSEQTHVSAM, SEQTHVSAM you can choose one of the following 3 alternatives to store trace data in sequential files:

**Static sequential S**
You may specify 2 to 7 sequential datasets for trace data collection. When the first dataset is full the Near-Term History Data Collector switches to the next available dataset. When the last available dataset in the sequence is full, the Near-Term History Data Collector switches to the first dataset in the sequence again and overwrites the data in the first dataset. Each time the Near-Term History Data Collector switches to a full sequential dataset to overwrite it, you can archive its content to additional sequential datasets.

**Dynamic sequential D**
The Near-Term History Data Collector always allocates a new dataset when the currently used dataset becomes full. As a result, the collected data is not overwritten.

**GDG G**
In this case a Generation Data Group GDG is used. The mechanism is similar to the one described for the storage type Static sequential. When all datasets are full the Near-Term History Data Collector overwrites the trace data in the first dataset. However, in a GDG, the z/OS, not the Near-Term History Data Collector, switches between the different datasets generations. For this alternative archiving is not supported.

**Required or optional**
Optional (Required in case KD2_PF_HIS_START is set to C, Y and KD2_PF_HIS_STORE is set to VSAMSEQ, VSAMSEQTHVSAM, SEQTHVSAM)

**Default value**
S

**Permissible values**
S, D, G

**Location where the parameter value is stored**
This value is not stored in a configuration member.
KD2_PF_HIS_SEQ_UNIT1

**KD2_PFnn_HIS_STORE:**

**Storage type**

**Description**

The data collected by Near-Term History is stored in VSAM datasets. If you want to make the data available for long-term history analysis with the Batch Reporter component, it has to be stored in sequential files in addition to VSAM datasets. If you want to collect Thread history data for Enhanced 3270UI, THVSAM should be specified. Specify one of the following values for storage type:

**VSAM**

Store the data to VSAM datasets for OMEGAMON DB2 Classic near-term-history (NTH) support.

**VSAMSEQ**

Store the data to VSAM datasets and sequential files for OMEGAMON DB2 Classic NTH support.

**THVSAM**

Store the data to VSAM datasets for Enhanced 3270UI Thread history support.

**VSAMSEQTHVSAM**

Store the data to VSAM datasets, sequential files for OMEGAMON DB2 Classic NTH support and VSAM datasets for Enhanced 3270UI Thread history support.
SEQTHVSAM
Store the data to sequential files for OMEGAMON DB2 Classic NTH support and VSAM datasets for Enhanced 3270UI Thread history support.

VSAMTHVSAM
Store the data to VSAM datasets for OMEGAMON DB2 Classic NTH support and VSAM datasets for Enhanced 3270UI Thread history support.

Required or optional

Snapshot history (including DB2 Connect Monitoring)
This section lists the parameters for snapshot history (including DB2 Connect Monitoring).

Snapshot history data is useful, for example, if you want to examine activities leading to, and following, an exception without recreating the situation. The data is periodically stored by the OMEGAMON Collector in a wrap-around-managed snapshot history data set.

You can define how often the snapshots are stored by setting the sample interval time. The amount of stored snapshots depends on the snapshot data volume and the specified snapshot history data set size. When the defined maximum number of snapshots is exceeded, the oldest snapshot is deleted and the newest snapshot is added.

You can view this information through the history mode in the Performance Expert Client. This mode allows you to display recently stored snapshots at a specified point-in-time. You can then scroll forward and backward through the history of snapshot data to get a better understanding of what happened and to identify what caused the problem (for example, detected situations, bottlenecks, deadlocks, timeouts).

KD2_PFnn_DCM_D2SHDCAI:

DB2 Connect application data interval

Description
Specifies in seconds how often the OMEGAMON Collector is to collect DB2 Connect application data for later viewing. This value can be set from 10 seconds to 86400 seconds for one day. It is recommended to set this value to a multiple of KD2_PFnn_SH_D2SHSTAI.

Required or optional
Optional (Required in case KD2_PF_SH_D2SHKHST is set to Y and KD2_PF_DCM_D2SHDCAP is set to Y)

Default value
60

Minimum
10

Maximum
86400

Location where the parameter value is stored
In the OMPEssid member of the rhilev.midlev.rtename.RKD2PAR library

Output line

KD2_PFnn_DCM_D2SHDCAP:

DB2 Connect Monitoring application data

Description
Specify whether DB2 Connect Monitoring application data is to be collected.

If you enable data collection for this collection then this enables the function DB2 Connect Monitoring.
Note: To use DB2 Connect Monitoring Performance Warehouse has to run at least once to set up the required tables for DB2 Connect Monitoring. Furthermore the DB2 Performance Expert Agent for DB2 Connect Monitoring Workstation has to be installed.

DB2 Explain
This section lists the parameters for DB2 Explain.

Explain functions provide an easy-to-read representation of access plan information for your SQL queries and statements. You can use this information to decide how to tune your queries. The built-in explain functions are Easy Explain and the EXPLAIN report.

Note: You must create a database to be used by EXPLAIN. There are no special requirements regarding database name, storage group, or index buffer pool. But you must use an 8 KB buffer pool. The database name has to be specified using the PARMGEN.

KD2_PFnn_EX_D2EXACT:

Enable DB2 EXPLAIN

Description
Specify whether you want to enable DB2 EXPLAIN:
Enable DB2 EXPLAIN.

Y

N

Disable DB2 EXPLAIN.

Required or optional

Required

Default value

N

Permissible values

Y, N

Location where the parameter value is stored

This value is not stored in a configuration member.

DB2 SQL Performance Analyzer
This section lists all configuration parameters provided for DB2 SQL Performance Analyzer.

DB2 SQL Performance Analyzer provides you with an extensive analysis of SQL queries without executing them. This analysis helps you in tuning your queries to achieve maximum performance. DB2 SQL Performance Analyzer can analyze new access paths, determine if action is needed, and estimate the costs of new paths in database resources consumed.

With DB2 SQL Performance Analyzer you can reduce the escalating costs of database queries by estimating their cost prior to execution. It delivers an Easy Explain function that provides an alternate view of the Explain data. Comparison of old and new plans is supported, along with Retro-Explain for Access plans, helping you to find out how long queries will take and to prevent queries from running too long. It can also aid in the migration of catalog statistics to test machines for in-depth analysis of production applications.

KD2_PFnn_SQLPA_CF_ANLC:

Fully qualified SQL PA ANLC config

Description
Specify the fully qualified SQL PA ANL Control configuration.

**Required or optional**
Optional (Required in case KD2_PF_SQLPA_ENABLE is set to Y and KD2_PF_SQLPA_CF_ENBL is set to Y)

**Default value**

Additional DB2 traces
This section lists the parameters for additional DB2 traces.

You can specify additional DB2 trace commands to be started automatically when OMEGAMON XE for DB2 PE starts. Use the following parameters to provide valid START TRACE commands. Note that when OMEGAMON XE for DB2 PE/OMEGAMON XE for DB2 PM shuts down, the traces are not stopped.

**KD2_PFnn_TRACES_318:**

Start IFCID 318

**Description**

Used to specify whether a start trace command should be issued for IFCID 318. IFCID 318 is a switch that causes DB2 to collect detailed information on SQL statements in the dynamic statement cache. The collected information is externalized by means of IFCID 316.

If you set 'Enable end-to-end SQL monitoring support' (KD2_OMPE_E2E_MON_SPRT) to Y, IFCID 318 must be set to Y.

Note: Dynamic statement cache data collection is only available for DB2 Version 8 and higher. If you intend to use end-to-end SQL monitoring dynamic statement cache data collection is required. Make sure to set this flag to Y.

**Required or optional**

**KD2_PFnn_TRACES_400:**

Start IFCID 400

**Description**

Used to specify whether a start trace command should be issued for IFCID 400. IFCID 400 is a switch that causes DB2 to collect detailed information on static SQL statement in the EDM pool. The collected information is externalized by means of IFCID 401. The default is N.

If you set 'Enable end-to-end SQL monitoring support' (KD2_OMPE_E2E_MON_SPRT) to Y, IFCID 400 must be set to Y.

Note: Static statement data collection is only available for DB2 Version 10. If you intend to use end-to-end SQL monitoring static SQL statement data collection is required. Make sure to set this flag to Y.

---

**Preparing the system**

Before you can configure OMEGAMON for DB2 PE, you must install the program files, set up PARMGEN and a first runtime environment, and ensure that your system fulfills the prerequisites for the components that you plan to use.
About this task

The following topics provide detailed information:
1. “Installing the program files”
2. “Setting up security for the OMEGAMON Collector address spaces”
3. “Setting up TCP/IP services for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring”
4. “Enabling started jobs for Performance Warehouse” on page 312
5. “Specifying DB2 load libraries for the ISPF Monitoring Dialogs” on page 313
6. “Setting up RRSAF” on page 314

Installing the program files

OMEGAMON XE for DB2 PE on z/OS is installed using SMP/E.

About this task

See the Program Directory for IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS for detailed instructions.

Setting up security for the OMEGAMON Collector address spaces

The OMEGAMON Collector started task runs under a user ID. Therefore, you must create either a user ID or a group ID with the name DB2PM and connect the started task to this ID. Note that if you do not want to use Performance Warehouse, DB2 Connect Monitoring, or SQL Performance Analyzer, you can use a different started task user ID that is not DB2PM. In this case, perform the steps below with your started task user ID instead of DB2PM.

Before you begin

Ensure that you have sufficient privileges to create a new user ID or group ID in the security system that you are using, for example RACF.

About this task

Complete the following steps to create the user ID or group ID DB2PM and connect the OMEGAMON Collector started task to it:

Procedure

1. Create the user ID DB2PM in your security system. If you prefer to use an alternative user ID other than DB2PM, create a group ID DB2PM and add the user ID that you want to use to the user group DB2PM.
2. Connect the OMEGAMON Collector started task to the user ID DB2PM.

Setting up TCP/IP services for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring

The OMEGAMON Collector uses OpenEdition to perform TCP/IP services. If you plan to use Performance Expert Client and/or end-to-end SQL or stored procedure monitoring, you must configure the OMEGAMON Collector to use TCP/IP
services. This means that the user ID and the connected group ID of the OMEGAMON Collector must be known to OpenEdition and have sufficient OpenEdition privileges.

**Before you begin**

Perform this task only if you plan to use Performance Expert Client and/or end-to-end SQL or stored procedure monitoring.

If you perform this task, ensure that you have system administrator privileges for your security system, for example RACF SPECIAL for RACF security.

**About this task**

OpenEdition can be used by user IDs that have a valid OMVS segment in the RACF user profile. Add the OMVS segment to the user ID of the OMEGAMON Collector by performing the following steps:

**Procedure**

1. Assign a UID in the OMVS segment to the RACF user profile of the OMEGAMON Collector user ID. Issue the following command:
   
   ```
   ALTUSER <OMEGAMON Collector user ID> OMVS(UID(0))
   ```

   where `<OMEGAMON Collector user ID>` is the user ID that the OMEGAMON Collector started task is connected to.

   **Note:** The usage of special TCP/IP services requires that the user ID of the OMEGAMON Collector has root privileges in OpenEdition. To minimize the impact of granting the OpenEdition root privilege, use a user ID for the OMEGAMON Collector started task that is not a valid TSO user ID.

2. Optional: If you connected the OMEGAMON Collector started task to a user ID and a group ID, you need to assign a GID in the OMVS segment to the group ID. Issue the following command:
   
   ```
   ALTGROUP <OMEGAMON Collector group ID> OMVS(GID(<gid>))
   ```

   where `<OMEGAMON Collector group ID>` is the group ID that the OMEGAMON Collector started task is connected to. Replace `<gid>` with a valid and free group ID in OpenEdition. You can use the `LISTGRP OMVS` command of RACF to get an overview about the currently used group IDs in OpenEdition.

**Enabling started jobs for Performance Warehouse**

The Performance Warehouse job is run as a started job. A started job is a started task that contains a job statement. If you plan to use Performance Warehouse, you must configure your z/OS system to support started jobs.

**Before you begin**

Perform this task only if you plan to use Performance Warehouse.

If your z/OS system is already configured to support started jobs, skip this task.

If you perform this task, ensure that you have UPDATE privileges on the system PARMLIB, for example on SYS1.PARMLIB.
About this task

Your z/OS system must be configured to search started jobs in the PROCLIB of the started tasks, so that the OMEGAMON Collector can create the Performance Warehouse at startup.

The master JCL MSTJCLxx in your system PARMLIB defines started job PROCLIBs either by an IEFJOBS or an IEFPDSI DD statement. As the Performance Warehouse job will be copied to the started tasks PROCLIB, this PROCLIB data set must be part of the IEFJOBS or IEFPDSI concatenation.

Procedure

1. Open the master JCL in your system PARMLIB and find the IEFJOBS or the IEFPDSI DD statement. If no IEFJOBS or IEFPDSI DD statement exists, add a new IEFJOBS DD statement to the master JCL.
2. Add a further partitioned data set to the IEFPDSI or IEFJOBS concatenation for your started tasks PROCLIB.

Specifying DB2 load libraries for the ISPF Monitoring Dialogs

If you want to use Online Monitoring from the ISPF Monitoring Dialogs, you must add the DB2 load libraries to your standard search libraries for load modules. This must be done for every user that wants to use Online Monitoring from the ISPF Monitoring Dialogs.

Before you begin

You only need to perform this task if you plan to use Online Monitoring from the ISPF Monitoring Dialogs. If you do not plan to use Online Monitoring from the ISPF Monitoring Dialogs, you can skip this task.

If you perform this task, ensure that you have z/OS system administrator privileges.

About this task

You must add the DB2 load library of the DB2 subsystem that you want to monitor to the standard search path.

Note: If you use more than one DB2 version, use the DB2 load library from the DB2 subsystem with the second highest DB2 version. Like this, you can monitor DB2 subsystems of three different versions. For example, with the load library of DB2 10, you can monitor subsystems of DB2 9 and DB2 10, and DB2 11. If you do not do this, you must unload and load the DB2 load modules when switching to a DB2 subsystem with a different DB2 version in the ISPF Monitoring Dialogs.

Use one of the following methods to add the DB2 load library to the standard search path:

Procedure

- Use the TSO TSOLIB command. This is the preferred method.
- Add the DB2 load library to the TSO logon step library STEPLIB DD.
- Add the DB2 load library to the link pack area LPALSTxx.
- Add the DB2 load library to the system link list concatenation LNKLSTxx.
Setting up RRSAF

OMEGAMON for DB2 PE uses Resource Recovery Services Attachment Facility (RRSAF) for connecting to DB2 subsystems.

About this task

Ensure that RRSAF can be used on your system. Complete the following steps:
1. Ensure that the RRS subsystem is running on your system.
2. If you have not already established a profile for controlling access from the RRS attachment facility, define \(<ssid>.RRSAF\) (where ssid is the DB2 subsystem ID) in the resource class DSNR (the RACF resource class for DB2). This has to be done for each DB2 subsystem that you want to monitor. You can also define a generic resource RRSAF. These profiles might already exist if, for example, stored procedures have been used before. Assign READ authority for this RACF profile to the OMEGAMON for DB2 PE Collector started task ID (userid).

Configuration scenarios

This section contains configuration scenarios to help you set up OMEGAMON for DB2 PE/OMEGAMON for DB2 PM.

About this task

The following topics provide detailed information:
1. “Basic configuration scenario”
2. “Installing OMEGAMON for DB2 PE from scratch with the most basic configuration”
3. “Configuration scenario specific to OMEGAMON for DB2 PE/OMEGAMON for DB2 PM” on page 321
4. “Configuring Near-Term History with system variable support” on page 322
5. “Configuring InfoSpher Optim Performance Manager and Performance Expert Client” on page 322

Basic configuration scenario

This section contains one basic scenario that shows how to set up OMEGAMON for DB2 PE/OMEGAMON for DB2 PM from scratch with the most basic configuration. The scenario mainly contains default values.

About this task

The following topic provides detailed information:
1. “Installing OMEGAMON for DB2 PE from scratch with the most basic configuration”

Installing OMEGAMON for DB2 PE from scratch with the most basic configuration

This scenario shows how to install OMEGAMON for DB2 PE from scratch.

Before you begin

Apply SMP/E before you start with this scenario.
About this task

To keep the setup effort to a minimum, monitoring functions are not enabled. After the configuration, you will be able to open the Classic interface and check the performance of your DB2 subsystem.

Procedure

1. Start the Configuration and Installation Tools user interface by issuing the command `ex` on the TKANCUS library in your SMP/E installation.

   ```
   ex '&trghlq.TKANCUS'
   ```

2. Use option 3 Configuration Workflow to open the PARMGEN workflow user interface.

   KCIPQGW
   Welcome to the z/OS Installation and Configuration Tools for z Systems Management Suites
   
   1. Checklist: System preparation checklists
      Tip: Read/Print Checklists prior to installation and configuration.
   
   2. Installation Workflow:
      SMP/E-install z/OS products with Install Job Generator (JOBGEN)
      Conditional: JOBGEN is not required when using SystemPac or ServerPac.
   
   3. Configuration Workflow (Post-installation):
      Configure z/OS products with Parameter Generator Workflow (PARMGEN)
   
   1. What's New in PARMGEN? <== Revised

3. As this is the first setup, you must provide GBL_TARGET_HILEV information in this first panel:

   KCIPOTLV
   ----------- SPECIFY GBL_TARGET_HILEV PARAM VERIFY GBL_TARGET_HILEV
   PARMGEN stores configuration values in the TSO user's ISPF profile.
   If this is the first-time your TSO user ID is invoking PARMGEN,
   enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

   HLQ of SMP/E target (TK*) datasets
   
   If this is not the first time your user ID (in this example, MIS1) is invoking PARMGEN, this panel is also presented if the GBL_TARGET_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

4. This is the first setup, so you must provide some basic information on the second panel:
Enter parameter values appropriate for the LPAR runtime environment (RTE).

**GBL_USER_JCL:** SYS1PMO.O310.V540.PARMGEN.JCL
(for example, SYS1.K02.V540.SYSPLEX.PARMGEN.JCL)
Specify the dataset name of the PARMGEN common/global library for the different LPAR runtime environments (RTEs).
Use the same dataset for managing the different LPAR RTEs.
Multiple users can specify the same dataset to manage RTEs.

**RTE_PLIB_HILEV:** SYS1PMO.O310
Specify the High-Level Qualifier (&hlq) portion of the PARMGEN interim staging and work libraries for this LPAR RTE:
- &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
- &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
- &hlq.&rte_name.WCONFIG

**RTE_NAME:** RTE0A___ (Type ? for a list of configured RTEs)
Specify the runtime environment (&rte_name) for this LPAR.

5. Add common PARMGEN-related information for the parameter **GBL_USER_JCL**. For example, which RTE did you use last, what jobs were run, when were they run, and what are their return codes.

6. Add high-level a qualifier for your runtime environments for parameter **RTE_PLIB_HILEV**.

7. Add the name of your new RTE for parameter **RTE_NAME**.

8. This example uses the following values for these parameters:
   - **GBL_USER_JCL:** SYS1PMO.O310.V540.PARMGEN.JCL
   - **RTE_PLIB_HILEV:** SYS1PMO.O310
   - **RTE_NAME:** RTE0A

**Note:** The length of **RTE_PLIB_HILEV** plus **RTE_NAME** must not exceed 18 characters.

9. Press Enter to commit your settings. The next panel is displayed:
10. Use option 1 KCIJPFCFG to start the setup of the PARMGEN work environment for this new RTE. As PARMGEN is workflow-based, this walkthrough follows steps 1 to 4, as shown in the list below the RTE names.

11. On KCIPQPG1, fill in your jobcard that will be used for all jobs at the bottom of the screen. If you need more lines for your jobcard, you can edit the $JOBCARD member in your user JCL data (provided by parameter GBL_USER_JCL).

Note: If you change $JOBCARD, the user interface only shows the first four lines.

12. Press Enter to display the next panel.

13. On KCIPQPG2, provide a value for parameter GBL_TARGET_HILEV. This parameter is the high-level qualifier of your SMP/E target data sets. Fill out UNIT, VOLSER, STORCLAS, MGMGCLAS, GBL_SYSDA_UNIT, and GBL_REGION as appropriate for your system.

14. Press Enter to get to the next panel.

15. On KCIPQPG3 you find a number of RTE-specific parameters. For this walkthrough, review the following:
   a. RTE_HILEV is the high-level qualifier as previously defined by parameter RTE_PLIB_HILEV, which is why it is set as default.
   b. RTE_VSAM_HILEV is the high-level qualifier for VSAM runtime libraries. The same applies here as for RTE_HILEV.
   c. RTE_TEMS_CONFIGURED_FLAG is the enablement flag for the Tivoli Enterprise Monitoring Server. Change the default to N, as this walkthrough does not cover the enablement of the Tivoli Monitoring infrastructure.
   d. RTE_X_SECURITY_EXIT_LIB is the security exit library. If you changed RTE_HILEV or RTE_VSAM_HILEV, ensure that the high-level qualifier is the same as for RTE_PLIB_HILEV.
   e. Leave the rest of the parameters as is and press Enter.
16. On **KCIP@PG1**, you see a list of products that can be configured, as a result of the components found. In general, you can exclude specific products if you do not want PARMGEN to run through their configuration processing. For OMEGAMON for DB2 PE, you must not exclude the Tivoli Enterprise Monitoring Server (KDS). Even if you disabled the Tivoli Enterprise Monitoring Server using **RTE_TEMS_CONFIGURED_FLAG** on **KCIP@PG3**, this product is still required for the configuration. For this example, do not exclude anything and confirm this with **Y** in the appropriate field.

17. Press **Enter** to display a dialog that asks you whether you want to back up your existing configuration.

18. Press **Enter**, as the backup is only required if you rerun the **KCIJPCFG** job.
19. Submit the KCIJPFG job that is open, then press PF3 once to go back to the main menu. You see in the status field of the KCICPFG job that the job is submitted.

20. Press Enter until the KCIJPFG field contains a return code. The expected return code is zero. If you have a higher return code, inspect the job log and take appropriate actions.

21. Use option 2 RTE0A (name of the RTE) to open the list of available PARMGEN profiles.

22. The list of available PARMGEN profiles is displayed on KCIP@PG6.

<table>
<thead>

2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Not Required) Customize the RTE Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
3. RTE0A Variables (system, user) CONFIG profile in GBL_USER_JCL global library (SYS1PMO.O310.V540.PARMGEN.JCL).
   Add or override system or user-defined symbols and their resolution values for symbols used in the user profiles.

(Tip) Review/Custimize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
4. WCONFIG SYS1PMO.O310.RTE0A.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:
5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
7. $SYSIN$PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

PARMGEN profiles contain the parameter value pairs that make up the configuration. RTE0A contains all product/component-specific parameters. $GBL$USR contains all global configuration parameters.

23. Use option 1 RTE0A to open the PARMGEN user profile for the products/components and adjust the following parameters with the given values:
   a. RTE_X_STC_INAPF_INCLUDE_FLAG = Y When this parameter is set to Y, the started task contains an imbed that does the APF authorization for you. If you need to set the APF authorizations in your environment by hand, leave this parameter to N and follow the steps in the Complete the Configuration for the OMEGAMON for Db2 Performance Expert/Monitor Technote at the end of this walkthrough.
   b. KD2_CLASSIC_DB2PM_PLANPKG_OWNER = DB2PM This is the name of the plan and package owner that is used to access the OMEGAMON for DB2 PE packages in DB2.
   c. KD2_OMPE_GRANT_PEUSER = <user for Started tasks> This is the user for the RACF userid/groupid in OMGssid grant job in xKD2SAM DB2 job. Under this user Classic Interface Started task and other Started tasks should run.
   d. KD2_DB01_DB2_SSID = <SSID of the subsystem you want to monitor> Use this parameter to specify the SSID of the subsystem that you want to monitor at the end of this walkthrough.
e. KD2_DB01_DB2_VER = <DB2 version of the subsystem that you want to monitor> Specify the DB2 version of your subsystem that you want to monitor. This can be either 10, 11 or 12.

24. Use PF3 to get back to KCIP@PG6. This walkthrough covers only a very basic setup. After you complete all the steps, you can adjust all parameters, add subsystems, and configure your monitoring profiles accordingly. For now, keep all other parameters as is.

25. Use option 2 $GBLSUSR to open the global PARMGEN user profile and adjust the following parameters with the given values:
   a. **GBL_DSN_DB2_RUNLIB_Vxx** = <Path to your DB2 runlib> This is the path to the data sets that holds your DB2 RUNLIB. You have to specify the corresponding library of the DB2 version that is provided by KD2_DB01_DB2_VER. This parameter and the following parameters are commented out by default. To comment them in, remove the asterisk (*) at the beginning of the line.
   b. **GBL_DSN_DB2_LOADLIB_Vxx** = <Path to your DB2 loadlib> This is the path to the data sets that hold your DB2 LOADLIB. You have to specify the corresponding library of the DB2 version that is provided by KD2_DB01_DB2_VER.
   c. **GBL_DSN_DB2_DSNEXIT** = <Path to your DB2 exit library> This is the path to the data sets that hold your DB2 exit library.

26. Use PF3 twice to get back to KCIPQPGB, the workflow user interface welcome page.

27. Use option 3 $PARSE to open KCIP@PR1.

28. Use option 1 $PARSE to open the composite job that generates the work libraries. The resulting set of libraries is a complete environment that can be used to test the configuration before deploying it to the production environment. In other words, $PARSE generates all the configuration members in the corresponding work data sets WK*.

29. Submit the job. The expected return code is zero.

30. Use PF3 to get back to KCIPQPGB the workflow user interface

31. Use option 4 SUBMIT to open KCIP@SUB. This panel contains several more jobs, most of which are conditional and are used to finish the configuration. This includes the allocation of the runtime libraries and the copy of the program code from the target libraries to the runtime libraries. Not all jobs that are listed here are submitted by the composite job automatically. This depends on your environment and your monitoring needs.
Use option 1 KCIP@SUB to open the composite SUBMIT job and submit it. The expected return code is zero.

Use PF3 to get back to the KCIP@SUB panel. Press Enter until all jobs are finished. The expected return codes are zero. If you have a higher return code, check the job log and take appropriate actions.

Use PF3 to get back to the KCIPQPGB panel.

As a final step, see “Completing the configuration for z/OS components” on page 405. This guide contains several mandatory steps to set up the server correctly. Most of these steps only have to be done once. After you finished these steps, you can start the server and open the Classic Interface to start monitoring your subsystem.

What to do next

After having installed OMEGAMON for DB2 PE from scratch, you can continue by enabling more functions. Functions that can be enabled are, for example, Near-Term History and Snapshot History.

You can continue with other scenarios in order to configure more than one DB2 subsystem, even if they are spread over different LPARs in your environment.

Configuration scenario specific to OMEGAMON for DB2 PE/OMEGAMON for DB2 PM

This section contains some scenarios that are specific to OMEGAMON for DB2 PE/OMEGAMON for DB2 PM.

About this task

The following topics provide detailed information:
1. “Configuring Near-Term History with system variable support” on page 322
2. “Configuring InfoSphere Optim Performance Manager and Performance Expert Client” on page 322
Configuring Near-Term History with system variable support
This scenario describes how to configure Near-Term History in an RTE that is enabled for system variable support.

Before you begin
As a prerequisite, you need an RTE having OMEGAMON for DB2 PE already configured and system variable support enabled.

Procedure
1. Start the Configuration and Installation Tools user interface by issuing the command `ex` on the TKANCUS library in your SMP/E installation.
   
   ```
   ex '&trgh1q.TKANCUS'
   ```

2. Use option 3 Configuration Workflow to open the PARMGEN workflow user interface.
3. Enable your existing RTE that has been already enabled for system variable support.
4. Use option 2 to open the PARMGEN profile selection menu.
5. Use option 1 to open the RTE LPAR configuration profile.
6. Enable Near-Term History for those profiles that you use for monitoring your DB2 subsystems by setting parameter `KD2_PFnn_HIS_START` to Y. `nn` is the profile ID. Previously, with the Configuration Tool, you had to enable system variable support for Near-Term History separately on the panel KD261PI Global Control Parameters. This prevented the use of `%DB%` and `%SY%` in the Near-Term History data sets. This limitation no longer exists. In addition, you do not have to enable system variable support for Near-Term History separately.
7. Use PF3 to get back to the main workflow panel KCIPQPGB.
8. Use option 3 to open the $PARSE job panel KCIP@PR1.
9. Use option 1 to open the composite $PARSE job and submit it. The expected return code is zero.
10. Use PF3 twice to get back to the main workflow panel KCIPQPGB.
11. Use option 4 to open the SUBMIT job panel KCIP@SUB.
12. Use option 5 to open the KCIJVUPV job that regenerates the Near-Term History configuration and submit it. The expected return code is zero.
13. Use option 12 to open the KCIJPW2R deployment job and submit it. The expected return code is zero.

What to do next
Now that you configured Near-Term History, restart the OMEGAMON for DB2 PE server. Use the Classic Interface to look at the history data.

Configuring InfoSphere Optim Performance Manager and Performance Expert Client
This scenario describes how to configure the InfoSphere Optim Performance Manager in order to get end-to-end SQL monitoring (Extended Insight) and stored procedure monitoring. This feature is only for OMEGAMON for DB2 PE only (not for OMEGAMON for DB2 PM).
Before you begin

As a prerequisite, you need a runtime environment having OMEGAMON for DB2 PE already configured.

Procedure

1. Start the Configuration and Installation Tools user interface by issuing the command \texttt{ex} on the TKANCUS library in your SMP/E installation.

\texttt{ex 'trgh1q.TKANCUS'}

2. Use option 3 Configuration Workflow to open the PARMGEN workflow user interface.

3. Enable the runtime environment where you want to configure InfoSphere Optim Performance Manager.

4. Use option 2 to open the PARMGEN profile selection menu.

5. Use option 1 to open the RTE LPAR configuration profile and adjust the following parameters:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|l|}
\hline
\textbf{Parameter} & \textbf{Value} & \textbf{Description} \\
\hline
\texttt{KD2_OMPE\_E2E\_MON\_SPRT} & Y & Enables Extended Insight Dashboard (end-to-end SQL monitoring) \\
\hline
\texttt{KD2\_DBnn\_DB2\_PORT\_NUM} & \textless port\textgreater & Mandatory. This specifies the port that is used to connect InfoSphere Optim Performance Manager to the OMEGAMON for DB2 PE server. You can keep the default port 2000. You need this port information for later. \\
\hline
\texttt{KD2\_PFnn\_TRACES\_318} & Y & Enables the automatic start of IFCID 318. \\
\hline
\texttt{KD2\_PFnn\_TRACES\_400} & Y & Enables the automatic start of IFCID 400. Set this parameter to Y only if you want to monitor DB2 10 and above. \\
\hline
\texttt{KD2\_PF01\_READA\_SPMON} & Y & Enables stored procedure monitoring. \\
\hline
\end{tabular}
\end{table}

6. Use PF3 to get back to the main workflow panel KCIPQPGB.

7. Use option 3 SPARSE to open the job panel KCIP@PR1.

8. Use option 1 to open the composite SPARSE job and submit it. The expected return code is zero.

9. Use PF3 to get back to the main workflow panel KCIPQPGB.

10. Use option 4 to open the SUBMIT job panel KCIP@SUB.

11. Use option 12 to open the KCIJPW2R to copy the configuration from the work libraries to the runtime libraries. Submit the upcoming job. The expected return code is zero.

What to do next

For integration of the InfoSphere Optim Performance Manager into Tivoli Enterprise Portal find more information in section “Enabling InfoSphere Optim Performance Manager integration” on page 377 in “Completing the configuration for z/OS components” on page 405.
Install InfoSphere Optim Performance Manager and configure it for the monitored database. For more information, see the IBM InfoSphere Optim Performance Manager in the Knowledge Center.

Configuring basic components on z/OS

The basic setup of OMEGAMON for DB2 PE covers the configuration of the OMEGAMON Collector, the configuration of the user interfaces, and the configuration of the monitoring functions that are enabled globally for all DB2 subsystems.

About this task

Perform the following steps to configure basic components on z/OS:

Procedure

1. Configure global control parameters. See “Configuring global control parameters and the OMEGAMON Collector” for detailed information.
4. Configure the user interfaces on z/OS. See the following topics for detailed information:
   • “Configuring Classic Interface” on page 325
   • For configuring OMEGAMON enhanced 3270 user interface, see the IBM OMEGAMON and Tivoli Management Services on z/OS shared documentation.
   • Optional: “Configuring ISPF Monitoring Dialogs” on page 334
5. Optional: Enable Performance Expert Client and/or end-to-end SQL or stored procedure monitoring support. See “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373 for detailed information.
6. Optional: Enable IBM Tivoli Monitoring and integration of Extended Insight (end-to-end SQL monitoring) support. See “Enabling IBM Tivoli Monitoring” on page 374 and “Enabling InfoSphere Optim Performance Manager integration” on page 377 for detailed information.

Configuring global control parameters and the OMEGAMON Collector

You must specify the global control parameters for the runtime environment that you created and configure the OMEGAMON Collector.

You must specify parameters to control specific rollout scenarios, to control the creation of DB2 related runtime members, and to handle DB2 Performance Expert Agent for DB2 Connect Monitoring program updates. To configure global control parameters and the OMEGAMON Collector, open the PARMGEN user profile and adjust the parameters that you find in the section "Basic product parameters" in the Parameter Reference.

Enabling DB2 Event Exception Processing

You can enable DB2 Event Exception Processing in the PARMGEN user profile.
DB2 Event Exception Processing alerts you when specific system events occur. These events include deadlocks, timeouts, locks, escalations, and starts and stops of a coupling facility structure rebuild. To enable DB2 Event Exception Processing, set parameter KD2_OMPE_DB2_EVENT to Y in the PARMGEN user profile. If you want to make further changes to DB2 Event Exception Processing, refer to the related parameters in section "Basic product parameters" in the Parameter Reference.

Here is a list of the related parameters:
- KD2_OMPE_AUTH_FAIL
- KD2_OMPE_EDMP_FULL
- KD2_OMPE_THREAD_COMMIT
- KD2_OMPE_DEADLOCK
- KD2_OMPE_TIMEOUT
- KD2_OMPE_CF_REBUILT
- KD2_OMPE_GLOBAL_TRACE
- KD2_OMPE_DSN_EXTENT
- KD2_OMPE_EXTENT_THOLD
- KD2_OMPE_USER
- KD2_OMPE_LOGSPACE

Enabling CPU parallelism data collection
You can enable CPU parallelism data collection in the PARMGEN user profile.

To collect query parallelism data for real-time and historical monitoring, enable CPU parallelism data collection. To enable CPU parallelism data collection, set parameter KD2_OMPE_CPU_PARALLEL to Y in the PARMGEN user profile. If you want to make further changes to CPU parallelism data collection, refer to the related parameters in section "Basic product parameters" in the Parameter Reference.

The following parameter is related:
- KD2_OMPE_DSP_SIZE

Configuring Classic Interface
Classic Interface is always configured by default.

If you want to make further changes to Classic Interface, refer to the related parameters in section "Basic product parameters" in the Parameter Reference.

Here is a list of the related parameters:
- KD2_CLASSIC_VTAM_NODE
- KD2_CLASSIC_VTAM_APPL_LOG
- KD2_CLASSIC_UMAX
- KD2_CLASSIC_USER_PROFILE
- KD2_CLASSIC_LROWS
- KD2_CLASSIC_DB2ID_DEFAULT

Near-term history data collection options
This topic provides an overview of the Near-term history data collection options member of RKD2PAR.
This topic describes the data collection options that determine the behavior of a Near-Term History Data Collector and the amount of data being collected.

For each Near-Term History Data Collector the Configuration Tool generates a data set member COPTcccc (where cccc specifies the DB2 subsystem identifier) that holds the data collection options. Collection options members for specific DB2 subsystems can be created and invoked at startup of a Near-Term History Data Collector. Collection options in a COPTcccc data set member are specified by keywords and associated keyword values. Basically, keywords and values specify and limit the data to be collected by the Near-Term History Data Collector.

Generally, the Configuration Tool should be used to generate collection options members. Nevertheless, a collection options member for a specific DB2 subsystem can also be created by copying an existing collection options member or the default member rhilev.RKD2PAR(COPTcccc) and modifying the collection options in the copied member.

**Keyword syntax and considerations**

Keywords in a collection options member are used in the following ways:

- **Keyword(value)**
- **Keyword(value,value,...)**
- **Keyword(value□value△...)**

If a keyword accepts only one value, enter the value in parentheses after the keyword. If a keyword accepts multiple values, enter the values in parentheses after the keyword and separate the values by commas or spaces.

The NOT operator (¬) negates value specifications. For example, CONNID(¬IM3D,¬I210) specifies that the Near-Term History Data Collector should collect data about all connection identifiers except for IM3D and I210.

The asterisk (*) wildcard character can be used at the end of value specifications. For example, PLAN(ABCD*) specifies that the Near-Term History Data Collector should collect data about all plans with names that begin with ABCD.

The question mark (?) wildcard character can be used as a single character replacement within value specifications. For example, DB2ID(D??T) specifies that the Near-Term History Data Collector should collect data about all DB2 subsystems with names that begin with D, followed by two variable characters, and end with T.

If you must continue statements in an COPTcccc member on another line for keywords such as AUTHID, CONNID, CORRID, ORIGAUTH, or PLAN:

- Do not use a continuation character. This means, do not repeat a “Keyword(” entry on the next line.
- Do no start the continuation line in column 1. Only keywords should begin in column 1, as in the following example:

```plaintext
PLAN(¬DSNG* ¬DSNTI* ¬FINAN1 ¬FINAN2 ¬DSNG* □¬DSNZZ ¬FINAN3 ¬FINAN4 ¬DSNR* ¬DSNRR* □¬FINAN5 ¬FINAN6)
```
Near-term history data collection options keywords by purposes:

This topic groups the keywords that can be used in a collection options member of RKD2PAR by their purposes.

**Define DB2 subsystem and collection interval**
- DB2SYS
- INTERVAL
- NTAINTRVAL

**Define data types to collect**
- ACCTG
- DYNAMICSQL
- LOCKCONT
- LOCKSUSP
- NEGSQL
- SCAN
- SORT
- STATISTICS

**Specify storage destination**
- ARCHIVESEQ
- DESTINATION
- H2DATASET
- SEQDATASET
- WRITEOPTION

**Define filter and options**
- AUTHID
- CONNID
- CONNTYPE
- CORRID
- ORIGID
- PLAN

**Performance options**
- BUFSIZE
- IFRREADTIME
- POSTPCT

**Near-term history data collection option keyword descriptions:**

This topic lists and describes in detail the keywords that can be used in a collection options member of RKD2PAR.

The keywords are listed in alphabetical order. Default values are underscored.
ACCTG - Near-term history data collection options keyword:

Specifies the type of Accounting data to collect.

**ACCTG**(type)

**type**

1 collects data from Accounting class 1 (IFCID 0003, and 0106, no In-DB2 or I/O and lock wait times).
2 collects data from Accounting class 1 and 2 (IFCID 0003 In-DB2 elapsed and CPU time).
3 collects data from Accounting class 1, 2, and 3 (IFCID 0003 all wait times I/O and lock wait times).
7 collects data from Accounting class 7 (IFCID 0003, 0239 Package In-DB2 time).
8 collects data from Accounting class 8 (IFCID 0003, 0239 Package I/O and lock wait times).
10 collects data from Accounting class 10 (IFCID 0239 Package detail).
11 collects data from Accounting class 11 (IFCID 0003 and 0200). For DB2 11 and above only.

Accounting class 10 data contains package detail data from IFCID 239. To avoid unnecessary system overhead, collect this data only if required.

To reduce the number of IFCIDs collected and not collect the IFCID 239, class 11 should be requested without classes 7, 8 and 10.

No default is applied. If this keyword is not specified, no Accounting data is collected.

ARCHIVESEQ - Near-term history data collection options keyword:

Specifies the pointer to the ARCScccc member in data set rhilev.RK02PAR. The member contains the JCL required to archive static sequential data sets and is mandatory in this case.

**ARCHIVESEQ**(member)

**member**

A 1- to 8-character member name.

AUTHID - Near-term history data collection options keyword:

Specifies the authorization identifier about which data should be collected.

**AUTHID**(identifier)

**identifier**

A 1- to 8-character authorization identifier.

No default is applied. If this keyword is not specified, all data from all authorization identifiers is collected.
BUFSIZE - Near-term history data collection options keyword:

Specifies the size of the buffer that is used to hold IFI records until they can be written out by the Near-Term History Data Collector.

**BUFSIZE**(n)

n The buffer size, in KB, from 50 to 16000 KB. 300 KB is the default.

CONNID - Near-term history data collection options keyword:

Specifies the connection identifier about which data should be collected.

**CONNID**(identifier)

identifier A 1- to 8-character connection identifier.

No default is applied. If this keyword is not specified, all data from all connection identifiers is collected.

CORRID - Near-term history data collection options keyword:

Specifies the correlation identifier about which data should be collected.

**CORRID**(identifier)

identifier A 1- to 12-character correlation identifier.

No default is applied. If this keyword is not specified, all data from all correlation identifiers is collected.

DB2SYS - Near-term history data collection options keyword:

Specifies the DB2 subsystem to be monitored.

**DB2SYS**(name)

name A 1- to 4-character DB2 subsystem name.

This keyword is required.

DESTINATION - Near-term history data collection options keyword:

Specifies the backup destination for the trace output from the DB2 traces started by the Near-Term History Data Collector.

**DESTINATION**(name)

name

**SMF** Record trace output to SMF (record types 100, 101, and 102).

**GTF** Record trace output to GTF.
No default is applied. If this keyword is not specified, the only trace destination will be the Instrumentation Facility Interface (IFI).

**DYNAMICSQ**AL - Near-term history data collection options keyword:

Specifies whether the Near-Term History Data Collector should collect SQL text and access path information for dynamic SQL.

**DYNAMICSQ**AL *(toggle)*

*toggle*

**YES**

IFCID63 is collected to provide SQL text.

**NO**

No SQL text-related IFCIDS are started.

**FULL**

IFCID350 is collected to provide SQL text.

**H2DATASET** - Near-term history data collection options keyword:

Specifies up to 60 names of the VSAM data sets in which the near-term history data is to be stored by the Near-Term Historical Data Collector.

**H2DATASET**(data set name,data set name,data set name)

data set name

A 1- to 44-character VSAM data set name.

This keyword is required if WRITEOPTION(VSAM) or WRITEOPTION(VSAM,SEQ) is specified.

**IFIREADTIME** - Near-term history data collection options keyword:

Specifies the frequency with which the Near-Term History Data Collector reads new IFI trace records into its buffer.

**IFIREADTIME**(mmssth)

mmssth

mm Minutes

ss Seconds

t Tenths

h Hundredths

If this keyword is not specified, the default of 010000 (one minute) is applied.

The maximum value that should be specified is one minute.

**INTERVAL** - Near-term history data collection options keyword:

Specifies the time interval used by the Near-Term History Data Collector to record Statistics or Accounting data, if the GROUPBY keyword is used.

**INTERVAL**(time specification)

time specification
An interval ranging from 1 to 60 minutes.

RMF
— This keyword synchronizes the collection interval with the RMF™ interval. If RMF is not active, a 15-minute interval is assumed.

LOCKCONT - Near-term history data collection options keyword:

Specifies whether the Near-Term History Data Collector should collect lock timeout and deadlock information.

LOCKCONT(toggle)

toggle

YES
Collect lock timeout and deadlock information.

NO
Do not collect lock timeout and deadlock information.

LOCKSUSP - Near-term history data collection options keyword:

Specifies whether the Near-Term History Data Collector should collect lock suspension information.

LOCKSUSP(toggle)

toggle

YES
Collect lock suspension information.

NO
Do not collect lock suspension information.

NEGSQL - Near-term history data collection options keyword:

Specifies whether the Near-Term History Data Collector should collect negative SQL code IFCID 58 and produce the Negative Application Codes SQL report.

NEGSQL(toggle)

toggle

YES
Collect negative SQL code IFCID 58 and produce the Negative Application Codes SQL report.

Note: Set NEGSQL to YES only if WRITEOPTION(VSAM, SEQ) is selected. In this case the negative SQL data is written to the sequential data set and can then be analyzed in the SQL Activity Report.

NO
Do not collect negative SQL code IFCID 58 and produce the Negative Application Codes SQL report.

NTAINTERVAL - Near-term history data collection options keyword:

Specifies the number of minutes or seconds to be used as the smallest time span for display of historical thread accounting data by subinterval. The subinterval should be specified as a period of time for convenient display of the threads executed. The more threads executed per minute, the smaller subinterval you may want to specify.
**NTAINTERVAL** *(time specification)*

*time specification*

- **n**  The subinterval in minutes.
- **nS**  The subinterval in seconds. **n** must be some even fraction of a minute, for example 5S, 6S, 10S, 20S, or 30S. However, 7S is not allowed.

The INTERVAL keyword can only be set as low as one minute. Installations with a huge number of threads per minute might use the Thread History By Subinterval panel to view thread history by smaller periods of time. The NTAINTERVAL keyword gives control over the time interval that is used for the Thread History By Subinterval panel.

**ORIGAUTH - Near-term history data collection options keyword:**

Specifies the original authorization identifier for which OMEGAMON XE for DB2 PE should collect Accounting activity data.

**ORIGAUTH**(identifier)

*identifier*

A 1- to 8-character original authorization identifier.

No default is applied. If this keyword is not specified, all data from all original authorization identifiers is collected.

**PLAN - Near-term history data collection options keyword:**

Specifies the plane name for which OMEGAMON XE for DB2 PE should collect data.

**PLAN**(name)

*name*

A 1- to 8-character plan name.

No default is applied. If this keyword is not specified, all data from all plan names is collected.

**SCAN - Near-term history data collection options keyword:**

Directs OMEGAMON XE for DB2 PE to collect scan data.

**SCAN**(toggle)

*toggle*

**YES**  Collect scan data.

**NO**  Do not collect scan data.

**SEQDATASET - Near-term history data collection options keyword:**

Specifies up to 10 names of static sequential data sets in which the near-term history data is to be stored by the Near-Term Historical Data Collector.

**SEQDATASET**(data set name,data set name,...)
data set name

A 1- to 44-character data set name.

This keyword is required if WRITEOPTION(VSAM,SEQ) is specified.

The SPACE keyword is required in conjunction with SEQDATASET to allocate the data set appropriately.

If dynamic sequential data sets or Generation Data Group (GDG) data sets were chosen as the medium of sequential data storage, the corresponding (base) file name is added as keyword value.

Example for static sequential data sets

SEQDATASET(
  SYS1PMO.O4.ESP.ESP4.DB11.RKD2SQ01
  SYS1PMO.O4.ESP.ESP4.DB11.RKD2SQ02
  SYS1PMO.O4.ESP.ESP4.DB11.RKD2SQ03
)
SPACE(CYL,65,2)

Example for dynamic sequential data set

SEQDATASET(SYS1PMO.O4.SEQARC.@DB2.@DATE.@TIME)
SPACE(CYL,5,2)

Example for GDG data set

SEQDATASET(SYS1PMO.O4.SEQGDG(+1))
SPACE(CYL,5,2)

SORT - Near-term history data collection options keyword:

Directs OMEGAMON XE for DB2 PE to collect sort data.

SORT(toggle)

toggle

  YES
  Collect sort data.

  NO
  Do not collect sort data.

SPACE - Near-term history data collection options keyword:

Used in conjunction with the SEQDATASET options keyword to specify the space allocation for a sequential data set.

SPACE(xxx,nnn,nnn2)

xxx

  CYL
  For cylinders.

  TRK
  For tracks.

nnn
  The number for primary allocation.

nnn2
  The number for secondary allocation.
STATISTICS - Near-term history data collection options keyword:

Directs OMEGAMON XE for DB2 PE to collect Statistics trace data.

**STATISTICS**(toggle)

toggle

**YES**

Collect Statistics trace data.

**NO**

Do not collect Statistics trace data.

WRITEOPTION - Near-term history data collection options keyword:

Specifies the storage medium for near-term history data.

**WRITEOPTION**(medium)

medium

**VSAM**

VSAM data set. This specification requires also the specification of the H2DATASET keyword.

VSAM is required for Accounting data to be displayed.

**VSAM, SEQ**

VSAM data set and sequential data set. This specification requires also the specification of the SEQDATASET keyword.

Configuring ISPF Monitoring Dialogs

ISPF Monitoring Dialogs is always configured by default.

If you want to make further changes to ISPF Monitoring Dialogs, refer to the related parameters in section "Basic product parameters" in the [Parameter Reference](#). The following parameter is related:

- KD2_OMPE_ISPF_LANGUAGE

Customizing the ISPF Online Monitor

You can customize the Online Monitor, for example, you might want to set exception thresholds or change the default layout of the panels.

For information about tailoring exception thresholds and exception profiling, see the [Reporting User’s Guide](#).

Customizing panels:

You can customize the layout of headings, field labels, fields displayed, and the order in which the fields appear in the Thread Detail panel, the DB2 Statistics Detail panel, and the DB2 System Parameters panel.

The panels are defined by using ISPF. Each field name corresponds to an ISPF variable.

Customize your panels to filter the data shown so that you can focus on particular areas of performance.
If you are adding or removing any fields from these panels, you need to add or remove the corresponding field help panels. You might also have to modify the exception processing variables in the same panels.

Example of a customized Thread Detail panel

To view an example of the standard Thread Detail panel, see [Standard Thread Detail panel](#).

The following figure shows an example of a customized Thread Detail panel. It demonstrates the flexibility of customizing panels.

![Customized Thread Detail panel](#)

**Figure 3. Customized Thread Detail panel**

The panel above is tailored to show LUW and CICS instances and more detailed buffer information. It is also tailored to show all needed fields in one panel, thereby removing the need to use the scrolling keys. Furthermore, the following general modifications were made to the panel above:

- Fields are added, removed, rearranged, and field labels are changed.
- The heading of the panel is changed from Thread Detail to Thread Information.

You can also add or remove field help panels and modify the exception processing ISPF variables to match the changes made to the fields.

**Note:** The DGOMTPSM (Thread Detail), DGOMSPSM (DB2 Statistics Detail), and DGOMZPSM (DB2 System Parameters) panels displayed at your site might have been tailored by your installation and consequently might not necessarily match the panel examples shown in this information.

**How to customize panels:**

Before you modify any of the Online Monitor detail panels, become familiar with the way ISPF panels are defined. Consult your system programmer before making any change to your ISPF or TSO environment.
The Online Monitor panels are defined by using ISPF. The procedure for customizing an Online Monitor panel involves copying the ISPF panel member to your own library, and editing your copy of the panel to match your requirements.

Each field name corresponds to an ISPF variable. If you add or remove fields, you also need to add or remove the corresponding help panels for the appropriate fields. For a list of all available Online Monitor fields and their corresponding help panel names, see “Online Monitor field table” on page 342.

Thread Detail panel:

Use the Thread Detail panel to view detailed information about the thread being monitored. From the Thread Detail panel, you can reach the Category windows, which show selected information about the monitored thread in greater detail.

To display the Thread Detail panel, select any active thread listed in the Thread Summary panel, Threads Holding Resource window, or the Periodic Exceptions List panel.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

Note: The Thread Detail panel displayed at your site might have been tailored by your installation and consequently might not necessarily match the panel example shown in this information.
Figure 4. Thread Detail panel

If you have enabled display exception processing, all fields in exception status are shown in reverse video, and the color indicates the level of the exception. Warning level exceptions are highlighted in yellow, while problem level exceptions are highlighted in red. Categories that can be selected from this panel are shown in reverse video when their next level windows contain fields in exception status.

If DBRM is used, the Current Package field displayed in the Thread Detail panel is shown as Current DBRM instead.

The following list describes some of the important fields that are shown in this panel:

**Type** The type of the thread being monitored.

- **ALLIED** The thread is not involved in any distributed activity.
- **A-DIST** The thread is initiated by a DB2 attach and requests data from one or more server locations.
- **DBAT** The thread is initiated by, and performing work on behalf of, a remote (requester) location.
D-DIST Distributed database access thread, both a DDF server and requester.

It is important to know whether the thread is involved in distributed activity, because this can affect the fields that should be monitored. For example, if the thread is involved in distributed activity, the class 1 elapsed time is higher than if there was no distributed activity, because this time includes network time.

**Class 1 Times**
This field shows the elapsed time and the CPU time for the processing performed and includes the time spent not only in DB2 but also in the application.

CPU time is the sum of:
- The agent’s CPU (TCB) time
- The CPU time spent in stored procedures
- The accumulated processing time of the parallel tasks (if query parallelism or utility parallelism is used)

**Class 2 Times**
This field shows the elapsed time and the CPU time for the processing performed in DB2 only. Elapsed time includes wait times.

CPU time is the sum of:
- The agent’s CPU (TCB) time
- The CPU time spent in stored procedures
- The accumulated processing time of the parallel tasks (if query parallelism or utility parallelism is used)

For threads that exploit query parallelism or utility parallelism, class 2 CPU time can be larger than class 2 elapsed time because the CPU time includes the execution time of all parallel threads. To separate the agent’s CPU time from the sum of all parallel tasks’ CPU times, select Times, which displays the Thread Times window. See also the discussion at the beginning of "Accounting times" on page 339.

**Class 3 Times**
This field shows the total time spent waiting because of class 3 suspensions. For threads that exploit query parallelism or utility parallelism, wait times are summed for the originating task and all parallel tasks. See also the discussion at the beginning of "Accounting times" on page 339.

**Suspensions**
This field includes all types of lock suspensions.

**Getpage requests**
This field shows the number of Getpage requests. Reducing Getpage requests reduces CPU usage and improves performance. Fewer Getpage requests also result in fewer synchronous reads, because fewer pages that are not in the buffer pool must be fetched.

**Prefetch reads**
This includes number of Prefetch reads done because of Sequential Prefetch, List Prefetch, and Dynamic Prefetch.

**Synchronous I/O**
This includes both synchronous reads and synchronous writes.
Accounting times:

Accounting times are usually the prime indicator of a performance problem and should be the starting point for analysis.

DB2 times are classified as follows:

- Class 1 time shows the time the application spent since connecting to DB2, including time spent outside DB2.
- Class 2 elapsed time shows the time spent in DB2. It is divided into CPU time and waiting time.
- Class 3 elapsed time is divided into various waits, such as the duration of suspensions because of waits for locks and latches or waits for I/O.

Tailoring the Thread Detail panel:

You can modify the Thread Detail panel to include the first 200 characters of the currently executing SQL statement. This field is divided into 4 fields of 50 characters each.

The names of these fields are:

- **QW01242T**
  - The first 50 characters of the SQL statement text

- **QW012422**
  - The second 50-character block of the SQL statement text

- **QW012423**
  - The third 50-character block of the SQL statement text

- **QW012424**
  - The fourth 50-character block of the SQL statement text.

The EXPLAIN command can also be made available in the Thread Detail panel so that you can examine the access path methods of the SQL statement text that is shown. To make the command available:

- Add the following line to the INIT section of the panel:
  
  ```
  &SQLONDET='X'
  ```

- Change the following statement:
  ```
  )PANEL KEYLIST(MTABLE,DGOF)
  ```

  to:

  ```
  )PANEL KEYLIST(MTABLE,DGOF)
  ```

The latter change assigns the EXPLAIN command to F18 (Explain).

Editing exception fields:

Each Online Monitor exception field has a corresponding ISPF variable that indicates the exception status of that field.

The ISPF variable has the same name as the OMEGAMON XE for DB2 PE field it represents, with the first letter of the field name replaced by an X for thread activity fields, and an E or T for statistics fields. For example, the thread activity field ADRECETT (Class 1 elapsed time) has a corresponding exception ISPF
variable XDRECETT, and the statistics field Q3STABRT (Rollback) has a corresponding exception ISPF variable E3STABRT.

An exception ISPF variable can contain one of the following one-character values:

- **P** Indicates a problem level exception
- **W** Indicates a warning level exception
- **blank** Indicates that the corresponding field is not in exception status.

If you want your exception fields to be highlighted when they are in exception status, you need to test for an exception condition and highlight the field appropriately. For example, to test and highlight the Q3STABRT field in the Thread Detail panel, you would add the following lines to the panel logic:

```plaintext
if (&x3stabrt = 'P')
    .attr(q3stabrt) = 'color(red) hilite(reverse)'
if (&x3stabrt = 'W')
    .attr(q3stabrt) = 'color(yellow) hilite(reverse)'
```

If you remove an exception field, also remove the corresponding code that tests and highlights the field.

*Editing selection fields:*

The selection fields in the detail panels provide access to other Online Monitor panels. These fields are selected by typing any nonblank character in a field and pressing Enter.

You can remove or disable any of the selection fields in the Thread Detail panel, DB2 Statistics Detail panel, or DB2 System Parameters panel.

The following table shows the names of all selection fields and their corresponding subheadings in the Thread Detail panel:

<table>
<thead>
<tr>
<th>Selection field name</th>

Online Monitor field table:

The tables in this section provide a list of the Online Monitor thread activity fields, statistics fields, and system parameters fields.

You can use these tables to cross-reference exception field names for display exception processing and for periodic exception processing, or to look up a field help panel name when customizing Online Monitor panels, as described in “Customizing panels” on page 334.

The following is a description of the table columns:

**Field name**
The name of the field.

**Field description**
The field title, as the field is shown in the panel. The field titles vary slightly from panel to panel depending on the context in which the fields are used.

**Help panel name**
The member name of the associated help panel.

**Exception**
Indicates if the field is an Online Monitor exception field.

OMEGAMON Collector purpose and function:

The OMEGAMON Collector executes as a started task address space. The purpose of the OMEGAMON Collector is to support functions that are not suited to a TSO address space.

The following functions are available if the OMEGAMON Collector is installed and active at your site:
- Viewing past data
- Periodic exception processing while you are not logged on
- Exception event processing
- Collection of parallel tasks for query CP parallelism

There is one OMEGAMON Collector for all DB2 subsystems.

Viewing past data

Before you can view past data, the OMEGAMON Collector needs to be active so that instrumentation data can be gathered.

This data is gathered by the OMEGAMON Collector at installation-defined intervals. You can specify the types of data (IFCID) gathered and the interval at which the data is collected using the OMEGAMON Collector parameters. The data gathered is written to a VSAM history data set or data space where it can be later retrieved and browsed using the HISTORY command.

You can qualify the thread activity data gathered by the OMEGAMON Collector to reduce unnecessary system overhead and to limit the quantity of data stored using the OMEGAMON Collector parameters.

For more information, see [IBM Db2 for z/OS in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter/SSEPGG_11.16.0/com.ibm.zos.doc/html/r0000001c.htm).

Periodic exceptions

With the OMEGAMON Collector active, you can log off the system while periodic exception processing is running. Any periodic exception messages issued while
you are offline are gathered by the OMEGAMON Collector and are written to the periodic exceptions list, where they can be examined by using the LOOK command. You are notified of any periodic exceptions when you log on to your TSO system the next time.

Exception events

With exception event processing, you can monitor the DB2 subsystem for the presence of specific events. When a specified event occurs and is detected, you are notified by the Exception Notification window.

You can log off the system while exception event processing is running. Any exception event messages issued while you are offline are gathered by the OMEGAMON Collector and are written to the exception event list, where they can be examined by using the LOOK command. You are notified of any exception events when you log on to your TSO system the next time.

You can specify the exception event traces to start during OMEGAMON Collector startup using the OMEGAMON Collector parameters. For more information, see IBM Db2 for z/OS in the IBM Knowledge Center.

Collection of parallelism data

The data that the Online Monitor shows for threads that exploit utility parallelism or query CP parallelism comes from three different sources:
1. The originating task
2. All currently active parallel tasks
3. All parallel tasks that have finished processing

While the first two types of data are readily available from DB2, the third type has to be stored and administered separately. This is accomplished by the OMEGAMON Collector if it has been set up to do so. See parameter COLLECTCPUPARALLEL or CCP in IBM Db2 for z/OS in the IBM Knowledge Center.

If your DB2 system exploits query CP parallelism, set CCP to YES to enable the OMEGAMON Collector to collect the parallel tasks that have finished processing. Otherwise, the performance data shown by the Online Monitor for a thread might not be correct, because it does not include all parallel tasks of that thread.

Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support

If you want to use Performance Expert Client, the SQL Dashboard, the end-to-end SQL or stored procedure monitoring support, you must enable the host data collector started task to listen on a specific TCP/IP port.

The SQL Dashboard allows you to monitor all dynamic and static SQL statements executed on DB2 for z/OS. The stored procedure monitoring allows you to see the overall execution but also to drill down into stored procedure nested SQL activities as well as information where stored procedures are used.

With the end-to-end SQL monitoring, distributed SQL statement execution can be monitored, as well as stored procedures called via DDF.
The three dashboards are using the InfoSphere Optim web user interface and its infrastructure with direct communication with the host data collector address space.

The Performance Expert Client is a user interface that supports online monitoring and reporting, Performance Warehouse management, and buffer pool analysis on the workstation.

To enable Performance Expert Client, the SQL Dashboard, the end-to-end SQL or stored procedure monitoring to communicate with the data collector, set parameter KD2_OMPE_PE_SUPPORT or parameter KD2_OMPE_E2E_MON_SPRT to Y in the PARMGEN user profile. If you want to make further changes to Performance Expert Client support and/or end-to-end SQL or stored procedure monitoring support, refer to the related parameters in section "Basic product parameters" in the Parameter Reference.

Here is a list of the related parameters:
- KD2_OMPE_TCPIP_NAME
- KD2_OMPE_TCPIP_ADDRESS
- KD2_OMPE_MAX_SESSIONS

After you have enabled Performance Expert Client support and/or end-to-end SQL or stored procedure monitoring support, you must perform the following tasks:
- You have to specify a separate port for each DB2 subsystem if the Performance Expert Client or end-to-end SQL or stored procedure monitoring is enabled, otherwise there will be errors in the log. See “Specifying the port information for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring” on page 394.
- Ensure that the OMEGAMON Collector is configured to use TCP/IP services. See “Setting up TCP/IP services for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring” on page 311 for detailed information.
- Install Performance Expert Client or end-to-end SQL or stored procedure monitoring on the workstation. For Performance Expert Client, see “Installing and configuring Performance Expert Client” on page 436 for more information. For end-to-end SQL or stored procedure monitoring, see “Installing and configuring end-to-end SQL or stored procedure monitoring” on page 851 for more information.

**Enabling IBM Tivoli Monitoring**

IBM Tivoli Monitoring (ITM) monitors and manages system and network applications and monitors the availability and performance of all parts of your enterprise. IBM Tivoli Monitoring also provides reports that you can use to track trends and troubleshoot problems.

IBM Tivoli Monitoring consists of the following components:
- Tivoli Enterprise Monitoring Agent. The Tivoli Enterprise Monitoring Agent for OMEGAMON for DB2 PE is the OMEGAMON Agent.
- Tivoli Enterprise Monitoring Server
- Tivoli Enterprise Portal Server
- Tivoli Enterprise Portal
- IBM Eclipse Help Server
To use IBM Tivoli Monitoring, you must install Tivoli Enterprise Monitoring Server, Tivoli Enterprise Monitoring Agent, and Tivoli Enterprise Monitoring Server application support. Additionally, you must install Tivoli Enterprise Portal, Tivoli Enterprise Portal Server, and IBM Eclipse Help Server on the workstation. Tivoli Data Warehouse is an optional component that is installed on the workstation.

The following sections contain detailed installation and configuration instructions or references to the respective documentation:

1. “Configuring Tivoli Enterprise Monitoring Server”
2. “Enabling Tivoli Enterprise Monitoring Agent”
3. “Verifying that Tivoli Enterprise Monitoring Agent starts correctly” on page 376
4. “Installing application support for a Tivoli Enterprise Monitoring Server on z/OS” on page 377

For more information about Tivoli Enterprise Portal, see “Installing and configuring Tivoli Enterprise Portal” on page 851.

For more information about Tivoli Data Warehouse, see “Adding Tivoli Data Warehouse” on page 851.

Detailed information about the components, additional instructions for installation, and additional instructions for configuration are available in the Tivoli Monitoring in the IBM Knowledge Center.

Configuring Tivoli Enterprise Monitoring Server

The Tivoli Enterprise Monitoring Server collects performance data from monitored resources, preprocesses it, and then archives it in a central database. You need at least one Tivoli Enterprise Monitoring Server to be the HUB for your Tivoli Enterprise Portal environment.

About this task

If you have many monitored resources, you might also install remote Tivoli Enterprise Monitoring Servers to preprocess some of the data for the HUB Tivoli Enterprise Monitoring Server.

Detailed configuration instructions are provided in the Tivoli Monitoring in the IBM Knowledge Center Search for Configuring Tivoli Enterprise Monitoring Server on z/OS. Also see section ‘Installing and configuring the hub Tivoli Enterprise Monitoring Server’.

Enabling Tivoli Enterprise Monitoring Agent

The Tivoli Enterprise Monitoring Agent for OMEGAMON for DB2 PE is the OMEGAMON Agent.

About this task

When used with OMEGAMON for DB2 PE, the Tivoli Enterprise Monitoring Agent does not retrieve performance data. Instead, it connects with the OMEGAMON Collector so that the Tivoli Enterprise Portal infrastructure can access the performance data that is collected in the OMEGAMON Collector.
You can configure the Tivoli Enterprise Monitoring Agent as a stand-alone address space or as part of a Tivoli Enterprise Monitoring Server address space. To improve performance, you might want to configure the Tivoli Enterprise Monitoring Agent as a stand-alone address space.

Restriction: When more than one Tivoli Enterprise Monitoring Agent for DB2 is installed and running on the same LPAR connecting to the same hub Tivoli Enterprise Monitoring Server, the hub Tivoli Enterprise Monitoring Server can only accept data from one Tivoli Enterprise Monitoring Agent per LPAR at a time.

The instructions in this section describe how to configure a stand-alone Tivoli Enterprise Monitoring Agent in its own address space (that is on the same LPAR as the Tivoli Enterprise Monitoring Server). Instructions for configuring the Tivoli Enterprise Monitoring Agent in a Tivoli Enterprise Monitoring Server address space are available in the Common PARMGEN - Implementation scenarios.

To configure Tivoli Enterprise Monitoring Agent, refer to the KD5 parameters in section ‘OMEGAMON XE for DB2 Agent’ in the IBM OMEGAMON for DB2 Performance Expert/Performance Monitor Parameter Reference.

For more information, refer to the IBM® OMEGAMON and Tivoli Management Services on z/OS shared documentation and the Common parameters.

For the Complete the Configuration information, refer to the Complete the Configuration for the OMEGAMON XE for Db2 Agent Technote.

Verifying that Tivoli Enterprise Monitoring Agent starts correctly

Before you install Tivoli Enterprise Portal, check that the Tivoli Enterprise Monitoring Server and the Tivoli Enterprise Monitoring Agent are configured correctly and that they connect to the other components correctly.

About this task

To verify that Tivoli Enterprise Monitoring Agent starts successfully, perform the following steps:

Procedure

1. Start the OMEGAMON Collector.
2. Start the Tivoli Enterprise Monitoring Server.
3. Start the Tivoli Enterprise Monitoring Agent.
4. Check the Tivoli Enterprise Monitoring Agent startup messages.
   a. Verify that the Tivoli Enterprise Monitoring Server that is configured is correct. This information is found in the RKLVLOG in the following message:
      
      \[(0008-DA3327CB:kbsssge.c,52,"BSS1_GetEnv") CT_OMSLIST="<protocol>:<TEMS>"\]

      where <protocol> is the communication protocol and <TEMS> is the name of the Tivoli Enterprise Monitoring Server.
   b. Verify that the Tivoli Enterprise Monitoring Agent connected to the Tivoli Enterprise Monitoring Server. This information is found in the RKLVLOG in the following message:
      
      \[(0001-DA300D6B:kraaulog.cpp,442,"ctira_insert_log") KRAREG000,
      Connecting to CMS MMRE:CMS., Producer(IRA Manager)\]
where MMRTE:CMS is the name of the Tivoli Enterprise Monitoring Server.

c. Verify that the Tivoli Enterprise Monitoring Agent connected to the OMEGAMON Collector. This information is in the JESMSGLG in the following message:

KO210189I AGENT Agent STC CONNECTED TO D2 OM Server STC VERSION V540 BY REQUEST - DB2 DB2SSID

where:

- Agent STC is the name of the Tivoli Enterprise Monitoring Agent started task.
- OM Server STC is the Started task ID of server.
- DB2SSID is the DB2 subsystem ID.

If you do not see this message, verify that the OMEGAMON Collector started task name specified in the KD5_AGT_STC parameter is correct on the SPECIFY CONFIGURATION PARAMETERS panel.

d. Verify that the Tivoli Enterprise Monitoring Agent connected to the OMEGAMON Collector. This information is in the JESYSMSG of the OMEGAMON Collector in the following message:

KO210154I D5API COLLECTOR IS CONNECTING TO DB2 DB2SSID ON BEHALF OF AGENT Agent STC

where:

- DB2SSID is the DB2 subsystem ID.
- Agent STC is the name of the Tivoli Enterprise Monitoring Agent started task.

If you do not see this message, verify on the SPECIFY CONFIGURATION PARAMETERS panel that the OMEGAMON Collector started task name, specified in the KD5_AGT_STC parameter, is correct.

Enabling InfoSphere Optim Performance Manager integration

If you want to use InfoSphere Optim Performance Manager integrated into Tivoli Enterprise Portal, you need to enable InfoSphere Optim Performance Manager integration.

About this task

Before you can use the InfoSphere Optim Performance Manager integrated into Tivoli Enterprise Portal, check that the subsystems are enabled for monitoring support in the Tivoli Enterprise Monitoring Agent configuration. To do this, set the appropriate values for the following parameters for each DB2 subsystem configuration:

- KD5_DBnn_OPM_E2ESECURE_SECURE
- KD5_DBnn_OPM_E2ESQLHN_TCP_HOST
- KD5_DBnn_OPM_E2ESQLPT_PORT_NUM

Installing application support for a Tivoli Enterprise Monitoring Server on z/OS

Before you can view data in the Tivoli Enterprise Portal on the workstation, you must install application support. Application support files provide agent-specific information for workspaces, helps, situations, templates, and other data.
About this task

Detailed configuration instructions are provided in the Tivoli Monitoring in the IBM Knowledge Center. Search for Configuring Tivoli Enterprise Monitoring Server on z/OS.

Best practices

This section contains different best practices to help you reduce the configuration effort.

About this task

The following topics provide detailed information:

1. “Creating new DB2 subsystem configurations and/or monitoring profiles via duplication”
2. “Configuring all DB2 subsystems/data sharing groups” on page 381

Creating new DB2 subsystem configurations and/or monitoring profiles via duplication

In order to monitor more DB2 subsystems/data sharing groups, you need to add more subsystem configurations to the PARMGEN profile. The same applies to monitoring profiles, if you want to analyze different performance metrics for selected DB2 subsystems. In order to create a new DB2 configuration or monitoring profile, you can duplicate an existing one. Per default, two DB2 configurations and one monitoring profile are available.

Before you begin

This best practice does not require any prerequisites. You can follow the steps while doing your first configuration or when updating your existing configuration.

About this task

You will duplicate an existing monitoring profile in this workflow. However, this information is also applicable to all other parameters that are table-based. These are all parameters of the structure kpp_Axx, where:

- pp is the product code
- AA is the parameter function identifier (for example, PF for monitoring profiles, or DB for DB2 configurations)
- xx is the row ID

In order to create a new monitoring profile in the PARMGEN user profile, you duplicate an existing profile. After this step, you adjust the profile ID that is part of the parameter. For example, in parameter KD2_PF01_SQLPA_VERSION, the profile ID is PF01.

The sample PARMGEN profile that is provided with OMEGAMON for DB2 PE already contains a default monitoring profile configuration. You can use this default profile for the following steps, or create a new profile PF02.

Procedure

1. Open the PARMGEN user profile and search for the first or any existing monitoring profile. Issue the following command: f PFxx
2. Issue the following primary command to exclude all lines: `x all`

3. Issue the following primary command to include all profile monitoring parameters: `f PF01 all`

**Note:** You can include commented lines using the line command `f`. For example, to include the six lines between `KD2_PF01_DESCRIPTION` and `KD2_PF01_OA_ECM`, use `f6`. This results in the following screen:

```
File Edit Edit_Settings Menu Utilities Compilers Test Help

8. Change the **KD2_PF02_PROFID** parameter to a new monitoring profile ID to ensure that it differs from the original profile ID.

---

### Configuring all DB2 subsystems/data sharing groups

The most basic deployment scenario in PARMGEN is to create one completely separate RTE on each single LPAR. PARMGEN provides support for system variables in order to have only one PARMGEN profile that can be shared among all runtime environments.

#### Before you begin

You need a runtime environment where OMEGAMON for DB2 PE is already configured. This runtime environment must have system variable support enabled.

The following table shows some necessary information on runtime environments for this best practice. The source runtime environment is the one that needs to exist already while the deployment target runtime environment is the one that is being created.

<table>
<thead>
<tr>
<th>Table 75. Runtime environment values</th>
</tr>

</tr>
<tr>
<td><strong>LPAR name</strong></td>
</tr>
<tr>
<td><strong>Global user JCL</strong></td>
</tr>
<tr>
<td><strong>Runtime environment high-level qualifier</strong></td>
</tr>
</tbody>
</table>

#### About this task

As DB2 subsystem configurations and data sharing group configurations (in the following example only DB2 subsystem configurations) depend on the LPAR, this approach is not ready for immediate use. The reason is that a DB2 subsystem resides on only one LPAR but PARMGEN configures all specified DB2 subsystem configurations that are given in the PARMGEN user profile. Thus, you need to adjust those DB2 subsystem configurations on each runtime environment. The best approach is to share as much as possible and to change as little as possible. This best practice will show you a way how to achieve this.
This scenario has the following setup: Two LPARs have two DB2 subsystems each. You need an existing runtime environment that is configured on the first LPAR. The following graphic shows the prerequisite and the outcome of this scenario.

The basic idea of the setup is to adjust RTE 1 in a way that it can be used as input for RTE 2 with as little effort as possible. Then you create RTE 2 and only adjust the local DB2 subsystem information.

**Procedure**

1. Adjust RTE 1 by moving all DB2 subsystem-specific information from the PARMGEN user profile to a new configuration member in your WCONFIG library.

2. Create two new configuration members in the WCONFIG library named DB2PMO1 and DB2PMO2. Name the configuration member starting with DB2, followed by the system name.

3. When starting on the deployment source runtime environment, move all **KD2_DBxx** parameters from the PARMGEN profile to DB2PMO1.
4. Add a short note to include the subsystem configuration in $SYSIN later.

5. DB2PMO1 now contains your DB2 subsystem configuration for your first LPAR. Adjust DB2PMO2 accordingly, so that it contains all DB2 subsystem configurations on your second LPAR. Create a DB2 subsystem configuration member for each LPAR where you want it to deploy OMEGAMON for DB2 PE.
6. Add the following parameters to the DB2PMO* configuration members:
   a. Parameter for the started task name (GLB_DB2_CLASSIC_STC from $GBLUSR) to the DB2PMO* configuration members, if USER.PROCLIB is shared.
   b. Parameters GLB_DSN_DB2_* from $GBLUSR to the DB2PMO* configuration members, if the DB2 run and load libraries are not shared.

   This prevents you from having to adjust these parameters on each LPAR.

   File Edit Edit_Settings Menu Utilities Compilers Test Help
   0000138 **GLB_DSN_DB2_DSNLOAD DSN.V9R1M0.SDSNLOAD**

   0000016 **CONFIG MEMBER=(WCONFIG:WCONFIG)**

8. Create a new runtime environment (RTE 2) on LPAR 2 and ensure that system variable support is enabled. Reference the PARMGEN profile of RTE 1 in the PARMGEN work environment setup.

   KCIIPPMG1 ---- SET UP PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
   Specify the RTE profile library and member name that fits your scenario:
   => SAR.PG.V540.OMPE01.WCONFIG(OMPE01) (ex:$dset(rte))
   - If creating a brand new RTE, leave this field blank. **or**
   - If creating another new RTE and you want to clone a PARMGEN-created RTE’s configured product set, specify the WCONFIG profile library and RTE member name to clone (ex.: $hlq.&rte.WCONFIG(&clone_from)). **or**
   - If reconfiguring or upgrading this existing OMPE02 RTE, specify its
Note: If you need more information on enterprise deployment, refer to the deployment scenario in the Parameter Reference.

9. Before submitting the KCIIJPCCF job to clone the existing OMPE01 RTE, include the DB2PMO* DB2 subsystem configuration members. This way, they are copied to RTE 2 as well.

```
000095 * ************************************************************
000096 * ----------- BEGIN - USER SECTION: SELECT MEMBER -------------- *
000097 * ************************************************************
000098 * USER SECTION: SELECT MEMBER *
000099 * ***************************************************************
001000 SELECT MEMBER=(???$C*)
001001 SELECT MEMBER=(???$P*,??@$PDAL,??@$PDPG)
001002 SELECT MEMBER=(???$S*,??@$X*)
001003 SELECT MEMBER=($GBL$,USR)
001004 SELECT MEMBER=(?JOBCARD)
001005 SELECT MEMBER=(DB2PMO*)
001006 SELECT MEMBER=(DB2PMO+)
001007 EXCLUDE MEMBER=(??@$CFG,??@$RCFG,??@$RCFG,??@$KCI$SYV,??@$KCI$SYN)
001008 EXCLUDE MEMBER=(??@$OC*,??@$OS*)
001009 EXCLUDE MEMBER=(??@$PAUD,??@$PSDA,KPD$PD*)
001010 * ----------- END - USER SECTION: SELECT MEMBER -------------- *
```

Note: This job will overwrite your existing JOBCARD with the one from RTE 1 on LPAR 1. If you want to prevent this, comment out the appropriate line in the KCIIJPCCF job (line number 104 in the above job example).

10. Replace %MODEL% with the source runtime environment (for example, OMPE01) before submitting the KCIIJPMC2 job.

```
000058 * ********** BEGIN - USER SECTION: CONFIG MEMBER ******************
000059 * **************************************************************
000060 CONFIG MEMBER=(WCONFIG:OMPE02)
000061 CONFIG MEMBER=(WCONFIG:DB2PMO2)
000062 CONFIG MEMBER=(WCONFIG:&user_config_profile_placeholder)
000063 CONFIG MEMBER=(WCONFIG:&profile)
000064 * **************************************************************
```

11. Remove all KD2_DBxx parameters in the PARMGEN user profile.

12. Add DB2PMO2 to the $SYSIN configuration profile including the member.

---

Chapter 3. Installing and configuring

385
**Note:** Depending on your configuration, it is possible that you do not have to submit the KCIIPMC2 job. Whenever possible, use system variables with system variable support. If you need the KCIIPMC2 merge job, check all parameters and adjust them if required. What you always have to adjust are the following:

- Name of runtime environment (and all corresponding prefixes)
- VTAM APPLID prefix
- Started task prefix (if your USER.PROCLIB is shared among the LPARs)

13. Finish the installation and configuration as usual.

**What to do next**

If you want to deploy to more LPARs, you have to create more LPAR-specific profiles. After that, the procedure remains the same. Create a new runtime environment having system variable support enabled, remove the **KD2_DBxx** parameters and include the LPAR-specific DB2PMO* configuration member in $SYSIN.

---

**Configuring monitoring profiles and DB2 subsystems**

OMEGAMON for DB2 PE provides several optional z/OS components to help you analyze, monitor, and tune your DB2 subsystems.

**About this task**

You must add one or more monitoring profiles to configure the monitoring functionality that you want to use for the different DB2 subsystems. In the next step you can associate these monitoring profiles to the DB2 subsystems that you want to monitor.

Adding and configuring one or more monitoring profiles:

- The monitoring profiles define the monitoring functionality that you want to use. To add a new monitoring profile, see "Creating new DB2 subsystem configurations and/or monitoring profiles via duplication" on page 378.
- The following topics provide detailed configuration information on the functionality that can be configured as part of a monitoring profile:
  
  - "Enabling Object Volume Analysis" on page 387
  - "Enabling Periodic Exception Processing" on page 388
  - "Enabling Near-Term History" on page 389
  - "Enabling Snapshot History" on page 391
  - "Enabling Performance Expert Agent for DB2 Connect Monitoring support" on page 391
  - "Enabling DB2 EXPLAIN" on page 392
  - "Enabling IBM DB2 SQL Performance Analyzer" on page 393
  - "Starting Additional DB2 Traces" on page 393

Now you can configure which DB2 subsystems you want to monitor:

- For each DB2 subsystem, you must specify which monitoring profile it should use. Each profile can be used for one or more DB2 subsystems. You do this by associating the DB2 subsystem with a monitoring profile. See "Associating a DB2 subsystem with a monitoring profile" on page 387 for instructions on how to do this.
You can configure as many DB2 subsystems as you like. However, the server only monitors the first 32 monitoring-enabled DB2 subsystems as listed in RKD2PRF(DB2PROF). To monitor more DB2 subsystems on a single LPAR you need to configure an additional OMPE Collector.

- For configuring DB2 subsystem-specific Performance Expert Client and/or end-to-end SQL or stored procedure monitoring, see “Specifying the port information for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring” on page 394 for configuration instructions.
- For configuring Performance Warehouse, see “Enabling Performance Warehouse” on page 395 for configuration instructions.

**Configuring DB2 subsystem monitoring**

You must associate each DB2 subsystem with a monitoring profile and build the DB2-related runtime members.

**About this task**

After you configure the monitoring profiles, you must configure the DB2 subsystem monitoring. The monitoring profiles define the monitoring functionality that you wish to use. Then you specify which monitoring profile you want to apply for each DB2 subsystem. In addition, you must enter some configuration information that is specific to each DB2 subsystem, and build the runtime members for the DB2 subsystem.

The following topic provides detailed configuration information:

1. “Associating a DB2 subsystem with a monitoring profile”

**Associating a DB2 subsystem with a monitoring profile**

You enter the configuration information for your DB2 subsystem and associate it with a monitoring profile.

**About this task**

In order to assign a monitoring profile to a DB2 subsystem configuration, provide the profile ID from the KD2_PFxx_PROFID parameter to the KD2_DBxx_DB2_PROFID parameter. The default profile assigned to the DB2 subsystems is P001.

**Enabling Object Volume Analysis**

The Object Volume Analysis function reveals the effect of an application on overall disk access. This can help you balance the load and determine where DB2 data sets should be placed to reduce system congestion.

**About this task**

The following sections provide detailed installation and configuration instructions:

1. “Configuring Object Volume Analysis” on page 388
2. “Verifying the Object Volume Analysis configuration” on page 388

**What to do next**

1. You configure Object Volume Analysis in a monitoring profile. After you have configured the component, you must associate a DB2 subsystem with this profile and create the runtime members for this DB2 subsystem. See “Configuring DB2 subsystem monitoring” for detailed instructions.
Configuring Object Volume Analysis
You can enable and configure Object Volume Analysis in the PARMGEN user profile.

About this task
To enable Object Volume Analysis, set parameter KD2_PFxx_OA_ECM to Y in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "Profile parameters", "Object/Volume analysis" in the [Parameter Reference](#).

Verifying the Object Volume Analysis configuration
Check the OMEGAMON Collector JESMSGLOG output to verify that the server accepted your parameters.

Before you begin
Before you test the setup of Object Volume Analysis, ensure that you have completed the product setup, so that you can start the OMEGAMON Collector.

About this task
After you have configured the DB2 subsystem, perform the following steps:

Procedure
1. Start the OMEGAMON Collector.
2. In SDSF, open the JESMSGLOG output of the OMEGAMON Collector started task.
3. Review the JESMSGLOG. You should see the output similar to the following excerpt:

   ...
   KO2E3000I EVENTMGR INITIALIZATION IN PROGRESS
   KO2E3001I EVENTMGR INITIALIZATION SUCCESSFUL
   ...
   KO2E3070I OBJECT ANALYSIS - INITIALIZATION IN PROGRESS FOR DB2=DB24
   KO2E3050I OBJECT ANALYSIS - PHASE1 INITIALIZATION COMPLETE FOR DB2=DB24
   ...
   KO2E3051I OBJECT ANALYSIS - PHASE2 INITIALIZATION COMPLETE FOR DB2=DB24
   ...
   KO2E3071I OBJECT ANALYSIS - INITIALIZATION SUCCESSFUL FOR DB2=DB24
   Messages KO2E3000I and KO2E301I indicate that the Event Collection Manager is configured and is starting.
   Messages KO2E3070I, KO2E3051I, and KO2E3071I indicate that the Object Analysis support is configured and is starting.

Enabling Periodic Exception Processing
Periodic Exception Processing analyzes system metrics and compares them against predefined thresholds, user-defined thresholds, and application metrics. When a threshold is exceeded, an exception event is shown.

About this task
You can use Periodic Exception Processing in three different ways:
• You configure Periodic Exception Processing in the PARMGEN user profile.
In this case, the function is started automatically at startup of the OMEGAMON Collector. One common set of threshold definitions is used for all users.

- You start Periodic Exception Processing manually after you start Performance Expert Client.
  
  In this case, you do not need to configure the function in the PARMGEN user profile. You can define a set of threshold definitions for each user ID.
- You can use the Exception Processing user exit that issues messages to the operator console in case of exceptions.

The following section provides detailed instructions for configuring Periodic Exception Processing in the PARMGEN user profile:

“Configuring Periodic Exception Processing in PARMGEN.”

What to do next

1. After you configure the component, you allocate operational data sets. See the “Completing the configuration for z/OS components” on page 405 for detailed instructions.

2. In addition, you have to provide threshold definitions in the threshold data set. Before you can use Periodic Exception Processing, you must allocate additional runtime data sets first to allocate the Threshold Exception data set, and then copy the default threshold definitions. For more information, see the Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS Reporting User’s Guide in the Tivoli Monitoring in the IBM Knowledge Center.

Configuring Periodic Exception Processing in PARMGEN

If you configure Periodic Exception Processing in PARMGEN, the function is started automatically at startup of the OMEGAMON Collector.

About this task

To configure Periodic Exception Processing, set parameter KD2_PFxx_AEXCP_D2PYACT to Y in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section “Profile parameters”, “Periodic exception processing” in the Parameter Reference.

Enabling Near-Term History

Near-Term History captures and stores recent DB2 instrumentation data so that you can review thread performance after the threads have ended.

About this task

Important: Near-Term History is only available through the Classic Interface.

The following sections provide detailed installation and configuration instructions:

1. “Configuring the Near-Term History Data Collector” on page 390
2. “Verifying the Near-Term History configuration” on page 390

What to do next

1. After you configure the component, you must allocate operational data sets. See “Completing the configuration for z/OS components” on page 405 for detailed instructions.
Configuring the Near-Term History Data Collector
You must specify the settings for the Near-Term History Data Collector in the PARMGEN user profile.

About this task
To configure Near-Term History, set parameter KD2_PFxx_HIS_START to Y or C in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "Profile parameters", "Near-Term History" in the Parameter Reference.

You can use variable %DB% for the DB2 subsystem ID or variable %SY% for the system ID in the VSAM data set names. Variable %DB% will be replaced by the DB2 subsystem ID for the allocation of the data sets, and variable %SY% will be replaced by the z/OS system ID that you configured.

Verifying the Near-Term History configuration
Check the OMEGAMON Collector JESMSGLOG output to verify that the server accepted your parameters.

Before you begin
Before you test the setup for Near-Term History, make sure that you have completed the product setup, so that you can start the OMEGAMON Collector.

About this task
To verify that the OMEGAMON Collector accepted your changes for Near-Term History, perform the following steps:

Procedure
1. Start the OMEGAMON Collector.
2. In SDSF, open the JESMSGLG output of the OMEGAMON Collector started task.
3. Review the JESMSGLG. You should see the output similar to the following excerpt:

Messages KO2O1309I and KO2O1308I indicate that Near-Term History started successfully for the configured DB2 subsystems. Message KO2R0128I identifies the previously configured Near-Term History data sets.
4. Review the SYSPRINT log. You should see the following message:

KO2013181 NEAR-TERM HISTORY DATA COLLECTOR - NEW OPTIONS
IN EFFECT FOR CURRENT INTERVAL (NEWINOPT)

**Enabling Snapshot History**

Snapshot history data is useful, for example, if you want to examine activities leading to, and following, an exception without recreating the situation.

**About this task**

The following section provides detailed installation and configuration instructions:

"Configuring Snapshot History"

**What to do next**

1. After you configure the component, you must allocate operational data sets. See “Completing the configuration for z/OS components” on page 405 for detailed instructions.

**Configuring Snapshot History**

Here you specify the type of information that is collected in the Snapshot History.

**About this task**

To enable Snapshot History, set parameter **KD2_PFxx_SH_D2SHKHST** to **Y** in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "Profile parameters", "Snapshot history (including DB2 Connect Monitoring)" in the [Parameter Reference].

**Enabling Performance Expert Agent for DB2 Connect Monitoring support**

The Performance Expert Agent for DB2 Connect Monitoring monitors connections of remote applications within the Distributed Relational Database Architecture (DRDA) of DB2 that are connected through DB2. It is installed on the DB2 Connect Server gateway and provides DB2 Connect data for the OMEGAMON Collector.

**Before you begin**

You must enable Performance Warehouse before beginning. See “Enabling Performance Warehouse” on page 395 for more information.

**Tip:** If you do not want to use Performance Warehouse for purposes other than DB2 Connect Monitoring, you can enable it in PARMGEN a single time, verify that the OMEGAMON Collector has created the Performance Warehouse tables, and then return to PARMGEN to disable it. If you disable Performance Warehouse, you must enable it again before you install a PTF that indicates that in the ++HOLD. Otherwise, the necessary changes to the Performance Warehouse database are not made. This might result in SQL errors.

**About this task**

The following section provides detailed installation and configuration instructions:
What to do next

1. After you complete the configuration steps outside of PARMGEN, you must complete the configuration in PARMGEN. See “Completing the configuration for z/OS components” on page 405 for detailed instructions.

2. After you have enabled Performance Expert Agent for DB2 Connect Monitoring support, you must install Performance Expert Agent for DB2 Connect Monitoring on the system hosting a DB2 Connect gateway. See “Installing and configuring Performance Expert Agent for DB2 Connect Monitoring” on page 406 for more information.

Configuring Performance Expert Agent for DB2 Connect Monitoring support

You can use the PARMGEN user profile to configure Performance Expert Agent for DB2 Connect Monitoring support.

About this task

To enable Performance Expert Agent for DB2 Connect Monitoring support, set parameter KD2_PFxx_SH_D2SHKHST to Y and parameter KD2_PFxx_DCM_D2SHDCAP to Y in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "Profile parameters", "Snapshot history (including DB2 Connect Monitoring)” in the Parameter Reference.

Enabling DB2 EXPLAIN

Explain functions provide an easy-to-read representation of access plan information for your SQL queries and statements. You can use this information to decide how to tune your queries. The built-in explain functions are Easy Explain and the EXPLAIN report.

Before you begin

You must create a database to be used by EXPLAIN. There are no special requirements regarding database name, storage group, or index buffer pool. But you must use an 8 KB buffer pool. The database name has to be specified in parameter KD2_PFxx_EX_D2EXDB.

About this task

The following section provides detailed installation and configuration instructions:

“Configuring DB2 EXPLAIN”

What to do next

1. After you complete the configuration steps in PARMGEN, you must complete the configuration outside of PARMGEN. See “Completing the configuration for z/OS components” on page 405 for detailed instructions.

Configuring DB2 EXPLAIN

Before you can use DB2 EXPLAIN, you must enter your configuration values in PARMGEN.
About this task

To configure DB2 EXPLAIN, set parameter **KD2_PFxx_EX_D2EXACT** to Y in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "Profile parameters", "DB2 Explain" in the Parameter Reference.

**Enabling IBM DB2 SQL Performance Analyzer**

IBM DB2 SQL Performance Analyzer provides resource usage information and costs associated with SQL queries without having to run them in DB2. This analysis helps you to tune your queries to achieve maximum performance.

**Before you begin**

You must enable Performance Warehouse before beginning. See [“Enabling Performance Warehouse” on page 395](#) for more information. Performance Warehouse has to be running while you are using SQL Performance Analyzer.

* You must install IBM DB2 SQL Performance Analyzer as a separate product before you begin. See the IBM DB2 SQL Performance Analyzer for z/OS Installation Guide in the IBM Db2 Tools Product Documentation.

**About this task**

The following section provides configuration instructions for IBM DB2 SQL Performance Analyzer:

[“Configuring IBM DB2 SQL Performance Analyzer.”](#)

**Configuring IBM DB2 SQL Performance Analyzer**

You use PARMGEN to enable and configure IBM DB2 SQL Performance Analyzer.

**About this task**

To configure IBM DB2 SQL Performance Analyzer, set parameter **KD2_PFxx_SQLPA_ENABLE** to Y in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "Profile parameters", "DB2 SQL Performance Analyzer" in the Parameter Reference.

**Starting Additional DB2 Traces**

With this option you can start additional DB2 traces. For certain functionality, such as displaying SQL statements and metrics for dynamic statement cache or EDM pool, it is required to start additional DB2 traces. Starting these traces causes considerable CPU overhead. Therefore, these traces are not started by default. With this option you can specify if additional DB2 traces should be started automatically when the OMEGAMON Collector starts.

**About this task**

The following section provides detailed installation and configuration instructions:

[“Configuring Additional DB2 Traces”](#)

**Configuring Additional DB2 Traces**

You can use the Configuration Tool to configure Additional DB2 Traces.
About this task

There are two ways to configure Additional DB2 Traces.

Procedure

- The first way is to set parameter KD2_PFxx_TRACES_318 and parameter KD2_PFxx_TRACES_400 to Y. This enables collection IFCID 318 for dynamic and IFCID 400 for static statement cache metrics.

  Note: Parameter KD2_PFxx_TRACES_400 is only applicable for DB2 10 and above versions. The enablement of those two parameters is required when using Extended Insight (end-to-end SQL monitoring) and stored procedure monitoring.

- The second way is to use the KD2_PFxx_TRACES_DB2CMDx parameters (where x is either 2, 3, or 4). This alternative gives you the possibility to provide three more custom START TRACE commands.

  Note: It is not possible to add line breaks to the statement. Therefore, use abbreviations for this command wherever possible.

  You find more information on these parameters in the Parameter Reference.

Configuring Additional Monitoring Features

Additional Monitoring Features are a special set of functions only for OMEGAMON for DB2 PE. If you want to enable additional monitoring functions, such as DB2 message monitoring and stored procedure monitoring, you must enable them in PARMGEN. DB2 message monitoring is used to show DB2 messages in the Tivoli Enterprise Portal workspaces. Stored procedure monitoring data is used in the InfoSphere Optim Performance Manager dashboards.

To start DB2 message monitor, set parameter KD2_PFxx_ACS_DB2MSGMON to Y.

To enable stored procedure monitoring support in the InfoSphere Optim Performance Manager user interface, set parameter KD2_PFxx_READA_SPMON to Y in the PARMGEN user profile. In order for this function to work, you also have to enable end-to-end SQL or stored procedure monitoring, see “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373, and you also have to enable collection of IFCID 318 and 400 traces, see “Configuring Additional DB2 Traces” on page 393.

You find more information on this and an other function-specific parameters in the Parameter Reference.

Specifying the port information for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring

If you want to use Performance Expert Client and/or end-to-end SQL or stored procedure monitoring for some DB2 subsystems, you must specify the Performance Expert Client port information for each DB2 subsystem.

Before you begin

You must enable Performance Expert Client support and/or end-to-end SQL or stored procedure monitoring support before you specify the port information. See “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373 for more information.
About this task

To specify the port information, use parameter **KD2_DBxx_DB2_PORT_NUM** for each of your DB2 subsystem configurations that you want to monitor using either Performance Expert Client or end-to-end SQL or stored procedure monitoring.

What to do next

1. For Performance Expert Client: After you have added Performance Expert Client support, you must install Performance Expert Client on the workstation. See "Installing and configuring Performance Expert Client” on page 436 for more information. For end-to-end SQL or stored procedure monitoring: After you have added end-to-end SQL or stored procedure monitoring support, you must install end-to-end SQL or stored procedure monitoring on the workstation. See “Installing and configuring end-to-end SQL or stored procedure monitoring” on page 851 for more information.

Verifying the Performance Expert Client support and/or end-to-end SQL or stored procedure monitoring support configuration

Check the OMEGAMON Collector started task SYSPRINT output to verify that the server accepted your parameters.

Before you begin

Before you test the setup of the OMEGAMON Collector, ensure you have completed the product setup, so that you can start the OMEGAMON Collector.

About this task

After you have configured the DB2 subsystem, perform the following steps:

Procedure

1. Start the OMEGAMON Collector.
2. Review the SYSPRINT output of the OMEGAMON Collector started task in SDSF. Verify that the following outputs match the parameters you specified:
   a. TCP/IP
   b. IP ADDRESS OF SERVER INSTANCE. If you left the IP address blank because your host only has one IP address, you will see 0.0.0.0 here.
   c. MAXIMUM NUMBER OF PARALLEL SESSIONS.
   d. TCPNAME (this value is not of interest for end-to-end SQL or stored procedure monitoring).
   e. DATASHARINGGROUP.
   f. TCPIP PORT.
3. Verify that the last output is FPEV1330I, TCP/IP SERVER TASK STARTED. This means that the TCP/IP port opened successfully.

Enabling Performance Warehouse

You can use PARMGEN to install and configure Performance Warehouse.

Before you begin

- The started task user ID must be DB2PM or associated with a group ID with the name DB2PM, see "Setting up security for the OMEGAMON Collector address spaces” on page 311.
If you want to install the Performance Warehouse Client, you must enable Performance Expert Client support first. See “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373 and “Specifying the port information for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring” on page 394 for more information.

Verify that your system supports started jobs. For a detailed explanation, see “Enabling started jobs for Performance Warehouse” on page 312.

Create any storage groups that you will use for this Performance Warehouse database.

Create 4 KB and 32 KB buffer pools that you will use for this Performance Warehouse database.

Grant user DB2PM or group DB2PM access to the buffer pools that you will use for this Performance Warehouse database.

About this task

The Performance Warehouse is an automated Performance Database that consists of DB2 tables to save Accounting and Statistics performance data and internal control tables.

The following section contains detailed installation and configuration instructions:
1. “Configuring the Performance Warehouse”

What to do next

After you enable Performance Warehouse, you must perform the following tasks:

• Complete the configuration outside of PARMGEN. See “Completing the configuration for z/OS components” on page 405 for more information.

• Install and configure the Performance Expert Client on the workstation. This enables you to view information that is stored in the Performance Warehouse using the Performance Warehouse Client function. For more information, see “Installing and configuring Performance Expert Client” on page 436 or “Configuring the Performance Warehouse Client” on page 443.

• Verify that the OMEGAMON Collector accepted your changes for Performance Warehouse. See “Verifying the Performance Warehouse configuration” on page 397 for more information.

Configuring the Performance Warehouse

You must configure Performance Warehouse so that the OMEGAMON Collector can create and control it.

About this task

You must configure Performance Warehouse on DB2 subsystem level. It cannot be configured on monitoring profile level, because several configuration parameters are unique for each DB2 subsystem.

During the configuration process, you can define some parameters for the database, but the database name is always DB2PM and you cannot change it.

To enable Performance Warehouse, set parameter KD2_DBxx_PWH_D2PWPWHA to Y in the PARMGEN user profile. For more information on this and on other function-specific parameters, refer to section "DB2 subsystem parameters", 
Verifying the Performance Warehouse configuration

Check the OMEGAMON Collector started task SYSPRINT output to verify that the server accepted your parameters.

Before you begin

Before you test the setup of the Performance Warehouse, ensure that you have completed the product setup, so that you can start the OMEGAMON Collector.

About this task

To verify that the OMEGAMON Collector has successfully incorporated your changes, review the SYSPRINT output of the OMEGAMON Collector started task:

Procedure

1. Start the OMEGAMON Collector.
2. In SDSF, open the SYSPRINT output of the OMEGAMON Collector started task.
3. Review the SYSPRINT. You should see the output similar to the following excerpt:

   0FPEV0129I D824 PERFORMANCEWAREHOUSE=YES
   0FPEV0133I D824 - PERFORMANCEWAREHOUSEADRESSSPACENAME=CANSPW
   0FPEV1339I D824 TCPIP PORT=6080
   ...
   0FPEV5003I D824 CHECKING DATABASE FOR NECESSARY CHANGES. PLEASE WAIT
   0FPEV5016I D824 REQUIRED DBRM DGOZMIG1 NOT BOUND. BINDING IT
   ...
   0FPEV5005I D824 DATABASE UPDATE COMPLETE

Note: It might take several minutes to create the Performance Warehouse database. Message 0FPEV5016I indicates that the OMEGAMON Collector is still creating the database and binding the DBRMs. In every subsequent startup, the database already exists and the OMEGAMON Collector will only check for required updates and BINDs. After this check, the message 0FPEV5005I is displayed.

Configuring additional components on z/OS

OMEGAMON for DB2 PE provides additional optional z/OS components to help you analyze, monitor, and tune your DB2 databases. These components are configured outside of PARMGEN.

About this task

The following sections provide configuration instructions for the additional components on z/OS:

- “Enabling Application Trace Facility” on page 398
- “Enabling Buffer Pool Analyzer” on page 398
- “Adding a Performance Database” on page 398
- “Enabling Reporter” on page 399
Enabling Application Trace Facility
You can enable and configure Application Trace Facility in the Classic Interface.

About this task
Application Trace Facility (ATF) traces the execution of a DB2 thread so that you can improve application flow and resource consumption.

You enable Application Trace Facility in the Classic Interface. For more information, see “IBM DB2 SQL Performance Analyzer (SQL PA)” on page 17.

Enabling Buffer Pool Analyzer
You can use the sample members in the TKO2SAMP library to help you configure Buffer Pool Analyzer.

About this task
IBM DB2 Buffer Pool Analyzer for z/OS helps database administrators manage buffer pools more efficiently by providing information about current buffer pool behavior and by using simulation to anticipate future behavior.

For detailed installation and configuration instructions see IBM DB2 Buffer Pool Analyzer for z/OS Configuration Guide on the IBM Db2 Tools Product Documentation.

Adding a Performance Database
You can use the sample statements in the sample library to create and to load a Performance Database. If you use an SMP/E sharing runtime environment, the sample library is TKO2SAMP. For all other types of runtime environments, the sample library is RKO2SAMP.

About this task
The Performance Database is a DB2 database that can hold aggregated and raw DB2 activity information spanning a long period of time. The type of data stored in the Performance Database depends on the reporter command (FILE or SAVE) used to create input data sets for the DB2 LOAD utility. This long-term history can help you with performance tuning activities, with trend analysis, and with capacity planning.

Important: If you are planning to use a Performance Warehouse and a Performance Database in the same DB2 subsystem, then you need to create the Performance Database tables with an owner ID that differs from the Performance Warehouse owner ID DB2PM.

To add a Performance Database, perform the following steps:

Procedure
1. Create data for the Performance Database from already collected performance data. You can use the OMEGAMON for DB2 PE batch reporter with either the
FILE option or the SAVE option to create performance data. However, if you use the SAVE option, you must convert the data to the FILE format before you can load it into the tables.

2. Create the Performance Database tables. You can use the sample CREATE statements in the RKO2SAMP library as a starting point and then modify the statements to meet your needs.

3. Load data into the Performance Database. You can use the sample LOAD statements in the RKO2SAMP library and the DB2 LOAD utility. If you modified the CREATE statements from the RKO2SAMP library, you must also modify the LOAD statements.

What to do next

For detailed information about the structure of the Performance Database, including the types of data that you can store in a Performance Database, and how it is formatted and loaded, see the *IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS; IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS: Reporting User’s Guide*.

Enabling Reporter

The Reporter is enabled when you download the program files from SMP/E.

About this task

The Reporter generates predefined reports to help you collect and analyze historical performance data. It also enables you to prepare performance data before you load it into the Performance Warehouse or into the Performance Database.

You do not need to perform any additional installation or configuration steps.

For more information about Reporter, see *IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS; IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS: Report Command Reference*.

Enabling options in OMEGAMON for DB2 PE Collector Realtime Customer Options (OMPEOPTS)

You can enable options in OMEGAMON for DB2 PE Collector Realtime Customer Options to override default settings.

About this task

OMEGAMON for DB2 PE externalizes user-modifiable options in member OMPEOPTS of the ‘hlq.RKD2PAR’ parameter library. You can use the defaults, or change them to conform to your installation standards.

The XCFMODE option specifies how the coupling facility component of the OMEGAMON for DB2 PE Collector subsystem is initialized at OMEGAMON for DB2 PE Collector initialization time. The default is XCFMODE=ACTIVE, which causes the coupling facility component of the OMEGAMON for DB2 PE to initialize in active mode. You can disable this option by specifying XCFMODE=INACTIVE. This causes the coupling facility XCF gateway component of the OMEGAMON for DB2 PE to be initialized in inactive mode.
Once XCFMODE is enabled, you can also enable user options DB2RTCPU and DB2REMIO. The default for both user options is enabled (DB2RTCPU=YES and DB2REMIO=YES).

The DB2RTCPU user option allows viewing DB2 remote thread CPU time for threads running on remote members of the data sharing group that the connected DB2 subsystem belongs to. It is also used for collecting lock information for remote threads. You can disable this user option by specifying DB2RTCPU=NO.

The DB2REMIO user option allows viewing Thread DSN Activity for threads running on remote members of the data sharing group that the connected DB2 subsystem belongs to. You can disable this user option by specifying DB2REMIO=NO.

The message subsystem displays the current DB2 subsystem and IRLM messages. It also allows you to issue DB2 commands, for example, to display the status of utility jobs or terminate utilities that have abended. Message subsystem activation and deactivation is controlled by the MGSUBSYS=[ACTIVE/INACTIVE] user option specified in OMPEOPTS member of the RKD2PAR PARMGEN data set. By default, OMEGAMON for DB2 PE on z/OS is shipped with MGSUBSYS=INACTIVE. To activate the message subsystem, set MGSUBSYS=ACTIVE and restart the OMEGAMON for DB2 PE Collector address space. You can then view messages when you select the DB2 CONSOLE option on the OMEGAMON Classic Interface Realtime main menu.

Cross-system coupling facility (OMEGAMON/XCF) feature

The cross-system-coupling facility (OMEGAMON/XCF) feature enables peer-to-peer communication between OMEGAMON Collectors.

The OMEGAMON Collector XCF gateway component allows peer-to-peer communication between OMEGAMON Collectors by implementing the cross-system coupling (XCF) services supported in the z/OS system complex (sysplex) environment. OMEGAMON Collectors use XCF member connection services to connect to a predefined OMPEXCF default group name. All OMEGAMON Collectors connected to the same group can then issue send and receive requests against each other to exchange DB2 performance monitoring data.

The OMEGAMON/XCF feature is initialized at OMEGAMON Collector initialization time when real-time user option XCFMODE=ACTIVE is specified in member OMPEOPTS of the RKD2PAR parameters data set. When XCFMODE=ACTIVE is specified, the XCF gateway component performs additional environmental initialization functions specified by the following parameters of member OMPE00 of the RKD2PAR data set:

- XCFGROUP=OMPEXCF
- XCFTASKS=04
- XCFTIMER=30
- DSPSIZE=128M

The XCF group is a set of related members defined in the z/OS XCF by the OMEGAMON Collector XCF gateway, in which members of the group can communicate (send and receive data) between z/OS systems with other OMEGAMON Collector members of the same group. A group can span one or more of the systems in a sysplex and represents a complete logical entity to z/OS XCF. When a Classic or Common (D5API) OMEGAMON Collector session is
started, the OMEGAMON Collector XCF gateway connects a member to the group name (XCFGROUP=OMPEXCF). The member connection persists for the life of the Classic or Common Collector session.

The z/OS XCF member connection is terminated when one of the following conditions is met:

- The Classic or Common Collector session terminates.
- The Classic session switches to a different DB2 subsystem.
- The OMEGAMON Collector address space is normally shut down.

When the OMEGAMON Collector address space is abnormally terminated, all connections are terminated. Cancelling or forcing the OMEGAMON Collector address space might under certain conditions only activate the XCF connections. Issuing the D XCF,GROUP,OMPEXCF z/OS command might still show these connections as defined to z/OS XCF.

**Note:**
The OMEGAMON Collector XCF gateway will reuse these existing connections on subsequent OMEGAMON Collector start ups.

Message KO2Z638I is issued to indicate that a Classic or Common Collector session has joined the OMPEXCF group. For example, KO2Z638I OMPE V540 Session BPMYD2C/IPV$TCE0 joined XCF group OMPEXCF/PMO1SGP1DM520001

**KO2Z638I message explanation:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMPE</td>
<td>Identifies the subsystem name assigned to the OMEGAMON Collector</td>
</tr>
<tr>
<td>V540</td>
<td>Identifies the OMEGAMON Collector release</td>
</tr>
<tr>

<td>Identifies the name of the OMEGAMON Collector STC address space</td>
</tr>
<tr>
<td>0001</td>
<td>Identifies the joined unique XCF gateway connection ID</td>
</tr>
</tbody>
</table>

Message KO2Z806I is issued to indicate that a Classic or Common Collector session has been disconnected from the OMPEXCF group. For example, KO2Z806I OMPE V540 Session BPMYD2C/IPV$TCE0 disconnected from XCF group OMPEXCF/PMO1SGP1DM520001

**KO2Z806I message explanation:**

<table>
<thead>
<tr>
<th>Value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMPE</td>
<td>Identifies the subsystem name assigned to the OMEGAMON Collector</td>
</tr>
</tbody>
</table>
This OMEGAMON Collector XCF gateway parameter specifies the number of receive tasks to attach in the OMEGAMON Collector address space. These tasks are used to receive and process OMEGAMON Collector service requests from other local or remote OMEGAMON Collectors connected to the same OMPEXCF group name.

The default number of tasks that are attached at OMEGAMON Collector initialization time is \textbf{MAXTASKS=04}. The minimum number of tasks that can be specified is \textbf{MAXTASKS=2}. At task initialization time, each receive task connects to the OMEGAMON Collector XCF gateway using the \textbf{XCFGROUP=OMPEXCF}. The XCF connection for each attached receive task persists for the life of the OMEGAMON Collector address space. When the OMEGAMON Collector is normally shut down, these XCF connections are terminated. When the OMEGAMON Collector is cancelled or forced, these XCF connections remain defined to the z/OS XCF and will be reused by the OMEGAMON Collector on subsequent start up.

You can display all XCF gateway connections by issuing the \texttt{D XCF,GROUP,OMPEXCF} z/OS XCF command. For example:

\begin{verbatim}
D XCF,GROUP,OMPEXCF

IXC332I  22.45.54  DISPLAY XCF 992
GROUP OMPEXCF:

  PMO1SGP1DM52X000  PMO1SGP1DM52X001  PMO1SGP1DM52X002
  PMO1SGP1DM52X003  PMO1SGP1DM52X004  PMO1SGP1DM52X005
  PMO1SGP1DM52X006  PMO1SGP1DM52X007  PMO1SGP1DM52X008
  PMO1SGP1DM52X009  PMO1SGP1DM52X010  PMO1SGP1DM52X011
  PMO1SGP1DM52X012  PMO1SGP1DM52X013  PMO1SGP1DM52X014
  PMO1SGP1DM52X015
\end{verbatim}

<table>
<thead>
<tr>
<th>Value</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMPEXCF</td>
<td>Identifies the OMEGAMON Collector XCF gateway group name</td>
</tr>
<tr>
<td>PM01</td>
<td>Identifies the SMF system ID</td>
</tr>
<tr>
<td>SGP1DM52</td>
<td>Identifies the name of the OMEGAMON Collector STC address space</td>
</tr>
<tr>
<td>X</td>
<td>Identifies the member name as a receive task member name</td>
</tr>
</tbody>
</table>
The default \texttt{XCFTIMER=30} parameter specifies the maximum elapsed time in seconds required to complete a send request for DB2 performance monitoring data from one OMEGAMON Collector to another collector, connected to the same \texttt{OMPEXCF} group. If a response is not received within the 30 seconds default elapsed time interval, the request is terminated and the \texttt{KO2Z810E} error message is issued. For example: 
\texttt{KO2Z810E OMPE V510 OMPE Collector SGP1DM5S SSID=D91A MEMBER=PM01SGP1DM5S0010 response not received} 

This error condition might be caused by one or more of the following:

- The remote OMEGAMON Collector address space terminated either normally or abnormally.
- All receive tasks specified by the \texttt{MAXTASKS} parameter are busy.
- The remote LPAR/VMID has failed or is being restarted.
- The OMEGAMON Collector WLM dispatch priority is too low.

Take the following action(s):

- Verify that the remote OMEGAMON Collector is still active.
- Increase the number of receive tasks defined by the \texttt{XCFTASKS} parameter.
- Increase the \texttt{XCFTIMER} elapsed time seconds value.
- Verify that the OMEGAMON Collector is executing with the same priority or higher as your DB2 subsystem.

The default \texttt{DSPSIZE=128M} parameter specifies the size of the XCF gateway data space (in megabytes) that is created when a Classic or Common Collector session is connected to the OMEGAMON Collector XCF gateway. The date space is used to collect remote thread CPU data. Up to 20,000 remote threads CPU usage data can be collected in a single XCF send service request.

\textbf{Note:} z/OS page data set space is only incurred when remote thread CPU data is being retrieved. When remote thread CPU data is not being collected, the paging space is released and not used.

\section*{Dynamic subsystem name assignment}

Dynamic subsystem name assignment removes the restriction that the OMEGAMON Collector subsystem name is specified in the \texttt{PARM=JCL} parameter.

This change does not affect you if you already specify the OMEGAMON Collector subsystem name in your JCL procedure. You can optionally specify a two-character prefix in addition to the four-character name that is required.

The following subsystem name specifications are supported:

- \texttt{PARM='/SUB=OMPE'}

  The OMEGAMON Collector JCL procedure is shipped with a default OMEGAMON Collector subsystem name of \texttt{OMPE(PARM='/SUB=OMPE')}.

  \begin{verbatim}
  //O2CI EXEC PGM=KO2ZTOPB,
  //       REGION=0M,MEMLIMIT=NOLIMIT,DPRTY=(15,15),TIME=1440,
  //       PARM=:'/SUB=OMPE'
  \end{verbatim}
This serviceability enhancement also allows you to only specify a two-character OMEGAMON Collector subsystem prefix. When only the subsystem prefix is specified, the subsystem initialization driver dynamically adds an unused suffix in the range of 00 to 99 to form a complete four-character OMEGAMON Collector subsystem name.

//O2CI EXEC PGM=KO2ZTOPB,
// REGION=OM,MEMLIMIT=NOLIMIT,DPRTY=(15,15),TIME=1440,
// PARM='/SUB=OM'

Once a subsystem name is associated with an OMEGAMON Collector address space, the association is maintained for the life of the z/OS operating system IPL.

The OMEGAMON Collector also creates a subsystem called O2. If Object Analysis is configured, a subsystem called E2 will be started.

**Defining OMEGAMON Collector component message logs**

This function allows units of work executing in the OMEGAMON Collector address space to have their messages stored in component message logs.

Component message logs are optional and are not required for normal OMEGAMON Collector operation.

The following component message logs are supported:

**FPEVLOG**
This log is activated when DD name "/FPEVLOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by the OMEGAMON Collector Performance Expert component.

**OMPELOG**
This log is activated when DD name "/OMPELOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by all OMEGAMON Collector components.

**KO2ILOG**
This log is activated when DD name "/KO2ILOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by the Common Collector subsystem.

**KO2HLOG**
This log is activated when DD name "/KO2HLOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by the OMEGAMON Collector Near-Term History component.

**KO2RLOG**
This log is activated when DD name "/KO2RLOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by the capture server component.

**KO2OLOG**
This log is activated when DD name "/KO2OLOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by OMEGAMON Collector Near-Term History parser component.

**KO2SLOG**
This log is activated when DD name "/KO2SLOG DD SYSOUT=*" is specified on the OMEGAMON Collector JCL procedure. It contains messages issued by Virtual Storage Manager STORMAN component.
Completing the configuration for z/OS components

About this task

After you configured OMEGAMON for DB2 PE, go through the list of mandatory steps in the post-configuration README in PARMGEN. Also consider going through the optional steps in that README to see whether further configuration steps are required. To open the post-configuration README follow these steps:

1. In PARMGEN, navigate to the Primary Option Menu on panel KCIPQPGB.
2. Either:
   - Select option 5 POSTCFG to open KCIP@FNL.
   - or:
     - Type U as primary command to show the utilities panel KCIPQPGU.
     - a. Select 13 Display a consolidated list of post-configuration READMEs.
3. In the product list, select KD5.

Questions and answers

This section contains frequently asked questions and their answers.

Why do I need to enable the use of an existing configuration for IBM DB2 SQL Performance Analyzer for z/OS?

OMEGAMON for DB2 PE V5.4.0 only supports the use of an existing configuration. All parameters that could be configured in the Configuration Tool on the panels KD261PR, KD261PS, KD261PT, and KD261PU are obsolete.

After migrating from a previous OMEGAMON for DB2 PE version, there are two ways in order to use IBM DB2 SQL Performance Analyzer with your existing configuration. For both, you have to enable the use of an existing configuration (KD2_PFxx_SQLPA_CF_ENBL set to Y). Then, do one of the following:

- Use IBM DB2 SQL Performance Analyzer to recreate your configuration and use KD2_PFxx_SQLPA_CF_ANLC and KD2_PFxx_SQLPA_CF_ANLP to point to it.
- Point KD2_PFxx_SQLPA_CF_ANLC and KD2_PFxx_SQLPA_CF_ANLP to the OMQCssid and OMQPssid configuration members that were generated in the Configuration Tool or PARMGEN in your previous OMEGAMON for DB2 PE version.

How can I change the plan name from the default DSNTIA\textit{vv} (where \textit{vv} is the DB2 z/OS version) to a custom name?

Use the KD2_PLAN_NAME_OVERRIDE parameter to provide an override.

Note: All plans will then have the same name, independent of the DB2 version.
Installing and configuring components on the workstation

In addition to the components on z/OS, OMEGAMON for DB2 PE also offers several components that run on the workstation.

About this task

The following sections provide installation and configuration instructions for components that run on the workstation:

- “Installing and configuring Performance Expert Agent for DB2 Connect Monitoring” on page 406
- “Installing and configuring Performance Expert Client” on page 436
- “Configuring the Performance Warehouse Client” on page 443
- “Adding Tivoli Data Warehouse” on page 851

Installing and configuring Performance Expert Agent for DB2 Connect Monitoring

You can use the installation wizard to install and configure Performance Expert Agent for DB2 Connect Monitoring on your workstation.

Before you begin

- You must enable Performance Warehouse before beginning. See “Enabling Performance Warehouse” on page 395 for more information.
- You must enable Performance Expert Agent for DB2 Connect Monitoring support on z/OS before beginning. See “Enabling Performance Expert Agent for DB2 Connect Monitoring support” on page 391 for more information.

About this task

The Performance Expert Agent for DB2 Connect Monitoring monitors connections of remote applications within the Distributed Relational Database Architecture (DRDA) of DB2 that are connected through DB2. It is installed on the DB2 Connect Server gateway and provides DB2 Connect data for the OMEGAMON Collector.

The following topics provide detailed installation and configuration instructions:

- “Configuration scenarios for Performance Expert Agent for DB2 Connect Monitoring” on page 407
- “Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 408
  1. “Hardware requirements for Performance Expert Agent on Windows” on page 409
  2. “Software requirements for Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 409
  3. “Downloading the program files of Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 410
  4. “Installing the program files of Performance Expert Agent Version 5 on Windows” on page 410
  5. “Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 411
  6. “Starting Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 420
Configuration scenarios for Performance Expert Agent for DB2 Connect Monitoring

With DB2 Connect Monitoring, you can monitor remote DB2 clients that connect through a DB2 Connect gateway. There are several possible ways to set up Performance Expert Agent for DB2 Connect Monitoring.

DB2 Connect Monitoring involves the OMEGAMON Collector and the Performance Expert Agent for DB2 Connect Monitoring. The Performance Expert Agent for DB2 Connect Monitoring, also called DB2 Connect Agent, collects information about the requests that are issued from the clients through the DB2 Connect gateway and makes it available for the OMEGAMON Collector. You can view the monitoring information with Tivoli Enterprise Portal, Classic Interface, and Performance Expert Client. This means that you can choose the platform that you are most comfortable with, view the type of information available, and decide which monitoring component is the most useful for you.

There are two configuration scenarios for the Performance Expert Agent for DB2 Connect Monitoring. Either you configure it to report the DB2 Connect gateway information to each DB2 subsystem that is monitored by the OMEGAMON Collector, or you configure it to report the information to just one of the monitored DB2 subsystems. This affects what data you can see in the user interface, for example in Performance Expert Client.

**Scenario 1: The Performance Expert Agent for DB2 Connect Monitoring reports all client requests that come through the DB2 Connect gateway to one DB2 subsystem.**

If the following conditions are met, the Performance Expert Agent for DB2 Connect Monitoring reports all requests that are issued to the DB2 Connect gateway to only one DB2 subsystem:

- Monitoring is enabled for only one DB2 subsystem. See “Enabling a DB2 instance gateway to be monitored by using Performance Expert Agent for DB2 Connect Monitoring” on page 413.
In the Configuration Tool, you enabled Performance Expert Agent for DB2 Connect Monitoring for only this one DB2 subsystem. See “Installing and configuring Performance Expert Agent for DB2 Connect Monitoring” on page 406.

In this setup, the data that you can access in the user interface is limited. If you are using Performance Expert Client, for example, and you select the DB2 subsystem for which you configured DB2 Connect Monitoring, you can retrieve all information that you gathered on the DB2 Connect gateway for this DB2 subsystem. However, if you select another DB2 subsystem in Performance Expert Client, you will not see any DB2 Connect data because the data is stored in the Performance Warehouse database for the one DB2 subsystem that is enabled for monitoring. The OMEGAMON Collector does not check this Performance Warehouse database when another DB2 subsystem is selected.

To view the requests from all DB2 subsystems, do not select a specific DB2 subsystem in the Performance Expert Client but choose the DB2 Connect gateway. This view is only available in Performance Expert Client, not in Tivoli Enterprise Portal or Classic Interface.

The setup of this scenario is limited, but it requires less configuration effort. It is sufficient if you plan to use the Performance Expert Client for monitoring and want to monitor the DB2 Connect data for all DB2 subsystems from only the DB2 Connect gateway perspective, or if you need the detailed data for only one DB2 subsystem.

Scenario 2: The Performance Expert Agent for DB2 Connect Monitoring reports all client requests that come through the DB2 Connect gateway to all DB2 subsystems.

If the following conditions are met, the Performance Expert Agent for DB2 Connect Monitoring reports all requests that are issued to the DB2 Connect gateway to all DB2 subsystems:

- Monitoring is enabled for all DB2 subsystems that you want to monitor. See “Enabling a DB2 instance gateway to be monitored by using Performance Expert Agent for DB2 Connect Monitoring” on page 413.
- In PARMGEN, you enabled Performance Expert Agent for DB2 Connect Monitoring for all DB2 subsystems. See “Installing and configuring Performance Expert Agent for DB2 Connect Monitoring” on page 406.

In this setup, you can select each of the DB2 subsystems in the monitoring user interface and access all data. The restrictions that are mentioned above do not apply here. In most cases, this setup is preferred.

Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on Windows

Performance Expert Agent for DB2 Connect Monitoring monitors connections of remote applications within the Distributed Relational Database Architecture (DRDA) of DB2. When Performance Expert Agent for DB2 Connect Monitoring is installed on the system on which DB2 Connect is installed as a gateway, it collects connection-related data, such as the connection status of a remote application. It also collects statistics about DB2 Connect activities.

The following topics provide additional information about how to install and configure Performance Expert Agent for DB2 Connect Monitoring on Windows:

- “Hardware requirements for Performance Expert Agent on Windows” on page 409
Hardware requirements for Performance Expert Agent on Windows:

Ensure that your system has enough resources. Check the RAM and available disk space.

The minimum hardware requirements for Performance Expert Agent are:

- A personal computer with Intel-based processor architecture, 400 MHz Pentium
- 256 MB RAM
- 150 MB disk space in the TEMP directory for the temporary program files during the installation of Performance Expert Agent. This applies to Windows 64-bit.
- The following disk space in the installation directory for the program files of Performance Expert Agent according to your operating system:
  - Windows 64-bit: 320 MB
- 5 MB disk space in the working directory for log and ini files of Performance Expert Agent
  The name of the working directory is
  C:\Program Files\IBM\IBM DB2 Performance Expert Agent V5\instances\<instance name>
  where <instance name> is the name of the DB2 instance on which Performance Expert Agent runs.

Software requirements for Performance Expert Agent for DB2 Connect Monitoring on Windows:

Performance Expert Agent for DB2 Connect Monitoring requires the following system and software prerequisites. Review these requirements to ensure that your environment is prepared for installation.

The minimum software requirements to install and run Performance Expert Agent for DB2 Connect Monitoring on Windows are:

- One of the following Windows versions:
  - Windows XP 64-bit Professional Edition
Windows 7
- One of the following DB2 systems:
  - DB2 Enterprise systems:
    - DB2 Enterprise Server Edition V9.7 or later
  - DB2 Connect systems:
    - DB2 Connect Application Server Edition V9.7 or later
    To check the fix pack level of your DB2 installation, type `db2level` on the command line.
- TCP/IP installed on the workstation.
- Software programs to download files or code from z/OS, such as File Transfer Protocol (FTP) or IBM Personal Communications.

**Downloading the program files of Performance Expert Agent for DB2 Connect Monitoring on Windows:**

**About this task**

Both, the initial version and later fixes for the program files for Performance Expert Agent for DB2 Connect Monitoring are available online. For download instructions, refer to the technote "OMEGAMON XE for DB2 PE/PM: web-based delivery and updates for Windows- and UNIX-based components" on the [IBM Support website](https://www.ibm.com/support). If needed, the direct link to the technote is also included in the hold instructions of every Performance Expert Agent PTF on the host. The available program build levels and fix descriptions are documented in the technote.

**Installing the program files of Performance Expert Agent Version 5 on Windows:**

Complete these steps to install Performance Expert Agent Version 5 or to migrate from Performance Expert Agent Version 3.

**Before you begin**

- The name of the directory from which you install the program files and the name of the directory to which you install the program files might not contain non-Latin-based characters.
- You need administration privileges and DB2 instance owner privileges.
- You must install Performance Expert Agent on the same system on which Database Connection Services (DCS) connections are performed.
- If you want to perform a silent installation for additional Performance Expert Agents, you must create a response file to record your installation steps. For detailed instructions on silent installation, see "Installing Performance Expert Agent silently by using a response file" on page 427.

**About this task**

To install the program files, complete these steps:

**Procedure**

1. Extract the files from the compressed file(s). Ensure that all downloaded files are extracted.
2. Ensure that all of the installation files are in the same directory. The installation package consists of these items:
a. An installation launcher db2pe.agent.*.install-on-win32.exe
b. An installation launcher db2pe.agent.*.install-on-win64.exe
c. The iehs321win.jar file that contains the help system files

The installation wizard starts, and the IBM DB2 Performance Expert Agent V5 Setup window opens.

3. Click Next.

The next IBM DB2 Performance Expert Agent V5 Setup window shows the License Agreement.

4. Select I accept the terms of the license agreement, then click Next.

The next IBM DB2 Performance Expert Agent V5 Setup window opens.

5. Specify the installation directory for the program files.

This step depends on the task that you want to perform:

- New installation: You install Performance Expert Agent Version 5 whereas no previous version is installed.

- If you install Performance Expert Agent Version 5 whereas no previous version is installed, take one of these steps:
  - To install the program files to the default installation directory, click Next.
    The name of the default installation directory is
    C:\Program Files\IBM\IBM DB2 Performance Expert Agent V5
  - To install the program files to a different directory, click Browse, select another directory, then click Next.
    The next IBM DB2 Performance Expert Agent V5 Setup window opens.

- If you migrate from Performance Expert Agent Version 3, select the installation directory in which the previous version of Performance Expert Agent is installed.
  The next IBM DB2 Performance Expert Agent V5 Setup window opens.

6. Check the displayed information, then click Install.

The program files are copied to the specified directory, then the next IBM DB2 Performance Expert Agent V5 Setup window opens. It shows summary information about the installation. It also shows the location of the log file.

7. Check the summary information, then click Finish to exit the installation wizard.

Results

Performance Expert Agent Version 5 is installed.

You can now start the configuration GUI of IBM DB2 Performance Expert Agent V5 Setup at any time from the Windows Start menu in Performance Expert Agent.

Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows:

Performance Expert Agent for DB2 Connect Monitoring stores the collected data in the Performance Warehouse database DB2PM on the host (referred to as performance database) on which the OMEGAMON Collector resides. OMEGAMON
Collector correlates this data with the monitored DB2 activity. Therefore, you must register the OMEGAMON Collector and prepare DB2 Connect monitoring before starting it.

You can use the GUI or the Command line utility to do this.

The following topics provide additional information:

- "Configuring Performance Expert Agent for DB2 Connect Monitoring by using the GUI" on page 413
- "Configuring Performance Expert Agent for DB2 Connect Monitoring by using the command line utility" on page 416

**Configuring Performance Expert Agent for DB2 Connect Monitoring by using the GUI:**

To configure Performance Expert Agent for DB2 Connect Monitoring so that it monitors DB2 instances that serve as a gateway, you must perform several tasks within the Agent Configuration GUI.

**Before you begin**

Before you install the program files, ensure that you have the necessary privileges and that the users and user groups under which Performance Expert Agent for DB2 Connect Monitoring should run are defined. The required privileges and user group requirements are as follows:

- To install the program files, you must have the following privileges:
  - Windows administrator rights.
  - DB2 instance owner privileges. The DB2 instance user ID and password must be alphanumeric. White-space characters or multibyte characters are not allowed.
- The setup procedure can use only existing users and user groups.
  - If you do not want to use the default account db2admin but the option **Account from locally defined users**, ensure that one of the following conditions applies:
    - The selected user has SYSADM authority in DB2 and the Windows right **Log on as service**.
    - The selected user is a member of the Windows administrators group.
  - If none of these conditions applies, the selected user cannot start Performance Expert Agent for DB2 Connect Monitoring.

- One or more local DB2 instances that serve as a DB2 Connect gateway must be available.

**About this task**

The Performance Expert Agent for DB2 Connect Monitoring Configuration GUI guides you through the following tasks:

- "Enabling a DB2 instance gateway to be monitored by using Performance Expert Agent for DB2 Connect Monitoring" on page 413
- "Adding a performance database for an enabled DB2 instance" on page 414
- "Changing authorization for a performance database" on page 414
- "Disabling a DB2 instance for monitoring by using Performance Expert Agent for DB2 Connect Monitoring" on page 415
- "Removing a performance database from a DB2 instance" on page 415
- "Testing the connection to a performance database" on page 415
What to do next

The Performance Expert Agent for DB2 Connect Monitoring Configuration GUI window has the following panes:

• The left pane shows the local DB2 instance gateways, in a tree structure.
• The right pane shows details of the selected instance.

You can configure Performance Expert Agent for DB2 Connect Monitoring by using one of these options:

• The menu bar
• The context menu
• The buttons in the table pane

Note: These topics describe how to configure the Performance Expert Agent for DB2 Connect Monitoring by using the menu bar options.

Enabling a DB2 instance gateway to be monitored by using Performance Expert Agent for DB2 Connect Monitoring:

When Performance Expert Agent for DB2 Connect Monitoring is newly installed, it does not yet monitor the local DB2 instances that serve as a DB2 Connect gateway. You must enable monitoring for these DB2 instances.

About this task

To enable a DB2 instance for monitoring, complete the following steps:

Procedure

1. Open the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window by clicking Start → Programs → IBM DB2 Performance Expert Agent V5 → Configure Using the GUI.
   • The left pane shows the local DB2 instances that serve as a DB2 Connect gateway. Active DB2 instances that are available for monitoring are indicated with (available).
   • If you have not yet configured a system for monitoring, the Enable Monitoring button is displayed in the right pane.
2. Select the DB2 instance that you want to monitor.
3. Click Enable Monitoring.
4. In the field User ID, enter the user ID of the administrator of the gateway.
5. In the field Password, enter the password for this user ID.
6. Click OK.

What to do next

After the DB2 instance is successfully enabled, you must add a performance database in which Performance Expert Agent for DB2 Connect Monitoring can store the collected data.
Adding a performance database for an enabled DB2 instance:

You must add one or more performance databases to each enabled DB2 instance in which Performance Expert Agent for DB2 Connect Monitoring stores the collected data. A performance database is the database on the host that has been enabled for Performance Warehouse.

About this task

To add a performance database, complete the following steps:

Procedure

1. Open the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window by clicking Start → Programs → IBM DB2 Performance Expert Agent V5 → Configure Using the GUI.
2. Select the DB2 instance for which you want to add a performance database.
3. Select Add Database from the Selected menu.
4. In the field System, select the system where the performance monitor is running, z/OS or Multiplatform. According to your selection, the relevant dialog details appear.
5. Complete all fields in the dialog box, then click OK. For more information about the fields, see Field description. After you click OK, the dialog box closes and the updated information is shown in the right pane of the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window.

What to do next

Before Performance Expert Agent for DB2 Connect Monitoring can collect data and store it in the performance database, you must start the Windows service for Performance Expert Agent for DB2 Connect Monitoring as described in “Starting Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 420.

Changing authorization for a performance database:

For security purposes, you might have to change authorization settings for a performance database. You must make these changes also on Performance Expert Agent for DB2 Connect Monitoring to enable connection to the database.

About this task

To change authorization for a performance database, complete the following steps:

Procedure

1. Open the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window by clicking Start → Programs → IBM DB2 Performance Expert Agent V5 → Configure Using the GUI.
2. Select the DB2 instance that you want to change.
3. Select the performance database for which you want to change the authorization.
4. Select Change Database Authorization from the Selected menu. The connection details are disabled, you can change only the user details.
5. Change the user ID, or the password, or both, then click OK.
If you change the user ID, the User ID column in the right pane shows the updated information.

Disabling a DB2 instance for monitoring by using Performance Expert Agent for DB2 Connect Monitoring:

When you disable a DB2 instance, monitoring stops immediately. The DB2 instance remains in the list of registered DB2 instances.

About this task

To disable a DB2 instance, complete the following steps:

Procedure

1. Open the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window by clicking Start → Programs → IBM DB2 Performance Expert Agent V5 → Configure Using the GUI.
2. Select the DB2 instance that you want to disable.
3. Select Disable Monitoring from the Selected menu.
4. Click OK. The selected DB2 instance is disabled for monitoring.

Removing a performance database from a DB2 instance:

You might have to remove a performance database if the location of the OMEGAMON Collector changes or is no longer available.

About this task

To remove a performance database, complete the following steps:

Procedure

1. Open the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window by clicking Start → Programs → IBM DB2 Performance Expert Agent V5 → Configure Using the GUI.
2. Select the DB2 instance for which you want to remove the performance database.
3. Select the performance database that you want to remove.
4. Select Remove Database from the Selected menu.
5. To confirm the removal, click Yes. The performance database is removed from the right pane in the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window.

Testing the connection to a performance database:

After you add a performance database, you can test the connection to ensure that Performance Expert Agent for DB2 Connect Monitoring can store collected data in this database.

About this task

To test the connection to a performance database, complete the following steps:
Procedure

1. Open the DB2 Performance Expert Agent for DB2 Connect Monitoring Configuration window by clicking Start → Programs → IBM DB2 Performance Expert Agent V5 → Configure Using the GUI.

2. Select the performance database that you want to test.

3. Select Test Database Configuration from the Selected menu. If the test is not successful, you get an SQL error message.

Configuring Performance Expert Agent for DB2 Connect Monitoring by using the command line utility:

Performance Expert Agent for DB2 Connect Monitoring can be configured with the command line utility to monitor DB2 connect gateways for collecting data.

Before you begin

Before you install the program files, ensure that you have the necessary privileges and that the users and user groups under which Performance Expert Agent for DB2 Connect Monitoring should run are defined. The required privileges and user group requirements are as follows:

- To install the program files, you must have the following privileges:
  - Windows administrator rights.
  - DB2 instance owner privileges. The DB2 instance user ID and password must be alphanumeric. White-space characters or multibyte characters are not allowed.

- The setup procedure can use only existing users and user groups.

If you do not want to use the default account db2admin but the option Account from locally defined users, ensure that one of the following conditions applies:
  - The selected user has SYSADM authority in DB2 and the Windows right Log on as service.
  - The selected user is a member of the Windows administrators group.

If none of these conditions applies, the selected user cannot start Performance Expert Agent for DB2 Connect Monitoring.

- One or more local DB2 instances that serve as a DB2 Connect gateway must be available.

About this task

Configuring Performance Expert Agent for DB2 Connect Monitoring with the command line utility includes the following tasks:

- "Registering the OMEGAMON Collector on Windows"
- "Reusing the configuration file on Windows" on page 419
- "Reactivating the connection mode on Windows" on page 419

Registering the OMEGAMON Collector on Windows:

Before Performance Expert Agent for DB2 Connect Monitoring can store the collected data, you must register the OMEGAMON Collector and prepare DB2 Connect monitoring.
About this task

To register the OMEGAMON Collector:

Procedure

1. Log on to the workstation on which Performance Expert Agent for DB2 Connect Monitoring is installed.
2. Open a Command Prompt window.
3. Change to the bin folder of the installation directory.
5. Enter one of the following commands on the command line depending on what you want to do.
   a. To add an OMEGAMON Collector that is located on z/OS to the e2e.ini file of Performance Expert Agent for DB2 Connect Monitoring, enter `e2e --addhost <host name> <DB2 port> <location name> <mainframe flag> <user login> <user password>`
      Variable description:
      <host name>
      Denotes the network host name or IP address of the DB2 subsystem on which the registered OMEGAMON Collector runs.
      <DB2 port>
      Denotes the port number of the DB2 subsystem on which the registered OMEGAMON Collector runs.
      <location name>
      Denotes the location name of the DB2 subsystem on which the registered OMEGAMON Collector runs.
      <mainframe flag>
      Denotes whether the OMEGAMON Collector is located in a mainframe environment.
      For a multiplatform environment, select 'N'.
      <user login>
      Denotes the user ID of the user who has access to the DB2PM database in Performance Warehouse on the OMEGAMON Collector side.
      <user password>
      Denotes the password of the user who has access to the DB2PM database in Performance Warehouse on the OMEGAMON Collector side.

      Important: You should not include the password in the --addhost command if it contains special characters because the command might not work with special characters. You are then prompted to enter the password afterwards on a separate line. You can include the following special characters in passwords, but they might not work on the command line: ! @ # $ % ^ & ( ) { } [ ] _ + | * . - / ? : ; , < > = " + !

   b. To change the user ID and password for a registered OMEGAMON Collector later, enter `e2e --change <number> <user login> <user password>` where:
Denotes the number of the OMEGAMON Collector that you want to change the user login and password for.

Denotes the user ID of the user who has access to the DB2PM database in Performance Warehouse on the OMEGAMON Collector side.

Denotes the password that you want to change.

Important: You should not include the password in the --change command if it contains special characters because the command might not work with special characters. You are then prompted to enter the password afterwards on a separate line. You can include the following special characters in passwords, but they might not work on the command line: ! @ # $ % ^ & ( ) [ ] { } * . - _ / \ ? ; , < > = " " + |

To see the numbers of all registered OMEGAMON Collectors, enter e2e --listhosts.

to remove the registration entry of an OMEGAMON Collector from the e2e.ini file of Performance Expert Agent for DB2 Connect Monitoring, enter e2e --removehost <number>

where:

Denotes the number of the OMEGAMON Collector that you want to remove the registration entry for.

to test the connection to the registered server, enter e2e --test <number>

6. Ensure that the following subcommands for the PESERVER subtask are issued before you start DB2 Connect monitoring:
   - SNAPSHOTHISTORY=Y for Snapshot History processing
   - SHDB2CONNECTAPPLICATION=Y if you want to collect DB2 Connect application data
   - SHDB2CONNECTSYSTEM=Y if you want to collect DB2 Connect system data

For detailed information about these subcommands, refer to "Subtask commands to Performance Expert Server" on page 4653.

7. When DB2 Connect monitoring is active for more than one server, ensure that only one of these servers accesses the collected data on the corresponding DB2 subsystem at a time.

You must consider this if one of these conditions applies:
   - You use more than one OMEGAMON for DB2 PE.
   - You use DB2 Performance Expert for z/OS and OMEGAMON for DB2 PE, or both, or several of both.
   - You use OMEGAMON for DB2 PE in a data sharing group running on different logically partitioned modes (LPARs) in a sysplex environment.

Results

All information regarding the server registration is added to the configuration file e2e.ini. You can reuse the configuration file that contains a list of registered OMEGAMON Collectors for other Performance Expert Agents for DB2 Connect Monitoring that you want to install. For more information about reusing the
configuration file, see “Reusing the configuration file on Windows.”

Reusing the configuration file on Windows:

You can reuse the e2e.ini configuration file of Performance Expert Agent for DB2 Connect Monitoring each time you install a new Performance Expert Agent for DB2 Connect Monitoring.

About this task

When you start Performance Expert Agent for DB2 Connect Monitoring, it uses the configuration file in the agent's working directory. If you want to reuse an existing e2e.ini configuration file for a new Performance Expert Agent for DB2 Connect Monitoring, perform the following steps:

Procedure

1. Copy the e2e.ini configuration file that you want to reuse from the agent’s working directory to another directory to store it there.
2. Install the new Performance Expert Agent for DB2 Connect Monitoring.
3. Copy the e2e.ini configuration file from the directory where you stored it to the new agent’s working directory.

Reactivating the connection mode on Windows:

If the host of the connection mode is in paused status, you can reactivate the connection in the e2e.ini configuration file. Refer to the --change command

About this task

Hosts in connection mode paused are shown in the log file and on the console after each start of Performance Expert Agent for DB2 Connect Monitoring. You can see the paused flag also by using the command e2e --listhosts.

Note: This information is not displayed in the GUI.

The connection to the corresponding host is changed to paused in the e2e.ini configuration file if one of the following conditions applies:

- You specified the wrong user ID or password.
- The password on the OMEGAMON Collector side is changed or expired.

To reactivate the connection to the registered OMEGAMON Collector, you must change the incorrect user ID or password by using either the command e2e --change or by selecting the Change option in the GUI.

Note: Starting with Performance Expert Agent V5, Performance Expert for Multiplatforms V5 and later are no longer supported. If a Performance Expert agent detects a connection to a Performance Expert for Multiplatforms V5 or later performance database, the corresponding connection is set in paused mode. This can happen in environments where Performance Expert agent retrieves both Multiplatforms and z/OS connection data from the DB2 Connect gateway and the Performance Expert for Multiplatforms V3.2.0 server is updated to version V5. In this scenario it is not possible to reactivate the paused connection.
Starting Performance Expert Agent for DB2 Connect Monitoring on Windows:

On Windows, you start Performance Expert Agent from the Windows Start Menu or from the Control Panel.

About this task

To start Performance Expert Agent for DB2 Connect Monitoring from the Control Panel:

Procedure

1. Click **Start** → **Settings** → **Control Panel** → **Administrative Tools**.
2. Double-click **Services**.
3. Check that the **DB2 Performance Expert Agent for DB2 Instance (DB2)** service is started, where (DB2) denotes the DB2 instance on which Performance Expert Agent for DB2 Connect Monitoring runs.
   
   If it is not started, right-click the corresponding service and click **Start**.
4. Optional: Configure the service to start automatically at system start.
   
   a. Right-click the corresponding service and click **Properties**.
   
   b. In the **Startup Type** list, select **Automatic**.

   The service will start automatically the next time Windows is started.

What to do next

Before you can work with Performance Expert Agent for DB2 Connect Monitoring, you must configure it as described in “Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 411.

Stopping Performance Expert Agent for DB2 Connect Monitoring on Windows:

On Windows, you stop Performance Expert Agent for DB2 Connect Monitoring from the Control Panel.

About this task

To stop Performance Expert Agent for DB2 Connect Monitoring on Windows:

Procedure

1. Click **Start** → **Settings** → **Control Panel** → **Administrative Tools**.
2. Double-click **Services**.
3. Right-click **Performance Expert Agent for DB2 Connect Monitoring**.
4. Click **Stop**.

Updating Performance Expert Agent for DB2 Connect Monitoring on Windows:

This method is a step-by-step update of Performance Expert Agent for DB2 Connect Monitoring using an installation wizard.

About this task

To update Performance Expert Agent for DB2 Connect Monitoring manually:
Procedure

1. Ensure that the OMEGAMON Collector from which you want to get the update is registered and configured for Performance Expert Agent for DB2 Connect Monitoring.

2. Log on to the system on which Performance Expert Agent for DB2 Connect Monitoring is installed.

3. Click Start → Settings → Control Panel.

5. Double-click Services.

6. Stop the service DB2 Performance Expert Agent for DB2 Instance (DB2), where (DB2) denotes the DB2 instance on which Performance Expert Agent for DB2 Connect Monitoring runs.

7. Open a Command Prompt window.

8. Change to your installation directory, for example, C:\Program Files\IBM\Performance Expert Agent for DB2 Connect Monitoring\bin

9. Enter e2e --update on the command line.

   If a new version of Performance Expert Agent for DB2 Connect Monitoring is found, you get the message New version downloaded.

10. Restart Performance Expert Agent for DB2 Connect Monitoring in one of the following ways:

    • Start the Performance Expert Agent for DB2 Connect Monitoring service in the Services window.

    • Enter e2e --start on the command line.

Results

The latest version of Performance Expert Agent for DB2 Connect Monitoring is installed. To test it, perform the following steps:

1. Ensure that Performance Expert Agent for DB2 Connect Monitoring is started.

2. Use Performance Expert Client to log on to a DB2 subsystem for which Performance Expert Agent for DB2 Connect Monitoring collects data about the connection status.

3. Verify that the data is collected.

If the update does not work correctly, you can recover the previous version of Performance Expert Agent for DB2 Connect Monitoring by doing the following:

1. Stop the service Performance Expert Agent for DB2 Connect Monitoring (DB2) if it is already started, where (DB2) denotes the DB2 instance on which Performance Expert Agent for DB2 Connect Monitoring runs.

2. Open a Command Prompt window.

3. Change to your installation directory, for example, C:\Program Files\IBM\Performance Expert Agent for DB2 Connect Monitoring\bin

4. Enter e2e --rollback on the command line.

The previous version of Performance Expert Agent for DB2 Connect Monitoring is reinstalled and you get the message Old version restored.
Removing Performance Expert Agent for DB2 Connect Monitoring on Windows:

About this task

To remove Performance Expert Agent for DB2 Connect Monitoring from your Windows workstation:

Procedure

1. Stop Performance Expert Agent for DB2 Connect Monitoring.
2. Click Start → IBM DB2 Performance Expert Agent V5 → Uninstall.
   The Performance Expert Agent for DB2 Connect Monitoring Setup window opens.
3. Click Next.
4. Check the summary information, then click Uninstall.
   The program files are removed. You are asked if you want to remove the files that were not deleted from the installation directory.
5. To completely remove Performance Expert Agent for DB2 Connect Monitoring, click Next.
   The files are removed and the next Performance Expert Agent for DB2 Connect Monitoring Setup window opens. It shows summary information and the location of the log file.
6. Click Finish to exit the InstallAnywhere Wizard.

Results

Performance Expert Agent for DB2 Connect Monitoring is completely removed from your Windows workstation.

Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux

Performance Expert Agent for DB2 Connect Monitoring monitors connections of remote applications within the Distributed Relational Database Architecture (DRDA) of DB2. When Performance Expert Agent for DB2 Connect Monitoring is installed on the system on which DB2 Connect is installed as a gateway, it collects connection-related data, such as the connection status of a remote application. It also collects statistics about DB2 Connect activities.

The following topics provide additional information about how to install and configure it on UNIX and Linux systems.

- “Hardware requirements for Performance Expert Agent on Linux and UNIX” on page 423
- “Software requirements for Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 423
- “Downloading the program files of Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 425
- “Installing the program files of Performance Expert Agent Version 5 on UNIX and Linux” on page 425
- “Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 429
- “Starting Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 434
Hardware requirements for Performance Expert Agent on Linux and UNIX:

Ensure that your system has enough resources. Check the RAM and available disk space.

The minimum hardware requirements for Performance Expert Agent are:

- 512 MB RAM
- The following disk space in a temporary directory for the temporary program files during the installation of Performance Expert Agent:
  - Linux on xSeries 32-bit: 260 MB
  - Linux on xSeries 64-bit: 500 MB
  - Linux on pSeries: 300 MB
  - Linux on zSeries: 300 MB
  - AIX®: 150 MB
  - HP-UX: 600 MB
  - Solaris Operating System: 500 MB
- The following disk space in the installation directory for the program files and log files of Performance Expert Agent:
  - Linux on xSeries 32-bit: 200 MB
  - Linux on xSeries 64-bit: 350 MB
  - Linux on pSeries: 200 MB
  - Linux on zSeries: 200 MB
  - AIX: 200 MB
  - HP-UX: 350 MB
  - Solaris Operating System: 350 MB
- 5 MB disk space in the working directory for log and ini files of Performance Expert Agent

Software requirements for Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

Performance Expert Agent for DB2 Connect Monitoring requires the following system and software prerequisites. Review these requirements to ensure that your environment is prepared for installation.

The minimum software requirements to install and run Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux are:

- One of the following operating systems:
  - AIX V6.1
  - AIX V7.1
- HP-UX for Itanium-based HP Integrity Series systems 11i v2 with patches PHKL_35029, PHSS_35045
- HP-UX for Itanium-based HP Integrity Series systems 11i v3
- Solaris Operating Environment V9 and V10 for UltraSPARC
- One of the Linux systems as shown in the following table:
Validated distributions are marked with *Validated*.

- Distributions that are supported, but have not yet been validated are marked with *Supported*.
- Unsupported distributions are marked with *Not supported*.

**Table 76. Supported Linux systems.**

Downloading the program files of Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

About this task

Both, the initial version and later fixes for the program files for Performance Expert Agent for DB2 Connect Monitoring are available online. For download instructions, refer to the technote "OMEGAMON XE for DB2 PE/PM: web-based delivery and updates for Windows- and UNIX-based components" on the IBM Software Support website. If needed, the direct link to the technote is also included in the hold instructions of every Performance Expert Agent PTF on the host. The available program build levels and fix descriptions are documented in the technote.

Installing the program files of Performance Expert Agent Version 5 on UNIX and Linux:

Complete these steps to install Performance Expert Agent Version 5 or to migrate from Performance Expert Agent Version 3.

Before you begin

- The name of the directory from which you install the program files and the name of the directory to which you install the program files, might not contain non-Latin-based characters or blanks.
- You must install Performance Expert Agent on the same system on which DCS connections are performed.
- If you want to perform a silent installation for additional Performance Expert Agents, you must create a response file to record your installation steps. For detailed instructions on silent installation, see "Installing Performance Expert Agent silently by using a response file" on page 427.
- If you want to run the installation wizard in GUI mode, ensure that you can run X applications.
- If you are migrating from Performance Expert Agent Version 3 on AIX, Linux on System z, HP-UX, or Solaris on a 32-bit platform, you must uninstall Performance Expert Agent Version 3 before beginning. If you want to reuse your current settings, you can save your existing configuration file. The configuration is stored in the e2e.ini file.
About this task

To install the program files, complete these steps:

Procedure

1. Log on as root and ensure that your umask is 022. sudo is not supported.
2. Extract the file from the downloaded compressed file into one directory. The installation package consists of the following item:
   - An installation launcher db2pe.agent.*.install-on-<operating system>.bin where <operating system> is your operating system, for example, db2pe.agent.*.install-on-xlinux.bin.
3. Start the installation wizard in GUI mode or in console mode.
   - To run the installation wizard in GUI mode, open a shell window and run the executable file that is appropriate for your operating system. The executable files have the following form:
     - For Linux on xSeries: 
       ./db2pe.agent.*.install-on-xlinux-x86-32.bin
       ./db2pe.agent.*.install-on-xlinux-x86-64.bin
     - For Linux on pSeries: 
       .db2pe.agent.*.install-on-pseries.bin
     - For Linux on zSeries: 
       .db2pe.agent.*.install-on-zseries.bin
     - For AIX: 
       .db2pe.agent.*.install-on-aix.bin
     - For HP-UX: 
       .db2pe.agent.*.install-on-hpai.bin
     - For the Solaris Operating Environment: 
       .db2pe.agent.*.install-on-solaris.bin
   - To run the installation wizard in console mode, enter the appropriate command for your operating system and append -i console. For example, for Linux on xSeries enter:
     .db2pe.agent.*.install-on-xlinux -i console

Note: To avoid problems with multiple versions of the script being present in the installation directory, you should use the original file name, replacing the * as appropriate.

Important: Installation path names might not contain blanks.
The program files are temporarily stored in a temporary directory. By default, the temporary directory is created in the home directory of the root user, for example, /root.

Important: If you specify a different temporary directory, program files are stored in the new temporary directory, and program scripts are stored in the default temporary directory. Therefore, you must ensure that both temporary directories have enough disk space.
To specify a different path name for the temporary directory, enter the command

export IATEMPDIR=<temp dir name>
where `<temp dir name>` is the name of the temporary directory.

The installation wizard starts, and the IBM DB2 Performance Expert Agent V5 Setup Welcome window opens.

4. Click **Next**.
   The IBM DB2 Performance Expert Agent V5 Setup window shows the License Agreement.

5. Select **I accept the terms of the license agreement**, then click **Next**.
   The next IBM DB2 Performance Expert Agent V5 Setup window opens.

6. Specify the installation directory for the program files.
   This step depends on the task that you want to perform:
   - **New installation**: You install Performance Expert Agent Version 5 whereas no previous version is installed.
   - **Migration from Performance Expert Agent Version 3 on the same platform**: You replace Performance Expert Agent Version 3 by Performance Expert Agent Version 5.
   - **Migration from Performance Expert Agent Version 3 on AIX, Linux on System z, or Solaris on a 32-bit platform**: You uninstall Performance Expert Agent Version 3 and then follow the new installation instructions.
   - If you install Performance Expert Agent Version 5 whereas no previous version is installed or you migrate from Performance Expert Agent Version 3 on an older platform, take one of these steps:
     - To install the program files to the default installation directory, click **Next**.
       The name of the default installation directory is:
       `/opt/IBM/db2peage/v5`
     - To install the program files to a different directory, click **Browse**, select another directory, then click **Next**.
       The next IBM DB2 Performance Expert Agent V5 Setup window opens.
   - If you migrate from Performance Expert Agent Version 3 on the same platform, select the installation directory in which the previous version of Performance Expert Agent is installed.
     The next IBM DB2 Performance Expert Agent V5 Setup window opens.

7. Click **Next**.
   The next IBM DB2 Performance Expert Agent V5 Setup window opens.

8. Check the displayed information, then click **Install**.
   The program files are copied to the specified directory, then the next IBM DB2 Performance Expert Agent V5 Setup window opens. It shows summary information about the installation. It also shows the location of the log file.

9. Check the summary information, then click **Finish** to exit the installation wizard.

**Results**

Performance Expert Agent Version 5 is installed.

*Installing Performance Expert Agent silently by using a response file:*

A silent installation is an installation that runs without displaying an interface or prompting you for input. You can do silent installations of Performance Expert Agent to simplify the process of installing it on multiple computers.
Before you begin

Before you install Performance Expert Agent silently, you must first create a response file. A response file is a file that contains the properties and values that drive the installation. You create a response file by running the installation wizard or console mode with the following command-line option: `-r response_file_name`. When you complete the installation, the information that you entered in the installation wizard or console mode is recorded in the response file. You will use this file to install the product silently on other computers.

Procedure

To install Performance Expert Agent silently by using a response file:
1. From the directory of the installation image for Performance Expert Agent, run the following command:
   
   On Windows 64-bit:
   ```
   db2pe.agent.*.install-on-win64.exe -i silent -f response_file_name
   ```

   For Linux on xSeries:
   ```
   db2pe.agent.*.install-on-xlinux-x86-32.bin -i silent -f response_file_name
   db2pe.agent.*.install-on-xlinux-x86-64.bin -i silent -f response_file_name
   ```

   For Linux on pSeries:
   ```
   db2pe.agent.*.install-on-pseries.bin -i silent -f response_file_name
   ```

   For Linux on zSeries:
   ```
   db2pe.agent.*.install-on-zseries.bin -i silent -f response_file_name
   ```

   For AIX:
   ```
   db2pe.agent.*.install-on-aix.bin -i silent -f response_file_name
   ```

   For HP-UX:
   ```
   db2pe.agent.*.install-on-hpia.bin -i silent -f response_file_name
   ```

   For the Solaris Operating Environment:
   ```
   db2pe.agent.*.install-on-solaris.bin -i silent -f response_file_name
   ```

   where response_file_name is the name of the response file that you created during a previous installation of the product.

   The product is installed.

   2. Verify that the installation was successful by checking the db2peage.log installation log file in the following directory:
      - On Windows: `%USERPROFILE%` (For example: C:\Documents and Settings\Administrator)
      - On Linux and Solaris: `/var/log`
      - On AIX and HP-UX: `/var/adm/sw`

   3. Start Performance Expert Agent:
      - “Starting Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 434
      - “Starting Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 420

What to do next

You are now ready to configure the product. For instructions on configuring and using Performance Expert Agent, see “Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 429 and/or “Configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 411.
Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

Performance Expert Agent for DB2 Connect Monitoring stores the collected data in the Performance Warehouse database DB2PM on the host (referred to as the performance database) on which the OMEGAMON Collector resides. OMEGAMON Collector correlates this data with the monitored DB2 activity. Therefore, you must register the OMEGAMON Collector and prepare DB2 Connect monitoring before starting it.

**Restriction:** Consider the following restrictions before configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

- When DB2 Connect monitoring is active for more than one server, only one of these servers should access the collected data on the corresponding DB2 subsystem at a time.
- When more than one Performance Expert Agent for DB2 Connect Monitoring is installed on one LPAR, the hub Tivoli Enterprise Monitoring Server can only accept monitoring data from one Performance Expert Agent for DB2 Connect Monitoring per LPAR at a time.

You must consider this if you use one of the following:

- More than one OMEGAMON for DB2 PE
- DB2 Performance Expert for z/OS and OMEGAMON for DB2 PE, or both, or several of both
- OMEGAMON for DB2 PE in a data sharing group running on different logically partitioned modes (LPARs) in a sysplex environment

The following topics provide additional information:

- “Registering the OMEGAMON Collector on UNIX and Linux as root”
- “Registering an OMEGAMON Collector on UNIX and Linux as DB2 instance owner” on page 430
- “Reusing the configuration file on UNIX and Linux” on page 433

**Registering the OMEGAMON Collector on UNIX and Linux as root:**

Before Performance Expert Agent for DB2 Connect Monitoring can store collected data, you must register the OMEGAMON Collector and prepare DB2 Connect monitoring before starting it.

**About this task**

To register the OMEGAMON Collector:

**Procedure**

1. Log on directly as root via telnet or ssh, for example, or switch to root by entering `su -`
2. Change to the directory `/opt/IBM/db2peage/V5/bin`
3. Invoke the configuration script by entering `.\db2peage-config`
   You get a list of available DB2 instances.
4. Type the name of the DB2 instance for which you want to configure Performance Expert Agent for DB2 Connect Monitoring.
   A menu from which you can choose options for the selected DB2 instance opens.
5. Select **Add a host to your Performance Expert Agent**.
   
   This host is the DB2 system on which the OMEGAMON Collector runs. It contains the DB2PM database in which the collected data is to be stored.
   
   To add all OMEGAMON Collectors now, select this option repeatedly. If you want to register other OMEGAMON Collectors later, refer to “Registering an OMEGAMON Collector on UNIX and Linux as DB2 instance owner.”
   
6. Ensure that the following subcommands for the PESERVER subtask are issued before you start DB2 Connect monitoring.

   **SNAPSHOTHISTORY=Y**
   
   for Snapshot History processing
   
   **SHDB2CONNECTAPPLICATION=Y**
   
   if you want to collect DB2 Connect application data
   
   **SHDB2CONNECTSYSTEM=Y**
   
   if you want to collect DB2 Connect system data
   
   For detailed information about these subcommands, refer to “Subtask commands to Performance Expert Server” on page 4653.
   
7. When DB2 Connect monitoring is active for more than one server, ensure that only one of these servers accesses the collected data on the corresponding DB2 subsystem at a time.
   
   You must consider this if you use one of the following:
   
   • More than one OMEGAMON for DB2 PE
   
   • DB2 Performance Expert for z/OS and OMEGAMON for DB2 PE, or both, or several of both
   
   • OMEGAMON for DB2 PE in a data sharing group running on different logically partitioned modes (LPARs) in a sysplex environment

Results

All information regarding the server registration is added to the configuration file e2e.ini. It is located in the directory /var/db2pe/V3/<DB2 subsystem>, where <DB2 subsystem> denotes the DB2 subsystem on which Performance Expert Agent for DB2 Connect Monitoring runs. You can reuse the configuration file that contains a list of registered OMEGAMON Collectors for other Performance Expert Agents for DB2 Connect Monitoring that you want to install. For more information about reusing the configuration file, see “Reusing the configuration file on UNIX and Linux” on page 433.

Registering an OMEGAMON Collector on UNIX and Linux as DB2 instance owner:

Probably, you have registered OMEGAMON Collectors during configuration of Performance Expert Agent for DB2 Connect Monitoring by using the script db2peage-config. You can, however, register and unregister OMEGAMON Collectors at any time without root authorization.

**Before you begin**

- You must prepare instances for the Performance Expert Agent for DB2 Connect Monitoring before beginning. You can do this either by:
  - Having registered an OMEGAMON Collector by using the script db2peage-config as root.
  - Starting the db2peage-config configuration script to prepare the instances, but exit the script without actually having configured the server. This will prepare the instances for later configuration.
If Performance Expert Agent for DB2 Connect Monitoring is started, you must stop it before you can issue any command.

**Note:** Starting with Performance Expert Agent V5, Performance Expert for Multiplatforms V5 and later are no longer supported. If a Performance Expert agent detects a connection to a Performance Expert for Multiplatforms V5 or later performance database, the corresponding connection is set in paused mode. This can happen in environments where the Performance Expert agent retrieves both Multiplatform and z/OS connection data from the DB2 Connect gateway and the Performance Expert for Multiplatforms V3.2.0 server is updated to version V5. In this scenario it is not possible to reactivate the paused connection.

**About this task**

To register an OMEGAMON Collector:

**Procedure**

1. Log on to the DB2 instance on which Performance Expert Agent for DB2 Connect Monitoring is installed.
2. Change to the BIN folder of the installation directory of Performance Expert Agent for DB2 Connect Monitoring.
3. Stop Performance Expert Agent for DB2 Connect Monitoring by entering `./e2e --stop`
4. Enter one of the following commands on the command line depending on what you want to do:
   a. To add an OMEGAMON Collector that is located on z/OS to the `e2e.ini` file of Performance Expert Agent for DB2 Connect Monitoring, enter `./e2e --addhost <host name> <DB2 port> <location name> <mainframe flag> <user login> <user password>`
      where the variables represent the following:
      
      `<host name>`
      the network host name or IP address of the DB2 subsystem on which the registered OMEGAMON Collector runs.

      `<DB2 port>`
      the port number of the DB2 subsystem on which the registered OMEGAMON Collector runs.

      `<location name>`
      the location name of the DB2 subsystem on which the registered OMEGAMON Collector runs.

      `<mainframe flag>`
      whether the OMEGAMON Collector is located in a mainframe environment.
      
      For a z/OS environment, specify Y. For a multiplatform environment, specify N.

      `<user login>`
      the user ID of the user who has access to the DB2PM database in Performance Warehouse on the OMEGAMON Collector side.

      `<user password>`
      the password of the user who has access to the DB2PM database in Performance Warehouse on the OMEGAMON Collector side.
**Important:** You should not include the password in the --addhost command if it contains special characters because the command might not work with special characters. You are then prompted to enter the password afterwards on a separate line. You can include the following special characters in passwords, but they might not work on the command line:

! @ # $ % ^ & ( ) [ ] { } * . - _ / \ ? : ; , < > = ' " + | 

b. To later change the user ID and password for a registered OMEGAMON Collector, enter 
```
./e2e --change <number> <user login> <user password>
```
where the variables represent the following:

<number>
the number of the OMEGAMON Collector for which user login and password are to be changed.

<user login>
the user ID of the user who has access to the DB2PM database in Performance Warehouse on the OMEGAMON Collector side.

<user password>
the password that is to be changed.

**Important:** You should not include the password in the --change command if it contains special characters because the command might not work with special characters. You are then prompted to enter the password afterwards on a separate line. You can include the following special characters in passwords, but they might not work on the command line:

! @ # $ % ^ & ( ) [ ] { } * . - _ / \ ? : ; , < > = ' " + | 

c. To see the numbers of all registered OMEGAMON Collectors, enter 
```
./e2e --listhosts
```
d. To remove the registration entry of an OMEGAMON Collector from the e2e.ini file of Performance Expert Agent for DB2 Connect Monitoring, enter 
```
./e2e --removehost <number>
```
where <number> denotes the number of the OMEGAMON Collector for which you want to remove the registration entry.

e. To test the connection, enter 
```
e2e --test <number>
```

5. Ensure that the following subcommands for the PESEVER subtask are issued before you start DB2 Connect monitoring:

```
SNAPSHOTHISTORY=Y
```
for Snapshot History processing

```
SHDB2CONNECTAPPLICATION=Y
```
if you want to collect DB2 Connect application data

```
SHDB2CONNECTSYSTEM=Y
```
if you want to collect DB2 Connect system data

6. When DB2 Connect monitoring is active for more than one server, ensure that only one of these servers accesses the collected data on the corresponding DB2 subsystem at a time.

You must consider this if you use one of the following:

- More than one OMEGAMON for DB2 PE
- DB2 Performance Expert for z/OS and OMEGAMON for DB2 PE, or both, or several of both
• OMEGAMON for DB2 PE in a data sharing group running on different logically partitioned modes (LPARs) in a sysplex environment

Results

All information regarding the server registration is added to the configuration file e2e.ini. You can reuse the configuration file that contains a list of registered OMEGAMON Collectors for other Performance Expert Agents for DB2 Connect Monitoring that you want to install. For more information about reusing the configuration file, see “Reusing the configuration file on UNIX and Linux.”

Reusing the configuration file on UNIX and Linux:

You can reuse the e2e.ini configuration file of Performance Expert Agent for DB2 Connect Monitoring each time you install a new Performance Expert Agent for DB2 Connect Monitoring.

About this task

To reuse the e2e.ini configuration file, it must be located in the directory /var/db2pe/V3/<DB2 instance>, where <DB2 instance> denotes the name of the monitored DB2 instance that serves as a gateway.

To reuse the e2e.ini configuration file for a new Performance Expert Agent for DB2 Connect Monitoring:

Procedure

1. Copy the e2e.ini configuration file that you want to reuse from the home directory to another directory to store it there.
2. Install the new Performance Expert Agent for DB2 Connect Monitoring.
3. Copy the e2e.ini configuration file from the directory in which you stored it to the directory /var/db2pe/V3/<DB2 instance>, where <DB2 instance> denotes the name of the monitored DB2 instance that serves as a gateway.
   When you start Performance Expert Agent for DB2 Connect Monitoring, it uses the configuration file in the directory /var/db2pe/V3/<DB2 instance>

Reactivating the connection mode on UNIX and Linux:

If the host of the connection mode is in paused status, you can reactivate the connection in the e2e.ini configuration file.

About this task

Hosts in connection mode paused are shown in the log file and on the console after each start of Performance Expert Agent for DB2 Connect Monitoring. You can see the paused flag also by using the command e2e --listhosts

The connection to the corresponding host is changed to paused in the e2e.ini configuration file if one of the following conditions applies:
• You specify the user ID or the password incorrectly.
• The password on the OMEGAMON Collector side is changed or expired.

To reactivate the connection to the registered OMEGAMON Collector, change the incorrect user ID or password by using the command e2e --change
Starting Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

About this task

To start Performance Expert Agent for DB2 Connect Monitoring:

Procedure
1. Log on as the DB2 instance owner under which you want to run Performance Expert Agent for DB2 Connect Monitoring.
2. Change to the directory `<installdiragent>/bin`
   where `<installdiragent>` denotes the installation directory of Performance Expert Agent for DB2 Connect Monitoring, for example, `/opt/IBM/db2peage/V5`
3. Enter `./e2e --start`.
   To start Performance Expert Agent for DB2 Connect Monitoring as a background process, enter one of the following commands:
   - `./e2e --start &`
   - `./e2e --start -bg`

What to do next

Before you can work with Performance Expert Agent for DB2 Connect Monitoring, you must configure it as described in "Configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux" on page 429.

Stopping Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

About this task

To stop Performance Expert Agent for DB2 Connect Monitoring:

Procedure
1. Log on as the DB2 instance owner under which you want to run Performance Expert Agent for DB2 Connect Monitoring.
2. Change to the directory `<installdiragent>/bin`
   where `<installdiragent>` denotes the installation directory of Performance Expert Agent for DB2 Connect Monitoring.
3. Enter the command `./e2e --stop`

Updating Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

This method is a step-by-step update of Performance Expert Agent for DB2 Connect Monitoring.

About this task

To update Performance Expert Agent for DB2 Connect Monitoring manually:

Procedure
1. Log on as the DB2 instance owner.
2. Change to the directory `<installdiragent>/bin`
where `<installdiragent>` denotes the installation directory of Performance Expert Agent for DB2 Connect Monitoring.

3. Stop Performance Expert Agent for DB2 Connect Monitoring if it is started by using the command `./e2e --stop`.

4. Log on as root.

5. Enter the command `./e2e --update`.
   
   If a new version of Performance Expert Agent for DB2 Connect Monitoring is found, you get the message New version downloaded.

6. Restart Performance Expert Agent for DB2 Connect Monitoring by entering the command `./e2e --start` on the command line.

Results

The latest version of Performance Expert Agent for DB2 Connect Monitoring is installed. To test it, perform the following steps:

1. Ensure that Performance Expert Agent for DB2 Connect Monitoring is started.
2. Use Performance Expert Client to log on to a DB2 subsystem or DB2 instance for which Performance Expert Agent for DB2 Connect Monitoring collects data about the connection status.
3. Verify that the data is collected.

If the update does not work correctly, you can recover the previous version of Performance Expert Agent for DB2 Connect Monitoring by doing the following:

1. Stop Performance Expert Agent for DB2 Connect Monitoring by entering `./e2e --stop` on the command line.
2. Enter `./e2e --rollback` on the command line.

The previous version of Performance Expert Agent for DB2 Connect Monitoring is reinstalled and you get the message Old version restored.

Removing Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux:

About this task

To remove Performance Expert Agent for DB2 Connect Monitoring from your UNIX or Linux system:

Procedure

1. Log on as the DB2 instance owner.
2. Change to the directory `<installdiragent>/bin`
   
   where `<installdiragent>` denotes the installation directory of Performance Expert Agent for DB2 Connect Monitoring.
4. Log on as root.
5. Enter `<installdiragent>/uninstall/uninstaller`
   
   where `<installdiragent>` denotes the installation directory of Performance Expert Agent for DB2 Connect Monitoring.
6. Press Enter.
   
   The InstallAnywhere Multiplatform Wizard opens.
7. Select Next and follow the instructions.
8. Select Finish to complete the procedure.
The InstallAnywhere Multiplatform Wizard is closed.
9. Enter `rm -fr /<installdiragent>` to delete the installation directory of Performance Expert Agent for DB2 Connect Monitoring.

Installing and configuring Performance Expert Client

Performance Expert Client provides real-time and historical monitoring of a DB2 subsystem or DB2 data sharing group. This section describes how to enable Performance Expert Client to an existing runtime environment.

Before you begin

You must do the following before beginning:

- Verify that your system meets the hardware and software requirements.
- Enable Performance Expert Client support on z/OS. See “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373.

About this task

The following topics provide detailed installation instructions:

- “Hardware requirements for Performance Expert Client”
- “Software requirements for Performance Expert Client” on page 437
- “Downloading the program files of Performance Expert Client” on page 438
- “Installing the program files of Performance Expert Client” on page 438
- “Preparing access to Performance Warehouse” on page 440
- “Defining the DB2 subsystem” on page 442

Hardware requirements for Performance Expert Client

Performance Expert Client requires the following hardware prerequisites. Review these requirements to ensure that your environment is prepared for installation.

The minimum hardware requirements to install and run Performance Expert Client are:

- A personal computer with Intel-based processor architecture, 400 MHz Pentium
- 512 MB RAM
- 650 MB (Windows 32-bit and 64-bit) disk space in the installation directory for the installation files
- 400 MB temporary space for running the installation program
- A high-resolution display unit of 1024 x 768 or higher
- If you install OMEGAMON for DB2 PE, which includes buffer pool object placement, the following free memory for object placement:
  - 60 MB for up to 1000 objects
  - 220 MB for up to 100 000 objects
  - 500 MB for up to 200 000 objects
  where objects are table spaces and index spaces.

Recommendation: If you have installed only the minimum requirements, you should not run other applications at the same time.
Software requirements for Performance Expert Client

Performance Expert Client requires the following system and software prerequisites. Review these requirements to ensure that your environment is prepared for installation.

The minimum software requirements to install and run Performance Expert Client are:

• One of the following Windows (x86-64) versions:
  – Windows XP Professional Edition with Service Pack 2, including XP FDCC

• The following data servers (64-bit) are supported for DB2 Performance Expert Client:
  – IBM DB2 Enterprise Server Edition for Linux, UNIX, and Windows Version 9.1 or later
  – IBM DB2 Workgroup Server Edition for Linux, UNIX, and Windows Version 9.1 or later
  – IBM DB2 Personal Server Edition for Linux, UNIX, and Windows Version 9.1 or later
  – IBM DB2 Connect Enterprise Edition for Linux, UNIX, and Windows Version 9.1 or later
  – IBM DB2 Connect Personal Edition for Linux, UNIX, and Windows Version 9.1 or later
  – IBM DB2 Connect Application Server Edition for Linux, UNIX, and Windows Version 9.1 or later
  – IBM DB2 Connect Unlimited Edition for zSeries Version 9.1
  – IBM DB2 Client Version 9.1
  – IBM DB2 Data Server Client Version 9.5 and Version 9.7

• If the Explain function is used:
  – IBM Db2 Query Workload Tuner for z/OS Version 5.1
  – IBM InfoSphere Optim Query Workload Tuner Version 4.1 or later (including Data Studio) (before Db2 12)

• TCP/IP installed on the workstation

• One of the following web browsers:
  – Microsoft Internet Explorer Version 7 or later
  – Netscape Navigator Version 7 or later
  – Mozilla Firefox Version 3.6 or later
Downloading the program files of Performance Expert Client

About this task

Both the initial version and later fixes for the program files for Performance Expert Agent for DB2 Connect Monitoring are available online. For download instructions, refer to the technote "OMEGAMON XE for DB2 PE/PM: web-based delivery and updates for Windows- and UNIX-based components" on the IBM Software Support website. If needed, the direct link to the technote is also included in the hold instructions of every Performance Expert Agent PTF on the host. The available program build levels and fix descriptions are documented in the technote.

Installing the program files of Performance Expert Client

After downloading the program files of Performance Expert Client, you install them using the InstallAnywhere Wizard.

Before you begin

Before beginning, you must do the following:

• Verify that you have administration privileges.
• Download the program files of Performance Expert Client. See "Downloading the program files of Performance Expert Client" for more information.
• Close the DB2 Control Center before installing the Performance Expert Client program files (if applicable).
• If you want to perform a silent installation, you must create a response file to record your installation steps. For detailed instructions on silent installation, see "Installing Performance Expert Client silently by using a response file" on page 439.

About this task

To install the program files, do the following:

Procedure

1. Verify that you have closed the DB2 Control Center. The DB2 Control Center must be closed before you start the client installation in order for the Control Center plug-in to be installed properly.
2. Extract the files and directories from the compressed file(s) into the installation directory, for example, C:\PROGRAMS\IBM\PECLIENT. The archives contain the following files and directories:
   • db2pe.client.*.exe
   • iehs*win.jar
3. Run the *.exe file. With Windows 8 or later, ensure that you run the *.exe file in Windows 7 Compatibility mode.
   The InstallAnywhere Wizard starts, and the IBM DB2 Performance Expert V5 Setup window opens.
   If you did not close the DB2 Control Center before installing the plug-in then you might not be able to access the Performance Expert Client from the DB2 Control Center.
4. Click Next.
   The next setup window shows the License Agreement.
5. To install Performance Expert Client, click I accept the terms of the license agreement, then click Next.
6. Click **Performance Expert on z/OS**, then click **Next**. If you only want to install IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS, click **Performance Monitor on z/OS** instead.

   In the next window, you can specify the installation path.

7. Select the setup type that you prefer, then click **Next**.

8. To install the program files to the default destination folder, click **Next**. To install the program files to a different folder, click **Browse**, then select another folder.

9. Check the summary information, then click **Install**.

   The program files are copied to the specified destination folder and the next setup window opens. It shows summary information about the installation. It also shows the location of the log file.

10. Click **Finish** to exit the InstallAnywhere Wizard.

**Results**

Performance Expert Client is installed.

**Installing Performance Expert Client silently by using a response file:**

A silent installation is an installation that runs without displaying an interface or prompting you for input. You can do silent installations of Performance Expert Client to simplify the process of installing it on multiple computers.

**Before you begin**

Before you install Performance Expert Client silently, you must first create a response file. A **response file** is a file that contains the properties and values that drive the installation. You create a response file by running the installation wizard or console mode with the following command-line option: -r *response_file_name*. When you complete the installation, the information that you entered in the installation wizard or console mode is recorded in the response file. You will use this file to install the product silently on other computers.

**Procedure**

To install Performance Expert Client silently by using a response file:

1. From the directory of the installation image for Performance Expert Client, run the following command:

   **On Windows 64-bit:**

   ```
   db2pe.client.*.install-on-win64.exe -i -silent -f *response_file_name*
   ```

   where *response_file_name* is the name of the response file that you created during a previous installation of the product.

   **Note:** Run as Administrator.

   **Note:** If you are on Windows 8, ensure that you run the *.exe* file in Windows 7 Compatibility mode.

   The product is installed.

2. Verify that the installation was successful by checking the *db2pec1i.log* installation log file in the following directory:
• On Windows: %USERPROFILE% (For example: C:\Documents and Settings\Administrator)

3. Start the Performance Expert Client from the Windows Start menu or the created Desktop icon.

What to do next

You are now ready to configure the product. For instructions on configuring and using Performance Expert Client, see “Preparing access to Performance Warehouse” and “Defining the DB2 subsystem” on page 442.

Preparing access to Performance Warehouse

Before you can access Performance Warehouse on z/OS from Performance Expert Client or use SQL activity tracing, you must configure the DB2 subsystem on which Performance Warehouse and the associated database DB2PM reside.

Before you begin

You must complete the configuration of Performance Warehouse as described in “Enabling Performance Warehouse” on page 395 before starting.

About this task

The following example shows how to configure the DB2 subsystem by using the Configuration Assistant. Note that the description applies to the Configuration Assistant for DB2 V10.

Procedure

1. Open the Configuration Assistant.
2. From the Selected menu, select Add Database Using Wizard....
   The Add Database Wizard opens.
3. On the Source page, click Manually configure a connection to a database, then click Next.
4. On the Protocol page, click TCP/IP, select The database physically resides on a host or OS/400 system, then click Next.
5. On the TCP/IP page, specify the host name or TCP/IP address, and the TCP/IP port number, then click Next.
6. On the Database page, specify the database name (DB2 subsystem location) and type a name for the database alias, then click Next.

Note: You use this database alias in the Connect to Performance Warehouse window.

7. This step is optional. On the Data Source page:
   a. Select Register this database for ODBC.
   b. Select As system data source.
   c. Click Next.
8. On the Node Options page, select z/OS as operating system, specify DB2 as instance name, then click Next.
9. On the Systems Options page, accept the default values, then click Next.
10. On the Security Options page, accept the default values, then click Finish.
11. This step is optional: On the DCS Options page, customize your direct connection to host or OS/400® databases.
Results

The DB2 subsystem is configured and you can access Performance Warehouse on z/OS or use SQL activity tracing.

Perform the following steps to start SQL activity trace from the Performance Expert Client:
1. Open the DB2 Subsystem Properties panel of the DB2 subsystem of interest.
2. On the Performance Warehouse tab, in the Database alias field, specify the database alias you just created.

Setting up your environment for Performance Warehouse

Before you can access Performance Warehouse on z/OS from Performance Expert Client, you must have at least DB2 Data Server Runtime Client installed with the appropriate licenses to access DB2 for z/OS. With OMEGAMON for DB2 PE, you receive a limited license for this usage.

About this task

Perform the following steps:

Procedure
1. Download the DB2 Data Server Runtime Client (version 9.7 or later) from the [Download Db2 Fix Packs by version for Db2 for Linux, UNIX and Windows website](#).
   - For DB2 10.1, select Fixpack 1.
2. Download the member FPEKCNLI from your TKO2WS01 SMPE/E library in binary format. Add the extension .zip. Extract the zip file. It contains several .lic and .jar files for the various Data Server Runtime client versions.
3. Locate the \consv_ee\db2\licence folder for your version within the .zip file. Extract the .lic file to Program Files\IBM\SQLLIB and the db2cc_license_cisuz.jar file to \IBM\SQLLIB\java.
4. Install the downloaded DB2 Data Server Runtime Client.
5. After successful installation, run the following command to register the license: `db2licm -a nnnn` where `nnnn` is the version-related .lic file name you have just extracted. Double check with command `db2licm -l` that you have the necessary permanent licenses installed.
6. Before you can access your z/OS database, it needs to be added to your workstation’s DB2 catalog. Enter `db2cmd` to start the DB2 Command Line Processor window from \IBM\SQLLIB. At the next prompt, type `db2`.

   Note: For the 9.7 driver, you can use the Client Configuration Assistant to perform this task.
   a. CATALOG TCP/IP NODE <node-name> REMOTE <host-name> SERVER <port-number> OSTYPE OS390 where port number is the port on which the DB2 subsystem is listening, not the port on which OMEGAMON is listening.
   b. CATALOG DATABASE <location-name> AS <alias> AT NODE <node-name> AUTHENTICATION SERVER
   c. CATALOG DCS DATABASE <alias> AS <target-DB-name>
Results

Now you can start the Performance Expert Client and add the alias for the Performance Warehouse connection and open Performance Warehouse.

Defining the DB2 subsystem

Before you can use the Performance Expert Client, you must establish a connection to the OMEGAMON Collector.

Before you begin

If there is a local firewall on the processor where the Performance Expert Client is installed, you must grant access for DB2PEClient.exe. Otherwise, the connection fails.

About this task

To monitor a DB2 subsystem from the PE Client, you must establish a connection between the PE Client and the OMEGAMON Collector. This allows the PE Client access to the performance data for this DB2 subsystem.

To define the DB2 subsystem, perform the following steps:

Procedure

1. Establish the connection.
   a. Start the Performance Expert Client and go to Monitor + New DB2 Subsystem.
   b. Select DB2 on z/OS, OS 390 systems. Click Next.
   c. In the Host field, enter the hostname where the OMEGAMON Collector is running.
   d. In the Port field, enter the port for the OMEGAMON Collector. Click Next.
   e. Click Retrieve. The Wizard adds information about the DB2 subsystem to your configuration.
   f. When prompted, enter a user ID and a password for a TSO user on the system where the OMEGAMON Collector is running. If the retrieval fails, check the following and then click retrieve again.
      - Check that the OMEGAMON Collector is started.
      - Check that the TCP/IP port is correct.
      - Check that a firewall is not blocking your connection request.
   g. Optional: If you want to work with Performance Warehouse, specify the database alias on the Performance Warehouse tab, in the Database alias field, specify the database alias you created.
   h. Click Finish.

2. Verify that the connection was successful.
   a. Logon to the OMEGAMON Collector. To do so, from the DB2 Performance Expert - System Overview window, right click on the server in the navigation tree in the panel on the left. Select Logon.
   b. Verify that the main functions for the Performance Expert Client are displayed in the middle panel of the window.
Configuring the Performance Warehouse Client

You can view information that is stored in the Performance Warehouse from the Performance Warehouse Client. If you want to use the Performance Warehouse Client, you must configure it first.

Before you begin

- You must install the Performance Expert Client before beginning. See “Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support” on page 373 and “Installing and configuring Performance Expert Client” on page 436 for more information.
- You must install Performance Warehouse on z/OS before beginning. See “Enabling Performance Warehouse” on page 395 for more information.

About this task

To complete this task, you can use the DB2 Configuration Assistant, or you can use the DB2 command line utility. These instructions explain how to use the DB2 Configuration Assistant. This is also a prerequisite action to be able to start SQL activity tracing.

Procedure

1. Define a DB2 connection to the Performance Warehouse database DB2PM. See “Preparing access to Performance Warehouse” on page 440 for a detailed description.
2. Configure the Performance Warehouse Client. In this step, you tell the Performance Warehouse Client which DB2 connection to use to access the Performance Warehouse.
   a. Start the Performance Expert Client.
   b. Right click on the DB2 subsystem that contains the Performance Warehouse from the navigation tree in the left frame. Select Properties.
   c. Select the Performance Warehouse tab. In the Database alias field, enter the Database alias that you just created. Click OK.

The Performance Warehouse Client is configured. You can start it by choosing one of the Performance Warehouse options in the Tools menu.

Supported Versions

Here you find an overview of the supported versions.

The following releases of OMEGAMON XE for DB2 PE are supported if you are running IBM Tivoli Management Services 6.3.0:

- Version 5.1.1
- Version 5.2.0
- Version 5.3.0
- Version 5.4.0

With OMEGAMON XE for DB2 PE you can:

- Obtain information about the performance and health of DB2.
- Get general information about OMEGAMON XE for DB2 PE workspaces, attributes, and predefined situations.
- Use the table of contents to view detailed information about a specific workspace or attributes.
Support for a staged migration

OMEGAMON XE for DB2 PE:
- V5.1.1 and V5.2 must run with Tivoli Management Services V6.2.3 Fix Pack 1 or later.
- V5.3 and V5.4 must run with Tivoli Management Services V6.3.0 Fix Pack 2 or later.
- V5.4 must run with Tivoli Management Services V6.3.0 Fix Pack 6 or later

If you have installed an earlier version of ITM, it must be upgraded to V6.3.0 Fix Pack 6 or later. Tivoli Management Services V6.3.0 and later supports OMEGAMON XE for DB2 PE V5.1.1 and later running in your environment during a migration period, so that you can deploy new V5.4 monitoring agents along with older monitoring agents of the same product. If you are running in this mixed-migration environment, there might be differences when viewing data for an agent running an earlier version.

General migration hints

The attribute *Product*, which is a two-letter code of a monitoring agent in the Tivoli Enterprise Monitoring Server (TEMS) table *INODESTS*, depends on the version installed:
- In V5.1.1 and later, the two-letter product code is *DP*.

**Note:** If you have customized your workspace or situations in Tivoli Enterprise Monitoring Server (TEMS) table *INODESTS* and filtering on attribute *Product* is set to *D5* (applies to versions of OMEGAMON XE for DB2 PE that are no longer supported), you must set the filtering to *D5* or *DP*. This migration is not required, if you use OMEGAMON XE for DB2 PE V5.1.1 or later.

Migrating a workspace

The attribute *Product* in workspace *Managed System Status* has the following values:
- *DP* for OMEGAMON XE for DB2 PE V5.1.1 or later

**Note:** The workspace *Managed System Status* can be navigated from navigator item *Enterprise*. If you have customized your workspace based on workspace *Managed System Status* and filtering on attribute *Product* is set to *D5* (applies to versions of OMEGAMON XE for DB2 PE that are no longer supported), you must set the filtering to *D5* or *DP*.

Migrating situations

If you have a customized situation based on product-provided situation *MS_Offline* from *All Managed Systems*, and filtering on attribute *Product* is set to *D5* (applies to versions of OMEGAMON XE for DB2 PE that are no longer supported), you must set the filtering to *D5* or *DP*.

**Upgrading to OMEGAMON XE for DB2 PE V5.4.0**

OMEGAMON XE V5.4.0 monitoring agents require Tivoli Management Services V6.3.0 Fix Pack 6.

If you upgrade from OMEGAMON XE for DB2 PE V4.2, V5.1.0, V5.1.1, V5.2 or V5.4, you must upgrade to Tivoli Management Services V6.3.0 Fix Pack 6 or later.
If you have installed an earlier version of Tivoli Management Services V6.3.0, you must, at least, upgrade the hub Tivoli Enterprise Monitoring Server before you install your first V5.4.0 monitoring agent. In addition, any remote monitoring server through which a V5.4.0 OMEGAMON XE monitoring agent reports to the hub monitoring server must also be upgraded to Tivoli Management Services V6.3.0 Fix Pack 6 or later.

The OMEGAMON XE V5.4.0 products support a staged migration. This means as you are migrating from OMEGAMON XE V4.2, V5.1, V5.2 or V5.3 products to OMEGAMON XE V5.4.0 products, you may have a combination of V5.1.0, V5.1.1, V5.2, V5.3 and V5.4 monitoring agents installed in your environment. For example, you may have an OMEGAMON XE for DB2 PE monitoring agent V5.3 and an OMEGAMON XE for DB2 PE monitoring agent V5.1 running in the same hub Tivoli Enterprise Monitoring Server environment during the migration period. Support of a mixed environment is provided as a migration help. Operators working in such a transitional environment should be aware of the following issues:

- OMEGAMON XE for DB2 supports agent versioning. If a workspace has different versions, it always shows the agent that corresponds to the version. For example, a V5.2 workspace is displayed for a V5.2 agent. The full-text help and the situation editor provides information for all supported versions of agents.

- You can use the predefined dynamic workspace links provided by the OMEGAMON XE for DB2 workspace in the workspace of another OMEGAMON XE product as long as the target workspace exists in this IBM Tivoli Monitoring (ITM) enterprise. If the target workspace does not exist, you will receive message KFWITM081E.

- You can use the predefined dynamic workspace links provided by V5.4.0 agents to link from an OMEGAMON XE V5.4.0 workspace to the workspace of another OMEGAMON XE V4.2 product as long as the target workspace exists in the product. If the target workspace does not exist, you will receive message KFWITM081E.

- In cases where the V5.4.0 of the target workspace has been modified (for example, HTML links added to some workspaces) you may notice a different behavior when you migrate the target product from V5.1.1 to V5.4.0.

- All user interfaces (except for the Configuration Tool and Install Shield) provided with Tivoli Enterprise Portal version 6.2 or later and the OMEGAMON XE version 5.1 or later monitoring agents are globalized. As a result, workspaces in OMEGAMON XE V5.1 or later are displayed in the specified language (for example, Spanish or Chinese).

**Organization of the Predefined Workspaces**

In most cases, a workspace contains data or columns that have similar attributes in an attribute group.

This table shows the relationships between the predefined workspaces and the attribute groups. (The workspaces are listed in alphabetical order.)

The following attribute groups are not associated with predefined workspaces. They can be used to create situations:

"Data Sharing Status Attributes" on page 835

"Local Group Object Analysis Thread Volume Attributes" on page 836

"Local Group Object Analysis Volume Group Attributes" on page 837

"Local Group Object Analysis Volume Database Attributes" on page 839

"Local Object Activity Attributes" on page 840

"Local Object Space Name Attributes" on page 842

All Threads Connected to DB2 Workspace:

The All Threads Connected to DB2 workspace provides an overview of the activity of all threads that are connected to DB2.

This workspace is comprised of the following views:

**In-DB2 CP CPU Time (bar chart)**
Shows the class 2 CPU time (in DB2) for all threads.

**In-DB2 Time (bar chart)**
Shows the class 2 elapsed time (in DB2) for all threads.

**All Threads Connected to DB2 (table view)**
Provides key data for all threads that are connected to DB2.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace”
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

All Threads Attributes:
Use the All Threads attributes to create situations to monitor thread activity including DB2 thread activity that originates from connected IMS or CICS subsystems.

**Ace Address** The DB2 thread ACE address for internal use.

**Agent Address** The address of the agent in DB2 associates all processes that are involved in a DB2 unit of work.

**AGNT ASID** The address space ID (ASID) of the agent.

**Agent TCB Address** The z/OS Task Control Block that is associated with this DB2 thread.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

**Authorization ID (Unicode)** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

**Begin Time** Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and IMS wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

**Bytes Sent** The number of bytes of data sent to the requester location.

**Cancel Command** The command string needed to cancel a thread. You can use Take Action with this attribute to cancel a thread: The format is "src CANCEL THREAD(nnnnnn)", where src is the subsystem recognition character and nnnnnn is the thread token.

**CICS MVS ID** The CICS MVS ID.

**Collection ID** This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters.

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

**Commits** The number of successful phase 2 or single-phase commit (sync) requests. Valid value is an integer in the range 0-999 commits.

**All Thread Attributes** Identifies the connection of an application to a DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

**All Thread Attributes** The type of connection associated with the thread.

Valid values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Conversations** The number of conversations that were initiated from the requester location.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters. For example: DLKEX212.

**CP CPU Rate** The central processor CPU rate.

**Current Period** The service class period number in goal mode.

**Database Access CPU** The database access agent CPU time. This value is calculated by accumulating the amount of CPU time spent by the database access thread at the DB2 server each time a request message is processed.

**Database Access Time** The timestamp of last send or receive in distributed database access.

**DB2 ID** The DB2 subsystem ID.

**DB2 Status** The current DB2 status of the thread. It is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

**Status**  **Description**

**NOT-AVAIL**  The thread is not available.

**IN-ABORT**  The thread is in abort processing.

**IN-ACCEL**  The thread is executing on IBM DB2 Analytics Accelerator for z/OS.
The thread is processing an autonomous procedure.

The thread is in dynamic bind processing.

The thread is in static bind processing.

Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

The thread is in Commit phase 1 processing.

The thread is in Commit phase 2 processing.

The thread is in Create Thread processing.

The thread is executing in DB2. A more descriptive status could not be determined.

The thread is in doubt.

The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

The thread is processing an SQL call.

The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

The thread is currently running in a stored procedure.

The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

The thread is currently running in a trigger.

The thread is currently running a user-defined function.

The thread is not currently executing in DB2.

The thread is trying but not able to run in a stored procedure or user-defined function.
SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.
WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT-LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.
Distributed Allied Elapsed Time The elapsed time for this thread executing on
distributed host.

Elapsed Time The total amount of elapsed time since thread creation or DB2
sign-on. Valid value is an integer in the range 0-99999999 seconds.

Elapsed Per Commit The average amount of elapsed time for each database
commit performed.

Enclave CP CPU Time The central processor CPU time used by each thread that is
associated with an enclave token.

Enclave CPU Time The enclave CPU time.

Enclave Token The ID assigned by the z/OS workload manager for this enclave. A
z/OS enclave lets each thread have its own performance objective. Using z/OS
workload management (WLM) support, you can establish z/OS performance
objectives for individual DDF server threads.

Enclave Token Unused This field is unused.

End User ID The user ID of the workstation end user. This user ID can be different
from the authorization ID used to connect to DB2. This field contains blanks if the
client does not supply this information (Field name: QWHCEUID).

Get Page The number of getpage requests. This field counts successful requests
for pages for queries that are processed in parallel and both successful and
unsuccessful requests for pages for queries that are not processed in parallel. Valid
value is an integer in the range 0-99999 pages.

Get Page 64 The number of getpage requests. This field counts successful requests
for pages for queries that are processed in parallel and both successful and
unsuccessful requests for pages for queries that are not processed in parallel. Valid
value is an integer in the range 0-999999999 pages.

Get Page Per Read The ratio of requested pages that resulted in actual I/O versus
being found in a buffer. The read I/O count divided by Get Page count.

Get Page Per Read 64 The ratio of requested pages that resulted in actual I/O versus
being found in a buffer. The read I/O count divided by Get Page count.

IIP CPU The accumulated CPU time consumed while executing on an IBM zIIP in
all environments.

IIP In-DB2 CPU The amount of time that the In DB2 CPU has been running on a
zIIP processor.

In DB2 IIP CPU The total amount of CPU time that DB2 has accumulated for a
thread in the zIIP processor. Valid value is an integer in the range 0-99999999
seconds.

In DB2 CP CPU Time The CP CPU time accumulated in DB2 when the SQL
statement exit from DB2.

In DB2 Per Commit The average amount of in-DB2 CPU time used between each
commit.
**In DB2 Time** The elapsed time accumulated in DB2 when the SQL statement exit from DB2.

**Interval Start** The start time of the interval.

**Job Name** The job name that is associated with a thread.

**Local Elapsed Time** The elapsed time, in tenths of a second, for local thread (in units that represent tenths of seconds).

**Location** The requesting location.

**Location (Unicode)** The requesting location.

**Logical Unit Name** The LUNAME of the connection to the remote DB2 system.

**Messages Sent** The number of messages sent to remote location.

**MVSID** The MVS system identifier.

**Original Authorization ID** The DB2 original Authorization ID of the thread. It is an alphanumeric text string, with a maximum length of 8 characters.

**Original Authorization ID (Unicode)** The DB2 original Authorization ID of the thread. It is an alphanumeric text string, with a maximum length of 8 characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Package Name (Unicode)** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Parallel Indicator** The thread parallelism indicator.

Valid values are:

* Indicates that this thread is a parallel task initiated for another (originating) thread to process a query request in parallel.

O Indicates that this thread is the originating thread that invoked autonomous procedures.

P Indicates that this thread is the parent, or originating thread, of the parallel tasks created to process a query request in parallel. The activity performed for this (originating) thread is reflected under the parallel tasks.

X Indicates that this thread is a parallel task initiated for another (originating) thread on another DB2 for SYSPLEX parallelism.

**Parent Ace** The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.
**Performance Index** This field is related to the z/OS Workload manager. A Performance Index less than one is an indication that the goal for this service class period is being exceeded. The service class period may be considered as a "donor", giving up CPU or pageable storage for other more important service class periods on the system. A Performance Index greater than one is an indication that the goal for this service class period is not being met. Depending on the importance, this Service class period may be considered for additional services to meet the defined goal.

**Plan** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Prefetch Requests** The number of prefetch requests issued per second over the last interval.

**Remote CPU** The database access agent CPU time at the remote location.

**Remote Elapsed** The elapsed database access agent time at the remote location.

**Request Type** The request type for a ALL THREAD related workspaces. Internal use only.

**Rows Sent** The number of rows of data sent to the requester location.

**Service Class** The service class name associated with this address space.

**SQL Calls Sent** The number of SQL statement sent to the server.

**SQL Received** The number of SQL statements received from the requester.

**Sync Reads** The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Synchronous Read I/O Rate** The thread synchronous read I/O rate.

**Thread Status** The current status of a thread.

Valid values are:

**Status**  **Description**

**NOT-AVAIL**  
The thread is not available.

**IN-ABORT**  
The thread is in abort processing.

**IN-ACCEL**  
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

**IN-AUTO-PROC**  
The thread is processing an autonomous procedure.

**IN-BIND-DYNM**  
The thread is in dynamic bind processing.
**IN-BIND-STAT**
The thread is in static bind processing.

**IN-COMMAND**
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

**IN-COMMIT**
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

**IN-COMT-PHS1**
The thread is in Commit phase 1 processing.

**IN-COMT-PHS2**
The thread is in Commit phase 2 processing.

**IN-CRTE-THRD**
The thread is in Create Thread processing.

**IN-DB2**
The thread is executing in DB2. A more descriptive status could not be determined.

**INDOUBT**
The thread is in doubt.

**IN-SIGNON**
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

**IN-SQL-CALL**
The thread is processing an SQL call.

**IN-SQL-SORT**
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

**IN-STOR-PROC**
The thread is currently running in a stored procedure.

**IN-TERM-THRD**
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

**IN-TRIGGER**
The thread is currently running in a trigger.

**IN-USER-FUNC**
The thread is currently running a user-defined function.

**NOT-IN-DB2**
The thread is not currently executing in DB2.

**SP/UDF-INACT**
The thread is trying but not able to run in a stored procedure or user-defined function.

**SWAPPED-OUT**
The thread is not currently executing in DB2. The thread originating address space is swapped out.
WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

**WAIT-ACCEL**
The thread is currently waiting for claimers to be released after acquiring drain lock.

**WAIT-CLAIMER**
The thread is currently waiting for claimers to be released after acquiring drain lock.

**WAIT-CL3LOCK**
The thread is currently waiting for the completion of an identify call to the IRLM.

**WAIT-COMMIT**
The thread is waiting for the FORCE-AT-COMMIT event to complete.

**WAIT-DRNLOCK**
The thread is currently waiting to acquire drain lock.

**WAIT LOB**
The thread is currently waiting for TCP/IP to materialize a LOB.

**WAIT-LOCKLAT**
The thread is waiting for a LOCK-I/O-LATCH.

**WAIT-LOCKPIP**
The thread is currently waiting for a PIPE suspend.

**WAIT-LOCKPQS**
The thread is currently suspended for parallel task synchronization.

**WAIT-LOGQSCE**
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

**WAIT-PGLATCH**
The thread is currently waiting for page latch.

**WAIT-SP-SCHD**
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

**WAIT-SWITCH**
The thread is currently waiting for the completion of a synchronous execution switch.

**WAIT-SYNC-IO**
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

*Note:* This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

**Status Description**

**NOT-AVAIL**
The thread is not available.
IN-ABORT
The thread is in abort processing.

IN-ACCEL
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
The thread is processing an autonomous procedure.

IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.
NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset,
SYSGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

**WAIT-SP-STOP**
The thread is queued waiting for a stopped stored procedure.

**WAIT-TERM-TH**
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

**UTIL-STOP**
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

**WAIT-ACCEL**
The thread is currently waiting for claimers to be released after acquiring drain lock.

**WAIT-CLAIMER**
The thread is currently waiting for claimers to be released after acquiring drain lock.

**WAIT-CL3LOCK**
The thread is currently waiting for the completion of an identify call to the IRLM.

**WAIT-COMMIT**
The thread is waiting for the FORCE-AT-COMMIT event to complete.

**WAIT-DRNLOCK**
The thread is currently waiting to acquire drain lock.

**WAIT LOB**
The thread is currently waiting for TCP/IP to materialize a LOB.

**WAIT-LOCKLAT**
The thread is waiting for a LOCK-I/O-LATCH.

**WAIT-LOCKPIP**
The thread is currently waiting for a PIPE suspend.

**WAIT-LOCKPQS**
The thread is currently suspended for parallel task synchronization.

**WAIT-LOGQSCE**
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

**WAIT-PGLATCH**
The thread is currently waiting for page latch.

**WAIT-SP-SCHD**
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

**WAIT-SWITCH**
The thread is currently waiting for the completion of a synchronous execution switch.
WAIT-SYNC-IO

The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Token The thread token uniquely identifies a specific thread.

Thread Type The thread type. It can be:

- A = IMS
- B = BATCH
- C = CICS
- 0 = Unknown
- 1 = DB_Access
- 3 = SYSTEM
- 5 = UTILITY
- 6 = RRSAF
- 7 = TSO
- 9 = Allied
- 10 = WAIT_LOCKLAT

Transaction ID The transaction ID at the workstation.

Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (Field name: QWHSLUUV).

Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Updates The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page that is updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2 internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

Wait Time Total class 3 wait time for a thread.

Workstation ID The end user’s workstation name. This field contains blanks if this information was not supplied by the client.

zIIP Different Speed The setting if the zIIP processor is at a different speed. Valid values are:

- Yes The zIIP processor is set to a different speed.
No The zIIP processor is set to the same speed.

**zIIP Processor** The setting to confirm that the enclave is using a zIIP processor.

Yes The enclave is using a zIIP processor.

No The enclave is not using a zIIP processor. If No then the other zIIP related fields will be N/A.

**Application Information Workspace:**

The Application Information workspace provides details on the Database Connection Services (DCS) application. You can use it for problem determination on DCS applications.

This workspace is comprised of the following views:

**Application Information (table view)**
Shows the key data for the DCS application.

**Client Information (table view)**
Shows details on the client application.

**DB2 Host (table view)**
Identifies the host database and shows how communication between the DB2 Connect gateway and the host database is established.

**Thread/Application ID (table view)**
Identifies the thread and the DCS application.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 Connect Server Attributes:**
Use DB2 Connect Server attributes to create situations that monitor all active and inactive gateways.

**Agents Assigned from Pool** The number of agents assigned by an agent pool.

**Agents Created because of Empty Pool** The number of agents created because the agent pool was empty.

**Agents Registered** The number of agents registered in the database manager instance that is being monitored.

You can use this counter in conjunction with the **Agents - Agents waiting for token** counter to determine the percentage of agents waiting for a token so they can perform a transaction in the database manager. If the percentage is high, you can improve the concurrency in the database manager by increasing the MAXCAGENTS (maximum number of concurrent agents) database manager configuration parameter. This number is always greater than, or equal to, the number of local databases with current connects.

**Agents Waiting for Token** The number of agents waiting for a token so they can perform a transaction in the database manager.

You can use this counter in conjunction with the **Agents - Agents registered** counter to determine the percentage of "sleeping" agents. If the percentage is high,
you can improve the concurrency in the database manager by increasing the MAXCAGENTS (maximum number of concurrent agents) database manager configuration parameter.

**Attempted Connections for DB2 Connect** The total number of current connections initiated from remote clients to the instance of the database manager that is being monitored. It also shows the level of activity between this instance and other instances of the database manager.

**Committed Private Memory** The amount of private memory that the instance of the database manager has committed at the time of the snapshot.

You can use this counter to set the MIN_PRIV_MEM (minimum committed private memory) database manager configuration parameter to ensure you have enough private memory available. This counter is only applicable to platforms containing an agent pool, such as OS/2.

**Connection Switches** The number of the times that an agent from the agent pool was primed with a connection and was stolen for use with a different DRDA database.

**Connection Waiting for Client to Send Request** The current number of connections to the host databases that are handled by the DB2 Connect gateway and are waiting for the client to send a request.

**Connection Waiting for Host Reply** The current number of connections to the host databases that are handled by the DB2 Connect gateway and are waiting for a reply from the host.

**Current Connections** The number of applications that are currently connected to the database.

You can use this counter to understand the level of activity within a database and the amount of system resource being used. It can help you adjust the setting of the MAXAPPLS (maximum number of applications) database configuration parameter and the MAXAGENTS (maximum number of agents) database manager configuration parameter. If its value is always the same as MAXAPPLS, you may want to increase the value of MAXAPPLS. If it is always less than MAXAPPLS, you may want to increase the value of MAXAGENTS.

**DB2 ID** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**Idle Agents** The number of agents in the agent pool that are currently unassigned to an application and are, therefore, idle.

**IP Address** The current IP address.

**Maximum Agent Overflows** The number of times a request to create a new agent was received when the MAXAGENTS (maximum number of agents) database manager configuration parameter had already been reached.

**Maximum Agents Registered** The maximum number of agents that the database manager has registered at the same time since it was started.
You can use this counter to evaluate your setting of the MAXAGENTS (maximum number of agents) database manager configuration parameter. The number of agents registered at the time the snapshot was taken is recorded in the Agents - Agents Registered counter.

**Maximum Agents Waiting** The maximum number of agents that have been waiting for a token at the same time since the database manager was started.

You can use this counter to evaluate your setting of the MAXCAGENTS (maximum number of concurrent agents) database manager configuration parameter. If MAXCAGENTS is set to its default value, which is -1, no agents should wait for a token and the value for this counter should be zero.

The number of agents waiting for a token at the time the snapshot was taken is recorded in the Agents Waiting for Token counter.

**Maximum Coordinating Agents** The maximum number of coordinating agents working at one time.

**MVS ID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.

This information can be useful if you are saving your monitor output in a file or database for later analysis and you need to differentiate the data from different database server nodes. This node name is determined based on the NNAME configuration parameter.

**Node Number** The number assigned to the node in the file with filename db2nodes and file type cfg. (db2nodes.cfg).

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Remote Connections** The current number of connections initiated from remote clients to the instance of the database manager that is being monitored.

**Remote Connections Executing in the DBM** The number of remote applications that are currently connected to a database and are currently processing a unit of work within the database manager instance being monitored.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken. If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Server Product Version ID** The product and version that is running on the server in the form pppvverm.
It provides the following information:

- *ppp* stands for SQL
- *vvv* identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- *rr* identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- *m* identifies a 1-digit modification level

**Server Status** Shows whether the server is active or inactive.

**Server Version** The version of the server returning the information.

**Sort Heap Allocated** The total number of allocated pages of sort heap space for all sorts at the level chosen and at the time the snapshot was taken.

The amount of memory allocated for each sort can be part of or the entire sort heap size available. Sort heap size is the amount of memory available for each sort as defined in the SORTHEAP database configuration parameter. It is possible for a single application to have concurrent sorts active. For example, in some cases a SELECT statement with a subquery can cause concurrent sorts. Information can be collected at two levels:

- At the database manager level, it represents the sum of sort heap space allocated for all sorts in all active databases in the database manager.
- At the database level, it represents the sum of the sort heap space allocated for all sorts in a database.

**Stolen Agents** The number of times that agents are stolen from an application. Agents are stolen when an idle agent associated with an application is reassigned to work on a different application.

**Time in DB2 Connect** For a DCS statement, this counter shows the elapsed time for processing an SQL request at a host database server. This value is reported by this server. In contrast to the **Times for sample SQL statement - Total statement time** counter, this counter does not include the network elapsed time between DB2 Connect and the host database server.

**Time in Network Connection** The total time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement.

**Time on DB2 Host** The total time, in seconds and microseconds, that was spent executing a particular statement in the SQL cache.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced from Greenwich Mean Time (GMT).

**Total Inactive DRDA agents** The number of connections made by a subagent to the database at the node.

**Total Statement Time** For a DCS statement, this counter shows the elapsed time between the time the statement was sent from the DB2 Connect gateway to the host for processing and the time at which the result was received from the host.
For a DCS database or application, this counter shows the sum of the elapsed
times for all the statements that were executed for a particular application or
database.

This counter shows the sum of the values for the Times for sample SQL statement - Time in DB2 Connect and Times for sample SQL statement - Time in network connection counters.

**Buffer Pool Details Workspace:**

The Buffer Pool Details workspace provides status, threshold, and ratio details
associated with specific buffer pool activity.

This workspace is comprised of the following views:

**Ratio (table view)**
Provides thread performance details associated with the buffer pool.

**Status (table view)**
Provides "at a glance" buffer pool details, including size and page allocation information.

**Thresholds (table view)**
Lists the thread’s performance and status thresholds for the selected buffer pool.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Buffer Pool Hit Percent Random**
The random buffer pool hit percentage calculated as follows: ((# of Random Getpages - # Random Sync Read I/O) / # of Random Getpages) * 100. Valid entry ranges from 0.0 to 100.0.
**Buffer Pool Hit Percent Sequential** The sequential buffer pool hit percentage calculated as follows: \( \frac{(# \text{ of Sequential Getpages} - # \text{Getpage Fails} - \# \text{pages read from DASD})}{# \text{of Sequential Getpages} - # \text{Getpage Fails}} \times 100 \). The \# pages read from DASD is the sum of Sequential Sync Read I/O, Sequential Prefetch Pages, List Prefetch Pages, and Dynamic Prefetch Pages. Valid entry ranges from 0.0 to 100.0.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>MVS is allowed to discard data cached in the hiperpool when a shortage of expanded storage arises.</td>
</tr>
<tr>
<td>No</td>
<td>MVS is prevented from discarding data cached in the hiperpool unless expanded storage pages are reconfigured out of the system.</td>
</tr>
</tbody>
</table>

It is an alphanumeric text string, with a maximum length of four characters.

**Deferred Write Thresh** The deferred write threshold for the virtual buffer pool - DWQT. Write operations are scheduled when the percentage of unavailable pages in the virtual buffer pool exceeds this threshold in order to decrease the unavailable pages to 10% below the threshold.

**Dyn Prefetch Per IO** The ratio of dynamic prefetch requests to dynamic prefetch I/Os.

**Dyn Prefetch Per IO Extended Precision** The ratio of dynamic prefetch requests to dynamic prefetch I/Os.

**Getpages Per Syn IO** The ratio of getpage requests to read I/Os.

**GetPages Per Synchronous IO Extended Precision** The ratio of getpage requests to read I/Os.

**Interval Time** The number of seconds since last sample.

**List Prefetch Per IO** The ratio of list prefetch requests to list prefetch I/Os.

**List Prefetch Per IO Extended Precision** The ratio of list prefetch requests to list prefetch I/Os.

**Max Concur Prefetch** The highest number of concurrent prefetch I/O streams allocated to support I/O parallelism.

**Maximum Concurrent Prefetch Extended Precision** The highest number of concurrent prefetch I/O streams allocated to support I/O parallelism.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Page Reads Per Dyn Prefetch** The ratio of pages read by dynamic prefetch to dynamic prefetch requests.
**Page Reads Per Dyn Prefetch Extended Precision** The ratio of pages read by dynamic prefetch to dynamic prefetch requests.

**Page Reads Per List Prefetch** The ratio of pages read by list prefetch to list prefetch requests.

**Page Reads Per List Prefetch Extended Precision** The ratio of pages read by list prefetch to list prefetch requests.

**Page Reads Per Prefetch** The ratio of pages read by prefetch processing to total prefetch requests.

**Page Reads Per Prefetch Extended Precision** The ratio of pages read by prefetch processing to total prefetch requests.

**Page Reads Perseq Prefetch** The ratio of pages read by sequential prefetch to sequential prefetch requests.

**Page Reads Per Sequential Prefetch Extended Precision** The ratio of pages read by sequential prefetch to sequential prefetch requests.

**Page Writes Per Write IO** The ratio of page writes to physical I/Os.

**Page Writes Per Write IO Extended Precision** The ratio of page writes to physical I/Os.

**Pages In Use** The number of virtual buffer pool pages in use at the end of the interval (a snapshot value of the current number of non-stealable buffers). A non-stealable buffer is either one which has an outstanding getpage (someone is currently looking at this page) or one which has been updated and not yet written out to DASD.

**Pool ID** Buffer Pool ID.

**Prefetch Per IO** The ratio of prefetch requests to physical I/Os.

**Prefetch Per IO Extended Precision** The ratio of prefetch requests to physical I/Os.

**Sequential Prefetch Per IO** The ratio of pages read by sequential prefetch to sequential prefetch I/O.

**Sequential Prefetch Per IO Extended Precision** The ratio of pages read by sequential prefetch to sequential prefetch I/O.

**Sysplex Parallel Thresh** Parallel I/O sequential threshold - VPPSEQT. This threshold determines how much of the virtual buffer pool might be used for parallel I/O operations. It is a percentage of the VPSEQT. If set to zero, I/O parallelism is disabled.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is **CYYMMDDHHMMSSmmm** (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
• Y = Year
• M = Month
• D = Day
• H = Hour
• M = Minute
• S = Second
• m = Millisecond

Use Count The number of open table spaces and index spaces in this buffer pool.

Vert Deferred Write Thresh The vertical deferred write threshold for the virtual buffer pool - VDWQT. This is the percentage of the buffer pool that might be occupied by updated pages from a single data set.

Virtual Page Steal Method Identifies the page stealing algorithm (PGSTEAL) that is used for the virtual buffer pool (DB2 field name: QDBPPGST). It controls when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Possible values are:

LRU Least recently used (LRU) objects are removed first. This means it takes away pages that are not used so that more recently used pages can remain in the virtual buffer pool. This is used by default.

FIFO This results in a small decrease in the cost of a Getpage operation. It can reduce internal DB2 latch contention in environments that require very high concurrency.

NONE Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

VP Buffers Allocated The number of pages allocated to the virtual buffer pool.

VP Buffers Delete The number of pages to be deleted from an active virtual buffer pool as a result of pool contraction.

VP Parallel Sequential Thresh The parallel I/O sequential threshold - VPPSEQT. This threshold determines how much of the virtual buffer pool might be used for parallel I/O operations. It is a percentage of the VPSEQT. If set to zero, I/O parallelism is disabled.

VP Sequential Thresh The sequential steal threshold for the virtual buffer pool - VPSEQT. This is the percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. If set to zero, prefetch is disabled.

VP Size The size of the virtual buffer pool.

Workfile Maximum The maximum number of work files that were allocated during sort/merge processing during the current statistics period.

Workfile Maximum Extended Precision The maximum number of work files that were allocated during sort/merge processing during the current statistics period.
Buffer Pool Management Workspace:

Buffer pools, also called virtual buffer pools, are areas of virtual storage where DB2 temporarily stores pages of table spaces or indexes.

The Buffer Pool Management workspace provides an overview of buffer pool activity. This workspace is comprised of the following views:

**Buffer Pool Management (table view)**
- Shows activity details for specific buffer pools.

**Buffer Pool Rates (bar chart)**
- Shows the rate of get page operations, read I/O operations, prefetch requests, and write I/Os performed.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 SRM BPM Attributes:**
Use the DB2 SRM BPM attributes to create situations to monitor buffer pool activity.

- **Allocated Pages** The total number of pages allocated to the buffer pool: It includes pages that are currently read or updated, updated pages, and available pages.

- **Get Page Rate** The number of get page operations per second over the last interval.

- **Get Page Rate Extended Precision** The number of get page operations per second over the last interval.

- **Interval Time** The number of seconds since last sample.

- **Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

- **Pages In Use** The number of virtual buffer pool pages in use at the end of the interval (a snapshot value of the current number of non-stealable buffers): A non-stealable buffer is either one which has an outstanding Getpage (someone is currently looking at this page) or one which has been updated and not yet written out to DASD.

- **Pool ID** The buffer pool ID.

- **Prefetch Request Rate** The number of prefetch requests issued per second over the last interval.

- **Prefetch Request Rate Extended Precision** The number of prefetch requests issued per second over the last interval.
**Read IO Rate** The number of read I/O operations per second over the last interval.

**Read IO Rate Extended Precision** The number of read I/O operations per second over the last interval.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Utilization** The percentage of the buffer pool currently in use: It is calculated as: \((\text{QBSTCBA} / \text{QBSTVPL})\times 100\) for DB2 9 and \((\text{QBSTCBA} / \text{QDBPVPSZ})\times 100\) for DB2 10 or later.

Field descriptions:

- **QBSTCBA**
  The total number of currently active (nonstealable) buffers.

- **QBSTVPL**
  The number of buffers allocated for a virtual buffer pool.

- **QDBPVPSZ**
  The size of the virtual buffer pool.

Valid entry ranges from 0 to 10000.

**VP Size** The size of the virtual buffer pool.

**Write IO Rate** The number of write I/Os performed per second over the last interval.

**Write IO Rate Extended Precision** The number of write I/Os performed per second over the last interval.

**CICS Connections Workspace:**

The CICS Connections workspace provides an overview of DB2 thread activity originating from connected CICS subsystems. It provides information on a connection level about all CICS subsystems identified to DB2.

This workspace is comprised of the following views:

**CICS Connections Summary (table view)**
Lists thread status details, including the components of the Thread Usage chart and thread utilization data.
Thread Usage (bar chart)

Shows the counts of currently active pool threads, pool threads that are waiting because the maximum has been reached, and active threads for this CICS connection (including entry and pool threads).

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 CICS Exceptions Attributes:
Use the DB2 CICS Exceptions attributes to create situations to monitor thread activity originating from connected CICS subsystems.

CICS ID The job name of the CICS region connected to this DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

CICS Release The enumerated value for the CICS release of the CICS region connected to this DB2 system.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Pool Thread Maximum The maximum number of pool threads that are allowed.

Pool Thread Utilization The utilization of pool threads based on the current pool thread in use count divided by the maximum allowed pool threads.

Pool Thread Waits The count of pool threads that are waiting because the maximum has been reached.

Pool Threads In Use The count of pool threads that are currently active.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 118031506450100 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

Total Thread Utilization The utilization of threads based on the current total threads in use divided by the maximum allowed threads.

Total Threads In Use The count of active threads for this CICS connection (including both entry and pool threads).
**Total Threads Maximum** The maximum number of threads that can be used concurrently for this CICS connection (entry plus pool threads).

**CICS Threads Workspace:**

The CICS Threads workspace provides data to monitor DB2 thread activity originating from connected CICS subsystems.

This workspace is comprised of the following views:

**CICS Threads (table view)**
Identifies and measures thread activity from the CICS region.

**Thread Counts (bar chart)**
Shows "at a glance" counts of entry threads in use, entry threads waiting, and pool thread overflow.

**Note:** This workspace is available only when at least one thread is active from the CICS region.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 CICS Threads Attributes:**
Use the DB2 CICS Threads attributes to create situations to monitor DB2 thread activity originating from connected CICS subsystems.

**CICS ID** The job name of the CICS region connected to this DB2 system.
It is an alphanumeric text string, with a maximum length of eight characters.

**CICS Release** The enumerated value for the CICS release of the CICS region connected to this DB2 system.

**Entry Thread Waiting** The count of threads waiting because the maximum entry thread limit has been reached.

**Entry Threads In Use** The count of active entry threads for this plan and transaction within the CICS region.

**Entry Threads Utilization** The percentage of total entry threads allowed for this plan.

**Maximum Entries** The cap on the number of entry threads allowed for this plan.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Plan Name** The name of the DB2 plan being executed by this CICS region. It is an alphanumeric text string, with a maximum length of eight characters.

**Pool Thread Overflow** The number of threads for this plan and transaction that is being executed on a thread from the global pool.
**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is `CYYMMDDHHMMSSmmm` (as in `1180315064501000` for `03/15/18 06:45:01`) where:
- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Transaction ID** The ID for the transaction currently being executed for the plan. It is an alphanumeric text string, with a maximum length of four characters.

**CICS Thread Summary Workspace:**

The CICS Thread Summary workspace provides an overview for threads originating from CICS.

This workspace is comprised of the following views:

- **CICS Thread Summary (table view)**
  Shows summary information for the CICS threads.

- **In-DB2-CPU Time (bar chart)**
  Shows the class 2 CPU time (in DB2) for CICS threads.

- **In-DB2 Time (bar chart)**
  Shows the class 2 elapsed time (in DB2) for CICS threads.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace”
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
Common Storage Workspace:

The Common Storage workspace provides an overview of the common storage above and below the 2 GB bar. You can view this information if DB2 10 is installed.

This workspace is comprised of the following views:
- Common Storage Below 2 GB (table view)
- Common Storage Above 2 GB (table view)
- MVS LPAR Shared Storage Above 2 GB
- DB2 Subsystem Shared Storage Above 2 GB
- DB2 Subsystem Shared Variable Storage Above 2 GB

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can use the navigation links in the MVS LPAR Shared Storage Above 2 GB view to open:
- "MVS Storage Above 2 GB Workspace" on page 750
- "MVS Storage Below 2 GB Workspace" on page 750

DB2 CICS Threads Attributes:

Use the DB2 CICS Threads attributes to create situations to monitor DB2 thread activity originating from connected CICS subsystems.

- **CICS ID** The job name of the CICS region connected to this DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

- **CICS Release** The enumerated value for the CICS release of the CICS region connected to this DB2 system.

- **Entry Thread Waiting** The count of threads waiting because the maximum entry thread limit has been reached.

- **Entry Threads In Use** The count of active entry threads for this plan and transaction within the CICS region.

- **Entry Threads Utilization** The percentage of total entry threads allowed for this plan.

- **Maximum Entries** The cap on the number of entry threads allowed for this plan.

- **Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

- **Plan Name** The name of the DB2 plan being executed by this CICS region. It is an alphanumeric text string, with a maximum length of eight characters.
Pool Thread Overflow The number of threads for this plan and transaction that is being executed on a thread from the global pool.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMDDHHMMSSmmm (as in 118031506450100 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

Transaction ID The ID for the transaction currently being executed for the plan. It is an alphanumeric text string, with a maximum length of four characters.

All Threads Attributes:
Use the All Threads attributes to create situations to monitor thread activity including DB2 thread activity that originates from connected IMS or CICS subsystems.

Ace Address The DB2 thread ACE address for internal use.

Agent Address The address of the agent in DB2 associates all processes that are involved in a DB2 unit of work.

AGNT ASID The address space ID (ASID) of the agent.

Agent TCB Address The z/OS Task Control Block that is associated with this DB2 thread.

Authorization ID The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Authorization ID (Unicode) The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Begin Time Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and ims wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

Bytes Sent The number of bytes of data sent to the requester location.
**Cancel Command** The command string needed to cancel a thread. You can use Take Action with this attribute to cancel a thread: The format is "src CANCEL THREAD(nnnnnn)", where src is the subsystem recognition character and nnnnnn is the thread token.

**CICS MVS ID** The CICS MVS ID.

**Collection ID** This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters.

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

**Commits** The number of successful phase 2 or single-phase commit (sync) requests. Valid value is an integer in the range 0-999 commits.

**All Thread Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**All Thread Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Conversations** The number of conversations that were initiated from the requester location.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters. For example: DLKEX212.

**CP CPU Rate** The central processor CPU rate.

**Current Period** The service class period number in goal mode.
**Database Access CPU** The database access agent CPU time. This value is calculated by accumulating the amount of CPU time spent by the database access thread at the DB2 server each time a request message is processed.

**Database Access Time** The timestamp of last send or receive in distributed database access.

**DB2 ID** The DB2 subsystem ID.

**DB2 Status** The current DB2 status of the thread. It is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be determined.</td>
</tr>
<tr>
<td>INDOUBT</td>
<td>The thread is in doubt.</td>
</tr>
<tr>
<td>IN-SIGNON</td>
<td>The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.</td>
</tr>
</tbody>
</table>
IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.
WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT-LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.
WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Distributed Allied Elapsed Time The elapsed time for this thread executing on distributed host.

Elapsed Time The total amount of elapsed time since thread creation or DB2 sign-on. Valid value is an integer in the range 0-99999999 seconds.

Elapsed Per Commit The average amount of elapsed time for each database commit performed.

Enclave CP CPU Time The central processor CPU time used by each thread that is associated with an enclave token.

Enclave CPU Time The enclave CPU time.

Enclave Token The ID assigned by the z/OS workload manager for this enclave. A z/OS enclave lets each thread have its own performance objective. Using z/OS workload management (WLM) support, you can establish z/OS performance objectives for individual DDF server threads.

Enclave Token Unused This field is unused.

End User ID The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (Field name: QWHCEUID).

Get Page The number of getpage requests. This field counts successful requests for pages for queries that are processed in parallel and both successful and unsuccessful requests for pages for queries that are not processed in parallel. Valid value is an integer in the range 0-999999 pages.

Get Page 64 The number of getpage requests. This field counts successful requests for pages for queries that are processed in parallel and both successful and
unsuccessful requests for pages for queries that are not processed in parallel. Valid value is an integer in the range 0-999999999 pages.

**Get Page Per Read** The ratio of requested pages that resulted in actual I/O versus being found in a buffer. The read I/O count divided by Get Page count.

**Get Page Per Read 64** The ratio of requested pages that resulted in actual I/O versus being found in a buffer. The read I/O count divided by Get Page count.

**IIP CPU** The accumulated CPU time consumed while executing on an IBM zIIP in all environments.

**IIP In-DB2 CPU** The amount of time that the In DB2 CPU has been running on a zIIP processor.

**In DB2 IIP CPU** The total amount of CPU time that DB2 has accumulated for a thread in the zIIP processor. Valid value is an integer in the range 0-999999999 seconds.

**In DB2 CP CPU Time** The CP CPU time accumulated in DB2 when the SQL statement exit from DB2.

**In DB2 Per Commit** The average amount of in-DB2 CPU time used between each commit.

**In DB2 Time** The elapsed time accumulated in DB2 when the SQL statement exit from DB2.

**Interval Start** The start time of the interval.

**Job Name** The job name that is associated with a thread.

**Local Elapsed Time** The elapsed time, in tenths of a second, for local thread (in units that represent tenths of seconds).

**Location** The requesting location.

**Location (Unicode)** The requesting location.

**Logical Unit Name** The LUNAME of the connection to the remote DB2 system.

**Messages Sent** The number of messages sent to remote location.

**MVSID** The MVS system identifier.

**Original Authorization ID** The DB2 original Authorization ID of the thread. It is an alphanumeric text string, with a maximum length of 8 characters.

**Original Authorization ID (Unicode)** The DB2 original Authorization ID of the thread. It is an alphanumeric text string, with a maximum length of 8 characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Package Name (Unicode)** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Parallel Indicator** The thread parallelism indicator. Valid values are:

- *: Indicates that this thread is a parallel task initiated for another (originating) thread to process a query request in parallel.
- O: Indicates that this thread is the originating thread that invoked autonomous procedures.
- P: Indicates that this thread is the parent, or originating thread, of the parallel tasks created to process a query request in parallel. The activity performed for this (originating) thread is reflected under the parallel tasks.
- X: Indicates that this thread is a parallel task initiated for another (originating) thread on another DB2 for SYSPLEX parallelism.

**Parent Ace** The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.

**Performance Index** This field is related to the z/OS Workload manager. A Performance Index less than one is an indication that the goal for this service class period is being exceeded. The service class period may be considered as a "donor", giving up CPU or pageable storage for other more important service class periods on the system. A Performance Index greater than one is an indication that the goal for this service class period is not being met. Depending on the importance, this Service class period may be considered for additional services to meet the defined goal.

**Plan** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Prefetch Requests** The number of prefetch requests issued per second over the last interval.

**Remote CPU** The database access agent CPU time at the remote location.

**Remote Elapsed** The elapsed database access agent time at the remote location.

**Request Type** The request type for a ALL THREAD related workspaces. Internal use only.

**Rows Sent** The number of rows of data sent to the requester location.

**Service Class** The service class name associated with this address space.
**SQL Calls Sent** The number of SQL statement sent to the server.

**SQL Received** The number of SQL statements received from the requester.

**Sync Reads** The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Synchronous Read I/O Rate** The thread synchronous read I/O rate.

**Thread Status** The current status of a thread.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>

<td>The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.</td>
</tr>
</tbody>
</table>
IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call's request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.
WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.
WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSC
The thread is currently suspended because of an ARCHIVE LOG MODE (QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>

<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
</tbody>
</table>
IN-DB2
   The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
   The thread is in doubt.

IN-SIGNON
   The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
   The thread is processing an SQL call.

IN-SQL-SORT
   The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
   The thread is currently running in a stored procedure.

IN-TERM-THRD
   The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
   The thread is currently running in a trigger.

IN-USER-FUNC
   The thread is currently running a user-defined function.

NOT-IN-DB2
   The thread is not currently executing in DB2.

SP/UDF-INACT
   The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
   The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
   The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
   The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
   The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCRW
   The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
   The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.
WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MGSSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.
WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Token The thread token uniquely identifies a specific thread.

Thread Type The thread type. It can be:
A = IMS
B = BATCH
C = CICS
0 = Unknown
1 = DB_Access
3 = SYSTEM
5 = UTILITY
6 = RRSAF
7 = TSO
9 = Allied
10 = WAIT_LOCKLAT
**Transaction ID** The transaction ID at the workstation.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (Field name: QWHLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**Updates** The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page that is updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2 internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Wait Time** Total class 3 wait time for a thread.

**Workstation ID** The end user’s workstation name. This field contains blanks if this information was not supplied by the client.

**zIIP Different Speed** The setting if the zIIP processor is at a different speed. Valid values are:

- **Yes** The zIIP processor is set to a different speed.
- **No** The zIIP processor is set to the same speed.

**zIIP Processor** The setting to confirm that the enclave is using a zIIP processor.

- **Yes** The enclave is using a zIIP processor.
- **No** The enclave is not using a zIIP processor. If No then the other zIIP related fields will be N/A.

**DB2 Memory Attributes:**
Use the attributes to view the DB2 memory for the database address space (DBM1 or DIST).

**4-Bit Aux Frames Shared Stack** Identifies the number of auxiliary slots (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out (DB2 field name: QW0225ShrStkStg_Aux). This field is available in z/OS 1.10 (and maintenance) or later.

**Shared stack storage (MB)** Identifies the number of real-storage frames (4K) in use for 64-bit shared stack storage. This is recorded at the subsystem level (DB2 field name: QW0225ShrStkStg_Real). This field is available in z/OS 1.10 (and maintenance) or later.

**64-Bit Shared Storage (MB)** Identifies the number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages) (DB2 field name: QW0225SHRPAGES).

**Active and Disconnect DBATs** Identifies the number of active and disconnected DBAT threads (DB2 field name: QW0225DB).
**Active Threads** Identifies the number of active allied threads (DB2 field name: QW0225AT).

**Average Thread Footprint 64-bit common real** Shows the current average real storage in use for common storage of active user threads (allied threads + active and pooled DBATs).

**Average Thread Footprint (MB)** Shows the current average real storage in use for subsystem shared storage of active user threads (allied threads + active and pooled DBATs).

**Agent Local Storage (MB)** The amount of storage, in MB, allocated for agent-related local storage (DB2 field name: QW0225AL). This storage is used for operations such as sort. Valid value is an integer in the range 0 - 9999999. This field includes the total agent local storage (31-bit DBM1 private variable pools) and total agent local storage (64-bit shared variable pools).

**Agent System Storage (MB)** Identifies the storage used by system agents (DB2 field name: QW0225AS). This field includes the total system agent storage (31-bit DBM1 private variable pools) and the total system agent storage (64-bit shared variable pools).

**Aux Storage Used 64-Bit shared (MB)** Shows the amount of auxiliary storage used for 64-bit shared storage for this MVS LPAR (including reserved auxiliary slots for pages that are paged in).

**Aux Stg In Use 64-Bit Common (MB)** Shows the number of auxiliary slots (4K) in use for 64-bit common storage. This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out (DB2 field name: QW0225ComStg_Aux). This field is available in z/OS 1.10 (and maintenance) or later.

**Auxiliary Slots Used Shared Storage 64 Bit** Shows the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (DB2 field name: QW0225SHRAUXSLOTS).

**Auxiliary Storage in use (MB)** Shows the number of 4 KB auxiliary slots that are used for 64-bit shared stack storage. This value is recorded at the subsystem level. It includes only auxiliary slots that are occupied by pages that are page out. This field is available in z/OS 1.10 (and maintenance) or later.

**Buffer Manager Storage Control Blocks (MB)** Identifies the total storage used for page set control blocks (DB2 field name: QW0225BB).

**Castout Engines** Identifies the number of engines available for data-sharing castout processing (DB2 field name: QW0225CE).

**Common Fixed Pool Above (MB)** Identifies the amount of storage allocated for 64-bit common fixed pool storage (DB2 field name: QW0225FCG).

**Common Fixed Pool Below (MB)** Identifies the amount of storage allocated for 31-bit common fixed pool storage (DB2 field name: QW0225FC).

**Common Getmained Above (MB)** Identifies the amount of storage allocated for 64-bit common getmained storage (DB2 field name: QW0225GCG).
Common Getmained Below (MB) Identifies the amount of storage allocated for 31-bit common getmained storage (DB2 field name: QW0225GC).

Common Storage Manager Control Block Above (MB) Identifies the amount of storage allocated for 64-bit common storage for storage manager control structures (DB2 field name: QW0225SMC).

Common Variable Pool Above (MB) Shows the amount of storage allocated for 64-bit common variable pool storage (DB2 field name: QW0225VCG).

Common Variable Pool Below (MB) Identifies the amount of storage allocated for 31-bit common variable pool storage (DB2 field name: QW0225VC).

Compression Dictionary Identifies the storage space allocated for the compression dictionary (DB2 field name: QW0225CD).

Data Sharing Group The name of the DB2 data sharing group. It is an alphanumeric text string with a maximum of 8 characters.

Data Sharing Member The name of the DB2 data sharing member or the member name of the DB2 subsystem. It is an alphanumeric text string with a maximum of 8 characters.

DB2 Subsystem The name of the DB2 subsystem.

DB2 Version The version of the DB2 system.

Deferred Write Engines Identifies the number of engines used for deferred write operations (DB2 field name: QW0225DW).

Dynamic Statement Cache Control Block (MB) Identifies the amount of storage used for dynamic statement cache control blocks above the 2 GB bar (DB2 field name: QW0225S2).

Extended CSA Size (MB) Identifies the size of the common storage area (CSA) above the 16 MB line (DB2 field name: QW0225EC).

GBP Write Engines Identifies the number of engines for group buffer pool writes (DB2 field name: QW0225GW).

HWM 64-Bit Shared Storage (MB) Identifies the high water mark number of 64-bit shared bytes for this MVS LPAR (DB2 field name: QW0225SHRGBYTES).

HWM Requested Non Shr Dyn SQL (MB) Shows statistics interval high-water mark (HWM) of requested non-shareable storage for dynamic SQL statements used by active threads. For DB2 10 or later, this value is related to shared agent local variable pools above the bar.

HWM Shr Dyn SQL (MB) Identifies the statistics interval high-water mark (HWM) of requested shareable storage for dynamic SQL statements used by active threads.

Interval Start The start time of this interval.
IRLM Current used 31-bit private  Shows the total amount of 31-bit private storage that is currently in use by Internal Resource Lock Manager (IRLM) pools (DB2 field name: QW0225I_BBPVT). This value is the total of all 31-bit IRLM private pools.

It can show the following values:

N/A  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  • A counter is not available in one DB2 version.
  • Counters are mutually exclusive.

N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
  • Required counter values for calculation marked as N/A or N/P.
  • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  • When counter values are not generated because of operational conditions (a trace class is not active).
  • An application does not provide a value because it is optional.

IRLM Current used 64-bit common  Shows the total amount of 64-bit common storage that is currently in use by Internal Resource Lock Manager (IRLM) pools (DB2 field name: QW0225I_ABCSA). This value is the total of all 64-bit common IRLM pools.

It can show the following values:

N/A  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  • A counter is not available in one DB2 version.
  • Counters are mutually exclusive.

N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
  • Required counter values for calculation marked as N/A or N/P.
  • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  • When counter values are not generated because of operational conditions (a trace class is not active).
  • An application does not provide a value because it is optional.

IRLM Current used 64-bit private  Shows the total amount of 64-bit private storage in use by Internal Resource Lock Manager (IRLM) pools (DB2 field name: QW0225I_ABPVT).
It can show the following values:

**N/A**  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.

**N/C**  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  - A divide by zero (percentages, ratios).
  - Suppression of negative elapsed time values.
  - Required counter values for calculation marked as N/A or N/P.
  - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P**  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  - When counter values are not generated because of operational conditions (a trace class is not active).
  - An application does not provide a value because it is optional.

**IRLM Current used ECSA** Shows the total amount of Extended Common Service Area (ECSA) storage in use by Internal Resource Lock Manager (IRLM) pools.

It can show the following values:

**N/A**  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.

**N/C**  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  - A divide by zero (percentages, ratios).
  - Suppression of negative elapsed time values.
  - Required counter values for calculation marked as N/A or N/P.
  - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

**N/P**  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  - When counter values are not generated because of operational conditions (a trace class is not active).
  - An application does not provide a value because it is optional.

**IRLM ECSA high water mark** Shows the high water mark of Extended Common Service Area (ECSA) storage allocated by Internal Resource Lock Manager (IRLM) pools.

It can show the following values:

**N/A**  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.
N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
  • Required counter values for calculation marked as N/A or N/P.
  • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  • When counter values are not generated because of operational conditions (a trace class is not active).
  • An application does not provide a value because it is optional.

IRLM HWM for 31-bit private (MB)  Shows the high water mark of 31-bit private storage that has been in use (DB2 field name: QW0225I_BBPVH). This value is the total amount of all 31-bit private IRLM pools.

It can show the following values:

N/A  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  • A counter is not available in one DB2 version.
  • Counters are mutually exclusive.

N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
  • Required counter values for calculation marked as N/A or N/P.
  • Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P  Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  • When counter values are not generated because of operational conditions (a trace class is not active).
  • An application does not provide a value because it is optional.

IRLM HWM for 64-bit common (MB)  Shows the high water mark of 64-bit common storage that has been in use. This value is the total of all 64-bit common IRLM pools (DB2 field name: QW0225I_ABCSH).

It can show the following values:

N/A  Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  • A counter is not available in one DB2 version.
  • Counters are mutually exclusive.

N/C  Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  • A divide by zero (percentages, ratios).
  • Suppression of negative elapsed time values.
KD2_PF_READA_SPMON

- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  - When counter values are not generated because of operational conditions (a trace class is not active).
  - An application does not provide a value because it is optional.

IRLM HWM for 64-bit private Shows the high water mark of 64-bit private storage allocated by IRLM pools (DB2 field name: QW0225I_ABPVH).

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  - A divide by zero (percentages, ratios).
  - Suppression of negative elapsed time values.
  - Required counter values for calculation marked as N/A or N/P.
  - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  - When counter values are not generated because of operational conditions (a trace class is not active).
  - An application does not provide a value because it is optional.

IRLM Threshold virtual 31-Bit Shows the threshold of 31-bit virtual storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded (DB2 field name: QW0225I_BPMAX).

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  - A divide by zero (percentages, ratios).
  - Suppression of negative elapsed time values.
  - Required counter values for calculation marked as N/A or N/P.
  - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).
N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:

- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

IRLM Threshold virtual 64-Bit Shows the threshold of 64-bit virtual storage available for normal IRLM execution. Only requests for storage by "must complete" tasks will be granted if this threshold is exceeded.

It can show the following values:

N/A Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:

- A counter is not available in one DB2 version.
- Counters are mutually exclusive.

N/C Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:

- A divide by zero (percentages, ratios).
- Suppression of negative elapsed time values.
- Required counter values for calculation marked as N/A or N/P.
- Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

N/P Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:

- When counter values are not generated because of operational conditions (a trace class is not active).
- An application does not provide a value because it is optional.

Log Manager Control frames Aux (MB) The number of frames in auxiliary storage that are being used for log manager control structures.

Log Manager Control frames REAL (MB) The number of frames in real storage that are being used for log manager control structures.

Log Manager Wrt buff frames REAL (MB) The number of frames in real storage that are being used for log manager write buffers.

MVS System ID The MVS system identifier.

Number of active parallel child threads Shows the number of active parallel child threads.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

P-Lock Notify Exit Engines Identifies the number of data sharing P-Lock engines and Notify Exit engines (DB2 field name: QW0225PL).

Prefetch Engines Identifies the number of engines used for sequential, list, and dynamic prefetch (DB2 field name: QW0225PF).
RID Pool Storage (MB) Identifies the storage for RID list processing such as list prefetch, index ANDing and ORing (DB2 field name: QW0225RP).

Real Frames Common 64-Bit Identifies the number of real-storage frames (4K) in use for 64-bit common storage. This is recorded at the subsystem level (DB2 field name: QW0225ComStg_Real). This field is available in z/OS 1.10 (and maintenance) or later.

Real Storage in use (MB) Shows the total amount of real storage in use for 64-bit shared storage. This is recorded at the subsystem level. This field is available in z/OS 1.10 (and maintenance) or later.

Shared Agent Local Storage (MB) Shows the amount of storage allocated for agent-related 64-bit local storage (DB2 field name: QW0225ALG).

Shared Agent Non-System Storage (MB) Shows the amount of 64-bit storage used by non-system agents. It is the difference between the Total Agent Local Storage (DB2 field name: QW0225ALG) and the Total Agent System Storage (DB2 field name: QW0225ASG).

Shared Agent System Storage (MB) Shows the amount of 64-bit storage used by system agents (DB2 field name: QW0225ASG).

Shared Fixed Storage 64-bit (MB) Identifies the amount of total fixed virtual shared storage above the 2 GB bar (DB2 field name: QW0225SF).

Shared Getmained Storage (MB) Identifies the amount of virtual shared storage acquired by GETMAIN above the 2 GB bar (DB2 field name: QW0225SG).

Shared Memory Objects Identifies the number of shared memory objects allocated for this MVS LPAR (DB2 field name: QW0225SHRNMOB).

Shared Non-System Agent Stack Storage (MB) Shows the amount of 64-bit shared storage allocated for non-system agent stack use.

Shared Non-System Agent Stack Storage in Use (MB) Shows the amount of 64-bit shared non-system agent stack that is in use.

Shared Pages Backed in Real Storage 64 Bit Shows the number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR (DB2 field name: QW0225SHRINREAL).

Shared Pages Paged In from Aux Storage 64 Bit Identifies the number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEINS).

Shared Pages Paged Out from Auxiliary Storage 64 Bit Shows the number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEOUTS).

Shared System Agent Stack Storage (MB) Shows the amount of 64-bit shared storage allocated for system agent stack use.

Shared Storage Manager Control Block (MB) Shows the amount of 64-bit shared storage allocated for storage manager control structures.
**Shared Variable Storage (MB)** Identifies the amount of virtual shared variable storage above the 2 GB bar (DB2 field name: QW0225SV).

**Stack Storage In Use (MB)** Shows the amount of 64-bit shared system agent stack that is in use.

**Shared thread and system (MB)** Shows the number of real-storage frames (4K) in use for 64-bit shared storage. This does not include shared stack storage (DB2 field name: QW0225ShrStg_Real). This is recorded at the subsystem level. This field is available in z/OS 1.10 (and maintenance) or later.

**Subsystem 64-bit Shared Thd and Sys** Shows the number of auxiliary slots (4K) in use for 64-bit shared storage. This does not include shared stack storage (DB2 field name: QW0225ShrStg_Aux). This is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS 1.10 (and maintenance) or later.

**Thread Copies of Cached SQL Date at HWM** Identifies the timestamp at high-water storage (DB2 field name: QW0225HT).

**Thread Copies of Cached SQL Statement Count** Identifies the number of statements in the local cache storage pool (DB2 field name: QW0225LC).

**Thread Copies of Cached SQL Statement Count at HWM** Identifies the number of statements in the local cache storage pool at high storage time (DB2 field name: QW0225HC).

**Total Agent Non-System Storage (MB)** Shows the total Agent Non-System Storage. It is the difference between the Total Agent Local Storage (QW0225AL) and the Total Agent System Storage (QW0225AS).

**Total Alloc Shr Static SQL (MB)** Identifies the total shareable storage allocated for static SQL statements.

**Total Allocated Shareable Storage for dynamic (MB)** Identifies the total shareable storage allocated for dynamic SQL statements used by active threads.

**Total Requested Non Shr Dyn SQL (MB)** Identifies the total non-shareable storage requested for dynamic SQL statements used by active threads. For DB2 10 or later, this value is related to shared agent local variable pools above the bar.

**Total Requested Shr Dyn SQL (MB)** Identifies the total shareable storage requested for dynamic SQL statements used by active threads.

**MVS Storage Attributes:**
Use the MVS Storage attributes to view the system storage sizes. This information is provided with DB2 10.

**24 Bit High Private (MB)** Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225HI). This storage is obtained from top downward, usually for authorized programs.

**24 Bit Low Private (MB)** Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225LO). This storage is obtained from bottom upward, usually for unauthorized programs.
31 Bit Extended High Private (MB) Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EH). This storage is obtained from top downward, usually for authorized programs.

31 Bit Extended Low Private (MB) Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EL). This storage is obtained from bottom upward, usually for unauthorized programs.

Active and Disconnect DBATs Identifies the number of active and disconnected DBAT threads (DB2 field name: QW0225DB).

Active Threads Identifies the number of active allied threads (DB2 field name: QW0225AT).

Address Space Name Shows the address space name (DBM1 or DIST) (DB2 field name: QW0225AN).

Agent Local Storage (MB) Identifies the amount of storage allocated for agent-related local storage (DB2 field name: QW0225AL). This storage is used for operations such as sort.

Agent Non-System Storage (MB) Identifies the total agent non-system storage. It is the difference between the Total Agent Local Storage (QW0225AL) and the Total Agent System Storage (QW0225AS).

Agent System Storage (MB) Identifies the storage used by system agents (DB2 field name: QW0225AS).

Auxiliary 4K Slot in Use 31 Bit Identifies the number of auxiliary slots (4K) in use by DBM1 (DB2 field name: QW0225AX).

Auxiliary 4K Slot in Use 64 Bit Identifies the number of auxiliary 4K slots in use for 64-bit private pools (DB2 field name: QW0225HVAuxSlots). This value is available from z/OS 1.11.

Auxiliary Slots Used Shared Storage 64 Bit Identifies the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (DB2 field name: QW0225SHRAUXSLOTS).

Auxiliary Storage in Use (MB) Identifies the number of auxiliary slots (4K) in use by DBM1 (DB2 field name: QW0225AX).

Avg Thread Footprint (MB) The current average memory usage of active allied threads and the maximum number of existing active DBATs. Valid value is an integer.

It is calculated as follows:

\[
\frac{\text{(total variable storage)} - \text{(total agent system storage)} - \text{(amount of storage allocated for the local cache storage pool)}}{\text{[(active allied threads) + (active DBATs)]}}
\]

Average Thread Footprint (MB) The current average memory usage of active allied threads and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.
It is calculated as follows:

\[
([\text{total variable storage}] - [\text{total agent system storage}] - [\text{amount of storage allocated for the local cache storage pool}]) \\
/ ([\text{active allied threads}] + [\text{active DBATs}])
\]

**Buffer Manager Data Manager Trace Table (MB)** Identifies the storage used for Buffer Manager and Data Manager internal trace tables (DB2 field name: QW0225TT).

**Buffer Manager Storage Control Blocks (MB)** Identifies the storage used for page set control blocks (DB2 field name: QW0225BB).

**Castout Buffers (MB)** Identifies the storage used for castout buffers (DB2 field name: SW0225C2).

**Castout Engines** Identifies the number of engines available for data-sharing castout processing (DB2 field name: QW0225CE).

**Common Fixed Pool Above (MB)** Identifies the amount of storage allocated for 64-bit common fixed pool storage (DB2 field name: QW0225FCG).

**Common Fixed Pool Below (MB)** Identifies the amount of storage allocated for 31-bit common fixed pool storage (DB2 field name: QW0225FC).

**Common Getmained Above (MB)** Identifies the amount of storage allocated for 64-bit common getmained storage (DB2 field name: QW0225GCG).

**Common Getmained Below (MB)** Identifies the amount of storage allocated for 31-bit common getmained storage (DB2 field name: QW0225GC).

**Common Storage Manager Control Block Above (MB)** Identifies the amount of storage allocated for 64-bit common storage for storage manager control structures (DB2 field name: QW0225SMC).

**Common Variable Pool Above (MB)** Identifies the amount of storage allocated for 64-bit common variable pool storage (DB2 field name: QW0225VCG).

**Common Variable Pool Below (MB)** Identifies the amount of storage allocated for 31-bit common variable pool storage (DB2 field name: QW0225VC).

**Compression Dictionary** Identifies the storage space allocated for the compression dictionary (DB2 field name: QW0225CD).

**Current Private High Addr 24 Bit** Identifies the current high address of the 24-bit private region (DB2 field name: QW0225TP). It indicates the highest value (upper limit) of the private area of the DB2 database address space and the private area of the distributed data address space.

**Current Private High Addr 31 Bit** Identifies the current high address of the 31-bit private region (DB2 field name: QW0225EP).

**DB2 ID** Identifies the DB2 ID.

**DB2 Version** The version of the DB2 system.
Deferred Write Engines Identifies the number of engines used for deferred write operations (DB2 field name: QW0225DW).

Dynamic Statement Cache Control Block (MB) Identifies the amount of storage used for dynamic statement cache control blocks above the 2 GB bar (DB2 field name: QW0225S2).

Extended CSA Size (MB) Identifies the size of the common storage area (CSA) above the 16 MB line (DB2 field name: QW0225EC).

Fixed Storage Identifies the total amount of fixed storage (DB2 field name: QW0225FX).

Fixed Storage above (MB) Identifies the total amount of fixed storage above the 2 GB bar (DB2 field name: QW0225FA).

GBP Write Engines Identifies the number of engines for group buffer pool writes (DB2 field name: QW0225GW).

Getmained Storage (MB) Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GM). This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Getmained Storage above (MB) Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GA). This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM). This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Getmained Stack Storage (MB) Identifies the total GETMAINED storage allocated for program stack use (DB2 field name: QW0225GS).

HWM Auxiliary 4K Slot in Use 64 Bit Identifies the high water mark for the number of auxiliary 4K slots in use for 64-bit private pools (DB2 field name: QW0225HVGAuxSlots). This value is available from z/OS 1.11.

HWM Real 4K Frame in Use 64 Bit Identifies the high water mark for the number of real 4K frames in use for 64-bit private pools (DB2 field name: QW0225HVGPagesInReal). This value is available from z/OS 1.11.

HWM Shared Bytes 64 Bit (MB) Identifies the high water mark for number of 64-bit shared bytes for this MVS LPAR (DB2 field name: QW0225SHRGBYTES).

HWM Thread Copies Cached SQL (MB) Identifies the statistics interval high-water mark of allocated storage for thread copies in the local cache storage pool (DB2 field name: QW0225HS).

Interval Start The time at the Tivoli Enterprise Monitoring Server location when the data was sampled. The format is MM/DD/YY HH:MM:SS.
Local Dynamic Statement Cache Control Block (MB) Identifies the storage for local dynamic statement cache control blocks (DB2 field name: QW0225SB).

Max Extended Region Size (MB) Identifies the maximum amount of MVS private storage available above the 16 MB line (DB2 field name: QW0225RG).

Max Number of Threads The maximum number of possible threads. This depends on the storage size, the average memory usage of active user threads, and the maximum number of existing active DBATs. Valid value is an integer.

It is calculated as follows:

\[
\text{Maximum Number of Threads} = \frac{(\text{extended region size}) - (31 \text{ bit extended low private}) - \text{minimum (extended region size / 8, 200 * 1024 * 1024)} - [(\text{total getmaind storage}) + (\text{total getmaind stack storage}) + (\text{total fixed storage})]}{\text{(average thread footprint)}}
\]

MVS System ID The MVS system identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Prefetch Engines Identifies the number of engines used for sequential, list, and dynamic prefetch (DB2 field name: QW0225PF).

Pipe Manager Subpool Storage (MB) Identifies the storage allocated to Pipe Manager for parallel query operations (DB2 field name: QW0225PM).

P-Lock Notify Exit Engines Identifies the number of data sharing P-Lock engines and Notify Exit engines (DB2 field name: QW0225PL).

RDS OP Pool Storage (MB) Identifies the storage for RDS operations pool used for sort, prepare, and so on (DB2 field name: QW0225RO).

Real 4K Frame in Use 31 Bit Identifies the amount of real-storage frames in use for 31-bit and 64-bit private pools (DB2 field name: QW0225RL).

Real 4K Frame in Use 64 Bit Identifies the number of real 4K frames in use for 64-bit private pools (DB2 field name: QW0225HVPagesInReal). This value is available from z/OS 1.11.

Real Storage in Use (MB) Identifies the amount of real storage in use for 31-bit and 64-bit private pools.
RID Pool Storage (MB) Identifies the storage for RID list processing such as list prefetch, index ANDing and ORing (DB2 field name: QW0225RP).

Shared Agent Local Storage (MB) Identifies the amount of storage allocated for agent-related 64-bit local storage (DB2 field name: QW0225ALG).

Shared Agent Non-System Storage (MB) Identifies the amount of 64-bit storage used by non-system agents. It is the difference between the Total Agent Local Storage (QW0225ALG) and the Total Agent System Storage.

Shared Agent System Storage (MB) Identifies the amount of 64-bit storage used by system agents (DB2 field name: QW0225ASG).

Shared Fixed Storage (MB) Identifies the amount of total fixed virtual shared storage above the 2 GB bar (DB2 field name: QW0225SF).

Shared Getmained Storage (MB) Identifies the amount of virtual shared storage acquired by GETMAIN above the 2 GB bar (DB2 field name: QW0225SG).

Shared Memory Objects Identifies the number of shared memory objects allocated for this MVS LPAR (DB2 field: QW0225SHRNMOB).

Shared Memory Storage (MB) Identifies the total 64-bit storage allocated for storage manager control structures (DB2 field name: QW0225SM).

Shared Memory Pages 64 Bit Identifies the number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages) (DB2 field name: QW0225SHRPAGES).

Shared Non-System Agent Stack Storage (MB) Identifies the amount of 64-bit shared storage allocated for non-system agent stack use (DB2 field name: QW0225GSG).

Shared Non-System Stack Storage in Use (MB) Identifies the amount of 64-bit shared non-system agent stack that is in use (DB2 field name: QW0225SUG).

Shared Pages Backed in Real Storage 64 Bit Identifies the number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR (DB2 field name: QW0225SHRINREAL).

Shared Pages Paged In from Auxiliary Storage 64 Bit Identifies the number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEINS).

Shared Pages Paged Out from Auxiliary Storage 64 Bit Identifies the number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR (DB2 field name: QW0225SHRPAGEOUTS).

Shared Storage Manager Control Block (MB) Identifies the amount of 64-bit shared storage allocated for storage manager control structures (DB2 field name: QW0225SMS).

Shared System Agent Stack Storage (MB) Identifies the amount of 64-bit shared storage allocated for system agent stack use (DB2 field name: QW0225GSG_SYS).
Shared System Agent Stack Storage in Use (MB) Identifies the amount of 64-bit shared system agent stack that is in use (DB2 field name: QW0225SUG_SYS).

Shared Variable Storage (MB) Identifies the amount of virtual shared variable storage above the 2 GB bar (DB2 field name: QW0225SV).

Stack Storage In Use (MB) Identifies the amount of stack storage that is in use (DB2 field name: QW0225SU).

Storage Cushion (MB) Identifies the storage reserved to allow DB2 to complete critical functions while short on storage (DB2 field name: STORCUSH). This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Storage Manager Control Block (MB) Identifies the total 64-bit storage allocated for storage manager control structures (DB2 field name: QW0225SM).

Thread Copies of Cached SQL (MB) Identifies the amount of storage allocated for the local cache storage pool (DB2 field name: QW0225SC). For DB2 10, the storage is allocated for executable code sequences of dynamic SQL statements.

Thread Copies of Cached SQL above HWM Allocated Statement (MB) Identifies the statistics interval high-water mark (HWM) of allocated storage for thread copies in the cache storage pool above the 2 GB bar (DB2 field name: QW0225H2).

Thread Copies of Cached SQL above In Use (MB) Identifies the amount of storage used for thread copies in the cache storage pool above the 2 GB bar (DB2 field name: QW0225L2).

Thread Copies of Cached SQL Date at HWM Identifies the timestamp at high-water storage (DB2 field name: QW0225HT).

Thread Copies of Cached SQL in Use (MB) Identifies the amount of storage used for thread copies in the local cache storage pool (DB2 field name: QW0225LS). This is a subset of the total allocated storage for thread copies QW0225SC.

Thread Copies of Cached SQL Statement Count Identifies the number of statements in the local cache storage pool (DB2 field name: QW0225LC).

Thread Copies of Cached SQL Statement Count at HWM Identifies the number of statements in the local cache storage pool at high storage time (DB2 field name: QW0225HC).

Thread Copies of Static SQL (MB) Identifies the amount of storage allocated below the bar for executable code sequences of static SQL statements (DB2 field name: QW0225SX).

Total Storage Below (MB) Identifies total DBM1 storage (DB2 field name: SW0225DB). This includes:
- Fixed length storage use
- Getmained storage
- Save areas
- Variables
Variable Storage (MB) Identifies the total storage used by all variable pools (DB2 field name: QW0225VR). This includes storage used by:

- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables

Variable Storage above (MB) Identifies the amount of variable storage available above the 2 GB bar (DB2 field name: QW0225VA).

QW0225AV Identifies the total amount of storage available for storage manager pools (DB2 field name: QW0225AV).

QW0225CR Identifies the storage reserved for operation that must complete before DB2 is allowed to stop (DB2 field name: QW0225CR).

QW0225F1 This field is for IBM service (DB2 field name: QW0225F1).

QW0225F2 This field is for IBM service (DB2 field name: QW0225F2).

QW0225MV Identifies the amount of storage available for operating system activity (DB2 field name: QW0225MV).

QW0225SO Identifies the amount of free storage, in megabytes, available in the DBM1 data space (DB2 field name: QW0225SO).

Coupling Facility Connections Workspace:

The Coupling Facility Connections workspace displays connection status information for all connections to a coupling facility structure.

Use the Coupling Facility Connections workspace to:

- View the status of all connections to a structure
- Identify the operating system name, the associated coupling facility name and job name

To investigate a non-active connection, review the information provided in Accessing an OMEGAMON Host Session.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Buffer Pool Connection Attributes:

Use the Group Buffer Pool (GBP) Connection attributes to create situations that monitor connections to DB2 coupling facilities.

Connection Status The status of the connection between a DB2 coupling facility member (IRLM subsystem) and group.

Valid values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>Active member connection</td>
</tr>
<tr>
<td>CONNECT</td>
<td>Member connected but not active</td>
</tr>
<tr>
<td>DISCONN</td>
<td>Member disconnected</td>
</tr>
<tr>
<td>FAILED</td>
<td>Member failed to connect</td>
</tr>
<tr>
<td>FAIL_PER</td>
<td>Member persistently fails to connect</td>
</tr>
</tbody>
</table>

**Coupling Facility Name** The name of a DB2 coupling facility. It is an alphanumeric text string with a maximum of 16 characters; for example, DB2_D411.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Data Sharing Group Element** The name of an element of within the data sharing group.

**DB2 ID** The name of a DB2 subsystem.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Job Name** The job name connected to a coupling facility structure. It is an alphanumeric text string with a maximum of 8 characters; for example, IRLM.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.
Coupling Facility Structures Workspaces:

The Coupling Facility Structures workspace provides a global view of LOCK1 and SCA coupling facility structures for a specific data sharing group.

Use the workspace to:
- Monitor activity rates within a structure
- Track structure utilization over a period of time
- View structure data for a true coupling facility situation
- View comprehensive global and false contention data

Analyzing Coupling Facility Connections

You can analyze a specific coupling facility structure to view the connection status of all connections to the structure.

From the Coupling Facility Structure table view, right-click a structure name and then click **Link to --> Coupling Facility Connections**. The **Coupling Facility Connections workspace** is displayed. This view shows the connection status details for your coupling facility structure.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Group Coupling Facility Attributes:

Use the DB2 Group Coupling Facility attributes to create situations that determine the excess usage and reduced availability of group coupling facility structures.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 Change Requests** The number of change requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 False Contention** Provides a global view of false contentions for all DB2 systems in a data sharing group. The formula is the number of false contentions divided by the total number of global contentions, multiplied by 100. Valid value is an integer in the range 0 - 99999999.

**DB2 False Suspends** The number of suspends because of MVS XES (Cross-system Extended Services) false contention. Valid value is an integer in the range 0 - 99999999.

**DB2 Global Contention** Provides a global view of global contentions for all DB2 systems in a data sharing group. The formula is the total number of suspends because global contention divided by the total number of XES requests, multiplied by 100. Valid value is an integer in the range 0 - 99999999.

**DB2 IRLM Suspends** The number of suspends because of IRLM global resource contentions. This occurs when IRLM states are in conflict and require inter-system communication for resolution. Valid value is an integer in the range 0 - 99999999.

**DB2 Lock Requests** The number of lock requests for P-locks. Valid value is an integer in the range 0 - 99999999.
**DB2 Unlock Requests** The number of unlock requests for P-locks. Valid value is an integer in the range 0 - 99999999.

**DB2 XES Suspends** The number of suspends because MVS XES global resource contentions that are not IRLM-level contention. This occurs when XES lock states are in conflict but the IRLM lock states are not in conflict. Valid value is an integer in the range 0 - 99999999.

**False Contention** The number of contentions that the IRLM thought were competing for the same database resource. Valid value is an integer in the range 0 - 99999999.

Usage: An IRLM subsystem identifies a contention but grants a lock to a contending IRLM subsystem because the contending IRLM is requesting access to a different segment in the database.

**False Contention Rate** The number of false contentions divided by the number of seconds during the collection interval. Valid value is an integer in the range 0 - 99999999.

**Global Contention** The total number of contentions competing for the same database resource. Valid value is an integer in the range 0 - 99999999.

**Global Contention Rate** The number of contentions divided by the number of seconds during the collection interval. Valid value is an integer in the range 0 - 99999999.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**List Entries Allocated** The total number of list entries that a DB2 system has allocated for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**List Entries Percent** The number of list entries that IRLM is currently using divided by the number of list entries that DB2 has allocated. Valid value is an integer in the range 0 - 100.

**List Entries Used** The total number of list entries IRLM is currently using for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Lock Entries Allocated** The total number of lock entries that a DB2 system has allocated for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Lock Entries Percent** The number of lock entries that IRLM is currently using divided by the number of lock entries DB2 has allocated. Valid value is an integer in the range 0 - 100.

**Lock Entries Used** The total number of lock entries IRLM is currently using for the LOCK1 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Number of Indexes** Identifies the number of indexes.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Structure Connect Count** The number of active connections to a structure. Valid value is an integer in the range 0 - 16.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Structure Size** The size, in kilobytes, of a DB2 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Structure Status** The current status of the coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The structure is active</td>
</tr>
<tr>
<td>INACTIVE</td>
<td>The structure is inactive</td>
</tr>
</tbody>
</table>

For duplexed group buffer pool structures, additional valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REB_NEW</td>
<td>Rebuild on new (secondary GBP)</td>
</tr>
<tr>
<td>REB_OLD</td>
<td>Rebuild on old (primary) GBP</td>
</tr>
<tr>
<td>REB_TRAN</td>
<td>Structure is in transition</td>
</tr>
<tr>
<td>REB_HOLD</td>
<td>Structure is in holding state</td>
</tr>
<tr>
<td>REB_ERR</td>
<td>Error during the structure rebuild</td>
</tr>
</tbody>
</table>

**Structure Type** The type of DB2 coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE</td>
<td>Cache data of interest to several DB2 systems in data sharing group</td>
</tr>
<tr>
<td>LIST</td>
<td>Shared Communications Area (SCA) for data sharing group members</td>
</tr>
<tr>
<td>LOCK</td>
<td>Controls locking</td>
</tr>
</tbody>
</table>

**Structure Used** The number of kilobytes that DB2 uses within a structure type. Valid value is an integer in the range 0 - 99999999.

**Structure Used Percent** The percent of the total available kilobytes that DB2 is currently using within a structure type. Valid value is an integer in the range 0 - 100.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.
Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Critical DB2 Messages by Message ID Workspace:

The Critical DB2 Messages by Message ID workspace displays critical DB2 messages sorted by message identification number.

This workspace is comprised of the following views:

Critical DB2 Messages by Message ID (table view)
Reports information about critical messages, including when the message was generated, the message identification number, and the message text.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following workspace from the Critical DB2 Messages by Message ID workspace:
• DB2 Messages

DB2 Message Attributes:
Use the DB2 Message attributes to identify problems with your DB2 system.

DB2ID The name of a DB2 subsystem.

DB2 Version The version of the DB2 system.

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

Long Message Action Code The long message action code.

Message ID The system identification number for the message. It is an alphanumeric text string with a maximum of eight characters.

Message Text A description of the message. It is an alphanumeric text string with a maximum of 2500 characters.

MVS System ID The MVS system identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
Note: By default DB2 messages are not collected. If you want to collect DB2 messages, use the Configuration Tool and select: Monitoring Profile configuration –> Additional configuration settings. If you configure it to YES, the DB2 message subtask is started during DB2 instance initialization.

To start or stop DB2 message collection manually specify the following:
`F <cccccccc>,F PEservername,F<db2>,FDB2MSGMON=<p>`

where:
- `cccccccc` Identifies the OMEGAMON Collector started task name.
- `db2` Identifies the DB2 name.
- `p` Select `Y` to start or `N` to stop the message subtask.

If you do not see any DB2 messages, check if DB2 message subtask is started from the OMEGAMON Collector started task.

Data Sharing Thread Activity Workspace:

The Data Sharing Thread Activity workspace provides a global view of thread activity for an entire data sharing group. A consolidated list of DB2 threads displays on the table view in alphabetical order by plan name. Your table view may sort differently if you have changed the sort field or sort order.

This workspace is comprised of the following views:
- Threads Using CP CPU (bar chart)
- Threads that have Wait Times (bar chart)
- Data Sharing Threads (table view)

Use the Data Sharing Threads table view to:
- Identify all active threads.
- Track thread activity for application threads over a period of time.
- Analyze thread data when a thread evaluates to true.

Monitoring Thread Activity

You can use the Data Sharing Threads table view to identify all active application threads and track thread activity over a period of time. You can use the thread data to:
- Monitor critical application threads.
- Evaluate the thread elapsed and wait times for critical threads.
- Observe thread activity for threads within the same system, group, and member.

Analyzing Thread Statistics

You can analyze a specific application thread on the Data Sharing Threads table view and review statistical information.
1. Right-click a row on the Data Sharing Threads table view.
2. Click Link to --&gt; Thread Statistics.

The Thread Statistics workspace displaying statistical information for your thread is displayed.
Investigating Excessive Thread Elapsed Time

You can use the Tivoli Enterprise Portal terminal emulator adapter to access an OMEGAMON host session. You can then review further information that will assist you in investigating a thread with excessive elapsed time. For information about using this feature, see the Tivoli Enterprise Portal online help.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Data Sharing Thread Detail Attributes:
Use Data Sharing Thread Detail attributes to create situations that monitor thread activity for an entire data sharing group.

Ace Address The DB2 thread ACE address for internal use.

Authorization ID The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Authorization ID (Unicode) The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Begin Time Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and ims wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

Cancel Command The command string needed to cancel a thread. You can use Take Action with this attribute to cancel a thread: The format is "src CANCEL THREAD(nnnnnn)", where src is the subsystem recognition character and nnnnnn is the thread token.

Collection ID The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters

Collection ID (Unicode) The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

Data Sharing Thread Detail Attributes Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Detail Attributes (Data Sharing) The type of DB2 connection.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job.</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>DB2CAF</td>
<td>DB2 call attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed or DBAccess</td>
<td>Distributed thread</td>
</tr>
<tr>
<td>IMS BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>

<td>IMS thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example DLKEX212.

**CP CPU Time** The central processor CPU time.

**DB2 ID** The name of a DB2 subsystem.

**Display CPU Time** The total amount of CPU time that DB2 has accumulated for a thread.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

Valid format is DD-HH:MM:SS, where:
- D = Day
- H = Hour
- M = Minute
- S = Second
For example, 00-20:16:18 indicates that the display elapsed time is 20 hours, 16 minutes, and 18 seconds.

**Display Wait Time** The total amount of thread wait time. The collection of thread wait time requires activation of Accounting Class 2 in the monitored DB2 subsystem.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**In DB2 Elapsed Time** The elapsed time accumulated in DB2.

**LUWID** The logical unit name (LUNAME) of the connection to the remote DB2 system.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package DBRM (Unicode)** The package DBRM name.

**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Parent Ace** The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. Valid format is alphanumeric, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Thread Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on. Valid value is an integer in the range 0 - 99999999 seconds.
**Thread Group Member Name** The name of the member within a data sharing group for a thread.

**Thread Group Name** The name of a data sharing group for a thread. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Thread Status** The current status of a thread.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be determined.</td>
</tr>
<tr>
<td>INDOUBT</td>
<td>The thread is in doubt.</td>
</tr>
<tr>
<td>IN-SIGNON</td>
<td>The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.</td>
</tr>
<tr>
<td>IN-SQL-CALL</td>
<td>The thread is processing an SQL call.</td>
</tr>
</tbody>
</table>
IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWRR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.
WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.
WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Stored Procedure Name The name of the stored procedure that a thread invokes. It is an alphanumeric text string, with a maximum of 18 characters; for example, SPCALC_TAX.

Thread Token The thread token uniquely identifies a specific thread.

Data Sharing Thread Detail Attributes The type of thread. It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMPP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Thread Wait Time The total amount of thread wait time. Valid format is an integer in the range 09 - 99999999 seconds. Note: collection of thread time requires activation of Accounting Class 2 in the Monitored DB2 subsystem.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

The timestamp format for SCAN and STR functions is **CYYMMDDHHMMSSmmm** (as in 1180315064501000 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Data Sharing Thread Statistics Workspace:** The Data Sharing Thread Statistics workspace displays thread statistics for a specific application thread. If the application thread is a parallel thread, the table view displays thread statistics for all the associated parallel threads.

**Viewing Additional Thread Information**

You can use the Tivoli Enterprise Portal terminal emulator adapter to access an OMEGAMON host session to investigate a thread with excessive elapsed time. For information about using this feature, see the Tivoli Enterprise Portal online help.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Data Sharing Thread Statistics Attributes:**
Use Data Sharing Thread Statistics attributes to create situations that determine the usage of parallel threads.

**Asynchronous Page Reads** The number of asynchronous page reads for prefetch. Valid value is an integer in the range 0 - 2147483647.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**Dynamic Prefetch** The number of dynamic prefetch requests. Valid value is an integer in the range 0 - 2147483647.

**Get Page Requests** The number of thread getpage requests. This includes conditional, unconditional, successful, and unsuccessful requests. Valid value is an integer in the range 0 - 2147483647.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.
Immediate Write I/O The number of synchronous write I/O requests that DB2 issues on behalf of a thread. Valid value is an integer in the range 0 - 2147483647.

List Prefetch The number of list prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of SETW The number of set write requests to write a page out to DASD. Valid value is an integer in the range 0 - 2147483647.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Plan Name The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Sequential Prefetch The number of sequential prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Synchronous Read I/O The number of synchronous read I/O requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

DB2 Thread Exceptions Indicates the type of parallel thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Not a parallel thread</td>
</tr>
<tr>
<td>Parent</td>
<td>Parallel thread is a parent</td>
</tr>
<tr>
<td>Child</td>
<td>Parallel thread is a child</td>
</tr>
<tr>
<td>Autonomous SP</td>
<td>Originating thread who invoked autonomous stored procedures</td>
</tr>
</tbody>
</table>
Unsuccessful Get Page Operation The number of conditional getpage requests that failed. Valid value is an integer in the range 0 - 2147483647.

DB2 Connect Server Workspace:

The DB2 Connect Server workspace provides key information about all active and inactive DB2 Connect gateways.

This workspace is comprised of the following views:

DB2 Connect Server - Key Events (bar chart)
Shows the key events of all active DB2 Connect gateways.

DB2 Connect Server (table view)
Shows key data on all active and inactive DB2 Connect gateways.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Package Statistics Workspace:

The Package Statistics workspace provides information about the size of the data exchanged between the DB2 Connect gateway and the host database and about the network time required.

It enables you to measure the throughput between the host database and the DB2 Connect gateway and gives you a better idea of the database activity and network traffic at the application level.

This workspace is comprised of the following views:

Thread/Application ID (table view)
Identifies the thread and the Database Connection Services (DCS) application.

Outbound Data (table view)
Shows the number of bytes exchanged between the host database and the DB2 Connect gateway during the processing of statements.

Network Time (table view)
Shows how many statements required which network time. The network time is the difference between the host response time and the elapsed execution time for a statement.

Data Sent (table view)
Shows how many packages of a certain size were sent from the DB2 Connect gateway to the host database.

Data Received (table view)
Shows many packages of a certain size were sent from the host database to the DB2 Connect gateway.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 Connect/Gateway Statistics Workspace:**

The DB2 Connect/Gateway Statistics workspace provides statistics about the selected DB2 Connect gateway, including details about the number of agents and pooled agents, the connections waiting for the host to reply, and the connections waiting for the client to send a request.

This workspace is comprised of the following views:

**DB2 Connect Server - Key Events (bar chart)**

Shows the key events of the selected DB2 Connect gateway.

**DB2 Connect Server - High Water Mark (bar chart)**

Shows key high water marks with regard to agents.

**DB2 Connect Information (table view)**

Shows key data on the selected DB2 Connect gateway.

**DB2 Connect Agents (table view)**

Provides information about the agents.

**Connections (table view)**

Provides information about the connections.

**Sorts/Memory (table view)**

Shows the total number of allocated pages of sort heap space for all sorts at the level chosen and at the time the snapshot was taken.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 Connect Server Package Statistics Workspace:**

The Package Statistics workspace provides statistics about the packages that were received at the selected DB2 Connect gateway.

This workspace is comprised of the following views:

**DB2 Connect Server - Package Network Time (bar chart)**

Shows the network time and the average network time required for processing a sample SQL statement. The network time is the difference between the host response time and the elapsed execution time for a statement.

**DB2 Connect Information (table view)**

Shows key information about the selected DB2 Connect gateway.

**Package Statistics (table view)**

Provides details on the packages received at the DB2 Connect gateway.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 Connect Server Package Attributes:**
Use DB2 Connect Server Package attributes to create situations that will alert you when the package network time is too high.

**Average Network Time** The result of the value for the Network time counter divided by the number of SQL chains being transferred.

**Average Request Size Outbound** The number of bytes sent by the DB2 Connect gateway to the host database, excluding communication protocol overhead, divided by the number of SQL chains being transferred.

**Average Response Size Outbound** The number of bytes received by the DB2 Connect gateway from the host database, excluding communication protocol overhead, divided by the number of SQL chains being transferred.

**DB2 Subsystem Identifier** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**IP Address** The current IP address.

**MVSID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.

This information can be useful if you are saving your monitor output in a file or database for later analysis and you need to differentiate the data from different database server nodes. This node name is determined based on the NNAME configuration parameter.

**Node Number** The number assigned to the node in the file with filename db2nodes and file type cfg. (db2nodes.cfg).

**Network Time** The difference between the value for the Times for sample SQL statement - Total statement time counter and the value of the Times for sample SQL statement - Time on DB2 host counter. Both counters are on the Performance page.

**Originating System ID** The managed system name of the agent. It is alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Parent Database Name** The name of the remote database to which the remote application is connected.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken.

If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information
can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Server Product Version ID** The product and version that is running on the server in the form pppvrrrm.

In this case, pppvrrrm represents:
- **ppp** stands for SQL
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level

**Server Status** Shows whether the server is active or inactive.

**Server Version** The version of the server returning the information.

**Statement Group** The number of statements with outbound bytes.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced from Greenwich Mean Time (GMT).

**DB2 Connect Server at Thread Level Workspace:**

The DB2 Connect Server at Thread Level workspace provides summary information about the Database Connection Services (DCS) application related to this thread.

This workspace is comprised of the following views:

**Application Time (bar chart)**
Shows the elapsed execution time of the unit of work that was completed most recently. It indicates the time that it takes for units of work to complete.

**Thread/Application ID (table view)**
Identifies the thread and the DCS application.

**DB2 Connect Server Information (table view)**
Shows key data on the DCS application.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 Connect Server at Thread Level Overview Attributes:**
Use the DB2 Connect Server at Thread Level attributes to create situations to monitor connected gateways of a DB2 subsystem.

**Ace Address** The DB2 thread ACE address for internal use.

**Application Agent ID** The system-wide unique ID for the application. On a single-partitioned database, this ID consists of a 16-bit counter. On a
multi-partitioned database, it consists of the coordinating partition number concatenated with a 16-bit counter. In addition, it is the same on every partition where the application might make a secondary connection.

**Application ID** The ID that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database.

It is known at both the client and the server, so you can use it to correlate the client and server parts of the application. For DDCS applications, you will also need to use the **Outbound Application ID** to correlate the client and server parts of the application. This ID is unique across the network. There are different formats for the application ID, which are dependent on the communication protocol between the client and the server machine on which the database manager, the DDCS, or both, are running. Each of the formats consists of three parts separated by periods.

<table>

<td>*NETBIOS.nname. Application instance</td>
<td>*NETBIOS.SBOIVIN. 930131214645</td>
<td>For nonpartitioned database systems, a NetBIOS application ID is made up by concatenating the string *NETBIOS, the NNAME defined in the database configuration file for the client, and a unique ID for the instance of this application. For partitioned database systems, a NetBIOS application ID is made up by concatenating the string N xxx.etc where xxx is the partition the application is attached to.</td>
</tr>
<tr>
<td>Local applications</td>
<td>*LOCAL.DB2 instance.Application instance</td>
<td>*LOCAL.DB2INST1. 930131235945</td>
<td>The application ID generated for a local application is made up by concatenating the string *LOCAL, the name of the DB2 instance, and a unique ID for the instance of this application.</td>
</tr>
</tbody>
</table>

**Application Idle Time** The number of seconds since an application issued any requests to the server. This includes applications that have not terminated a transaction, for example, not issued a commit or rollback. You can use this information to implement applications that force users that have been idle for a specified number of seconds.

**Application Name** The name of the application running at the client as known to the database manager or DB2 Connect. Together with the **Application ID** counter, it can be used to relate data items with your application.

**Application Status Change Time** The date and time the application entered its current status. This counter allows you to determine how long an application has been in its current status. If it has been in the same status for a long period of time, this can indicate a problem.

**Authorization ID** Shows the authorization ID of the user who invoked the application that is being monitored. On a DB2 Connect gateway node, this is the authorization ID of the user on the host.

**Authorization ID** The authorization ID.

**Authid (Unicode)** The authorization ID.
**Client Communication Protocol** The communication protocol that the client application is using to communicate with the server. You can use this counter for problem determination on remote applications.

Valid values for this counter are:
- API Constant Communication Protocol
- SQLM_PROT_UNKNOWN (Note 1)
- SQLM_PROT_LOCAL none (Note 2)
- SQLM_PROT_APPC APPC
- SQLM_PROT_TCPIP TCP/IP
- SQLM_PROT_IPXSPX IPX/SPX
- SQLM_PROT_NETBIOS NETBIOS

**Note:** The client is communicating using an unknown protocol. This value is only returned if future clients connect with a down-level server. The client is running on the same node as the server and no communications protocol is in use.

**Client Operating Platform** The operating system on which the client application is running. You can use this counter for problem determination on remote applications.

**Client Process ID** The process ID of the client application that made the connection to the database. You can use this counter to correlate monitor information such as CPU and I/O time to your client application. In the case of a DRDA-AS connection, this counter is set to 0.

**Client Product Version ID** The product and version that is running on the client. You can use this counter to identify the product and code version of the database client. It is in the form pppvvvrmm, where:
- **ppp** stands for SQL
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level

**Code Page Used by Application** The code page ID. For snapshot monitor data, this is the code page at the partition where the monitored application started. This ID can be used for problem determination for remote applications. You can use this information to ensure that data conversion is supported between the application code page and the database code page or, for DRDA host databases, the host coded character set ID (CCSID). For event monitor data, this is the code page of the database for which event data is collected. You can use this counter to determine whether your event monitor application is running under a different code page from that used by the database. Data written by the event monitor uses the database code page. If your event monitor application uses a different code page, you might need to perform some character conversion to make the data readable.

**Commit Statements Attempted** The total number of SQL COMMIT statements that have been attempted.
A small change rate in this counter during the monitor period can indicate that applications do not commit frequently, which can lead to problems with logging and data concurrency. You can also use this counter to calculate the total number of units of work by calculating the sum of the following:

\[
\text{(Commit statements attempted)} + \text{(Internal commits)} + \text{(Rollback statements attempted)} + \text{(Internal rollbacks)}
\]

**Configuration Name of Client**

The NNAME in the database manager configuration file at the client node. You can use this counter to identify the client node that is running the application.

**DB2 Connect Server at Thread Level Overview Attributes**

Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Corrid**

The correlation ID.

**Database Alias at the Gateway**

The alias used at the DB2 Connect gateway to connect to the host database. Use this counter for problem determination on DCS applications.

**DB2 Connect First Connect**

The date and time at which the first connection to the host database was initiated from the DB2 Connect gateway. Use this counter for problem determination on DCS applications.

**DB2 ID**

The DB2 subsystem ID.

**DCS Application Status**

The current status of the application. It can help you diagnose potential application problems.

**DCS Database Name**

The name of the remote database as cataloged in the DCS directory. Use this counter for problem determination on DCS applications.

**Elapsed Time DB2CONN Execution**

Shows the time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement. Use this counter to determine what portion of the overall processing time is due to DB2 Connect gateway processing.

**Failed Statement Percentage**

The number of statements that were attempted, but failed.

**Failed Statements Operations**

The number of SQL statements that were attempted, but failed.

You can use this counter to calculate the total number of successful SQL statements at the database or application level:

\[
\text{(Dynamic SQL statements attempted)} + \text{(Static SQL statements attempted)} - \text{(Failed statement operations)}
\]

This count includes all SQL statements that received a negative SQLCODE. This counter might also help you determine the reasons for poor performance because failed statements mean time wasted by the database manager and, as a result, lower throughput for the database.

**Gateway Snapshot Time**

The date and time at which the database system monitor information was collected.
Host Coded Character Set ID The coded character set ID (CCSID) of the host database. Use this counter for problem determination on DCS applications.

Host Database Name The real name of the host database for which information is being collected or to which the application is connected. This is the name that was given to the database when it was created. Use this counter for problem determination on DCS applications.

Host Product Version ID The product and version that is running on the server.

This counter is used to identify the product and code version of the DRDA host database product. It is in the form pppvvvrrm, where:

- **ppp** identifies the host DRDA product:
  - ARI for DB2 for VSE & VM
  - DSN for DB2 for OS/390 and z/OS
  - QSQ for DB2 UDB for AS/400
  - SQL for other DB2 products
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level

Inbound Bytes Received The number of bytes received (measured in 1000-byte increments) by the DB2 Connect gateway from the client, excluding communication protocol overhead (for example, TCP/IP or SNA headers). Use this counter to measure the throughput from the client to the DB2 Connect gateway.

Inbound Communication Address The communication address of the client. For example, it could be an SNA net ID and Logical Unit partner name, or an IP address and port number for TCP/IP. Use this counter for problem determination on DCS applications.

IP Address The current IP address.

Last Reset Timestamp The date and time that the monitor counters were reset for the application issuing the GET SNAPSHOT. You can use this counter to determine the scope of information returned by the database system monitor. If the database manager counters have never been reset, the value for this counter is zero. The database manager counters is only reset if you reset all active databases.

Most Recent Unit of Work Elapsed Time The elapsed execution time of the most recently completed unit of work. It indicates time that it takes for units of work to complete.

MVSID The MVS system identifier.

Name The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

Number of Open Cursors The number of cursors currently open for an application. Use this counter to assess how much memory is being allocated. The amount of memory allocated by the DB2 client, DB2 Connect, or the database agent on the target database is related to the number of cursors that are currently
open. Knowing this information can help with capacity planning. For example, each open cursor that is blocking has a buffer size as specified by the RQROBLK database manager configuration parameter. If DEFERRED_PREPARE is enabled, two buffers are allocated.

**Number of SQL Statements Attempted** The number of SQL statements that have been attempted since the latter of: application startup, database activation, or last reset. For a data transmission, this is the number of SQL statements that have been attempted against this DCS database or in this DCS application since the database was activated, the connection to it was established by the application, or RESET MONITOR was issued against the database, and that used this number of data transmissions between the DB2 Connect gateway and the host during statement processing. Use this counter to measure the database activity for a database or application. To calculate the SQL statement throughput for a given period, you can divide this counter by the elapsed time between two snapshots. For a data transmission, use this counter to get statistics on how many statements used two, three, four, etc. data transmissions during their processing. At least two data transmissions are necessary to process a statement: a send and a receive. These statistics can give you a better idea of the database or application activity and network traffic for a database or an application.

**Number of Transmissions** The number of data transmissions between the DB2 Connect gateway and the host that was used to process this DCS statement. (One data transmission consists of one send or one receive.)

Use this counter to get a better understanding of the reasons why a particular statement took longer to execute. For example, a query returning a large result set might need many data transmissions to complete.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Outbound Application ID** This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway.

You can use this counter in conjunction with the Application ID counter to correlate the client and server parts of the application information. This ID is unique across the network.
<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network.Logical Unit Name.Application instance</td>
<td>CAIBMTOR.OSFDBM0.93013194520</td>
<td>Application ID is the displayable format of an actual SNA LUWID (logical unit-of-work ID) that flows on the network when an APPC conversation is allocated. APPC-generated application IDs are made up by concatenating the network name, the Logical Unit name, and the LUWID instance number, which creates a unique label for the client/server application. The network name and Logical Unit name can each be a maximum of 8 characters. The application instance corresponds to the 12-decimal-character LUWID instance number.</td>
</tr>
</tbody>
</table>

**Outbound Application ID Internal** The interval for the Outbound Application ID.

**Outbound Communication Address** The communication address of the target database. For example, it could be an SNA net ID and Logical Unit partner name, or an IP address and port number for TCP/IP. Use this counter for problem determination on DCS applications.

**Outbound Communication Protocol** The communication protocol used between the DB2 Connect gateway and the host. Use this counter for problem determination on DCS applications.

Valid values are:

- `SQLM_PROT_APPC`
- `SQLM_PROT_TCP/IP`

**Outbound Sequence Number** Reserved for future use. In this release, its value will is always 0001. It can contain different values in future releases of the product.

**Previous Unit of Work Completion Timestamp** The time when the previous unit of work was completed.

You can use this counter with the **Overall transaction data - Unit of work stop timestamp** counter to calculate the total elapsed time between COMMIT or ROLLBACK points, and with the **Overall transaction data - Unit of work start timestamp** counter to calculate the time spent in the application between units of work:

- For applications currently within a unit of work, this is the time at which the latest unit of work completed.
- For applications not currently within a unit of work (the application has completed a unit of work, but not yet started a new one), this is the stop time of...
the last unit of work that completed prior to the one that just completed. The stop time of the one just completed is indicated by the **Overall transaction data**

- **Unit of work stop timestamp** counter.

- For applications within their first unit of work, this is the database connection request completion time.

**Plan** The plan name.

**Rollback Statements Attempted** The total number of SQL ROLLBACK statements that have been attempted.

A ROLLBACK can result from an application request, a DEADLOCK, or an error situation. This counter only includes the number of ROLLBACK statements issued from applications. For an application, this counter can help you determine the level of database activity for the application and the amount of conflict with other applications. For a database, it can help you determine the amount of activity in the database and the amount of conflict between applications running on the database.

**Note:** Try to minimize the number of rollbacks because higher rollback activity results in lower throughput for the database.

You can also use this counter to calculate the total number of units of work, by calculating the sum of the following:

(Commit statements attempted) + (Internal commits) + (Rollback statements attempted) + (Internal rollbacks)

**Row Selected** The number of rows that have been selected and returned to the application.

You can use this counter to gain insight into the current level of activity within the database. This counter does not include a count of rows read for actions, such as COUNT(*) or joins. For a federated system you can calculate the average time to return a row to the federated server from the data source:

\[
\text{average time} = \frac{\text{rows returned}}{\text{aggregate query response time}}
\]

You can use these results to modify CPU speed or communication speed parameters in =SYSCAT.SERV. Modifying these parameters can impact whether the optimizer does or does not send requests to the data source.

**Sequence Number** Is incremented whenever a unit of work ends, that is, when a COMMIT or ROLLBACK terminates a unit of work.

Together with the **Application ID** counter, this counter uniquely identifies a transaction.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken. If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Time Stamp** The start time of this interval.
**Transaction ID** The unique transaction ID across all databases generated by a transaction manager in a two-phase commit transaction.

You can use this ID to correlate the transaction generated by the transaction manager with the transactions executed against multiple databases. In addition, it can help you diagnose transaction manager problems by tying database transactions that involve a two-phase commit protocol with the transactions that are originated by the transaction manager.

**Total Inbound Bytes Sent** The number of bytes (measured in 1000-byte increments) sent by the DB2 Connect gateway to the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers. Use this counter to measure the throughput from the DB2 Connect gateway to the client.

**Total Host Response Time** For a DCS statement, this is the elapsed time between the time that the statement was sent from the DB2 Connect gateway to the host for processing and the time when the result was received from the host.

For a DCS database or DCS application, it is the sum of the elapsed times for all the statements that were executed for a particular database or application. For a data transmission, this is the sum of host response times for all the statements that used this many data transmissions. Use this counter with the Overall transaction data - Total outbound bytes sent and Overall transaction data - Total out bytes received counters to calculate the outbound response time (transfer rate):

\[
\frac{(\text{Total outbound bytes sent}) + (\text{Total out bytes received})}{\text{Total host response time}}
\]

**Total Outbound Bytes Received** The number of bytes (measured in 1000-byte increments) received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes received by the DB2 Connect gateway from the host during the processing of all the statements that used this number of data transmissions. Use this counter to measure the throughput from the host databases to the DB2 Connect gateway.

**Total Outbound Bytes Sent** The number of bytes sent (measured in 1000-byte increments) by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes sent by the DB2 Connect gateway to the host during the processing of all the statements that used this number of data transmissions. Use this counter to measure the throughput from the DB2 Connect gateway to the host database.

**Total Statement Execution Elapsed Time** For a DCS statement, this is the elapsed time spent processing an SQL request on a host database server. This value is reported by this server. In contrast to the Overall transaction data - Total host response time counter, this counter does not include the network elapsed time between DB2 Connect and the host database server. At other levels, this value represents the sum of the host execution times for all the statements that were executed for a particular database or application, or for those statements that used a given number of data transmissions. Use this counter, along with other elapsed time monitor elements, to evaluate the processing of SQL requests by the database server and to help isolate performance issues. Subtract the value for this counter from the value for the Overall transaction data - Total host response time counter to calculate the network elapsed time between DB2 Connect and the host database server.
Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Unit of Work Completion Status The status of the unit of work and how it stopped.

You can use this counter to determine if the unit of work ended due to a DEADLOCK or abnormal termination. It can be:
- Committed due to a commit statement
- Rolled back due to a rollback statement
- Rolled back due to a deadlock
- Rolled back due to an abnormal termination
- Committed at normal application termination
- Unknown as a result of a FLUSH EVENT MONITOR command for which units of work were in progress

Note: API users should refer to the sqlmon.h header file containing definitions of database system monitor constants.

Unit of Work Start Timestamp The date and time at which the unit of work first required database resources.

This resource requirement occurs at the first SQL statement execution of that unit of work:
- For the first unit of work, it is the time of the first database request (SQL statement execution) after the date and time that a connection request was granted.
- For subsequent units of work, it is the time of the first database request (SQL statement execution) after the previous COMMIT or ROLLBACK.

The database system monitor excludes the time spent between the COMMIT/ROLLBACK and the next SQL statement from its definition of a unit of work. This measurement method reflects the time spent by the database manager in processing database requests, separate from the time spent in the application before the first SQL statement of that unit of work. The unit-of-work elapsed time does include the time spent running the application between SQL statements within the unit of work. You can use this counter with the Overall transaction data - Unit of work stop timestamp counter to calculate the total elapsed time of the unit of work and with the Overall transaction data - Previous Unit of Work completion timestamp counter to calculate the time spent in the application between units of work. You can use the Overall transaction data - Unit of work stop timestamp and Overall transaction data - Previous Unit of Work completion timestamp counters to calculate the elapsed time for a unit of work.

Unit of Work Stop Timestamp The date and time at which the most recent unit of work completed, which occurs when database changes are committed or rolled back.

You can use this counter with the Overall transaction data - Previous Unit of Work completion timestamp counter to calculate the total elapsed time between COMMIT or ROLLBACK points, and with the Overall transaction data - Unit of
**work start timestamp** counter to calculate the elapsed time of the latest unit of work. The timestamp contents are set as follows:

- When the application has completed a unit of work and has not yet started a new one (as defined by the **Overall transaction data - Unit of work start timestamp** counter). This counter is a valid, nonzero timestamp.
- When the application is currently executing a unit of work, this counter contains zeros.
- When the application first connects to the database, this counter is set to the connection completion time.

As a new unit of work is started, the contents of this counter are moved to the **Overall transaction data - Previous Unit of Work completion timestamp** counter.

**User Login ID** Shows the ID that the user specified when logging in to the operating system. This ID differs from authorization ID, which the user specifies when connecting to the database. You can use this counter to determine the operating system user ID of the individual running the application that you are monitoring.

**DB2 Messages Workspace:**

The DB2 Messages workspace displays messages that can help you identify problems with your DB2 system.

This workspace is comprised of the following views:

**Critical DB2 Messages (table view)**
Displays all critical DB2 messages and warning DB2 messages. Critical messages are highlighted in red and warning messages are highlighted in yellow.

**Last 10 DB2 Messages (table view)**
Displays the ten most recent DB2 messages. Critical messages are highlighted in red and warning messages are highlighted in yellow.

**Note:** Not all messages are written to the message log. DISPLAY commands, for example, are filtered out and are not shown in the log.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Note:** By default DB2 messages are not collected. If you want to collect DB2 messages, use the Configuration Tool and select: Monitoring Profile configuration --> Additional configuration settings. If you configure it to YES, the DB2 message subtask is started during DB2 instance initialization.

To start or stop DB2 message collection manually, specify the following:

F <ccccccccc>,F PESERVER,F<db2>,DB2MSGMON=<p>

where:

- **ccccccccc** Identifies the OMEGAMON Collector started task name.
- **db2** Identifies the DB2 name.
- **p** Enter Y to start or N to stop the message subtask.
If you do not see any DB2 messages, check if the DB2 message subtask is started from the OMEGAMON Collector started task.

You can link to the following workspaces from the DB2 Messages workspace:

- Critical DB2 Messages by Message ID
- DB2 Messages by Time Interval
- DB2 Messages by Message ID

DB2 Messages by Message ID Workspace:

The DB2 Messages by Message ID workspace displays DB2 messages sorted by message identification number.

This workspace is comprised of the following views:

DB2 Messages by Message ID (table view)

Reports when the message was generated, the message identification number, and the message text.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following workspaces from the DB2 Messages by Message ID workspace:

- DB2 Messages
- DB2 Messages by Time Interval

DB2 Messages by Time Interval Workspace:

The DB2 Messages by Time Interval workspace displays DB2 messages sorted by time. The most recent messages are at the top of the list.

This workspace is comprised of the following views:

DB2 Messages by Time Interval (table view)

Reports when the message was generated, the message identification number, and the message text.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following workspaces from the DB2 Messages by Time Interval workspace:

- DB2 Messages
- DB2 Messages by Message ID

DBAT End-to-End SQL Monitoring Workspace:

The DBAT End-to-End SQL Monitoring workspace provides summarized performance information about DDF (Distributed Data Facility) thread activity. From here you can launch to the Extended Insight Analysis Dashboard, which collects the various SQL statement executions and shows them in an aggregated view.
This workspace is comprised of the following views:

**DDF DB Access Thread CPU% (bar chart)**
Shows the percentage of CPU that is used by distributed database access threads, which are server threads responding to SQL requests from a remote DB2 location.

**DDF DB Access Thread In-DB2 CP CPU Time (bar chart)**
Shows the class 2 CPU time (in DB2) that is used by distributed database access threads.

**Distributed Database Access Thread Connection Summary (table view)**
Provides the distributed database access threads connection summary.
Click the *End-to-End SQL Monitoring* link to launch to the *Extended Insight Analysis Dashboard*.

**Distributed Database Access Thread Summary (table view)**
Provides key data to identify which distributed database access threads use resources excessively.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**DB2 SRM Subsystem Attributes:**
Use the DB2 SRM Subsystem attributes to create situations to monitor workload related information associated with a DB2 subsystem.

**Abends EOM Rate** The number of abends per second because an End of Memory (EOM) condition was detected over the last sampling period.

**Abends EOT Rate** The number of abends per second because an End of Task (EOT) condition was detected over the last sampling period.

**Abort Rate** The number of abort requests per second over the last sampling period.
Background Limit The system limit on background connections.

Background Utilization The percentage of available threads being used for background connections. Valid entry ranges from 0.0 to 100.0.

CONDBAT The maximum number of concurrent remote connections of Database Access Threads (DBATs) defined in DSNZPARM (Field name: QWP1CDB). When this limit is reached, any new connection request is rejected. Valid entry is an integer.

Commit Rate The number of commits per second over the last sampling period.

Create Thread Wait Rate The number of Create Thread requests per second that had to wait over the last sampling period.

Create Threads Rate The number of threads created per second over the last sampling period.

CTHREAD HWM The highest number of batch CICS, IMS, and TSO tasks.

Current Background The current number of background connections.

Current DBAT The current number of active DBATs.

Current Foreground The current number of foreground connections.

Current Threads The current number of active threads; Database Access threads are not included.

DBAT Conn HWM The number of high water mark remote connections (Field name: QDSTHWDT).

DBAT Conn Utilization The percentage of remote connections (CONDBAT) (derived field: SDBATCUT). The value is calculated as follows: DBAT connection * 100 / QWP1CDB

DBAT Connection The current number of remote connections for both, active and inactive connections (derived field: SDBATCON).

The value of active connections is calculated as follows: QDSTCNAT - QDSTNADS (active DBATs - disconnected DBATs)

The value of inactive connections is calculated as follows: QDSTQCIT + QDSTCIN2 (type1 inactive DBATs + type2 inactive DBATs)

DBAT Utilization The number of Database Access Threads (DBATs) in use is approaching the maximum number of DBATs defined by the MAXDBAT parameter in DSNZPARM.

Delta Abends EOM The number of abends detected because an End of Memory during the last sampling period.

Delta Abends EOT The number of abends detected because End of Task during the last sampling period.

Delta Aborts The number of abort requests during the last sampling period.

</table>
MAXDBAT The number of maximum DBATs defined in DSNZPARM.

MAXDBAT HWM The maximum number of active and disconnected (pooled) DBATs that existed (field name: QDSTHWAT). This value is a high-water mark for QDSTCNAT.

Max Threads Allowed The total number of concurrent threads allowed.

OPM IP ADDR The host name or IP address of the IBM Optim Performance manager Web console.

OPM Port The port number of the IBM Optim Performance Web console.

OPM HTTP The HTTP or HTTPS for internal use only.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Phase1 Commit Rate The number of phase 1 commits per second over the last sampling period.

Phase2 Commit Rate The number of phase 2 commits per second over the last sampling period.

Read Only Commit Rate The number of read only commits per second over the last sampling period.

Sign-on Rate The number of sign-on requests per second over the last sampling period.

Single Phase Commit Rate The number of single phase commits per second over the last sampling period.

Terminate Thread Rate The number of Terminate Thread requests per second over the last sampling period.

Thread Utilization The percentage of available threads being used; this percentage is calculated as Current Threads/CTHREAD parameter in DSNZPARM *100; Database Access threads are not included. Valid entry ranges from 0.0 to 100.0.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond
Total Abends EOM The total number of abends detected because End of Memory.

Total Abends EOT The total number of abends detected because End of Task.

Total Aborts The total number of abort requests.

Total Commits The total number of commit requests.

Total Create Thread Wait The total number of times a Create Thread operation has to wait.

Total Create Threads The total number of threads created.

Total Identify The total number of Identify requests.

Total In Doubt The total number of Unit of Recovery threads that went in doubt.

Total In Doubt Resolve The total number of Unit of Recovery threads that were in doubt that were resolved.

Total Phase1 Commits The total number of phase 1 commits.

Total Phase2 Commits The total number of phase 2 commits.

Total Read Only Commits The total number of read only commits.

Total Sign-on The total number of sign-on requests.

Total Single Phase Commits The total number of single phase commits.

Total Terminate Thread The total number of thread terminations.

DDF Conversations Workspace:

The DDF Conversations workspace presents conversation (connection between two transaction programs) information.

This workspace is comprised of the following view:

DDF Conversations (table view)

Lists conversation details, including IDs, counts, and maximums.

Note: This workspace is available only when the DB2 system is configured to use the distributed data facility.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 DDF CONV Attributes:

Use the DB2 DDF CONV attributes to create situations to monitor conversation (connection between two transaction programs) information.

Conversation LOGMODE The conversation ID (LOGMODE Name). It is an alphanumeric text string, with a maximum length of eight characters.
**Conversation LUNAME** The conversation ID (LUNAME Name). It is an alphanumeric text string, with a maximum length of eight characters.

**Conversation Utilization** The percentage of maximum conversations that is currently in use. Valid entry ranges from 0.0 to 100.0.

**Conversation Waits** The count of processes waiting because the conversation limit has been reached.

**Conversations In Use** The current count of conversations.

**Conversations Max** The maximum number of concurrent conversations allowed as derived from CNOS.

**Conversations Other Limit** The maximum number of concurrent conversations defined in CDB.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 118031506450100 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**DDF Statistics Workspace:**

The DDF Statistics workspace monitors Distributed Database Facility (DDF) statistics, including send and receive counts.

This workspace is comprised of the following views:

**Send/Receive Counts (bar chart)**
- Shows "at a glance" counts of SQL calls, messages, and transactions (received and sent).

**Distributed Thread Statistics (table view)**
- Lists activity data associated with the DDF.

**Note:** This workspace is available for any thread defined as an allied-distributed thread.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DB2 DDF Attributes:
Use the DB2 DDF attributes to create situations to monitor Distributed Database Facility statistics.

Aborts Received The number of aborts received from remote location.

Aborts Sent The number of aborts sent to remote location.

Agent Elapsed Time The elapsed time at the local site spent processing for the remote site (in units that represent tenths of seconds).

Block Mode Switches The count of block mode switches performed.

Blocks Received The blocks received from remote location.

Blocks Sent The blocks sent to remote location.

Commits Received The number of commits received from remote location.

Commits Sent The number of commits sent to remote location.

Conversations Initiated Local The number of conversations initiated by local side of connection.

Conversations Initiated Remote The number of conversations initiated by remote side of connection.

Conversations Allocated The conversations allocated.

Conversations Deallocated The conversations deallocated.

Conversations Queued The number of conversations queued.

Coordinator Backouts Received The number of backout requests received from coordinator (2-phase commit only).

Coordinator Backouts Sent The number of backout requests sent to the coordinator (2-phase commit only).

Coordinator Commits Received The number of commit requests received from coordinator (2-phase commit only).

Coordinator Commits Sent The number of commit requests sent to the coordinator (2-phase commit only).

Coordinator Forgets Sent The number of forget response requests sent to the coordinator (2-phase commit only).

Data Bytes Received The number of data bytes received from the remote location.

Data Bytes Sent The number of data bytes sent to the remote location.

Data Rows Received The number of data rows received from the remote location.

Data Rows Sent The number of data rows sent to the remote location.
**DB Access CPU Time** The database access agent CPU time at the remote site (in units that represent milliseconds).

**Directed Access** The type of directed access.

**Elapsed DB Access** The elapsed database access agent time at the remote site (in units that represent tenths of seconds).

**Interval Time** The number of seconds since last sample (in units that represent seconds).

**Last Agent Request Received** The number of last agent requests received from initiator (2-phase commit only).

**Last Agent Request Sent** The number of last agent requests sent to coordinator (2-phase commit only).

**Local Elapsed Time** The elapsed time, in tenths of a second, for local thread (in units that represent tenths of seconds).

**Maximum Conversations** The maximum conversations allowed.

**Message Buffer Rows** The message buffer rows.

**Messages Received** The number of messages received from remote location.

**Messages Sent** The number of messages sent to remote location.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Participant Backouts Received** The number of backout requests received from participant (2-phase commit only).

**Participant Backouts Sent** The number of backout requests sent to the participant (2-phase commit only).

**Participant Commits Received** The number of commit requests received from participant (2-phase commit only).

**Participant Commits Sent** The number of commit requests sent to the participant (2-phase commit only).

**Participant Forgets Received** The number of forget requests received from participant (2-phase commit only).

**Prepare Requests Received** The number of prepare requests received from participant (2-phase commit only).

**Prepare Requests Sent** The number of prepare requests sent to participant (2-phase commit only).

**Protocol Used** The protocol used for this conversation. It is an alphanumeric text string, with a maximum length of 12 characters.
Remote Binds The binds from remote access.

Remote Commit Operations The number of commit operations performed with the remote location as COORD.

Remote CPU Time The CPU time for remote system in milliseconds (in units that represent milliseconds).

Remote Elapsed Time The elapsed time for remote thread in tenths of a second (in units that represent tenths of seconds).

Remote In Doubt Threads The number of threads that went in doubt with the remote location as COORD.

Remote Location Name The name of the remote system to which this thread is connected. It is an alphanumeric text string, with a maximum length of 12 characters.

Remote Logical Unit Name The LUNAME of the connection to the remote DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

Remote Product ID The remote product ID. It is an alphanumeric text string, with a maximum length of eight characters.

Remote Rollback Operations The number of rollback operations performed with the remote location as COORD.

SQL Calls Received The number of SQL calls received from the remote location.

SQL Calls Sent The number of SQL calls made to the remote location.

Thread Token The attribute that ties this entry to the owning thread by using the thread token as a foreign key.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

Transactions Received The number of Transactions received from remote location.

Transactions Sent The number of transactions sent to remote location.
Detailed Thread Exception Workspace:

The Detailed Thread Exception workspace provides a detailed view of threads and thread exceptions connected to DB2.

This workspace is comprised of the following views:

**Locks owned (bar chart)**
Provides information about the number of locks owned by an individual thread.

**Detailed Thread Exceptions (table view)**
Lists “status” data for the activity of individual threads.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace”
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**DB2 Thread Exceptions Attributes:**
Use the DB2 Thread Exceptions attributes to create situations to monitor thread-related performance.

**Ace Address** The DB2 thread ACE address for internal use.

**Archive Tape Wait** True if waiting for a tape for an archive operation. It is an alphanumeric text string, with a maximum length of one character.

**Asynchronous Page Reads** The number of asynchronous page reads for prefetch. Valid value is an integer in the range 0 - 2147483647.

**Authorization ID** The authorization ID of the thread. It is an alphanumeric text string, with a maximum length of eight characters.

**Authorization ID (Unicode)** The authorization ID of the thread. It is an alphanumeric text string, with a maximum length of eight characters.
**Begin Time** Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and IMS wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

**Cancel Command** The command string needed to cancel a thread. It is an alphanumeric text string, with a maximum length of eight characters.

**CICS MVS ID** The MVS identifier used for CICS dynamic workspace linking.

**Collection ID** The collection ID.

**Collection ID (Unicode)** The collection ID.

**Commit Count** The number of times the thread successfully completed commit processing. DB2 resets the commit count at Create Thread and Signon. If Signon is not driven, the count is cumulative.

**Commit Ratio** The ratio of total system page updates to total commits.

**Connection ID** Identifies the connection of an application to a DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

**Connection Type** The type of thread connection.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application_Directed</td>
<td>Application directed access</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DB2_CALL_ATTACH</td>
<td>DB2 call attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>DISTRIBUTED</td>
<td>Distributed thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>IMS</td>
<td>IMS thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The correlation ID for this thread. It is an alphanumeric text string, with a maximum length of 12 characters.
**CPU Utilization** The rate of CPU consumption during last interval.

**CP CPU Time** The total amount of central processor CPU time that DB2 has accumulated for a thread.

**CP DB2 CPU Used** The CP CPU time accumulated in DB2 when the SQL statement exit from DB2.

**DB2 Elapsed Time** The elapsed time accumulated in DB2 when the SQL statement exit from DB2.

**DB2 ID** The name of the DB2 system on which this thread is running. It is an alphanumeric text string, with a maximum length of four characters.

**Display CPU Time** The total amount of CPU time that DB2 has accumulated for a thread.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

Valid format is DD-HH:MM:SS, where:
- D = Day
- H = Hour
- M = Minute
- S = Second

For example, 00-20:16:18 indicates that the display elapsed time is 20 hours, 16 minutes, and 18 seconds.

**Display Wait Time** The total amount of thread wait time. The collection of thread wait time requires activation of Accounting Class 2 in the monitored DB2 subsystem.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
• D = Day
• H = Hour
• M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Distributed Bytes Received** The amount of data received by distributed threads from remote DB2.

**Distributed Bytes Received 64** The amount of data received by distributed threads from remote DB2. It has a length of 64 bit to resolve overflow problems.

**Distributed Bytes Sent** The amount of data sent by distributed threads to remote DB2.

**Distributed Bytes Sent 64** The amount of data sent by distributed threads to remote DB2. It has a length of 64 bit to resolve overflow problems.

**Distributed CPU Seconds** The amount of CPU time being used by a distributed DB access thread (in units that represent milliseconds).

**Dynamic Prefetch** The number of dynamic prefetch requests. Valid value is an integer in the range 0 - 2147483647.

**Elapsed Time** The elapsed time for a DB2 thread (in units that represent seconds).

**Getpage Count** The number of get page operations for this thread during the last interval.

**Getpage Ratio** The number of Get pages divided by the Read I/O count.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Immediate Write I/O** The number of synchronous write I/O requests that DB2 issues on behalf of a thread. Valid value is an integer in the range 0 - 2147483647.

**In-DB2 IIP CPU Time** The IIP CPU time consumed when executing in DB2.

**In Doubt** If True, the thread is in an INDOUBT status. It is an alphanumeric text string, with a maximum length of one character.

**Interval Time** The amount of time this thread has existed during the last sampling period (in units that represent seconds).

**Job Name** The job name connected to a coupling facility structure. It is an alphanumeric text string with a maximum of 8 characters; for example, IRLM.

**List Prefetch** The number of list prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

**Lock Percentage** The number of locks owned divided by the maximum allowed locks for a thread.

**Locks Max** The maximum number of locks allowed for a single thread.
Locks Owned The number of locks this thread currently owns.

LUWID The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCAC001.02022A.A1FEBE04B9D4=8

Misc Flag Miscellaneous flag. It is an alphanumeric text string, with a maximum length of one character.

MVS System The name of the MVS image where the DB2 system identified by the DB2ID field is running. It is an alphanumeric text string, with a maximum length of four characters.

Name The name of the DB2 thread. It is an alphanumeric text string, with a maximum length of four characters.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package DBRM (Unicode) The package DBRM name.

Package Name The name of the package to which this thread belongs.

Page Update Rate The number of page update requests per second made by a thread.

Plan Name The ID of the plan this thread is executing. It is an alphanumeric text string, with a maximum length of eight characters.

Parent Ace The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.

Prefetch Count The number of sequential, prefetch operations during the interval.

Prefetch Rate The read sequential, prefetch rate.

Read Count The number of read operations during the interval.

Read I/O Rate The thread synchronous read I/O rate.

Resource Count The total resource count.

Resource Limit The limit on number of resources allowed.
**Resource Limit Percent** The resource usage divided by resource limit.

**Sync Read Count** The number of synchronous reads during last interval.

**Thread Connection Type** The type of thread connection.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

</tbody>
</table>

**Thread Create Wait** The application waiting for thread creation. It is an alphanumeric text string, with a maximum length of one character.

**Thread Group Member Name** The name of the member within a data sharing group for a thread.

**Thread Group Name** The name of a data sharing group for a thread. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Thread Status** The description of the current thread status. It is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

**Status** **Description**

NO-T-AVAIL
   The thread is not available.

IN-ABORT
   The thread is in abort processing.

IN-ACCEL
   The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
   The thread is processing an autonomous procedure.
IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call's request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.
WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.
UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Stored Procedure Name The name of the stored procedure that a thread invokes. It is an alphanumeric text string, with a maximum of 18 characters; for example, SPCALC_TAX.
Thread Token The thread token used as foreign key to DDF, also used for the cancel thread command.

Thread Type The type of thread. It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Thread Wait Time The total amount of thread wait time. It is an integer in the range 09 - 99999999 seconds. Note: collection of thread time requires activation of Accounting Class 2 in the Monitored DB2 subsystem.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

Type Indicator Indicates the type of parallel thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Not a parallel thread</td>
</tr>
<tr>
<td>Parent</td>
<td>Parallel thread is a parent</td>
</tr>
<tr>
<td>Child</td>
<td>Parallel thread is a child</td>
</tr>
</tbody>
</table>
KD2_PF_READA_SPMON

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autonomous SP</td>
<td>Originating thread which invoked autonomous stored procedures</td>
</tr>
</tbody>
</table>

**Unsuccessful Get Page Operation** The number of conditional getpage requests that failed. Valid value is an integer in the range 0 - 2147483647.

**Update Count** The number of update operations during last interval.

**Wait Resource** The resource being waited on. It is an alphanumeric text string, with a maximum length of six characters.

**Wait Time** Total class3 wait time for a thread.

**Wait Time Distributed Query** The time distributed allied thread has been waiting for response - remote SQL (in units that represent milliseconds).

**Wait Time Drain Claims** The time thread waiting for drain of claims.

**Wait Time Drain Lock** The time thread waiting for acquisition of drain lock.

**Wait Time Global Lock** The time thread waiting because of global contention.

**Wait Time Log Queue** The time thread waiting for ARCHIVE LOG MODE(QUIESCE).

**Wait Time Procedure** The time thread waiting for a TCB to schedule a stored procedure.

**Wait Time Resource** The time thread waiting for a resource.

**Wait Time Service** The time thread waiting for DB2 Service (in units that represent milliseconds).

**Distributed Allied Thread Summary Workspace:**

The Distributed Allied Thread Summary workspace provides summarized performance information about DDF (Distributed Data Facility) thread activity.

This workspace is comprised of the following views:

**DDF Allied Thread-Remote Elap Time (bar chart)** Shows the remote elapsed time for the distributed allied threads that are used to issue SQL requests to a remote DB2 location.

**DDF Allied Thread-Remote CPU (bar chart)** Shows the remote CPU for distributed allied threads.

**Distributed Allied Thread Summary (table view)** Provides key data to identify which distributed allied threads use resources excessively.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

Distributed Thread Detail Workspace:

The Distributed Thread Detail workspace provides information about the VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

This workspace is comprised of the following views:

**Thread ID (table view)**
Identifies the thread.

**Distributed VTAM APPC Conversations (table view)**
Shows the VTAM APPC conversations data of the thread if the thread is connected through VTAM APPC.

**Distributed TCP/IP Data (table view)**
Shows the TCP/IP data of the thread if the thread is connected through TCP/IP.

**Distributed Remote Location Summary (table view)**
Each row provides a SQL statistics summary for each remote DB2 location with which the thread has communicated, as a requestor or a server.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Distributed Thread Detail Attributes:**
Use the Distributed Thread Detail attributes to create situations that monitor VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

**Aborts Received** The number of rollback requests received from the requesting location (single-phase commit operators only). This value is maintained at the server location.

**Aborts Sent** The number of rollback requests sent to the server location (single-phase commit operations only). This value is maintained at the requesting location.

**Ace Address** The ace address.

**Agent Address** The agent address.

**AGNT ASID** The address space ID (ASID) of the agent.

**Agent TCB Address** The Agent TCB address.

**Allocations Received** The number of create database access thread (DBAT) requests received by the server DBAT from the requester allied agent. This value is maintained by the server DBAT and is always 1.

**Allocations Sent** The number of successful conversation allocations. All allocation attempts, whether successful or not, are counted in QLACCNVS. The difference between QLACCNVS and QLACCNVA can be used to identify a session resource on resource constraint problem.

**Application Directed Access** If using application directed access, this is on.

**Authorization ID** The authorization ID.

**Authorization ID (Unicode)** The authorization ID.

**Backouts Received** The number of backout requests received from the coordinator (two-phase commit operations only).

**Backouts Received from Coordinator** The number of backout responses received from the participant (two-phase commit operations only). This indicates that the participant voted no to the prepare request.

**Backouts Sent** The number of backout requests sent to the participant (two-phase commit operations only).

**Backouts Sent to Coordinator** The number of backout responses sent to the coordinator (two-phase commit operations only). This indicates that the participant voted no to the prepare request.

**Binds** The number of static SQL statements that were bound for remote access (DB2 private protocol only). This value is maintained at the requester location.

**Block Mode Switch Count** The number of times a switch was made from continuous block mode to limited block mode (DB2 private protocol only).
**Blocks Received** The number of blocks received using block fetch. This value is maintained at the requester location.

**Blocks Sent** The number of blocks transmitted using block fetch. This value is maintained at the server location.

**Bytes Received** The number of bytes of data received from the server location. More bytes of data might be sent from the server location than are received by the requester because of the way SQL statements are processed internally.

**Bytes Sent** The number of bytes of data sent to the requester location. This value is maintained at the server location.

**Collection** The package collection ID.

**Collection (Unicode)** The package collection ID.

**Commits Performed** The number of commit operations performed with the remote location as the coordinator (two-phase commit operations only).

**Commits Received** The number of commit requests received from the requester location (single-phase commit operations only). This value is maintained as the server location.

**Commits Received Phase 2** The number of commit requests received from the coordinator (two-phase commit operations only).

**Commits Sent** The number of commit requests sent to the server location (single-phase commit operations only). This value is maintained at the requester location.

**Commits Sent Phase 2** The number of commit requests sent to the participant (two-phase commit operations only).

**Distributed Thread Detail Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Distributed Thread Detail Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>

<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Conversation ID** The conversation ID.

**Conversations Allocated** The number of successful conversation allocations.

**Conversations Deallocated** The number of conversations terminated.

**Conversations Initiated Location** The number of conversations that were initiated from the requester to the server location. This value is updated as the server location.

**Conversations Initiated Thread** The number of conversations that were initiated from the requester location. This value is maintained at the requester.

**Conversations Queued** The number of conversation requests queued by DDF that are waiting for allocation. This value is maintained at the requestor location. If the value is a large number, you might want to increase the limit for the number of conversations. See SE for the number of conversations.

**Conversation Status** The conversation status.

**Correlation ID** The correlation ID.

**DBAT CPU** The database access agent CPU time at the serving location.

**DBAT Elapsed** The elapsed time at the requester. It includes the total of DB2 and network time (DB2 field name: ADDSELRQ).

**DB2 ID** The DB2 subsystem ID.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

**Forgets Received** The number of forget responses received from the participant (two-phase commit operations only). This indicates that the participant was read only.

**Forgets Sent** The number of forget responses sent to the coordinator (two-phase commit operations only). This indicates that the participant was read only.

**From Location** The location from.

**Host Name** The host name.
Interval Start  The start time of this interval.

IP Address  The TCP/IP address (prior to DB2 9).

Last Agents Received  The number of last agent requests received from the initiator (two-phase commit operations only). This counter is incremented when the DB2 server is receiving a last agent request from its upstream partner.

Last Agents Sent  The number of last agent requests sent to the coordinator (two-phase commit operations only).

Last Appc Request  The conversation last appc request issued.

Last Appc Qualifier Used  The conversation last appc qual issued.

Location  The requesting location.

Location (Unicode)  The requesting location.

Logical Unit Name  The conversation Logical Unit name.

Maximum Conversations  The largest number of conversations open at any time.

Message Buffer Rows  The number of rows transmitted in message buffers using block fetch. This field is maintained at both the requester and the server locations.

Messages Received  The number of messages received from the location. More messages might be sent from the server location than are received by the requester because of the way SQL statements are processed internally. This value is maintained internally.

Messages Sent  The number or messages sent to the location. A message, as defined by VTAM, is a group of characters and control IT sequences transferred as an entity. This value is maintained at the location where the messages originated.

MVS ID  The MVS system identifier.

Number In Doubt  The number of threads that became INDOUBTz with the remote location as the coordinator (two-phase commit operations only). This indicates that communication with the coordinator was lost.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package DBRM  The package DBRM name.

Package DBRM (Unicode)  The package DBRM name.

Plan  The plan name.

Port  The TCP/IP port number.

Prepares Received  The number of prepare requests received from the coordinator (two-phase commit operations only).
Prepares Sent  The number of prepare requests sent to the participant (two-phase commit operations only).

Product Name  Shows the ACCRDB PRID parameter of the DDM command, where "ACCRDB" is the product specific ID of the "access relational database" and "PRID" is the product ID of the requester. The value is zero if the record is written at the application requester location.

Protocol Used  The protocol used.

Remote Elapsed Time  The remote elapsed time.

Remote Wait Time  The time spent waiting for remote response.

Request Commits Received  The number of request commit responses received from the participant (two-phase commit operations only).

Request Commits Sent  The number of request commit responses sent to the coordinator (two-phase commit operations only).

Rollbacks Remote  The number of rollback operations performed with the remote location as the coordinator (two-phase commit operations only).

Row Count  The row counter.

Rows Received  The number of rows of data retrieved from the server location (the count does not include either the SQLDA or SQLCA if they are transmitted). This value is maintained at the requester location.

Rows Send  The number of rows of data sent to the requester location (includes SQLDA). This value is maintained at the server location.

Service Name  The EXSCAT SRVNAM parameter.

Session ID  The session ID.

Srvclsnm  The EXSCAT SRVNAM parameter.

SQL Calls Received  The number of SQL statements received from the requester.

SQL Calls Sent  The number of SQL statements sent to the server. This value is maintained at the requester location.

System Access  System access.

Thread Type  The thread type is DBACCESS/ALLIED.

Time Since Last VTAM Request  The time since the last VTAM request was issued.

Transaction ID  The transaction ID at the workstation.

Uniqueness Value  The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSFLUUV).

Uniqueness Value 2  The DB2 thread uniqueness value. For internal use.
VTAM Logmode The VTAM log mode entry name in use by the session.

VTAM Luname The location Logical Unit name.

Workstation ID The workstation ID.

Distributed Thread SQL Statistics Workspace:

The Distributed Thread SQL Statistics workspace provides distributed SQL statistics for a remote DB2 location with which the distributed (DDF) thread has communicated, as a requester or a server.

This workspace is comprised of the following views:

Thread ID (table view)
Identifies the thread.

Distributed VTAM APPC Conversations (table view)
Shows the VTAM APPC conversations data of the thread if the thread is connected through VTAM APPC.

Distributed TCP/IP Data (table view)
Shows the TCP/IP data of the thread if the thread is connected through TCP/IP.

Distributed SQL Statistics (table view)
Shows SQL-related statistics for the selected remote DB2 location with which the thread has communicated, as a requester or a server.

Send & Receive (table view)
Shows send and receive data for the selected remote DB2 location with which the thread has communicated, as either a requester or a server.

2-Phase Commit: Send & Receive (table view)
Shows two-phase-commit-related send and receive data for the selected remote DB2 location with which the thread has communicated, as either a requester or a server.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Application Parameters Workspace:

The DSG DSNZPARM Application Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect the default settings of the DB2 application.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPF - Application Default 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.
DSNTIP4 - Application Default 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

DSNTIP4 - Application Default 3 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Parameters Attributes:
Use the DB2 Parameters attributes to view ZPARM fields to see how your DB2 subsystem is configured. This information also applies if DB2 is a member of a data sharing group.

Data Sharing Group The name of the DB2 data sharing group. It is an alphanumeric text string with a maximum of 8 characters.

Data Sharing Member The name of the DB2 data sharing member or the member name of the DB2 subsystem. It is an alphanumeric text string with a maximum of 8 characters.

DB2 Subsystem The name of the DB2 subsystem.

Field Name The name of the DB2 field. It is an alphanumeric text string with a maximum of 8 characters.

Field Description The description of the DB2 field. It is an alphanumeric text string with a maximum of 44 characters.

The field descriptions of the DB2 parameters are listed in alphabetical order:
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3990-3 SEQ CACHE (SEQCACH)</td>
<td>Indicates whether DB2 prefetch uses sequential mode to read cached data from a 3990 controller. When BYPASS (default), DB2 prefetch bypasses the cache. When SEQ, DB2 prefetch uses sequential access for read activity. There is a performance benefit using SEQ with DFSMS or DFP controls with newer 3990 caches. Install parameter SEQUENCEAL CACHE on panel DSNTIPE, or ZPARM SEQCACH in DSN6SPRM.</td>
</tr>
<tr>
<td>ACCEL STARTUP (ACCEL)</td>
<td>Specifies the accelerator servers to be used.</td>
</tr>
<tr>
<td>ACCESS CONTROL (ACCESS CNTL MODULE)</td>
<td>Shows the name of the default access control exit module. This field corresponds to field ACCESS CONTROL on installation panel DSNTIPO3. The ZPARM name is ACCESS CNTL MODULE in DSN6SYSP.</td>
</tr>
<tr>
<td>ACTIVATE I/O SCHEDULING (SPRMIOP)</td>
<td>The enablement of the index I/O parallelism ZPARM.</td>
</tr>
<tr>
<td>ACTIVE LOGS - NUMBER OF COPIES (TWOACTV)</td>
<td>The TWOACTV subsystem parameter specifies the number of copies of the active log that DB2 is to maintain: 1 (single logging) or 2 (dual logging). ZPARM TWOACTV in DSN6LOGP</td>
</tr>
<tr>
<td>ACTIVE LOGS ARE OFFLOADED ONLINE</td>
<td>Shows whether the offload process is initiated online.</td>
</tr>
<tr>
<td>ADMIN SCHEDULER (ADMTPROC)</td>
<td>The name of the JCL procedure for starting the DB2 administrative scheduler task address space. DB2 parameter ADMTPROC in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AGGREGATION FIELDS (ACCUMUID)</td>
<td>Shows the aggregation fields used for DDF and RRSAF accounting rollup. Values are defined as follows:</td>
</tr>
<tr>
<td></td>
<td>0 End user ID, transaction name, and workstation name</td>
</tr>
<tr>
<td></td>
<td>1 End user ID</td>
</tr>
<tr>
<td></td>
<td>2 End user transaction name</td>
</tr>
<tr>
<td></td>
<td>3 End user workstation name</td>
</tr>
<tr>
<td></td>
<td>4 End user ID and transaction name</td>
</tr>
<tr>
<td></td>
<td>5 End user ID and workstation name</td>
</tr>
<tr>
<td></td>
<td>6 End user transaction name and workstation name</td>
</tr>
<tr>
<td></td>
<td>This value is ignored if DDF or RRSAF accounting are not used. DB2 writes individual accounting threads for threads that do not have all aggregation fields populated that are specified by this parameter.</td>
</tr>
<tr>
<td></td>
<td>Install parameter AGGREGATION FIELDS on installation panel DSNTIPN, or ZPARM ACCUMUID in DSN6SYSP.</td>
</tr>
<tr>
<td>ALLOCATION UNITS (ALCUNIT)</td>
<td>The unit used in allocating archive data sets. Possible values are CYLINDER, TRACK, and BLOCK.</td>
</tr>
<tr>
<td></td>
<td>Install parameter ALLOCATION UNITS on panel DSNTIPA, or ZPARM ALCUNIT in DSN6ARVP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ALLOW AUTOBIND OPERATION (ABIND)</td>
<td>Indicates whether autobind is enabled. Values are:</td>
</tr>
<tr>
<td></td>
<td><strong>YES</strong> Allows automatic rebind operations to be performed when a plan/package:</td>
</tr>
<tr>
<td></td>
<td>• Was marked “invalid”.</td>
</tr>
<tr>
<td></td>
<td>• Was bound on DB2 Vn, but is now running on DB2 Vn-1</td>
</tr>
<tr>
<td></td>
<td>• After use on DB2 Vn-1 (as previously described), is later used again on DB2 Vn</td>
</tr>
<tr>
<td></td>
<td><strong>NO</strong> Prevent DB2 from performing any automatic rebind operations under any circumstances.</td>
</tr>
<tr>
<td>COEXIST</td>
<td>Allows automatic rebind operation to be performed in a DB2 Data Sharing coexistence environment when the plan/package:</td>
</tr>
<tr>
<td></td>
<td>• Is marked “invalid” or</td>
</tr>
<tr>
<td></td>
<td>• Was last bound in DB2 Vn and is running on DB2 Vn-1</td>
</tr>
<tr>
<td></td>
<td>ZPARM ABIND in DSN6SPRM.</td>
</tr>
<tr>
<td>ALLOW EXPLAIN AT AUTOBIND (ABEXP)</td>
<td>Indicates whether EXPLAIN processing occurs during automatic rebind.</td>
</tr>
<tr>
<td></td>
<td><strong>YES</strong> means EXPLAIN processing happens during automatic rebind of a plan or package that has EXPLAIN(YES) as a bind option. If the PLAN TABLE does not exist, automatic rebind continues, but there is no EXPLAIN output. Explain processing does not happen for a plan or package with EXPLAIN(NO).</td>
</tr>
<tr>
<td></td>
<td>ZPARM ABEXP in DSN6SPRM.</td>
</tr>
<tr>
<td>ALLOW TRACKMOD FOR IMPLICIT TSS (IMPTKMOD)</td>
<td>Shows whether you have specified the TRACKMOD option on ALTER TABLESPACE for an implicitly created table space.</td>
</tr>
<tr>
<td></td>
<td>This field corresponds to field TRACK MODIFIED PAGES on installation panel DSNTIP7. The ZPARM name is IMPTKMOD in DSN6SPRM.</td>
</tr>
<tr>
<td>AMOUNT OF SPACE ABOVE MVS</td>
<td>The amount of space above MVS</td>
</tr>
<tr>
<td>APPL COMPAT LEVEL (APPL COMPAT)</td>
<td>The application compatibility level.</td>
</tr>
<tr>
<td>APPL REGISTRATION TABLE (RGFNMPRT)</td>
<td>The name of the application registration table.</td>
</tr>
<tr>
<td></td>
<td>Install parameter APPL REGISTRATION TABLE on panel DSNTIPZ or ZPARM RGFNMPRT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>APPLICATION ENCODING DEFAULT (APPENSCH)</td>
<td>The Application encoding scheme. Install parameter APPLICATION ENCODING on installation panel DSNTIPF, or ZPARM APPENSCH in DSNHDEC.</td>
</tr>
<tr>
<td>ARCHIVE COPY 1 MASS STORAGE GROUP (MSGVP)</td>
<td>The mass storage system volume group name of the first storage group.</td>
</tr>
<tr>
<td>ARCHIVE COPY 2 MASS STORAGE GROUP (MSGVP2)</td>
<td>The mass storage system volume group name of the second storage group.</td>
</tr>
<tr>
<td>ARCHIVE LOG BLOCK SIZE BYTES (BLKSIZE)</td>
<td>The block size of the archive log data set. The block size must be compatible with the device type used for archive logs. The value is rounded up to the next multiple of 4096 bytes. If the archive log is written to tape, use the largest possible block size to improve the reading speed. Recommended block size values are 28672 for tape, 20480 for 3380, and 24576 for 3390 or RAMAC. Install parameter BLOCK SIZE on panel DSNTIPA, or ZPARM BLKSIZE in DSN6ARVP.</td>
</tr>
<tr>
<td>ARCHIVE LOG RACF PROTECTION (PROTECT)</td>
<td>Indicates whether archive log data sets are protected with individual RACF profiles when they are created. When YES, RACF protection must be active for DB2. YES also means that you cannot use RACF generic profiles for archive log data sets. If your archive log is on tape, RACF class TAPEVOL must be active, otherwise, the off-load will fail. Install parameter ARCHIVE LOG RACF on panel DSNTIPP, or ZPARM PROTECT in DSN6ARVP.</td>
</tr>
<tr>
<td>ARCHIVE LOGS - COPY 1 PREFIX (ARCPFX1)</td>
<td>The prefix for copy 1 of the archive data set. This prefix is appended to the high-level qualifier. ZPARM ARCPFX1 in DSN6ARVP.</td>
</tr>
<tr>
<td>ARCHIVE LOGS - COPY 2 PREFIX (ARCPFX2)</td>
<td>The prefix for copy 2 of the archive data set. This prefix is appended to the high-level qualifier. ZPARM: ARCPFX2 in DSN6ARVP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ART/OR T ESCAPE CHAR (RGFESCP)</td>
<td>The escape character used in the application registration table (ART) or object registration table (ORT). Sets of names in the ART and OR T can be represented by patterns that use the underscore (_) and percent sign (%) characters in the same way as in an SQL LIKE predicate. Install parameter ART/OR T ESCAPE CHARACTER on panel DSNTIPZ, or ZP ARM RGFESCP in DSN6SPRM.</td>
</tr>
<tr>
<td>ASCII GRAPHIC CCSID (AGCCSID)</td>
<td>Indicates the ASCII graphic coded character set ID. The default (0) means the installation has no ASCII databases, table spaces, or tables. Install parameter ASCII CCSID on panel DSNTIPF, or ZP ARM AGCCSID in DSNHDEC P.</td>
</tr>
<tr>
<td>ASCII MIXED CCSID (AMCCSID)</td>
<td>Indicates the ASCII mixed coded character set ID. The default (0) means the installation has no ASCII databases, table spaces, or tables. Install parameter ASCII CCSID on panel DSNTIPF, or ZP ARM AMCCSID in DSNHDEC P.</td>
</tr>
<tr>
<td>ASCII SINGLE-BYTE CCSID (ASCCSID)</td>
<td>The ASCII single-byte coded character set ID. The default (0) means the installation has no ASCII databases, table spaces, or tables. Install parameter ASCII CCSID on panel DSNTIPF, or ZP ARM ASCCSID in DSNHDEC P.</td>
</tr>
<tr>
<td>ASSEMBLY DATE</td>
<td>The date on which this module was assembled.</td>
</tr>
<tr>
<td>AUTH EXIT CHECK (AUTHEXIT CHECK)</td>
<td>The AUTH subsystem parameter controls whether DB2 is to check authorizations.</td>
</tr>
<tr>
<td>AUTH EXIT LIMIT (AEXITLIM)</td>
<td>The AEXITLIM subsystem parameter controls the number of abends of the DB2 access control authorization exit routine that are to be tolerated before it is shut down.</td>
</tr>
<tr>
<td>AUTHEXIT CACHEREFRESH</td>
<td>The authorization exit cache refresh.</td>
</tr>
<tr>
<td>AUTO START (IRLMAUT)</td>
<td>Indicates whether IRLM is started automatically by DB2. Install parameter AUTO START on panel DSNTIP, or ZPARM IRLMAUT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>AUTO STARTED DATABASE/TBLSPACE</td>
<td>Database or table space is automatically started.</td>
</tr>
<tr>
<td>AUTOMATICALLY REOPTIMIZE DYN SQL (REOPTEXT)</td>
<td>Indicates that the access path of the dynamic SQL statement was automatically reoptimized.</td>
</tr>
</tbody>
</table>
| BACKOUT DURATION (BACKODUR) | Indicates how much of the log to process for backout when LIMIT BACKOUT = YES or AUTO. During restart, backward log processing continues until both of the following events occur:  
  • All inflight and inabort URs with update activity against the catalog or directory are backed out.  
  • The number of log records processed is equal to the number specified in BACKOUT DURATION times the value of CHECKPOINT FREQ. If the checkpoint frequency is specified in minutes, the number of records processed is the default of 50000 records multiplied by the value of CHECKPOINT FREQ.  
In-flight and in-abort URs that are not completely backed out during restart are converted to postponed-abort status. Page sets or partitions with postponed-backout work are put into restart pending (RESTP). This state blocks all access to the object other than access by the command RECOVER POSTPONED or by automatic backout processing performed by DB2 when LIMITED BACKOUT = AUTO.  
A table space might be in restart pending mode, without the associated index spaces also in restart pending mode. This happens if a postponed abort UR makes updates only to non-indexed fields of a table in a table space. In this case, the indexes are accessible to SQL (for index-only queries), even though the table space is inaccessible.  
Install parameter BACKOUT DURATION on panel DSNTIPL, or ZPARM BACKODUR in DSN6SYSP. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIF COMPATIBILITY</td>
<td>The BIF_COMPATIBILITY subsystem parameter specifies whether the built-in functions and specifications are to return results in the DB2 10 format or revert to the pre-Version 10 format. Acceptable values are: CURRENT V9 V9_TRIM V9_DECIMALVARCHAR N/P</td>
</tr>
<tr>
<td>ZPARM BIF_COMPATIBILITY in</td>
<td>DSN6SPRM.</td>

<tr>
<td>CORRELATION ID MONITOR (SPRMOZCI)</td>
<td>The correlation ID of the online application that made the last change to DB2 system settings.</td>
</tr>
<tr>
<td>CURRENT DEGREE (CDSSRDEF)</td>
<td>Shows the default for the CURRENT DEGREE special register when no degree is explicitly set with SET CURRENT DEGREE. The default disables query parallelism. Install parameter CURRENT DEGREE on panel DSNTIP8, or ZPARM CDSSRDEF in DSN6SPRM.</td>
</tr>
</tbody>
</table>
| CURRENT MAINTAINED TABLE TYPE (MAINTYPE)         | Shows the default special register for the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement when no value is explicitly set. Possible values are:  
  - ALL  
  - NONE  
  - SYSTEM (default)  
  - USER  
   
  The default allows query rewrite using system-maintained materialized query tables (SYSTEM) when CURRENT REFRESH AGE is set to ANY. When USER, query rewrite is done using user-maintained materialized query tables when CURRENT REFRESH AGE is set to ANY. ALL means that query rewrite uses both system-maintained and user- maintained materialized query tables. Install parameter CURRENT MAINT TYPES on panel DSNTIP8, or ZPARM MAINTYPE in DSN6SPRM. |

<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DATABASE PROTOCOL (DBPROTCL)</td>
<td>The default protocol (DRDA or PRIVATE) used when option DBPROTocol BIND is not explicitly specified for the bind of a plan or a package. When field INSTALL TYPE on panel DSNTIPA1 is INSTALL, the default value for DATABASE PROTOCOL is DRDA. When the value of INSTALL TYPE is MIGRATE, the default value for DATABASE PROTOCOL is PRIVATE. An application program might contain statements with three-part names, or aliases that reference remote objects. At bind or rebind of a plan, a user can specify whether these statements flow to the remote site using DB2 private or DRDA protocol. DB2 private protocol is appropriate if you do not plan to move applications that use three-part names to DRDA access immediately. To use DRDA access for applications with three-part names, you must bind packages for those applications at each location that the applications access, then bind all packages into a plan. If you cannot perform this activity immediately, and you want your applications to continue to work, you should specify PRIVATE for DATABASE PROTOCOL. The BIND commands for DB2-supplied applications are in job DSNTIJSG. Install parameter DATABASE PROTOCOL on panel DSNTIP5, or ZPARM DBPROTCL in DSN6SYSP.</td>
</tr>
<tr>
<td>DATASET STATS TIME (DSSTIME)</td>
<td>The time interval, in minutes, before DB2 resets data set statistics collected for the online performance monitors. Online performance monitors can request DB2 data set statistics for the current interval with an IFI READS request for IFCID 199. Install parameter DATASET STATS TIME on panel DSNTIPN, or ZPARM DSSTIME in DSN6SYSP.</td>

</tbody>
</table>
| DATE FORMAT (DATE)                     | Default output format for dates. Valid formats are ISO (yyyy-mm-dd), USA (mm/dd/yyyy), EUR (dd.mm.yyyy), JIS (yyyy-mm-dd), or LOCAL (your choice, defined by a date exit routine). DB2 interprets the input date from the punctuation and converts the output date to the required format. Install parameter DATE FORMAT on panel DSNTIP4, or ZPARM DATE in DSNHDEC.
<p>| DB2-SUPPLIED DECP                      | Indicates that DECP is supplied by DB2. Using a DB2 supplied DECP could cause data corruption due to applications using wrong CCSIDs.                                                                     |
| DBADM CREATE AUTH (DBACRvw)            | Shows whether a DB2 administrator can create a view or alias for another user. Possible values are YES or NO. The default is NO.                                                                                     |
|                                        | Install parameter DBADM CREATE AUTH on panel DSNTIPP, ZPARM DBACRvw in macro DSN6SPRM.                                                                                                                         |
| DDF COMPATIBILITY                      | The DDF compatibility.                                                                                                                                                                                    |
| DDF START OPTION (DDF)                 | Specifies how the data types of stored procedure output parameters are determined when a non-Java client calls a DB2 for z/OS stored procedure. Valid values are null and SP_PARMS_NJv. The default value of null means that the data types of the returned output data match the data types of the parameters in the stored procedure definition. This is the default behavior starting in DB2 for z/OS Version 10. |
| DDF THREADS (CMTSTAT)                  | The CMTSTAT subsystem parameter controls whether threads are to be made active or inactive after they successfully commit or roll back and hold no cursors. A thread can become inactive only if it holds no cursors, has no temporary tables defined, and executes no statements from the dynamic statement cache. Acceptable values are ACTIVE or INACTIVE. ZPARM CMTSTAT in macro DSN6FAC. |</p>
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DDF/RRSAF ACCUMULATION (ACCUMACC)</td>
<td>Shows whether DB2 accounting data for DDF and RRSAF threads is accumulated by end user. When NO, DB2 writes an accounting record when a DDF thread is made inactive, or when signon occurs for an RRSAF thread. A value in the range 2 through 65535 shows the number of times an end-user identifier should occur before DB2 writes an accounting record. An end-user identifier is the concatenation of the end-user user ID, end-user transaction name, and the end-user workstation name. Tracing, Checkpoint &amp; Pseudo-Close Parameters (DSNTIPN). These values can be set by DDF threads using SERVER CONNECT and SET CLIENT calls, and by RRSAF threads using the RRSAF SIGN, AUTH SIGNON, and CONTEXT SIGNON functions. An accounting record might be written prior to the number of end user occurrences in the following instances: • When an internal storage threshold is reached for the accounting RRSAF signon call. • When the thread deallocates, the accumulated accounting data for all end users on this thread is written (one record per end user). • When this parameter is dynamically changed to deactivate accounting accumulation. In this instance, the next end-UR (for DDF thread) or signon (for a RRSAF thread) causes DB2 to write the accumulated accounting data for all end users on this thread (one record per end user). Install parameter DDF/RRSAF ACCUM on installation panel DSNTIPN, or ZPARM ACCUMACC in DSN6SYS.</td>
</tr>
<tr>
<td>DEADLOCK CYCLES (DEADLOK)</td>
<td>The value of the DEADLOCK CYCLE field specifies the number of local deadlock cycles that must expire before the IRLM does global deadlock detection processing. The DEADLOCK CYCLE field is used only for DB2® data sharing. The associated IRLM PROC parameter is DEADLOK.</td>
</tr>

</tbody>
</table>
| DESCRIBE FOR STATIC SQL (DESCSTAT)                | Shows whether DB2 builds a DESCRIBE SQLDA when binding static SQL statements. A DESCRIBE cannot be issued against a static SQL statement except:  
- In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL. In this instance, a DESCRIBE on an SQL statement in the extended dynamic package appears to DB2 as a DESCRIBE on a static SQL statement in the DB2 package.  
- When an application uses a stored procedure result set, the application must allocate a cursor for that result set. The application can do this using a DESCRIBE CURSOR statement. The SQL statement actually described is the one with the cursor declared in the stored procedure. If that statement is static, a static SQL statement must be described.  
When NO (default), DB2 does not generate a DESCRIBE SQLDA at BIND time for static SQL statements. If a DESCRIBE request is received at execution time, DB2 generates an error. However, if the describe request comes from a DESCRIBE CURSOR statement, DB2 satisfies the request but is only able to provide data type and length information. Column names are not provided.  
When YES, DB2 generates a DESCRIBE SQLDA at BIND time so that DESCRIBE requests for static SQL can be satisfied during execution.  
**Note:** You must rebind packages after this value has been set to YES.  
This option increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically-bound SQL SELECT statement.  
Install parameter DESCRIBE FOR STATIC on panel DSNTIP4, or ZPARM DESCSTAT in DSN6SPRM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
<p>| DEVICE TYPE 1 (UNIT)                               | The UNIT subsystem parameter specifies the device type or unit name that is to be used for storing archive log data sets. Acceptable values are the device type or unit name. The default value is TAPE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |</p>

</tr>
<tr>
<td>1</td>
<td>No changes are propagated.</td>
</tr>
<tr>
<td>2</td>
<td>DPROP propagates SQL changes, and those changes made to tables defined with DATA CAPTURE CHANGES are only allowed when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. If any of these conditions are not met, no changes to the DB2 table are permitted.</td>
</tr>
<tr>
<td>3</td>
<td>Data propagation occurs when monitor trace class 6 is active, DPROP is installed, and the DB2 application is running in an IMS environment. In this instance, an application that is not running in an IMS environment can update DB2 tables defined with DATA CAPTURE CHANGES. However, these changes are not propagated to IMS.</td>
</tr>
<tr>
<td><strong>ANY</strong></td>
<td>Allows subsystems to propagate some data with DPROP and other data with a different propagation program.</td>
</tr>
</tbody>
</table>

Tables that should only be updated by DB2 applications running in an IMS environment can be protected using the following methods:

- Use the ENABLE parameter on BIND to specify a specific attachment facility through which updates to data propagation tables can be made.
- Define a validation procedure for data propagation tables to define which plans can update those tables.
- Allow update authority for data propagation tables to a group of authorization IDs that can only run in IMS.

Install parameter DPROP SUPPORT on panel DSNTIPO, or ZPARM EDPROP and CHGDC in DSN6SPRM.
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVALUATE UNCOMMITTED (EVALUNC)</td>
<td>Shows whether stage 1 predicate evaluation during table access can proceed upon uncommitted data or not. This applies to isolation levels of Read Stability and Cursor Stability only. When NO (default), predicate evaluation occurs only on committed data (or on the application’s own uncommitted changes). NO ensures that all qualifying data is always included in the answer set. When YES, predicate evaluation can occur upon uncommitted data. Only committed data is returned to the query. However, a decision can be made to omit a row from the answer set based on uncommitted data. Later, undo processing (statement rollback or statement failure) could cause the data to revert to a state that satisfies the predicate. When YES, DB2 can request fewer locks than in previous versions when processing isolation level Read Stability and Cursor Stability queries. The number of locks avoided is related to the access path of the query, the number of rows evaluated when processing the stage 1 predicate of the query, and the number of those rows that are overflow rows. Specifically, for isolation level Read Stability and Cursor Stability queries, locks are avoided for rows that do not satisfy the stage 1 predicate, provided they are not overflow rows. Table access includes table space scans and index-to-data access, including ridlist-to-data access. For isolation Cursor Stability ridlist production, all row/page locking is avoided. Install parameter EVALUATE UNCOMMITTED on panel DSNTIP8, or ZPARM EVALUNC in DSN6SPRM.</td>
</tr>
<tr>
<td>EXTENDED DATESTAMP INDICATOR</td>
<td>The indicator of the extended date stamp.</td>

<tr>
<td>EXTRA BLOCKS SERVED (EXTRASRV)</td>
<td>The maximum number of extra DRDA query blocks DB2 returns to a DRDA client.</td>
</tr>
<tr>
<td></td>
<td>The default is 100.</td>
</tr>
<tr>
<td></td>
<td>This controls the total amount of data that can be transmitted on any given network exchange. It does not limit the size of the SQL query answer set.</td>
</tr>
<tr>
<td></td>
<td>ZPARM EXTRASRV in DSN6SYSP.</td>
</tr>
<tr>
<td>FACILITY ENTRIES</td>
<td>Facility entries.</td>
</tr>
<tr>
<td>FACILITY NAME</td>
<td>The name of the DDF facility.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>FAST RESTORE (REC FASTREPLICATION)</strong></td>
<td>The REC FASTREPLICATION parameter specifies whether the RECOVER utility should use FlashCopy® to recover from a FlashCopy image copy. Acceptable values are NONE, PREFERRED (default), or REQUIRED. This parameter applies only to Version 10 new-function mode. ZPARM REC FASTREPLICATION in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>FIELD PROCS DESCRIBE TABLE BLOCK (SPRMFPD)</strong></td>
<td>The number of field procedures for the DESCRIBE TABLE block.</td>
</tr>
<tr>
<td><strong>FLASHCOPY (FLASHCOPY)</strong></td>
<td>FLASHCOPY</td>
</tr>
<tr>
<td><strong>FLASHCOPY PPRC</strong></td>
<td>The FLASHCOPY PPRC subsystem parameter specifies the behavior for DFSMSdss FlashCopy requests when the target disk storage volume is the primary device in a peer-to-peer remote copy (Metro Mirror) relationship. Acceptable values are NONE, PREFERRED, REQUIRED (default), or blank. ZPARM FLASHCOPY PPRC in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>FREE LOCAL CACHE STM (CACHEDYN FREELOCAL)</strong></td>
<td>Indicates whether DB2 can free cached dynamic statements to relieve DBM1 below-the-bar storage. CACHEDYN_FREELOCAL applies only when the KEEPDYNAMIC(YES) bind option is active. If you specify 0, DB2 does not free cached dynamic statements to relieve high use of storage by dynamic SQL caching. The default value is 1, which means that DB2 frees some cached dynamic statements to relieve high use of storage when the cached SQL statement pools have grown to a certain size. ZPARM CACHEDYN_FREELOCAL in macro DSN6SPRM.</td>
</tr>
</tbody>
</table>
| **GET ACCEL ARCHIVE** | Determines the default value that is to be used for the CURRENT GET ACCEL ARCHIVE special register:  
**NO** Indicates that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.  
**YES** Indicates that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived. ZPARM name GET ACCEL ARCHIVE in macro DSN6SPRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP NAME (GRPNNAME)</td>
<td>The name of the DB2 data sharing group. The group name encompasses the entire data sharing group and is the basis for the coupling facility structure names. N/A means this DB2 is not part of a data sharing group. ZP ARM GRPNNAME in DSN6GRP.</td>
</tr>
<tr>
<td>HONOR KEEPDICTIONARY</td>
<td>Specifies whether DB2 honors the LOAD and REORG parameter KEEPDICTIONARY when tables are converted from basic row format to reordered row format. If HONOR_KEEPDICTIONARY is set to a value of YES, DB2 honors the LOAD and REORG parameter KEEPDICTIONARY. If HONOR_KEEPDICTIONARY is set to the default value of NO, DB2 ignores the LOAD and REORG parameter KEEPDICTIONARY when tables are converted from basic row format to reordered row format. ZP ARM HONOR_KEEPDICTIONARY in macro DSN6SPRM</td>
</tr>
<tr>
<td>HOP SITE AUTHORIZATION (SPRMHOP) (HOPAUTH)</td>
<td>Indicates whose authorization is checked at a second server (sometimes called a hop site) when the requester is not DB2 for z/OS. This option applies only when DB2 private protocol is used for the hop from the second to the third site. When BOTH (default), the package owner's authorization is checked for static SQL, and the runner's authorization ID is checked for dynamic SQL. When RUNNER, both static and dynamic SQL use the runner's authorization. Install parameter AUTH AT HOP SITE on panel DSNTIP5, ZP ARM HOPAUTH in DSN6SPRM.</td>
</tr>
<tr>
<td>ICF CATALOG ALIAS (CATALOG)</td>
<td>The alias of the VSAM integrated catalog facility user catalog or the name of the master catalog where the DB2 VSAM data sets created during installation are cataloged. The MVS catalog alias is also used as the high-level qualifier for DB2 VSAM data sets. Install parameter CATALOG ALIAS on panel DSNTIPA, or ZP ARM CATALOG in DSN6ARVP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IDENTIFY/AUTH (IDAUTH MODULE)</td>
<td>Shows the name of the default identify or authorization exit module. This field corresponds to field IDENTIFY/AUTH on installation panel DSNTP03. The ZPARM name is IDAUTH MODULE in DSN6SYSP.</td>
</tr>
<tr>
<td>IDLE THREAD TIMEOUT (IDTHTOIN)</td>
<td>The approximate time, in seconds, that an active server thread can remain idle before it is canceled. Inactive and indoubt threads are not subject to timeout. Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. 0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any. ZPARM IDTHTOIN in DSN6FAC.</td>
</tr>
<tr>
<td>IGNORE SORTNUM STATEMENT (IGNSORTN)</td>
<td>The IGNSORTN subsystem parameter determines whether occurrences of the SORTNUM clause in utility control statements are to be ignored. Acceptable values are YES or NO (default). ZPARM IGNSORTN in DSN6SPRM.</td>
</tr>
<tr>
<td>IMMEDIATE WRITE (IMMEWRI)</td>
<td>Indicates how DB2 updates group buffer pool dependent pages. This is only valid in a data-sharing environment. Group buffer pool dependent pages can be written to DASD or SYSTEM pagesets. Install parameter IMMEDIATE WRITE on panel DSNTIP8, or ZPARM IMMEDWRI in DSN6GRP.</td>
</tr>
<tr>
<td>IMPLICIT TIMEZONE (IMPLICIT TIMEZONE)</td>
<td>The implicit time zone that is associated with DB2 table columns and routine parameters that are declared as time stamp with time zone. For IFCID 106 - Application Programming Defaults, this field is displayed twice, with its hex value and in a readable string. This field corresponds to DSNHDECP field IMPLICIT TIMEZONE.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IMS BMP TIMEOUT (BMPTOUT)</td>
<td>The number of RESOURCE TIMEOUT units that an IMS BMP connection waits for a lock to be released.</td>
</tr>
<tr>
<td></td>
<td>The default value is 4, meaning that an IMS BMP connection can wait 4 times the resource timeout value for a resource.</td>
</tr>
<tr>
<td></td>
<td>Install parameter IMS BMP TIMEOUT on panel DSNTIPI, or ZPARM BMPTOUT in DSN6SPRM.</td>
</tr>
<tr>
<td>IMS DLI TIMEOUT (DLITOUT)</td>
<td>The number of RESOURCE TIMEOUT units that a DL/I batch connection waits for a lock to be released.</td>
</tr>
<tr>
<td></td>
<td>For example, if you use the default value of 6, a DL/I batch application can wait 6 times the resource timeout value for a resource.</td>
</tr>
<tr>
<td></td>
<td>Install parameter DL/I BATCH TIMEOUT on panel DSNTIPI, or ZPARM DLITOUT in DSN6SPRM.</td>
</tr>
<tr>
<td>INCLUDE DEPENDENT PRIVILEGE ON REVOKE</td>
<td>Allows revoking of dependent privileges to be controlled at the SQL level.</td>
</tr>
<tr>
<td>INDEX CLEANUP THREADS</td>
<td>The index cleanup threads.</td>
</tr>
<tr>
<td>INDEX I/O PARALLELISM (INDEX IO PARALLELISM)</td>
<td>The enablement of the index I/O parallelism ZPARM.</td>
</tr>
<tr>
<td>INDEX SPACE ALLOCATION IN KB (IXQTY)</td>
<td>Shows the amount of space in KB for primary and secondary space allocation for DB2-defined data sets for index spaces created without the USING clause. 0 indicates that DB2 uses standard defaults. Install parameter INDEX SPACE ALLOCATION on panel DSNTIP7, or ZPARM IXQTY in DSN6YSP.</td>
</tr>
<tr>
<td>INITIAL MODULE</td>
<td>The name of the initial DSNZPARM load module.</td>
</tr>
<tr>
<td>INSTALL DD CONTROL SUPT (RGFINSTL)</td>
<td>Indicates whether data definition support has been installed.</td>
</tr>
<tr>
<td></td>
<td>Install parameter INSTALL DD CONTROL SUPT on panel DSNTIPZ, or ZPARM RGFINSTL in DSN6SPRM.</td>
</tr>
<tr>
<td>IRLM INITIALIZATION INQUIRY TIME</td>
<td>The number of seconds DB2 waits before querying whether IRLM has completed initialization.</td>
</tr>
<tr>
<td></td>
<td>DB2 parameter SPRMISWI in DSNMSPRM.</td>
</tr>
<tr>
<td>IRLM MAXIMUM CSA ALLOWED</td>
<td>The maximum common service area (CSA) allowed for internal resource lock manager (IRLM).</td>

<td>• FORTRAN</td>
</tr>
<tr>
<td></td>
<td>• PLI</td>
</tr>
<tr>
<td></td>
<td>When this is C or C++, you can fold SQL identifiers to uppercase.</td>
</tr>
<tr>
<td></td>
<td>Install parameter LANGUAGE DEFAULT on panel DSNTIPF, or ZPARM DEFLANG in DSNHDECP.</td>
</tr>
<tr>
<td>LEVELID UPDATE FREQ (DLDFREQ)</td>
<td>The DLDFREQ subsystem parameter specifies whether the level ID of a page set or partition is to be updated at DB2-determined checkpoint intervals. Acceptable values are ON (default) or OFF. ZPARM DLDFREQ in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LIKE BLANK INSIGNIFICANT</td>
<td>The LIKE BLANK INSIGNIFICANT field specifies whether blanks are significant when applying the LIKE predicate to a string.</td>
</tr>
<tr>
<td></td>
<td>When the LIKE predicate is applied against fixed length character column data, DB2 strips trailing blanks from the data before performing the comparison. If the data is all blank, DB2 reduces it to a single blank before performing the comparison.</td>
</tr>
<tr>
<td></td>
<td>If not set, LIKE treats trailing blanks within fixed length character strings as significant.</td>
</tr>
<tr>
<td>LIMIT BACKOUT (LBACKOUT)</td>
<td>The LBACKOUT subsystem parameter specifies whether DB2 is to postpone backward-log processing for some units of work. Acceptable values are AUTO (default), YES, LIGHT, LIGHTAUTO, or NO.</td>
</tr>
<tr>
<td></td>
<td>ZPARM LBACKOUT in DSN6SYSP.</td>
</tr>
<tr>
<td>LOAD (FLASHCOPY LOAD)</td>
<td>The value of the FLASHCOPY LOAD subsystem parameter specifies whether the FLASHCOPY option of the LOAD utility is to be used by default. Acceptable values are NO (default) or YES.</td>
</tr>
<tr>
<td></td>
<td>ZPARM FLASHCOPY LOAD in DSN6SPRM.</td>
</tr>
<tr>
<td>LOB INLINE LEN (LOB INLINE LENGTH)</td>
<td>The default inline length for any new storing large object (LOB) column in a Universal Table Space on the DB2 subsystem. The valid values are from 0 to 32680 inclusive (in bytes). The default value for this ZPARM is 0, which indicates that no inline attribute is required for any LOB column (BLOB, CLOB or DBCLOB) created on this subsystem.</td>
</tr>
<tr>
<td>LOCAL DATE LENGTH (DATELEN)</td>
<td>Shows the length of the longest field required to hold a locally defined date.</td>
</tr>
<tr>
<td></td>
<td>The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).</td>
</tr>
<tr>
<td></td>
<td>Install parameter LOCAL DATE LENGTH on panel DSNTIP4, or ZPARM DATELEN in DSNHDECP.</td>
</tr>
<tr>
<td>LOCAL TIME LENGTH (TIMELEN)</td>
<td>Shows the length of the longest field required to hold a time when a locally defined time format is used.</td>
</tr>
<tr>
<td></td>
<td>The default (0) indicates an IBM-supplied format (ISO, JIS, USA, or EUR).</td>
</tr>
<tr>
<td></td>
<td>Install parameter LOCAL TIME LENGTH on panel DSNTIP4, or ZPARM TIMELEN in DSNHDECP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LOCALE LC CTYPE (LC CTYPE)</td>
<td>The LC TYPE DECIMAL value specifies the system LOCALE LC CTYPE. A locale is the part of your system environment that depends on language and cultural conventions. An LC CTYPE is a subset of a locale that applies to character functions. A valid locale can consist of 0 to 50 characters.</td>
</tr>
<tr>
<td>LOCKS PER TABLE (SPACE) (NUMLKTS)</td>
<td>The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE. Install parameter LOCKS PER TABLE(SPACE) on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.</td>
</tr>
<tr>
<td>LOCKS PER USER (NUMLKUS)</td>
<td>The maximum number of page or row locks that a single application can hold concurrently on all table spaces.</td>
</tr>
<tr>
<td></td>
<td>This includes locks on data pages, index pages, subpages, and rows that the program acquires when it accesses table spaces.</td>
</tr>
<tr>
<td></td>
<td>The limit applies to all table spaces defined with the LOCKSIZE PAGE, LOCKSIZE ROW, or LOCKSIZE ANY options. 0 means that there is no limit to the number of page and row locks a program can acquire.</td>
</tr>
<tr>
<td></td>
<td>DB2 assumes that 250 bytes of storage are required for each lock. If NO is specified for CROSS MEMORY, the value of this field has to take into account the available lock space. If referential constraints between tables is defined, the value of this field might need to be increased.</td>
</tr>
<tr>
<td></td>
<td>Install parameter LOCKS PER USER on panel DSNTIPJ, or ZPARM NUMLKUS in DSN6SPRM.</td>
</tr>
<tr>
<td>LOG CHECKPOINT TYPE (CHKTYPE)</td>
<td>The CHKTYPE subsystem parameter indicates whether the interval between log checkpoints is to be based on the number of written log records, the time between checkpoints, or both. Acceptable values are LOGRECS, MINUTES (default), or BOTH.</td>
</tr>
<tr>
<td></td>
<td>ZPARM CHKTYPE in DSN6SYSP.</td>
</tr>
<tr>
<td>MANAGE REAL STORAGE (REALSTORAGE MANAGEMENT)</td>
<td>Specifies whether DB2 should manage real storage consumption. Valid values are ON, OFF, and AUTO (default). The default setting is AUTO.</td>
</tr>
<tr>
<td></td>
<td>ZPARM REALSTORAGE MANAGEMENT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>MANAGE THREAD STORAGE (MINSTOR)</strong></td>
<td>Shows whether DB2 uses storage management to optimize the amount of working storage consumed by individual threads.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MANAGE THREAD STORAGE on panel DSNTIPE, or ZPARM MINSTOR in DSN6SPRM.</td>
</tr>
<tr>
<td></td>
<td>For best performance, this parameter should be NO, meaning DB2 does not manage thread storage.</td>
</tr>
<tr>
<td></td>
<td>When YES, DB2 uses best fit algorithm to manage and assign thread storage. This can help on systems that have many long-running threads and that are constrained on DBM1 address space.</td>
</tr>
<tr>
<td>Max 31-bit IRLM Private Storage</td>
<td>The maximum 31-bit IRLM private storage.</td>
</tr>
<tr>
<td>Max 64-bit IRLM Private Storage</td>
<td>The maximum 64-bit IRLM private storage.</td>
</tr>
<tr>
<td><strong>MAX ABEND COUNT (STORMXAB)</strong></td>
<td>The number of times a stored procedure is allowed to terminate abnormally, after which SQL CALL statements for the stored procedure are rejected.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX ABEND COUNT on panel DSNTIPX, or ZPARM STORMXAB in DSN6SYSP.</td>
</tr>
<tr>
<td><strong>MAX BATCH CONNECTIONS (IDBACK)</strong></td>
<td>The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:</td>
</tr>
<tr>
<td></td>
<td>• All batch jobs using QMF.</td>
</tr>
<tr>
<td></td>
<td>• All batch jobs using the DSN command processor.</td>
</tr>
<tr>
<td></td>
<td>• All tasks connected to DB2 through call attach facility (CAF) running in batch. This can include:</td>
</tr>
<tr>
<td></td>
<td>– Batch jobs using QMF</td>
</tr>
<tr>
<td></td>
<td>– APPC applications</td>
</tr>
<tr>
<td></td>
<td>– TCP/IP FTP connections</td>
</tr>
<tr>
<td></td>
<td>When the number of batch jobs reaches this limit, further requests are rejected.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX BATCH CONNECT on panel DSNTIPE, or ZPARM IDBACK in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>MAX CONCURRENT PKG OPS</td>
<td>Specifies the maximum number of automatic bind requests, remote bind requests, remote rebind requests, CREATE TRIGGER statements, and CREATE PROCEDURE statements for packages that can be processed simultaneously. If the value of the AUTO BIND field of panel DSNTIPO is set to NO, the value of MAX_CONCURRENT_PKG_OPS has no effect. The default value of MAX_CONCURRENT_PKG_OPS is 10. ZPARM MAX_CONCURRENT_PKG_OPS in macro DSN6SPRM.</td>
</tr>
</tbody>
</table>
| MAX CONCURRENT(CTHREAD) | The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently. Separate threads are created for each occurrence of the following:  
• TSO user (whether running a DSN command or a DB2 request from QMF)  
• Batch job (whether running a DSN command or a DB2 utility)  
• IMS region that can access DB2  
• Active CICS transaction that can access DB2  
• Task connected to DB2 through the call attachment facility. Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP. |
<p>| MAX DATA CACHING MB (MXDTCACH) | The MXDTCACH subsystem parameter specifies the maximum amount of memory, in MB, that is to be allocated for data caching per thread. Acceptable values are 0 to 512. ZPARM MXDTCACH in DSN6SPRM. |
| MAX DBM1 STG FOR LOG | The maximum DBM1 storage that can be used by the fast log apply process. The default value is 0 MB, which means that fast log apply is disabled except during DB2 restart, when fast log apply is always enabled. Install parameter LOG APPLY STORAGE on panel DSNTIPL, or ZPARM LOGAPSTG in DSN6SYSP. |
| MAX DSSIZE FOR IMPLICIT TSS (IMPDSSIZE) | Shows the maximum DSSIZE in gigabytes that DB2 uses for creating each partition of an implicitly created base table space. This field corresponds to field DEFAULT DSSIZE on installation panel DSNTI7P. The ZPARM name is IMPDSSIZE in DSN6SPRM. |</p>
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX INACTIVE DBATS (MAXTYPE1)</td>
<td>Indicates the number of type 1 inactive threads that DB2 allows. A large number of type 1 inactive threads can adversely affect system performance. Type 1 inactive threads are used for DB2 private protocol. DRDA uses type 2 inactive threads. Zero indicates that type 1 inactive connections are not allowed. Threads remain active when they become eligible to be made a type 1 inactive thread. A value greater than zero indicates that type 1 inactive connections are allowed, but are limited to this number. When a thread becomes eligible to be made a type 1 inactive thread, and this threshold is reached, the remote connection is terminated. When this is equal to MAX REMOTE CONNECTED on panel DSNTIPE, DB2 allows all remote threads to become type 1 inactive threads. Install parameter MAX INACTIVE DBATS on panel DSNTIPR, or ZPARM MAXTYPE1 in DSN6FAC.</td>
</tr>
<tr>
<td>Max Numb in IN-List (INLISTP)</td>
<td>Allows you to specify the maximum number of elements in an IN-list for certain IN predicate optimizations to occur. The default value for INLISTP is 50. ZPARM INLISTP in macro DSN6SPRM.</td>
</tr>
<tr>
<td>MAX NUMBER DS CONCURRENTLY IN USE (DSMAX)</td>
<td>The maximum number of data sets that can be open at one time. The practical limit can be less than the MVS limit of 32727, depending on available storage below the line. Install parameter DSMAX on panel DSNTIPC, or ZPARM DSMAX in DSN6SPRM.</td>
</tr>

<tr>
<td>MAX OPEN CURSORS (MAX_NUM_CUR)</td>
<td>Shows the maximum number of cursors, including allocated cursors, that are open at a given DB2 site per thread. RDS keeps a total of currently open cursors. If an application attempts to open a thread after the maximum is reached, the statement will fail.</td>
</tr>
<tr>
<td></td>
<td>In a data sharing group, this parameter is shown at member scope.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX OPEN CURSORS on panel DSNTIPX, or ZPARM MAX_NUM_CUR in DSN6SPRM.</td>
</tr>
<tr>
<td>MAX OPEN FILE REFS (MAXOFILR)</td>
<td>The maximum number of concurrently open data sets for processing LOB file references.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX OPEN FILE REFS on panel DSNTIPE or ZPARM MAXOFILR in DSN6SYSP.</td>
</tr>
<tr>
<td>MAX REMOTE ACTIVE (MAXDBAT)</td>
<td>The maximum number of database access threads (DBATs) that can be active concurrently. When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request.</td>
</tr>
<tr>
<td></td>
<td>When DDF THREADS is ACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate.</td>
</tr>
<tr>
<td></td>
<td>When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection.</td>
</tr>
<tr>
<td></td>
<td>The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBAT in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>

<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| MAX RID BLOCKS OF TEMP STRG (MAXTEMPS RID)| The maximum number of RID blocks of temporary storage in the work file database that a single RID list can use at any point in time. This field corresponds to field MAX TEMP RID on installation panel DSNTIP9. The ZPARM name is MAXTEMPS RID. It can have the following values:  
-1 If MAXTEMPS RID=NONE  
0 If MAXTEMPS RID=NOLIMIT  
1 to 329166 Otherwise |
| MAX RID POOL SIZE (MAXRBLK)               | The amount of storage needed for the RID pool. This can be the value calculated by the CLIST, based on input from previous panels, or the value entered in the Override column at installation time.  
When 0, DB2 does not use access paths or join methods that depend on RID pool storage.  
Install parameter RID POOL SIZE on panel DSNTIPC, or ZPARM MAXRBLK in DSN6SPRM. |
| MAX STORED PROCS (MAX_ST_PROC)            | Shows the maximum number of stored procedures per thread. If an application attempts to call a stored procedure after this is reached, the statement will fail. In a data sharing group, this parameter is shown as member scope.  
Install parameter MAX STORED PROCS on panel DSNTIPX, or ZPARM MAX_ST_PROC in DSN6SPRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX TSO USERS (IDFORE)</td>
<td>The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUIF). Each of the following is a separate user:</td>
</tr>
<tr>
<td></td>
<td>• Each TSO foreground user executing a DSN command.</td>
</tr>
<tr>
<td></td>
<td>• Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.</td>
</tr>
<tr>
<td></td>
<td>When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected. There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS.</td>
</tr>
<tr>
<td></td>
<td>These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZP ARMS IDFORE in DSN6SYSP.</td>
</tr>
<tr>
<td>MAX ZIVLEMPEL DICT ENTRY (SPRMMDE)</td>
<td>Hardware data compression uses the Ziv-Lempel compression technique, which uses a fixed number of bits to replace a variable number of bytes. This technique requires use of a dictionary.</td>
</tr>
<tr>
<td>MAXIMUM DEGREE PARALLELISM (PARAMDEG)</td>
<td>Indicates the upper limit on the degree of parallelism for a parallel group.</td>
</tr>
<tr>
<td></td>
<td>This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAX DEGREE on panel DSNTIPE, or ZPARM PARAMDEG in DSN6SPRM.</td>
</tr>
<tr>
<td>MAX DS OPEN STOP ASYNC DRAIN (SPRMMDD)</td>
<td>The percentage of maximum open data sets until the asynchronous drain operations are stopped.</td>
</tr>
<tr>
<td></td>
<td>DB2 parameter SPRMMDD in DSN6SPRM.</td>
</tr>
<tr>
<td>MAXIMUM EXTEND SERVICE TASKS (SPRMEST)</td>
<td>Maximum number of extended service tasks.</td>
</tr>
<tr>
<td>MAXIMUM KEPT DYNAMIC STATEMENTS (MAXKEEPD)</td>
<td>Shows the total number of prepared dynamic SQL statements that are saved past a commit point. 0 means that prepared dynamic SQL statements are not saved past commit points. Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>MAXIMUM LE TOKENS (LEMAX)</td>
<td>The maximum number of LE tokens active at any time. When zero, no tokens are available.</td>
</tr>
<tr>
<td></td>
<td>A token is used each time one of the following is used: trigonometry functions, degrees, radians, rand, exp, power, log functions, upper, lower, translate.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAXIMUM LE TOKENS on panel DSNTIP7, or ZPARM LEMAX in DSN6SPRM.</td>
</tr>
<tr>
<td>MAXIMUM NOT FOUND HASH RECORDS (SPRMKFC)</td>
<td>The maximum number of NOT FOUND hash records.</td>
</tr>
<tr>
<td>MAXIMUM NUMBER OF DS IN BSDS (MAXARCH)</td>
<td>The maximum number of archive log volumes that can be recorded in the BSDS.</td>
</tr>
<tr>
<td></td>
<td>When this number is exceeded, recording resumes at the beginning of the BSDS.</td>
</tr>
<tr>
<td></td>
<td>For dual archive, this value applies to each log data set. As an example, a value of 500 allows 500 COPY-1 and 500 COPY-2 data sets in the BSDS.</td>
</tr>
<tr>
<td></td>
<td>You must create image copies of all DB2 objects, probably several times, before the archive log data sets are discarded. If you fail to retain an adequate number of archive log data sets for all the image copies, you might need to cold start or reinstall DB2. In either case, data is lost.</td>
</tr>
<tr>
<td></td>
<td>Install parameter RECORDING MAX on panel DSNTIPA, or ZPARM MAXARCH in DSN6LOGP.</td>
</tr>
<tr>
<td>MAXIMUM READ TAPE UNITS (MAXRTU)</td>
<td>The maximum number of tape units that can be allocated for archive read purposes.</td>
</tr>
<tr>
<td></td>
<td>Install parameter READ TAPE UNITS on panel DSNTIPA, or ZPARM MAXRTU in DSN6LOGP.</td>
</tr>
<tr>
<td>MAXIMUM REMOTE CONNECT (CONDBAT)</td>
<td>The maximum allowed number of concurrent remote connections. When this limit is reached, any new connection request is rejected. Install parameter MAX REMOTE CONNECTED on panel DSNTIPE, or ZPARM CONDBAT in DSN6SYSP.</td>
</tr>
<tr>
<td>MAXIMUM TAPE UNITS (RESTORE TAPEUNITS)</td>
<td>The maximum number of tape units or tape drives that the restore system utility can use to restore from a system-level backup that has been dumped to tape.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MAXIMUM TAPE UNITS on installation panel DSNTIP6, or ZPARM RESTORE TAPEUNITS in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MAXIMUM TEMP STG/AGNT IN MB (MAXTEMPS)</td>
<td>The maximum amount of storage in the Workfile Database that can be used by each agent (derived from ZPARM MAXTEMPS).</td>
</tr>
<tr>
<td>MAXSORT IN MEMORY</td>
<td>The maximum number of in-memory work files created by the SORT component that were active at any point in time since DB2 start. This is a high-water mark count.</td>
</tr>
<tr>
<td>MEASURED USAGE PRICING</td>
<td>Detailed measured usage price tracking.</td>
</tr>
<tr>
<td>MEMBER NAME (MEMBNAME)</td>
<td>The member name of this DB2. N/A means this DB2 is not part of a data sharing group.</td>
</tr>
<tr>
<td></td>
<td>Install parameter MEMBER NAME on panel DSNTIPK, or ZPARM MEMBNAME in DSN6GRP.</td>
</tr>
<tr>
<td>MIN SCALE DECIMAL DIVIDE (MINDVSCL)</td>
<td>The minimum scale for the result of a decimal division. The values for this parameter are none (the default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.</td>
</tr>
<tr>
<td>MINIMUM DIVIDE SCALE (DECDIV3)</td>
<td>The DECDIV3 subsystem parameter determines whether to retain at least three digits to the right of the decimal point after any decimal division. Acceptable values are YES or NO. The default is NO. ZPARM DECDIV3 in DSN6SPRM.</td>
</tr>
<tr>
<td>MINS BETWEEN CHECKPOINT (CHKMINS)</td>
<td>Shows the number of minutes between log checkpoints if the LOG checkpoint type is BOTH (records and minutes).</td>
</tr>
<tr>
<td></td>
<td>This field corresponds to field MINUTES/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKMINS in DSN6SYSP.</td>
</tr>
<tr>
<td>MINUTES/CHECKPOINT (CHKFREQ)</td>
<td>Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached. You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records. Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MIXED DATA (MIXED)</td>
<td>The value of the MIXED DECP field indicates how the EBCDIC CCSID and ASCII CCSID fields are to be interpreted by DB2. The MIXED DATA option has no effect on the UNICODE CCSID field. Regardless of the setting for MIXED DATA, UNICODE UTF-8 data is considered mixed data and is processed according to the rules for mixed data.</td>
</tr>
<tr>
<td>MONITOR SIZE (MONSIZE)</td>
<td>The default number of bytes allocated for the monitor trace buffer. Install parameter MONITOR SIZE on panel DSNTIPN, or ZPARM MONSIZE in DSN6SYSP.</td>
</tr>
<tr>
<td>MONITOR TRACE (MON)</td>
<td>Shows whether the monitor trace is started automatically when DB2 is started. When YES, the default (trace class 1) is started. Numeric values show which classes are started. When ALL, monitor trace classes 1 through 8 are started. Install parameter MONITOR TRACE on panel DSNTIPN, or ZPARM MON in DSN6SYSP.</td>
</tr>
<tr>
<td>MVS ENVIRONMENT</td>
<td>The type of MVS environment in which DB2 is running.</td>
</tr>
<tr>
<td>NEW FUNCTION MODE (NEWFUN)</td>
<td>If YES, the DB2 subsystem/group is running in New Function Mode. At this mode/catalog level, the New Function Mode is enabled and available. The DB2 catalog is completely Unicode (UTF-8) and long names can be used. Install parameter INSTALL TYPE on panel DSNTIPA1, or ZPARM NEWFUN in DSNHDECP.</td>
</tr>

</tbody>
</table>
| **NPAGES THRESHOLD OPTIMIZER** (SPRMNPAG) | This parameter allows you to specify the optimizer threshold for qualifying a table as small.  
-1 Every table qualifies as small.  
0 No table qualifies as small (this is the default).  
1 Only tables with zero pages qualify as small.  
2 Tables with less than two pages qualify as small.  
10 Tables with less than ten pages qualify as small.  
502 Tables with less than 502 pages, and tables that have not had statistics collected qualify as small. For example, when NPAGES = -1.  
DB2 parameter NPGTHRSH in DSN6SPRM. |
| **OBJECT CREATE FORMAT** | The format of OBJECT CREATE. |
| **OBJECT REGISTRATION TABLE NAME** (RGFNMDRT) | The name of the object registration table.  
Install parameter OBJT REGISTRATION TABLE on panel DSNTIPZ, or ZPARM RGFNMORT in DSN6SPRM. |
| **ONLINE ZPARM TYPE** | The type of DB2 system parameter changed by the last SET SYSPARM statement. |
| **OPT1 ROWB LOCK SORT** | Specifies whether DB2 explicitly blocks sort operations when the OPTIMIZE FOR 1 ROW clause is specified on a query. Valid values are ENABLE or DISABLE.  
ZPARM OPT1ROWBLOCSORT in macro DSN6SPRM. |
| **OPTIMIZATION HINTS ALLOWED** (OPTHINTS) | Shows whether DB2 can use optimization hints from the PLAN TABLE to influence the access paths used for certain queries.  
Install parameter OPTIMIZATION HINTS on panel DSNTIP8, or ZPARM OPPTHINTS in DSN6SPRM. |
| **OPTIMIZE EXTENT SIZING** (MGEXTSZ) | Indicates whether DB2 uses sliding secondary quantity for DB2 managed data sets to optimize extent sizing. Install parameter OPTIMIZE EXTENT SIZING on panel DSNTIP7, or ZPARM MGEXTSZ in DSN6SYSP. |
| **OUTER JOIN PERFORM ENHANCEMENT** (OJPERFEH) | Indicates whether outer join performance enhancements are enabled.  
DB2 parameter OJPERFEH in DSN6SPRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTPUT BUFFER (OUTBUFF)</td>
<td>The output log buffer size in kilobytes. There is only one output log buffer per DB2 subsystem. Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations. Increasing this parameter also helps avoid log write waits for an available buffer during heavy update workload. When the specified size is not a 4 KB multiple, it is rounded up to the next 4 KB multiple. Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in DSN6LOGP.</td>
</tr>
<tr>
<td>PACKAGE AUTH CACHE SIZE</td>
<td>The amount of storage allocated for caching authorization information for all packages on this DB2 member. 32 KB hold about 375 collection-ID.package-IDs. The cache is stored in the DSN1DBM1 address space. Install parameter PACKAGE AUTH CACHE on panel DSNTIPP, or ZPARM CACHEPAC in DSN6SPRM.</td>
</tr>
</tbody>
</table>
| PAD INDEXES BY DEFAULT (PADIX)| Shows whether new indexes are be padded by default.  
• YES indicates that a new index is padded unless the NOT Padded option is specified on the CREATE INDEX statement.  
• The default value, NO, indicates that a new index is not padded unless the Padded option is specified on the CREATE INDEX statement. Install parameter PAD INDEXES BY DEFAULT on installation panel DSNTIPE, or ZPARM PADIX in DSN6SPRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>

<tr>
<td>REAL TIME STATS (STATSINT)</td>
<td>The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes. Install parameter REAL TIME STATS on panel DSNTIPO, or ZPARM STATSINT in DSN6SPRM.</td>
</tr>
<tr>
<td>REALSTORAGE MAX</td>
<td>The maximum amount of real storage.</td>
</tr>
<tr>
<td>REBIND PLAN MGMT DEF</td>
<td>Controls which queries are populated in the access path repository (ZPARM parameter PLANMGMTSCOPE). Possible values are: A ALL: Includes static and dynamic SQL queries. S STATIC: Includes static SQL queries only. This is the default. D DYNAMIC: Includes dynamic SQL queries only.</td>
</tr>
<tr>
<td>REBUILD INDEX (FLASHCOPY REBUILD INDEX)</td>
<td>The value of the FLASHCOPY REBUILD INDEX subsystem parameter specifies whether the FLASHCOPY option of the REBUILD INDEX utility is to be used by default. Acceptable values are NO (default) or YES. ZPARM FLASHCOPY REBUILD INDEX in DSN6SPRM.</td>
</tr>
</tbody>
</table>
| RECALL DATABASE (RECALL)                          | The RECALL subsystem parameter controls whether DFSMSHsm automatic recall is to be performed for DB2 databases:  
|                                                    | • YES indicates that DFSMSHsm is invoked to automatically recall migrated table spaces. This is the default.  
<p>|                                                    | • NO indicates that a DB2 table space that has been migrated is considered to be an unavailable resource. It must be recalled explicitly before DB2 can use it. ZPARM RECALL in DSN6SPRM. |</p>
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECALL DELAY (RECALLD)</td>
<td>The RECALLD subsystem parameter specifies the maximum length of time, in seconds, that a program can be delayed for a DFSMShsm recall. If the recall is not completed within the specified number of seconds, the program receives an error message indicating that the set is unavailable, but that a recall was initiated. If you use 0 and the RECALL DATABASE field is YES, the recall is performed asynchronously. This field is ignored if the RECALL DATABASE field is NO. The RECALL DELAY option is not used when running a DB2 utility against a DB2-migrated data set. ZPARM RECALLD in DSN6SPRM.</td>
</tr>
<tr>
<td>RECORDS BETWEEN CHECKPOINT (CHKLOGR)</td>
<td>Shows the number of records between log checkpoints if the LOG checkpoint type is BOTH (records and minutes). This field corresponds to field RECORDS/CHECKPOINT on installation panel DSNTIPL1, or ZPARM name CHKLOGR in DSN6SYSP.</td>
</tr>
<tr>
<td>RECORDS/CHECKPOINT (CHKFREQ)</td>
<td>Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached. You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records. Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.</td>
</tr>
<tr>
<td>REGISTRATION DATABASE (RGFDBNAM)</td>
<td>The name of the database that contains the registration tables. Install parameter REGISTRATION DATABASE on panel DSNTIPZ, or ZPARM RGFDBNAM in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>REORG LIST PROCESSING</td>
<td>Specifies the default setting for the PARALLEL option of the DB2 REORG TABLESPACE utility. Valid values for the REORG_LIST_PROCESSING subsystem parameter are PARALLEL and SERIAL. ZPARM REORG_LIST_PROCESSING in macro DSN6SPRM.</td>
</tr>
<tr>
<td>REORG MAPPING DATABASE</td>
<td>REORG mapping database.</td>
</tr>
<tr>
<td>REORG PART SORT NPSI</td>
<td>Specifies whether the REORG TABLESPACE PART utility decides to sort all of the keys of a non-partitioned secondary index. The setting is ignored for a REORG that is not part-level or without non-partitioned secondary indexes. The default value of REORG PART SORT NPSI is NO, which means that only keys of the non-partitioned secondary indexes that are in the scope of the REORG are sorted. ZPARM REORG PART SORT NPSI in DSN6SPRM.</td>
</tr>
<tr>
<td>REORG TABLESPACE (FLASHCOPY REORG TS)</td>
<td>The value of the FLASHCOPY REORG TS subsystem parameter specifies whether the FLASHCOPY option of the REORG TABLESPACE utility is to be used by default. Acceptable values are NO (default) or YES. ZPARM FLASHCOPY REORG TS in DSN6SPRM.</td>
</tr>
<tr>
<td>REQUIRE FULL NAMES (RGFFULLQ)</td>
<td>Indicates whether registered objects require fully qualified names. Install parameter REQUIRE FULL NAMES on panel DSNTIPZ, or ZPARM RGFFULLQ in DSN6SPRM.</td>
</tr>
<tr>
<td>RESIDENT TRACE TBL SIZE (TRACTBL)</td>
<td>Shows the size of the RES trace table in 4 KB blocks. A value of 16 means 64 KB have been allocated for this table. This is the default destination for the global trace records in DB2. Most trace records require 32-byte entries; events with more than three data items require 64-byte entries. Install parameter TRACE SIZE on panel DSNTIPN, or ZPARM TRACTBL in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>RESOURCE AUTHID (RLFAUTH)</td>
<td>The authorization ID used for the resource limit facility (governor). This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report. Install parameter RESOURCE AUTHID on panel DSNTIPP, or ZPARAM RLFAUTH in DSN6SYSP.</td>
</tr>
<tr>
<td>RESOURCE LIMIT AUTO START (RLF)</td>
<td>Shows whether the resource limit facility (governor) is automatically started when DB2 is started. Install parameter RLF AUTO START on panel DSNTIPO, or ZPARAM RLF in DSN6SYSP.</td>
</tr>
<tr>
<td>RESOURCE TIMEOUT (IRLMRWT)</td>
<td>The number of seconds before a timeout is detected. This is an integer multiple of DEADLOCK TIME on panel DSNTIPI. Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time. For data sharing, the actual timeout period is longer than the timeout value. Install parameter RESOURCE TIMEOUT on panel DSNTIPI, or ZPARAM IRLMRWT in DSN6SPRM.</td>
</tr>
<tr>
<td>RESTART OR DEFER (RESTART)</td>
<td>The RESTART subsystem parameter determines whether DB2 is to restart or defer processing for the specified databases, table spaces, and index spaces when DB2 is started. Acceptable values are RESTART (default) or DEFER. ZPARAM RESTART in DSN6SPRM.</td>
</tr>
<tr>
<td>RESTORE RECOVER FROMDUMP</td>
<td>If YES, the system-level backup that is the recovery base, is from a dump on tape. Otherwise NO is shown. Install parameter RESTORE/RECOVER on installation panel DSNTIP6, or ZPARAM RESTORE RECOVER FROMDUMP in DSN6SPRM.</td>
</tr>
<tr>
<td>RESTRICT ALT COL FOR DCC</td>
<td>Specifies whether restrictions apply to ALTER TABLE ALTER COLUMN statements for target tables that are defined with the DATA CAPTURE CHANGES attribute. Valid values are NO (default) and YES.RESTRICT_ALT_COL_FOR_DCC in macro DSN6SPRM.</td>
</tr>
<tr>
<td><strong>DB2 parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------</td>
</tr>
</tbody>
</table>
| RESYNC INTERVAL (RESYNC) | The number of minutes between resynchronization periods.  
A resynchronization period is the time during which indoubt logical units of work involving this DB2 subsystem and partner logical units are processed.  
Install parameter RESYNC INTERVAL on panel DSNTIPR, or ZPARM RESYNC in DSN6FAC. |
| RETAINED LOCK TIMEOUT (RETLWAIT) | Indicates whether a request is suspended until an incompatible retained lock becomes available.  
This value is only significant in a data sharing environment. It indicates how long a transaction should wait for a lock on a resource if another DB2 in the data sharing group has failed and is holding an incompatible lock on that resource. Locks held by failed DB2 members are called retained locks.  
This value is a multiplier that is applied to the connection’s normal timeout value. For example, if the retained lock multiplier is 2, then the timeout period for a call attachment connection that is waiting for a retained lock is twice the normal CAF timeout period. The default is 0, meaning applications do not wait for incompatible retained locks, the lock request is immediately rejected and the application receives a "resource unavailable" SQLCODE.  
Install parameter RETAINED LOCK TIMEOUT on panel DSNTIPI, or ZPARM RETLWAIT in DSN6SPRM. |
| RETENTION PERIOD (ARCRETN) | The number of days DB2 keeps archive log data sets.  
This value is added to the current date to calculate the expiration date.  
The retention period is often used in tape management systems to control the reuse and scratching of data sets and tapes. DB2 uses this as the value for the dynamic allocation parameter DALRETPD when archive log data sets are created.  
Install parameter RETENTION PERIOD on panel DSNTIPA, or ZPARM ARCRETN in DSN6ARVP. |

</thead>
</table>
| REVOKE DEP PRIV (REVOKE_DEP_PRIVILEGES) | Include dependent privileges on REVOKE. Possible values are:  
  - Y: If INCLUDING DEPENDENT PRIVILEGES is enforced.  
  - N: If NOT INCLUDING DEPENDENT PRIVILEGES is enforced.  
  - S: If specified in a REVOKE statement. |

**RLF ERROR PARAMETER**

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently executing statement.  

- **NOLIMIT** (default) allows all dynamic SQL statements to run without limit.  
- **NORUN** terminates all dynamic SQL statements immediately with an SQL error code.  

The number of CPU service units allowed for a query can be anywhere from 1 to 5000000.  

Install parameter RLST ACCESS ERROR (RLFERR) on panel DSNTIPR, or ZPARM RLFERRD in DSN6SYSP.

**RLST ACCESS ERROR (RLFERR)**

The action taken by DB2 when the governor cannot use the resource limit:

- **NOLIMIT**  
  The dynamic SQL statements run without limit.  

- **NORUN**  
  The dynamic SQL statements terminated with an SQL error code.  

A number from 1 to 5000000 represents the number of CPU service units allowed for a query. Install parameter RLST ACCESS ERROR (RLFERR) on panel DSNTIPO, or ZPARM RLFERRD in DSN6SYSP.

**RLST ACCESS ERROR (RLFERRD)**

The action taken by DB2 when the governor cannot use the resource limit:

- **NOLIMIT**  
  The dynamic SQL statements run without limit.  

- **NORUN**  
  The dynamic SQL statements terminated with an SQL error code.  

A number from 1 to 5000000 represents the number of CPU service units allowed for a query.  

Install parameter RLST ACCESS ERROR (RLFERRD) on panel DSNTIPO, or ZPARM RLFERRD in DSN6SYSP.
<table>
<thead>
<tr>
<th>DB2 parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RLIST NAME SUFFIX (RLFTBL)</td>
<td>The default resource limit specification table (RLST) suffix. This suffix is used when the resource limit facility (governor) is automatically started or when the governor is started without specifying a suffix. Install parameter RLIST NAME SUFFIX on panel DSNTIPO, or ZPARM RLFTBL in DSN6YSP.</td>
</tr>
<tr>
<td>RO SWITCH CHKPTS (PCLOSEN)</td>
<td>The number of consecutive DB2 checkpoints that a page set or partition can remain in read/write mode since it was last updated. When this limit or the RO SWITCH TIME is reached, DB2 changes the page set or partition to read only. This can improve performance for recovery, logging, and data-sharing processing. Install parameter RO SWITCH CHKPTS on panel DSNTIPL, or ZPARM PCLOSEN in DSN6YSP.</td>
</tr>
<tr>
<td>RO SWITCH TIME (PCLOSET)</td>
<td>The number of minutes that a page set or partition can remain in read-write mode since it was last updated. When this limit or the RO SWITCH CHKPTS is reached, DB2 changes the page set or partition to read-only. This can improve performance for recovery, logging, and data-sharing processing. Install parameter RO SWITCH TIME on panel DSNTIPL, or ZPARM PCLOSET in DSN6YSP.</td>
</tr>
<tr>
<td>ROUTINE AUTH CACHE (CACHERAC)</td>
<td>The amount of storage allocated for caching authorization information for all routines on this DB2 member. Routines include stored procedures and user-defined functions. 32 KB hold about 380 schema.routine.type entries. Install parameter ROUTINE AUTH CACHE on panel DSNTIPL, or ZPARM CACHERAC in DSN6SPRM.</td>
</tr>
</tbody>
</table>
| SEC ADMIN 1 TYPE (SECADM1 TYPE)       | Security administrator 1 type. Possible values are:  

  - Blank indicates that the authorization ID (AUTH ID) is used.
  - L Indicates that ROLE is used.

This field corresponds to field SEC ADMIN 1 TYPE on installation panel DSNTIPL, or ZPARM SECADM1_TYPE in DSN6SPRM. |
<table>
<thead>
<tr>
<th>DB2 parameter</th>

</table>
| SEC ADMIN 2 TYPE (SECADM2 TYPE) | Security administrator 2 type. Possible values are:  
    'blank' Indicates that the authorization ID (AUTH ID) is used.  
    'L' Indicates that ROLE is used.  
    This field corresponds to field SEC ADMIN 2 TYPE on installation panel DSNTIPPI, or ZPARM SECADM2_TYPE in DSN6SPRM. |
| SECONDARY QUANTITY (SECQTY) | The device type or unit name for storing archive log data sets.  
The value can be any alphanumeric string. If you choose to archive to DASD, you can specify a generic device type with a limited volume range. DB2 requires that all archive log data sets allocated on DASD are cataloged.  
If the device type is DASD, CATALOG DATA must be set to YES. If the unit name specifies DASD, the archive log data sets can extend to a maximum of 15 volumes. PRIQTY and SECQTY must be large enough to contain all active log data set data without extending beyond 15 volumes. If the unit name specifies a tape device, DB2 can extend to a maximum of 20 volumes. Default is TAPE.  
Install parameter DEVICE TYPE 1 on panel DSNTIPA, or ZPARM UNIT in DSN6ARVP. |
| SECURITY ADMIN 1 (SECADM1) | Security administrator 1 authorization ID (blank if ROLE).  
This field corresponds to field SECURITY ADMIN 1 on installation panel DSNTIPPI, or ZPARM SECADM1 in DSN6SPRM. |
| SECURITY ADMIN 2 (SECADM2) | Security administrator 2 authorization ID (blank if ROLE).  
This field corresponds to field SECURITY ADMIN 2 on installation panel DSNTIPPI, or ZPARM SECADM2 in DSN6SPRM. |
| SECURITY ADMIN1 TYPE | Security administrator 1 type. Possible values are:  
    '' Blank indicates that the authorization ID (AUTH ID) is used.  
    'L' Indicates that ROLE is used.  
    This field corresponds to field SEC ADMIN 1 TYPE on installation panel DSNTIPPI, or ZPARM SECADM1_TYPE in DSN6SPRM. |
<table>
<thead>

<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>START AUDIT TRACE (AUDITST)</td>
<td>Shows whether the audit trace is started automatically when DB2 is started. When YES, the audit trace is started for the default class (class 1) whenever DB2 is started. When ALL, an audit trace is automatically started for all classes. Install parameter AUDIT TRACE on panel DSNTIPN, or ZPARM AUDITST in DSN6SYSP.</td>
</tr>
<tr>
<td>START GLOBAL TRACE (TRACSTR)</td>
<td>Shows whether the global trace is started automatically when DB2 is started. When YES, the global trace starts for the default classes (classes 1, 2, and 3) whenever DB2 is started, and additional data consistency checks are made whenever a data page or index page is modified. When ALL, the global trace is automatically started for all classes. The global trace is used to diagnose problems in DB2 but it also impacts DB2 performance. If you have production systems requiring high performance, you might consider turning off global trace. If you do this, be aware that this presents a serviceability exposure. In the event of a system failure, IBM service personnel will ask you to turn on global trace and attempt to recreate the problem. Install parameter TRACE AUTO START on panel DSNTIPN, or ZPARM TRACSTR in DSN6SYSP.</td>
</tr>
<tr>
<td>START SMF ACCOUNTING (SMFACCT)</td>
<td>Shows whether DB2 sends accounting data to SMF automatically when DB2 is started. Numeric values show what classes are sent. When YES, the default class (class 1) is sent. When ALL, accounting classes one through five are started. The SMFPRM xx member of SYS1.PARMLIB must also be set to allow SMF to write the records. Install parameter SMF ACCOUNTING on panel DSNTIPN, or ZPARM SMFACCT in DSN6SYSP.</td>

<tr>
<td>START SMF STATISTICS (SMFSTAT)</td>
<td>Shows whether a Statistics trace was started automatically at DB2 startup time. The classes started are shown separated by commas. DB2 sends collected trace data to SMF. The SMFPRM xx member of SYS1.PARMLIB must be set to allow SMF to write the records. Install parameter SMF STATISTICS on panel DSNTIPN, or ZPARM SMFSTAT in DSN6SYSP.</td>
</tr>
<tr>
<td>STATFDBK SCOPE</td>
<td>STATFDBK scope.</td>
</tr>
<tr>
<td>STATISTICS CLUSTERING (STATCLUS)</td>
<td>Shows if the RUNSTATS utility uses enhanced or standard clustering statistics: ENHANCED is used if it is on, otherwise STANDARD is shown. Install parameter STATISTICS CLUSTERING on panel DSNTIP6, or ZPARM STATCLUS in DSN6SPRM.</td>
</tr>
<tr>
<td>STATISTICS HISTORY (STATHIST)</td>
<td>Shows which inserts and updates are recorded in catalog history tables. The report can show the following values: N / NONE Changes in the catalog are not recorded. This is the default. A / ALL All inserts and updates in the catalog are recorded. P / ACCESSPATH All inserts and updates to access path related catalog statistics are recorded. S / SPACE All inserts and updates to space related catalog statistics are recorded. Install parameter STATISTICS HISTORY on panel DSNTIPO, or ZPARM STATHIST in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STATISTICS ROLLUP DEFAULT (STATROLL)</td>
<td>Shows whether RUNSTATS utility aggregates the partition level statistics, even though some parts may not contain data. This should be YES for DB2 systems that have large partitioned table spaces, index spaces, or both. This enables the aggregation of part level statistics and helps the optimizer to choose a better access path. Install parameter STATISTICS ROLLUP on panel DSNTIPO, or ZPARM STATROLL in DSN6SPRM.</td>
</tr>
<tr>
<td>STATISTICS SYNC (SYNCVAL)</td>
<td>Shows whether DB2 statistics recording is synchronized with some part of the hour. The installation can specify that the DB2 statistics recording interval be synchronized with the beginning of the hour (00 minutes past the hour) or any number of minutes past the hour up to 59. Possible values are: 0-59, which indicate the synchronization point. When NO or N/A is shown, synchronization is disabled, this is the default. If STATISTICS TIME INTERVAL IN MINUTES (STATIME) is greater than 60, NO or N/A is shown. Install parameter STATISTICS SYNC on panel DSNTIPN, or ZPARM SYNCVAL in DSN6SYSP.</td>
</tr>
<tr>
<td>STATISTICS TIME INTERVAL (STATIME)</td>
<td>The time interval, in minutes, between statistics collections. Statistics records are written approximately at the end of this interval. Install parameter STATISTICS TIME on panel DSNTIPN, or ZPARM STATTIME in DSN6SYSP.</td>
</tr>
<tr>
<td>STRING DELIMITER (DELIM)</td>
<td>Shows the string delimiter for COBOL. Default string delimiter is the quotation mark. This option is applicable to all types of COBOL. Install parameter STRING DELIMITER on panel DSNTIPF, or ZPARM DELIM in DSNHDECP.</td>
</tr>
<tr>
<td>SU CONVERSION FACTOR</td>
<td>The CPU service unit conversion factor for this CPU. This factor allows conversion CPU time in seconds to a common unit, called service unit (SU). The conversion factor used depends on the machine. Service units allow you to calculate CPU execution times across a data sharing group.</td>
</tr>

<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>TCP/IP KEEPALIVE (TCPKPALV)</td>
<td>Indicates whether the TCP/IP configuration KeepAlive value has been overwritten. When ENABLE (default), KeepAlive is enabled, the TCP/IP configuration stack value is used. When DISABLE, TCP/IP KeepAlive has been disabled. A value in the range 1 through 65534 means KeepAlive is active, and the TCP/IP stack value has been overridden. The number reported shows the time, in seconds, between TCP/IP probes. When considering overwriting the keep-alive time, it is recommended to set a value close to the IDLE THREAD TIMEOUT value on installation panel DSNTIPR or the IRLM RESOURCE TIMEOUT value on installation panel DSNTIP1. It is good practice to set all these to about five minutes, or less. Because KeepAlive detection is accomplished by probing the network at this interval, avoid small values, which can cause excessive network traffic and system resource consumption. The trick is to find a proper balance that allows network failures to be detected on a timely basis without impacting system and network performance. Install parameter TCP/IP KEEPALIVE on panel DSNTIP5, ZPARM TCPKPALV in DSN6FAC.</td>
</tr>
<tr>
<td>TEMP DS UNIT NAME (VOLTDEVT)</td>
<td>Shows the device type or unit name for allocating temporary data sets. It is the direct access or disk unit name used for the precompiler, compiler, assembler, sort, linkage editor, and utility work-files in the tailored jobs and CLISTs. It can be any device type acceptable to the DYNALLOC parameter of the SORT or OPTION options for DFSORT. The default is SYSDA. Install parameter TEMPORARY UNIT NAME on DSNTIPA2, or ZPARM VOLTDEVT in DSN6SPRM.</td>
</tr>
<tr>
<td>TEMPLATE TIME</td>
<td>The template time.</td>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEMPORARY UNIT NAME</td>
<td>The value of the TEMPORARY UNIT NAME field specifies the device type or unit name that is to be used for allocating temporary data sets. The value of TEMPORARY UNIT NAME is the direct access or disk unit name that is used for the precompiler, compiler, assembler, sort, linkage editor, and utility work files in the tailored jobs and CLISTs.</td>
</tr>
<tr>
<td>THE LIMIT IN SUS</td>
<td>The limit in service units (SUS).</td>
</tr>
<tr>
<td>TIME FORMAT (TIME)</td>
<td>Indicates the default output format for times. Valid values are ISO (hh.mm.ss), USA (hh:mm AM), EUR (hh:mm:ss), JIS (hh:mm:ss), or LOCAL (your choice, defined by a time exit routine). DB2 interprets the input time from the punctuation and converts the output time to the required format. Install parameter TIME FORMAT on panel DSNTIP4, or ZPARM TIME in DSNHDECP.</td>
</tr>
<tr>
<td>TIME OF LAST CHANGE</td>
<td>Time of the last online change made to DB2 system settings.</td>
</tr>
<tr>
<td>TIME TO AUTOSTART (IRLMSWT)</td>
<td>The IRLM wait time in seconds. DB2 autostart abends if IRLM does not start within this time. Install parameter TIME TO AUTOSTART on panel DSNTIP1, or ZPARM IRLMSWT in DSN6SPRM.</td>
</tr>
<tr>
<td>TIMEOUT INTERVAL</td>
<td>The approximate time, in seconds, that an active server thread can remain idle before it is canceled. Inactive and indoubt threads are not subject to timeout. Threads are checked for timeouts every 3 minutes. This means that timeouts might not be honored for up to 3 minutes when the timeout value is less than this. 0 (default) means timeout processing is disabled, idle server threads remain in the system and continue to hold their resources, if any. Install parameter IDLE THREAD TIMEOUT on panel DSNTIPR, or ZPARM IDTHTOIN in DSN6FAC.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>TIMEOUT VALUE (STOR TIME)</strong></td>
<td>The number of seconds before DB2 stops waiting for an SQL CALL statement to be assigned to one of the TCBs in the DB2 stored procedures address space. Install parameter TIMEOUT VALUE on panel DSNTIPX, or ZPARM STOR TIME in DSN6SPR.</td>
</tr>
<tr>
<td><strong>TIMESTAMP IN NAME (TSTAMP)</strong></td>
<td>Determines whether the time stamp is to be placed in the name of an archive log data set. You can specify YES or NO. This field is a constant for QWP3FLG1.</td>
</tr>
<tr>
<td><strong>TRACKER SITE (TRKRSITE)</strong></td>
<td>Indicates whether this subsystem is a remote tracker site for another DB2 subsystem.</td>
</tr>
<tr>
<td></td>
<td>When YES, this is a tracker site. A DB2 tracker site is a separate DB2 subsystem or data sharing group that exists solely for the purpose of keeping shadow copies of your primary site's data. No independent work can be run on the tracker site. Install parameter TRACKER TYPE on panel DSNTIPO, or ZPARM TRKRSITE in DSN6SPR.</td>
</tr>
<tr>
<td><strong>U LOCK FOR RR OR RS (RRULOCK)</strong></td>
<td>Indicates whether the U (UPDATE) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table.</td>
</tr>
<tr>
<td></td>
<td>When YES, the U lock is used for an updated cursor with repeatable read or read stability.</td>
</tr>
<tr>
<td></td>
<td>When NO, the S lock is used for an updated cursor with repeatable read or read stability.</td>
</tr>
<tr>
<td></td>
<td>If the cursor in the running applications includes the clause FOR UPDATE OF, but updates are infrequent, S locks generally provide better performance.</td>
</tr>
<tr>
<td></td>
<td>Install parameter U LOCK FOR RR/RS on panel DSNTIPI, or ZPARM RRULOCK in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>UNICODE GRAPHIC CCSID (UGCCSID)</strong></td>
<td>Unicode graphics character set identification. Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UGCCSID in macro DSNHDECP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UNICODE IFCIDS (UIFCIDS)</td>
<td>Shows whether output from IFC records should include Unicode information. Only a subset of the character fields (identified in the IFCID record definition by a %U in the comment area to the right of the field declaration in the DSNDQWxx copy files) are encoded in Unicode. The remaining fields maintain the same encoding of previous releases. Install parameter UNICODE IFCIDS on panel DSNTIPN, or ZPARM UIFCIDS in DSN6SYSP.</td>
</tr>
<tr>
<td>UNICODE MIXED CCSID (UMCCSID)</td>
<td>Unicode Mixed Character Set identification. Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM UMCCSID in macro DSNHDECP.</td>
</tr>
<tr>
<td>UNICODE SINGLE-BYTE CCSID (USCCSID)</td>
<td>Unicode Single Byte Character Set identification. Parameter UNICODE CCSID in installation panel DSNTIPF, or ZPARM USCCSID in macro DSNHDECP.</td>
</tr>
<tr>
<td>UNION COLNAME 7</td>
<td>The UNION COLNAME 7.</td>
</tr>
<tr>
<td>UNKNOWN AUTHID (DEFLTID)</td>
<td>The authorization ID used if RACF is not available for batch access and USER= is not specified in the job statement. This identifier can be a long string. If there is insufficient space to show the complete string, the string is truncated in the report block. The complete string is shown in a separate list of long names at the end of the report. Install parameter UNKNOWN AUTHID on panel DSNTIPF, or ZPARM DEFLTID in DSN6SPRM.</td>
</tr>
<tr>
<td>UNREGISTERED DDL DEFAULT (RGFDEFLT)</td>
<td>The action taken for DDL that names an unregistered object. Options are REJECT, ACCEPT, or APPL, which rejects the DDL when the current application is not registered. Install parameter UNREGISTERED DDL DEFAULT on panel DSNTIPZ, or ZPARM RGFDEFLT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>UPDATE PART KEY COLUMNS (PARTKEYU)</strong></td>
<td>Indicates whether values in columns that participate in partitioning keys can be updated. Possible values are YES, NO, or SAME. When SAME, updates are allowed only when the updated row remains in the same partition. The default value is YES. Install parameter UPDATE PART KEY COLS on panel DSNTIP8, or ZPARM PARTKEYU in DSN6SPRM.</td>
</tr>
<tr>
<td><strong>UR CHECKPOINT FREQ (URCHKTH)</strong></td>
<td>Shows the number of checkpoint cycles to complete before DB2 issues a warning message to the console and writes an IFCID 313 record for an uncommitted, indoubt, or inflight unit of recovery (UR). The default is 0, which disables this option. Install parameter UR CHECK FREQ on panel DSNTIPL, or ZPARM URCHKTH in DSN6SYSP.</td>
</tr>
<tr>
<td><strong>UR LOG WRITE CHECK (URLGWTH)</strong></td>
<td>Shows the number of log records that are to be written by an uncommitted unit of recovery (UR) before DB2 issues a warning message to the console. This provides notification of a long-running UR. Long-running URs might result in a lengthy DB2 restart or a lengthy recovery situation for critical tables. Log records are specified in 1-K (1000 log records) increments. A value of 0 indicates that no write check is to be performed. Install parameter UR LOG WRITE CHECK on panel DSNTIPL, ZPARM URLGWTH in DSN6SYSP.</td>
</tr>
<tr>
<td><strong>UR WARNING THRESHOLD MINUTES (LRDRTHLD)</strong></td>
<td>Shows the number of minutes that a read claim can be held by an agent before DB2 reports it as a long-running reader. Valid values are 0 (default) through 1439. Install parameter LONG-RUNNING READER on installation panel DSNTIPE, or ZPARM LRDRTHLD in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>USE FOR DYNAMIC RULES (DYNRULS)</td>
<td>Shows whether DB2 uses the application programming defaults specified on this panel or those of the DB2 precompiler options for dynamic SQL statements bound using DYNAMICRULES bind, define, or invoke behavior.</td>
</tr>
<tr>
<td></td>
<td>When YES, the application programming (DSNHDDECL) defaults are used for dynamic SQL statements in plans or packages bound using DYNAMICRULES bind, define, or invoke behavior.</td>
</tr>
<tr>
<td></td>
<td>The following defaults are affected:</td>
</tr>
<tr>
<td></td>
<td>• DECIMAL POINT IS</td>
</tr>
<tr>
<td></td>
<td>• STRING DELIMITER</td>
</tr>
<tr>
<td></td>
<td>• SQL STRING DELIMITER</td>
</tr>
<tr>
<td></td>
<td>• MIXED DATA</td>
</tr>
<tr>
<td></td>
<td>• DECIMAL ARITHMETIC</td>
</tr>
<tr>
<td></td>
<td>When NO, values of the precompiler options are used for dynamic SQL statements in plans or packages bound with DYNAMICRULES(BIND).</td>
</tr>
<tr>
<td></td>
<td>Install parameter USE FOR DYNAMICRULES on panel DSNTIP4, or ZPARM DYNRULS in DSNHDECPL.</td>
</tr>
<tr>
<td>USE PROTECTION (AUTH)</td>
<td>Shows whether DB2 performs authorization checking.</td>
</tr>
<tr>
<td></td>
<td>When all authorization checking by DB2 is disabled, the GRANT statement is also disabled (granting every privilege to PUBLIC); this is not recommended.</td>
</tr>
<tr>
<td></td>
<td>Install parameter USE PROTECTION on panel DSNTIPP; or ZPARM AUTH in DSN6SPRM.</td>
</tr>
<tr>
<td>USER ID MONITOR (SPRMOZUS)</td>
<td>The user ID that made the last online change to DB2 system settings.</td>
</tr>
<tr>
<td>USER LOB VALUE STORAGE (LOBVALA)</td>
<td>Specifies an integer that establishes an upper limit for the amount of storage each user can be used for storing lob values (in KB).</td>
</tr>
<tr>
<td>USER XML VALUE STORAGE (XMLVALA)</td>
<td>The maximum amount of memory for each user for storing XML values. This is ZPARM XMLVALA in DSN6SYSR.</td>
</tr>
<tr>
<td>UT DB2 SORT USE (DB2SORT)</td>
<td>The DB2SORT subsystem parameter specifies whether DB2 utilities are to use DB2 Sort instead of DFSORT for utility sort processing when DB2 Sort is installed. Acceptable values are ENABLE (default) or DISABLE. ZPARM DB2SORT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>UT SORT DATA SET ALLOCATION (UTSORTAL)</td>
<td>The UTSORTAL subsystem parameter specifies how sort work data sets are allocated when utilities are run. This parameter applies to the CHECK, LOAD, REBUILD, REORG, and RUNSTATS utilities. Acceptable values are YES (default) or NO. ZPARM UTSORTAL in DSN6SPRM.</td>
</tr>
<tr>
<td>UTILITY CACHE OPTION (SEQPRES)</td>
<td>Shows whether utilities that scan a nonpartitioned index followed by an update of a subset of the pages in the index allow data to remain in 3990 cache longer when reading data. Install parameter UTILITY CACHE OPTION on panel DSNTIPE, or ZPARM SEQPRES in DSN6PRM.</td>
</tr>
<tr>
<td>UTILITY OBJECT CONVERSION</td>
<td>The conversion of UTILITY OBJECT.</td>
</tr>
<tr>
<td>UTILITY TIMEOUT FACTOR (UTIMOUT)</td>
<td>Shows how much longer utilities can wait for a resource than SQL applications can. This is the number of RESOURCE TIMEOUT units that a utility or utility command can wait for a lock or for all claims on a resource of a particular claim class to be released. The default value is 6, meaning a utility can wait 6 times longer than an SQL application for a resource. Install parameter UTILITY TIMEOUT on panel DSNTIPI, or ZPARM UTIMOUT in DSN6PRM.</td>
</tr>
<tr>
<td>VALUE FOR TRIGGER DRAIN (SPRMTDD)</td>
<td>The percentage below 100% DSMAX that open data sets can reach before an asynchronous drain is started. The default is 1, meaning that asynchronous drain starts when the number of open data sets reaches 99% of DSMAX. DB2 defers closing and deallocating the table spaces or indexes until the number of open data sets reaches one of the following limits: • The MVS limit for the number of concurrently open data sets. • 99% (default) of the value that you specified for DSMAX. When one of these limits is reached, DB2 closes a number of data sets not in use equal to 3% (default) of the value DSMAX. Thus, DSMAX controls not only the limit of open data sets, but also the number of data sets that are closed when that limit is reached. DB2 parameter SPRMTDD in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VARCHAR INDEX (RETVLCFK)</td>
<td>Indicates whether the VARCHAR column is retrieved from the index. The data sharing scope of this parameter is GROUP. When NO, index-only access of variable length column data is disabled. DB2 must retrieve data from the data page. Data is retrieved with no padding. When YES, index-only access of variable length column data is enabled. This can improve performance. Data retrieved from the index is padded with blanks to the maximum length of the column. Install parameter VARCHAR FROM INDEX on panel DSNTIP8, or ZPARM RETVLCFK in DSN6SPRM.</td>
</tr>
<tr>
<td>VARY DS CONTROL INTERVAL (DSVCI)</td>
<td>Specifies whether DB2 optimizes VSAM CONTROL INTERVAL to page size for data set allocation. It shows if DB2-managed data sets created by CREATE TABLESPACE have variable VSAM control intervals (VARY DS CONTROL INTERVAL). Install parameter VARY DS CONTROL INTERVAL on panel DSNTIP7, or ZPARM DSVCI in DSN6SYSP.</td>
</tr>
<tr>
<td>WFSTGUSE AGENT THRESHOLD</td>
<td>The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database by an agent (derived from ZPARM WFSTGUSE_AGENT_THRESHOLD).</td>
</tr>
<tr>
<td>WFSTGUSE SYSTEM THRESHOLD</td>
<td>The alert threshold of high space-usage for DGTTs or non-DGTT work files in the Workfile Database (derived from zparm WFSTGUSE_SYSTEM_THRESHOLD).</td>
</tr>
<tr>
<td>WLM ENVIRONMENT (WLMENV)</td>
<td>Workload manager environment. Install parameter WLM ENVIRONMENT on panel DSNTIPX, or ZPARM WLMENV in DSN6SYSP.</td>
</tr>
<tr>
<td>WTO ROUTING CODES (ROUTCDE)</td>
<td>The MVS console routing codes. These codes are assigned to messages that are not solicited from a specific console. Up to 16 comma-separated codes can be shown. Install parameter WTO ROUTE CODES on panel DSNTIPO, or ZPARM ROUTCDE in DSN6SYSP.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>WTOR BEFORE MOUNT FOR ARCHIVE (ARCWTOR)</td>
<td>Indicates whether DB2 must send a message to the operator and wait for an answer before attempting to mount an archive log data set. Other DB2 users can be forced to wait while the mount is pending. They are not affected while DB2 is waiting for a response to the message. When YES, a device such as tape is used that requires long delays for mounts. DEVICE TYPE 1 shows the device type or unit name. Install parameter WRITE TO OPER on panel DSNTIPA, or ZPARM ARCWTOR in DSN6ARVP.</td>
</tr>
<tr>
<td>X LOCK FOR SEARCHED U/D (XLKUPDLT)</td>
<td>The locking method used when performing a searched UPDATE or DELETE. When NO, DB2 uses an S or U lock when scanning for qualifying rows. For any qualifying rows or pages the lock is upgraded to an X lock before performing the update or delete. For nonqualifying rows or pages the lock is released if using ISOLATION(CS). For ISOLATION(RS), or ISOLATION(RR), an S lock is retained on the rows or pages until the next commit point. This option is used to achieve higher rates of concurrency. When YES, DB2 gets an X lock on qualifying rows or pages. For ISOLATION(CS), the lock is released if the rows or pages are not updated or deleted. For ISOLATION(RS) or ISOLATION(RR), an X lock is retained until the next commit point. This is beneficial in a data sharing environment when most or all searched updates and deletes use an index. The downside is that if searched updates or deletes result in a tablespace scan, the likelihood of timeouts and deadlocks greatly increases. Install parameter X LOCK FOR SEARCHED U/D on panel DSNTIPI, or ZPARM XLKUPDLT in DSN6SPRM.</td>
</tr>
<tr>
<td>DB2 parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>XML RANDOMIZE DOCID</td>
<td>Specifies whether DB2 is to sequentially or randomly generate the DOCID values for XML columns. This parameter does not affect existing tables that have XML columns. Those tables continue to generate DOCIDs in the order that was specified by XML RANDOMIZE DOCID when the table was created or in sequential order if the parameter was not specified. Acceptable values are NO (default) or YES. ZPARM XML RANDOMIZE in DSN6SYSP.</td>
</tr>
<tr>
<td>Z/OS CRITICAL RESERVED SPACE MUST COMPLETE</td>
<td>The amount of space reserved for z/OS critical work that must be completed.</td>
</tr>
<tr>
<td>Z/OS LOCK TABLE HASH ENTRIES</td>
<td>The number of z/OS lock table hash entries.</td>
</tr>
<tr>
<td>Z/OS LOCK TABLE LIST ENTRIES</td>
<td>The number of z/OS lock table list entries.</td>
</tr>
<tr>
<td>Z/OS METRICS (ZOSMETRICS)</td>
<td>YES indicates that gathering of z/OS metrics using the RMF interface is enabled. ZPARM ZOSMETRICS in DSN6SPRM.</td>
</tr>
<tr>
<td>Z/OS RESERVED SPACE</td>
<td>The z/OS reserved space.</td>
</tr>
</tbody>
</table>

**Field Value** The value of the DB2 field. It is an alphanumeric text string with a maximum of 44 characters.

**Interval Start** The start time of this interval.

**MVS System ID** The MVS system identifier.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**DSG DB2 Parameters:**
Use DSG DB2 Parameters attributes to view DB2 parameters for data sharing groups.

**DB2 ID** The DB2 subsystem ID.

**Data Sharing Group** The name of the Data Sharing Group.

**Data Sharing Member** The name of the Data Sharing Group Member.

**Field Description** The description of the data field.

**Field Name** The name of the data field.

**Field Value** The data value.

**Interval Start** The start time of this interval.

**MVS System ID** The MVS system identifier.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Sequence Number** The sequence number of the data field.

**DSG DSNZP Parm Archiving Parameters Workspace:**

The DSG DSNZP Parm Archiving Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 archiving.

This workspace is comprised of the following views:

**DSNZP Parm Module Information (table view)**

Shows the name and the assembly date of the current, initial, and previous DSNZP Parm module.

**DSNTIPA - Archive Log Parameters (table view)**

Shows the DB2 field names, ZP Parm names, and the values set for each parameter. These entries define the characteristics of archive log data sets.

**DSNTIPH - System Resource (table view)**

Shows the DB2 field names, ZP Parm names, and the values set for each parameter. These entries specify the names of bootstrap data sets, active logs, and archive logs. These entries also specify the number of copies (1 for single logging or 2 for dual logging) for the active and archive logs.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZP Parm Authorization, RLF, and DDF Parameters Workspace:**

The DSG DSNZP Parm Authorization, RLF, and DDF Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 access and security.

This workspace is comprised of the following views:

**DSNZP Parm Module Information (table view)**

Shows the name and the assembly date of the current, initial, and previous DSNZP Parm module.

**DSNTIPO - Operator Functions (table view)**

Shows the DB2 field names, ZP Parm names, and the values set for each parameter. These entries affect various operator functions. These functions include write-to-operator route codes, automatic recall, and the maximum amount of CPU time that is to be allocated for a dynamic SQL statement.

**DSNTIPP - Protection 1 (table view)**

Shows the DB2 field names, ZP Parm names, and the values set for each parameter. These entries define security information.
DSNTIPP - Protection 2 (table view)
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define security information.

DSNTIPR - DDF 1 (table view)
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

DSNTIPR - DDF 2 (table view)
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZP ARM Buffer Pool Parameters Workspace:
The DSG DSNZP ARM Buffer Pool Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 buffer pool default settings.

This workspace is comprised of the following views:

DSNZP ARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZP ARM module.

DSNTIP1 - Buffer Pools (table view)
Shows the DB2 field names, ZP ARM names, and the values set for each parameter. These entries specify the size of your virtual buffer pools.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZP ARM Data Parameters Workspace:
The DSG DSNZP ARM Data Parameters workspace for data sharing groups (DSG) shows information about the data that affects the default settings of the DB2 application.

This workspace is comprised of the following views:
DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIP2 - Data (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the name of the ICF catalog for DB2 VSAM data sets and indicate whether to create the specified catalog. The entries also define z/OS Storage Management Subsystem (SMS) classes that are to be used when defining data sets for the DB2 catalog and directory.

DSNTIP3 - Default Startup (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the default member names of certain modules that are to be loaded at DB2 startup. These modules are the system parameter module, the application default module, and the exit modules.

DSNTIPM - MVS Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the specifications for the DSNTIJMV job, which defines DB2 to z/OS and updates several PARMLIB members.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Data Sharing Parameters Workspace:
The DSG DSNZPARM Data Sharing Parameters workspace for data sharing groups (DSG) shows information about the data sharing installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPK - Data Sharing Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data sharing function (GROUP, MEMBER, or ENABLE).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSG DSNZPARM Data Set and Database Parameters Workspace:

The DSG DSNZPARM Data Set Parameters workspace for data sharing groups (DSG) shows information about the data set and database-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIP7 - SQL Object Defaults 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

**DSNTIP71 - SQL Object Defaults 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

**DSNTIP9 - Workfile Database (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the 4 KB and 32 KB page size table spaces in the DB2 Workfile Database.

**DSNTIPS - Auto Start DB/TS (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the databases, table spaces, and index spaces to restart automatically when you start DB2.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM DDCS Parameters Workspace:

The DSG DSNZPARM Data Definition Control Support (DDCS) Parameters workspace for data sharing groups (DSG) shows information about the DDCS installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.
DSNTIPZ - Data Definition Control (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data definition control support.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM IRLM Parameters Workspace:

The DSG DSNZPARM Internal Resource Lock Manager (IRLM) Parameters workspace for data sharing groups (DSG) shows information about the IRLM with which DB2 communicates.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
   Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPI - IRLM 1 (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

DSNTIPI - IRLM 2 (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

DSNTIPI - IRLM Processing Parm (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the IRLM processing parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Logging Parameters Workspace:

The DSG DSNZPARM Logging Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect DB2 logging.

This workspace is comprised of the following views:
DSNZP Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZP module.

DSNTIPL - Active Log Parms (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics of active log data sets.

DSNTIPL1 - Checkpoint Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics for log checkpoints.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZP Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZP module.

From DSN6SYSP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SYSP macro.

From DSN6SPRM1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

From DSN6SPRM2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

From DSN6LOGP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6LOGP macro.

From DSN6ARVP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6ARVP macro.
From DSN6FAC (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the data-only subsystem parameters that are provided with the DSN6FAC macro.

From DSNHDECP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the parameters of the application default load module DSNHDECP which is generated as part of the DB2 installation or migration.

Others (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the other system parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Performance and Optimization Parameters Workspace:

The DSG DSNZPARM Performance and Optimization Parameters workspace for data sharing groups (DSG) shows information about the installation parameters for performance and optimization invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIP8 - Performance and Optimization 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

DSNTIP81 - Performance and Optimization 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

DSNTIP82 - Query Accelerator Ref (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the performance and optimization parameters for query accelerators.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPAREM Storage and Size Parameters Workspace:

The DSG DSNZPAREM Storage and Size Parameters workspace for data sharing groups (DSG) shows virtual storage allocations for the DB2 buffer pools and the Environmental Descriptor Manager (EDM) pool.

This workspace is comprised of the following views:

DSNZPAREM Module Information (table view)
- Shows the name and the assembly date of the current, initial, and previous DSNZPAREM module.

DSNTIPC - Storage Sizes (table view)
- Shows the DB2 field names, ZPAREM names, and the values set for each parameter. These entries show the messages that the installation CLIST issues to indicate calculated storage sizes.

DSNTIPD - Sizes (table view)
- Shows the DB2 field names, ZPAREM names, and the values set for each parameter. These entries show the size of the DB2 catalog, directory, and log data sets. They also define the amount of storage that can be used for storing large object (LOB) values.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPAREM Stored Procedures Parameters Workspace:

The DSG DSNZPAREM Stored Procedures Parameters workspace for data sharing groups (DSG) shows information about the installation parameters in the DSNZPAREM module for stored procedures invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPAREM Module Information (table view)
- Shows the name and the assembly date of the current, initial, and previous DSNZPAREM module.

DSNTIPX - Routine Parameters (table view)
- Shows the DB2 field names, ZPAREM names, and the values set for each parameter. These entries are used to start the stored procedures address space so that it can run stored procedures or user-defined functions.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Thread Parameters Workspace:**

The DSG DSNZPARM Thread Parameters workspace for data sharing groups (DSG) shows information about the DB2 system-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIPE - Thread Management 1 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

- **DSNTIPE1 - Thread Management 2 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSG DSNZPARM Trace Parameters Workspace:**

The DSG DSNZPARM Trace Parameters workspace for data sharing groups (DSG) shows information about the automatic startup of traces in DB2.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIPN - Trace Parameters (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the audit, global, accounting, and monitor traces and the checkpoint frequency.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSG DSNZPARM Utility Parameters Workspace:

The DSG DSNZPARM Utility Parameters workspace for data sharing groups (DSG) shows information about the utility parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIP6 - UtilityParms 1 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

- **DSNTIP6 - UtilityParms 2 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

- **DSNTIP6 - UtilityParms 3 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSG DSNZPARM Application Parameters Workspace:

The DSG DSNZPARM Application Parameters workspace for data sharing groups (DSG) shows information about the parameters that affect the default settings of the DB2 application.

This workspace is comprised of the following views:

- **DSNZPARM Module Information (table view)**
  Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

- **DSNTIPF - Application Default 1 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

- **DSNTIP4 - Application Default 2 (table view)**
  Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels,
the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

**DSNTIP4 - Application Default 3 (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Application Parameters Workspace:**

The DSNZPARM Application Parameters workspace shows information about the parameters that affect the default settings of the DB2 application.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**

Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPF - Application Default 1 (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

**DSNTIP4 - Application Default 2 (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

**DSNTIP4 - Application Default 3 (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define application programming default values. These values are used as default values by the program preparation panels, the program preparation CLIST (DSNH), and the precompiler. These values can also be used as default values by other programs, such as DB2 QMF.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Archiving Parameters Workspace:**

The DSNZPARM Archiving Parameters workspace shows information about the parameters that affect DB2 archiving.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPA - Archive Log Parameters (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the characteristics of archive log data sets.

**DSNTIPH - System Resource (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries specify the names of bootstrap data sets, active logs, and archive logs. These entries also specify the number of copies (1 for single logging or 2 for dual logging) for the active and archive logs.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Authorization, RLF, and DDF Parameters Workspace:**

The DSNZPARM Authorization, RLF, and DDF Parameters workspace shows information about the parameters that affect DB2 access and security.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPO - Operator Functions (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect various operator functions. These functions include write-to-operator route codes, automatic recall, and the maximum amount of CPU time that is to be allocated for a dynamic SQL statement.

**DSNTIPP - Protection 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define security information.

**DSNTIPP - Protection 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define security information.
DSNTIPR - DDF 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

DSNTIPR - DDF 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the configuration options for the SYSIBM.USERNAMES encryption routine.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARAM Buffer Pool Parameters Workspace:

The DSNZPARAM Buffer Pool Parameters workspace shows information about the parameters that affect DB2 buffer pool default settings.

This workspace is comprised of the following views:

DSNZPARAM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.

DSNTIP1 - Buffer Pools (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries specify the size of your virtual buffer pools.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARAM Data Sharing Parameters Workspace:

The DSNZPARAM Data Sharing Parameters workspace shows information about the data sharing installation parameters in the DSNZPARAM module.

This workspace is comprised of the following views:

DSNZPARAM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.
DSNTIPK - Data Sharing Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data sharing function (GROUP, MEMBER, or ENABLE).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Data Set and Database Parameters Workspace:
The DSNZPARM Data Set Parameters workspace shows information about the data set and database-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIP7 - SQL Object Defaults 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

DSNTIP71 - SQL Object Defaults 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define default values for the system-required objects that DB2 creates automatically. DB2 uses these options for any indexes or table spaces that it implicitly creates. The remaining fields provide general default settings for creating table spaces.

DSNTIP9 - Workfile Database (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the 4 KB and 32 KB page size table spaces in the DB2 Workfile Database.

DSNTIPS - Auto Start DB/TS (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the databases, table spaces, and index spaces to restart automatically when you start DB2.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSNZPARM DDCS Parameters Workspace:

The DSNZPARM Data Definition Control Support (DDCS) Parameters workspace shows information about the DDCS installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPZ - Data Definition Control (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the data definition control support.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM IRLM Parameters Workspace:

The DSNZPARM Internal Resource Lock Manager (IRLM) Parameters workspace shows information about the IRLM with which DB2 communicates.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
- Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPI - IRLM 1 (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

**DSNTIPI - IRLM 2 (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the installation of the internal resource lock manager (IRLM).

**DSNTIPI - IRLM ProcessingParms (table view)**
- Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the IRLM processing parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Logging Parameters Workspace:**

The DSNZPARM Logging Parameters workspace shows information about the parameters that affect DB2 logging.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPL - Active Log Parms (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics of active log data sets.

**DSNTIPL1 - Checkpoint Parameters (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define characteristics for log checkpoints.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Other System Parameters Workspace:**

The DSNZPARM Other System Parameters workspace shows information about the other system parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**From DSN6SYSP (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SYSP macro.

**From DSN6SPRM1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.

**From DSN6SPRM2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6SPRM macro.
From DSN6LOGP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6LOGP macro.

From DSN6ARVP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the DSN6ARVP macro.

From DSN6FAC (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the data-only subsystem parameters that are provided with the DSN6FAC macro.

From DSNHDECP (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the parameters of the application default load module DSNHDECP which is generated as part of the DB2 installation or migration.

Others (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the subsystem parameters that are associated with the other system parameters.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARAM Performance and Optimization Parameters Workspace:

The DSNZPARAM Performance and Optimization Parameters workspace shows information about the installation parameters for performance and optimization invoked by SQL CALL statements.

This workspace is comprised of the following views:

**DSNZPARAM Module Information (table view)**
Shows the name and the assembly date of the current, initial, and previous DSNZPARAM module.

**DSNTIP8 - Performance and Optimization 1 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.

**DSNTIP81 - Performance and Optimization 2 (table view)**
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries set the application programming default values pertaining to performance and optimization.
**DSNTIP82 - Query Accelerator Ref (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the performance and optimization parameters for query accelerators.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Storage and Size Parameters Workspace:**

The DSNZPARM Storage and Size Parameters workspace shows virtual storage allocations for the DB2 buffer pools and the Environmental Descriptor Manager (EDM) pool.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**

Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

**DSNTIPC - Storage Sizes (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the messages that the installation CLIST issues to indicate calculated storage sizes.

**DSNTIPD - Sizes (table view)**

Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the size of the DB2 catalog, directory, and log data sets. They also define the amount of storage that can be used for storing large object (LOB) values.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DSNZPARM Thread Parameters Workspace:**

The DSNZPARM Thread Parameters workspace shows information about the DB2 system-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

**DSNZPARM Module Information (table view)**

Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.
DSNTIPE - Thread Management 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

DSNTIPE1 - Thread Management 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Thread Parameters Workspace:

The DSNZPARM Thread Parameters workspace shows information about the DB2 system-related installation parameters in the DSNZPARM module.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPE - Thread Management 1 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

DSNTIPE1 - Thread Management 2 (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries determine the main storage sizes.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Data Parameters Workspace:

The DSNZPARM Data Parameters workspace shows information about the data that affects the default settings of the DB2 application.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.
DSNTIPA2 - Data (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the name of the ICF catalog for DB2 VSAM data sets and indicate whether to create the specified catalog. The entries also define z/OS Storage Management Subsystem (SMS) classes that are to be used when defining data sets for the DB2 catalog and directory.

DSNTIP03 - Default Startup (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries define the default member names of certain modules that are to be loaded at DB2 startup. These modules are the system parameter module, the application default module, and the exit modules.

DSNTIPM - MVS Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries show the specifications for the DSNTIJMV job, which defines DB2 to z/OS and updates several PARMLIB members.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Stored Procedures Parameters Workspace:

The DSNZPARM Stored Procedures Parameters workspace shows information about the installation parameters in the DSNZPARM module for stored procedures invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPX - Routine Parameters (table view)
Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries are used to start the stored procedures address space so that it can run stored procedures or user-defined functions.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DSNZPARM Trace Parameters Workspace:

The DSNZPARM Trace Parameters workspace shows information about the automatic startup of traces in DB2.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
   Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIPN - Trace Parameters (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries affect the audit, global, accounting, and monitor traces and the checkpoint frequency.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DSNZPARM Utility Parameters Workspace:

The DSNZPARM Utility Parameters workspace shows information about the utility parameters invoked by SQL CALL statements.

This workspace is comprised of the following views:

DSNZPARM Module Information (table view)
   Shows the name and the assembly date of the current, initial, and previous DSNZPARM module.

DSNTIP6 - Utility Parms 1 (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

DSNTIP6 - Utility Parms 2 (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

DSNTIP6 - Utility Parms 3 (table view)
   Shows the DB2 field names, ZPARM names, and the values set for each parameter. These entries configure the default behavior of enhancements to the BACKUP SYSTEM, RESTORE SYSTEM, RECOVER, and other utilities.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

EDM Pool Workspace:

The EDM Pool workspace provides an overview of the Environmental Descriptor Manager (EDM) pool activity connected with DB2. The workspace layout depends on the DB2 version installed.

The EDM Pool workspace prior to DB2 10 is comprised of the following views:

**EDM Statistics (table view)**

Lists total counts, counts during the last sample period, and the "per second" count for a variety of tasks associated with the EDM pool.

**EDM Pool Load Activity Summary (bar chart view)**

Provides activity details of the EDM pool, including the number of pages dedicated to a type of pool usage and the percentage of the EDM pool dedicated to that type of usage.

**EDM Pool Utilization (bar chart view)**

Shows the relative distribution of available pages, cursor table pages, database descriptor pages, and package table pages.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Note: If DB2 10 is installed, click the navigation link **EDM Pool (DB2 10)** in the **EDM Statistics** view to open the "EDM Pool (DB2 10) Workspace" on page 676.

**EDM Pool Attributes:**

Use the EDM Pool, DB2 SRM EDM, and DB2 SRM EDM Statistics attributes to create situations to monitor the Environmental Descriptor Manager (EDM) pool activity that is connected with DB2. The attributes depend on the DB2 version installed.

**Available Pages** The total number of EDM pages that are currently available. It is zero for DB2 10 or later.

**Available Percentage** The percentage of EDM Pool that is currently available. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 9 or later.

**Cursor Table Load Rate (CT Loads)** The number of Cursor Table loads from DASD per second.

**Cursor Table Pages** The total number of EDM pages that are currently in use for Cursor Tables. It is zero for DB2 9 or later.

**Cursor Table Percentage** The percentage of EDM Pool that is currently in use for Cursor Tables. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cursor Table Request Rate (Cursor Table</strong></td>
<td>The number of Cursor Table requests per second.</td>
</tr>
<tr>
<td><em>Reqs)</em>*</td>
<td></td>
</tr>
<tr>
<td><strong>Dataspace Free Pages</strong></td>
<td>The number of free pages in EDM Pool Dataspace.</td>
</tr>
<tr>
<td><strong>Dataspace Total Pages</strong></td>
<td>The total number of pages in EDM Pool Dataspace.</td>
</tr>
<tr>
<td><strong>DB2 ID</strong></td>
<td>The name of a DB2 subsystem.</td>
</tr>
<tr>
<td><strong>DB2 Version</strong></td>
<td>The version of the DB2 system.</td>
</tr>
<tr>
<td><strong>DBD Free Pages</strong></td>
<td>The total number of DBD pages that are currently on free queue.</td>
</tr>
<tr>
<td><strong>DBD Free Percentage</strong></td>
<td>The percentage of DBD that is currently on the free queue. Valid entry ranges from 0.0 to 100.0.</td>
</tr>
<tr>
<td><strong>DBD Held Pct</strong></td>
<td>The percentage of DBD pages that are held.</td>
</tr>
<tr>
<td><strong>DBD Load Rate (DBD Loads)</strong></td>
<td>The number of database descriptor loads from DASD per second.</td>
</tr>
<tr>
<td><strong>DBD Pages</strong></td>
<td>The number of DBD pages that are in use.</td>
</tr>
<tr>
<td><strong>DBD Pages Held</strong></td>
<td>The number of DBD pages that are held.</td>
</tr>
<tr>
<td><strong>DBD Percentage</strong></td>
<td>The percentage of DBD pages that are in use; for DB2 10, this percentage is calculated as 100 - (((stealable+free)/total)*100).</td>
</tr>
<tr>
<td><strong>DBD Request Rate (Database Descriptor</strong></td>
<td>The number of database descriptor requests per second.</td>
</tr>
<tr>
<td><strong>Reqs)</strong></td>
<td></td>
</tr>
<tr>
<td><strong>DBD Stealable Pages</strong></td>
<td>The current number of stealable pages used for database descriptors (DBDs).</td>
</tr>
<tr>
<td><strong>DBD Total Pages</strong></td>
<td>The total number of pages that are assigned to DBD pool.</td>
</tr>
<tr>
<td><strong>Dynamic SQL Cache</strong></td>
<td>The total number of EDM pages that are currently used for dynamic SQL cache.</td>
</tr>
<tr>
<td><strong>Dynamic SQL Cache Loads (DSC Loads)</strong></td>
<td>The total number of dynamic SQL cache loads from DASD.</td>
</tr>
<tr>
<td><strong>Dynamic SQL Cache Percentage</strong></td>
<td>The percentage of EDM Pool that is currently used for Dynamic SQL caching. Valid entry ranges from 0.0 to 100.0.</td>
</tr>
<tr>
<td><strong>Dynamic SQL Cache Requests (Dynamic SQL</strong></td>
<td>The total number of dynamic SQL requests.</td>
</tr>
<tr>
<td><strong>Reqs)</strong></td>
<td></td>
</tr>
<tr>
<td><strong>EDM Free Pages</strong></td>
<td>The total number of free pages in the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). It is zero for DB2 10 or later.</td>
</tr>
<tr>
<td><strong>EDM Free Percentage</strong></td>
<td>The percentage of free pages in the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). A valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.</td>
</tr>
</tbody>
</table>
EDM In Use Pages The total number of pages that are currently in use in the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). It is zero for DB2 10 or later.

EDM In Use Percentage The percentage of EDM pages (DB2 9 or below) or the percentage of DBD pages (DB2 10 or later) that is currently in use. A valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.

EDM Total Pages The total number of pages that are assigned to the EDM pool (DB2 9 or below) or the DBD pool (DB2 10 or later). It is zero for DB2 10 or later.

Fails because of Dataspace Full The total number of fails because the EDM Pool Dataspace is full.

Fails because of DBD Pool Full The total number of fails because the DBD Pool is full.

Fails because of EDM Pool Full The total number of fails because the EDM Pool is full.

Fails because of RDS Pool Full The total number of fails because the RDS Pool (above) is full.

Fails because of SKEL Pool Full The total number of fails because the Skeleton (SKEL) Pool is full.

Fails because of STMT Pool Full The total number of fails because the Statement (STMT) Pool is full.

Fails because of RDS Pool (below) Full The total number of fails because the RDS Pool (below) is full.

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package Search Not Found Delete The number of not found record deleted from CACHE.

Package Search Not Found Insert The number of not found record added to CACHE.

Package Search Not Found Match The number of CACHED not found record located.

Package Table Load Rate (PT Loads) The number of Package Table loads from DASD per second.

Package Table Pages The total number of pages that are currently in use for Package Table. It is zero for DB2 10 or later.

Package Table Percentage The percentage of EDM Pool that is currently in use for Package Table. Valid entry ranges from 0.0 to 100.0. It is zero for DB2 10 or later.
Package Table Request Rate (Package Table Reqs) The number of Package Table requests per second.

RDS Above CT Pages The number of pages in the RDS pool above the bar used for the cursor tables (CTs). This is a snapshot value. It is zero for DB2 10 or later.

RDS Above CT Percent The percentage of pages that are currently held for cursor table (CT) in the RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above Free Pages The number of free pages in RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above Free Percent The percentage of free pages in RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above In Use Pages The number of pages that are currently in use in RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above In Use Percent The percentage of pages that are currently in use in RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above PT Pages Held The number of pages that are currently held for package tables (PT) in RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above PT Percentage The percentage of pages that are currently held for package tables (PT) in RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Above Total Pages The total number of pages that are assigned to RDS Pool above the bar. It is zero for DB2 10 or later.

RDS Below Cursor Table Pages The number of pages that are currently held for cursor tables in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below Cursor Table Percent The percentage of pages that are currently held for cursor tables in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below Free Pages The number of free pages in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below Free Percent The percentage of free pages in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below In Use Pages The number of pages that are currently in use in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below In Use Percent The percentage of pages that are currently in use in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below Package Table Pages The number of pages that are currently held for package tables in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below Package Table Percent The percentage of pages that are currently held for package tables in RDS Pool below the bar. It is zero for DB2 10 or later.

RDS Below Total Pages The total number of pages that are assigned to RDS Pool below the bar. It is zero for DB2 10 or later.
**Skeleton Cursor Table Pages (SKCT Pages)** The total number of EDM pages that are currently held for skeleton cursor tables (SKCT).

**Skeleton Cursor Table Percentage (SKCT Percentage)** The percentage of EDM that is currently held for skeleton cursor tables (SKCT). Valid entry ranges from 0.0 to 100.0.

**SKEL Free Pages** The number of free pages that are currently in the skeleton (SKEL) Pool.

**SKEL Free Percent** The percentage of free pages that are currently in the skeleton (SKEL) Pool.

**SKEL In Use Pages** The number of pages that are currently in use in the skeleton (SKEL) Pool.

**SKEL In Use Percentage** The percentage of pages that are currently in use in the skeleton (SKEL) Pool; for DB2 10, this percentage is calculated as 100 - (((stealable+free)/total)*100).

**SKEL Pool Pages** The current number of pages in the skeleton (SKEL) Pool above the bar.

**SKPT Pages** The total number of pages that are currently held for skeleton package tables (SKPT).

**SKPT Percentage** The percentage of pages that are currently held for skeleton package tables (SKPT). Valid entry ranges from 0.0 to 100.0.

**SKPT Stealable Pages** The total number of stealable pages used for skeleton package tables (SKPT) pages that can be reused.

**Statement Free Pages** The number of free pages that are currently in the Statement Pool.

**Statement Free Percent** The percentage of free pages that are currently in the Statement Pool.

**Statement in Global Cache** The number of statements in Global Cache.

**Statement Held Percentage** The percentage of pages that are currently held in the Statement Pool.

**Statements Pages Held** The number of pages that are currently held in the Statement Pool.

**Statement Total Pages** The current number of pages in the EDM Statement pool above the bar. This is a snapshot value.

**EDM Pool (DB2 10) Workspace:**

The EDM Pool (DB2 10) workspace provides an overview of the Environmental Descriptor Manager (EDM) pool activity connected with DB2. You can view this information if DB2 10 is installed.

The EDM Pool (DB2 10) workspace is comprised of the following views:
EDM Statistics (table view)
Lists total counts, counts during the last sample period, and the “per second” count for a variety of tasks associated with the EDM pool.

EDM Pool Load Activity Summary (bar chart view)
Provides activity details of the EDM pool, including the number of pages dedicated to a type of pool usage and the percentage of the EDM pool dedicated to that type of usage.

EDM Pool Utilization (bar chart view)
Shows the relative distribution of available pages, cursor table pages, database descriptor pages, and package table pages.

DBD Pool (table view)
Lists information about database descriptors (DBDs).

DBD Pool Utilization (pie chart view)
Shows information about the utilization of the database descriptor (DBD) pool.

PKG Search / STMT in Global Cache (table view)
Lists information about package search and statement in global cache.

SKEL Pool (table view)
Lists information about the EDM skeleton pool.

Statement Pool (table view)
Lists information about the statements.

SKEL Pool Utilization (pie chart view)
Shows information about the EDM skeleton pool.

Statement Pool Utilization (pie chart view)
Shows information about the statements.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Enclave Thread Summary Workspace:

The Enclave Thread Summary Workspace provides an overview of the activity of all threads that are connected to DB2 and are associated with an enclave token.

This workspace is comprised of the following views:

Enclave Thread CPU% (bar chart)
Shows the percentage of the CPU used by each thread that is associated with an enclave token.

Enclave Thread Enclave CPU Time (bar chart)
Shows the CPU time used by each thread that is associated with an enclave token.
Enclave Thread Summary (table view)

Provides an overview of the activity of all threads that are connected to DB2 and are associated with an enclave token.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

Thread Enclave Attributes:
Use the Thread Enclave attributes to create situations that monitor the activity of threads that are connected to DB2 and are associated with an enclave token.

Accounting The account information.

Ace Address The ace address.

Agent Address The agent address.

AGNT ASID The address space ID (ASID) of the agent.

Agent TCB Address The Agent TCB Address.

Authorization ID The authorization ID.

Authorization ID (Unicode) The authorization ID.

Average Time Goal The average response time goal.

Class The transaction class.

Collection The package collection ID.

Collection (Unicode) The package collection ID.
Collection Name The subsystem collection name.

Thread Enclave Attributes Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Enclave Attributes The connection type.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

CPU Critical CPU critical (Y or N).

Correlation ID The correlation ID.

DB2 ID The DB2 subsystem ID.

Discretionary Goal The discretionary goal.

Duration Service Unit The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 1 The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 2 The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 3 The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 4 The service class period duration in service units. The value is zero for the last period.
Duration Service Unit 5 The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 6 The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 7 The service class period duration in service units. The value is zero for the last period.

Duration Service Unit 8 The service class period duration in service units. The value is zero for the last period.

Enclave CPU Time The enclave CPU time.

Enclave Export Token The export token associated with the enclave, if any. A monitor can collect IWMRQRY answer areas from multiple systems and match RQAD for a particular multisystem enclave using the export token.

Enclave STOKEN The STOKEN of the address space that owns the enclave. If the enclave is foreign, this STOKEN refers to an address space on another system (not the local system).

Enclave Token The enclave token.

End User ID The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

Function Name The function name.

Goal Description The goal description.

Goal Description 1 The goal description one.

Goal Description 2 The goal description two.

Goal Description 3 The goal description three.

Goal Description 4 The goal description four.

Goal Description 5 The goal description five.

Goal Description 6 The goal description six.

Goal Description 7 The goal description seven.

Goal Description 8 The goal description eight.

Goal Mode The system WLM mode (G for Goal or C for Compatibility).

Goal Type The goal type indicator.

IIP Flag Indicates if the systems has a zIIP processor. Valid values are Y or N.

IIP Speed Indicates if the zIIP processor runs at a different speed than CP processor.
Importance Level  The importance level. The range is one to five; One is the most important.

IMPORTANCE1  The importance level. The range is one to five; One is the most important.

IMPORTANCE2  The importance level. The range is one to five; One is the most important.

IMPORTANCE3  The importance level. The range is one to five; One is the most important.

IMPORTANCE4  The importance level. The range is one to five; One is the most important.

IMPORTANCE5  The importance level. The range is one to five; One is the most important.

IMPORTANCE6  The importance level. The range is one to five; One is the most important.

IMPORTANCE7  The importance level. The range is one to five; One is the most important.

IMPORTANCE8  The importance level. The range is one to five; One is the most important.

Information Flag  The return information flag.

Interval Start  The start time of this interval.

Location  The requesting location.

Location (Unicode)  The requesting location.

Logical Unit  The logical unit name.

LUWID  The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCACO01.02D22A.A1FEBE0489D4=8

MVS ID  The MVS system identifier.

Network ID  The network ID.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
Owner Job Name The job name of the address space that owns the enclave. If the enclave is foreign, the job name refers to a job on another system (not the local system).

Owner System The name of the system where the owner of the enclave resides. If the enclave is foreign, this is the system where the original enclave is located. Otherwise it is the local system name.

Package DBRM The package DBRM name.

Package DBRM (Unicode) The package DBRM name.

Parm1 The first start parameters.

Parm2 The second start parameters.

Percentile The goal percentile value.

Percentile1 The goal percentile value.

Percentile2 The goal percentile value.

Percentile3 The goal percentile value.

Percentile4 The goal percentile value.

Percentile5 The goal percentile value.

Percentile6 The goal percentile value.

Percentile7 The goal percentile value.

Percentile8 The goal percentile value.

Percentile Time Goal The percentile response time goal.

Performance Index The performance index.

Performance Value The performance value.

Period Number The service class period number in goal mode. When in goal mode, if the address space is a server, this value is always one. When in compatibility mode, this is the performance group period number.

Plan The plan name.

Priority The subsystem priority.

Process Name The enclave process name.

Program Name The transaction program name.

Report Class The name of the report class associated with this address space. This is only valid in goal mode.

Report Class Description The report class description.
**Resource Group** The name of the resource group associated with this address space. This is only valid in goal mode.

**Scheduling Environment** The enclave scheduling environment.

**Service Class** The name of the service class associated with this address space. This is only valid in goal mode.

**Service Class Description** The service class description.

**Service Class Resource Description** The service class resource description.

**Service Class Resource Group** The service class resource group.

**Service Class Workload** The workload name.

**Service Class Workload Description** The description of the workload.

**Service Periods** The number of service class periods for this service class.

**Storage Protection** Storage protection (Y or N).

**Stored Procedure Name** The name of the stored procedure.

**Subsystem** The subsystem name.

**Subsystem Type** The subsystem type.

**Subsystem Parameter** The subsystem parameter.

**System Goal** The system goal.

**Time Unit** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit1** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit2** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
KD2_PF_READA_SPMON

- M = Minute
- H = Hour

**Time Unit3** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit4** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit5** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit6** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit7** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour

**Time Unit8** The response time unit indicator (mmm:SS:MM:HH).

Valid format is mmm:SS:MM:HH, where:
- m = Millisecond
- S = Second
- M = Minute
- H = Hour
**Total Delays** The total number of delay samples used in the SRMS execution velocity calculation.

**Total Usings** This is a sum of the number of times the work for the service class period is allowed to use WLM managed resources.

**Transaction** The transaction ID at the workstation.

**Type** The enclave type. It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Enclave Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Original_Dependent</td>
<td>The enclave was created by IWMECREA and is a continuation of the transaction for the owning address space.</td>
</tr>
<tr>
<td>2</td>
<td>Original_Independent</td>
<td>The enclave was created by IWMECREA and is an independent transaction.</td>
</tr>
<tr>
<td>3</td>
<td>Foreign_Independent</td>
<td>The enclave was created by IWMIMPT and is a continuation of an independent enclave on another system.</td>
</tr>
<tr>
<td>4</td>
<td>Foreign_Dependent</td>
<td>The enclave was created by IWMIMPT and is a continuation of a dependent enclave on another system.</td>
</tr>
<tr>
<td>5</td>
<td>Inactive_Enclave</td>
<td>The enclave is currently on an inactive enclave queue because SRM did not find any work unit associated with the enclave. The enclave will move back to active queue once a work unit joins the enclave.</td>
</tr>
<tr>
<td>6</td>
<td>Currently_Promoted</td>
<td>The enclave is currently promoted because of a chronic resource contention.</td>
</tr>
<tr>
<td>7</td>
<td>Continuation_Independent</td>
<td>The enclave is a continuation of an independent enclave.</td>
</tr>
</tbody>
</table>

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**User ID** The user ID.

**Velocity Goal** The velocity goal.

**Velocity or Response Time Goal** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 1** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 2** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

**Velocity or Response Time Goal 3** The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.
Velocity or Response Time Goal 4 The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

Velocity or Response Time Goal 5 The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

Velocity or Response Time Goal 6 The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

Velocity or Response Time Goal 7 The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

Velocity or Response Time Goal 8 The response time goal or the velocity goal. The value is zero if the goal is discretionary or if its a system goal or if no goal is defined.

Version The version.

WLM Descriptor The WLM environment description.

WLM Procedure The WLM environment procedure name.

WLM System Type The type of WLM application environment system.

Workload Manager The WLM (application) environment.

Workload Name The name of the workload associated with this address space. This is only valid in goal mode.

Workstation The workstation ID.

End-to-End SQL Monitoring Workspace:

The End-to-End SQL Monitoring workspace launches to the Extended Insight Analysis Dashboard for the selected subsystem.

The Extended Insight Analysis Dashboard collects the various SQL statement executions and shows them in an aggregated view. This view is updated every 1 minute. It does not display real-time snapshots. These SQL statements may be grouped using the application server, the end-user ID, end-user transaction name, or end-user workstation name.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
Global Lock Conflicts Workspace:

The Global Lock Conflicts workspace lets you view summary information about your enterprise.

This includes the number of:
- Lock conflicts, threads, and GBP connections
- Monitored databases for a data sharing group
- Monitored DB2 systems
- Object analysis databases

This workspace is comprised of the following views:

**Lock Elapsed Time in Seconds (bar chart)**
Shows the elapsed time in seconds.

**Local Lock Conflict Table View**
Shows more information about global locking conflicts.

Thread information is not available if the thread is owned by the other member of the data sharing group.

**DB2 Lock Conflict Attributes:**
Use DB2 Lock Conflict Group attributes to create situations that monitor DB2 database lock conflicts.

**Authorization ID** The primary authorization ID from connection or sign-on, that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Authorization ID (Unicode)** The primary authorization ID from connection or sign-on, that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Begin Time** Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do
not terminate (such as CICS primed threads and imss wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

**DB2 Lock Conflict Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**DB2 Lock Conflict Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>

<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example, DLKEX212.

**DB2 ID** The name of a DB2 subsystem.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

It is an alphanumeric text string with a maximum of 8 characters; for example TDDDB242G.

**Lock Elapsed Time** The amount of time (in seconds) a waiter has been waiting for the resource.

**Lock Level** Identifies the lock resource usage.

Valid values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>

<td>Share intent exclusive</td>
</tr>
<tr>
<td>U</td>
<td>Update</td>
</tr>
<tr>
<td>UNS</td>
<td>Unprotected shared</td>
</tr>
<tr>
<td>X</td>
<td>Exclusive</td>
</tr>
</tbody>
</table>

**Lock Resource** The resource a lock owner currently has locked or the resource that caused DB2 to suspend a lock request. It is an alphanumeric text string, with a maximum of 50 characters; for example, DB=TBLBLK2 PS=PAGELK2.

**Lock Status** The status of a job holding or waiting on a lock: If the status is OWN with a DB2 subsystem name, the lock is owned by another DB2 subsystem in the Data Sharing Group (DSG); for example, if lock status is OWN-DB2A, the lock is owned by DB2 subsystem DB2A.

**Lock Token** Lock Token.

**Lock Type** The lock type of the lock request.

Valid values are:

*Table 78. Lock types*

</tbody>
</table>
| CDRN      | The Cursor Stability drain (CDRN) lock is acquired to drain all CS read access to an object:  
|           | - DB = database name  
|           | - PS = pageset name  
|           | - PT = partition |
| CMDS      | The DB2 Command Serialization (CMDS) lock. |
| CMIG      | The CATMAINT migration (CMIG) lock is acquired when catalog migration is performed. |
| COLL      | The Collection (COLL) lock |
| DBDL      | The DBD load (DBDL) lock is the database descriptor load lock. |
| DBEX      | The Database exception (DBEX) lock indicates a lock on a "Logical page list" (LPL) or "Group buffer pool recovery pending" (GRECP) database exception status.  
|           | This lock is only used in a data sharing environment. |
| DBXU      | The DB exception update lock is used for updating the database exception status. |
| DGTT      | The DGTT URID lock is acquired to protect segments that belong to a Declared Global Temporary Table (DGTT). These segments are deallocated during Commit 1 by logging them and serializing them using the Unit of Recovery ID (URID) lock. |
| DPAG      | The DB2 page (DPAG) lock in a tablespace. When programs read data or update data, they acquire a page lock containing the data:  
|           | - DB = database name  
|           | - PS = pageset name  
|           | - PG = page |
| DSET      | The partitioned lock.  
|           | A partitioned tablespace contains one or more partitions (up to 64). It is created when you create a table space using the SQL CREATE TABLESPACE statement with the NUMPARTS parameter.  
|           | Only one table can be stored on a partitioned tablespace. Each partition contains one part of a table. The partitioned lock only locks the partition with the data that is referenced:  
|           | - DB = database name  
|           | - PS = pageset name  
|           | - PT = partition number |
| DTBS      | The Database lock indicates a lock on the database:  
|           | - DB = database name  
|           | - PS = pageset name  
|           | - PT = partition number |
| GRBP      | The Group buffer pool (GRBP) start/stop lock.  
|           | BP=buffer pool ID |
| HASH      | The Hash anchor (HASH) lock:  
|           | - DB = database name  
|           | - PS = pageset name  
<p>|           | - PG = page |</p>
<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HPSP</td>
<td>The Header Page (HP) Bucket or Stored Procedure (SP) Command lock.</td>
</tr>
</tbody>
</table>
| IEOF      | The Index end of file (IEOF) lock is acquired at the index end of file.  
  • DB = database name  
  • PS = pageset name  
  • PT = partition |
| IPAG      | The Index page (IPAG) lock in an index space. When application programs read or update data, they acquire a lock on the page containing the index when indexing is used.  
  • DB = database name  
  • PS = pageset name  
  • PG = page |
| IXKY      | The Index key (IXKY) lock. |
| LBLK      | The Large object (LOB) lock. |
| LPLR      | The Logical page list recovery (LPLR) lock. |
| MDEL      | The Mass delete (MDEL) lock is acquired when doing a mass delete from a table (for example, when you DELETE FROM a table) within a segmented tablespace.  
  It is used to prevent another user from reusing freed segments before a delete operation is committed.  
  • DB = database name  
  • PS = pageset name |
| PALK      | The Partition lock.  
  • DB = database name  
  • PS = pageset name  
  • PT = partition |
| PBPC      | The Group BP level castout (PBPC) P-lock.  
  A physical lock acquired when a castout of a group buffer pool occurs. Castout is the process of writing pages in the group buffer pool out to DASD.  
  This lock is only used in a data sharing environment. |
| PCDB      | The DDF CDB P-lock.  
  A Distributed Data Facility communication database physical lock.  
  This lock is only used in a data sharing environment. |
| PDBD      | The DBD P-lock is a database descriptor physical lock.  
  This lock is only used in a data sharing environment. |
| PDSO      | The Pageset or partitioned pageset open lock.  
  If the data set supporting the tablespace that is referenced by the application is not opened, the program will acquire a lock to open the data set. The data set will stay open if CLOSE=NO is defined in the SQL statement creating the tablespace.  
  • DB = database name  
  • PS = pageset name |
**Table 78. Lock types (continued)**

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| PITR      | The Index manager tree (PITR) is a physical lock (P-lock). This lock is only used in a data sharing environment.  
- DB = database name  
- PS = pageset name  
- PT = partition |
| PPAG      | The Page P-lock is a physical lock on a page. This lock is only used in a data sharing environment. |
| PPSC      | The Pageset/partition level castout physical lock (P-lock). This lock is only used in a data sharing environment. |
| PPSP      | The Pageset/partition physical lock (P-lock). This lock is only used in a data sharing environment. |
| PRLF      | The Resource Limit Facility (RLF) physical lock (P-lock). This lock is only used in a data sharing environment. |
| PSET      | The Pageset (PSET) lock can be a tablespace or indexspace. A pageset containing DB2 tables is a tablespace. A pageset containing DB2 index structure is an indexspace. A pageset can be simple or partitioned. This lock type is for the simple pageset only.  
- DB = database name  
- PS = pageset name |
| PSPI      | The Pageset piece (PSPI) lock. A pageset is a collection of pageset pieces. Each pageset piece is a separate VSAM data set. A simple pageset contains from 1 to 32 pieces. Each piece of a simple pageset is limited to 2 GB. Whenever a simple pageset piece reaches this size, another piece is allocated and the pageset grows. This is a lock on the expanded pageset piece. |
| RDBD      | The Repair DBD (RDBD) lock is acquired when REPAIR DBD REBUILD is running (test/diagnose). |
| RDRN      | The Repeatable Read drain (RDRN) lock is acquired to drain all RR access to an object.  
- DB = database name  
- PS = pageset name  
- PT = partition |
| RGDA      | The Retry Getpage During Abort (RGDA) lock. |
| ROW       | The Row lock indicates a lock on a row. |
| RSTR      | The Shared Communications Area (SCA) restart (RSTR) lock indicates a lock on SCA access for restart/redo information. (BMC-RSTP) |

  - PS = pageset name  
  - PT = partition  
| XMLK      | The XML lock. |

**LUWID** The logical unit of work ID (LUWID) for a thread.

**MVS System** An ID for the MVS System Management Facility (SMF). It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string with a maximum of 8 characters. For example PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Resource Name 1 (Unicode)** The resource name of type defined by type code.

**Resource Name 2 (Unicode)** The resource name of type defined by type code.

**Resource Name 3** The resource name of type defined by type code.

**Resource Name 4** The resource name of type defined by type code.

**Resource Type 1** This value indicates what is contained in Resource Name 1.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BP</td>
<td>Buffer Pool</td>
</tr>
<tr>
<td>CO</td>
<td>Collection name</td>

</tbody>
</table>

**Resource Type 2** This value indicates what is contained in Resource Name 2.

Valid values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
<td>Package</td>
</tr>
<tr>
<td>PS</td>
<td>Page Set (Table space)</td>
</tr>
</tbody>
</table>

**Resource Type 3** This value indicates what is contained in Resource Name 3.

**Resource Type 4** This value indicates what is contained in Resource Name 4.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PT</td>
<td>Partition</td>
</tr>
</tbody>
</table>

**SUBSYS** The IRLM subsystem name.

**Thread Status** The current status of a thread.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be determined.</td>
</tr>
</tbody>
</table>
INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.
WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MESSAGE
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSN recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.
WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG
MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Token The thread token uniquely identifies a specific thread.

DB2 Lock Conflict Attributes The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>

</table>
Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

Uniqueness Value2 The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: the last 2 bytes of QWHSLUUV).

Group Buffer Pool Workspace:

The DB2 Group Buffer Pool workspaces provide detailed coupling facility structure information about your group buffer pool (GBP) structures.

Using the Group Buffer Pool workspaces, you can:
- Monitor structure utilization over a period of time
- Verify the status of all connections to a structure

You must be running in a DB2 data sharing environment with the MVS/ESA Coupling Facility to take advantage of the DB2 Group Buffer Pools feature.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Buffer Pool Attributes:

Use Group Buffer Pool (GBP) attributes to create situations to determine the usage and availability of coupling facility structures relating to group buffer pools, the shared communication area, and the lock table.

Cross Invalidate Count The number of notifications that the DB2 buffer has modified. Valid value is an integer in the range 0 - 99999999.

Cross Invalidate Rate The rate of cross invalidations per second. Valid value is an integer in the range 0 - 99999999.
**Data Pages** The number of data pages that DB2 has allocated for the group buffer pool. Valid value is an integer in the range 0 - 99999999.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Directory Entries** The total number of directory entries that a DB2 system has allocated for a coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**IDNAME** An internal attribute used for navigation. It contains either the Data Sharing Group Name or the DB2ID.

Valid format is alphanumeric with a maximum of 8 characters; for example TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Read Count** The total number of page read requests to a group buffer pool. Valid value is an integer in the range 0 - 99999999.

**Read Hit Count** The number of successful page read requests to a group buffer pool without causing a physical database read. Valid value is an integer in the range 0 - 99999999.

**Read Hit Percent** The percentage of successful page read requests in relation to the total page read requests for a group buffer pool. Valid value is an integer in the range 0 - 100.

**Structure Connect Count** The number of active connections to a structure. Valid value is an integer in the range 0 - 16.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

**Structure Size** The size, in kilobytes, of a DB2 coupling facility structure. Valid value is an integer in the range 0 - 99999999.

**Structure Status** The current status of the coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The structure is active</td>
</tr>
<tr>
<td>INACTIVE</td>
<td>The structure is inactive</td>
</tr>
</tbody>
</table>

For duplexed group buffer pool structures, additional valid values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REB_NEW</td>
<td>Rebuild on new (secondary GBP)</td>
</tr>
<tr>
<td>REB_OLD</td>
<td>Rebuild on old (primary) GBP</td>
</tr>
<tr>
<td>REB_TRAN</td>
<td>Structure is in transition</td>
</tr>
<tr>
<td>REB_HOLD</td>
<td>Structure is in holding state</td>
</tr>
<tr>
<td>REB_ERR</td>
<td>Error during the structure rebuild</td>
</tr>
</tbody>
</table>

**Structure Type** The type of DB2 coupling facility structure.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CACHE</td>
<td>Cache data of interest to several DB2 systems in data sharing group</td>
</tr>
<tr>
<td>LIST</td>
<td>Shared Communications Area (SCA) for data sharing group members</td>
</tr>
<tr>
<td>LOCK</td>
<td>Controls locking</td>
</tr>
</tbody>
</table>

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Buffer Pool Connections Workspace:**

The Group Buffer Pool (GBP) Connections workspace displays connection status information for all connections to a specific group buffer pool structure.

Use this workspace to:

- Review the status of all connections to a structure
- Identify the operating system, together with the associated coupling facility name and job name

To investigate a nonactive connection, review the information provided in Accessing an OMEGAMON Host Session.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
Group Buffer Pool Detailed Statistics Workspace:

Use the Group Buffer Pool (GBP) Detailed Statistics workspace to display group buffer pool statistics for a specific group buffer pool structure.

You can use data to monitor:
- The dynamic rebuild of a group buffer pool
- Castout paging and I/O activity

You can use the Tivoli Enterprise Portal terminal emulator adapter feature to access an OMEGAMON host session and view additional group buffer pool information.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Buffer Pool Statistics Workspace:

The Data Sharing Group Buffer Pool (GBP) Statistics workspace displays detailed information about the activity in a DB2 group buffer pool during the collection interval.

Using this workspace, you can:
- Monitor structure utilization over a period of time
- Verify the status of all connections to a structure
- Review GBP statistics for a data sharing group and GBP structure

You must be running in a DB2 data-sharing environment with MVS/ESA Coupling Facility to take advantage of the Data Sharing Group Buffer Pools Statistics feature.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Buffer Pool Statistics Detail Attributes:

Use the Group Buffer Pool (GBP) Statistics Detail attributes to create situations to determine the usage of group buffer pools.

**Castout Engine Not Available** The number of times a castout engine was not available to write changed pages from a group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Castout for Class Threshold** The group buffer pool castout class threshold. Castout begins when the number of changed pages for a particular castout class exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

**Castout for GBP Threshold** The group buffer pool castout threshold. Castout begins when the number of changed pages in the group buffer pool exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

**Changed Page Writes** The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Clean Page Writes** The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.
Cross Invalidate Reads No Data The number of reads to the group buffer pool because a page in the member's buffer pool was invalidated, where the data was not found in the group buffer pool and the member read the page from DASD. Valid value is an integer in the range 0 - 2147483647.

Cross Invalidate Reads With Data The number of reads to the group buffer pool because a page in the member's buffer pool was invalidated, where the data was found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

DB2 ID The name of a DB2 subsystem.

GBP Reads No Data The number of reads to the group buffer pool where the data was not found. Valid value is an integer in the range 0 - 2147483647.

GBP Reads With Data The number of reads to the group buffer pool where the data was found. Valid value is an integer in the range 0 - 2147483647.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

IXLCACHE Delete Name The number of times that DB2 issued a request to the group buffer pool to delete directory and data entries associated with a specific page set or partition. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Castout Class The number of requests from the page set or partition castout owner or the group buffer pool owner to the group buffer pool to determine which pages are cached in the group buffer pool as changed pages that need to be cast out. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Castout Stats The number of requests that the group buffer pool structure owner issues when the GBPOOLT threshold is reached to determine which castout classes have changed pages. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Directory Information The number of requests that the group buffer pool structure owner issues for group buffer pool checkpoints to read the directory entries of all changed pages in the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read STGSTATS The number of times DB2 requested statistical information from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Unlock Castout The number of times that DB2 issues an unlock request to the coupling facility for castout I/Os that have completed. Valid value is an integer in the range 0 - 2147483647.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.
**Number of Checkpoints** The number of times that DB2 writes the changed pages in the group buffer pool to the page set. Valid value is an integer in the range 0 - 2147483647.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Pages Castout** The number of data pages that a member has cast out of the group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Number of Rebuilds** The number of times that a member has participated in rebuilding a group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Prefetch Read No Data** The number of reads to the group buffer pool for prefetch processing, where the data is not found and the member reads the page from DASD. Valid value is an integer in the range 0 - 2147483647.

**Prefetch Read With Data** The number of reads to the group buffer pool for prefetch processing, where the data is found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

**Read Fails for Storage** The number of group buffer pool read requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.

**Register Page List Request** The number of register page list requests by prefetch. Valid value is an integer in the range 0 - 2147483647.

**Register Page Request** The number of times that DB2 requested interest to the group buffer pool for a single page. Valid value is an integer in the range 0 - 2147483647.

**RPL Reads Changed Pages** The number of group buffer pool reads by prefetch to retrieve a changed page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

**RPL Reads Clean Pages** The number of group buffer pool reads by prefetch to retrieve a clean page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

**Structure Name** The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDDB241G.SCA.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Unregister Page Request** The number of times that DB2 unregistered interest for a single page from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Write Engine Not Available** The number of times a write engine was not available to write changed pages from a group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Write Fails for Storage** The number of group buffer pool write requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.

**Write System Changed Page** The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Write System Clean Page** The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Group Buffer Pool Statistics Attributes:**

Use Group Buffer Pool (GBP) Statistics attributes to create situations that monitor the utilization of critical group buffer pool resources.

**Castout Engine Not Available** The number of times a castout engine was not available to write changed pages from a group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

**Castout for Class Threshold** The group buffer pool castout class threshold. Castout begins when the number of changed pages for a particular castout class exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

**Castout for GBP Threshold** The group buffer pool castout threshold. Castout begins when the number of changed pages in the group buffer pool exceeds this threshold. Valid value is an integer in the range 0 - 2147483647.

**Changed Page Writes** The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Clean Page Writes** The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Cross Invalidate Reads No Data** The number of reads to the group buffer pool because a page in the member's buffer pool was invalidated, where the data was not found in the group buffer pool and the member read the page from DASD. Valid value is an integer in the range 0 - 2147483647.
Cross Invalidate Reads With Data The number of reads to the group buffer pool because a page in the member's buffer pool was invalidated, where the data was found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

DB2 ID The name of a DB2 subsystem.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

GBP Reads No Data The number of reads to the group buffer pool where the data was not found. Valid value is an integer in the range 0 - 2147483647.

GBP Reads With Data The number of reads to the group buffer pool where the data was found. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Delete Name The number of times that DB2 issued a request to the group buffer pool to delete directory and data entries associated with a specific page set or partition. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Castout Class The number of requests from the pageset or partition castout owner or the group buffer pool owner to the group buffer pool to determine which pages are cached in the group buffer pool as changed pages that need to be cast out. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Castout Stats The number of requests that the group buffer pool structure owner issues when the GBPOOLT threshold is reached to determine which castout classes have changed pages. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read Directory Information The number of requests that the group buffer pool structure owner issues for group buffer pool checkpoints to read the directory entries of all changed pages in the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Read STGSTATS The number of times DB2 requested statistical information from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

IXLCACHE Unlock Castout The number of times that DB2 issues an unlock request to the coupling facility for castout I/Os that have completed. Valid value is an integer in the range 0 - 2147483647.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of Checkpoints The number of times that DB2 writes the changed pages in the group buffer pool to the pageset. Valid value is an integer in the range 0 - 2147483647.

Number of DB2 systems The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.
Number of Pages Castout The number of data pages that a member has cast out of the group buffer pool to DASD. Valid value is an integer in the range 0 - 2147483647.

Number of Rebuilds The number of times that a member has participated in rebuilding a group buffer pool. Valid value is an integer in the range 0 - 2147483647.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Prefetch Read No Data The number of reads to the group buffer pool for prefetch processing, where the data is not found and the member reads the page from DASD. Valid value is an integer in the range 0 - 2147483647.

Prefetch Read With Data The number of reads to the group buffer pool for prefetch processing, where the data is found and returned to the member. Valid value is an integer in the range 0 - 2147483647.

Read Fails for Storage The number of group buffer pool read requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.

Register Page List Request The number of register page list requests by prefetch. Valid value is an integer in the range 0 - 2147483647.

Register Page Request The number of times that DB2 requested interest to the group buffer pool for a single page. Valid value is an integer in the range 0 - 2147483647.

RPL Reads Changed Pages The number of group buffer pool reads by prefetch to retrieve a changed page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

RPL Reads Clean Pages The number of group buffer pool reads by prefetch to retrieve a clean page from the group buffer pool as a result of feedback from the register page list. Valid value is an integer in the range 0 - 2147483647.

Structure Name The name of a DB2 coupling facility structure. It is an alphanumeric text string, with a maximum of 16 characters; for example, TDDB241G.SCA.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second
For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

For example, 07-16-12 14:58:29 indicates that data collection ended on July 16, 2012 at 14:58:29 PM.

**Unregister Page Request** The number of times that DB2 unregistered interest for a single page from the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Write Engine Not Available** The number of times a write engine was not available to perform a coupling facility write. Valid value is an integer in the range 0 - 2147483647.

**Write Fails for Storage** The number of group buffer pool write requests that failed because of a shortage of coupling facility resources. Valid value is an integer in the range 0 - 2147483647.

**Write System Changed Page** The number of changed pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Write System Clean Page** The number of clean pages written to the group buffer pool. Valid value is an integer in the range 0 - 2147483647.

**Group Buffer Pool Structures Workspace:**

You can use the Group Buffer Pool (GBP) Structures workspace to verify that your group buffer pool structures are active and to track structure utilization over a period of time.

Use the structure data on the workspace to:

- Monitor the read hit percent and buffer invalidate rate for group buffer pool structures
- Identify the number of DB2 subsystems using a group buffer pool
- Monitor the ratio of directory entries to data pages allocated

**Analyzing Group Buffer Pool Connections**

You can analyze a specific group buffer pool structure to view the connection status of all connections to the structure.

1. Right-click a structure name.
2. Click **Link to --** GBP Connections.

The GBP Connections workspace is displayed showing the connection status details for your group buffer pool structure.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Activity Database Workspace:**

The Group Object Activity Database workspace displays information so that you can do a high-level analysis of getpage and I/O activity for a DB2 database.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Activity Summary Attributes:**

Use the Group Object Activity Summary attributes to create situations that monitor the I/O and getpage activity by database.

**ASYNC Write Rate** The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with 1 decimal place allowed, in the range 0.0 - 9999.9.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Database** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Getpage Percent** The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.5.

**Getpage Rate** The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.3.

**Getpage RIO Ratio** The ratio of getpage requests to read I/Os for the database.

The ratio is calculated by dividing the number of getpage requests by the sum of the following values:

- Number of synchronous reads
- Number of prefetch read I/Os

Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.8.

**ID Name** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of ASYNC Writes** The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Getpages** The number of getpage reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Number of Other Writes** The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.
**Number of Prefetch Reads** The number of prefetch read I/Os for the database. Valid value is an integer in the range 0 - 2147483647.

**Number of SYNC Reads** The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Write Rate** The number of immediate and format writes per second. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.6.

**Percent of I/O** The percentage of the total I/O activity that is applicable to the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

**Prefetch Read Rate** The number of prefetch read I/Os per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Space Name** The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

**SYNC Read Rate** The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Object Activity by Space Name:**

The Group Object Activity by Space Name workspace displays information about the getpage and I/O activity for spaces for a selected DB2 database.

The table view shows information about the spaces that have had getpage and I/O activity during the collection period.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
**Group Object Space Name Attributes:**
Use the Group Object Space Name attributes to create situations that monitor object, volume, and extent activity for all DB2 object spaces in a data sharing group.

**Buffer Pool ID** An ID for a buffer pool.

Valid values are:
- 0 - 49
- 32K
- 32K0 - 32K9

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Database Name** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Extents per Data Set Ratio** The average number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 100.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Max Number of Extents per DSN** The largest number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 219.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 you are monitoring. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Number of Volumes** The number of volumes on which the data set resides. Valid value is an integer in the range 0 - 256.

**Object Space Name** The name of a DB2 object space. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

**Object Type** The type of object space name.

Valid values are:

<table>

</table>

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Object Activity by Space Name Detail Workspace:**

The Group Object Activity by Space Name Detail workspace displays detailed information about the getpage and I/O activity for spaces for each DB2.

For example, for each space name, you can display:
- The DB2 ID
- Information about the DB2 operations, such as number of getpages and synchronous reads

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Workspace:**

The DB2 Group Object Analysis workspaces provide detailed object analysis information about DB2 databases.

Using the Group Object Analysis workspaces, you can:
- Monitor and evaluate object allocation data for DB2 databases
- Evaluate and analyze space name allocation data for a specific DB2 database

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Attributes:**
Use the Group Object Analysis (GOA) attributes to create situations that monitor object volume and extent activity for all DB2 systems in a data sharing group.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDDB241G.

**Database Name** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Extents per Data Set Ratio** The average number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 100.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDDB242G.

**Max Number of Exts per DSN** The largest number of extents per data set of space name for a DB2 database. Valid value is an integer in the range 0 - 219.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 you are monitoring. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Number of Indexes** The number of index spaces that the operating system currently has allocated to DB2. Valid value is an integer in the range 0 - 99999.

**Number of Spaces** The total number of index spaces and table spaces that the operating system currently has allocated to DB2. Valid value is an integer in the range 0 - 99999.

**Number of Table Spaces** The number of table spaces that the operating system currently has allocated to DB2. Valid value is an integer in the range - 10000.

**Number of Volumes** The number of volumes on which the data set resides. Valid value is an integer in the range 0 - 256.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
KD2_PF_READA_SPMON

- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Group Object Analysis Thread Database Workspace:**

The Group Object Analysis (GOA) Thread Database workspace displays information so that you can analyze which threads are generating I/O activity for a selected database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Thread Activity Summary Attributes:**

Use the Group Object Analysis (GOA) Thread Activity summary attributes to create situations that monitor thread activity.

**ASYNC Write Rate** The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with one decimal place allowed.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example, D412.

**Database** The name of a DB2 database. Valid format is alphanumeric with a maximum of 8 characters; for example, DSNDB06.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**Dynamic Prefetch Read Rate** The number of dynamic prefetch read I/Os made per second by the thread. Valid format is a decimal number, with one decimal place allowed.

**Getpage per Read I/O** The ratio of getpage requests to read I/Os for the database.

The ratio is calculated by dividing the number of getpage requests by the sum of the following values:

- Number of synchronous reads
- Number of prefetch read I/Os
Valid format is a decimal number, with one decimal place allowed.

**Getpage Percent** The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.5.

**Getpage Rate** The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example, TDDB242G.

**List Prefetch Read Rate** The number of list prefetch I/Os made per second by the thread. Valid format is a decimal number, with one decimal place allowed.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Number of ASYNC Writes** The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.

**Number of Dynamic Prefetch Reads** The number of dynamic prefetch read I/Os made by the thread. Valid value is an integer in the range 0 - 2147483647.

**Number of Getpage Reads** The number of getpage reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Number of List Prefetch Reads** The number of list prefetch I/Os made by the thread. Valid value is an integer in the range 0 - 2147483647.

**Number of Other Writes** The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.

**Number of Sequential Prefetch Reads** The number of sequential prefetch reads for the thread. Valid value is an integer in the range 0 - 2147483647.

**Number of SYNC Reads** The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

**Number of Threads** The total number of currently monitored threads. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Other Write Rate** The number of immediate and format writes per second. Valid format is a decimal number, with one decimal place allowed.

**Percent of I/O** The percentage of the total I/O activity that is applicable to the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an
Sequential Prefetch Read Rate  The number of sequential prefetch read I/Os per second made by the thread. Valid format is a decimal number, with one decimal place allowed.

Space Name  The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

SYNC Read Rate  The number of synchronous reads per second for the database or space name. Valid format is a decimal number, with one decimal place allowed.

Time Stamp  Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Group Object Analysis Thread Space Name Workspace:

The Group Object Analysis (GOA) Thread Space Name workspace displays information so that you can analyze which threads are generating I/O activity for the space name.

The workspace displays information for each thread that generated I/O activity to the space name during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Object Analysis Thread Volume Summary Attributes:

Use the Group Object Analysis (GOA) Thread Volume Summary attributes to create situations that monitor the thread activity for volumes.

Authorization ID  The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

Correlation ID  The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.
**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 Read I/O** The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**DB2 Read I/O Rate** The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**DB2 Write I/O** The number of I/O writes. Valid value is an integer in the range 0 - 2147483647; for example, 20.

**DB2 Write I/O Rate** The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**Max DB2 I/O Rate** The maximum DB2 I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

**Max DB2 Read I/O Rate** The maximum DB2 read I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Max DB2 Write I/O Rate** The maximum write I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.0.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Threads** The total number of currently monitored threads. Valid value is an integer in the range 0 - 999999.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Percent Volume Use** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I//O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.
Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Total DB2 I/O** The total DB2 I/O count. Valid value is an integer in the range 0 - 2147483647.

**Total DB2 I/O Rate** The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, to a maximum of 6 characters; for example, PRI123.

**Group Object Analysis Thread Space Name Detail Workspace:**

The Group Object Analysis (GOA) Thread Space Name Detail workspace displays detailed information about the threads that are generating I/O activity for the space name.

For example, for a space name, you can display the:

- Plan name
- Authorization ID
- Correlation ID
- DB2 ID

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Volume Workspace:**

The Group Object Analysis (GOA) Volume workspace displays information about the performance of volumes that contain DB2 objects so that you can monitor the DASD performance by volume.

The workspace displays only the volumes that contain DB2 objects that are allocated and available for use by DB2.

Using this table view, you can:

- Display the number of DB2 systems for the volume
- Monitor for volumes with a high utilization rate
- Determine the number of data sets and extents that are allocated

To display the view:

1. Right-click a volume name.
2. Click **Link to** followed by a specific Data Sharing workspace from the pop-up menu.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Volume Summary Attributes:**
Use the Group Object Analysis (GOA) Volume Summary attributes to create situations that monitor DASD performance by volume.

**Data Sharing Group** The name of a data sharing group.

It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 I/O Percent** The percentage of total DB2 I/O that is attributable to the volume. It is calculated by dividing the volume DB2 I/O count by the total DB2 I/O count. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 24.

**Extents per Data Set Ratio** The ratio of total extents allocated to the total data set count.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- **M** = Month
- **D** = Day
- **Y** = Year
- **H** = Hour
- **M** = Minute
- **S** = Second
For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Volume DB2 I/O** The total number of I/Os for the volume originating from the DB2 subsystem being monitored. Valid value is an integer in the range 0 - 2147483647.

**Volume DB2 I/O Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Volume DB2 I/O Rate Max** The maximum I/O rate per second during the collection interval. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 2147483647.0; for example, 2.5.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval. This value is the sum of the average IOS pending time, the average IOS connect time, and the average IOS disconnected time for the volume. It does not include IOS queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Service Time Max** The maximum service time for the volume since the beginning of the collection interval. The value is the sum of the IOS pending time, the IOS connect time, and the IOS disconnect time for the volume. It does not include IOS queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.5.

**Volume Total I/O** The total number of I/Os for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is an integer in the range 0 - 2147483647; for example, 19.

**Volume Total I/O Rate** The total number of I/Os per second for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Volume Utilization** The percentage of volume utilization and represents the percentage of time the volume is in use. Valid value is an integer in the range 0 - 100; for example, 22.

**Group Object Analysis Volume Database Workspace:**

The Group Object Analysis (GOA) Volume Database workspace displays information you can use to analyze I/O activity for a single volume in a DB2 database.
The table view displays a row for each database that has I/O to the selected volume during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Volume Database Summary Attributes:**
Use the Group Object Analysis (GOA) Volume Database Summary attributes to create situations that monitor I/O activity for a single volume in a DB2 database.

**Database Name** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDBDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 Read I/O** The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**DB2 Read I/O Rate** The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**DB2 Read I/O Rate Max** The maximum DB2 read I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**DB2 Write I/O** The number of write I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 20.

**DB2 Write I/O Rate** The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.0.

**DB2 Write I/O Rate Max** The maximum write I/O rate per second during the current interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.
Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Space Name  The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example DSNUCX01.

Time Stamp  Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Total DB2 I/O  The total DB2 I/O count. Valid value is an integer in the range 0 - 2147483647.

Total DB2 I/O Rate  The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

Total DB2 I/O Rate Max  The maximum I/O rate per second during the collection interval. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.5.

Volume Name  The name of the volume that contains the DB2 objects. It is an alphanumeric text string, to a maximum of 6 characters; for example, PRI123.

Volume Use Percent  The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

Group Object Analysis Volume Space Name Workspace:

The Group Object Analysis (GOA) Volume Space Name workspace displays information that permits you to analyze I/O activity for a single volume for a DB2 database or space name.

The table view displays information for each space name in the selected database with I/O activity to the volume during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
Group Object Analysis Volume Space Name Detail Workspace:

The Group Object Analysis (GOA) Volume Space Name workspace displays detailed information for a single volume for a DB2 database or space name.

For each space name, you can display:
- The DB2 ID
- Information about the DB2 operations (such as the number of I/O reads and I/O writes)

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Object Analysis Volume Thread Workspace:

The Group Object Analysis (GOA) Volume Thread workspace displays information you can use to analyze which threads are generating I/O activity for a single volume in a DB2 database.

The view shows information for each thread that generated I/O activity to the selected database during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Group Object Analysis Volume Summary Attributes:

Use the Group Object Analysis (GOA) Volume Summary attributes to create situations that monitor DASD performance by volume.

Data Sharing Group The name of a data sharing group.

It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDDB241G.

DB2 ID The name of a DB2 subsystem.

DB2 I/O Percent The percentage of total DB2 I/O that is attributable to the volume. It is calculated by dividing the volume DB2 I/O count by the total DB2 I/O count. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 24.

Extents per Data Set Ratio The ratio of total extents allocated to the total data set count.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of Data Sets The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.
**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Volume DB2 I/O** The total number of I/Os for the volume originating from the DB2 subsystem being monitored. Valid value is an integer in the range 0 - 2147483647.

**Volume DB2 I/O Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Volume DB2 I/O Rate Max** The maximum I/O rate per second during the collection interval. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 2147483647.0; for example, 2.5.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval. This value is the sum of the average IOS pending time, the average IOS connect time, and the average IOS disconnected time for the volume. It does not include IOS queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Service Time Max** The maximum service time for the volume since the beginning of the collection interval. The value is the sum of the IOS pending time, the IOS connect time, and the IOS disconnect time for the volume. It does not include IOS queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.5.

**Volume Total I/O** The total number of I/Os for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is an integer in the range 0 - 2147483647; for example, 19.
**Volume Total I/O Rate** The total number of I/Os per second for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Volume Utilization** The percentage of volume utilization and represents the percentage of time the volume is in use. Valid value is an integer in the range 0 - 100; for example, 22.

**Group Object Analysis Volume Database Workspace:**

The Group Object Analysis (GOA) Volume Database workspace displays information you can use to analyze I/O activity for a single volume in a DB2 database.

The table view displays a row for each database that has I/O to the selected volume during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Volume Thread Workspace:**

The Group Object Analysis (GOA) Volume Thread workspace displays information you can use to analyze which threads are generating I/O activity for a single volume in a DB2 database.

The view shows information for each thread that generated I/O activity to the selected database during the collection interval.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Group Object Analysis Volume Thread Detail Workspace:**

The Group Object Analysis (GOA) Volume Thread Detail workspace displays detailed information about the DB2 threads that are generating I/O for the volume.

For each volume name, you can display the:

- Plan name
- Authorization ID
- Correlation ID
- DB2 ID

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
IMS Connections Workspace:

The IMS Connections workspace provides an overview of DB2 thread activity originating from connected IMS subsystems.

It provides information on a connection level about all IMS subsystems identified to DB2. This workspace is comprised of the following views:

IMS Connections (table view), which

Lists the number of active threads, unconnected regions, dependent regions currently connected to this DB2 system, and dependent regions defined for this IMS connection.

IMS Region Counts (bar chart)

Shows this information in a "graphic" form.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 IMS Connections Attributes:

Use the DB2 IMS Connections attributes to create situations to monitor DB2 thread activity originating from connected IMS subsystems.

Active Threads The count of threads currently active for this IMS region.

Connected Dependent Regions The count of dependent regions currently connected to this DB2 system.

Defined Dependent Regions The count of defined dependent regions for this IMS connection.

IMS Name The ID for this IMS connection. It is an alphanumeric text string, with a maximum length of four characters.

IMS Version The version of the IMS system. It is an alphanumeric text string, with a maximum length of four characters.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Time The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is **CYYMMDDHHMMSSmmm** (as in 1180315064501000 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond
Unconnected Regions The number of regions not connected.

IMS Region Information Workspace:

The IMS Region Information workspace provides detailed status information for a specific IMS dependent region.

This workspace is comprised of the following view:

IMS Region Information (table view)

Lists region identification data and region status.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 IMS Regions Attributes:
Use the DB2 IMS Regions attributes to create situations to monitor IMS dependent regions.

Application Name The PSB name active in the IMS dependent region. This field applies only to dependent regions (not to the control region). It is an alphanumeric text string, with a maximum length of eight characters.

Command Recognition Character The command recognition character used to pass commands to the external subsystem. It is an alphanumeric text string, with a maximum length of four characters.

Connection Status The region connection status.

Error Option Specification The type of error option specification in use.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>The appropriate return code is sent to the application, and the SQL code is returned.</td>
</tr>
<tr>
<td>Q</td>
<td>The application is abended. This is a PSTOP transaction type. The input transaction is re-queued for processing and new transactions are queued.</td>
</tr>
<tr>
<td>A</td>
<td>The application is abended. This is a STOP transaction type. The input transaction is discarded and new transactions are not queued.</td>
</tr>
</tbody>
</table>

It is an alphanumeric text string, with a maximum length of four characters.

IMS Name The ID for this IMS connection. Valid entry is an alphanumeric text string, with a maximum length of four characters.

IMS Version The version of the IMS system. Valid entry is an alphanumeric text string, with a maximum length of four characters.

Interface Control Module The name of the interface control module. It is an alphanumeric text string, with a maximum length of eight characters.
**Language Token Interface** The name of the language interface token. It is an alphanumeric text string, with a maximum length of four characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Region Name** The region started task name. It is an alphanumeric text string, with a maximum length of eight characters.

**Region Type** The type of IMS region.

**Resource Translation Table** The name of the resource translation table. This table maps the IMS application names into DB2 plan names. If this entry is omitted, the DB2 plan name is the IMS application program name. It is an alphanumeric text string, with a maximum length of eight characters.

**Status** The current DB2 status of the thread. Valid entry is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYMN</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and</td>
</tr>
<tr>
<td></td>
<td>executing within the DB2 command processor. (This type of thread always</td>
</tr>
<tr>
<td></td>
<td>has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate</td>
</tr>
<tr>
<td></td>
<td>from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
</tbody>
</table>
IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.
WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.
WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Time
The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is 

\[ \text{CY}MMDDHHMMSSmmm \]

(as in 1180315064501000 for 03/15/18 06:45:01) where:

- \( C \) = Century (0 for 20th, 1 for 21st)
- \( Y \) = Year
- \( M \) = Month
- \( D \) = Day
- \( H \) = Hour
- \( M \) = Minute
- \( S \) = Second
- \( m \) = Millisecond

IMS Thread Summary Workspace:

The IMS Thread Summary workspace provides an overview for threads originating from connected IMS subsystems.
This workspace is comprised of the following views:

**IMS Thread Summary (table view)**
Shows summary information for the IMS threads.

**In-DB2 CPU Time (bar chart)**
Shows the class 2 CPU time (in DB2) for IMS threads.

**In-DB2 Time (bar chart)**
Shows the class 2 elapsed time (in DB2) for IMS threads.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:
- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace”
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

**Installation Parameters:**

The Installation Parameters navigator item opens the DSNZPARM Thread Parameters workspace.

Select the Installation Parameters workspace to view information about DB2 parameters for a:
- Single DB2 subsystem
- Data sharing group (DSG)

**Lock Conflicts Workspace:**

The Lock Conflicts workspace provides an overview of the DB2 database lock conflicts.

This workspace is comprised of the following views:

**Lock Elapsed Time in Seconds (bar chart)**
Shows the elapsed time in seconds.
Local Lock Conflicts (table view)

Shows more information about local locking conflicts.

Thread information is not available if the thread is owned by the other member of the data sharing group.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554

- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

Local DB2 Lock Conflict Attributes:

Use Local DB2 Lock Conflict Group attributes to create situations that monitor DB2 database lock conflicts.

Authorization ID The primary authorization ID from connection or signon, that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

Authorization ID (Unicode) The primary authorization ID from connection or signon, that identifies the execution privileges an application has to a DB2 object or service. Valid format is alphanumeric with a maximum of 8 characters; for example, TRAN5.

Begin Time Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and ims wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

Local DB2 Lock Conflict Attributes Identifies the connection of an application to a DB2 system.
Local DB2 Lock Conflict Attributes  The type of connection associated with the thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Correlation ID  The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example, DLKEX212.

DB2 ID  The name of a DB2 subsystem.

Display Elapsed Time  The total amount of elapsed time since thread creation or DB2 sign-on.

IDNAME  An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

Lock Elapsed Time  The amount of time (in seconds) a waiter has been waiting for the resource.

Lock Level  Identifies the lock resource usage.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>
</tr>
<tr>
<td>NSU</td>
<td>Non-shared Update</td>
</tr>
</tbody>
</table>
Lock Resource
The resource a lock owner currently has locked or the resource that caused DB2 to suspend a lock request. It is an alphanumeric text string, with a maximum of 50 characters; for example, DB=TBLBLK2 PS=PAGELK2.

Lock Status
The status of a job holding or waiting on a lock: If the status is OWN with a DB2 subsystem name, the lock is owned by another DB2 subsystem in the Data Sharing Group (DSG); for example, if lock status is OWN-DB2A, the lock is owned by DB2 subsystem DB2A.

Lock Token
Lock Token.

Lock Type
The lock type of the lock request.

Valid values are:

Table 79. Lock types

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACSC</td>
<td>The Accelerator Services commands (ACSC) lock.</td>

<td>DBEX</td>
<td>The Database exception (DBEX) lock indicates a lock on a “Logical page list” (LPL) or “Group buffer pool recovery pending” (GRECP) database exception status. This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>DBXU</td>
<td>The DB exception update lock is used for updating the database exception status.</td>
</tr>
<tr>
<td>DGTT</td>
<td>The DGTT URID lock is acquired to protect segments that belong to a Declared Global Temporary Table (DGTT). These segments are deallocated during Commit 1 by logging them and serializing them using the Unit of Recovery ID (URID) lock.</td>
</tr>
</tbody>
</table>
| DPAG      | The DB2 page (DPAG) lock in a tablespace. When programs read data or update data, they acquire a page lock containing the data.  
  - DB = database name  
  - PS = pageset name  
  - PG = page |
| DSET      | The partitioned lock.  
  A partitioned tablespace contains one or more partitions (up to 64). It is created when you create a table space using the SQL CREATE TABLESPACE statement with the NUMPARTS parameter.  
  Only one table can be stored on a partitioned tablespace. Each partition contains one part of a table. The partitioned lock only locks the partition with the data that is referenced.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition number |
| DTBS      | The Database lock indicates a lock on the database.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition number |
| GRBP      | The Group buffer pool (GRBP) start/stop lock.  
  BP=buffer pool ID |
| HASH      | The Hash anchor (HASH) lock.  
  - DB = database name  
  - PS = pageset name  
  - PG = page |
| HPSP      | The Header Page (HP) Bucket or Stored Procedure (SP) Command lock |
| IEOF      | The Index end of file (IEOF) lock is acquired at the index end of file.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition |
Table 79. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| IPAG      | The Index page (IPAG) lock in an index space. When application programs read or update data, they acquire a lock on the page containing the index when indexing is used.  
- DB = database name  
- PS = pageset name  
- PG = page |
| IXY      | The Index key (IXKY) lock. |
| LBLK      | The Large object (LOB) lock. |
| LPLR      | The Logical page list recovery (LPLR) lock. |
| MDEL      | The Mass delete (MDEL) lock is acquired when doing a mass delete from a table (for example, when you DELETE FROM a table) within a segmented tablespace.  
It is used to prevent another user from reusing freed segments before a delete operation is committed.  
- DB = database name  
- PS = pageset name |
| PALK      | The Partition lock.  
- DB = database name  
- PS = pageset name  
- PT = partition |
| PBPC      | The Group BP level castout (PBPC) P-lock.  
A physical lock acquired when a castout of a group buffer pool occurs. Castout is the process of writing pages in the group buffer pool out to DASD.  
This lock is only used in a data sharing environment. |
| PCDB      | The DDF CDB P-lock.  
A Distributed Data Facility communication database physical lock.  
This lock is only used in a data sharing environment. |
| PDBD      | The DBD P-lock is a database descriptor physical lock.  
This lock is only used in a data sharing environment. |
| PDSO      | The Pageset or partitioned pageset open lock.  
If the data set supporting the tablespace that is referenced by the application is not opened, the program will acquire a lock to open the data set. The data set will stay open if CLOSE=NO is defined in the SQL statement creating the tablespace.  
- DB = database name  
- PS = pageset name |
| PITT      | The Index manager tree (PITR) is a physical lock (P-lock).  
This lock is only used in a data sharing environment.  
- DB = database name  
- PS = pageset name  
- PT = partition |
Table 79. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPAG</td>
<td>The Page P-lock is a physical lock on a page. This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PPSC</td>
<td>The Pageset/partition level castout physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PPSP</td>
<td>The Pageset/partition physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PRLF</td>
<td>The Resource Limit Facility (RLF) physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td>PSET</td>
<td>The Pageset (PSET) lock can be a tablespace or indexspace. A pageset containing DB2 tables is a tablespace. A pageset containing DB2 index structure is an indexspace. A pageset can be simple or partitioned. This lock type is for the simple pageset only.</td>
</tr>
<tr>
<td>PSPI</td>
<td>The Pageset piece (PSPI) lock. A pageset is a collection of pageset pieces. Each pageset piece is a separate VSAM data set. A simple pageset contains from 1 to 32 pieces. Each piece of a simple pageset is limited to 2 GB. Whenever a simple pageset piece reaches this size, another piece is allocated and the pageset grows. This is a lock on the expanded pageset piece.</td>
</tr>
<tr>
<td>RDBD</td>
<td>The Repair DBD (RDBD) lock is acquired when REPAIR DBD REBUILD is running (test/diagnose).</td>
</tr>
<tr>
<td>RDRN</td>
<td>The Repeatable Read drain (RDRN) lock is acquired to drain all RR access to an object.</td>
</tr>
<tr>
<td>RGDA</td>
<td>The Retry Getpage During Abort (RGDA) lock.</td>
</tr>
<tr>
<td>ROW</td>
<td>The Row lock indicates a lock on a row.</td>
</tr>
<tr>
<td>RSTR</td>
<td>The Shared Communications Area (SCA) restart (RSTR) lock indicates a lock on SCA access for restart/redo information. (BMC-RSTP)</td>
</tr>
<tr>
<td>SDBA</td>
<td>The Start/stop lock on DBA (SDBA) table indicates a lock on the table, tablespace, or database when a CREATE/DROP is processed against these objects.</td>
</tr>
<tr>
<td>SENV</td>
<td>The System environment (SYSENV) serialization lock.</td>
</tr>

</table>
| WDRN      | The Write drain (WDRN) lock is acquired to drain all write access to an object.  
  • DB = database name  
  • PS = pageset name  
  • PT = partition |
| XMLK      | The XML lock. |

**LUWID** The logical unit of work ID (LUWID) for a thread.

**MVS System** An ID for the MVS System Management Facility (SMF). It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string with a maximum of 8 characters. For example PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Resource Name 1 (Unicode)** The resource name of type defined by type code.

**Resource Name 2 (Unicode)** The resource name of type defined by type code.

**Resource Name 3** The resource name of type defined by type code.

**Resource Name 4** The resource name of type defined by type code.

**Resource Type 1** This value indicates what is contained in Resource Name 1.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BP</td>
<td>Buffer Pool</td>
</tr>
<tr>
<td>CO</td>
<td>Collection name</td>
</tr>
<tr>

</tbody>
</table>

**Resource Type 3** This value indicates what is contained in Resource Name 3.

**Resource Type 4** This value indicates what is contained in Resource Name 4.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PT</td>
<td>Partition</td>
</tr>
</tbody>
</table>

**SUBSYS** The IRLM subsystem name.

**Thread Status** The current status of a thread.

Valid values are:

**Status** Description

NOT-AVAIL
The thread is not available.

IN-ABORT
The thread is in abort processing.

IN-ACCEL
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
The thread is processing an autonomous procedure.

IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.
INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.
WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.
WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Token The thread token uniquely identifies a specific thread.

Local DB2 Lock Conflict Attributes The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value2** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: the last 2 bytes of QWHSLUUV).

**Log Manager Workspace:**

The Log Manager workspace provides an overview of the DB2 log manager active logging and archiving activity.

This workspace is comprised of the following views:

- **Archive in Progress (table view)**
  Shows details associated with the log data sets of the current archiving activity.

- **Data Set Utilization (linear gauge chart view)**
  Indicates the percent of the current data set that is in use.

- **Log Manager Statistics (table view)**
  Lists total counts, counts during the last sample period, and the “per second” count for a variety of reads, writes, and allocations associated with DB2 SRM log management.

- **Log Manager Summary (table view)**
  Shows details associated with logging and archiving activity.

- **Primary Data Set (table view)**
  Shows details associated with the data sets of the primary log activity

- **Secondary Data Set (table view)**
  Shows details associated with the data sets of the secondary log activity.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli...
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 SRM Log Manager Attributes:**
Use the DB2 SRM Log Manager attributes to create situations to monitor the DB2 log manager activity.

- **Active Log CIs Rate** The number of active log control intervals (CIs) created per second over the last sampling period.
- **Archive CIs Offloaded Rate** The number of archive log write CIs offloads per second over the last sampling period.
- **Archive Read Allocation Rate** The number of archive log read allocations per second over the last sampling period.
- **Archive Recording Mode** The recording mode for the archive can be either dual or single. It is an alphanumeric text string, with a maximum length of one character.
- **Archive Write Allocation Rate** The number of archive log write allocations per second over the last sampling period.
- **Begin RBA** The lowest Relative Byte Address (RBA) in the log of the primary data set (DB2 11).
- **BSDS Access Rate** The number of BSDS access requests per second over the last sampling period.
- **Checkpoint Frequency** The number of bytes in the output buffer before a checkpoint is performed.
- **Current RBA** The current Relative Byte Address (RBA) in the log of the primary data set (DB2 11).
  
  It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.
- **Current Relative Byte Address** The current Relative Byte Address (RBA) in the log of the primary data set. It is an alphanumeric text string, with a maximum length of 12 characters.
- **Data Set Size** The size of the current logging data set.
- **Data set Utilization** The percentage of the current data that is in use. Valid entry ranges from 0.0 to 100.0.
- **Delta Active Log CIs** The number of active log CIs created during the last sampling period.
- **Delta Archive CIs Offloaded** The number of archive log CIs offloads during the last sampling period.
Delta Archive Read Allocation  The number of archive log read allocations during the last sampling period.

Delta Archive Write Allocation  The number of archive log write allocations during the last sampling period.

Delta BSDS Access  The number of BSDS access requests during the last sampling period.

Delta LookAhead Tape Failed  The number of look ahead tape mounts not satisfied during the last sampling period.

Delta LookAhead Tape Performed  The number of look ahead tape mounts performed during the last sampling period.

Delta LookAhead Tape Requests  The number of look ahead tape mounts attempted during the last sampling period.

Delta Reads Active Archive Log  The number of reads from the active archive log during the last sampling period.

Delta Reads Active Log  The number of reads from the active log during the last sampling period.

Delta Reads Delayed No Control Unit  The number of reads delayed because no tape control unit during the last sampling period.

Delta Reads Delayed Contention  The number of reads delayed as a result of the tape contention during the last sampling period.

Delta Reads Output Log Buffer  The number of reads from the output log buffer during the last sampling period.

Delta Write Active Buffer  The number of write active log buffer during the last sampling period.

Delta Write Delay No Buffer  The number of write delays as a result of no buffers during the last sampling period.

Delta Write Force  The number of write force requests during the last sampling period.

Delta Write Nowait  The number of write NOWAIT requests during the last sampling period.

Delta Write Wait  The number of write wait requests during the last sampling period.

End RBA  The highest Relative Byte Address (RBA) in the log of the primary data set (DB2 11).

It is an alphanumeric text string, with a maximum length of 20 characters. For DB2 11, the RBA can consist of up to 10 bytes. For versions prior to DB2 11, the RBA can consist of up to 6 bytes.

Filler  A placeholder to keep fullword alignment.
**High Relative Byte Address** The highest Relative Byte Address (RBA) in the log of the primary data set. It is an alphanumeric text string, with a maximum length of 12 characters.

**Input Buffer Size** The size of the log input buffer.

**Interval Time** The number of seconds since last sample.

**Log Recording Mode** The recording mode for the log, which can be either dual or single. It is an alphanumeric text string, with a maximum length of one character.

**Logs Available** The number of log data sets that are currently available.

**Logs Defined** The number of log data sets that have been defined.

**Look Ahead Tape Failed Rate** The number of look ahead tape mounts not satisfied per second over the last sampling period.

**Look Ahead Tape Performed Rate** The number of look ahead tape mounts performed per second over the last sampling period.

**Look Ahead Tape Requests Rate** The number of look ahead tape mount attempts per second over the last sampling period.

**Low Relative Byte Address** The lowest Relative Byte Address (RBA) in the log of the primary data set. It is an alphanumeric text string, with a maximum length of 12 characters.

**Next Checkpoint** The number of bytes before next checkpoint is to be performed.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Output Buffersize** The size of the log output buffer.

**Percent Logs Available** The percentage of active log data sets that are currently available.

**Primary Data Set Name** The current name of the log of the primary data set. It is an alphanumeric text string, with a maximum length of four characters.

**Read Active Archive Log Rate** The number of reads per second from the active archive log over the last sampling period.

**Read Active Archive Log Rate** The number of reads from the active log per second over the last sampling period.

**Read Output Log Buffer Rate** The number of reads from the output log buffer per second over the last sampling period.

**Reads Delayed Contention Rate** The number of reads delayed because the tape contention per second over the last sampling period.

**Reads Delayed NoCU Rate** The number of reads delayed as a result of no tape control unit per second over the last sampling period.
Secondary Data Set Name The current name of the log of the secondary data set. It is an alphanumeric text string, with a maximum length of four characters.

Time Stamp The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMSSmmm (as in 118031506450100 for 03/15/18 06:45:01) where:
• C = Century (0 for 20th, 1 for 21st)
• Y = Year
• M = Month
• D = Day
• H = Hour
• M = Minute
• S = Second
• m = Millisecond

Total Active Log CIs The total number of active log CIs created.

Total Archive CIs Offloaded The total number archive log CIs offloads.

Total Archive Read Allocation The total number of archive log read allocations.

Total Archive Write Allocation The total number of archive log write allocations.

Total BSDS Access The total number of BSDS access requests.

Total Look Ahead Tape Failed The total number of look ahead tape mounts not satisfied.

Total Look Ahead Tape Performed The total number of look ahead tape mounts performed.

Total Look Ahead Tape Requests The total number of look ahead tape mounts attempted.

Total Reads Active Archive Log The total number of reads from the active archive log.

Total Reads Active Log The total number of reads from the active log.

Total Reads Delayed Contention The total number of reads delayed as a result of tape contention.

Total Reads Delayed No Control Unit The total number of reads delayed as a result of no tape control unit.

Total Reads Output Log Buffer The total number of reads from the output log buffer.

Total Write Active Buffer The total number of write active log buffers.

Total Write Delay No Buffer The total number of writes delayed as a result of no buffer.
Total Write Force  The total number of write force requests.

Total Write Nowait  The total number of write nowait requests.

Total Write Wait  The total number of write wait requests.

Write Active Buffer Rate  The number of write active log buffers per second over the last sampling period.

Write Delay No Buffer Rate  The number of write delays per second as a result of no buffer over the last sampling period.

Write Force Rate  The number of write force requests per second over the last sampling period.

Write Nowait Rate  The number of write nowait requests per second over the last sampling period.

Write Threshold  Write threshold.

Write Wait Rate  The number of write wait requests per second over the last sampling period.

MVS Storage Above 2 GB Workspace:

The MVS Storage Above 2 GB workspace provides an overview of MVS storage above the 2 GB bar. It shows information about storage allocation within the DBM1 address space. You can view this information if DB2 10 is installed.

This workspace is comprised of the following views:
• MVS Storage Above 2 GB (table view)
• MVS Storage Above 2 GB (bar chart view)
• DBM1 MVS Storage above 2 GB (table view)
• Real and Auxiliary Storage (table view)

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can use the navigation links in the MVS Storage Above 2 GB view to open:
• “MVS Storage Below 2 GB Workspace”
• “Common Storage Workspace” on page 480

MVS Storage Below 2 GB Workspace:

The MVS Storage Below 2 GB workspace provides an overview of MVS storage below the 2 GB bar. It shows information about storage allocation within the DBM1 address space. You can view this information if DB2 10 is installed.

This workspace is comprised of the following views:
• MVS Storage Below 2 GB (table view)
• MVS Storage Below 2 GB (bar chart view)
• MVS Storage (table view)
• DBM1 MVS Storage Below 2 GB (table view)
• System Storage Engines and Thread Information (table view)
• DB2 IRLM Storage (table view) shows the usage of IRLM storage (DB2 11 or later)

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can use the navigation links in the MVS Storage view to open:
• “MVS Storage Above 2 GB Workspace” on page 750
• “Common Storage Workspace” on page 480

Object Analysis Database Workspace:

The Object Analysis Database workspace provides a global view of object allocation data for a specific data sharing group.

A consolidated list of DB2 databases is displayed on the table in ascending order by database name. Your view may sort differently if you have changed the sort field or sort order.

Use this view to:
• Evaluate DB2 database object allocations
• Track object allocation data over a period of time
• Analyze space name allocation data for a specific DB2 database

The Object Analysis Database table view only displays databases that contain spaces currently allocated to the DB2 subsystems that are part of the data sharing group you are monitoring.

Note: The Event Manager for Object Analysis must be active to allow object analysis data to be collected.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Object Analysis Space Name Workspace:

The Object Analysis Space Name workspace displays space name allocation data for a specific DB2 database.

Use this workspace to evaluate and analyze the space name allocation data that a specific DB2 database owns.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Object Analysis Space Name Detail Workspace:

The Object Analysis Space Name Detail workspace displays detail object analysis data for each DB2 object space in a DB2 database.
Use this workspace to evaluate and analyze space name allocation data for each DB2 object space in a DB2 database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Overall Transaction Data Workspace:**

The Overall Transaction Data workspace provides information about the Database Connection Services (DCS) application at the transaction level.

This workspace is comprised of the following views:

- **Application - Network (bar chart)**
  Shows the number of data transmissions between the DB2 Connect gateway and the host database and the number of bytes sent between the client application, the DB2 Connect gateway, and the host database. This view enables you to measure the throughput between the client and the DB2 Connect gateway and between the DB2 Connect gateway and the host database.

- **Application - SQL Statement (bar chart)**
  Shows the number of SQL, SQL COMMIT, and SQL ROLLBACK statements that have been attempted and the number of SQL statements that have been attempted but have failed. This view enables you to measure the database activity for the DCS application.

- **Thread/Application ID (table view)**
  Identifies the thread and the DCS application.

- **Last Reset and Connect Timestamp (table view)**
  Shows when the monitor counters were reset for the application issuing the GET SNAPSHOT and when the first connection to the host database was initiated from the DB2 Connect gateway.

- **Network & Times (table view)**
  Provides details about the throughput, and the times for data transmissions, between the client application, the DB2 Connect gateway, and the host database.

- **Unit of Work (table view)**
  Provides details about the SQL statements and units of work performed.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Performance Workspace:**

The Performance workspace shows the information obtained by running a sample SQL statement between the DB2 Connect gateway and the host database. It enables you to detect any bottlenecks.

This workspace is comprised of the following views:

- **DB2 Connect Server - SQL Statement Time (pie chart)**
  Shows the distribution of the various amounts of time required to process the sample SQL statement.
DB2 Connect Information (table view)
   Shows key information about the selected DB2 Connect gateway.

Time for Sample SQL Statement (table view)
   Shows the various amount of time required to process the sample SQL statement.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

SQL Counts 1 Workspace:

The SQL Counts 1 workspace provides information about SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements.

This workspace is comprised of the following views:

DML (table view)
   Provides information on SQL DML (Data Manipulation Language) statements.

DCL (table view)
   Provides information on DCL (Data Control Language) declarations.

DDL Create (table view)
   Provides information on SQL DDL (Data Definition Language) statements for Create.

DDL Drop (table view)
   Provides information on SQL DDL (Data Definition Language) statements for Drop.

DDL Alter / Rename (table view)
   Provides information on SQL DDL (Data Definition Language) statements for Alter / Rename.

Note: Each table view provides the following information:

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td>The total counts since the last sample period.</td>
</tr>
<tr>
<td>Delta</td>
<td>The changes since the last sample period.</td>
</tr>
<tr>
<td>Rate</td>
<td>The number of requests per second over the last sampling interval.</td>
</tr>
</tbody>
</table>

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

SQL Counts Attributes:
Use the SQL Counts attributes to create situations to monitor the SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements, associated with a DB2 subsystem. They also show information for stored procedures, user-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements. They provide information about multi-row processing and concentrate statements.
**4K Used Instead 32K** The number of times that space in a 4 KB page table space was used because space in a 32 KB page table space was preferred but not available (Field name: QISTWFP2).

**32K Used Instead 4K** The number of times that space in a 32 KB page table space was used because space in a 4 KB page table space was preferred but not available (Field name: QISTWFP1).

**Agent Max Storage** The maximum amount of storage that can be used for each agent (Field name: QISTWMXA).

**Allocate Cursor** The number of SQL ALLOCATE CURSOR statements executed (field name: QXALOCC).

**Alter Database** The number of ALTER DATABASE statements executed (Field name: QXALDAB).

**Alter Function** The number of ALTER FUNCTION statements executed (Field name: QXALUDF).

**Alter Index** The number of ALTER INDEX statements executed (Field name: QXALTIX).

**Alter Procedure** The number of ALTER PROCEDURE statements executed (Field name: QXALPRO).

**Alter Stogroup** The number of ALTER STOGROUP statements executed (field name: QXALTST).

**Alter Table** The number of ALTER TABLE statements executed (Field name: QXALT TA).

**Alter Tablespace** The number of ALTER TABLESPACE statements executed (Field name: QXALT TS).

**Alter Trusted Context** The number of alter trusted context statements executed (Field name QXALTCTX) - not supported prior to DB2 9.

**Associate Locator** The number of SQL ASSOCIATE LOCATORS statements executed (Field name: QXALOCL).

**Close Cursor** The number of CLOSE statements executed. This number at the server location might not match the user application because of DDF’s internal processing (DB2 field name: QXCLOSE).

**Comment On** The number of COMMENT ON statements executed (Field name: QXCMTON).

**Connect (Type 1)** The number of CONNECT type 1 statements executed (Field name: QXCON1).

**Connect (Type 2)** The number of CONNECT type 2 statements executed (field name: QXCON2).

**Create Alias** The number of CREATE ALIAS statements executed (Field name: QXCRALS).
Create Database The number of CREATE DATABASE statements executed (Field name: QXCRDAB).

Create Distinct Type The number of CREATE DISTINCT TYPE statements executed (Field name: QXCDIST).

Create Function The number of CREATE FUNCTION statements executed (Field name: QXCRUDF).

Create Global Temp Table The number of CREATE GLOBAL TEMPORARY TABLE statements executed (Field name: QXCRGTT).

Create Index The number of CREATE INDEX statements executed (Field name: QXCRINDEX).

Create Procedure The number of CREATE PROCEDURE statements executed (Field name: QXCRPRO).

Create Role The number of CREATE ROLE statements executed (Field name QXCRROLE) - not supported prior to DB2 9.

Create Stogroup The number of CREATE STOGROUP statements executed (Field name: QXCRSTG).

Create Synonym The number of CREATE SYNONYM statements executed (field name: QXCRSYN).

Create Table The number of CREATE TABLE statements executed (Field name: QXCRTABLE).

Create Tablespace The number of CREATE TABLESPACE statements executed (Field name: QXCTAB).

Create Trigger The number of CREATE TRIGGER statements executed (field name: QXCTRIGGER).

Create Trusted Context The number of create trusted context statements executed (Field name QXCRTRUSTED) - not supported prior to DB2 9.

Create View The number of CREATE VIEW statements executed (Field name: QXDEFFVU).

Current Total Storage The total whole kilobytes of storage that are currently used in the workfile database (field name: QISTWCTO).

DB2 ID The DB2 subsystem ID.

Delete The number of DELETE statements executed (DB2 field name: QXDELETE).

Delete Rows Accessed The number of rows accessed by READ transactions because of uncommitted DELETE operations (using currently committed semantic for FETCH) - (Field name: QISTRCCD).

Delta The changes since the last sample period.
Describe The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXDESC).

Describe Table The number of DESCRIBE TABLE statements executed (Field name: QXDSCR_TB).

Description The description of the monitored activity.

Direct Row Revert to Index The number of times that direct row access failed and an index was used to find a record (Field name: QXROIIDX).

Direct Row Revert to TS Scan The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was not able to use a matching index scan (Field name: QXROITS).

Direct Row Successful The number of times that direct row access was successful (Field name: QXROIMAT).

Drop Alias The number of SQL DROP ALIAS statements executed (field name: QXDRPA).

Drop Database The number of DROP DATABASE statements executed (Field name: QXDRPDB).

Drop Distinct Type The number of DROP DISTINCT TYPE statements executed (Field name: QXDDIST).

Drop Function The number of DROP FUNCTION statements executed (field name: QXDRPFN).

Drop Index The number of DROP INDEX statements executed (Field name: QXDRPIX).

Drop Package The number of SQL DROP PACKAGE statements executed (field name: QXDRPPKG).

Drop Procedure The number of DROP PROCEDURE statements executed (Field name: QXDRPPR).

Drop Role The number of DROP ROLE statements executed (Field name QXDRPROL) - not supported prior to DB2 9.

Drop Stogroup The number of DROP STOGROUP statements executed (Field name: QXDRPST).

Drop Synonym The number of DROP SYNONYM statements executed (Field name: QXDRPSY).

Drop Table The number of DROP TABLE statements executed (Field name: QXDRPTA).

Drop Tablespace The number of DROP TABLESPACE statements executed (Field name: QXDRPTS).
**Drop Trigger** The number of DROP TRIGGER statements executed (Field name: QXDRPTR).

**Drop Trusted Context** The number of drop trusted context statements executed (Field name QXDRPCTX) - not supported prior to DB2 9.

**Drop View** The number of DROP VIEW statements executed (Field name: QXDRPVU).

**Fetch** The number of FETCH statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXFETCH).

**Grant** The number of GRANT statements executed (Field name: QXGRANT).

**Incremental Bind** The number of incremental binds (excluding prepare) (field name: QXINCRB).

**Insert** The number of INSERT statements executed (Field name: QXINSRT).

**Insert Rows Skipped** The number of rows skipped by READ transactions because of uncommitted INSERT operations (using currently committed semantic for FETCH) - (Field name: QISTRCCI).

**Interval Time** The number of seconds since last sample.

**Job Name** The job name that is associated with a thread.

**Label On** The number of LABEL ON statements executed (Field name: QXLABON).

**Literals Dups Created** The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTSTCWLD). The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

**Literals Matches Found** The number of times DB2 found a matching reusable copy of a dynamic statement in cache because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTSTCWLM).

**Literals Parsed** The number of times DB2 parsed dynamic statements because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTSTCWLP).

**Literals Replaced** The number of times DB2 replaced at least one literal in a dynamic statement because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTSTCWLR).

**Lock Table** The number of LOCK TABLE statements executed (Field name: QXLOCK).

**Max Nested SQL Trigger** The maximum level of indirect SQL cascading (Field name: QXCASCSDP). This includes cascading because of triggers, UDFs, or stored procedures.
Max Total Storage The maximum total amount of storage that is used in the
workfile database (Field name QISTWMXU).

Merge The number of MERGE statements executed (DB2 field name QXMERGE) -
not supported prior to DB2 9.

MVS ID The MVS system identifier.

Number of Max Exceeded The number of times the maximum amount of storage
that an agent can use was exceeded (field name: QISTWFNE).

Open Cursor The number of OPEN statements executed (Field name: QXOPEN).

Originating System ID The managed system name of the agent. It is an
alphanumeric text string, with a maximum of 32 characters; for example,
DB91:SYS1:DB2.

Parallel Bypass DB2 (Buffers) The number of times the parallelism coordinator
had to bypass a DB2 when distributing tasks because one or more DB2 members
did not have enough buffer pool storage (Field name: QXXCSKIP). The number in
this field is only incremented at the parallelism coordinator once per parallel
group, even though more than one DB2 might have lacked buffer pool storage for
that parallel group. It is also only incremented when the buffer pool is defined to
allow for parallelism. For example, if VPXPSEQT=0 on an assistant, DB2 does not
send parallel work there and the number in this field is not incremented.

Parallel Degree Executed The total number of parallel groups that executed in the
planned parallel degree (DB2 field name: QXNORGRP). This field is incremented
by one for each parallel group that executed in the planned degree of parallelism
(as determined by DB2).

Parallel Degree Reduced (no buffer) The total number of parallel groups that did
not reach the planned parallel degree because of a lack of storage space or
contention on the buffer pool (Field name: QXREDGRP).

Parallel Failed (Cursor) The total number of parallel groups that fell back to
sequential mode because of a cursor that can be used by UPDATE or DELETE
(Field name: QXDEGCUR).

Parallel Failed (No Buffer) The total number of parallel groups that fell back to
sequential mode because of a storage shortage or contention on the buffer pool
(Field name: QXDEGBUF).

Parallel Failed (No ESA Sort) The total number of parallel groups that fell back to
sequential mode because of a lack of ESA sort support (DB2 field name:
QXDEGESA).

Parallel Failed (No Enclaves) The total number of parallel groups that executed in
sequential mode because of the unavailability of MVS/ESA enclave services (Field
name: QXDEGENC).

Parallel Grp Executed The total number of parallel groups that were executed
(Field name: QXTOTGRP).

Parallel Maximum LOB Storage The maximum storage used for LOB values (DB2
field name: QXSTLOBV).
Parallel Single DB2 (Coord=NO) The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO (Field name: QXCOORNO). When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Parallel Single DB2 (Cursor) The total number of parallel groups executed on a single DB2 subsystem because of a repeatable-read or read-stability isolation (Field name: QXISORR).

Parallel Sysplex Intent The total number of parallel groups that DB2 intended to run across the data sharing group (Field name: QXXCBPNX). This number is only incremented at the parallelism coordinator at run time.

Prepare The number of PREPARE statements executed. This number at the server location might not match the user application because of DDF’s internal processing (Field name: QXPREP).

Prepare Avoided KEEPDYN(YES) The number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache (Field name: QXSTNPRP). When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary. An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Prepare Copied from Cache The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache (Field name: QXSTFND).

Prepare Discarded - MAXKEEPD The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDEXP).

Prepare Implicit KEEPDYN(YES) An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES (Field name: QXSTIPRP). If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Prepare No Match The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement (Field name: QXSTNFND).

Prepare Purged - DROP/ALT/REV The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDINV).

Rate The number of requests per second over the last sampling interval.
**Release** The number of RELEASE statements executed (DB2 field name: QXREL).

**Rename Index** The number of RENAME INDEX statements executed (Field name QXRNIX) - not supported prior to DB2 9.

**Rename Table** The number of RENAME TABLE statements executed (Field name: QXRNTAB).

**Revoke** The number of REVOKE statements executed (Field name: QXREVOK).

**RID HWM** The highest number of RID blocks in use at any time since DB2 startup (Field name: QISTRHIG). This is a high-water mark.

**RID In Use** The number of RID blocks currently in use (snapshot value) (Field name: QISTRCUR).

**RID Exceeded Pool** The number of times the maximum RID pool storage was exceeded (Field name: QISTRMAX). The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:
(Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

**RID Exhausted Virtual** The number of times RID pool processing was not used because DBM1 storage was exhausted (Field name: QISTRSTG).

**RID Not Used (no storage)** The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID pool process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXNSMIAP).

**RID Not Used (Max Limit)** The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXMRMIAP). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

**RID Pool Used** The number of times the RID (RECORD ID) pool has been processed (Field name: QXMIAP). During RID (RECORD ID) pool (also called RID list) processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (ORed) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

**RID Terminated (> DM)** The number of times a RID pool processing operation terminated because the number of RID entries was greater than the DM limit (Field name: QISTRPLM).

**RID Terminated (> RDS)** The number of times RID pool processing terminated because the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size) (Field name: QISTRLLM).
Row Triggers Executed The number of times a row trigger was activated (Field name: QXROWTRG).

Rows Deleted The number of rows that have been deleted because of SQL DELETE statements (Field name: QXRWSDELETE).

Rows Fetched The number of rows that have been fetched because of SQL FETCH statements (Field name: QXRWSFETCH).

Rows Inserted The number of rows that have been inserted because of SQL INSERT statements (Field name: QXRWSINSERT).

Rows Updated The number of rows that have been updated because of SQL UPDATE statements (Field name: QXRWSUPDATE).

Select The number of SQL SELECT statements executed (Field name: QXSELECT).

Set Connection The number of SET CONNECTION statements executed (Field name: QXSETCON).

Set Current Degree The number of SET CURRENT DEGREE statements executed (field name: QXSETCDG).

Set Current Path The number of SET CURRENT PATH statements executed (Field name: QXSETPATH).

Set Current Rules The number of SET CURRENT RULES statements executed (Field name: QXSETCRL).

Set Current SQLID The number of SET CURRENT SQLID statements executed (Field name: QXSETSQL).

Set Host Variable The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked (Field name: QXSETHV).

SP Abended The number of times a stored procedure terminated abnormally (Field name: QXCALLAB).

SP Call Statements The number of times the SQL CALL statements executed to invoke a stored procedure (SP).

SP Rejected The number of times an SQL CALL statement was rejected because of the procedure that is in the STOP ACTION(REJECT) state (Field name: QXCALLRJ).

SP Timed-Out The number of times an SQL CALL statement timed out when waiting to be scheduled (Field name: QXCALLTO).

SQL Error in Trigger The number of times an SQL error occurred during the execution of a triggered action (Field name: QXTRGERR). This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

Stmt Triggers Executed The number of times a statement trigger was activated (Field name: QXSTTRG).
Storage in 4K TS The total whole kilobytes of storage that were used for 4 KB table spaces (Field name: QISTW4K).

Storage in 32K TS The total whole kilobytes of storage that were used for 32 KB table spaces (Field name: QISTW32K).

Time Stamp The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMMDDHHMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:
• C = Century (0 for 20th, 1 for 21st)
• Y = Year
• M = Month
• D = Day
• H = Hour
• M = Minute
• S = Second
• m = Millisecond

Total The total count executed by the thread.

UDFs Abended The number of times a user-defined function (UDF) abended (Field name: QXCAUDAB).

UDFs Executed The number of user-defined functions (UDFs) executed (Field name: QXCAUD).

UDFs Rejected The number of times a user-defined function (UDF) was rejected (Field name: QXCAUDRJ).

UDFs Timed Out The number of times a user-defined function (UDF) timed out while waiting to be scheduled (Field name: QXCAUDTO).

Update The number of UPDATE statements executed (Field name: QXUPDTE).

Update Rows Accessed The number of rows accessed by READ transactions because of uncommitted UPDATE operations (using currently committed semantic for FETCH) - (Field name: QISTRCCU).

SQL Counts 2 Workspace:

The SQL Counts 2 workspace provides information about stored procedures, User-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements.

This workspace is comprised of the following views:
• Stored Procedures
• User-defined functions
• Triggers
• Direct row access
• Parallelism
• RID Pool Access
• Prepare Statements.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**SQL Counts 3 Workspace:**

The SQL Counts 3 workspace provides information about currently committed rows, multi-row processing, workfile storage, and concentrate statements.

This workspace is comprised of the following views:

**Use Currently Committed**

Shows, for the selected thread, the number of rows for currently committed data that is skipped or accessed by read transactions when processing a DB2 application.

**Multi-Row Processing**

 Enables you to track performance improvements such as multi-row fetch and multi-row insert.

**Workfile Storage**

Shows the statistics on the usage and storage of DB2 workfiles.

**Concentrate Statements**

Indicates if literal constants, which are referenced in dynamic SQL statements, are replaced with special markers so that these constants are not cached with the statement in the dynamic SQL statement cache.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Statement Information Workspace:**

The Statement Information workspace provides information about the SQL statement that was last performed by the Database Connection Services (DCS) application.

It enables you to measure the throughput between the client application, the DB2 Connect gateway, and the host database and to measure the times required for processing an SQL statement.

This workspace is comprised of the following views:

**Application - Network (bar chart)**

Shows the number of data transmissions between the DB2 Connect gateway and the host database and the number of bytes sent between the client, the DB2 Connect gateway, and the host database.

**Thread/Application ID (table view)**

Identifies the thread and the DCS application.

**Statement Information (table view)**

Provides information about the SQL statement that was last performed by the DCS application.

**Time (table view)**

Shows the times required for processing an SQL statement.
Network Statistics (table view)
Shows the number of bytes exchanged between the client application, the DB2 Connect gateway, and the host database.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread DB2 Connect Statement Attributes:
Use the DB2 Connect Statement attributes to create situations to identify any statement with long elapsed time.

Ace Address The DB2 thread ACE address for internal use.

Application Creator The authorization ID of the user who precompiled the application. You can use this counter to identify the SQL statement that is processing, in conjunction with the CREATOR column of the package section information in the catalogs.

Application ID The ID that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database.

It is known at both the client and the server, so you can use it to correlate the client and server parts of the application. For DDCS applications, you will also need to use the Outbound Application ID to correlate the client and server parts of the application. This ID is unique across the network. There are different formats for the application ID, which are dependent on the communication protocol between the client and the server machine on which the database manager, the DDCS, or both, are running. Each of the formats consists of three parts separated by periods.

<tr>
<td>APPC</td>
<td>Network.Logical Unit Name.Application instance</td>
<td>CAIBMTOR.OSFDBX0930131194520</td>
<td>This application ID is the displayable format of an actual SNA LUWID (logical unit-of-work ID) that flows on the network when an APPC conversation is allocated. APPC-generated application IDs are made up by concatenating the network name, the Logical Unit name, and the LUWID instance number, which create a unique label for the client/server application. The network name and Logical Unit name can each be a maximum of 8 characters. The application instance corresponds to the 12-decimal-character LUWID instance number.</td>
</tr>
<tr>
<td>TCP/IP</td>
<td>IPAddr.Port.Application instance</td>
<td>A12CF9E8.3F0A.930131214645</td>
<td>A TCP/IP-generated application ID is made up by concatenating the IP address in hexadecimal characters, the port number (4 hexadecimal characters), and a unique ID for the instance of this application. The IP address is a 32-bit number displayed as a maximum of 8 hexadecimal characters.</td>

</table>
| IPX/SPX      | Netid.nodeid.Application instance | C11A8E5C.400011528250131214645 | An IPX/SPX-generated application ID is made up by concatenating a character network ID (8 hexadecimal characters), a node ID (12 hexadecimal characters), and a unique ID for the instance of the application. The application instance corresponds to a 10-decimal-character timestamp of the form mmddhhmmss, where:  
  - M = Month  
  - D = Day  
  - H = Hour  
  - M = Minute  
  - S = Second |
| NetBIOS      | *NETBIOS.nname.Application instance | *NETBIOS.SBOIVIN.930131214645 | For nonpartitioned database systems, a NetBIOS application ID is made up by concatenating the string *NETBIOS, the NNAME defined in the database configuration file for the client, and a unique ID for the instance of this application. For partitioned database systems, a NetBIOS application ID is made up by concatenating the string N xxx etc where xxx is the partition the application is attached to. |
Application Name The name of the application running at the client as known to the database manager or DB2 Connect.

Together with the Application ID counter, it can be used to relate data items with your application.

Authorization ID The authorization ID.

Authid (Unicode) The authorization ID.

Blocking Cursor Indicates whether the statement being executed is using a blocking cursor. Using blocking for data transfer for a query can improve its performance. The SQL used for a query can affect the use of blocking and might require some modification.

Corrid The correlation ID.

Thread DB2 Connect Statement Attributes Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

DB2 ID The DB2 subsystem ID.

Gateway Snapshot Time The date and time at which the database system monitor information was collected.

Host Response Time For a DCS statement, this is the elapsed time between the time that the statement was sent from the DB2 Connect gateway to the host for processing and the time when the result was received from the host.

For a DCS database or a DCS application, it is the sum of the elapsed times for all the statements that were executed for a particular application or database. For a data transmission, this is the sum of host response times for all the statements that used this many data transmissions. Use this counter with the Network statistic - Outbound number of bytes sent and Network statistic - Outbound bytes received counters to calculate the outbound response time (transfer rate):

\[
\text{outbound number of bytes sent + outbound bytes received} / \text{host response time}
\]

Inbound Number of Bytes Received The number of bytes received by the DB2 Connect gateway from the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers. Use this counter to measure the throughput from the client to the DB2 Connect gateway.

<table>

<tbody>
<tr>
<td>Local applications</td>
<td>*LOCAL.DB2 instance.Application instance</td>
<td>*LOCAL.DB2INST1.930131235945</td>
<td>The application ID generated for a local application is made up by concatenating the string *LOCAL, the name of the DB2 instance, and a unique ID for the instance of this application.</td>
</tr>
</tbody>
</table>
**Inbound Number of Bytes Sent** Shows the number of bytes sent by the DB2 Connect gateway to the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers. Use this counter to measure the throughput from the DB2 Connect gateway to the client.

**IP Address** The current IP address.

**Local: System CPU Time** The total system CPU time, in seconds and microseconds, used by the statement that is currently executing.

Together with the other related CPU-time counters, it can help you understand the level of activity within an application and identify applications that could benefit from additional tuning. This counter includes time spent on SQL and non-SQL statements and on any fenced user-defined functions (UDF) or stored procedures executed by the application. System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

**Note:** If this information is not available for your operating system, this counter is set to 0.

**Local: User CPU Time** The total user CPU time, in seconds and microseconds, used by the currently executing statement. Together with the other related CPU-time counters, it can help you understand the level of activity within an application and identify applications that could benefit from additional tuning. This counter includes time spent on SQL and non-SQL statements and on any fenced user-defined functions (UDF) or stored procedures executed by the application. System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

**Most Recent Statement Elapsed Time** The elapsed execution time of the most recently completed statement. Use this counter as an indicator of the time that it takes for a statement to complete.

**MVSID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Number of Successful Fetches** For statement snapshot monitoring and the statement event type, this is the number of successful fetches performed on a specific cursor. For DCS statement snapshot monitoring, this is the number of attempted physical fetches during the execution of a statement regardless of how many rows were fetched by the application. That is, this counter shows the number of times the server needed to send a reply data back to the gateway while processing a statement. You can use this counter to gain insight into the current level of activity within the database manager.

**Outbound Application ID (Internal)** This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway. You can use this counter in conjunction with the Application ID counter to correlate the client and server parts of the application information. This ID is unique across the network.

**Outbound Application ID** This ID is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the
host, while the application ID is used to connect a client to the DB2 Connect gateway. You can use this counter in conjunction with the Application ID counter to correlate the client and server parts of the application information. This ID is unique across the network.

**Outbound Blocking Cursor** Indicates whether blocking is used for data transfer from the DRDA server to the DB2 Connect gateway for a particular query. Using blocking for data transfer for a query can improve its performance. The SQL used for a query can affect the use of blocking and might require some modification.

**Outbound Bytes Received** The number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

For a data transmission, this is the number of bytes received by the DB2 Connect gateway from the host during the processing of all the statements that used this number of data transmissions.

<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network.Logical Unit Name.Application instance</td>
<td>CAIBMTO.0SFDBM0.930131</td>
<td>Application ID is the displayable format of an actual SNA LUWID (logical unit-of-work ID) that flows on the network when an APPC conversation is allocated. APPC-generated application IDs are made up by concatenating the network name, the Logical Unit name, and the LUWID instance number, which creates a unique label for the client/server application. The network name and Logical Unit name can each be a maximum of 8 characters. The application instance corresponds to the 12-decimal-character LUWID instance number.</td>
</tr>
</tbody>
</table>

**Outbound Number of Bytes Sent** The number of bytes sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers. For a data transmission, this is the number of bytes sent by the DB2 Connect gateway to the host during the processing of all the statements that used this number of data transmissions. Use this counter to measure the throughput from the DB2 Connect gateway to the host database. Use this counter to measure the throughput from the host databases to the DB2 Connect gateway.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package Name** The name of the package that contains the SQL statement that is currently executing. You can use this counter to identify the application program and the SQL statement that is executing.
**Plan** The plan name.

**Query Cost Estimate** The estimated cost, in timerons, for a query, as determined by the SQL compiler. It allows correlation of actual run-time with the compile-time estimates.

In addition, it returns information for the following SQL statements when you are monitoring DB2 Connect.

- PREPARE represents the relative cost of the prepared SQL statement.
- FETCH contains the length of the row retrieved if the DRDA server is DB2 for OS/400.

If information is not collected for a DRDA server, this counter is set to zero.

**Note:** If the DRDA server is DB2 for OS/390 and z/OS, this estimate could be higher than 2**32 - 1 (the maximum integer number that can be expressed through an unsigned long variable). In that case, the value returned by the monitor for this counter is 2**32 - 1.

**Query Number of Rows Estimate** The estimated number of rows that is returned by a query.

This estimate by the SQL compiler can be compared with the run-time actuals. This counter also returns information for the following SQL statements when you are monitoring DB2 Connect.

- INSERT, UPDATE, and DELETE indicate the number of rows affected.
- PREPARE estimates the number of rows that are returned if the DRDA server is DB2 Universal Database, DB2 for VM and VSE, or DB2 for OS/400.
- FETCH sets to the number of rows fetched if the DRDA server is DB2 for OS/400.

If information is not collected for a DRDA server, this counter is set to zero.

**Section Number** The internal section number in the package for the SQL statement that is currently processing or has processed most recently.

For a static SQL, you can use this counter together with the creator, package version, and package name to query the SYSCAT.STATEMENTS system catalog table and obtain the static SQL statement text, using the sample query as follows:

```sql
SELECT SEQNO, SUBSTR(TEXT,1,120)
FROM SYSCAT.STATEMENTS
WHERE PKGNAME = 'package_name' AND PKGSHEMA = 'creator' AND VERSION = 'package_version_id' AND SECTNO = section_number
ORDER BY SEQNO
```

**Note:** This query can cause lock contentions. Therefore, try to use it only when there is little other activity against the database.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken.

**Statement Operation** The statement operation that is currently being processed or has processed most recently (if none is currently running).
You can use this counter to determine the operation that is executing or recently finished. It can be one of the following.

- For SQL operations:
  - SELECT
  - PREPARE
  - EXECUTE
  - EXECUTE IMMEDIATE
  - OPEN
  - FETCH
  - CLOSE
  - DESCRIBE
  - STATIC COMMIT
  - STATIC ROLLBACK
  - FREE LOCATOR
  - PREP_COMMIT
  - CALL
  - PREP_OPEN
  - PREP_EXEC
  - COMPIL
  - For non-SQL operations:
    - RUN STATISTICS
    - REORG
    - REBIND
    - REDISTRIBUTE
    - GET TABLE AUTHORIZATION
    - GET ADMINISTRATIVE AUTHORIZATION

**Note:** API users should refer to the sqlmon.h header file containing definitions of database system monitor constants.

**Statement Start Timestamp** The date and time at which the statement operation started executing. You can use this counter with the SQL statements - Statement operation counter to calculate the elapsed statement operation execution time.

**Statement Stop Timestamp** The date and time at which the statement operation stopped executing. You can use this counter with the SQL statements - Statement operation counter to calculate the elapsed statement operation execution time.

**Elapsed Execution Time** For a DCS statement, this is the elapsed time spent processing an SQL request on a host database server. This value is reported by this server. In contrast to the Times - Host response time counter, this counter does not include the network elapsed time between DB2 Connect and the host database server. At other levels, this value represents the sum of the host execution times for all the statements that were executed for a particular database or application, or for those statements that used a given number of data transmissions.

**No. of Statements** The number of SQL statements that have been attempted since the latter of: application startup, database activation, or last reset. For a data transmission, this is the number of SQL statements that have been attempted against this DCS database or in this DCS application since the database was
activated, the connection to it was established by the application, or RESET MONITOR was issued against the database, and that used this number of data transmissions between the DB2 Connect gateway and the host during statement processing.

**No. of Transmissions** The number of data transmissions between the DB2 Connect gateway and the host that was used to process this DCS statement. One data transmission consists of one send or one receive.

**Time Spent on Gateway Processing** The time, in seconds and microseconds, at the DB2 Connect gateway to process an application request since the connection was established, or to process a single statement. Use this counter to determine what portion of the overall processing time is because of DB2 Connect gateway processing.

**Time Stamp** The start time of this interval.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**Storage Consumption Workspace:**

The Storage Consumption workspace provides an overview of DB2 DBM1 virtual storage, MVS storage and real storage.

This workspace is comprised of the following views:

**Key Indicators (table view)**

Shows the average size of the thread footprint and the projected maximum number of threads that you can run with the current storage configuration.

**DBM1 Storage below 2 GB with Cushion (table view)**

Shows the amount of virtual storage below 2 GB that is used by the DBM1 address space.

**DBM1 Storage below 2 GB with Cushion (bar chart)**

Shows the amount of virtual storage below 2 GB that is used by the DBM1 address space.

**MVS Storage (table view)**

Shows the amount of storage used by MVS.

**MVS Storage (bar chart)**

Shows the amount of storage used by MVS.

**Real Storage (table view)**

Shows the amount of real storage used by the main storage device and by the auxiliary storage device.

**Real Storage (bar chart view)**

Shows the amount of real storage used by the main storage device and by the auxiliary storage device.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to one of the following workspaces from the DBM1 Storage Consumption workspace. In your workspace, you will only see the link that corresponds to the version of DB2 that you are monitoring.

- If DB2 10 is installed, click the navigation link DB2 10 MVS Storage in the EDM Statistics view to open the “MVS Storage Below 2 GB Workspace” on page 750 workspace.

**DB2 Memory DBM1 or DIST Attributes:**
Use the attributes to view the DB2 memory for the database address space (DBM1 or DIST).

- **24 Bit High Private (MB)** Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225HI). This storage is obtained from top downward, usually for authorized programs.

- **24 Bit Low Private (MB)** Identifies the amount of private MVS storage below the 16 MB line (DB2 field name: QW0225LO). This storage is obtained from bottom upward, usually for unauthorized programs.

- **31 Bit Extended High Private (MB)** Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EH). This storage is obtained from top downward, usually for authorized programs.

- **31 Bit Extended Low Private (MB)** Identifies the amount of private MVS storage above the 16 MB line (DB2 field name: QW0225EL). This storage is obtained from bottom upward, usually for unauthorized programs.

- **31 Bit Storage Reserved for MVS** Identifies the amount of storage available for operating system activity (DB2 field name: QW0225MV).

- **64 Bit Thread and System Only Aux (MB)** Shows the amount of auxiliary storage in use for 64-bit private pools. This does not include buffer pool storage (DB2 field name: QW0225PriStg_Aux). This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS 1.10 (and maintenance) or later.

- **64 Bit Thread and System Only Real (MB)** Shows the number of real-storage frames (4K) in use for 64-bit private pools. This is a subset of QW0225HVPagesInReal and does not include buffer pool storage (DB2 field name: QW0225PriStg_Real). This field is available in z/OS 1.10 (and maintenance) or later.

- **Address Space Name** Shows the address space name (DBM1 or DIST) (DB2 field name: QW0225AN).

- **Aux 31 Bit in Use** Shows the amount of auxiliary storage in use for 31-bit private pools. This value is available from z/OS V1.11.
Auxiliary Slots Used Shared Storage 64 Bit Shows the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (DB2 field name: QW0225SHRAUXSLOTS).

Auxiliary Storage in Use Shows the number of auxiliary slots that are in use. Each slot is 4 KB. This value is available from z/OS V1.11.

Auxiliary 4K Slot in Use 64 Bit Identifies the number of 4 KB auxiliary slots currently in use for 64-bit private storage. This value includes reserved auxiliary slots for pages that are paged in (DB2 field name: QW0225HVAUXSLOTS). This value is available from z/OS V1.11.

Available 31-Bit Storage Shows the total amount of storage available for storage manager pools (DB2 field name: QW0225AV).

Avg Thread Footprint (MB) Shows the current average memory usage of active user threads (allied threads and DBATs).

Average Thread Footprint private real Shows the current average real storage in use for private DBM1 storage of active user threads (allied threads + active and pooled DBATs).

Average Thread Mem Usage Type 2 Shows the current average memory usage of active allied threads and the maximum number of active DBATs that existed. The formula used for this value is suited for Enterprise Resource Planning (ERP) systems.

Castout Buffers (MB) Shows the total storage for buffers needed for all castout engines. It is calculated as follows: (castout engines) * 128 * 1024.

Current Private High Addr 24 Bit Identifies the current high address of the 24-bit private region (DB2 field name: QW0225TP). It indicates the highest value (upper limit) of the private area of the DB2 database address space and the private area of the distributed data address space.

Current Private High Addr 31 Bit Identifies the current high address of the 31-bit private region (DB2 field name: QW0225EP).

Data Sharing Group The name of the DB2 data sharing group. It is an alphanumeric text string with a maximum of 8 characters.

Data Sharing Member The name of the DB2 data sharing member or the member name of the DB2 subsystem. It is an alphanumeric text string with a maximum of 8 characters.

DB2 Subsystem The name of the DB2 subsystem.

DB2 Version The version of the DB2 system.

Fixed Storage (MB) Identifies the total amount of fixed storage (DB2 field name: QW0225FX).

Fixed Storage above (MB) Identifies the total amount of fixed storage above the 2 GB bar (DB2 field name: QW0225FA).
Getmained Storage (MB) Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GM). This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Getmained Storage above (MB) Identifies the total storage acquired by GETMAIN (DB2 field name: QW0225GA). This includes space for the compression dictionary, and statement and DBD cache that can be used by the Environmental Descriptor Manager (EDM). This figure can be different from the sum of GETMAIN storage items shown in the statistics DBM1 storage, because DB2 does not produce grouping statistics for all GETMAIN storage.

Getmained Stack Storage (MB) Identifies the total GETMAINED storage allocated for program stack use (DB2 field name: QW0225GS). This includes total getmained stack storage, total 64-bit shared system agent stack, and total 64-bit shared non-system agent stack.

HWM Auxiliary 4K Slot in Use 64 Bit Shows the high water mark of auxiliary storage in use for 64-bit private pools. This value is available from z/OS V1.11.

HWM 64 bit real storage in use MB Shows the high water mark of real storage in use for 64-bit private pools. This value is available from z/OS V1.11.

Interval Start The start time of this interval.

Max Extended Region Size (MB) Identifies the maximum amount of MVS private storage available above the 16 MB line (DB2 field name: QW0225RG).

Max Number of Threads The maximum number of possible threads. It depends on the storage size and average memory usage of active user threads.

Max Number Possible Type 2 Threads The maximum number of possible threads. It depends on the storage size and average memory usage of active allied threads and the maximum number of active DBATs that existed.

MVS System ID The MVS system identifier.

Number of Real Frames in Use Identifies the amount of real-storage frames in use for 31-bit and 64-bit private pools (DB2 field name: QW0225RL).

Originating System ID The managed system name of the agent. It is an alphanumeric text string with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Real 31 bit in use (MB) Shows the amount of real storage in use for 31-bit private pools. This value is available from z/OS V1.11.

Real 64 bit in use (MB) Shows the amount of real storage in use for 64-bit private pools. This value is available from z/OS V1.11.

Real 4K Frame in Use Shows the amount of real storage in use for 31-bit and 64-bit private pools; prior to DB2 10, it shows the real storage used by DBM1, in megabytes.
Stack Storage In Use (MB) The amount of stack storage which is in use; this includes total stack storage in use, total 64-bit shared system agent stack in use, and total 64-bit shared non-system agent stack in use (DB2 field name: QW0225SU).

Storage Manager Control Block (MB) Identifies the total 64-bit storage allocated for storage manager control structures (DB2 field name: QW0225SM). This includes total 64-bit private storage for storage manager control structures, total 64-bit common storage for storage manager control structures, and total 64-bit shared storage for storage manager control structures.

Stor Res Must Complete Identifies the storage reserved for operation that must complete before DB2 is allowed to stop (DB2 field name: QW0225CR).

Storage Cushion Warning to Contract Storage cushion warning to contract (DB2 field name: QW0225SO).

Storage Cushion (MB) Identifies the storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use.

Total 31-bit stack in use for system agents Shows the amount of 31-bit stack storage that is in use for system agents (DB2 field name: QW0225SS). This is a subset of QW0225SU.

Total Storage Below (MB) Shows the total DBM1 storage below 2 GB.

Total Storage Below (MB) Shows the total DIST storage below the bar.

Variable Storage (MB) The total variable storage available below the 31-bit bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225VR).

Variable Storage Above (MB) Identifies the total variable storage available above the 31-bit bar (DB2 field name: QW0225VA).

Storage Consumption Attributes:
Use the Storage Consumption attributes to assess storage consumption issues for your DB2 version.

Agent Local Storage (MB) The amount of storage, in MB, allocated for agent-related local storage. This storage is used for operations such as sort. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225AL).

Agent System Storage (MB) The storage used by system agents. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225AS).

Auxiliary Storage in Use (MB) The auxiliary storage used by DBM1, in megabytes. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225AX).

Average Thread Footprint (MB) The current average memory usage of active allied threads and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.

It is calculated as follows:
[(total variable storage) 
- (total agent system storage) 
- (amount of storage allocated for the local cache storage pool)] 
/ [(active allied threads) + (active DBATs)]

**Buffer Manager Data Manager Trace Table (MB)** The storage used for Buffer Manager and Data Manager internal trace tables. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225TT).

**Buffer Manager Storage CNTL Blocks (MB)** The storage used for Buffer Manager Control Blocks. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225BB).

**Castout Engines** The number of engines available for data-sharing castout processing. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225CC).

**Compression Dictionary (MB)** The storage space, in megabytes, allocated for the compression dictionary. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225CD).

**DBM1 Storage (MB)** The total DBM1 storage. Valid value is an integer in the range 0 - 999999.

This includes:
- Fixed length storage use
- Getmained storage
- Save areas
- Variables

It is calculated as follows:

(total getmained storage) 
+ (total variable storage) 
+ (total fixed storage) 
+ (total getmained stack storage)

**Castout Buffers (MB)** The total storage for buffers needed for all castout engines. Valid value is an integer in the range 0 - 999999.

It is calculated as follows:

(castout engines) * 128 * 1024

**DB2ID** The name of a DB2 subsystem.

**DB2 Version** The version of the DB2 system.

**Deferred Write Engines** The number of engines used for deferred write operations. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225DW).
Extended CSA Size (MB) The size of the common storage area (CSA) above the 16 MB line. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225EC).

Fixed Storage above (MB) The total amount of fixed storage above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225FA).

Fixed Storage (MB) The total amount of fixed storage. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225FX).

Fixed Virtual 64 Bit Shared (MB) The amount of total fixed virtual shared storage above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SF).

GBP Write Engines The number of engines for group buffer pool writes. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225GW).

Getmained Stack Storage (MB) The total GETMAINEd storage allocated for program stack use. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225GS).

Getmained Storage above (MB) The total storage acquired by GETMAIN above the 2 GB bar. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225GA).

Getmained Storage (MB) The total storage acquired by GETMAIN. This includes space for virtual pools, EDM pool, compression dictionary, castout buffers, and the data space lookaside buffer, hiperpool control blocks, and data space buffer pool control blocks. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225GM).

Getmained Virtual 64 Bit Shared (MB) The amount of virtual shared storage acquired by GETMAIN above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SG).

Interval Start The date and time, as set on the monitored system, indicating the instance when the agent collects information.

Local Dynamic Statement Cache Control Blocks The storage for local dynamic statement cache blocks. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SB).

Max Extended Region Size (MB) The maximum amount of MVS private storage available above the 16 MB line. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225RG).

Maximum Number of Threads The maximum number of possible threads. This depends on the storage size, the average memory usage of active user threads, and the maximum number of existing active DBATs. It is an alphanumeric text string with a maximum of 10 characters.

It is calculated as follows:
{(extended region size) - (31 bit extended low private)
- minimum (extended region size / 8, 200 * 1024 * 1024)
- [(total getmained storage) + (total getmained stack storage) + (total fixed storage)]
/ (average thread footprint)

MVS System ID The MVS system identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Pipe Manager Subpool Storage (MB) The storage allocated to Pipe Manager for parallel query operations. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225PM).

P-Lock Notify Exit Engines The number of engines for data sharing P-lock/notify exit engines. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225PL).

Prefetch Engines The number of engines used for sequential, list, and dynamic prefetch. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225PF).

RDS OP Pool Storage (MB) The storage for RDS operations pool used for sort, prepare, and so on. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225RO).

Real Storage in Use (MB) The real storage used by DBM1, in megabytes. Valid value is an integer in the range 0 - 999999.

RID Pool Storage (MB) The storage for RID list processing, such as list prefetch, index ANDing, and ORing. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225RP).

Shared Memory Storage (MB) The amount of virtual shared memory storage above the 2 GB bar. Valid value is an integer in the range 0 - 999999.

Stack Storage In Use (MB) The amount of stack storage which is in use. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SU).

Storage Cushion (MB) The storage reserved to allow DB2 to complete critical functions while short on storage. This includes the contract warning cushion, storage reserved for must-complete operations, and storage for MVS use. Valid value is an integer in the range 0 - 999999.

Thread Copies of Cached SQL (MB) The amount of storage allocated for the local cache storage pool. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SC).

Thread Copies of Cached SQL above HWM for Allocated Statements (MB) The statistics interval high-water mark (HWM) of allocated storage for thread copies in the local cache storage pool above the 2 GB bar. This is a subset of the counter Thread Copies of Cached SQL Statement Count. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225H2).
Thread Copies of Cached SQL above In Use (MB) The amount of storage used for thread copies in the local cache storage pool above the 2 GB bar. This is a subset of the counter Thread Copies of Cached SQL Statement Count. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225L2).

Thread Copies of Cached SQL above (MB) The amount of storage allocated for the local cache storage pool above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225S2).

Thread Copies of Cached SQL Date at High Water Mark The timestamp at high-water storage (DB2 field name: QW0225HT).

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Thread Copies of Cached SQL HWM for Allocated Statements (MB) The statistics interval high-water mark of the allocated storage for thread copies in the local cache storage pool. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225HS).

Thread Copies of Cached SQL In Use (MB) The amount of storage used for thread copies in the local cache storage pool. This is a subset of the total allocated storage for thread copies. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225LS).

Thread Copies of Cached SQL Statement Count The number of statements in the local cache storage pool. Valid value is an integer in the range 0 - 999999 (DB2 field name: QW0225LC).

Thread Copies of Cached SQL Statement Count at High Water Mark The number of statements in the local cache storage pool at high storage time. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225HC).

Variable Storage (MB) The total storage used by all variable pools. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225VR).

This includes storage used by:
- System agents
- Local agents
- RID pool
- Pipe manager subpool
- Local dynamic statement cache control blocks
- Local dynamic statement cache statement pool
- Buffer and data manager trace tables
Variable Storage above (MB) The amount of variable storage available above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225VA).

Variable Virtual 64 Bit Shared (MB) The amount of virtual shared variable storage above the 2 GB bar. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225SV).

24 Bit High Private (MB) The amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for unauthorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225HI).

24 Bit Low Private (MB) The amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225LO).

31 Bit Extended High Private (MB) The amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225EH).

31 Bit Extended Low Private (MB) The amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs. Valid value is an integer in the range 0 - 9999999 (DB2 field name: QW0225EL).

Subsystem Management Workspace:

The Subsystem Management workspace provides an overview of workload related information about the DB2 subsystem that you are monitoring.

This workspace is comprised of the following views:

Background Utilization (needle gauge)  
Shows the percentage of available threads being used for background connections.

Foreground Utilization (needle gauge)  
Shows the percentage of available threads being used for foreground connections.

Subsystem Management Statistics (table view)  
Lists total counts, counts during the last sample period, and the "per second" count for a variety of subsystem requests, abends, and thread statuses associated with the System Resource Manager (SRM) system.

Subsystem Management Summary (table view)  
Lists thread availability and usage statistics for foreground and background connections.

Thread Events Approaching Max (bar chart view)  
Shows the utilization of the thread events for foreground and background connections.

Thread Events High Water Mark (bar chart view)  
Shows the high-water marks for thread events for foreground and background connections.
Thread Events (bar chart view)
-- Shows information on the thread events for foreground and background connections.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

System Status Workspace:

The System Status workspace reflects the health of your DB2 system.

This workspace is comprised of the following views:

System Key Events (table view)
-- Shows the system key events.

System Key Events (bar chart)
-- Shows the system key events.

DDF Send Rate (needle gauge)
-- Reports the send rate of the Distributed Data Facility (DDF).

DDF Receive Rate (needle gauge)
-- Reports the receive rate of the Distributed Data Facility (DDF).

Thread Events Approaching Max (bar chart view)

EDM Utilization (needle gauge)
-- Reports the number of current EDM pages divided by total EDM pages for DB2 9 or below. For DB2 10 or later, it reports the number of current DBD pages divided by total DBD pages.

DBAT Wait Percent (needle gauge)
-- Shows the percentage of threads that are waiting for database services.

System State Information (table view)
-- Provides activity and performance details of your DB2 system.

Operating System CPU (table view)
-- Provides CPU information about the operating system.

Operating System CPU Utilization (bar chart)
-- Provides CPU information about the operating system.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
DB2 System States Attributes:
Use the DB2 System States attributes to create situations to monitor system-level performance and exception alerts.

Active Stored Procedures The number of stored procedures currently executing.

Active Triggers The number of triggers currently executing.

Active User Functions The number of user defined functions currently executing.

Allowed locks per TS The default (SYSTEM) for the LOCKMAX clause of the SQL statements CREATE TABLESPACE and ALTER TABLESPACE. Install parameter LOCKS PER TABLESPACE on panel DSNTIPJ, or ZPARM NUMLKTS in DSN6SPRM.

Archive Device The CCUU address of the device that is to be used for mounting the tape. It is an alphanumeric text string, with a maximum length of four characters.

Archive DSN The data set name of the archive file being waited on. It is an alphanumeric text string, with a maximum length of 44 characters.

Archive Volser The volser for tape volume being waited on. It is an alphanumeric text string, with a maximum length of six characters.

ASIDs Stored Procedures The number of unique active threads executing stored procedures.

ASIDs User Functions The number of ASIDs executing user functions.

Bytes written to log The log rate for the active log data sets in MB per second. This figure is valid for dual logging. If single logging is used, multiply the value shown by 2. This rate is MB/sec at which data is written to the active log data set. It was calculated by multiplying QJSTCWR (label LOG CI WRITTEN (LOG1&2)) by 4096, then dividing the result by (1024 * 1024 * statistics-interval-seconds * 2).

When the value exceeds 10MB/sec per log copy, you should examine I/O tuning of log data sets; for example, using faster log devices and/or I/O striping, using variable-length or compressed log record layouts to reduce log data size.

CF global contention The total number of suspends because of contention divided by the total number of synchronous requests that went to XES, and the lock requests that were converted from synchronous to asynchronous locks, and the locks because of child lock propagation. If multiple members from the same data sharing group run on the same LPAR, the global contention rate should be ignored for a member where the QTGSFCON flag is zero. The QTGSFCON flag indicates whether the false contention is reported at the subsystem (=1) or LPAR level (=0).

Checkpoint freq Checkpoint frequency. This shows either the number of minutes (1 through 60) or the number of DB2 log records between the start of successive checkpoints. DB2 starts a new checkpoint when this value is reached. You can use the SET LOG command to change the number of log records between checkpoints dynamically. Valid values are 1-60 when specifying a time value and 200-16000000 when specifying a number of records. Install parameter CHECKPOINT FREQ on panel DSNTIPL, ZPARM CHKFREQ in DSN6SYSP.
Class castout thresh reached The number of times group buffer pool castout was initiated because the group buffer pool class castout threshold was detected. The class castout threshold is one of two group buffer pool thresholds. In most cases the default value for the class threshold (10 percent) is a good choice. Depending on your workload, altering this value can reduce DASD contention during castout.

Current Open Data Set The current number of open data sets.

Current Thread Count The current number of active threads.

DB2 ID The name of a DB2 subsystem.

DB2 version The DB2 version.

DB Wait Percent The percentage of threads that are waiting for database services. Valid entry ranges from 0.0 to 100.0.

Deadlocks The number of times deadlocks were detected. This number should be low, ideally 0. Deadlocks occur when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Ensure that all applications accessing the same tables access them in the same order. Deadlocks can also occur through index page splits if there is high insert activity. In this case, the recommendation is to set SUBPAGES to 1 for the index. This field is incremented once for each deadlock encountered. There is no correlation between this field and the deadlock events reported in the Locking report set or the number of IFCID 172 records written. This field reports all deadlocks, regardless of how they were resolved. The locking report and record trace IFCID 172 show only those deadlocks that were resolved by DB2.

Dist DB Inactive The state will be true if this DB2 system is not enabled for the Distributed Data Facility (DDF). It is an alphanumeric text string, with a maximum length of one character.

Dist Receive Rate The DDF Receive bytes per second in units of 1,000.

Dist Send Rate The DDF Send bytes per second in units of 1,000.

DM critical thresh reached The number of times the deferred write threshold (DWTH) was reached. This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use. DB2 checks this threshold when an update to a page is completed. If the percentage of unavailable pages in the virtual buffer pool exceeds the threshold, write operations are scheduled for enough data sets (up to 128 pages per data set) to reduce the number of unavailable buffers to 10% below the threshold.

DSC active Indicates whether prepared dynamic SQL statements are saved for later use by eligible application processes in the EDM pool. Install parameter CACHE DYNAMIC SQL on panel DSNTIP8, or ZPARM CACHEDYN in DSN6SPRM.

DSC size The size of the statement cache that can be used by the Environmental Descriptor Manager (EDM). This value is used at DB2 startup time as the minimum value. You can increase and subsequently decrease this value with the SET SYSPARM command. This value cannot be decreased below the value that is specified at DB2 startup. The CLIST calculates a statement cache size. This storage pool is located above the 2 GB bar. The value used at DB2 startup time is either
calculated by the CLIST based on input from other installation information or an
override value. For record trace, this value is shown in bytes. Install parameter
EDM STATEMENT CACHE on panel DSNTIPC, or ZP ARM EDMSTMTC in
DSN6SPRM.

**DSMAX** The maximum number of open data sets allowed to be specified in
DSNZP ARM.

**DSMAX Utilization** The number of data sets opened is approaching the maximum
number of open data sets defined by the DSMAX parameter in DSNZP ARM.

**DWQT reached** The number of times the deferred write threshold (DWTH) was
reached. This threshold is a percentage of the virtual buffer pool that might be
occupied by unavailable pages, including both updated pages and pages in use.
DB2 checks this threshold when an update to a page is completed. If the
percentage of unavailable pages in the virtual buffer pool exceeds the threshold,
write operations are scheduled for enough data sets (up to 128 pages per data set)
to reduce the number of unavailable buffers to 10% below the threshold.

**EDM Current Pages** The current number of EDM pages (DB2 9 or below) or the
current number of DBD pages (DB2 10 or later) that are used.

**EDM Pool full** The total number of failures because the EDM pool or EDM pool
was full.

**EDM Total Pages** The total number of pages allocated for the EDM pool (DB2 9 or
below) or the total number of pages allocated for the DBD pool (DB2 10 or later).

**EDM Utilization** The current EDM pages divided by total EDM pages (DB2 9 or
below) or the current DBD pages divided by total DBD pages (DB2 10 or later).

**GBP castout thresh reached** The number of times a group buffer pool castout was
initiated because the group buffer pool castout threshold was detected. The GBP
castout threshold, GBP class castout threshold, and the length of the GBP
checkpoint interval determine the castout characteristics of the group buffer pool.
You can consider this threshold a safety margin to protect the group buffer pool
from being accidentally flooded by overactive applications. In most situations, the
default value for the group buffer pool castout threshold of 50 percent is a good
choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer
pool thresholds. A value near to 100 indicates that in most cases DB2 found
skeleton copies of prepared statements in global dynamic cache and could perform
short prepares. A value near to 0 indicates that in most cases skeleton copies of
prepared statements were not found in global dynamic cache and full prepares
were performed.

**Global cache hit ratio** The ratio of successful search requests for prepared
statements from the global dynamic SQL cache. This indicates the effectiveness of
the global dynamic SQL cache in the EDM pool.

**Global Trace Active** The state will be true if this DB2 system currently has the
global tracing active. It is an alphanumeric text string, with a maximum length of
one character.

**Group or Subsystem Name** The DB2ID or data sharing group name. It is an
alphanumeric text string with a maximum of 8 characters; for example, TDB241G.
**Group Object Analysis Status** The status of the Event Manager for Object Analysis.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIX</td>
<td>Some Event Managers are active</td>
</tr>
<tr>
<td>NO</td>
<td>Event Manager is not active</td>
</tr>
<tr>
<td>YES</td>
<td>Event Manager is active</td>
</tr>
</tbody>
</table>

**Group or Subsystem Type** Indicates whether a group or subsystem is a DB2 or a data sharing group.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>DB2 subsystem</td>
</tr>
<tr>
<td>DSGRP</td>
<td>Data sharing group</td>
</tr>
</tbody>
</table>

**Incomp retained locks** The number of global lock or change requests denied or suspended due to an incompatible retained lock.

**In Doubt Threads** The number of threads that are in an INDOUBT status.

**Indoubt-URs** The number of indoubt units of recovery. A unit of recovery is indoubt when a failure occurs after a successful prepare but before a successful commit. The failure can occur in the address space of the application, the transaction manager, DB2, or all of these. IMS and CICS applications use the prepare and commit sequence to commit work. Ideally, this value should be 0.

**Interval Time** The number of seconds since last sample.

**Lock Conflict Count** The total number of owners and waiters that are in lock conflict. Valid value is an integer in the range 0 - 99999999.

**Lock Escalations** Number of all types of lock escalations.

**Lock Escalation Exclusive** The number of times that the allowable number of locks per table space was exceeded resulting in page (IX) lock to escalate to table or table space lock in exclusive mode.

**Lock Escalation Rate** The number of lock escalations (exclusive and shared) per second in this interval.

**Lock Escalation Shared** The number of times that the allowable number of locks per table space was exceeded, resulting in page (IS) lock to escalate to table or table space lock in shared mode.

**Max active DBATs** The maximum number of database access threads (DBATs) that can be active concurrently. The maximum number of database access threads (DBATs) that can be active concurrently. When this limit has been reached, DB2 uses the value of DDF THREADS on panel DSNTIPR to decide how to handle a new allocation request. When DDF THREADS is ACTIVE and MAX REMOTE
CONNECTED has not been reached, the allocation request is allowed but any further processing for the connection is queued waiting for an active database access thread to terminate. When DDF THREADS is INACTIVE and MAX REMOTE CONNECTED has not been reached, the allocation request is allowed and is processed when DB2 can assign an unused database access thread slot to the connection. The total number of threads accessing data concurrently is the sum of MAX USERS and MAX REMOTE ACTIVE. The maximum allowable value for this sum is 2000. Install parameter MAX REMOTE ACTIVE on panel DSNTIPE, or ZPARM MAXDBA in DSN6SYSP.

**Max Batch users** The maximum allowed number of concurrent connections for batch jobs and utilities. This includes:

- All batch jobs using QMF.
- All batch jobs using the DSN command processor.
- All tasks connected to DB2 through call attach facility (CAF) running in batch.
  - This can include:
    1. Batch jobs using QMF
    2. APPC applications
    3. TCP/IP FTP connections

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

**Max DB2 allied users** The maximum number of allied threads (threads started at the local subsystem) that can be allocated concurrently. Separate threads are created for each occurrence of the following:

- TSO user (whether running a DSN command or a DB2 request from QMF)
- Batch job (whether running a DSN command or a DB2 utility)
- IMS region that can access DB2
- Active CICS transaction that can access DB2
- Task connected to DB2 through the call attachment facility

Install parameter MAX USERS on panel DSNTIPE, or ZPARM CTHREAD in DSN6SYSP.

**Max degree** Indicates the upper limit on the degree of parallelism for a parallel group. This field has a value of 0. This means PARAMDEG is not set and DB2 can set a default maximum degree of parallelism based on the system configuration.

Install parameter MAX DEGREE on panel DSNTIP8, or ZPARM PARAMDEG in DSN6SPRM.

**Max opened DS** The maximum number of data sets that can be open at one time. The practical limit can be less than the MVS limit of 32727, depending on available storage below the line. Install parameter DSMAX on panel DSNTIPC, or ZPARM DSMAX in DSN6SPRM.

**Max kept dyn stmt** Shows the total number of prepared dynamic SQL statements that are saved past a commit point. 0 means that prepared dynamic SQL statements are not saved past commit points. Install parameter MAX KEPT DYN STMTS on panel DSNTIPE, or ZPARM MAXKEEPD in DSN6SPRM.

**Max size of EDM Pool** The size (in kilobytes) of the environmental descriptor manager (EDM) pool. This can be the value calculated by the CLIST, based on
input from previous panels, or the value entered in the Override column at installation time. Install parameter EDMPOOL STORAGE SIZE on panel DSNTIPC, or ZPARM EDMPOOL in DSN6SPRM.

**Max TSO users** The maximum number of concurrent TSO foreground connections (QMF, DSN, DB2I, and SPUFI). Each of the following is a separate user:
- Each TSO foreground user executing a DSN command.
- Each TSO foreground user connected to DB2 through the call attachment facility (CAF). This can include QMF users running in TSO foreground or user-written CAF applications running in TSO foreground.

When the number of TSO users attempting to access DB2 exceeds this limit, connection requests are rejected. There is no subsystem parameter to control the maximum concurrent connections for IMS and CICS. These are controlled by using IMS and CICS facilities. For CICS attachment, the maximum number of connections to DB2 can be controlled using the resource control table (RCT) TYPE=INIT THRDMAX value. Install parameter MAX TSO CONNECT on panel DSNTIPE, or ZPARM IDFORE in DSN6SYSP.

**Merge error BP shortage** The total number of work files that were rejected during all merge passes because of insufficient buffer resources. This field and the degraded low buffers field determine the average number of work files that cannot be honored at each merge pass because of insufficient buffer pool space. Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the size of the buffer pool using the ALTER BUFFERPOOL command. Note that, when there are many concurrent sorts or large sorts, it is a good idea to dedicate a separate buffer pool for sort work files. This will greatly facilitate work-file performance tuning.

**Migrated DS timed out** The number of recall timeouts.

**MVS System** An ID for the MVS System Management Facility (SMF). It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**No QP BP shortage** The total number of parallel groups that fell back to sequential mode due to a storage shortage or contention on the buffer pool.

**No QP no MVS enclave serv** The total number of parallel groups that executed in sequential mode due to the unavailability of MVS/ESA enclave services.

**Nonstealable pages** Percentage of non-stealable pages in use.

**Number of Active DBATs** The current number of active and disconnected (pooled) DBATs.

**Number of batch users** The number of connections to a single instance from batch or TSO background tasks.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of GBP Connections** The total number of Group Buffer Pool (GBP) Connections.
**Number of TSO users** The number of connections to a single instance from TSO foreground tasks.

**Object Analysis DB Count** The total number of monitored databases in a specific data sharing group that are participating in object analysis. Valid value is an integer in the range 0 - 4999.

**Open DS thresh reached** The number of data sets that were closed because the total number of open data sets reached the deferred close threshold value. The deferred close value is based on the value of DSMAX or the MVS DD limit (whichever is smaller).

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Output buffer full** The number of waits caused by an unavailable output log buffer. When DB2 wants to write a log record and the log buffer is not available, DB2 and the application must wait for an available log buffer.

**Output buffer size** The output log buffer size in kilobytes. There is only one output log buffer per DB2 subsystem. Increasing this parameter reduces BSDS I/O updates when there is a buffer wraparound. Frequent wraparounds are likely in LOAD or REORG with logging, and mass insert operations. Increasing this parameter also helps avoid log write waits for an available buffer during heavy update workload. When the specified size is not a 4KB multiple, it is rounded up to the next 4 KB multiple. Install parameter OUTPUT BUFFER on DSNTIPL, or ZPARM OUTBUFF in DSN6LOGP.

**Pages castout** The number of times a group buffer pool castout was initiated because the group buffer pool castout threshold was detected. The GBP castout threshold, GBP class castout threshold, and the length of the GBP checkpoint interval determine the castout characteristics of the group buffer pool. You can consider this threshold a safety margin to protect the group buffer pool from being accidentally flooded by overactive applications. In most situations, the default value for the group buffer pool castout threshold of 50 percent is a good choice. Use the ALTER GROUPBUFFERPOOL command to tune the group buffer pool thresholds.

**Pages read from BPs** The number of Getpage requests including conditional and unconditional requests.

**Pages read from DASD** The number of synchronous read I/O operations performed by DB2 for applications and utilities. This number includes both Synchronous Reads Sequential Access Only (QBSTSIO) and synchronous read operations for non-sequential access. You can use this value and the value of Synchronous Reads Sequential Access Only to calculate the number of Non-Sequential Synchronous Reads. Check the buffer pool hit ratio if the number of non-sequential synchronous reads is larger than expected.

**Resource Timeout** The number of seconds before a timeout is detected. This is an integer multiple of DEADLOCK TIME on panel DSNTIPJ. Timeout means that a lock request has waited for a resource (or for claims on a resource for a particular claim class to be released) longer than this time. For data sharing, the actual timeout period is longer than the timeout value. Install parameter RESOURCE TIMEOUT on panel DSNTIPL, or ZPARM IRLMRWT in DSN6SPRM.
Resource unavailable The number of read accesses delayed due to unavailable resources. Generally, this can be due to insufficient tape units allocated. If this is so, reissue the SET ARCHIVE command and use a higher value for the count parameter. Another (although unlikely) cause is insufficient archive log read service task availability.

Resync attempted The number of resynchronization connections attempted with all remote locations (two-phase commit operations only). A large value can indicate network or system problems.

RID Pool size The size of the RID pool in bytes.

RID Pool size too small The number of times the maximum RID pool storage was exceeded. The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is: (Number of concurrent RID processing activities) x (average number of RIDs) x 2 x (5 bytes per RID).

RIDPool Fail No Storage Due to insufficient storage for the candidate RID lists, DB2 was unable to use more than one index when accessing a DB2 table.

RIDPool Fail No Storage Rate The number of RIDPOOL fallbacks per second in this interval.

SMF overruns The total number of SMF buffer overruns. Ideally, this field should be 0 or very small.

Sort degraded BP too small The number of times that a merge pass was not efficiently performed due to a shortage of space in the buffer pool. The number in this field is incremented for each merge pass where the maximum number of work files allowed is less than the number of work-files requested. The maximum number of work files allowed is calculated as follows: Buffers consumed = 2*(work files already allocated); Buffers available = (sequential steal threshold * buffer pool size - buffers consumed); Maximum work files allowed = buffers available / (2 * 8); Ideally, the number in this field should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are too many concurrent work files. For example, there could be a number of concurrently open cursors that require sorting. Consider increasing the buffer pool size using the ALTER BUFFERPOOL command.

Sort error BP shortage The number of times a work file could not be created due to insufficient buffer resources. It indicates that a sort is in progress and limited in regard to the number of work files it can use. Ideally, this should be 0. Otherwise, it indicates a shortage of buffer pool space or that there are many concurrent work files. For example, there could be a number of open cursors that require sorting. Generally, sorts are performed more efficiently with additional work files, but there are internal DB2 limits on the number of work files a transaction can have. It is possible that at run time a transaction cannot use as many work files as it had planned. You can control this by increasing the buffer pool size (ALTER BUFFERPOOL), or changing the transaction so it requires fewer concurrent work files.

SP abends The number of times a stored procedure terminated abnormally.

SP start failed/rejected The number of times an SQL CALL statement was rejected due to the procedure being in the STOP ACTION(REJECT) state.
**SP timed out** The number of times an SQL call timed out waiting to be scheduled.

**Status** Indicates whether a DB2 subsystem or data sharing group for a monitored entity is operational. Valid values are OFFLINE or ONLINE.

**Tape volume contention** The number of read accesses that were delayed because of a tape volume contention when only one reader per tape is possible.

**Threads Wait Limit** The number of inactive connections waiting because the system thread limit (MAXDBAT) has been reached: If CONQUED is less than or equal to DSCDBAT and CONQUED is less than or equal to (MDBAT-ADBAT), inactive connections waiting equals to 0, otherwise inactive connections waiting equals to CONQUED - (MDBAT-ADBAT+DSCDBAT); refer to the DB2 DISPLAY DDF DETAIL command for the field names.

**Threads Wait Lock** The number of threads in a suspend state because they are waiting to obtain a lock.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is **CYYMMDDHHMSSmmm** (as in 1180315064501000 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Timeouts** The number of times a unit of work was suspended for a time exceeding the timeout value. This number should be low, ideally 0.

**Transactions per second** The number of successful requests for commit phase 1 in a two-phase commit environment such as CICS or IMS. It includes successfully prepared agents associated with threads that use the Recoverable Resource Manager Services Attach Facility (RRSAF). It does not include successful single-phase commits or distributed two-phase commits. IMS and CICS applications use the PREPARE and COMMIT sequence to commit work.

**Trigger Depth** The depth of the largest trigger stack.

**UDF abended** The number of times a user-defined function abended.

**UDF start failed/rejected** The number of times a user-defined function was rejected.

**UDF timed out** The number of times a user-defined function timed out while waiting to be scheduled.

**Users Waiting Threads** The count of users waiting for threads.
**Wait Tape Mount** The state will be true if the DB2 system is waiting on a tape mount to recover from an archive log. It is an alphanumeric text string, with a maximum length of one character.

**Write failed no storage** The number of coupling facility write requests that could not complete due to a lack of coupling facility storage resources. It is an alphanumeric text string, with a maximum length of one character.

**ZOS CPU Utilization Attributes:**
Use the ZOS CPU Utilization attributes to determine how much of your processor is used by DB2.

**Note:** Parameter ZOSMETRICS must be set to YES for enabling DB2 to retrieve data from the RMF interface. If ZOSMETRICS is not set to YES, you might see negative Operating System CPU data. ZPARM ZOSMETRICS in DSN6SPRM.

**CPU Utilization DB2** The percentage of the processor used by the DB2 subsystem; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

**CPU Utilization DB2 DBM1** The percentage of the processor used by the DB2 DBM1 address space; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

**CPU Utilization DB2 MSTR** The percentage of the processor used by the DB2 MSTR address space; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

**CPU Utilization LPAR** The average processor usage per LPAR; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

**DB2ID** The name of a DB2 subsystem.

**DB2 Version** The version of the DB2 system.

**Free Real Storage LPAR (MB)** The free real storage on the logical partition (LPAR), in MB.

**Free Virtual Storage LPAR (MB)** The free virtual storage on the LPAR, in MB.

**Interval Start** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

**MVS System ID** The MVS system identifier.

**Number of CPU on LPAR** The number of processors on the LPAR; if parameter ZOSMETRICS is not set to YES for enabling DB2 to retrieve data from the RMF interface, you might see negative Operating System CPU data.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
Page-in Rate LPAR The Page-in Rate in percents for the LPAR.

Page-in Rate DB2 The Page-in Rate in percents for the DB2 subsystem.

Real Storage non LPAR (MB) The total real storage on the LPAR, in MB.

RMF API Reason Code The reason code from the RMF API call.

RMF API Return Code The return code from the RMF API call.

RMF API Status Flag The status flag for the Resource Measurement Facility (RMF) API call.

Unreferenced Interval Count The unreferenced interval count.

Used Free Real DB2 (MB) The real storage used by the DB2 subsystem, in MB.

Used Virtual Storage DB2 (MB) The virtual storage used by the DB2 subsystem, in MB.

Virtual Storage LPAR (MB) The total virtual storage on the LPAR, in MB.

Tasks List Workspace:

The Tasks List workspace provides statistics about the processes at the selected DB2 Connect gateway, such as the CPU and the working set. It enables you to determine if the DB2 Connect gateway is overloaded by DB2 Connect or any other allocation application.

This workspace is comprised of the following views:

**DB2 Connect Server - Process Memory Usage (bar chart)**
Shows the current working set of a process. The current working set is the number of pages that are currently resident in memory.

**DB2 Connect Information (table view)**
Shows key information about the selected DB2 Connect gateway.

**Tasks List (table view)**
Provides details on the processes.

**Process CPU % (bar chart)**
Shows the percentage of time that a process used the CPU since the last update.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**DB2 Connect Server Tasklist Attributes:**
Use DB2 Connect Server Tasklist attributes to create situations that identify any process using too much CPU time or memory.

**CPU Usage Per Process** The percentage of time that a process used the CPU since the last update.

**DB2 ID** The DB2 subsystem ID.
**Gateway Process ID** The numerical ID that uniquely distinguishes a process while it runs.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**IP Address** The current IP address.

**Memory Usage by Process** The current working set of a process, in kilobytes. The current working set is the number of pages currently resident in memory.

**MVSID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.

This information can be useful if you are saving your monitor output in a file or database for later analysis and you need to differentiate the data from different database server nodes. This node name is determined based on the NNAME configuration parameter.

**Node Number** The number assigned to the node in the file with filename db2nodes and file type cfg. (db2nodes.cfg).

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Overall Process Time** The sum of the times contained in the System Process Time and User Process Time columns.

**Process Name** The name of the process.

**Process Owner Name** The session ID that owns the process.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken.

If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Server Product Version ID** The product and version that is running on the server in the form pppvvrrm.

In this case pppvvrrm represents:
- **ppp** stands for SQL
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
• \( rr \) identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
• \( m \) identifies a 1-digit modification level

**Server Status** Shows whether the server is active or inactive.

**Server Version** The version of the server returning the information.

**System Process Time** The total system CPU time, in seconds and microseconds, used by the database manager agent process, the unit of work, or the statement.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced from Greenwich Mean Time (GMT).

**User Process Time** The total user CPU time, in seconds and microseconds, used by the database manager agent process, the unit of work, or the statement.

**Threads Workspaces:**

The DB2 Threads workspaces provide detailed thread activity information about your DB2 threads.

Using the Thread workspaces, you can:
• Identify all active threads within a data sharing group
• Evaluate and analyze thread activity for application threads
• Monitor and track thread activity over a period of time
• View statistics for an application thread
• View claim or locks owned by threads

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Activity Workspace:**

The Thread Activity workspace provides a global view of thread activity for a specific DB2 subsystem. A consolidated list of DB2 threads displays on the table view in alphabetical order by plan name. Your table view may sort differently if you have changed the sort field or sort order.

Use the Thread Activity table view to:
• Identify all active threads
• Track thread activity for specific threads
• Analyze thread data when a thread evaluates to true
• View thread SQL counts 1, 2, or 3

**Monitoring Thread Activity**

You can view the Top Ten In-DB2 CPU Time threads from a bar chart as well as from the table view. You can use the thread data to:
• Monitor critical application threads
• Evaluate the thread elapsed and wait times for critical threads

Analyzing Specific Threads

You can analyze a specific application thread from the Thread Activity table view by viewing the thread detail.
1. Right-click a row on the Thread Activity table view.
2. Click Link to --> Thread Detail.

The Thread Detail workspace displays detailed information about a specific thread including the thread ID, thread activity, triggers, user-defined functions, and stored procedures.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread Detail Attributes (Data Sharing):
Use Thread Detail attributes to create situations that monitor DB2 threads. This information is used locally for data sharing.

Authorization ID The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Authorization ID (Unicode) The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Collection ID The collection ID.

This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters

Thread Detail Attributes (Data Sharing) Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

Thread Detail Attributes (Data Sharing) The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

</table>

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example DLKEX212.

**CPU Rate** The thread CPU rate.

**DB2 ID** The name of a DB2 subsystem.

**Display CPU Time** The total amount of CPU time that DB2 has accumulated for a thread.

Valid format is HH:MM:SS:mmm, where:
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- **D** = Day
- **H** = Hour
- **M** = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**Display Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on.

Valid format is DD-HH:MM:SS, where:
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second

For example, 00-20:16:18 indicates that the display elapsed time is 20 hours, 16 minutes, and 18 seconds.

**Display Wait Time** The total amount of thread wait time. The collection of thread wait time requires activation of Accounting Class 2 in the monitored DB2 subsystem.

Valid format is HH:MM:SS:mmm, where:
KD2_PF_READA_SPMON

- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**ID Name** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**IIP CPU** The accumulated CPU time consumed while executing on an IBM zIIP in all environments.

**In DB2 CP CPU Time** The CP CPU time accumulated in DB2 include the current in-DB2 CPU time for the SQL statement in progress.

**In DB2 Elapsed Time** The elapsed time accumulated in DB2 include the current in-DB2 time for the SQL statement in progress.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Thread CPU Time** The total amount of CPU time that DB2 has accumulated for a thread. Valid value is an integer in the range 0 - 99999999 seconds.

**Thread Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on. Valid value is an integer in the range 0 - 99999999 seconds.

**Thread Group Name** The name of a data sharing group for a thread. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDDB241G.

**Thread Group Member Name** The name of the member within a data sharing group for a thread.

**Thread Status** The current status of a thread.
Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and</td>
</tr>
<tr>
<td></td>
<td>executing within the DB2 command processor. (This type of thread always</td>
</tr>
<tr>
<td></td>
<td>has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate</td>
</tr>
<tr>
<td></td>
<td>from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be</td>
</tr>
<tr>
<td></td>
<td>determined.</td>
</tr>
<tr>
<td>INDOUBT</td>
<td>The thread is in doubt.</td>
</tr>
<tr>
<td>IN-SIGNON</td>
<td>The thread is in signon processing. This status applies only to threads</td>
</tr>
<tr>
<td></td>
<td>originating from CICS or IMS attachments.</td>
</tr>
<tr>
<td>IN-SQL-CALL</td>
<td>The thread is processing an SQL call.</td>
</tr>
<tr>
<td>IN-SQL-SORT</td>
<td>The thread is executing an SQL call and is doing the sort processing</td>
</tr>
<tr>
<td></td>
<td>required to satisfy the call’s request.</td>
</tr>
<tr>
<td>IN-STOR-PROC</td>
<td>The thread is currently running in a stored procedure.</td>
</tr>
<tr>
<td>IN-TERM-THRD</td>
<td>The thread is in termination as a result of allied task termination. This</td>
</tr>
<tr>
<td></td>
<td>status corresponds to DB2 DISPLAY THREAD=D status.</td>
</tr>
</tbody>
</table>
IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).
WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.
WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Stored Procedure Name The name of the stored procedure that a thread invokes. It is an alphanumeric text string, with a maximum of 18 characters; for example, SPCALC_TAX.

Thread Detail Attributes (Data Sharing) The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>

<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attach</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Thread Wait Time The total amount of thread wait time. It is an integer in the range 09 - 99999999 seconds. Note: collection of thread time requires activation of Accounting Class 2 in the Monitored DB2 subsystem.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

The timestamp format for SCAN and STR functions is CYYMDDHHMMSSmmm (as in 118031506450100 for 03/15/18 06:45:01) where:
- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
Thread Activity by Package Workspace:

The Thread Activity by Package workspace provides an overview of the activity of the ten threads, sorted by package name, that use the most class 2 CPU and elapsed time (in DB2).

This workspace is comprised of the following views:

**Top Ten In-DB2 CPU Time Threads (bar chart)**
Shows the class 2 CPU time (in DB2) for the ten threads that use the most class 2 CPU time.

**Top Ten In-DB2 Time Threads (bar chart)**
Shows the class 2 elapsed time (in DB2) for the ten threads that use the most class 2 elapsed time.

**Top Ten In-DB2 CP CPU Time Threads (table view)**
Provides key data for the ten threads, sorted by package name, that use the most class 2 CPU time (in DB2).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace”
- “Thread Activity by Plan Workspace”
- “Utility Jobs Workspace” on page 831

Thread Activity by Plan Workspace:

The Thread Activity by Plan workspace provides an overview of the activity of the top ten threads, sorted by plan name, that use the most class 2 CPU and elapsed time (in DB2).
This workspace is comprised of the following views:

**Top Ten In-DB2 CP CPU Time Threads (bar chart)**
Shows the class 2 CPU time (in DB2) for the ten threads that use the most class 2 CPU time.

**Top Ten In-DB2 Time Threads (bar chart)**
Shows the class 2 elapsed time (in DB2) for the ten threads that use the most class 2 elapsed time.

**Top Ten In-DB2 CP CPU Time Threads (table view)**
Provides key data for the ten threads, sorted by plan name, that use the most class 2 CPU time (in DB2).

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
- “Utility Jobs Workspace” on page 831

You can also link to:
- OMEGAMON XE for NetView DVIPA Definition and Status, if installed
- OMEGAMON XE for Mainframe Networks Applications, if installed

**Thread Detail Workspace:**

The Thread Detail workspace provides detailed information about the activity of an individual thread.

This workspace is comprised of the following views:
- Thread ID (table view), which identifies the thread.
- Accounting Time (chart view)
- In-DB2 Times (table view), which shows class 2 CPU time (in DB2).
- Triggers (table view)
- Thread Activity (table view), which provides information about the status of the thread, the CPU, and parallel tasks.
KD2_PF_READA_SPMON

- User-Defined Functions (table view)
- Stored Procedures (table view)
- Savepoints (table view)
- Thread SQL counts 1 (table view), which provides information associated with a thread:
  - SQL DCL (Data Control Language) declarations
  - SQL DDL (Data Definition Language) statements
  - SQL DML (Data Manipulation Language) statements
- Thread SQL counts 2 (table view), which provides information on:
  - Stored Procedures
  - User-Defined Functions
  - Triggers
  - Direct Row Access
  - Parallelism
  - RID Pool Access
  - Prepare Statements
- Thread SQL counts 3 (table view), which provides information on:
  - Multi-Row Processing
  - Concentrate Statements

All other tables provide details on the named activities.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Enclave Detail Workspace:**

The Thread Enclave workspace provides detailed information about the attributes of an enclave.

This workspace is comprised of the following views:
- Thread ID (table view)
- General Information (table view)
- Performance Index Input Data for Velocity Goal (table view)
- Service Period Information (table view)
- Classification Work Qualifiers (table view)
- Service Class Information (table view)
- WLM Application Environment (table view)
- zIIP Information (table view)

The Thread ID table identifies the thread. The General Information table shows details about the enclave token and the CPU. All other tables provide details on the named activities.
Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Enclave Service Period Information Workspace:**

The Thread Enclave Service Period Information workspace provides detailed information about the service periods for the current service class.

This workspace is comprised of the following views:

**Thread ID (table view)**
Identifies the thread.

**Current Period (table view)**
Provides the service class name and current period information.

**First Four Periods (table view)**
Provides information about the first four entries of period. If the period is not defined, a zero or no data is shown.

**Next Four Periods (table view)**
Provides information about the next four entries of period. If the period is not defined, a zero or no data is shown.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Locks Owned Workspace:**

The Thread Locks Owned workspace provides detailed information about all the locks and claims owned by an individual thread.

This workspace is comprised of the following views:

**Thread ID (table view)**
Identifies the thread.

**Locks Ownership Information (table view)**
Provides totals of all the types of locks owned by the thread, as well as the percentage of total locks allowed that are currently held (the percent of the DB2 parameter NUMLKUS).

**Locks Owned (table view)**
Shows all the locks owned by this thread.

**Claims Owned (table view)**
Shows all the claims owned by this thread.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli
Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Thread Locks Owned Attributes:**
Use Thread Locks Owned attributes to view detailed information about all the locks and claims owned by an individual thread.

**AGNT ASID** The address space ID (ASID) of the agent.

**Authorization ID** The authorization ID.

**Authorization ID (Unicode)** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 128 characters.

**Claim Class** The type of claim class. Possible claim classes are:
- CS  Cursor stability
- RR  Repeatable read
- Write  Write access

**Claim Type** The type of object that is claimed. Possible claim types are:
- TS  Tablespace
- TS LPRT  Tablespace logical partition
- TS PART  Tablespace partition
- IX  Index space
- IX LPRT  Index space logical partition
- IX PART  Index partition

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

**Thread Locks Owned Attributes** Connection ID. Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Thread Locks Owned Attributes** The type of connection associated with the thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
</tbody>
</table>

</table>

**Correlation ID** The DB2 Correlation ID.

**DB2 ID** The name of a DB2 subsystem.

**Elapsed time** Shows the elapsed time in milliseconds.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

**Job Name** The job name that is associated with a thread.

**Lock Claim Resource** The name of the object which is locked or claimed. The resource name can include the database name, pageset name, partition number, page number, record id (RID), collection ID, package name, or plan name:
- DB=database name can be represented as DBID=identifier.
- PS=pageset name can be represented as PSID=identifier.
- DBID represents the decimal identifier of the database.
- PSID represents the decimal identifier of the table space or index space.

**Lock Level** The level or mode of the lock request. This information describes the level of resource access demanded by the lock request. Possible lock levels are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS</td>
<td>Intent share</td>
</tr>
<tr>
<td>IX</td>
<td>Intent exclusive</td>

</tr>
</tbody>
</table>

**Lock Type** The lock type of the lock request. Possible lock types are:

*Table 80. Lock types*

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACSC</td>
<td>The Accelerator Services commands (ACSC) lock.</td>
</tr>
<tr>
<td>ALBP</td>
<td>The Alter buffer pool (ALBP) lock indicates a lock on a buffer pool during execution of an ALTER BUFFERPOOL command.</td>
</tr>
<tr>
<td>BIND</td>
<td>The BIND lock indicates an autobind or remote bind lock.</td>
</tr>
</tbody>
</table>
| BMBA      | The Buffer manager SCA MBA (BMBA) L-lock.  
            The Buffer Manager (BM) gets this lock when it needs to read, insert, or update a multiple buffer pool (MBA) record in a Shared Communications Area (SCA).  
            (BMC_MBAO or BMC_MBAR) |
| BPPS      | The Buffer Manager Pageset (BPPS) RR (repeatable read) P-lock:  
            • BP = buffer pool ID  
            • DB = database name  
            • PS = pageset name |
| CCAT      | The CATMAINT convert catalog (CCAT) lock is acquired when catalog conversion is performed. |
| CDBL      | The Compress dictionary build (CDBL) lock. |
| CDIR      | The CATMAINT convert directory (CDIR) lock is acquired when directory conversion is performed. |
| CDRN      | The Cursor Stability drain (CDRN) lock is acquired to drain all CS read access to an object:  
            • DB = database name  
            • PS = pageset name  
            • PT = partition |
| CMDS      | The DB2 Command Serialization (CMDS) lock. |
| CMIG      | The CATMAINT migration (CMIG) lock is acquired when catalog migration is performed. |
| COLL      | The Collection (COLL) lock |
| DBDL      | The DBD load (DBDL) lock is the database descriptor load lock. |
| DBEX      | The Database exception (DBEX) lock indicates a lock on a “Logical page list” (LPL) or “Group buffer pool recovery pending” (GRECP) database exception status.  
            This lock is only used in a data sharing environment. |
| DBXU      | The DB exception update lock is used for updating the database exception status. |
| DGTT      | The DGTT URID lock is acquired to protect segments that belong to a Declared Global Temporary Table (DGTT). These segments are deallocated during Commit 1 by logging them and serializing them using the Unit of Recovery ID (URID) lock. |
### Table 80. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DPAG</strong></td>
<td>The DB2 page (DPAG) lock in a tablespace. When programs read data or update data, they acquire a page lock containing the data.</td>
</tr>
<tr>
<td></td>
<td>- DB = database name</td>
</tr>
<tr>
<td></td>
<td>- PS = pageset name</td>

<tr>
<td><strong>PPAG</strong></td>
<td>The Page P-lock is a physical lock on a page. This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td><strong>PPSC</strong></td>
<td>The Pageset/partition level castout physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td><strong>PPSP</strong></td>
<td>The Pageset/partition physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
</tbody>
</table>
### Table 80. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PRLF</strong></td>
<td>The Resource Limit Facility (RLF) physical lock (P-lock). This lock is only used in a data sharing environment.</td>
</tr>
<tr>
<td><strong>PSET</strong></td>
<td>The Pageset (PSET) lock can be a tablespace or indexspace. A pageset containing DB2 tables is a tablespace. A pageset containing DB2 index structure is an indexspace. A pageset can be simple or partitioned. This lock type is for the simple pageset only.</td>
</tr>
</tbody>
</table>
|           | • DB = database name  
|           | • PS = pageset name |
| **PSPI**  | The Pageset piece (PSPI) lock. A pageset is a collection of pageset pieces. Each pageset piece is a separate VSAM data set. A simple pageset contains from 1 to 32 pieces. Each piece of a simple pageset is limited to 2 GB. Whenever a simple pageset piece reaches this size, another piece is allocated and the pageset grows. This is a lock on the expanded pageset piece. |
| **RDBD**  | The Repair DBD (RDBD) lock is acquired when REPAIR DBD REBUILD is running (test/diagnose). |
| **RDRN**  | The Repeatable Read drain (RDRN) lock is acquired to drain all RR access to an object. |
|           | • DB = database name  
|           | • PS = pageset name  
|           | • PT = partition |
| **RGDA**  | The Retry Getpage During Abort (RGDA) lock. |
| **ROW**   | The Row lock indicates a lock on a row. |
| **RSTR**  | The Shared Communications Area (SCA) restart (RSTR) lock indicates a lock on SCA access for restart/redo information. (BMC-RSTP) |
| **SDBA**  | The Start/stop lock on DBA (SDBA) table indicates a lock on the table, tablespace, or database when a CREATE/DROP is processed against these objects. |
|           | • DB = database name  
|           | • PS = pageset name |
| **SENV**  | The System environment (SYSENV) serialization lock. |
| **SKCT**  | The Skeleton cursor table (SKCT) lock indicates a lock on the application plan. |
|           | PLAN= plan name |
| **SKPT**  | The Skeleton package table (SKPT) lock indicates a lock on the application package. |
|           | TOKEN= the consistency token (CONTOKEN) column from SYSIBM.SYSPACKAGE. |
Table 80. Lock types (continued)

<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPRC</td>
<td>The System level point in time (PIT) recovery lock. &lt;br&gt;SYS_PITR</td>
</tr>
<tr>
<td>SREC</td>
<td>The Log range lock. &lt;br&gt;DB2 writes a record in the log range tablespace (SYSLGRNG) every time a tablespace is opened and updated, and updates SYSLGRNG whenever that tablespace is closed. &lt;br&gt;The record contains the opening and/or closing log RBA (relative byte address) for the tablespace. When DB2 writes to SYSLGRNG, the program acquires a lock on the tablespace with updates. &lt;br&gt;• DB = database name &lt;br&gt;• TS = tablespace name</td>
</tr>
<tr>
<td>TABL</td>
<td>The Table (TABL) lock on the table which resides in a segmented tablespace. &lt;br&gt;• DBID = DBid &lt;br&gt;• TABL = Tableid</td>
</tr>
<tr>
<td>UIDA</td>
<td>The Util I/O Damage Assessment lock.</td>
</tr>
<tr>
<td>UNDT</td>
<td>The Undetermined (UNDT) lock indicates that this lock cannot be determined because it is not part of the other listed lock types. &lt;br&gt;Resource ID (in hexadecimal).</td>
</tr>
<tr>
<td>UNKN</td>
<td>The Unknown (UNKN) lock indicates the resource does not exist.</td>
</tr>
<tr>
<td>UTEX</td>
<td>The Utility exclusive execution (UTEX) lock. &lt;br&gt;UTEXEC</td>
</tr>
<tr>
<td>UTID</td>
<td>The Utility identifier (UTID) lock. &lt;br&gt;UID=utility id</td>
</tr>
<tr>
<td>UTOB</td>
<td>The Utility object (UTOB) lock. &lt;br&gt;• DB = database name &lt;br&gt;• PS = pageset name &lt;br&gt;• PT = partition</td>
</tr>
<tr>
<td>UTSE</td>
<td>The Utility serialization (UTSE) lock is required when running utility jobs. &lt;br&gt;UTSERIAL</td>
</tr>
<tr>
<td>WDRN</td>
<td>The Write drain (WDRN) lock is acquired to drain all write access to an object. &lt;br&gt;• DB = database name &lt;br&gt;• PS = pageset name &lt;br&gt;• PT = partition</td>
</tr>
<tr>
<td>XMLK</td>
<td>The XML lock.</td>
</tr>
</tbody>
</table>

**LUWID** The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
USCAC001.020222.A1FE8E048904+8

MVSID The MVS system identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package DBRM (Unicode) The package DBRM name.

Plan The plan name.

Resource Type The type of resource can be Lock or Claim.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Total Locks The number of locks of the same lock type owned by the thread.

Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Thread Locks Owned Summary Attributes:
Use Thread Locks Owned Summary attributes to view a summary of all locks and claims owned by a thread.

AGNT ASID The address space ID (ASID) of the agent.

Authorization ID The authorization ID.

Authorization ID (Unicode) The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 128 characters.

Bind ACQUIRE Option The ACQUIRE option specified at BIND time: ALLOCATE or USE. This allows you to control when the allocation of tablespace locks is to
occur. If ACQUIRE(USE) is specified, tablespace locks will be acquired when the
resource is used by the application. If ACQUIRE(ALLOCATE) is specified, all
tablespace locks will be obtained at plan allocation time. Dynamic SQL users
(QMF, SPUFI) always execute with the ACQUIRE(USE) option.

**Bind RELEASE Option** The RELEASE option specified at BIND time: COMMIT or
DEALLOCATE. The RELEASE option controls when tablespace and SKCT locks
are freed. RELEASE(COMMIT) causes these locks to be released at each commit
point. RELEASE(DEALLOCATE) causes these locks to be freed at application
termination. Page locks are always released at commit time, regardless of the
release option.

**Catalog Locks** The total number of all catalog locks owned. This number includes
any locks owned on a page or tablespace in database DSNDB06. This is the total of
the catalog pageset and page locks.

**Catalog Page Row Locks** The total number of page and row locks on the catalog
(DSNDB06) database. This includes data page (DPAG), index page (IPAG), and
row (ROW) locks.

**Catalog Pageset Locks** The total number of pageset locks in which the object of the
lock is a pageset owned by the catalog (DSNDB06) database (PSET).

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an
alphanumeric text string, with a maximum of 128 characters.

**Thread Locks Owned Summary Attributes** Connection ID.Identifies the
connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Thread Locks Owned Summary Attributes** The type of connection associated with
the thread.

<table>
<thead>

<td>DB2 Utility</td>
</tr>
</tbody>
</table>

**Correlation ID** The DB2 Correlation ID.

**DB2 ID** The name of a DB2 subsystem.

**Directory and Other Locks** The total number of directory and other locks owned by the thread. Directory locks are issued against resources contained in the DSNDB01 directory database.

**Elapsed time** Shows the elapsed time in milliseconds.

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (DB2 field name: QWHCEUID).

**ISOLATION Option** The ISOLATION option specifies when the plan is bound. The isolation parameter allows you to control the data consistency in the pages that the plan accesses. It has an effect on the number of page or row locks held concurrently by an application.

The available options are:

**Cursor Stability (CS or CURSOR)**
Causes a page lock acquired for read processing to be released when the application subsequently accesses data contained on another data page. (Page locks acquired as a result of update activity are always retained until commit.)

**Read Stability (RS or READ)**
Is similar to Repeatable Read but this isolation option allows to insert new rows or update rows that did not satisfy the original search condition of the application.

**Repeatable Read (RR or REPEAT)**
Causes all application locks obtained for read processing to be retained until application commit time.

**RR with X-lock (REPEATX)**
Means Repeatable Read with X-lock.

**RS with X-lock (READX)**
Means Read Stability with X-lock.

**Uncommitted Read (UR or UNCOMMIT)**
Causes data to be read without acquiring locks. This can result in accessing data that has been updated but not yet committed. It applies only to read-only operations: SELECT, SELECT INTO, or FETCH from a read-only result table. Use this isolation level only when:
- Data consistency is not necessary or inconsistencies already exist
- Errors cannot occur with its use, such as with a reference table that is rarely updated

**Job Name** The job name that is associated with a thread.
Locks Owned The total number of all locks owned by the thread. This includes all lock types.

LUWID The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
USCACO01.02D22A.A1FE8E0489D4=8

MVSID The MVS system identifier.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package DBRM (Unicode) The package DBRM name.

Page Row Lock Total number of page and row locks owned by the thread. It includes data page locks (DPAG), index page locks (IPAG), and row locks (ROW). It excludes any locks in which the lock object is owned by the catalog database or the directory database.

Pageset and Dataset Locks The total number of pageset locks held. This excludes pageset locks in which the lock object is a pageset owned by the catalog database or the directory database. Lock types included are PSET and DSET.

Percent NUMLKUS The current percentage of NUMLKUS reached by the thread. NUMLKUS is an installation parameter in DSNZPARM that specifies the maximum number of page, row, LOB, or XML locks that can be held by a single process at any one time. It includes locks for both, the DB2 catalog and directory and for user data.

Plan The plan name.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
• M = Month
• D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.
Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUV).

Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Thread SQL Counts 1 Workspace:

The Thread SQL Counts 1 workspace provides information about SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements.

This workspace is comprised of the following views:

Thread ID (table view)
List the thread IDs.

DML (table view)
Provides information on SQL DML (Data Manipulation Language) statements.

DCL (table view)
Provides information on DCL (Data Control Language) declarations.

DDL Create (table view)
Provides information on SQL DDL (Data Definition Language) statements for Create.

DDL Drop (table view)
Provides information on SQL DDL (Data Definition Language) statements for Drop.

DDL Alter / Rename (table view)
Provides information on SQL DDL (Data Definition Language) statements for Alter / Rename.

Note: For DML, DCL, and DDL, each table view provides total counts since the last sample period.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread SQL Counts Attributes:
Use the Thread SQL Counts attributes to create situations to monitor the SQL DCL (Data Control Language) declarations, SQL DDL (Data Definition Language) statements, and SQL DML (Data Manipulation Language) statements, associated with a thread. These attributes also list information for stored procedures, user-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements. They also show information for currently committed rows, multi-row processing, workfile storage, and concentrate statements.

Abort The number of times the thread has rolled back uncommitted data (Field name QWACCOMM).

AGNT ASID The address space ID (ASID) of the agent.

Allocate Cursor The number of SQL ALLOCATE CURSOR statements executed (Field name: QXALOCC).
Alter Database  The number of ALTER DATABASE statements executed (Field name: QXALDAB).

Alter Function  The number of ALTER FUNCTION statements executed (Field name: QXALUDF).

Alter Index  The number of ALTER INDEX statements executed (Field name: QXALTIX).

Alter Procedure  The number of ALTER PROCEDURE statements executed (Field name: QXALPRO).

Alter Stogroup  The number of ALTER STOGROUP statements executed (Field name: QXALTST).

Alter Table  The number of ALTER TABLE statements executed (Field name: QXALTTA).

Alter Tablespace  The number of ALTER TABLESPACE statements executed (Field name: QXALTTS).

Alter Trusted Context  The number of alter trusted context statements executed (Field name QXALTCTX) - not supported prior to DB2 9.

Associate Locator  The number of SQL ASSOCIATE LOCATORS statements executed (Field name: QXALOCL).

Authorization ID  The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Authorization ID (Unicode)  The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 128 characters.

Close Cursor  The number of CLOSE statements executed. This number at the server location might not match the user application because of DDF’s internal processing (DB2 field name: QXCLOSE).

Collection ID (Unicode)  The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

Comment On  The number of COMMENT ON statements executed (Field name: QXCMTON).

Commit  The number of times the thread successfully concluded commit phase 2 processing (Field name QWACABRT).

Connect (Type 1)  The number of CONNECT type 1 statements executed (Field name: QXCON1).

Connect (Type 2)  The number of CONNECT type 2 statements executed (Field name: QXCON2).

Thread SQL Counts Attributes  Connection ID. Identifies the connection of an application to a DB2 system.
Thread SQL Counts Attributes The type of connection associated with the thread.

Valid values are:

<table>

</tbody>
</table>

Correlation ID The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example DLKEX212.

Create Alias The number of CREATE ALIAS statements executed (Field name: QXCRALS).

Create Database The number of CREATE DATABASE statements executed (Field name: QXCRDAB).

Create Distinct Type The number of CREATE DISTINCT TYPE statements executed (Field name: QXCDIST).

Create Function The number of CREATE FUNCTION statements executed (field name: QXCRUDF).

Create Global Temp Table The number of CREATE GLOBAL TEMPORARY TABLE statements executed (field name: QXCRGTT).

Create Index The number of CREATE INDEX statements executed (Field name: QXCRINX).

Create Procedure The number of CREATE PROCEDURE statements executed (Field name: QXCRPRO).

Create Role The number of CREATE ROLE statements executed (Field name QXCRROL) - not supported prior to DB2 9.
**Create Stogroup** The number of CREATE STOGROUP statements executed (field name: QXCRSTG).

**Create Synonym** The number of CREATE SYNONYM statements executed (Field name: QXCRSYN).

**Create Table** The number of CREATE TABLE statements executed (Field name: QXCRTAB).

**Create Tablespace** The number of CREATE TABLESPACE statements executed (Field name: QXCTABS).

**Create Trigger** The number of CREATE TRIGGER statements executed (Field name: QXCTRIG).

**Create Trusted Context** The number of create trusted context statements executed (Field name: QXCRCTX) - not supported prior to DB2 9.

**Create View** The number of CREATE VIEW statements executed (Field name: QXDEFVU).

**DB2 ID** The DB2 subsystem ID.

**Delete** The number of DELETE statements executed (DB2 field name: QXDELET).

**Describe** The number of DESCRIBE, DESCRIBE CURSOR, DESCRIBE INPUT, and DESCRIBE PROCEDURE statements executed. This number at the server location might not match the user application because of DDF’s internal processing (Field name: QXDESC).

**Describe Table** The number of DESCRIBE TABLE statements executed (Field name: QXDSCR_TB).

**Description** The description of the monitored activity.

**Direct Row Revert to Index** The number of times that direct row access failed and an index was used to find a record (Field name: QXROIIDX).

**Direct Row Revert to TS Scan** The number of times that an attempt to use direct row access reverted to using a table-space scan because DB2 was not able to use a matching index scan (Field name: QXROITS).

**Direct Row Successful** The number of times that direct row access was successful (Field name: QXROIMAT).

**Drop Alias** The number of SQL DROP ALIAS statements executed (Field name: QXDRPAL).

**Drop Database** The number of DROP DATABASE statements executed (field name: QXDRPDB).

**Drop Distinct Type** The number of DROP DISTINCT TYPE statements executed (Field name: QXDDIST).

**Drop Function** The number of DROP FUNCTION statements executed (Field name: QXDRPFN).
**Drop Index** The number of DROP INDEX statements executed (Field name: QXDRPIX).

**Drop Package** The number of SQL DROP PACKAGE statements executed (Field name: QXDRPPKG).

**Drop Procedure** The number of DROP PROCEDURE statements executed (Field name: QXDRPPR).

**Drop Role** The number of DROP ROLE statements executed (Field name QXDRPROL) - not supported prior to DB2 9.

**Drop Stogroup** The number of DROP STOGROUP statements executed (Field name: QXDRPS).

**Drop Synonym** The number of DROP SYNONYM statements executed (Field name: QXDRPSY).

**Drop Table** The number of DROP TABLE statements executed (Field name: QXDRPTA).

**Drop Tablespace** The number of DROP TABLESPACE statements executed (Field name: QXDRPTS).

**Drop Trigger** The number of DROP TRIGGER statements executed (Field name: QXDRPTR).

**Drop Trusted Context** The number of drop trusted context statements executed (Field name QXDRPCTX) - not supported prior to DB2 9.

**Drop View** The number of DROP VIEW statements executed (Field name: QXDRPVU).

**End User ID** The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (Field name: QWHCEUID).

**Fetch** The number of FETCH statements executed. This number at the server location might not match the user application because of DDF’s internal processing (Field name: QXFETCH).

**Grant** The number of GRANT statements executed (Field name: QXGRANT).

**Incremental Bind** The number of incremental binds (excluding prepare) (Field name: QXINCRB).

**Insert** The number of INSERT statements executed (Field name: QXINSRT).

**Interval Start** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

**Job Name** The job name that is associated with a thread.

**Label On** The number of LABEL ON statements executed (Field name: QXLABON).
Literals Dups Created The number of times DB2 created a duplicate STMT instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLDP). The duplicate STMT instance was needed because a cache match failed because the literal reusability criteria was not met.

Literals Matches Found The number of times DB2 found a matching reusable copy of a dynamic statement in cache because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLMP).

Literals Parsed The number of times DB2 parsed dynamic statements because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLPLP).

Literals Replaced The number of times DB2 replaced at least one literal in a dynamic statement because of CONCENTRATE STATEMENTS WITH LITERALS behavior (Field name: QXSTCWLRLR).

Lock Table The number of LOCK TABLE statements executed (Field name: QXLOCK).

LUWID The logical unit of work ID (LUWID) for a thread.

This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCAC001.02022A.A1FE8E9489D4=8

Max Nested SQL Trigger The maximum level of indirect SQL cascading (Field name: QXCASCDP). This includes cascading because of triggers, UDFs, or stored procedures.

Max Parallel Degree The maximum degree of parallel query processing executed among all parallel groups to indicate the extent to which queries were processed in parallel (Field name: QXMAXDEG).

Merge The number of MERGE statements executed (DB2 field name QXMERGE) - not supported prior to DB2 9.

MVS ID The MVS system identifier.

Open Cursor The number of OPEN statements executed (Field name: QXOPEN).

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Package DBRM (Unicode) The package name of the database request module (DBRM) with which a thread is associated. It is an alphanumeric text string with a maximum of 128 characters.
Parallel Bypass DB2 (Buffers) The number of times the parallelism coordinator had to bypass a DB2 when distributing tasks because one or more DB2 members did not have enough buffer pool storage (Field name: QXXCSKIP). The number in this field is only incremented at the parallelism coordinator once per parallel group, even though more than one DB2 might have lacked buffer pool storage for that parallel group. It is also only incremented when the buffer pool is defined to allow for parallelism. For example, if VXPSEQT=0 on an assistant, DB2 does not send parallel work there and the number in this field is not incremented.

Parallel Degree Executed The total number of parallel groups that executed in the planned parallel degree (Field name: QXNORGRP). This field is incremented by one for each parallel group that executed in the planned degree of parallelism (as determined by DB2).

Parallel Degree Reduced (no buffer) The total number of parallel groups that did not reach the planned parallel degree because of a lack of storage space or contention on the buffer pool (Field name: QXREDGRP).

Parallel Failed (Cursor) The total number of parallel groups that fell back to sequential mode because of a cursor that can be used by UPDATE or DELETE (Field name: QXDEGCUR).

Parallel Failed (No Buffer) The total number of parallel groups that fell back to sequential mode because of a storage shortage or contention on the buffer pool (Field name: QXDEGBUF).

Parallel Failed (No ESA Sort) The total number of parallel groups that fell back to sequential mode because of a lack of ESA sort support (Field name: QXDEGESA).

Parallel Failed (No Enclaves) The total number of parallel groups that executed in sequential mode because of the unavailability of MVS/ESA enclave services (Field name: QXDEGENC).

Parallel Grp Executed The total number of parallel groups that were executed (Field name: QXTOTGRP).

Parallel Maximum LOB Storage The maximum storage used for LOB values (DB2 field name: QXSTLOBV).

Parallel Single DB2 (Coord=NO) The total number of parallel groups executed on a single DB2 subsystem due to the COORDINATOR subsystem value being set to NO (Field name: QXCOORNO). When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

Parallel Single DB2 (Cursor) The total number of parallel groups executed on a single DB2 subsystem because of a repeatable-read or read-stability isolation (Field name: QXISORR).

Parallel Sysplex Intent The total number of parallel groups that DB2 intended to run across the data sharing group (Field name: QXXCBPNX). This number is only incremented at the parallelism coordinator at run time.

Parallelism Disabled YES indicates that query parallelism is disabled by the Resource Limit Facility for at least one dynamic SQL SELECT statement.
Plan Name: The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Prepare: The number of PREPARE statements executed. This number at the server location might not match the user application because of DDF's internal processing (Field name: QXPREP).

Prepare Avoided KEEPDYN(YES): The number of times where no SQL PREPARE or EXECUTE IMMEDIATE was issued by the application and a copy of a prepared SQL statement was found in local dynamic SQL cache (Field name: QXSTNPRP). When an application plan or package is bound with KEEPDYNAMIC YES, a copy of each prepared SQL statement for the application thread is held in the local dynamic SQL cache and kept across a commit boundary. An application thread can save the total cost of a prepare by using a copy of the prepared statement in the local dynamic SQL cache from an earlier prepare by the same thread. To do this, the application must be modified to avoid issuing repetitive SQL PREPAREs for the same SQL statement.

Prepare Copied from Cache: The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache (Field name: QXSTFND).

Prepare Discarded - MAXKEEPD: The number of times statements are invalidated in the local dynamic SQL cache because the MAXKEEPD limit has been reached and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDEXP).

Prepare Implicit KEEPDYN(YES): An implicit prepare occurs when the user copy of the prepared SQL statement no longer exists in the local dynamic SQL cache and the application plan or package is bound with KEEPDYNAMIC YES (Field name: QXSTIPRP). If the skeleton copy of the prepared SQL statement exists in the global dynamic SQL cache in the EDM pool, a short prepare is executed, otherwise a full prepare is executed.

Prepare No Match: The number of times that DB2 searched the prepared statement cache but could not find a suitable prepared statement (Field name: QXSTNFND).

Prepare Purged - DROP/ALT/REV: The number of times statements are invalidated in the local dynamic SQL cache because of SQL DDL or updated RUNSTATS information and prepared SQL statements in the local dynamic SQL cache have to be reclaimed (Field name: QXSTDINV).

Release: The number of RELEASE statements executed (DB2 field name: QXREL).

Rename Index: The number of RENAME INDEX statements executed (Field name QXRNIX) - not supported prior to DB2 9.

Rename Table: The number of RENAME TABLE statements executed (Field name: QXRNTAB).

Revoke: The number of REVOKE statements executed (Field name: QXREVOK).
RID HWM  The highest number of RID blocks in use at any time since DB2 startup (Field name: QISTRHIG). This is a high-water mark.

RID In Use  The number of RID blocks currently in use (snapshot value) (Field name: QISTRCUR).

RID Exceeded Pool  The number of times the maximum RID pool storage was exceeded (Field name: QISTRMAX). The size is determined by the installation parameter RID POOL SIZE (DB2 install panel DSNTIPC). It can be 0, or between 128 KB and 10 GB. The general formula for calculating the RID pool size is:
Number of concurrent RID processing activities x average number of RIDs x 2 x 5 bytes per RID.

RID Exhausted Virtual  The number of times RID pool processing was not used because DBM1 storage was exhausted (Field name: QISTRSTG).

RID Not Used (no storage)  The number of times DB2 detected that no storage was available to hold a list of RIDs during a given RID pool process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXNSMIAP).

RID Not Used (Max Limit)  The number of times DB2 detected that a RID list exceeded one or more internal limits during a given RID list (or RID pool) process involving one index (single index access with list prefetch) or multiple indexes (multiple index access) (DB2 field name: QXMRIAP). The internal limits include the physical limitation of the number of RIDs a RID list can hold and threshold values for the retrieval, ORing, and ANDing of RIDs.

RID Pool Used  The number of times the RID (RECORD ID) pool has been processed (Field name: QXMIAP). During RID (RECORD ID) pool (also called RID list) processing, DB2 uses an index to produce a list of candidate RIDs, which is called a RID list. The RID list can be sorted and intersected (ANDed) or unioned (OREd) with other RID lists before actually accessing the data pages. RID list processing is used for a single index (index access with list prefetch) or for multiple indexes (multiple index access), which is when the RID lists are ANDed and ORed.

RID Terminated (> DM)  The number of times a RID pool processing operation terminated because the number of RID entries was greater than the DM limit (Field name: QISTRPLM).

RID Terminated (> RDS)  The number of times RID pool processing terminated because the number of RIDs that can fit into the guaranteed number of RID blocks was greater than the maximum limit (25% of table size) (Field name: QISTRLLM).

Row Triggers Executed  The number of times a row trigger was activated (Field name: QXROWTRG).

Rows Deleted  The number of rows that have been deleted because of SQL DELETE statements (Field name: QXRWSDELETE). 

Rows Fetched  The number of rows that have been fetched because of SQL FETCH statements (Field name: QXRWSFETCH).

Rows Inserted  The number of rows that have been inserted because of SQL INSERT statements (Field name: QXRWSINSERT).
**Rows Updated** The number of rows that have been updated because of SQL UPDATE statements (Field name: QXRWSUPDTD).

**Select** The number of SQL SELECT statements executed (Field name: QXSELECT).

**Set Connection** The number of SET CONNECTION statements executed (Field name: QXSETCON).

**Set Current Degree** The number of SET CURRENT DEGREE statements executed (Field name: QXSETCDG).

**Set Current Path** The number of SET CURRENT PATH statements executed (Field name: QXSETPTH).

**Set Current Rules** The number of SET CURRENT RULES statements executed (Field name: QXSETCRL).

**Set Current SQLID** The number of SET CURRENT SQLID statements executed (Field name: QXSETPSQL).

**Set Host Variable** The number of SET HOST VARIABLE statements executed. The special register that was retrieved is not tracked (Field name: QXSETHV).

**SP Abended** The number of times a stored procedure terminated abnormally (Field name: QXCALLAB).

**SP Call Statements** The number of times the SQL CALL statements executed to invoke a stored procedure (SP).

**SP Rejected** The number of times an SQL CALL statement was rejected because of the procedure that is in the STOP ACTION(REJECT) state (Field name: QXCALLRJ).

**SP Timed-Out** The number of times an SQL CALL statement timed out when waiting to be scheduled (Field name: QXCALLTO).

**SQL Error in Trigger** The number of times an SQL error occurred during the execution of a triggered action (Field name: QXTRGERR). This includes errors that occur in user-defined functions or stored procedures that are called from triggers and that pass back a negative SQLCODE.

**Stmt Triggers Executed** The number of times a statement trigger was activated (Field name: QXSTTRG).

**Total** The total count executed by the thread.

**UDFs Abended** The number of times a user-defined function (UDF) abended (Field name: QXCAUDAB).

**UDFs Executed** The number of user-defined functions (UDFs) executed (Field name: QXCAUD).

**UDFs Rejected** The number of times a user-defined function (UDF) was rejected (Field name: QXCAUDRJ).
UDFs Timed Out The number of times a user-defined function (UDF) timed out while waiting to be scheduled (Field name: QXCAUDT).

Uniqueness Value The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (Field name: QWHSLUUV).

Uniqueness Value 2 The DB2 thread uniqueness value. For internal use.

Update The number of UPDATE statements executed (Field name: QXUPDTE).

Thread SQL Counts 2 Workspace:

The Thread SQL Counts 2 workspace provides information about stored procedures, user-defined functions, triggers, direct row access, parallelism, RID pool access, and prepare statements.

This workspace is comprised of the following views:
  • Thread ID (table view)
  • Stored Procedures
  • User-Defined Functions
  • Triggers
  • Parallelism
  • RID Pool Access
  • Prepare Statements
  • Direct Row Access

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread SQL Counts 3 Workspace:

The Thread SQL Counts 3 workspace provides information about multi-row processing and concentrate statements.

This workspace is comprised of the following views:

Thread ID (table view)
Lists the thread IDs.

Multi-Row Processing
Enables you to track performance improvements such as multi-row fetch and multi-row insert.

Concentrate Statements
Indicates if literal constants, which are referenced in dynamic SQL statements, are replaced with special markers so that these constants are not cached with the statement in the dynamic SQL statement cache.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.
Thread Statistics Workspace:

The Thread Statistics workspace displays thread statistics for a specific application thread. If the application thread is a parallel thread, the table view displays thread statistics for all the associated parallel threads.

Viewing Additional Thread Information

You can use the Tivoli Enterprise Portal terminal emulator adapter to access an OMEGAMON host session to investigate a thread with excessive elapsed time. For information about using this feature, see the Tivoli Enterprise Portal online help.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

Thread Statistics Attributes:
Use Thread Statistics attributes to create situations that determine the usage of parallel threads.

Asynchronous Page Reads The number of asynchronous page reads for prefetch. Valid value is an integer in the range 0 - 2147483647.

Correlation ID The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

DB2 ID The name of a DB2 subsystem.

Dynamic Prefetch The number of dynamic prefetch requests. Valid value is an integer in the range 0 - 2147483647.

Get Page Requests The number of thread getpage requests. This includes conditional, unconditional, successful, and unsuccessful requests. Valid value is an integer in the range 0 - 2147483647.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

Immediate Write I/O The number of synchronous write I/O requests that DB2 issues on behalf of a thread. Valid value is an integer in the range 0 - 2147483647.

List Prefetch The number of list prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of SETW The number of set write requests to write a page out to DASD. Valid value is an integer in the range 0 - 2147483647.
Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Plan Name  The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Sequential Prefetch  The number of sequential prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Synchronous Read I/O  The number of synchronous read I/O requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Time Stamp  Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Type Indicator  Indicates the type of parallel thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>blank</td>
<td>Not a parallel thread</td>
</tr>
<tr>
<td>Parent</td>
<td>Parallel thread is a parent</td>
</tr>
<tr>
<td>Child</td>
<td>Parallel thread is a child</td>
</tr>
<tr>
<td>Autonomous SP</td>
<td>Originating thread who invoked autonomous stored procedures</td>
</tr>
</tbody>
</table>

Unsuccessful Get Page Operation  The number of conditional getpage requests that failed. Valid value is an integer in the range 0 - 2147483647.

Thread Wait Events Workspace:

The Thread Wait Events workspace provides wait time and counts on events that the thread waited on.

This workspace is comprised of the following views:

- Thread ID (table view)
- Archive Log Wait Events (table view)
The Thread ID table identifies the thread. All other tables provide time information and counts with regard to the named events.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**Utility Jobs Workspace:**

The Utility Jobs workspace provides an overview of all active utilities. Workspace monitoring includes utilities that because of abnormal termination, have not yet completed their run.

This workspace is comprised of the following view:

**Notepad (notepad view)**

Is a simple text editor for writing notes about the workspace.

**Utility Jobs (table view)**

Lists the phase, record counts, and status of DB2 utility jobs.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

You can link to the following Thread summary workspaces:

- “All Threads Connected to DB2 Workspace” on page 451
- “CICS Thread Summary Workspace” on page 479
- “Detailed Thread Exception Workspace” on page 554
- “Distributed Allied Thread Summary Workspace” on page 564
- “DBAT End-to-End SQL Monitoring Workspace” on page 544
- “Enclave Thread Summary Workspace” on page 677
- “IMS Thread Summary Workspace” on page 731
- “Lock Conflicts Workspace” on page 732
- “Thread Activity by Package Workspace” on page 803
- “Thread Activity by Plan Workspace” on page 803
DB2 SRM UTL Attributes:
Use the DB2 SRM UTL attributes to create situations to monitor all active utilities. Monitoring also includes utilities that due to abnormal termination, have not yet completed their run.

**ID** The utility qualifier. It is an alphanumeric text string, with a maximum length of eight characters.

**Job Name** The utility job name. It is an alphanumeric text string, with a maximum length of eight characters.

**Name** The utility name. It is an alphanumeric text string, with a maximum length of eight characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Phase** The utility phase. It is an alphanumeric text string, with a maximum length of eight characters.

**Record Count** The number of records/pages processed.

**Run Date** The date the job was run (if available).

The timestamp format for SCAN and STR functions is \texttt{CYYMMDDHHMMSSmmm}
(as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Stat** A for Active, S for stopped.

**Status** The utility status. It is an alphanumeric text string, with a maximum length of 12 characters.

**Statement** The statement number.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is \texttt{CYYMMDDHHMMSSmmm}
(as in 1180315064501000 for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
User The user ID. It is an alphanumeric text string, with a maximum length of eight characters.

Utilid The utility qualifier. It is an alphanumeric text string, with a maximum length of 16 characters.

Volume Activity Workspace:

The Volume Activity workspace provides an overview of the performance of volumes that contain DB2 objects in order to evaluate DASD performance by volume.

This workspace is comprised of the following views:

Service Time (bar chart)
Shows the average service time for the volume since the beginning of the collection interval.

Volume Activity (table view)
Includes data that allows you to monitor I/O activity for individual volumes.

Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

DB2 Volume Activity Attributes:
Use the DB2 Volume Activity attributes to create situations to monitor the status and performance of DB2 volume activity.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum length of eight characters.

DB2 IO Percent The percentage of DB2 I/O activity to the volume. Valid entry ranges from 0.0 to 100.0.

DB2 ID The name of the DB2 subsystem. It is an alphanumeric text string, with a maximum length of four characters.

Extents per Data Set Ratio The ratio of total extents allocated to the total data set count.

Filler A placeholder to keep fullword alignment.

IDNAME An internal attribute used for navigation, it contains either the data sharing group name or the DB2ID. It is an alphanumeric text string, with a maximum length of eight characters.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string, with a maximum length of four characters.
**Number of Data Sets** The total number of allocated data sets for the DB2 subsystem being monitored.

**Number of DB2 systems** The total number of monitored DB2 systems that are sharing this volume.

**Number of Extents** The number of extents the operating system has allocated for a data set.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is CYYMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:
- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Volume DB2 IO** The total number of I/Os for this volume originating from the DB2 system being monitored.

**Volume DB2 IO Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored.

**Volume DB2 IO Rate MAX** The maximum I/O rate per second during the collection period.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum length of six characters.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval.

**Volume Service Time MAX** The maximum service time for the volume since the beginning of the collection interval.

**Volume Total IO** The total number of I/Os for this volume.

**Volume Total IO Rate** The total number of I/Os per second for the volume.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume that is attributable to the database, computed by dividing the total I/O rate for the database by the total DB2 I/O rate to the volume. Valid entry ranges from 0.0 to 100.0.
Volume Utilization  The percentage of volume utilization, which represents the percent of time the volume is in use. Valid entry ranges from 0.0 to 100.0.

Data Sharing Status Attributes:
Use the Data Sharing Status attributes to create situations that monitor the status of a specific DB2 system or data sharing group.

DB2 ID  The name of a DB2 subsystem.

Group Object Analysis Status  The status of the Event Manager for Object Analysis.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIX</td>
<td>Some Event Managers are active</td>
</tr>
<tr>
<td>NO</td>
<td>Event Manager is not active</td>
</tr>
<tr>
<td>YES</td>
<td>Event Manager is active</td>
</tr>
</tbody>
</table>

Group or Subsystem Name  An internal attribute used for navigation. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

Group or Subsystem Type  Indicates whether a group or subsystem is a DB2 or a data sharing group.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>DB2 subsystem</td>
</tr>
<tr>
<td>DSGRP</td>
<td>Data sharing group</td>
</tr>
</tbody>
</table>

Lock Conflict Count  The total number of owners and waiters that are in lock conflict. Valid value is an integer in the range 0 - 99999999.

MVS Subsystem  The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

Number of DB2 systems  The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

Number of GBP Connections  The total number of Group Buffer Pool (GBP) Connections.

Number of Threads  The total number of currently monitored threads. Valid value is an integer in the range 0 - 99999999.

Object Analysis DB Count  The total number of monitored databases in a specific data sharing group that are participating in object analysis. Valid value is an integer in the range 0 - 4999.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Status** Indicates whether a DB2 subsystem or data sharing group for a monitored entity is operational. Valid values are OFFLINE or ONLINE.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Local Group Object Analysis Thread Volume Attributes:**
Use the Local Group Object Analysis (GOA) Thread Volume attributes to create situations that monitor the thread activity for volumes.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters; for example, TRAN5.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**DB2 Read I/O** The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**DB2 Read I/O Rate** The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**DB2 Write I/O** The number of I/O writes. Valid value is an integer in the range 0 - 2147483647; for example, 20.

**DB2 Write I/O Rate** The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Percent Volume Use** The percentage of DB2 I/O activity to the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 5.0.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Total DB2 I/O** The total I/O count. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**Total DB2 I/O Rate** The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

**Local Group Object Analysis Volume Group Attributes:**
Use the Local Group Object Analysis (GOA) Volume Group attributes to create situations that monitor DASD performance by volume.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. Valid format is alphanumeric with a maximum of 4 characters; for example SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.
**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Originating System ID** The managed system name of the agent. Valid format is alphanumeric, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Volume DB2 I/O** The total number of I/Os for the volume originating from the DB2 subsystem being monitored. Valid value is an integer in the range 0 - 2147483647.

**Volume DB2 I/O Rate** The total number of I/Os per second for the volume originating from the DB2 subsystem being monitored. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, with a maximum of 6 characters; for example, PRI123.

**Volume Service Time** The average service time for the volume since the beginning of the collection interval. This value is the sum of the average I/Os pending time, the average I/Os connect time, and the average I/Os disconnected time for the volume. It does not include I/Os queue time. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Total I/O** The total number of I/Os for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is an integer in the range 0 - 2147483647; for example, 19.

**Volume Total I/O Rate** The total number of I/Os per second for the volume. The value is from an MVS perspective. If the volume is shared by multiple MVS systems, the value may not reflect all I/O activity for the volume. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.7.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The program calculates the value by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.
**Volume Utilization** The percentage of volume utilization. The value represents a percentage of time the volume is in use. Valid value is an integer in the range 0 - 100; for example, 22.

**Local Group Object Analysis Volume Database Attributes:**
Use the Local Group Object Analysis (GOA) Volume Database attributes to create situations that monitor I/O activity for a single volume in a DB2 database.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Database** The name of a DB2 database. Valid format is alphanumeric with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem. It is an alphanumeric text string with a maximum of 4 characters.

**DB2 Read I/O** The number of read I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 22.

**DB2 Read I/O Rate** The read I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**DB2 Write I/O** The number of write I/Os. Valid value is an integer in the range 0 - 2147483647; for example, 20.

**DB2 Write I/O Rate** The write I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.2.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID. It is an alphanumeric text string with a maximum of 8 characters; for example, TDDB242G.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

**Number of Data Sets** The total number of allocated data sets for the DB2 being monitored. Valid value is an integer in the range 0 - 10000.

**Number of Extents** The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Space Name** The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
• Y = Year
• H = Hour
• M = Minute
• S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Total DB2 I/O** The total I/O count. Valid value is an integer in the range 0 - 2147483647.

**Total DB2 I/O Rate** The total I/O rate per second. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.4.

**Volume Name** The name of the volume that contains the DB2 objects. It is an alphanumeric text string, to a maximum of 6 characters; for example, PRI123.

**Volume Use Percent** The percentage of DB2 I/O activity to the volume. The value is calculated by dividing the total I/O rate for the database by the total I/O rate for the volume. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 3.0.

**Local Object Activity Attributes:**
Use the Local Object Activity attributes to create situations that you can use to monitor the I/O and getpage activity by database.

**ASYNC Write Rate** The number of asynchronous writes per second during the collection interval. Valid format is a decimal number, with 1 decimal place allowed, in the range 0.0 - 9999.9; for example, 2.1.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Database** The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

**DB2 ID** The name of a DB2 subsystem.

**Getpage Rate** The number of getpage requests per second for the database or space name. Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.3.

**Getpage RIO Ratio** The ratio of getpage requests to read I/Os for the database.

The ratio is calculated by dividing the number of getpage requests by the sum of the following values:
• Number of synchronous reads
• Number of prefetch read I/Os

Valid format is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 1.8.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.
MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

Number of ASYNC Writes The number of asynchronous writes during the collection interval. Valid value is an integer in the range 0 - 2147483647.

Number of Getpages The number of getpage requests for the database or space name. Valid value is an integer in the range 0 - 2147483647.

Number of Other Writes The number of immediate and format writes. Valid value is an integer in the range 0 - 2147483647.

Number of Prefetch Reads The number of prefetch read I/Os for the database. Valid value is an integer in the range 0 - 2147483647.

Number of SYNC Reads The number of synchronous reads for the database or space name. Valid value is an integer in the range 0 - 2147483647.

Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Other Write Rate The number of immediate and format writes per second. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.6.

Percent of Getpage Activity The percentage of total getpage activity that is applicable to the database, space name, or thread. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.6.

Percent of I/O The percentage of total I/O activity that is applicable to the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 100.0; for example, 2.0.

Prefetch Read Rate The number of prefetch read I/Os per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 0.9.

Space Name The name of the selected space for which thread activity has occurred. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

SYNC Read Rate The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
• S = Second
For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

Local Object Space Name Attributes:
Use the Local Object Space Name attributes to create situations that monitor object, volume, and extent activity for a specific DB2 object space.

Buffer Pool ID The ID for a buffer pool. Valid values are:
• 32K = 80
• 32K1 = 81
• 32K2 = 82
• 32K3 = 83
• 32K4 = 84
• 32K5 = 85
• 32K6 = 86
• 32K7 = 87
• 32K8 = 88
• 32K9 = 89

Database Name The name of a DB2 database. It is an alphanumeric text string with a maximum of 8 characters; for example, DSNDB06.

Data Sharing Group The name of a data sharing group. It is an alphanumeric text string, with a maximum length of eight characters.

DB2 ID The name of a DB2 subsystem.

Extents per Data Set Ratio The average number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 100.

IDNAME An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

Max Number of Extents per DSN The largest number of extents per data set or space name for a DB2 database. Valid value is an integer in the range 0 - 219.

MVS System The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example, SP11.

Number of Data Sets The total number of allocated data sets for the DB2 you are monitoring. Valid value is an integer in the range 0 - 10000.

Number of Extents The number of data set extents that the operating system has allocated for a data set. Valid value is an integer in the range 0 - 219.

Number of Volumes The number of volumes on which the data set resides. Valid value is an integer in the range 0 - 256.

Object Space Name The name of a DB2 object space. It is an alphanumeric text string, with a maximum of 8 characters; for example, DSNUCX01.

Object Type The type of object space name.
Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INDX</td>
<td>Index</td>
</tr>
<tr>
<td>PTIX</td>
<td>Partitioned index</td>
</tr>
<tr>
<td>PTTS</td>
<td>Partitioned table space</td>
</tr>
<tr>
<td>SEGM</td>
<td>Segmented table space</td>
</tr>
<tr>
<td>TBLSS</td>
<td>Simple table space</td>
</tr>
<tr>
<td>UNDT</td>
<td>Undetermined</td>
</tr>
</tbody>
</table>

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Accessing an OMEGAMON Host Session**

When researching the cause of an alert, you may want to review conditions raised by an OMEGAMON product.

To access an OMEGAMON host session, use the *terminal emulator adapter* feature of Tivoli Enterprise Portal.

The terminal emulator adapter turns a view into a 3270 or 5270 interface so you can connect to any TN3270 or TN5250 host system (such as MVS or OS/400) using TCP/IP. The terminal emulator adaptor provides for simple terminal emulation. It also provides a scripting language interface that:
- Allows you to record (capture) a host session. As you interact with a host session, the session is recorded as a set of script commands that can be saved under a name you specify and played back at a later time. This allows you to automate navigation to a specific set of panels.
- Allows you to author complex scripts containing custom functions for manipulating host sessions.

**The Summarization and Pruning Feature**

Use the Summarization and Pruning feature to customize the time required for saving data (*pruning*) and how often to compress data (*summarization*) in the Tivoli Data Warehouse.
OMEGAMON XE for DB2 PE supports configurable data summarization and data pruning. With summarized data, the performance of queries can be improved considerably. In addition, with data summarization and data pruning working together, the amount of disk space utilized can be better managed.

The Summarization and Pruning feature uses information that is stored in the data warehouse to generate, store, and prune data. The data in the data warehouse is a historical record of activity and conditions in your enterprise. Summarizing the data is the process of aggregating your historical data into time-based categories such as hourly, daily, weekly, and so on. You can summarize your data to perform historical analysis of the data over time.

Pruning data means that old data is deleted automatically, rather than manually. You can set pruning criteria to remove old data from the data warehouse to limit the size of your database tables.

Conﬁguring Summarization and Pruning:

Summarization and Pruning allows you to customize the length of time for which to save data and how often to compress data. You can see and maintain the historical collections that have been conﬁgured for a monitored application and conﬁgure new collections.

Before you begin

Before you begin, ensure that you have started the following items:

• Tivoli Enterprise Monitoring Server
• Tivoli Enterprise Portal Server
• Tivoli Enterprise Portal
• Tivoli Enterprise Monitoring Agent

About this task

Configure the supported workspaces for summarization and pruning.

Procedure

1. From the Edit menu of the Tivoli Enterprise Portal, select History Configuration. The History Collection Configuration window opens.
2. In the Monitored Applications pane, select OMEGAMON XE for DB2 PE and PM on z/OS. The Select Attribute Groups pane opens.
3. From the Select Attribute Groups column, select the name of the attribute group that you want to configure.
4. In the Configuration and Controls section, set the Summarization and Pruning options.
   a. In the Summarization section, set the time period for data aggregation.
   b. In the Pruning section, set the time period to prune data.
5. Click OK to save your changes and close the window.

Summarization and Pruning Workspaces:

Certain workspaces in OMEGAMON XE for DB2 PE allow data to be aggregated and pruned. This feature is called summarization and pruning.
The following workspaces support summarization and pruning:

<table>
<thead>
<tr>
<th>Workspace</th>
<th>View</th>
<th>Attribute Group Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Buffer Pool Details Workspace” on page 471</td>
<td>Status, Thresholds, Ratio</td>
<td>DB2_SRM_BPD</td>
</tr>
<tr>
<td>“Buffer Pool Management Workspace” on page 475</td>
<td>Buffer Pool Management</td>
<td>DB2_SRM_BPM</td>
</tr>
<tr>
<td>“CICS Connections Workspace” on page 476</td>
<td>CICS Connection Summary</td>
<td>DB2_CICS_Exceptions</td>
</tr>
<tr>
<td>“CICS Threads Workspace” on page 478</td>
<td>CICS Threads</td>
<td>DB2_CICS_Threads</td>
</tr>
<tr>
<td>“DB2 Connect Server Workspace” on page 526</td>
<td>DB2 Connect Server</td>
<td>DB2_CONNECT_SERVER</td>
</tr>
<tr>
<td>“DDF Conversations Workspace” on page 549</td>
<td>DDF Conversation</td>
<td>DB2_DDF_CONV</td>
</tr>
<tr>
<td>“IMS Connections Workspace” on page 726</td>
<td>IMS Connections</td>
<td>DB2_IMS_Connections</td>
</tr>
<tr>
<td>“Package Statistics Workspace” on page 528</td>
<td>Package Statistics</td>
<td>DB2_CONNECT_PACKAGE</td>
</tr>
<tr>
<td>System Resource Manager (“EDM Pool Workspace” on page 672)</td>
<td>EDM Statistics</td>
<td>DB2_SRM_EDM_Statistics</td>
</tr>
<tr>
<td></td>
<td>EDM Summary</td>
<td>DB2_SRM_EDM</td>
</tr>
<tr>
<td>System Resource Manager (“Log Manager Workspace” on page 745)</td>
<td>Log Manager Statistics</td>
<td>DB2_SRM_Log_Statistics</td>
</tr>
<tr>
<td></td>
<td>Log Manager Summary</td>
<td>DB2_SRM_Log_Manager</td>
</tr>
<tr>
<td></td>
<td>Log_Detail</td>
<td>DB2_SRM_Log_Manager</td>
</tr>
<tr>
<td>System Resource Manager (“Subsystem Management Workspace” on page 781)</td>
<td>Subsystem Management Statistics</td>
<td>DB2_SRM_Subsystem_Statistics</td>
</tr>
<tr>
<td></td>
<td>Subsystem Management Summary</td>
<td>DB2_SRM_Subsystem</td>
</tr>
<tr>
<td>“System Status Workspace” on page 782</td>
<td>System State Information</td>
<td>DB2_System_States</td>
</tr>
</tbody>
</table>

To use the summarization and pruning feature, you must also specify the behavior and summary type as follows:

<table>
<thead>
<tr>
<th>Type of data</th>
<th>Behavior</th>
<th>Summary Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rate, Ratio, Percent data</td>
<td>GAUGE</td>
<td>AVG</td>
</tr>
<tr>
<td>Delta data</td>
<td>PDEL</td>
<td>SUM</td>
</tr>
<tr>
<td>Maximum data</td>
<td>PEAK</td>
<td>MAX</td>
</tr>
<tr>
<td>Minimum data</td>
<td>LOW</td>
<td>MIN</td>
</tr>
<tr>
<td>Size data</td>
<td>PROPERTY</td>
<td>LAT (latest)</td>
</tr>
<tr>
<td>Total, Accumulative data</td>
<td>COUNT</td>
<td>LAT</td>
</tr>
<tr>
<td>Current data</td>
<td>GAUGE (apply to counter as well)</td>
<td>AVG</td>
</tr>
</tbody>
</table>

**History Configuration**

Use the History Configuration window to configure history collection for OMEGAMON XE for DB2 PE.
The Collection Location must be set to TEMA for the following attribute groups:

- All threads
- Thread details
- Distributed thread details
- Thread enclave
- Detailed thread exception
- MVS storage

For more information, refer to Historical data collection configuration

**HTML Navigation**

The HTML navigation allows you to navigate from one workspace to another, while passing context information to the next workspace.

You can use the HTML navigation feature to navigate from one workspace to another, while passing context information to the next workspace. The workspaces that belong to the same functional unit are linked using HTML navigation. Tivoli Enterprise Portal workspaces are grouped into the following units: Thread Summary workspaces, Thread Detail workspaces, and Statistics workspaces.

The workspaces have been grouped into following functional units:

1. Thread Summary workspaces:
   - “All Threads Connected to DB2 Workspace” on page 451
   - “CICS Thread Summary Workspace” on page 479
   - “Detailed Thread Exception Workspace” on page 554
   - “Distributed Allied Thread Summary Workspace” on page 564
   - “DBAT End-to-End SQL Monitoring Workspace” on page 544
   - “Enclave Thread Summary Workspace” on page 677
   - “IMS Thread Summary Workspace” on page 731
   - “Lock Conflicts Workspace” on page 732
   - “Thread Activity by Package Workspace” on page 803
   - “Thread Activity by Plan Workspace” on page 803
   - “Utility Jobs Workspace” on page 831

2. Thread Detail workspaces:
   - “Thread Activity by Plan Workspace” on page 803
   - “Thread Detail Workspace” on page 804
   - “Distributed Thread Detail Workspace” on page 565
   - “Thread Enclave Detail Workspace” on page 805
   - “Thread Locks Owned Workspace” on page 806
   - “Thread SQL Counts 1 Workspace” on page 818
   - “Thread SQL Counts 2 Workspace” on page 828
   - “Thread SQL Counts 3 Workspace” on page 828
   - “Thread Wait Events Workspace” on page 830

3. Statistic workspaces
   - “Buffer Pool Management Workspace” on page 475
   - “DB2 Connect Server Workspace” on page 528
   - “EDM Pool Workspace” on page 672 (System Resource Manager)
   - “EDM Pool (DB2 10) Workspace” on page 676 (System Resource Manager)
Adding HTML Links to the Existing HTML Navigation Structure:

You can add new HTML links to the existing HTML navigation structure.

About this task

Add a new HTML link to the existing HTML navigation structure.

Procedure

1. Determine the name of the customized workspace that you want to add to the existing navigation structure. You find the workspace name in the title bar of the Tivoli Enterprise Portal window.

2. Determine the workspace ID that uniquely identifies the customized workspace. Enter the following SQL statement on the Tivoli Enterprise Portal Server database: `select OBJECTID from <TEPS database name>.KFWORKSPACE where "NAME" like '<name of the new user-defined workspace>'` In this SQL statement `<TEPS database name>` is the database name of Tivoli Enterprise Portal Server. Make a note of the OBJECTID, as it is needed later.

3. Choose a navigation category that you would like to add the new workspace link to. The available navigation categories are:
   - Statistic_Navigation
   - Thread_Detail_Navigation
   - Thread_Summary_Navigation

4. Open the file with file extension XML that defines all HTML links for the chosen navigation category. The name of the file is `<navigation category>.xml`. The path for this file is the following: `ITM base directory\CNB\classes\candle\kdp\resources\help\language locale\HTML_BrowserNavigation\version where:

   - *ITM base directory* Identifies the base directory of IBM Tivoli Monitoring
   - *language locale* Identifies the language that is used. An empty language locale string represents the English language locale.
   - *version* Identifies the current version: V540

5. Add a new `first_level_navigator` node. You can add the new node between any other existing `first_level_navigator` nodes. If you add the new node at the bottom of the file with file extension XML, the new HTML link shows up at the end of the HTML links list.

6. Make the following changes to the added `first_level_navigator` node: Set the name of your customized workspace as the new `caption_EN_US` value. Set the name of your customized workspace as the new `caption_NLS` value. Set the `target_workspace_objectid` to the OBJECTID that you have determined in Step 2. Parameter details:
KD2_PF_READA_SPMON

a. caption_EN_US: This property must be unique in the file with file extension XML. Therefore, choose a caption_EN_US name that does not exist yet in this file.

b. caption_NLS: This xml node contains the link caption. The new workspace link gets its caption from here.

c. target_workspace_objectid: This xml node defines the target workspace for the HTML link.

d. keep_symbols: This parameter is important for context-sensitive navigation. keep_symbols set to 'true' specifies that there is context information that must be passed along when linking to the workspace. keep_symbols set to 'false' specifies that no context information that must be passed along when linking to the workspace. Do not change this parameter.

7. To generate the files with file extension XML that are required for the HTML navigation in Tivoli Enterprise Portal, browse to the following directory: ITM base directory\CNB\classes\candle\kdp\resources\help\language locale\HTML_BrowserNavigation\version where:

ITM base directory
Identifies the base directory of IBM Tivoli Monitoring

language locale
Identifies the language that is used. An empty language locale string represents the English language locale.

version Identifies the current version: V540

10. Use the added HTML link to navigate to your customized workspace. The new customized workspace is displayed. But in the HTML navigation the wrong navigator item is highlighted. The new customized workspace is displayed and that navigator item should be the one that is highlighted.

a. To correct this, open the Properties dialog for the HTML navigation. In the "HOME" text field, change the file name of the file with file extension XML to the caption_EN_US value that you specified for the added HTML link.

b. In the file name, replace all blanks by underscores.

c. Click OK.

11. Click on the added HTML link again, and click OK when you are asked to save the workspace changes. Now the correct navigator item is highlighted when the new customized workspace is displayed in Tivoli Enterprise Portal.

Exception paths:
About this task

One exception path is that you enter a wrong OBJECTID into the file with file extension XML (see Step 5 on page 847). This means that the identifier for the workspace that Tivoli Enterprise Portal should navigate to is wrong. The effect in Tivoli Enterprise Portal is that nothing happens when you click on that workspace link with the wrong OBJECTID in the HTML navigation view. There is no error message displayed on the Tivoli Enterprise Portal GUI, but Tivoli Enterprise Portal provides a trace log. You can navigate to the trace log using the Manage Tivoli Enterprise Monitoring Services dialog.

Results

In the trace log you find the following error messages that indicate the problem:
An error occurred requesting the workspace record for: REPORT, 117cae1a3ad

No workspace group was found for the given workspace type and id
At least one invalid parameter found, request has failed.

Here 117cae1a3ad is the wrong OBJECTID.

What to do next

You can correct the OBJECTID by either removing a typo or by determining the correct workspace ID of the new customized workspace (Step 2 on page 847).

Changing HTML Links to Point to User-Defined Workspaces:

You can customize workspaces and change the corresponding HTML link to point to the user-defined workspace.

About this task

Alter an HTML link to link to a different workspace.

Procedure

1. Determine the name of the workspace link that you want to use in order to point to a user-defined workspace. For example, you have created a customized Thread Wait Events workspace. Now you want to change the default Thread Wait Events HTML link to point to your customized Thread Wait Events workspace. In this case, the name of the workspace link that you want to change is Thread Wait Events.

2. Open the Properties dialog of the browser view of the HTML navigation browser and determine the navigation category that the workspace link belongs to. The available navigation categories are:
   - Statistic_Navigation
   - Thread_Detail_Navigation
   - Thread_Summary_Navigation

3. Navigate to your custom workspace that should become the new target of the HTML link. Determine the name of the new user-defined workspace that should be the new target for the link. You find the workspace name in the title bar of the Tivoli Enterprise Portal window.

4. Determine the workspace ID that uniquely identifies the new customized workspace. Enter the following SQL statement on the Tivoli Enterprise Portal Server database: select OBJECTID from <TEPS database name>.KFWWORKSPACE where "NAME" like '%<name of the new user-defined workspace>' In this SQL statement <TEPS database name> is the database name of Tivoli Enterprise Portal Server. Make a note of the OBJECTID, as it is needed later.

5. Open the XML file that defines all HTML links for the chosen navigation category. The name of the XML file is <navigation category>.xml. The path for this XML file is the following: <ITM base directory>\CNB\classes\candle\kdp\resources\help\<language locale>\HTML_BrowserNavigation\V420 where <ITM base directory> is the base directory of IBM Tivoli Monitoring.

Remark: An empty language locale string represents the English language locale.
6. Search for the `caption_NLS` element that contains the name of the workspace link that you want to change. You have determined the workspace name in Step 1 on page 849.

```xml
<first_level_navigator>
  <caption_EN_US>Thread Wait Events</caption_EN_US>
  <caption_NLS>Thread Wait Events</caption_NLS>
  <target_workspace_objectid>1013a039535:420</target_workspace_objectid>
  <keep_symbols>true</keep_symbols>
</first_level_navigator>
```

7. Make the following changes: Set the `caption_NLS` to the name of your customized workspace that you have determined in Step 3 on page 849. Set the `target_workspace_objectid` to the OBJECTID that you have determined in Step 4 on page 849. Parameter details:
   a. `caption_EN_US`: Do not change the text in this node as it is important for the proper function of the HTML navigation.
   b. `caption_NLS`: This xml node contains the link caption.
   c. `target_workspace_objectid`: This xml node defines the target workspace for the HTML link. Set it to the OBJECTID determined in Step 3 on page 849.
   d. `keep_symbols`: This parameter is important for context-sensitive navigation. `keep_symbols` set to 'true' specifies that there is context information that must be passed along when linking to the workspace. `keep_symbols` set to 'false' specifies that no context information that must be passed along when linking to the workspace. Do not change this parameter.

8. XML files that are required for the HTML navigation in Tivoli Enterprise Portal are generated in this step. To generate these XML files, browse to the following directory: `<ITM base directory>\CNB\classes\candle\kdp\resources\help\<language locale>\HTML_BrowserNavigation\V420` where `<ITM base directory>` is the base directory of IBM Tivoli Monitoring.

11. The old HTML link caption has changed to the caption of the new customized workspace. When clicking on that customized workspace HTML link, Tivoli Enterprise Portal links to this new workspace.

**Exception paths:**

**About this task**

One exception path is that you enter a wrong OBJECTID into the XML file (see Step 5 on page 849). This means that the identifier for the workspace that Tivoli Enterprise Portal should navigate to is wrong. The effect in Tivoli Enterprise Portal is that nothing happens when you click on that workspace link with the wrong OBJECTID in the HTML navigation view. There is no error message displayed on the Tivoli Enterprise Portal GUI, but Tivoli Enterprise Portal provides a trace log. You can navigate to the trace log using the Manage Tivoli Enterprise Monitoring Services dialog.

**Results**

In the trace log you find the following error messages that indicate the problem:
An error occurred requesting the workspace record for: REPORT, 117cael1a3ad

No workspace group was found for the given workspace type and id
At least one invalid parameter found, request has failed.

Here 117cael1a3ad is the wrong OBJECTID.

What to do next

You can correct the OBJECTID by either removing a typo or by determining the correct workspace ID of the new customized workspace (Step 3 on page 849).

Installing and configuring Tivoli Enterprise Portal

In this step, you install and configure Tivoli Enterprise Portal, Tivoli Enterprise Portal Server, and IBM Eclipse Help Server on the workstation.

Before you begin

You must install and configure the IBM Tivoli Monitoring components on z/OS before installing and configuring Tivoli Enterprise Portal. See “Enabling IBM Tivoli Monitoring” on page 374 for more information.

About this task

The entire OMEGAMON family of products uses the Tivoli Enterprise Portal, so the installation and configuration are not explained here. For detailed instructions, see the Tivoli Monitoring in the IBM Knowledge Center.

Adding Tivoli Data Warehouse

The configuration of your Tivoli Data Warehouse will vary, depending on the size of the environment, which database management systems you use, and which operating systems you use.

Before you begin

You must install and configure the IBM Tivoli Monitoring components on z/OS before adding Tivoli Data Warehouse. See “Enabling IBM Tivoli Monitoring” on page 374 for more information.

About this task

You can use the Tivoli Data Warehouse to store collected performance information for a long time. This is helpful when you want to compare DB2 activity that occurred in the past or when you want to review trends.

For detailed installation and configuration instructions, see Setting up data warehousing in the Monitoring section of the Tivoli Monitoring in the IBM Knowledge Center.

Installing and configuring end-to-end SQL or stored procedure monitoring

In this step, you install and configure end-to-end SQL or stored procedure monitoring on the workstation.
Before you begin

1. You must add end-to-end SQL or stored procedure monitoring support before installing and configuring end-to-end SQL or stored procedure monitoring. See "Enabling Performance Expert Client support, SQL Dashboard, or end-to-end SQL or stored procedure monitoring support" on page 373 for more information.

2. You must add port information for end-to-end SQL or stored procedure monitoring before installing and configuring end-to-end SQL or stored procedure monitoring. See “Specifying the port information for Performance Expert Client and/or end-to-end SQL or stored procedure monitoring” on page 394 for more information.

3. You must add additional DB2 traces before installing and configuring end-to-end SQL or stored procedure monitoring. See “Starting Additional DB2 Traces” on page 393 for more information.

4. In order to use stored procedure monitoring, you must enable it separately. See “Configuring Additional Monitoring Features” on page 394 for more information.

About this task

Installation and configuration of the InfoSphere Optim Performance Manager including the end-to-end SQL or stored procedure monitoring feature is documented in the InfoSphere Optim Performance Manager Installation Guide, Version 5.1.1 or higher. For more information on configuring the stored procedure monitoring feature, refer to the InfoSphere Optim Performance Manager Installation Guide, Version 5.1.1.1. For detailed instructions, see the IBM InfoSphere Optim Performance Manager in the Knowledge Center.

About this information

This information describes how to configure the component Buffer Pool Analyzer for z/OS (hereafter abbreviated to Buffer Pool Analyzer).

Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:

- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

Who should read this information

This information is written for database administrators (DBAs), system programmers, and system operators who are responsible for configuring Buffer Pool Analyzer.

To configure this program you should have a working knowledge of:

- Multiple Virtual Storage (MVS)
- Time Sharing Option (TSO)
- Interactive System Productivity Facility (ISPF)
- Job control language (JCL)
- Structured Query Language (SQL)
- z/OS
Installing Buffer Pool Analyzer Client

This topic describes how to install Buffer Pool Analyzer Client. It also explains how to start it. Buffer Pool Analyzer Client is required if you want to use the graphical user interface (GUI) of Buffer Pool Analyzer Client.

Note: IBM OMEGAMON for Db2 Performance Monitor on z/OS: From Version 5.4.0 Buffer Pool Analyzer is no longer a standalone option, it is only delivered as part of IBM OMEGAMON for Db2 Performance Expert on z/OS. If you want to update your client you must select IBM OMEGAMON for Db2 Performance Expert on z/OS.

Hardware requirements
The minimum hardware requirements to install and run Performance Expert Client are:

- A personal computer with Intel-based processor architecture, 400 MHz Pentium
- 512 MB RAM
- 390 MB (Windows 64-bit) disk space in the installation directory for the installation files
- 350 MB temporary space for running the installation program
- A high-resolution display unit of 1024 x 768 or higher
- For object placement, the following free memory:
  - 60 MB for up to 1000 objects
  - 220 MB for up to 100 000 objects
  - 500 MB for up to 200 000 objects
  where objects are table spaces and index spaces.

Recommendation: If you have installed only the minimum requirements, you should not run other applications at the same time.

Software requirements
The minimum software requirements to install and run Buffer Pool Analyzer Client are:

- One of the following Windows (x86, x86-64) versions:
  - Windows XP Professional Edition with Service Pack 2, including XP FDCC
  - Windows 7 Professional Edition and Ultimate Edition including FDCC
  - Optimization Service Center for DB2 for z/OS V1.1 or Optimization Service Center for DB2 for z/OS V1.2
  - TCP/IP installed on the workstation
  - One of the following web browsers:
    - Microsoft Internet Explorer V5 or later
- Netscape Navigator V7 or later
- Mozilla V1.5 or later
- Software programs to download files or code from z/OS, such as File Transfer Protocol (FTP) or IBM Personal Communications

**Installing the program files**

**About this task**

**Requirement:** You must have administration privileges to install Buffer Pool Analyzer Client.

After the installation completes successfully, you can start Buffer Pool Analyzer Client and use its functions from the DB2 Control Center.

**Downloading the program files of Buffer Pool Analyzer Client:** Both the initial version and later fixes for the program files for Buffer Pool Analyzer Client are available online. For download instructions, refer to the technote “OMPE: web-based delivery of updates for PE Workstation Client and PE Agent” on the IBM Software Support website. If needed, a direct link to the technote is included in the hold instructions of every PE Client PTF on the host. The available program build levels and fix descriptions are documented in the technote.

**Note:** The technote and website refer to the Performance Expert Client rather than the Buffer Pool Analyzer Client. However, these are the same. You chose at installation which product you want to install.

**Installing Buffer Pool Analyzer Client:**

After downloading the program files of Buffer Pool Analyzer Client, you can install them using the InstallAnywhere Wizard.

To begin installation, follow these steps:
- Verify that you have administration privileges.
- Download the program files of Buffer Pool Analyzer Client. See “Downloading the program files of Buffer Pool Analyzer Client” for more information.
- Close the DB2 Control Center before installing the Buffer Pool Analyzer Client program files.

To install the program files, follow these steps:
1. Verify that you have closed the DB2 Control Center. The DB2 Control Center must be closed before you start the client installation in order for the Control Center plugin to be installed properly.
2. Extract the files and directories from the compressed file(s) into the installation directory, for example, C:\PROGRAMS\IBM\BPACLIENT.
   The archives contain the following files and directories:
   - db2pe.client.*.exe
   - iehs*win.jar
   The InstallAnywhere Wizard starts, and the IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS V5 Setup window opens.
   If you did not close the DB2 Control Center before installing the plug-in then you might not be able to access the Buffer Pool Analyzer Client from the DB2 Control Center.
4. Click Next.
   The next IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS V5 Setup window shows the License Agreement.

5. To install Buffer Pool Analyzer Client, select I accept the terms of the license agreement, then click Next.
   The next IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS V5 Setup window opens. It lets you select the different clients.

6. Click Buffer Pool Analyzer Client, then click Next.
   The IBM DB2 Buffer Pool Analyzer V5 Setup window opens. It lets you specify the installation path.

7. To install the program files to the default destination folder, click Next. To install the program files to a different folder, click Browse and select another folder.
   The next IBM DB2 Buffer Pool Analyzer V5 Setup window opens.

8. Select the setup type that you prefer, then click Next.
   The next IBM DB2 Buffer Pool Analyzer V5 Setup window opens.

9. Check the summary information, then click Install.
   The program files are copied to the specified destination folder and the next IBM DB2 Buffer Pool Analyzer V5 Setup window opens. It shows summary information about the installation. It also shows the location of the log file.

10. Click Finish to exit the InstallAnywhere Wizard.

Starting Buffer Pool Analyzer Client

About this task

To start Buffer Pool Analyzer Client, follow one of these options:

- Click Start → Programs → IBM DB2 Buffer Pool Analyzer for z/OS → IBM DB2 Buffer Pool Analyzer for z/OS.
- Double-click the IBM DB2 Buffer Pool Analyzer for z/OS icon on your desktop.

Buffer Pool Analyzer Client is then started.

Related reading: For information about how to work with Buffer Pool Analyzer Client, refer to Buffer Pool Analyzer User’s Guide.

Configuration summary for Buffer Pool Analyzer

Follow the installation instructions in the Program Directory that is included with Buffer Pool Analyzer. After you install Buffer Pool Analyzer, you must configure the tool by using the instructions in this topic.

The SMP/E installation of Buffer Pool Analyzer is described in Program Directory for IBM OMEGAMON for Db2 Performance Expert on z/OS.

This topic describes how to configure the setup of Buffer Pool Analyzer. It also explains the mandatory or optional setup steps, and shows the corresponding authorizations that you need to perform each step.

Recommendation: The product image is installed from tape to the high-level qualifier hlqdb2pe. Before you start the configuration, you should create other data sets to which sample members are to be copied and where sample members are to be changed. This prevents your sample members from being overwritten, for example, when you install a program temporary fix (PTF).
Overview of the setup procedure for Buffer Pool Analyzer

The table in this section shows a typical configuration procedure for Buffer Pool Analyzer.

Table 81. Typical configuration procedure for Buffer Pool Analyzer

</tbody>
</table>
### Table 82. Required authorizations for setup steps (continued)

<table>
<thead>
<tr>
<th>Step</th>
<th>Authorization</th>
</tr>
</thead>
</table>
| “Step 2: Binding Buffer Pool Analyzer packages for DB2” on page 858 | The following DB2 privileges:  
  - BINDADD  
  - PACKADM on collection BPO540  
  - SELECT on the following catalog tables:  
    – SYSIBM.SYSINDEXES  
    – SYSIBM.SYSTABLESPACE  
  GRANT statements to support these authorizations are included in section 1 of the DDL member BPOAUTH. |
| “Step 3: Binding DB2 plan” on page 858 | The DB2 privilege BINDADD |
| “Step 4: Reviewing security requirements for Buffer Pool Analyzer” on page 858 | The following DB2 privileges:  
  - EXECUTE on the Buffer Pool Analyzer plan (K02PLAN)  
  - MONITOR1 privilege  
  - MONITOR2 privilege  
  - TRACE and DISPLAY privilege  
  - Resource Access Control Facility (RACF) administrator  
  - PCF administrator  
  GRANT statements to support these authorizations are included in section 2 of the DDL member BPOAUTH. |
| “Step 5: Changing the FPEJINIT EXEC” on page 858 | Authorizations required for these steps. |
| “Step 6: Configuring ISPF defaults” on page 859 |  |
| “Step 7: Adding Buffer Pool Analyzer to your ISPF environment” on page 860 |  |

### Step 1: Granting DB2 privileges for Buffer Pool Analyzer

This section explains how to grant DB2 privileges for Buffer Pool Analyzer.

**About this task**

You must perform this step for each DB2 subsystem for which you want to use Buffer Pool Analyzer.

To grant DB2 privileges, follow these steps:

**Procedure**

1. Run section 1 of the DDL member BPOAUTH.
2. Run the DDL member by using SQL Processor Using File Input (SPUFI) or an equivalent.

**What to do next**

Ensure that the SQL return code is 0 and that a commit is performed.
Step 2: Binding Buffer Pool Analyzer packages for DB2

This section explains how to bind Buffer Pool Analyzer packages for DB2.

About this task

You must perform this step for each DB2 subsystem for which you want to use Buffer Pool Analyzer.
1. Change the DB2 subsystem ID.
2. Change the DB2 high-level qualifier in the job BPOYBIND.
3. Run the job BPOYBIND.
4. Repeat this step.

Step 3: Binding DB2 plan

In this step you bind the plan for Buffer Pool Analyzer.

About this task

To bind the plan for Buffer Pool Analyzer, run the job BPOYPLAN for each DB2 subsystem for which you want to use Buffer Pool Analyzer.

Step 4: Reviewing security requirements for Buffer Pool Analyzer

Depending on your system software and the functions that you plan to use, you might have to change the existing security definitions.

About this task

To work with the Host Online Monitor, users need the following DB2 privileges:

EXECUTE
On the host online monitor plan (K02PLAN).

MONITOR1
Grants the privilege to obtain IFC data classified as serviceability data, statistics, accounting, and other performance data that does not contain potentially sensitive data.

MONITOR2
Grants the privilege to obtain IFC data classified as containing potentially sensitive data, such as SQL statement text and audit data. Note that users with MONITOR2 privileges have also MONITOR1 privileges.

TRACE and DISPLAY
For users who have to use the CRD function.

GRANT statements to support these authorizations are included in section 2 of the DDL member BPOYAUTH.

Step 5: Changing the FPEJINIT EXEC

About this task

To change the FPEJINIT EXEC, follow these steps:

Procedure
1. Copy the FPEJINIT EXEC from the target library hlqdb2pe.TKO2SAMP into a library that is in your EXEC library concatenation.
2. Change the corresponding lines in this EXEC. They are at the beginning of the
EXEC and are delimited by comments. These comments indicate the start and
the end of the section that you can change.

   checks = 1;
   rte_mode = 0;
   smpe_mode = 1;
   hlq2.1 = "hlq of SMP/E data sets";
   sclm_mode = 0;

where "hlq of SMP/E data sets" denote the names that you choose for the
SMP/E target libraries.

For example, if the libraries start with SYS1.DB2BPA, change the statement in
the following way:

   hlq2.1 = "SYS1.DB2BPA"

3. Save the updated FPEJINIT EXEC.

4. Optionally change the FPEJINIT EXEC after the installation verification
   procedure (IVP) completes successfully from checks = 1 to checks = 0.

What to do next

Requirement: If you want to use the Host Online Monitor, you must do the
following before you start your ISPF session:

- Allocate the DB2 load library corresponding to the version and release number
  of the DB2 subsystem to be monitored to ISPLLIB. You can also have the library
  in a STEPLIB, JOBLIB, or the system LNKLST concatenation.
- To test this EXEC, perform the installation verification procedures as described
  in “Verifying configuration and setup of Buffer Pool Analyzer” on page 861.

Step 6: Configuring ISPF defaults

BPOJVARs is a REXX EXEC in the library hlqdb2pe.TKO2SAMP that you can use
to configure defaults for the ISPF dialog.

About this task

To run this EXEC and configure ISPF defaults for Buffer Pool Analyzer, follow
these steps:

Procedure

1. Enter the following command in ISPF option 6 (TSO Command Processor) to
run the EXEC:

   EXEC 'hlqdb2pe.TKO2SAMP(BPOJVARs)'

   The following panel shows the parameters.

```
BPOJOPTS   IBM DB2 Buffer Pool Analyzer Customization

Complete fields as indicated, then press Enter.

Type requested names
z/OS subsystem name . . . DGOV
Load library . . . . . . . 'BP0540.TKANMOD'

Select option with '/'
/ Load library is in the system LNKLST concatenation

F1=Help  F2=Split  F9=Swap  F12=Cancel
```
2. Check the following parameters and configure them according to your needs:
   - z/OS subsystem name
   - Load library name
   - Load library in the system LNKLST concatenation

3. Complete the panel fields and press Enter.
   Message BPOJ0008 is displayed.
   In the following example, the name of the load library is changed. It is also specified that the load library is in the system LNKLST concatenation.

```
BPOJOPTS IBM DB2 Buffer Pool Analyzer Customization
Complete fields as indicated, then press Enter.

Type requested names
z/OS subsystem name ... DGOV
Load library ... 'SYS1.TKANMOD'

Select option with '/'
/ Load library is in the system LNKLST concatenation
```

F1=Help  F2=Split  F9=Swap  F12=Cancel

---

**Step 7: Adding Buffer Pool Analyzer to your ISPF environment**

This topic is intended primarily for DBAs working with ISPF and TSO systems.

**About this task**

You can add Buffer Pool Analyzer as an ISPF application to your environment.

To update the corresponding panels so that this ISPF application can be started, follow these steps:

**Procedure**

1. Select a panel that is available to all users, for example, the ISPF/PDF main menu ISR@PRIM.
2. Change the panel for the application.
   The associated ZSEL variable value for the application is CMD(%FPEJINIT).
3. Ensure that the new version of the FPEJINIT EXEC is available in the active EXEC library. FPEJINIT uses the TSO ALTLIB command to allocate and deallocate the EXEC library dynamically.

**Step 8: Optional. Adding Buffer Pool Analyzer to the DB2 Administration Tool launchpad**

**About this task**

**Requirement:** You must have system administrator privileges to perform this step.

To add Buffer Pool Analyzer to the DB2 Administration Tool launchpad, follow these steps:

**Procedure**

1. Edit the sample EXEC BPOADBI in the library hlqdb2pe.TKO2SAMP in the following way:
   a. Set the high-level qualifier of DB2 Admin data sets.
b. Set the name of the CLSIT/EXEC library, which contains the ADBDMTI exec.

c. Specify the ISPF statement to invoke Buffer Pool Analyzer.

2. Execute the EXEC BPOADBI.

Buffer Pool Analyzer is added to the launchpad.

Related reading: For more information about how to add an IBM DB2 tool for the launchpad, refer to DB2 Universal Database™ for z/OS Administration Guide.

Step 9: Optional. Installing Buffer Pool Analyzer Client

About this task

To use the graphical user interface (GUI), you must install Buffer Pool Analyzer Client. How to do this is described in “Installing Buffer Pool Analyzer Client” on page 853.

Verifying configuration and setup of Buffer Pool Analyzer

This topic contains a summary of the configuration and verification jobs. It also shows how to run a sample job to verify the configuration of Buffer Pool Analyzer.

Summary of configuration and verification jobs

The following table shows the configuration jobs that you can edit and run after the SMP/E installation is finished.

The SMP/E installation is described in Program Directory for IBM DB2 Buffer Pool Analyzer for z/OS.

<table>
<thead>
<tr>
<th>Job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPOYAUTH</td>
<td>Grant DB2 privileges for Buffer Pool Analyzer. Use the DDL member.</td>
</tr>
<tr>
<td>BPOYBIND</td>
<td>DB2 bind packages for Buffer Pool Analyzer.</td>
</tr>
<tr>
<td>BPOYPLAN</td>
<td>DB2 bind plan for Buffer Pool Analyzer.</td>
</tr>
<tr>
<td>BPOYAUTH</td>
<td>Review security requirements. Use the DDL member.</td>
</tr>
<tr>
<td>BPOJIVPA</td>
<td>Verifies the configuration of Buffer Pool Analyzer.</td>
</tr>
</tbody>
</table>

Running the sample verification job

You can run the verification job BPOJIVPA after the configuration is finished.

About this task

Data set hlqdb2pe.TKO2SAMP contains the sample job BPOJIVPA to help you verify the configuration.

Submit the job BPOJIVPA. This procedure causes the production of a report file. The expected return code is zero.

Final step

Verification of the configuration is now complete.

About this task

After the IVP completes successfully, move the updated FPEJINIT to a system EXEC or CLIST library so that the users can access it.
Chapter 4. Migrating

Migration considerations

Before migrating to OMEGAMON for DB2 PE V5.4.0, familiarize yourself with changed values for certain parameters.

This information applies to both migration scenarios, migrating from the Configuration Tool and migrating in PARMGEN. Values have changed for the following parameters in the PARMGEN profile for V5.4.0:

Table 84. Changed parameter values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>V5.1.0/V5.1.1 values</th>
<th>V5.2.0 values</th>
<th>V5.3.0 values</th>
<th>V5.4.0 values</th>
</tr>
</thead>
<tbody>
<tr>
<td>KD2_DBxx_DB2_VER</td>
<td>81, 91, 10</td>
<td>91, 10, 11</td>
<td>10, 11</td>
<td>10, 11, 12</td>
</tr>
<tr>
<td>KD2_PFxx_SQLPA_VERSION</td>
<td>3.1, 3.2, 4.1</td>
<td>4.1, 4.2</td>
<td>4.1, 4.2, 5.1</td>
<td>4.2, 5.1</td>
</tr>
<tr>
<td>KD2_PFxx_SQLPA_CF_ENBL</td>
<td>Y, N</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>GBL_DSN_DB2_LOADLIB_V10</td>
<td>N/A</td>
<td>DB2 load and run libraries</td>
<td>DB2 load and run libraries</td>
<td>DB2 load and run libraries</td>
</tr>
<tr>
<td>GBL_DSN_DB2_RUNLIB_V10</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>GBL_DSN_DB2_LOADLIB_V11</td>
<td>N/A</td>
<td>DB2 load and run libraries</td>
<td>DB2 load and run libraries</td>
<td>DB2 load and run libraries</td>
</tr>
<tr>
<td>GBL_DSN_DB2_RUNLIB_V11</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>GBL_DSN_DB2_LOADLIB_V12</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>DB2 load and run libraries</td>
</tr>
<tr>
<td>GBL_DSN_DB2_RUNLIB_V12</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

With OMEGAMON for DB2 PE V5.2.0, support for DB2 8 is dropped and support for DB2 11 is added. Thus, 81 is not a valid value anymore. With OMEGAMON for DB2 PE V5.3.0, support for DB2 9 is dropped. With OMEGAMON for DB2 PE V5.4.0, support for DB2 12 is added.

With OMEGAMON for DB2 PE V5.2.0, support for SQL Performance Analyzer (SQLPA) for V3.2 and V3.1 is dropped and support for V4.2 is added. Thus, 4.1 and 4.2 are the only valid values for this parameter. With OMEGAMON for DB2 PE V5.4.0, support for V4.1 is dropped. Thus, 4.2 and 5.1 are the only valid values for this parameter.

With OMEGAMON for DB2 PE V5.2.0, configuration support for SQLPA as part of OMEGAMON for DB2 PE configuration is dropped. Hence, you need to enable the use of an existing configuration with this parameter. You then need to specify the ANLP and ANLC members that you configured in SQLPA.

To configure the load and run libraries for DB2 10 monitoring, you need to specify them with these parameters. You find these parameters in the global parameter configuration profile $GBL$USR. If you do not see these parameters in this profile, then you can add them to the already existing LOADLIB and RUNLIB parameters for the other DB2 versions.

To configure the load and run libraries for DB2 11 monitoring, you need to specify them with these parameters. You find these parameters in the global parameter configuration profile $GBL$USR. If you do not see these parameters in this profile, then you can add them to the already existing LOADLIB and RUNLIB parameters for the other DB2 versions.

To configure the load and run libraries for DB2 12 monitoring, you need to specify them with these parameters. You find these parameters in the global parameter configuration profile $GBL$USR. If you do not see these parameters in this profile, then you can add them to the already existing LOADLIB and RUNLIB parameters for the other DB2 versions.
Table 84. Changed parameter values (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>V5.1.0/V5.1.1 values</th>
<th>V5.2.0 values</th>
<th>V5.3.0 values</th>
<th>V5.4.0 values</th>
</tr>
</thead>
<tbody>
<tr>
<td>GBL_DSN_DB2_LOADLIB_V8</td>
<td>DB2 load and run libraries</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>GBL_DSN_DB2_RUNLIB_V8</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

With OMEGAMON for DB2 PE V5.2.0, monitoring support for DB2 8 is dropped. Thus, these parameters are ignored during configuration.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>V5.1.0/V5.1.1 values</th>
<th>V5.2.0 values</th>
<th>V5.3.0 values</th>
<th>V5.4.0 values</th>
</tr>
</thead>
<tbody>
<tr>
<td>GBL_DSN_DB2_LOADLIB_V9</td>
<td>DB2 load and run libraries</td>
<td>DB2 load and run libraries</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>GBL_DSN_DB2_RUNLIB_V9</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

With OMEGAMON for DB2 PE V5.3.0, monitoring support for DB2 9 is dropped. Thus, these parameters are ignored during configuration.

Migrating from OMEGAMON for DB2 PE version 5.2.0 to version 5.4.0

Migrating from OMEGAMON for DB2 PE V5.2.0 to OMEGAMON for DB2 PE V5.4.0 requires you to upgrade several components by following these steps:

- “Installing the SMP/E”
- “Upgrading the runtime environment in PARMGEN” on page 873

The following steps must also be performed if you have installed the components:

- “Upgrading Tivoli Enterprise Monitoring Agent” on page 867
- “Upgrading the Performance Database” on page 868
- “Upgrading the Performance Expert Client” on page 870
- “Upgrading the Performance Expert Agent for DB2 Connect Monitoring” on page 870
- “Upgrading IBM Tivoli Monitoring components” on page 870
- “Migrating user-tailored report (UTR) layouts” on page 871

Installing the SMP/E

You can use a separate SMP/E CSI zone for the new version of OMEGAMON for DB2 PE, or you can use the same SMP/E CSI zone for both, the old and the new versions.

When installing the SMP/E, do the following:

- Follow the instructions in the program directory and check the PSP bucket for additional information. You find the program directory in the Knowledge Center of your product.
- Install the latest PTF for OMEGAMON for DB2 PE V5.4.0.

Using a separate SMP/E CSI zone for OMEGAMON for DB2 PE V5.1.0/V5.1.1 and OMEGAMON for DB2 PE V5.4.0

Install the SMP/E as you would for a new installation.

For more information, see migration scenario in the Common PARMGEN - Implementation scenarios.
Using the same SMP/E CSI zone for OMEGAMON for DB2 PE V5.1.0/V5.1.1 and OMEGAMON for DB2 PE V5.4.0

Use the instructions in the program directory, but consider that the SMP/E control statements of each FMID will control their acceptance and installation rules. For information about the FMIDs, see the following table:

*Table 85. Differences in the FMIDs in version 5.1.0, the FMIDs in version 5.1.1, and the FMIDs in version V5.4.0*

<table>
<thead>
<tr>
<th>V5.1.0 FMID</th>
<th>V5.1.1 FMID</th>

<td>N/A</td>
<td>HPMZ511</td>
<td>HPMZ540</td>
<td>Optim Performance Manager</td>
<td>No.</td>
<td>None</td>
</tr>
</tbody>
</table>

As a result of these FMID changes, the following will occur:

- FMID HKDB54X deletes the license keys for versions 4.1.0, 4.2.0, 5.1.0, or 5.1.1, 5.2.0 and 5.3.0 respectively.
- FMID HKDB540 deletes versions 4.1.0, 4.2.0, 5.1.0, 5.1.1, 5.2.0 and 5.3.0 respectively. HKDB540 cannot be installed in parallel in the same CSI.
- HKDS630, HKCI310, HKLV630, and HKOB730 delete earlier versions of the product. These FMIDs are shared with other OMEGAMON products. Consider the following overlapping activities:
  - You might have already installed some of the prerequisite PTFs. Identify which of the PTFs are prerequisites and check to see if they are installed.
  - These FMIDs will not reinstall if they were already installed with a different OMEGAMON product.
  - FMIDs HKDS630 and HKLV630 are shared with IBM Tivoli Monitoring V6.3.0. As a result, upgrades to IBM Tivoli Monitoring V6.3.0 can cause some upgrade activities to occur in some of the OMEGAMON components on the distributed side. Shared components such as Tivoli Enterprise Portal Server and Tivoli Enterprise Portal might be affected.
You might have already upgraded to IBM Tivoli Monitoring V6.3.0 if you have several OMEGAMON components installed. OMEGAMON for DB2 PE V5.3.0 and OMEGAMON DB2PM V5.3.0 also work with IBM Tivoli Monitoring V6.3.0.

Related information:
- IBM DB2 and IMS Tools PTF Listing
- New package versioning technote
- Tivoli Monitoring and OMEGAMON XE knowledge centers

Upgrading the runtime environment in PARMGEN

You need to upgrade your runtime environments so that they can be used in the new version.

About this task

For more information, see migration scenario in the Common PARMGEN - Implementation scenarios.

Note: Only valid for migration from V5.1.0 to V5.4.0: The Near-Term History Data Collector does not issue a START TRACE command to start flag IFCID 318 anymore. If you rely on this, you have to explicitly add this START TRACE command to option Specify Additional Traces when configuring your DB2 monitoring profile. See "Configuring Additional DB2 Traces" on page 393 for more information.

Note: For DB2 12, you must provide corresponding load and run libraries for using the version-specific libraries. As $GBL$USR is not updated during migration, you need to add the corresponding parameters manually. Add GBL_DSN_DB2_LOADLIB_V12 and GBL_DSN_DB2_RUNLIB_V12 to the list of DB2 system libraries, as shown below.

```
GBL_DSN_DB2_SDSNLOAD  "DSN.VAR1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V8  "DSN.V8R1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V9  "DSN.V9R1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V10  "DSN.VAR1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V11  "DSN.VBR1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V12  "DSN.VCR1M0.SDSNLOAD"
GBL_DSN_DB2_RUNLIB_V8  "DSN.V8R1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V9  "DSN.V9R1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V10  "DSN.VAR1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V11  "DSN.VBR1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V12  "DSN.VCR1M0.RUNLIB"
GBL_DSN_DB2_DSNEXIT  "DSN.VAR1M0.DSNEXIT"
```

Procedure

1. Alternative for recreating the BIND jobs:
   a. Copy the BIND sample jobs FPEVOMBD and FPEVOMBP from the $shilev.TKO2SAMP library to the $shilev.RKD2PRF library of the RTE.
   b. Rename the sample job FPEVOMBD to OMBDBID, and rename the sample job FPEVOMBP to OMBPDBID.
c. Submit the `&rhilev:RKD2PRF(CRTDB2M)` job. This will recreate all configured DB2 subsystem-related runtime members. This means that a BIND job for each configured DB2 subsystem will be created.

d. Continue with this step for both alternatives: For each DB2 subsystem you want to monitor, submit the BIND jobs `OMBP<ssid>` and `OMBD<ssid>` where `<ssid>` is the DB2 subsystem ID. If EXPLAIN is used, for each DB2 subsystem for which you want to use EXPLAIN, submit the BIND jobs `EXBP<ssid>` and `EXBD<ssid>` where `<ssid>` is the DB2 subsystem ID. For more information, see the [PARMGEN Alternative Configuration for IBM OMEGAMON and other Tivoli Management Services technote](#).

2. Repeat the above steps for each runtime environment.

**Related information:**

[New package versioning technote](#)

## Upgrading Tivoli Enterprise Monitoring Agent

If the upgraded runtime environment has a Tivoli Enterprise Monitoring Agent, you must also upgrade the Tivoli Enterprise Monitoring Agent.

### Procedure

Refer to the migration scenario in the [Common PARMGEN - Implementation scenarios](#).

## Upgrading the Performance Warehouse

If you created a Performance Warehouse for the earlier version, you must manually upgrade it for V5.4.0.

### Before you begin

If you start with the new version 5.4.0 of Performance Warehouse, you do not have to upgrade. Instead, do the following:

- Delete the existing Performance Warehouse database DB2PM from the old version and drop the plan DB2PM with its packages.
- If Performance Warehouse is enabled in the configuration, the OMEGAMON Collector of the new version automatically manages the bind of its packages in the plan DB2PM and creates the Performance Warehouse tables.

If you created a Performance Warehouse for the earlier version and want to use existing process definitions and executions, queries and rules of thumb, and data in Accounting tables you must manually upgrade it for V5.4.0.

**Note:** Data stored in Statistics tables cannot be migrated to the new version 5.4.0 due to major data model changes.

If Performance Warehouse is enabled, the new OMEGAMON Collector automatically detects that an old Performance Warehouse is in place and the task of the Performance Warehouse server is stopped.

### About this task

For upgrading Performance Warehouse, do the following:

1. Disconnect all workstation clients and stop the old or new OMEGAMON Collector, for which the Performance Warehouse is enabled.
2. Drop the table space STAT in the database DB2PM.
3. Start the new OMEGAMON Collector with newly created Performance Warehouse configuration and Performance Warehouse response file. The Collector should re-create the table space STAT (default: 32K table space; must be greater than 4K) and create the new Statistics tables. If this step fails, continue with step 5 otherwise continue with step 4.
4. Stop the task of the Performance Warehouse server by using the following console command: /F <started task>,F PESERVER,F <db2ssid>, PWH=N
5. Restart the task of the Performance Warehouse server in FORCE mode by using the following console command: /F <started task>,F PESERVER,F <db2ssid>, PWH=F.

What to do next

Note: After creation or upgrade of the Performance Warehouse tables, the table space STAT may be placed by DB2 in advisory REORG-pending (AREO*) status because of ALTER TABLE statements executed by the OMEGAMON Collector. A table space is in AREO* status because existing data is not immediately converted to its new definition. Reorganizing the table space prevents possible performance degradation.

Recommendation: When data is in REORG-pending or AREO* status, use the REORG utility with the SCOPE PENDING option to automatically reorganize partitions. With this option, you do not need to first identify which partitions need to be reorganized, or to customize the REORG control statement.

Related information:

Migrating statistics SQL queries
If you have created SQL queries they may not work anymore if they refer to storage-related data in the previous statistics GENERAL data. This data have been removed from the GENERAL table and can be accessed now in the statistics STORAGE table of the Performance Database. The queries must be rewritten according to the new data model.

Migrating statistics rules of thumb
If you have created rules of thumb they may not work anymore if they refer to storage-related data in the previous statistics GENERAL data. This data have been removed from the GENERAL table and can be accessed now in the statistics STORAGE table of the Performance Database. The rules of thumb must be rewritten according to the new data model.

Upgrading the Performance Database
If you created a Performance Database for the earlier version, you can partially upgrade it for V5.4.0.

About this task

Note: If possible, start with the new V5.4.0 of Performance Database tables, because many changes were applied to the data model between version V5.2.0 and V5.4.0.
If you start with V5.4.0 Performance Database tables, you do not have to upgrade the Performance Database. Instead, do the following:
- Use the sample CREATE and LOAD parts in library RKO2SAMP (RTE) and customize them according to your needs.
- If you work with Accounting and Statistics SAVE tables, use the SAVE file conversion utility that is shipped with version 5.4.0.

If you created a Performance Database for the earlier version and want to use the data stored in tables in the new version, you must manually upgrade it for version V5.4.0 by following these steps:

1. Request the current V5.3.0 library RKO2SAMP (RTE) library from IBM support.
2. Apply the migration steps of version V5.2.0 to version V5.3.0 as described in sub-chapter "Upgrading the Performance Database" of "Chapter 20. Migrating from OMEGAMON XE for DB2 PE version 5.2.0 to version 5.3.0" in IBM OMEGAMON for DB2 Performance Expert on z/OS IBM / OMEGAMON for DB2 Performance Monitor on z/OS Version 5.3.0 Configuration and Customization. Note that two new LOAD members DGOSLMGE and DGOSLMST are available in V5.3.0 library RKO2SAMP (RTE), that support the split and migration of statistics tables DB2PM_STAT_GENERAL and DB2PM_STAT_STORAGE.
3. Execute the ALTER TABLE statements (that apply to version V5.3.0) to add columns as listed in members (DGO*UPDB) in the V5.3.0 library RKO2SAMP (RTE).
4. Execute the ALTER TABLE statements (that apply to version V5.4.0) to add or drop columns as listed in members (DGO*UPDB) in the V5.4.0 library RKO2SAMP (RTE).
5. To populate the modified tables with new data, do the following:
   - Use the LOAD parts of the new version and change them according to your needs.
   - If you work with Accounting and Statistics SAVE tables, use the SAVE file conversion utility that is shipped with the new version.

Migrating data to new statistics tables
If you created a Performance Database for the earlier versions 5.1.0/5.1.1 and want to use the data stored in Accounting and Statistics tables in the new version, you must manually upgrade it for V5.3.0.

You do this by performing the migration steps for upgrading from versions 5.1.0/5.1.1 to V5.2.0 as documented in the Configuration and Customization Version 5.2.0 and performing the migration steps from V5.2.0 to V5.3.0 as described in the next chapter of this book.

Migrating statistics SQL queries
If you have tailored SQL queries they may no longer work if they refer to storage-related data in the previous statistics GENERAL data. This data resides now in the statistics STORAGE table. The queries must be rewritten according to the new data model.

Migrating statistics field selection lists of the Spreadsheet Input Data Generator
OMEGAMON for DB2 PE users can tailor the field selection lists delivered with the Spreadsheet Input Data Generator. V5.3.0 introduces a new table DB2PM_STAT_STORAGE which contains data that was previously stored in columns of table DB2PM_STAT_GENERAL. Accordingly, new field selection lists
for the spreadsheet utility are delivered for statistics general- and storage-related data. If you want to use your old field selection lists, they must be adjusted to the new data model.

It is strongly recommended to recreate the user-tailored field selection lists based on the sample lists delivered as members RKANSAMF/TKANSAMF(FPEP*) in the product library. Note that RKANSAMF/TKANSAMF is a new product library such the sample lists in this library can be used now as input by the Spreadsheet Input Data Generator (without copy step) if you do not want to customize the lists.

**Updating the Performance Expert Client**

You must upgrade to the new Performance Expert Client when you upgrade the server. The old Performance Expert Client does not work with the new server.

Follow the instructions for installing the Performance Expert Client. For detailed instructions for installing the Performance Expert Client, see ”Installing and configuring Performance Expert Client” on page 436.

When you double-click the .exe icon, you will be prompted to upgrade. Follow the prompts in the wizard. You do not need to uninstall the old version before beginning because the new version overwrites the old version. Subsystem definitions in the old Performance Expert Client are automatically imported into the new Performance Expert Client. You do not need to manually export and then import the definitions.

**Upgrading the Performance Expert Agent for DB2 Connect Monitoring**

Performance Expert Agent for DB2 Connect Monitoring must be updated manually to version V5.4.0 on each system.

**Before you begin**

**Note:** Configuration entries containing the DB2 Performance Expert for Linux, UNIX, and Windows server version 3.2.0 or later are still possible, but are no longer supported. They will be set to paused status during runtime.

**Procedure**

Manually upgrade the Performance Expert Agent for DB2 Connect Monitoring on each system. For detailed instructions, see ”Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 408 or ”Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 422.

**Upgrading IBM Tivoli Monitoring components**

IBM Tivoli Monitoring components such as Tivoli Enterprise Monitoring Server, Tivoli Enterprise Portal, and Tivoli Enterprise Portal Server must be upgraded so that the OMEGAMON for DB2 PE V5.4.0 Application Support works.
**Procedure**

1. Upgrade each of the IBM Tivoli Monitoring framework components to IBM Tivoli Monitoring V6.3.0. Personalized workspaces are automatically migrated during the upgrade. See the [Tivoli Monitoring in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter) for detailed instructions.

2. If you do not have self-describing agent capability configured, upgrade OMEGAMON for DB2 PE Application Support by using the V5.1.0 Consolidated DVD image. For detailed instructions, refer to the IBM Tivoli OMEGAMON XE Monitoring Agents on z/OS Quick Start Guide in the [Tivoli Monitoring in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter).

3. Set the attribute Product (two-letter code of a monitoring agent) to D5 or DP if necessary.
   
   a. In V5.1.1, the attribute Product in Tivoli Enterprise Monitoring Server table INODESTS has a value of DP for OMEGAMON for DB2 PE. In V5.1.0 and V4.2.0, this two-letter product code is D5. If you have a customized workspace or situation on Tivoli Enterprise Monitoring Server table INODESTS and filtering on the attribute Product that is set to D5, then you need to set the filtering to D5 or DP. If you only use OMEGAMON for DB2 PE V5.1.1, and neither V5.1.0 nor V4.2.0, this migration will not apply to you.
   
   b. The attribute Product in workspace Managed System Status will have a value of DP for OMEGAMON for DB2 PE V5.1.1, and D5 for V5.1.0 and V4.2.0. You can navigate to workspace Managed System Status from navigator item Enterprise. If you have a customized workspace based from workspace Managed System Status and filtering on the attribute Product set to D5, then you need to set it to D5 or DP.
   
   c. If you have a customized situation based from product-provided situation MS_Offline from All Managed Systems, and filtering on attribute Product set to D5, then you need to set it to D5 or DP.

**What to do next**

If you are upgrading from OMEGAMON for DB2 PE V5.1.0, V4.2.0, V4.1.0, or V3.1.0 and you want to run the OMEGAMON enhanced 3270 user interface, you need to re-configure the Tivoli Enterprise Monitoring Server.

**Related information:**

- [Tivoli Monitoring and OMEGAMON XE Knowledge Center](https://www.ibm.com/support/knowledgecenter)
- [IBM DB2 Tools Product Page](https://www.ibm.com/support/knowledgecenter)

**Migrating user-tailored report (UTR) layouts**

OMEGAMON for DB2 PE users can create and tailor their own accounting and statistics report layouts with the User-Tailored Reporting feature (UTR).

They can add and remove report blocks and fields within blocks and can change block and field labels according to their needs. The UTR functionality is described in the [Reporting User’s Guide](https://www.ibm.com/support/knowledgecenter) Customizing OMEGAMON XE for DB2 PE functions.

OMEGAMON for DB2 PE supports the migration of accounting and statistics report layouts created with previous releases. This means that ‘old’ layouts are identified and mapped to the internal representation of the new version such that a user-defined report is externalized similarly in version 5.4.0. **However, it is**
strongly recommended to recreate a user-tailored report layout always within the new version to avoid report mismatches due to semantic changes in the new version.

Migrating from OMEGAMON for DB2 PE version 5.3.0 to version 5.4.0

Migrating from OMEGAMON for DB2 PE V5.3.0 to V5.4.0 requires you to upgrade several components:

- "Installing the SMP/E"
- "Upgrading the runtime environment in PARMGEN" on page 873

The following steps must also be performed if you have installed the components:

- "Upgrading Tivoli Enterprise Monitoring Agent" on page 867
- "Upgrading the Performance Database" on page 876
- "Upgrading the Performance Expert Client" on page 870
- "Upgrading the Performance Expert Agent for DB2 Connect Monitoring" on page 870
- "Upgrading IBM Tivoli Monitoring components" on page 870
- "Migrating user-tailored report (UTR) layouts" on page 871

Installing the SMP/E

You can use a separate SMP/E CSI zone for the new version of OMEGAMON for DB2 PE, or you can use the same SMP/E CSI zone for both, the old and the new versions.

When installing the SMP/E, you must do the following:

- Follow the instructions in the program directory and check the PSP bucket for additional information. You can find the program directory in the Knowledge Center of your product.
- Install the latest PTF for OMEGAMON for DB2 PE V5.3.0.

Using a separate SMP/E CSI zone for OMEGAMON for DB2 PE V5.3.0 and OMEGAMON for DB2 PE V5.4.0

Install the SMP/E as you would for a new installation.

For more information, see migration scenario in the Common PARMGEN - Implementation scenarios.

Using the same SMP/E CSI zone for OMEGAMON for DB2 PE V5.3.0 and OMEGAMON for DB2 PE V5.4.0

You can use the instructions in the program directory, but consider that the SMP/E control statements of each FMID will control their acceptance and installation rules. For information about the FMIDs, see the following table.

Table 86. Differences in the FMIDs in version 5.3.0 and the FMIDs in version 5.4.0

<table>
<thead>
<tr>
<th>V5.3.0 FMID</th>
<th>V5.4.0 FMID</th>

</tr>
<tr>
<td>HKOB623</td>
<td>HKOB730</td>
<td>OMNIBASE</td>
<td>Yes. Addition of new functions.</td>
<td>All OMEGAMON products</td>
</tr>
</tbody>
</table>

As a result of these FMID changes, the following will occur:

- FMID HKDB54X deletes the license keys for versions 4.1.0, 4.2.0, 5.1.0, or 5.1.1, 5.2.0 and 5.3.0 respectively.
- FMID HKDB540 deletes versions 4.1.0, 4.2.0, 5.1.0, 5.1.1, 5.2.0 and 5.3.0 respectively. HKDB530 cannot be installed in parallel in the same CSI.
- HKDS630, HKCI310, HKLV630, and HKOB730 delete earlier versions of the product. These FMIDs are shared with other OMEGAMON products. Consider the following overlapping activities:
  - You might have already installed some of the prerequisite PTFs. Identify which of the PTFs are prerequisites and check to see if they are installed.
  - These FMIDs will not reinstall if they were already installed with a different OMEGAMON product.
  - FMIDs HKDS630 and HKLV630 are shared with IBM Tivoli Monitoring V6.3.0. As a result, upgrades to IBM Tivoli Monitoring V6.3.0 can cause some upgrade activities to occur in some of the OMEGAMON components on the distributed side. Shared components such as Tivoli Enterprise Portal Server and Tivoli Enterprise Portal might be affected.
  - You might have already upgraded to IBM Tivoli Monitoring V6.3.0 if you have several OMEGAMON components installed. OMEGAMON for DB2 PE V5.3.0 and OMEGAMON DB2PM V5.3.0 also work with IBM Tivoli Monitoring V6.3.0.

- [Tivoli Monitoring and OMEGAMON XE knowledge center](#)

**Upgrading the runtime environment in PARMGEN**

You need to upgrade your runtime environments so that they can be used in the new version.
About this task

For more information, see the migration scenario in the [Common PARMGEN - Implementation scenarios](#).

**Note:** For DB2 12, you must provide corresponding load and run libraries for using the version-specific libraries. As $GBL$USR is not updated during migration, you need to add the corresponding parameters manually. Add `GBL_DSN_DB2_LOADLIB_V12` and `GBL_DSN_DB2_RUNLIB_V12` to the list of DB2 system libraries, as shown below.

GBL_DSN_DB2_SDSNLOAD "DSN.VAR1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V8 "DSN.V8R1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V9 "DSN.V9R1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V10 "DSN.VAR1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V11 "DSN.VBR1M0.SDSNLOAD"
GBL_DSN_DB2_LOADLIB_V12 "DSN.VCR1M0.SDSNLOAD"
GBL_DSN_DB2_RUNLIB_V8 "DSN.V8R1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V9 "DSN.V9R1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V10 "DSN.VAR1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V11 "DSN.VBR1M0.RUNLIB"
GBL_DSN_DB2_RUNLIB_V12 "DSN.VCR1M0.RUNLIB"
GBL_DSN_DB2_DSNEXIT "DSN.VAR1M0.DSNEXIT"

**Procedure**

1. **Alternative for recreating the BIND jobs:**
   a. Copy the BIND sample jobs FPEVOMB and FPEVOMP from the `&shilev:TKO2SAMP` library to the `&rhlxv.RKDO2PRF` library of the RTE.
   b. Rename the sample job FPEVOMB to OMBDDBID, and rename the sample job FPEVOMP to OMBPDBID.
   c. Submit the `&rhlxv.RKDO2PRF(CRTDB2M)` job. This will recreate all configured DB2 subsystem-related runtime members. This means that a BIND job for each configured DB2 subsystem will be created.
   d. Continue with this step for both alternatives: For each DB2 subsystem you want to monitor, submit the BIND jobs OMBP<ssid> and OMBD<ssid> where `<ssid>` is the DB2 subsystem ID. If EXPLAIN is used, for each DB2 subsystem for which you want to use EXPLAIN, submit the BIND jobs EXBP<ssid> and EXBD<ssid> where `<ssid>` is the DB2 subsystem ID. For more information, see the [PARMGEN Alternative Configuration for IBM OMEGAMON and other Tivoli Management Services technote](#).

2. Repeat the steps above for each runtime environment.

**Related information:**

[New package versioning technote](#)

**Upgrading Tivoli Enterprise Monitoring Agent**

If the upgraded runtime environment has a Tivoli Enterprise Monitoring Agent, you must also upgrade the Tivoli Enterprise Monitoring Agent.

**Procedure**

Refer to the migration scenario in the [Common PARMGEN - Implementation scenarios](#).
Upgrading the Performance Warehouse

If you created a Performance Warehouse for the earlier version, you must manually upgrade it for V5.4.0.

Before you begin

If you start with the new version 5.4.0 of Performance Warehouse, you do not have to upgrade. Instead, do the following:

- Delete the existing Performance Warehouse database DB2PM from the old version and drop the plan DB2PM with its packages.
- If Performance Warehouse is enabled in the configuration, the OMEGAMON Collector of the new version automatically manages the bind of its packages in the plan DB2PM and creates the Performance Warehouse tables.

If you created a Performance Warehouse for the earlier version and want to use existing process definitions and executions, queries and rules of thumb, and data in Accounting tables you must manually upgrade it for V5.4.0.

Note: Data stored in Statistics tables cannot be migrated to the new version 5.4.0 due to major data model changes.

If Performance Warehouse is enabled, the new OMEGAMON Collector automatically detects that an old Performance Warehouse is in place and the task of the Performance Warehouse server is stopped.

About this task

For upgrading Performance Warehouse, do the following:

1. Disconnect all workstation clients and stop the old or new OMEGAMON Collector, for which the Performance Warehouse is enabled.
2. Drop the table space STAT in the database DB2PM.
3. Start the new OMEGAMON Collector with newly created Performance Warehouse configuration and Performance Warehouse response file. The Collector should re-create the table space STAT (default: 32K table space; must be greater than 4K) and create the new Statistics tables. If this step fails, continue with step 5 otherwise continue with step 4.
4. Stop the task of the Performance Warehouse server by using the following console command: /F <started task>, F PESERVER, F <db2ssid>, PWH=N
5. Restart the task of the Performance Warehouse server in FORCE mode by using the following console command: /F <started task>, F PESERVER, F <db2ssid>, PWH=F.

What to do next

Note: After creation or upgrade of the Performance Warehouse tables, the table space STAT may be placed by DB2 in advisory REORG-pending (AREO*) status because of ALTER TABLE statements executed by the OMEGAMON Collector. A table space is in AREO* status because existing data is not immediately converted to its new definition. Reorganizing the table space prevents possible performance degradation.

Recommendation: When data is in REORG-pending or AREO* status, use the REORG utility with the SCOPE PENDING option to automatically reorganize partitions. With this option, you do not need to first identify which partitions need
to be reorganized, or to customize the REORG control statement.

**Related information:**

[New package versioning technote](#)

**Migrating statistics SQL queries**
If you have created SQL queries they may not work anymore if they refer to storage-related data in the previous statistics GENERAL data. This data have been removed from the GENERAL table and can be accessed now in the statistics STORAGE table of the Performance Database. The queries must be rewritten according to the new data model.

**Migrating statistics rules of thumb**
If you have created rules of thumb they may not work anymore if they refer to storage-related data in the previous statistics GENERAL data. This data have been removed from the GENERAL table and can be accessed now in the statistics STORAGE table of the Performance Database. The rules of thumb must be rewritten according to the new data model.

**Upgrading the Performance Database**
If you created a Performance Database for version V5.3.0, you can partially upgrade it for V5.4.0.

**About this task**

If you start with the V5.4.0 version of Performance Database tables, you do not have to upgrade the Performance Database. Instead, follow these steps:

- Use the sample CREATE and LOAD parts in library RKO2SAMP (RTE) and customize them according to your needs.
- If you work with Accounting and Statistics SAVE tables, use the SAVE file conversion utility that is shipped with the new version of OMEGAMON for DB2 PE.

If you created a Performance Database for the earlier version and want to use the data stored in tables in the new version, you must manually upgrade it for version V5.4.0:

1. Request the current V5.3.0 library RKO2SAMP (RTE) library from IBM support.
2. Execute the ALTER TABLE statements (that apply to version V5.3.0 and have not been executed so far) to add columns as listed in members (DGO*UPDB) in the V5.3.0 library RKO2SAMP (RTE).
3. Execute the ALTER TABLE statements (that apply to version V5.4.0) to add or drop columns as listed in members (DGO*UPDB) in the V5.4.0 library RKO2SAMP (RTE).
4. To populate the modified tables with new data, do the following:
   - Use the LOAD parts of the new version and change them according to your needs.
   - If you work with Accounting and Statistics SAVE tables, use the SAVE file conversion utility that is shipped with the new version.

**Migrating data to new statistics tables**
If you created a Performance Database for the earlier V5.2.0 and want to use the data stored in Statistics tables in the new version, you must manually upgrade it for V5.3.0.
• You do this by executing the ALTER TABLE statements to add new columns to statistics tables as listed in the member RKO2SAMP(DGOSUPDB) (RTE).

• V5.3.0 introduces a new table DB2PM_STAT_STORAGE which contains data that was previously stored in columns of table DB2PM_STAT_GENERAL. Old general data can be migrated to the new tables by unloading the data and modifying the load statement generated by the UNLOAD utility. The load statement must be split into two statements which populate the new tables according to your customized table definitions.

To populate the new tables with new data, do the following:

• Use the LOAD parts of the new version and change them according to your needs.

• If you work with Statistics SAVE tables, use the SAVE file conversion utility that is shipped with the new V5.3.0 or convert the SAVE data directly with the SAVE CONVERT command.

During the life cycle of V5.3.0, new columns might be added to the Performance Database tables. Corresponding ALTER TABLE statements would be delivered in the DGO*UPDB members of the sample library RKO2SAMP (RTE) where * is A for Accounting, S for Statistics, W for System Parameters, and X for Audit.

Note: After execution of ALTER TABLE statements, DB2 might place the table space that contains the modified data in advisory REORG-pending (AREO*) status. A table space is in AREO* status because existing data is not immediately converted to its new definition. Reorganizing the table space prevents possible performance degradation.

When data is in REORG-pending or AREO* status, use the REORG utility with the SCOPE PENDING option to automatically reorganize partitions. With this option, you do not need to first identify which partitions need to be reorganized, or to customize the REORG control statement.

Migrating statistics SQL queries

If you have tailored SQL queries they may no longer work if they refer to storage-related data in the previous statistics GENERAL data. This data resides now in the STORAGE table. The queries must be rewritten according to the new data model.

Migrating statistics field selection lists of the Spreadsheet Input Data Generator

OMEGAMON for DB2 PE users can tailor the field selection lists delivered with the Spreadsheet Input Data Generator. V5.3.0 introduces a new table DB2PM_STAT_STORAGE which contains data that was previously stored in columns of table DB2PM_STAT_GENERAL. Accordingly, new field selection lists for the spreadsheet utility are delivered for statistics general- and storage-related data. If you want to use your old field selection lists, they must be adjusted to the new data model.

It is strongly recommended to recreate the user-tailored field selection lists based on the sample lists delivered as members RKANSAMF/TKANSAMF(FPEP*) in the product library. Note that RKANSAMF/TKANSAMF is a new product library such the sample lists in this library can be used now as
input by the Spreadsheet Input Data Generator (without copy step) if you do not want to customize the lists.

**Updating the Performance Expert Client**
You must upgrade to the new Performance Expert Client when you upgrade the server. The old Performance Expert Client does not work with the new server.

Follow the instructions for installing the Performance Expert Client. For detailed instructions for installing the Performance Expert Client, see [“Installing and configuring Performance Expert Client” on page 436](#).

When you double-click the .exe icon, you will be prompted to upgrade. Follow the prompts in the wizard. You do not need to uninstall the old version before beginning because the new version overwrites the old version. Subsystem definitions in the old Performance Expert Client are automatically imported into the new Performance Expert Client. You do not need to manually export and then import the definitions.

**Upgrading the Performance Expert Agent for DB2 Connect Monitoring**
Performance Expert Agent for DB2 Connect Monitoring must be updated manually to version V5.4.0 on each system.

**Before you begin**

*Note:* Configuration entries containing the DB2 Performance Expert for Linux, UNIX, and Windows server version 3.2.0 or later are still possible, but are no longer supported. They will be set to *paused* status during runtime.

**Procedure**

Manually upgrade the Performance Expert Agent for DB2 Connect Monitoring on each system. For detailed instructions, see [“Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on Windows” on page 408](#) or [“Installing and configuring Performance Expert Agent for DB2 Connect Monitoring on UNIX and Linux” on page 422](#).

**Upgrading IBM Tivoli Monitoring components**
IBM Tivoli Monitoring components such as Tivoli Enterprise Monitoring Server, Tivoli Enterprise Portal, and Tivoli Enterprise Portal Server must be upgraded so that the OMEGAMON for DB2 PE V5.4.0 Application Support works.

**Procedure**

1. Upgrade each of the IBM Tivoli Monitoring framework components to IBM Tivoli Monitoring V6.3.0. [Personalized workspaces are automatically migrated during the upgrade. See the Tivoli Monitoring in the IBM Knowledge Center](#) for detailed instructions.
2. If you do not have self-describing agent capability configured, upgrade OMEGAMON for DB2 PE Application Support by using the V5.1.0 Consolidated DVD image. For detailed instructions, refer to the IBM Tivoli OMEGAMON XE Monitoring Agents on z/OS Quick Start Guide in the Tivoli Monitoring in the IBM Knowledge Center.
3. Set the attribute Product (two-letter code of a monitoring agent) to D5 or DP if necessary.
   
a. In V5.1.1, the attribute Product in Tivoli Enterprise Monitoring Server table INODESTS has a value of DP for OMEGAMON for DB2 PE. In V5.1.0 and V4.2.0, this two-letter product code is D5. If you have a customized workspace or situation on Tivoli Enterprise Monitoring Server table INODESTS and filtering on the attribute Product that is set to D5, then you need to set the filtering to D5 or DP. If you only use OMEGAMON for DB2 PE V5.1.1, and neither V5.1.0 nor V4.2.0, this migration will not apply to you.

b. The attribute Product in workspace Managed System Status will have a value of DP for OMEGAMON for DB2 PE V5.1.1, and D5 for V5.1.0 and V4.2.0. You can navigate to workspace Managed System Status from navigator item Enterprise. If you have a customized workspace based from workspace Managed System Status and filtering on the attribute Product set to D5, then you need to set it to D5 or DP.

c. If you have a customized situation based from product-provided situation MS_Offline from All Managed Systems, and filtering on attribute Product set to D5, then you need to set it to D5 or DP.

What to do next

If you are upgrading from OMEGAMON for DB2 PE V5.1.0, V4.2.0, V4.1.0, or V3.1.0 and you want to run the OMEGAMON enhanced 3270 user interface, you need to re-configure the Tivoli Enterprise Monitoring Server.

Migrating user-tailored report (UTR) layouts

OMEGAMON for DB2 PE users can create and tailor their own accounting and statistics report layouts with the User-Tailored Reporting feature (UTR).

They can add and remove report blocks and fields within blocks and can change block and field labels according to their needs. The UTR functionality is described in the [Reporting User’s Guide](#) Customizing OMEGAMON XE for DB2 PE functions.

OMEGAMON for DB2 PE supports the migration of accounting and statistics report layouts created with previous releases. This means that ‘old’ layouts are identified and mapped to the internal representation of the new version such that a user-defined report is externalized similarly in version 5.4.0. However, it is strongly recommended to recreate a user-tailored report layout always within the new version to avoid report mismatches due to semantic changes in the new version.

The Accounting Save-File Utility

Use the Save-File utility to migrate and convert Accounting Save data sets into a format suitable for OMEGAMON for Db2 PE V5.4.0.

The function performed is specified in a parameter on the EXEC command.
Migrating Data Sets

This topic describes how to migrate Accounting Save data sets created by OMEGAMON for Db2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON for Db2 PE V5.4.0.

To migrate Accounting Save data sets:
1. Create a VSAM data set for V520 or V530.
2. Define an OMEGAMON for Db2 PE V5.4.0 VSAM data set using IDCAMS as output.
3. Use the MIGRATE function of the Save-File utility to migrate the data sets of OMEGAMON for Db2 PE V5.2.0 or V5.3.0.
4. Restore the migrated VSAM data sets in V540 and compare the reports.

The RKO2SAMP library provides the sample job DGOPJAMI, which you can modify to suit your installation.

Note:
- You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.
  To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.
- Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

Converting Data Sets

To store performance data in Performance Database tables or spreadsheets, you must first convert Accounting Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON for Db2 PE.

You can use the CONVERT function of the Accounting Save-File Utility to convert Accounting Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets. The RKO2SAMP library provides the sample job DGOPJACO, which you can modify to suit your installation.

You can also use the ACCOUNTING SAVE subcommand with the CONVERT option to convert and save reduced data into a sequential data set. The output of this subcommand option is a sequential data set, that is specified and requested in SYSIN. The data set attributes are:

**Organization**
- PS

**Record format**
- VB

**Record length**
- 9072

**Block size**
- 9076
For more information about the ACCOUNTING SAVE subcommand refer to Report Command Reference.

The following list shows the types of records that are created by the CONVERT function (or CONVERT command option) and where to find their layout descriptions in the sample library RKO2SAMP:

- General data records (DGOADSGE)
- Buffer pool data records (DGOADSBU)
- Distributed Data Facility (DDF) data records (DGOADSDF)
- Group buffer pool records (DGOADSGP)
- Package records (DGOADSPK)
- Resource Limit Facility (RLF) records (DGOADSRF)
- Accelerator records (DGOADSXC)

For more information about the Spreadsheet Input-Data Generator refer to Reporting User’s Guide.

Save-File Utility DD Statements

This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.

**Input**

The DDNAME of the input data set. This can be an OMEGAMON for Db2 PE V5.2.0 or V5.3.0 Accounting SAVE data set for the MIGRATE function, or an OMEGAMON for Db2 PE V5.4.0 Accounting VSAM Save data set for the CONVERT function.

**Output**

The DDNAME of the output data set.

For CONVERT, allocate the data set with the following characteristics:

RECFM  
  VB  
LRECL  
  9072  
BLKSIZE  
  9076

Refer to “OMEGAMON for Db2 PE VSAM Data Sets” on page 4647 for details on how to specify the allocated data sets to migrate to OMEGAMON for Db2 PE V5.4.0.

**DPMLOG**

OMEGAMON for Db2 PE command processor messages and messages indicating exceptional processing conditions are written to DPMLOG. If DPMLOG is not specified, it is dynamically allocated to the SYSOUT message class of the job. Allocate the data set with the following attributes:

RECFM  
  FBA
The Statistics Save-File Utility

Use the Save-File utility to migrate and convert Statistics Save data sets into a format suitable for OMEGAMON for Db2 PE V5.4.0.

The function performed is specified in a parameter on the EXEC command.

Migrating Data Sets

This topic describes how to migrate Statistics Save data sets created by OMEGAMON for Db2 PE V5.2.0 or V5.3.0 into the record format of OMEGAMON for Db2 PE V5.4.0.

To migrate Statistics Save data sets:
1. Create a VSAM data set for V520 or V530.
2. Define an OMEGAMON for Db2 PE V5.4.0 VSAM data set using IDCAMS as output.
3. Use the MIGRATE function of the Save-File utility to migrate the data sets of OMEGAMON for Db2 PE V5.2.0 or V5.3.0.
4. Restore the migrated VSAM data sets in V540 and compare the reports.

The RKO2SAMP library provides the sample job DGOPJSMI, which you can modify to suit your installation.

Note:
- You can only process VSAM data sets in the same version of OMEGAMON for Db2 PE as they have been created. For example, if you create a SAVE data set in version 530, it can only be RESTORED in version 530.

To use a SAVE data set in a higher version, you must migrate the SAVE data set using a migration utility.
- Before you restore or convert SAVE data sets from V5.2.0 or V5.3.0, you must first migrate this data to OMEGAMON for Db2 PE V5.4.0 format.
- Restored reports only show fields that are supported by the current version of OMEGAMON for Db2 PE.

Converting Data Sets

To store performance data in Performance Database tables or spreadsheets, you must first convert Statistics Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets that can be used by the DB2 load utility or the Spreadsheet Input-Data Generator of OMEGAMON for Db2 PE.

You can use the CONVERT function of the Statistics Save-File Utility to convert Statistics Save data sets of OMEGAMON for Db2 PE V5.4.0 into sequential data sets. The RKO2SAMP library provides the sample job DGOPJSCO, which you can modify to suit your installation.
You can also use the STATISTICS SAVE subcommand with the CONVERT option to convert and save reduced data into a sequential data set. The output of this subcommand option is a sequential data set, that is specified and requested in SYSIN. The data set attributes are:

**Organization**
- PS

**Record format**
- VB

**Record length**
- 9072

**Block size**
- 9076

For more information about the STATISTICS SAVE subcommand refer to Report

Command Reference

The following list shows the types of records that are created by the CONVERT function (or CONVERT command option) and where to find their layout descriptions in the sample library RKO2SAMP:
- General data records (DGOSDGEN)
- Buffer Pool data records (DGOSDBUF)
- DDF data records (DGOSDDDF)
- Group Buffer Pool records (DGOSDGBP)
- Buffer Pool data set records (DGOSDSET)
- Accelerator data records (DGOSDXCL)
- Aggregated Accounting data records (DGOSDACC)
- Storage data records (DGOSDSTG)

For more information of the Spreadsheet Input-Data Generator refer to Reporting

User’s Guide

**Save-File Utility DD Statements**

This topic lists the DD statements needed for migration and conversion. All of the DD statements described here are required.

**Input**

The DDNAME of the input data set. This can be an OMEGAMON for Db2 PE V5.2.0 or V5.3.0 Statistics Save data set for the MIGRATE function, or an OMEGAMON for Db2 PE V5.4.0 Statistics VSAM Save data set for the CONVERT function.

**Output**

The DDNAME of the output data set.

For CONVERT, allocate the data set with the following characteristics:

RECFM
- VB

LRECL
- 9072
Refer to "OMEGAMON for Db2 PE VSAM Data Sets" on page 4647 for details on how to specify the allocated data sets to migrate to OMEGAMON for Db2 PE V5.4.0.

**DPMLOG**

OMEGAMON for Db2 PE command processor messages and messages indicating exceptional processing conditions are written to DPMLOG. If DPMLOG is not specified, it is dynamically allocated to the SYSOUT message class of the job. Allocate the data set with the following attributes:

**RECFM**
- FBA

**LRECL**
- 133

**BLKSIZE**
- 6251
Chapter 5. Monitoring

This section provides information about the monitoring components.

Classic interface

This information describes the real time online monitor of the following products:
- IBM OMEGAMON for Db2 Performance Expert on z/OS
- IBM OMEGAMON for Db2 Performance Monitor on z/OS

It contains illustrations and descriptions of the real time panels of the product's classic interface. This includes the Application Trace Facility panels and the panels that display near-term history data information.

Note: This information describes the online monitoring functions that are accessible through the OMEGAMON classic user interface (also called the VTAM interface). Until equivalent functions become accessible through the OMEGAMON classic user interface, you might still have to refer to Monitoring Performance from ISPF.

For the most current version of this publication, always check the following websites:
- OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)
- OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)

The product often provides context-related online help information that can be invoked from menus, panels, and windows by using the F1 key or the Help button. Online help information is not necessarily repeated in this information, especially if it is very detailed information that is of interest only when you actively work with a function. You are encouraged to use F1 or Help to see the entire available information.

Who should read this information

This information is intended for IBM data server professionals who want to analyze and tune the performance of a Db2 database management system.

Product overview

OMEGAMON XE for DB2 PE is a software performance monitor for the IBM product Database 2 (DB2). It includes a realtime and a near-term history monitoring component to give you a comprehensive view of your DB2 subsystem.

Realtime component

The realtime component consists of a realtime monitor that you can use to monitor DB2.

It provides a classic user interface, with conventional menus and panels to facilitate navigation through the product. Through these menus and panels you
can access the most current DB2 performance data, like thread use, locking conflicts, SQL calls, and so on. They also enable you to start and view an application trace to obtain realtime information about application flow and resource consumption.

**Near-term history component**

The near-term history component consists of the Near-Term History Data Collector, which gathers statistical and accounting information (including distributed database information), and limited performance information from a DB2 subsystem and stores it in VSAM data sets or sequential files, as the activities occur.

Use the near-term history panels to view statistics and thread information that was gathered a few minutes or a few hours ago and to view the current Near-Term History Data Collector specifications.

**Introduction to product main menus and options**

This topic introduces the OMEGAMON XE for DB2 PE menus and options.

OMEGAMON XE for DB2 PE provides access to its realtime and near-term history functions through menus. The menus described in this topic are the ones you see when you start OMEGAMON XE for DB2 PE.

You can always press F1 (Help) on the menus and panels to obtain detailed information about the subject currently displayed.

When you start OMEGAMON XE for DB2 PE from ISPF (start EXEC FPEJINIT), you are presented with the following main menu:

```
FPEFMENU       IBM OMEGAMON for DB2 Performance Expert on z/OS

Select one of the following.

1. Create and execute reporting commands
2. View online DB2 activity - Classic Interface
3. View online DB2 activity - PE ISPF OLM
4. Maintain parameter data sets
5. Customize report and trace layouts
6. Exception profiling

Command ===>  F1=Help   F2=Split   F3=Exit   F9=Swap   F12=Cancel
```

This menu provides access to the OMEGAMON XE for DB2 PE functions. The following topics briefly describe the available options.

**Note:** The following remarks apply to most menus and panels:

- Some menu options or panels might not be available, depending on the installation and configuration options that were chosen at your location.
- The command line and PF keys usage follows usual ISPF conventions and is not described in this information. For more information, see Monitoring Performance from ISPF.
- If the PF key F11 (Zoom) is indicated in the upper right corner of a panel, you can usually select a particular listed item (by positioning the cursor on the corresponding line) and press F11, which then displays additional or detail information about the selected item.
• Several panels can highlight information to raise your attention to important information, for example, to thresholds that exceed predefined values. If panels provide highlighting capabilities, the potentially highlighted fields are described, together with reasons, in the relevant topics under the heading “Highlighting”. If this heading is not shown in a panel description, the panel does not provide highlighting.

• OMEGAMON XE for DB2 PE supports 64-bit integers. A number can have one of the following suffixes:
  - **K** Represents 1000 or 1024.
  - **M** Represents 1000 x 1000, or 1024 x 1024.
  - **G** Represents 1000 x 1000 x 1000, or 1024 x 1024 x 1024.
  - **T** Represents 1000 x 1000 x 1000 x 1000, or 1024 x 1024 x 1024 x 1024.
  - **?** Indicates that the number is larger than T.

**Create and execute reporting commands**

This menu option navigates to the Interactive Report Facility (IRF), where you can interactively specify reports and create and execute the corresponding batch report command stream, which then generate the requested report.

The Interactive Report Facility (IRF) is an alternative to creating batch report command streams by using the ISPF editor. The IRF is described in the *Reporting User’s Guide*.

**View online DB2 activity - Classic Interface**

Select this menu option to navigate to the OMEGAMON XE for DB2 PE Classic Interface panel, where you can specify certain parameters and log on to the Classic Interface Realtime Monitor.

**Logging on to the Classic Interface:**

Before you can log on to the Classic Interface Realtime Monitor, you must specify or change several parameters.

If you have selected the View online DB2 activity - Classic Interface menu option, the following panel is displayed:

```plaintext
-KO2MPSPF------ Invoke OMEGAMON XE for DB2 PE Classic Interface -------------------

Specify Classic Interface parameters:

DB2 subsystem ID ===> SDAZ  VTAM APPLID ===> IPAUD2C
User profile ===> #P  Logical rows ===> 999 (24-9999)

Optionally, specify an immediate RETURN PF key to immediately close the Classic Interface Realtime Monitor and return to the OMEGAMON XE for DB2 PE main menu. This overrides the default (00) Classic Interface PF key.

RETURN PF key ===> 00

Enter L to Logon to Classic Interface Realtime Monitor. Enter END to exit.

Command ===> F1=Help  F3=Exit  F12=Cancel
```
Before you can log on to the Classic Interface Realtime Monitor, you must specify or change the following parameters.

**DB2 subsystem ID**
The identifier of the DB2 subsystem to be monitored.

**VTAM APPLID**
The VTAM application ID to be used for the session.

**User profile**
The member of the user profile to be used for the session.

**Logical rows**
The number of logical rows to be used for the session.
If you encounter problems when browsing larger data sets, increase this value.

**RETURN PF key**
You can specify a PF key to immediately close the Classic Interface Realtime Monitor and return to the OMEGAMON XE for DB2 PE main menu. This PF key can be used from any of the following VTAM session panels, regardless of the menu depth. The default definition (00) requires that you close each VTAM session panel separately with F3 (Exit).

Type L on the command line and press Enter to log on.

**Directly logging on to the Classic Interface from native VTAM:**

You can also log on to the Classic Interface Realtime Monitor from native VTAM.

If you prefer to start an OMEGAMON session directly from native VTAM, you can enter the following logon command, including parameters, in a VTAM panel.

```
LOGON APPLID(applid)
```

```
LOGON APPLID(applid)
```

```
DATA(DB2=ssid, LROWS=log_rows, USER=profile)
```

**applid**
The VTAM APPLID specified to OBVTAM when it was started.

**ssid**
The identifier of the DB2 subsystem to be monitored. If not specified, the subsystem identifier that was established during configuration is used.
If NONE is specified instead of a ssid identifier, or if the specified or default DB2 subsystem is not up or does not exist, you are navigated to the Redirect Monitoring to Another DB2 panel; in this panel, you can view the status of available subsystems and choose a different one.

**log_rows**
The number of logical rows to be used for the session. If not specified, the default number is 255.

**profile**
The member of the user profile to be used. If not specified, the default profile is #P.
The Classic Interface main menu:

After a successful log on, use the Classic Interface main menu to select a function and navigate through subsequent menus and panels.

After a successful log on, the following menu is displayed:

```
ZMENU  VTM  02  V540.4P DA41 S 11/04/13 8:57:28 2
> Help/News/Index PF1  Exit PF3  PF Keys PF5
> Type a selection letter at the left end of the top line and press ENTER.

===============================================================================
MENU  OMEGAMON CLASSIC INTERFACE -- REALTIME MAIN MENU
  S  SUMMARY  ............  Summary of DB2 activity
  E  EXCEPTIONS  ..........  Current or potential system problems
  T  THREAD ACTIVITY ......  Thread activity information
  U  THREAD ACTIVITY ......  Thread activity information by package
  L  LOCKING CONFLICTS ....  Locking conflict information
  R  RESOURCE MANAGERS ....  Resource manager, other DB2 subsystem information
  A  APPLICATION TRACE ....  Trace and view application activity
  D  DISTRIBUTED DATA ......  Distributed database system information
  O  OBJECT ANALYSIS ......  Object and volume information
  G  DB2 CONNECT SERVER ...  DB2 Connect/Gateways with connection to DB2
  C  MVS CONSOLE ...........  MVS console to issue commands and view messages
  B  DB2 CONSOLE ...........  DB2 console to issue commands and view messages
  M  MISCELLANEOUS .........  Address space information, OMEGAMON commands, etc.
  P  PROFILE ...............  Customize OMEGAMON session and exception settings
  H  HISTORY ...............  Near-Term History information
  V  SQL PA REPORTS........  View SQL PA reports
  Z  OTHER DB2 .............  Redirect monitoring to another DB2
===============================================================================
```

The following options are available from this menu:

**SUMMARY**

This option displays a summary of critical system-wide DB2 activity and resource utilization.

For more information, see “Summary” on page 896.

**EXCEPTIONS**

This option lists current exceptions that have exceeded their threshold conditions and might indicate a current or potential system problem.

For more information, see “Exceptions” on page 902.

**THREAD ACTIVITY (by plan time)**

This option lists activity information of all threads with non-blank plan name (ordered by thread plan time).

For more information, see “Thread Activity” on page 921.

**THREAD ACTIVITY (by package)**

This option lists activity information of threads with non-blank packages only that are currently connected to DB2 (ordered by thread elapsed time).

For more information, see “Thread Activity” on page 921.

**LOCKING CONFLICTS**

This option lists existing locking contentions.

For more information, see “Locking Conflicts” on page 1086.

**RESOURCE MANAGERS**

This option provides access to information about resource managers, such as Buffer Manager, Log Manager, Bind Statistics, and others.
APPLICATION TRACE
This option provides access to the Application Trace Facility (ATF).
For more information, see “Application Trace Facility (ATF)” on page 1341.

DISTRIBUTED DATA
This option lists Distributed Data Facility (DDF) related information.
For more information, see “Distributed Data Facility” on page 1388.

OBJECT ANALYSIS
This option lists allocation-related object and volume information at the database level.
For more information, see “Object Analysis” on page 1394.

DB2 CONNECT SERVER
This option lists DB2 Connect Servers that serve as DB2 Connect gateways to the selected DB2 subsystem.
For more information, see “DB2 Connect Server” on page 1430.

MVS CONSOLE
This option provides access to the MVS system console, where you can issue commands and view messages.
For more information, see “MVS System Console and Message Traffic” on page 899.

DB2 CONSOLE
This option provides access to the DB2 system console, where you can issue commands and view messages.
For more information, see “DB2 System Console and Message Traffic” on page 1024.

MISCELLANEOUS
This option provides access to information about address spaces and permits to issue OMEGAMON commands.
For more information, see “Address Space Information” on page 1439 and “OMEGAMON Commands” on page 1452.

PROFILE
This option provides access to the Profile Maintenance Menu, where you can customize sessions, set exception thresholds, and maintain installation- and user-specific profiles.
For more information, see “Profile Maintenance Facility” on page 1486.

HISTORY
This option navigates to the Near-Term History Information menu, where you can work with near-term history statistics information and near-term thread information. You can also view the current specifications about the Near-Term History Data Collector.
For more information, see “Near-term history information” on page 1518.

SQL PA REPORTS
This option provides access to various SQL Performance Analyzer (SQL PA) reports about current SQL performance.
For more information, see “SQL Performance Analyzer Reports” on page 1703.

OTHER DB2
This option permits to redirect monitoring to another DB2 subsystem.
For more information, see “Redirect Monitoring to Another DB2” on page 900.

For detailed information about this panel and on subsequent panels, press F1 (Help). If applicable, place the cursor in an entry field for specific field help.

Switching among DB2 subsystems and data sharing group members:

It is often necessary to monitor a subsystem that is different from the one you specified when you logged on to the Classic Interface Realtime Monitor. Several panels in the Classic Interface are enabled to switch the subsystem, the member of a data sharing group, or even a data sharing group without the necessity for leaving the Classic interface for a re-logon to a different subsystem.

On panels that are enabled for switching, the top row provides a slightly modified layout, with two fields serving as input fields. The following Thread Activity panel is an example. The two fields of interest are emphasized for the discussion.

<table>
<thead>
<tr>
<th>Meanings and usages of the input fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>The field showing the currently monitored DB2 subsystem (here DA41) allows for switching to a different subsystem by entering a different DB2 subsystem name.</td>
</tr>
<tr>
<td>The accompanying indicator shows S for a single DB2 subsystem or a member of a data sharing group, or G for a data sharing group.</td>
</tr>
<tr>
<td>Invalid DB2 subsystem or data sharing group names cause an error message.</td>
</tr>
<tr>
<td>The 3270 Tab key can be used to navigate the cursor from the command area to the DB2 subsystem field.</td>
</tr>
</tbody>
</table>
If a panel is not enabled for switching, both fields serve as display fields. No input is possible.

**View online DB2 activity - PE ISPF OLM**

This menu option navigates to the Online Monitor Main Menu, where you can access the IBM DB2 Performance Expert ISPF Online Monitor.

**Note:** The IBM DB2 Performance Expert ISPF Online Monitor is described in *Monitoring Performance from ISPF*. It is kept available until an equivalent function is provided by the OMEGAMON XE for DB2 PE Classic Interface.

**Maintain parameter data sets**

This menu option navigates to the Data Set Maintenance menu, where you can maintain exception thresholds, correlation translations, time zone information, and MAINPACK definitions.

If this option is selected, the following menu is displayed:

```
Data Set Maintenance Menu
Select one of the following.
  1. Maintain exception thresholds
  2. Maintain correlation translations
  3. Maintain time zone information
  4. Maintain MAINPACK definitions

Exception data set

DPMPARMS data set

Command ===>
F1=Help    F2=Split    F3=Exit    F6=History    F9=Swap    F12=Cancel
```

On this menu, you can customize certain DB2 monitoring parameters by modifying parameters in an Exception Threshold data set and in defined members of the DPMPARMS data set. These data sets must be allocated before they can be edited.

**Maintain exception thresholds**

Use this option to edit exception thresholds in the Exception Threshold data set.

Exception reporting identifies DB2 threads and statistics intervals that have fields with values outside the thresholds specified in the Exception Threshold data set. Exception processing is available in batch Accounting and Statistics report sets and in the Online Monitor thread and statistics functions.

**Maintain correlation translations**

Use this option to edit correlation translation data in the CORRDATA member of the DPMPARMS data set.

The correlation ID is a 12-byte field within the DB2 correlation header of the instrumentation trace records that is used to identify the task being executed by DB2.

The correlation ID contains different information about the task depending on the type of connection. For this reason, OMEGAMON XE for DB2 PE
provides a correlation translation data set, which is used to divide the correlation ID into a correlation name and a correlation number as follows:

**CORRNAME**
Correlation name, which translates to the first eight bytes of the correlation ID.

**CORRNMBR**
Correlation number, which translates to the last four bytes of the correlation ID, padded out with 4 blanks.

**Note:** The correlation translation data set is only required for two-phase-commit environments such as CICS and IMS.

**Maintain time zone information**
Use this option to edit the time zone information in the LOCDATA member of the DPMPARMS data set member.

The time zone information is used to adjust differences in the times of the data to be reported. Adjust the times if:
- The CPU clock of your MVS system is not set to the local time, but you want to use the local time in your reports.
- You want to generate reports or traces that show activity at more than one location and the CPU clock settings of the locations are different.
  This is often the case when the locations are in different time zones.

When you have entered the time zone information to the DPMPARMS data set member, you can use the TIMEZONE option of the GLOBAL command to adjust the times used in reporting.

**Maintain MAINPACK definitions**
Use this option to edit MAINPACK definitions in the MAINPACK member of the DPMPARMS data set member.

In the Accounting report set you can use the MAINPACK identifier to distinguish plans according to the packages they contain. You can define certain aspects of the MAINPACK identifier:
- Whether the first or the last package executed within a plan is used as the MAINPACK.
- Whether you want to use the package ID, the collection ID, or the location name of the package as the value of the identifier. In the case of a DBRM, the program name is always used.

You can specify different MAINPACK definitions for data from different environments and from different plans.

**Exception data set**
Use this field to specify the name of your Exception Threshold data set. The data set must be preallocated and cataloged before you can edit it.

To specify the data set, enter any fully qualified name by enclosing it in apostrophes. If you omit the apostrophes, your TSO prefix is appended to the data set name.

If you want to use a new Exception Threshold data set, it must be allocated using the following attributes:

**DSORG**
A data set organization of PS (sequential).

**RECFM**
A record format of VB or V.
LRECL
A record size of at least 255.
BLKSIZE
The block size must be at least 4 bytes more than LRECL.

DPMPARMS data set
Use this field to specify the name of your DPMPARMS data set. Any modifications you make to time zone specifications, correlation translation, or to the MAINPACK identifier definition are recorded in the individual members of the DPMPARMS data set.

The data set must be preallocated and cataloged before you can edit it.

To specify the data set, enter any fully qualified name by enclosing it in apostrophes. If you omit the apostrophes, your TSO prefix is appended to the data set name.

If you want to use a new DPMPARMS data set, it should be allocated using the following attributes:

DSORG
A data set organization of PO (partitioned).
RECFM
A record format of FB or F.
LRECL
A record size of 80.
BLKSIZE
A block size that can be any multiple of LRECL.

For detailed information about this panel and on subsequent panels, press F1 (Help). If applicable, place the cursor in an entry field for specific field help.

Customize report and trace layouts
This menu option navigates to the User-Tailored Reporting Layout Generation panel, where you can tailor Accounting and Statistics report and trace layouts.

If this option is selected, the User-Tailored Reporting Layout Generation panel is displayed:

```
User-Tailored Reporting Layout Generation

Select one of the following report set functions and then enter the DPMPARMS data set to be used.

1. Accounting report
2. Statistics report
3. Accounting trace
4. Statistics trace

DPMPARMS data set

Command ==> F1=Help  F2=Split  F3=Exit  F6=History  F9=Swap  F12=Cancel
```

In this panel, you can choose one of the sample layouts to be used as a basis for your own Accounting or Statistics report or trace layout. All layouts must be based on the sample layouts. For example, to tailor your own Accounting report layout, select Accounting report from this panel. In the subsequent panels, you can choose whether you want to base your report on the short or long sample layout and
define blocks of information and individual fields to be added on your layout. You can also delete blocks of information and fields from the sample layout and change the labels of fields.

When you have finished customizing your report or trace layout, it is saved to the DPMPARMS data set that you specify in this panel.

For detailed information about this panel and on subsequent panels, press F1 (Help). If applicable, place the cursor in an entry field for specific field help.

**Exception Profiling**
This menu option navigates to the Exception Profiling panel, where you profile exception settings, such as thresholds settings, input data sets to be used, and reports to be generated.

If this option is selected, the Exception Profiling panel is displayed:

```
Exception Profiling

Complete the following control information, then press Enter.

Warning exceptions . . . . . . . . . . . . . . . ( % of input data)
Problem exceptions . . . . . . . . . . . . . . . ( % of input data)
Produce profile report . . . . . . . . . . . . . (1=yes 2=no)

Input data set
______________________________________________
Input threshold data set
______________________________________________
Output threshold data set
______________________________________________
Output report data set
______________________________________________

Command =>>>  F1=Help  F2=Split  F3=Exit  F6=History  F9=Swap  F12=Cancel
```

In this panel, you can specify the required data sets and profiling criteria that are required to calculate the thresholds in an Exception Threshold data set. A report that shows the details of the distribution and the expected number of exceptions for each field can also be produced. The panel contains the following fields:

- **Warning exceptions**
  You can specify the percentage of input data that is to trigger a warning.

- **Problem exceptions**
  You can specify the percentage of input data that is to trigger a problem.

- **Produce profile report**
  You can specify whether you want to produce a profile report containing details about each field. The profile report includes a table of expected number of exceptions for various threshold entries.

- **Input data set**
  Specify the name of the data set containing data from your DB2 subsystem. The data set can be a GTF, SMF, or DPMOUT data set. The records in this data set should be representative of the type of data that you usually monitor. The input data should also contain a sufficient number of records
to enable the profiling to be performed with reasonable accuracy. The data should also cover an appropriate span of time.

**Input threshold data set**
Specify the name of the data set that contains entries for the fields you want checked. It can be one of the Exception Threshold data sets provided in SDGOSAMP or your own data set.

**Output threshold data set**
Specify the name of the data set that the calculated threshold values are to be written to.

**Output report data set**
Specify the name of the data set that will contain the profile report (if requested).

**Summary**
Select this main menu option for summary and overview information of current DB2 activity and DB2 connections.

For more system-related information, see “Resource Managers and Other DB2 Subsystem Information menu” on page 1110.

**Summary of DB2 Activity**
This panel provides an overview of current DB2 activities and resource utilization, along with summaries of DB2 connection activities (grouped by connection types IMS, CICS, TSO, batch, utilities, distributed, and stored procedures).

<table>
<thead>

</tr>
</tbody>
</table>

Navigation

For additional information about
- a connection type, move the cursor to the connection line and press F11 (Zoom).
- other topics, use the PF keys.

Fields

**DB2 summary information**: All rate information is computed by dividing the reported value by the elapsed time since the previous OMEGAMON XE for DB2 PE cycle. For example, OMEGAMON XE for DB2 PE computes the synchronous Read I/O rate by dividing the number of synchronous Read requests since the previous OMEGAMON XE for DB2 PE cycle by the elapsed time since the previous cycle.

**SSAS+DBAS+ IRLM+DIST CPU**

The CPU rate (percent) used by these DB2 address spaces. It includes both TCB and SRB time. DB2 use of cross memory services causes the majority of DB2 CPU time to be attributed (by SRM) to the user’s address space. Therefore, the CPU value does not include DB2 CPU time attributed to the user’s address space as a result of cross memory services use. For more information, see "Analyzing DB2 CPU Usage".

**Thread Commit Rate**

The number of Commits per second.
Create Thread Rate
The number of Create Thread requests per second.

Thread Signon Rate
The number of Thread Signon requests per second. Thread signon processing is only applicable in the CICS and IMS DB2 attachment environments.

Synch Read I/O Rate
The number of synchronous Read I/Os per second.

Prefetch Req Rate
The number of Sequential Prefetch and List Prefetch requests per second.

Update Request Rate
The number of Update requests per second. The Update count is incremented each time a row in a page is updated.

Write I/O Rate
The number of Write I/Os per second. Write I/O is normally performed asynchronously. Updated pages are queued by the data set until written. Updated pages are physically written using the DB2 Deferred Write algorithm.

Getpages/Read I/O
The Getpage to Read I/O ratio. This value helps in measuring read and buffer pool efficiency. The value is computed by dividing the total number of Getpage requests by the total number of synchronous read I/O requests since the last OMEGAMON XE for DB2 PE cycle.

Pages/Write I/O
The average number of pages written per Write I/O. This value is computed by dividing the number of pages written by the number of Write I/Os since the last OMEGAMON XE for DB2 PE cycle.

Current Lock Suspensions
The current number of threads that are waiting because of a lock request issued for a resource that is unavailable.

Locking Timeouts
The number of locking timeouts since DB2 was started. Timeouts occur because lock requests were suspended for a time in excess of the locking timeout value.

Locking Deadlocks
The number of locking deadlocks that occurred since DB2 was started. Deadlocks are a result of locking contention.

Locking Escalations
The number of lock escalations that occurred since DB2 was started. This count includes the number of escalations to both shared and exclusive modes.

DB2 connection information: A summary of connection information by DB2 connection type.

Connection Type
A single line is displayed for each DB2 connection type.

Connections
The number of active connections originating from the connection type. For
Distributed, it is the count of remote DB2 connections in which the DB2 subsystem being monitored has active DB2-to-DB2 system conversations. For remote DB2 subsystems and in Data Sharing Group mode, this field is marked as not available (N/A).

**Threads**
The number of active threads that are originating from the connection type. This number includes active parallel task threads that are initiated by threads that are originating from the connection type. For Distributed, it is the number of active database access threads that are active on the DB2 subsystem being monitored.

**CPU**
The total CPU rate (percent) attributable to the connection type. For non-CICS connection types, this value is the total CPU rate of all address spaces within the connection type with active threads. For CICS connections, this value is the total CPU rate attributable to all active threads originating from CICS connections. For more information about CPU use, see "Analyzing DB2 CPU Usage". For remote DB2 subsystems and in Data Sharing Group mode, this field is marked as not available (N/A).

**Getpage Rate**
The total Getpage rate per second for active threads originating from the connection type.

**Elapsed Time**
The average elapsed time for an active thread within the connection type. This value is computed by adding the elapsed time of all active threads within the connection type and dividing it by the total number of active threads.

**MVS System Console and Message Traffic**
Use this panel to issue MVS commands and to display MVS console messages.
This panel might require special authorization before you can enter DB2
commands. Type /PWD on the top line of the panel, enter a valid password when
requested, then press Enter. Then follow the instructions to issue DB2 commands.

Navigation

For additional information about other topics, use the PF keys.

Commands

OCMD

After you type an MVS command and press Enter, OMEGAMON XE for
DB2 PE displays a message that indicates whether the command was
issued successfully. See the output of the MVS messages below CONS to
see the results of the command you issued. For information about valid
MVS commands, see z/OS MVS System Commands.

CONS Determines the ID of the console buffer to display.

line10 Displays the last nn lines of the output buffer for the MVS operator
console. Here, it displays the last 10 lines.

Redirect Monitoring to Another DB2

Use this panel to change the DB2 system you are monitoring or to redirect
OMEGAMON XE for DB2 PE to a restarted DB2 system.

In this panel you can redirect OMEGAMON to another DB2 subsystem in one of
the following ways:

- Place the cursor on the line of the DB2 subsystem that you want to monitor and
  press F11.
- Enter the name of the DB2 subsystem after RL06.

The OMEGAMON logon panel is displayed. Press ENTER to start a new session.
For the new session, the current user profile is used.
If you do not want to redirect to another DB2 system, press PF3 to return to the Main Menu.

**Navigation**

For additional information about

- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- other topics, use the PF keys.

**Fields**

**Name**  The name of the DB2 subsystem.

**Command Prefix**  The name of the DB2 command prefix.

**Scope**  The scope for the command prefix. Possible values are:

- **S**  The indicated DB2 subsystem is a single subsystem that is not a member of a data sharing group.
- **M**  The indicated DB2 subsystem is a member of a data sharing group.
- **M***  The indicated DB2 subsystem is a member of a data sharing group and controls the DB2 Connect monitoring for the group (the subsystem is the current DB2 Connect group-scope monitoring master, abbreviated as “DB2C Master”).

When the PE Server subtask acting as DB2C Master terminates, the value changes from M* to M and DB2 Connect data is no longer monitored.

If another PE Server subtask in the data sharing group takes over DB2 Connect monitoring and becomes the new DB2C Master:

- The value changes from M to M*.
- The name of the DB2 subsystem now acting as the new DB2C Master is shown on the corresponding DB2 Connect panels.

**Note:** During the transition of the DB2C Master role (which might take several minutes) DB2 Connect data cannot be monitored, no DB2 subsystem is marked as DB2C Master, and on corresponding DB2 Connect panels the name of the DB2C Master is shown as N/A.

**Group Attach**  The group attachment name, used for data sharing. This field is blank if the DB2 subsystem is not defined as a member of a data sharing group.

**Ver**  The version of the DB2 subsystem is displayed if the DB2 subsystem is active.

**Status**  The following values are possible

- **Active**  DB2 subsystem is active.
- **Not Active**  DB2 subsystem is not active.
- **Unreachable**  Unable to connect to the DB2 subsystem.
Unsupported
DB2 lower than version 10 or higher than version 12 is not supported.

Restricted
DB2 is in restricted access mode.

Wait RRS
DB2 is waiting for RRS connection.

LPAR The logical partition (LPAR) defined for your system.

Usable
An indication whether the resources defined for your system can be used.
If a DB2 subsystem has not been fully configured for monitoring or is not active, it will be indicated as No.

Exceptions
Select this main menu option for exception information of thread, CICS, IMS, and DB2 system activity that OMEGAMON XE for DB2 PE has found to be outside specified thresholds.

OMEGAMON XE for DB2 PE continually monitors the system for problems related to threads, CICS, IMS, and DB2 system operation. If a condition goes above or below a user-specified threshold or if an unexpected condition occurs (an exception is said to have tripped), OMEGAMON XE for DB2 PE displays a corresponding message. You can access online recommendations for tripped exceptions by using F10 (Recommendations).

Because each system is different, adjust the exception thresholds to reflect potential DB2 performance problems for your site. For more information, see "Profile Maintenance Facility" on page 1486.

Exception Messages
These panels show exception information about a selected group of exceptions. Use these panels to select a different exception group (All, Thread, CICS, IMS, or DB2 System) or to obtain information about the status of the currently selected exception group. Online recommendations for exceptions are accessible through F10 (Recommendation).

The following Exception Messages panel is an example for all exceptions. The panels for Thread, CICS, IMS, or DB2 System exceptions look similar.
You can select a different exception group as required.

- **Option A (All exceptions)** displays all groups (Thread, CICS, IMS, System) alphabetically, ordered by group. Groups are separated by headers.

- If you select option **B (Thread exceptions)**, OMEGAMON XE for DB2 PE identifies the thread to which the exceptions apply, and displays all exceptions that have been tripped for that thread.

- If option **C (CICS exceptions)** is selected, OMEGAMON XE for DB2 PE provides information about exceptional conditions occurring within the CICS/DB2 attachment of CICS regions connected to DB2.

- If you select option **D (IMS exceptions)**, OMEGAMON XE for DB2 PE provides information about exceptional conditions occurring within the IMS/DB2 attachment of IMS dependent and control regions connected to DB2.

- If you select option **E (DB2 System)**, OMEGAMON XE for DB2 PE provides information about the current condition of DB2 system resources and functions, including DB2 connections and threads, buffer management, log management, and locking.

If you select **F (Status)**, OMEGAMON XE for DB2 PE displays the Current Status for Exceptions panel for the currently selected exception group (the group displayed in Exception Messages panel). For more information, see the description of panel "Current Status for Exceptions".
Navigation

For additional information about
• an exception, move the cursor to the exception line and press F11 (Zoom).
• exception recommendations, move the cursor to the exception line and press F10 (Recommendation).
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Each of the exceptions on the Exception Messages panel has the following default characteristics:
• Bell=OFF
• Boxchar=NO BOX
• Boxclr=NONE
• Boxattr=NONE
• Display=CLR3
• Attribute=NONE
• ExNcyc=0
• Stop=0
• Cumulative=0
• Auto=OFF
• Log=OFF
• Limit=200
• Repeat=YES
• Persist=1

To change a characteristic of any exception, see "Profile Maintenance Facility".

A description of possible exceptions (arranged in alphabetical order) follows:

ARCM
Thread backout processing is waiting for an archive tape mount.

OMEGAMON XE for DB2 PE displays the ARCM exception when a thread is waiting for a tape mount. DB2 requires the archive tape mount during abort processing to backout changes made in the current unit of recovery. The thread does not do any processing until the tape is mounted, and holds DB2 resources until the abort request is complete.

ARCM is a member of the thread (TH) exception group. This exception monitors an action, not a value; its threshold is always N/A. The default state for ARCM is ON. If State is ON and a DB2 thread is waiting for a tape mount of an archive log, OMEGAMON XE for DB2 PE displays the exception.

ARCV
A DB2 recovery log archive is currently waiting for a tape mount.

A tape mount is necessary if DB2 recovery log archiving is to tape. Log data set archiving is an automatic feature of the DB2 log manager. Log archiving is initiated internally by DB2 when an active log is full. It runs as a subtask within the DB2 subsystem, and as a result, no job or started task is initiated.
ARCV is a member of the DB2 system (SY) exception group. This exception monitors an action, not a value; its threshold is always N/A. The default state for ARCV is ON. If State is ON and an archive is waiting for a tape mount, OMEGAMON XE for DB2 PE displays the exception.

BMTH

Warns that a particular buffer pool has exceeded a user-specified percentage of its capacity. This exception can also warn that use of the buffer pool has reached one of three DB2 buffer manager thresholds: SPTH, DMTH, or IWTH.

When the percentage is below 90%, you get the basic exception message, assuming that you have set the threshold at 90% or lower. This message simply reports the percentage of use for any buffer pool that has reached the threshold value.

When the buffer pool used percentage is between 90% and 94.9%, inclusive, the exception message will include the information that the buffer pool has reached the Sequential Prefetch threshold (SPTH).

When the buffer pool used percentage is between 95% and 97.5%, inclusive, the exception message will include the information that the buffer pool has reached the Data Manager threshold (DMTH).

When the buffer pool used percentage exceeds 97.5%, the exception message will include the information that the buffer pool has reached the Immediate Write threshold (IWTH).

BMTH is a member of the system (SY) exception group. The default threshold is 90%.

Note: To be notified when each of the buffer manager thresholds is reached, set the BMTH threshold to 90% or less.

CICT

Provides thread use information for an individual CICS region.

CICT is a member of the CICS (CI) exception group. The default threshold for CICT is 80% of the THRDMAX value in the Resource Control Table (RCT). The threshold can be any value from 1% through 100%. If the ratio of active CICS threads to the THRDMAX value exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

COMT

Ratio of updates to commits is greater than \textit{nnn:n}.

OMEGAMON XE for DB2 PE displays the COMT exception when the number of system page updates per Commit exceeds the installation-defined threshold.

The update count used in the rate calculation is incremented each time a row in a page is updated.

COMT is a member of the thread (TH) exception group. Default threshold for COMT is 100 page updates to 1 commit. The threshold can be any value from 1 through 10,000. If the ratio of updates to commits exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

CTHD

Application is waiting for thread creation.

This is caused when the system maximum thread limit is reached (CTHREAD parameter). CTHD is a member of the thread (TH) exception group. This exception monitors an action, not a value; its threshold is
always N/A. If State is ON and a user is waiting for thread creation, OMEGAMON XE for DB2 PE displays the exception.

**DDFS** Reports when DDF is not active.

OMEGAMON XE for DB2 PE displays the DDFS exception when it detects that the Distributed Database Facility (DDF) is not active in the DB2 subsystem being monitored. This might be because DSNZPARM specifies that DDF must be started manually; it might also reflect an abnormal termination of the distributed database facility.

DDFS is a member of the system (SY) exception group. This exception monitors an action, not a value; its threshold is always N/A.

**DRCV**

Monitors the VTAM APPC receive rate.

OMEGAMON XE for DB2 PE displays the DRCV exception when the DDF VTAM receive data rate exceeds the exception threshold.

DRCV is a member of the system (SY) exception group. The exception threshold rate is expressed as KB per second. The default threshold for DRCV is 1000 KB per second.

**DSND**

Monitors the VTAM APPC send rate.

OMEGAMON XE for DB2 PE displays the DSND exception when the DDF VTAM APPC send data rate exceeds the exception threshold.

DSND is a member of the system (SY) exception group. The exception threshold rate is expressed as KB per second. The default threshold for DSND is 1000 KB per second.

**DWAT**

Monitors the time a distributed allied thread has been waiting for a response to a remote SQL request.

OMEGAMON XE for DB2 PE displays the DWAT exception when it detects that a distributed allied thread has been waiting for a response to a remote SQL request for a period of time greater than the exception threshold.

DWAT is a member of the thread (TH) exception group. The exception threshold is expressed as an integer, that is, the number of seconds that can elapse before the exception will trip. The default threshold for DWAT is 120 seconds.

**EDMU**

EDMU is a member of the DB2 system (SY) exception group. The default threshold for EDMU is 90% of the pool size. The threshold can be any value between 1% to 100%. If the ratio of the pool in use to total pool size exceeds this threshold, OMEGAMON XE for DB2 PE displays an exception message.

EDMU provides information about EDM pool utilization.

DB2 uses the environmental descriptor management (EDM) pool to manage and contain the following features:
- Database descriptors (DBDs)
- Cursor tables (CTs)
- Skeleton cursor tables (SKCTs)
• Package tables (PTs)
• Skeleton package tables (SKPTs)
• Dynamic SQL caches (DSCs)

The size of each pool is defined by its individual installation parameter.

To compute the EDM-in-use-ratio for DB2 10.1 and higher, OMEGAMON XE for DB2 PE totals the EDM pages in use by database descriptors (DBDs) and divides this number by the total DBD pool size.

**ENTO** Provides information about POOL thread use originating from CICS transactions that were diverted to the pool because all ENTRY threads for the requested DB2 plan are in use.

ENTO does not analyze ENTRY definitions with a THRDA value of zero because these threads automatically use the buffer pool and are considered legitimate POOL thread users.

ENTO analyzes all ENTRY thread definitions with TWAIT=POOL and THRDA>0 specified. As a result, it can trip and display multiple times on one OMEGAMON XE for DB2 PE cycle for the same CICS region. The Plan=cccccccc displays the DB2 plan name assigned to the entry threads. If the DB2 plan name is ********, the entry definition is using the CICS dynamic plan exit. The variable aaaa is the first CICS transaction defined to the plan. The CICS transaction ID is needed because the same DB2 plan can be defined to multiple ENTRY definitions. A CICS transaction can only be defined to a single DB2 plan. Therefore, the transaction ID in the exception output provides a unique identifier of which ENTRY definition is overflowing if the DB2 plan is defined to multiple ENTRY definitions.

ENTO is a member of the CICS (CI) exception group. The default threshold for ENTO is three transactions. The threshold can be any value from 1 through 100 transactions. If the number of transactions using a POOL thread due to an overflow exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**ENTU** Provides information about CICS ENTRY thread use.

The definition of ENTRY threads (in the RCT) is optional. The definition and use of ENTRY threads enables the DB2 user to assign one or more DB2 threads to a single DB2 plan. You can also define one or more transactions that might use the plan.

ENTU analyzes all ENTRY thread definitions. As a result, it can trip and display multiple times on one OMEGAMON XE for DB2 PE cycle for the same CICS region. The Plan=cccccccc displays the DB2 plan name assigned to the entry threads. If the DB2 plan name is ********, the entry definition is using the CICS dynamic plan exit. The variable aaaa is the first CICS transaction defined to the plan. The CICS transaction ID is needed because the same DB2 plan can be defined to multiple ENTRY definitions. A CICS transaction can only be defined to a single DB2 plan. Therefore, the transaction ID in the exception output provides a unique identifier of which ENTRY definition is incurring the thread use reported by the exception.

ENTU ignores all ENTRY definitions with a THRDA value of zero and TWAIT=POOL. It also ignores any ENTRY definitions in which THRDA is set to one, regardless of the TWAIT operand in use.

ENTU is a member of the CICS (CI) exception group. The default threshold for ENTU is 95% of the THRDA value. The threshold can be any value from 1% through 100%. If the ratio of active threads originating from an
ENTRY definition to the ENTRY definition’s THRDA value exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**ENTW**

Provides information about CICS transactions waiting for ENTRY threads.

The definition of ENTRY threads (in the RCT) is optional. By using ENTRY threads, you can assign one or more DB2 threads to a single DB2 plan. You can also define one or more transactions which might use the plan. Other options are available when defining ENTRY threads, one of it is TWAIT. TWAIT is used to govern the required processing when all DB2 threads associated with an ENTRY definition (plan) are in use. If TWAIT is YES specified and no ENTRY thread is available, the request is queued and waits for a thread assigned to the ENTRY definition to become available. This exception is tripped and displayed when the number of transactions waiting for an ENTRY thread exceeds the exception threshold.

The exception routine analyzes all ENTRY thread definitions with TWAIT is YES specified. As a result, the exception can trip and display multiple times on one OMEGAMON XE for DB2 PE cycle for the same CICS region. The Plan=cccccccc is the DB2 plan name assigned to the ENTRY threads. The variable aaaa is the first CICS transaction defined to the plan. The CICS transaction ID is needed because the same DB2 plan can be defined to multiple ENTRY definitions. A CICS transaction can only be defined to a single DB2 plan. The transaction ID in the exception output provides a unique identifier of which ENTRY definition is incurring the waits if the DB2 plan is defined to multiple ENTRY definitions.

ENTW is a member of the CICS (CI) exception group. The default threshold for ENTW is two transactions. The threshold can be any value between 1 and 100 transactions. If the number of transactions waiting for an ENTRY thread exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**ETIM**

Monitors the elapsed time for a DB2 thread (from Signon or Create Thread).

ETIM displays the wall clock time that the plan has been actively holding thread resources. This might indicate that service level commitments have been exceeded.

ETIM is a member of the thread (TH) exception group. The default threshold for ETIM is 600 seconds. The threshold can be any value between 1 and 999999.99 seconds. If the thread elapsed time exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**GETP**

Provides information about Getpage requests per Read I/O.

The counters which DB2 maintains for this activity are updated throughout the life of the thread, and are reset when DB2 signon occurs.

GETP is a member of the thread (TH) exception group. The default threshold for GETP is 15 (1.5 Getpages to Read I/Os). The threshold can be any value between 0 and 100. Specify the threshold as an integer, where 1 equals 0.1 Getpages to Read I/Os. For example, OMEGAMON XE for DB2 PE sets a threshold specified as 20 equal to a ratio of 2.0 Getpages to Read I/Os. If the ratio of the Getpage rate to Read I/Os falls below the threshold, OMEGAMON XE for DB2 PE displays the exception.

**GTRC**

Indicates that the DB2 global trace is currently active.
GTRC is a member of the DB2 system (SY) exception group. This exception monitors an action, not a value; its threshold is always N/A. If State is ON and the global trace is active, OMEGAMON XE for DB2 PE displays the exception.

IDBC Provides information about the CPU time used by DB2 to process this thread.

IDBC is a member of the thread (TH) exception group. The default threshold for IDBC is 0.7 seconds. The threshold can be any value between 0.00 and 999999.99 seconds. The threshold is specified in 100ths of seconds. For example, to set a threshold of 0.7, specify a value of 70. If the total In-DB2 CPU time exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

IDBK Provides information about how close DB2 is to the maximum number of allowed background connections.

IDBK is a member of the DB2 system (SY) exception group. The default threshold for IDBK is 90% of the IDBACK installation parameter. The threshold can be any value between 1% and 100%. If the ratio of active background connections to the IDBACK value in use exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

IDBT Provides information about how long DB2 has been processing this thread.

IDBT is a member of the thread (TH) exception group. The default threshold for IDBT is 5 seconds. The threshold can be any value between 1 and 999999.99 seconds. If the total In-DB2 time exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

IDFR Provides information about how close DB2 is to the maximum number of allowed foreground connections.

IDFR is a member of the DB2 system (SY) exception group. The default threshold for IDFR is 85% of the IDFORE installation parameter. The threshold can be any value between 1% and 100%. If the ratio of active foreground connections to the IDFORE value in use exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

IMCN Warns when an IMS region is defined to DB2, but the connection failed.

IMCN is a member of the IMS (IM) exception group. This exception monitors an action, not a value; its threshold is always N/A. If State is ON and a region is defined but not connected to DB2, OMEGAMON XE for DB2 PE displays the exception.

IMND Warns when no IMS dependent region is defined to DB2.

IMND is a member of the IMS (IM) exception group. This exception monitors an action, not a value; its threshold is always N/A. If State=ON and no dependent region is defined to DB2, OMEGAMON XE for DB2 PE displays the exception.

INDB Provides information about individual threads that are in indoubt status. These threads might cause DB2 resources to be unavailable to other active threads until either restart or RECOVER INDOUBT processing occurs.
INDB is a member of the thread (TH) exception group. This exception monitors an action, not a value; its threshold is always N/A. If State=ON and a thread is in doubt, OMEGAMON XE for DB2 PE displays the exception.

**INDT**

Provides information about the number of indoubt threads in the DB2 system.

INDT is a member of the DB2 system (SY) exception group. The default threshold for IND is one indoubt thread. The threshold is a value between 1 and 100 threads. If the number of indoubt threads exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

**LKUS**

Provides information about the number of locks owned by an individual thread. If the thread reaches 100% of NUMLKUS, DB2 terminates the thread.

LKUS is a member of the thread (TH) exception group. The default threshold for LKUS is 80% of the NUMLKUS parameter defined by the installation. The threshold can be any value between 1% and 100%. If an active thread exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**LOGN**

Provides information about the availability of primary active logs.

Active log data sets are allocated to DB2 during startup processing. When an active log data set is full, it is automatically archived by DB2 to an archive log. When an active log is successfully archived, it is available for reuse. The availability of active logs is critical to the functioning of DB2. If no active log is available, the DB2 subsystem will hang until one becomes available. The lack of an active log could be caused by an insufficient number of logs defined when DB2 was installed, too small log data set size, or possibly due to problems encountered during the archive process.

LOGN is a member of the DB2 system (SY) exception group. The default threshold for LOGN is two available logs. The threshold is a value between 1 and 100 logs. If the number of available primary active logs is less than or equal to the threshold value, OMEGAMON XE for DB2 PE displays the exception.

**MCNV**

Monitors the percentage of the maximum number of allowed conversations for each logmode and the number of threads that are waiting (if any).

OMEGAMON XE for DB2 PE displays the MCNV exception when the number of conversations in use constitutes a specified percentage of the preset maximum for a given logmode. In addition, when the percentage reaches 100%, the exception displays the number of threads waiting because the preset maximum was exceeded.

MCNV is a member of the system (SY) exception group. The exception threshold is expressed as a percentage (0-100). For example, if you want OMEGAMON XE for DB2 PE to notify you when any logmode has started 80% of its allotment of conversations, set the threshold to 80. The default threshold for MCNV is 80%.

**MDBT**

Monitors the percentage of maximum number of allowed database access threads that are in use.
OMEGAMON XE for DB2 PE displays the MDBT exception when the number of distributed database access threads in use constitutes a specified percentage of the preset maximum. The maximum is set in DSNZPARM by the MAXDBAT parameter.

MDBT is a member of the system (SY) exception group. The exception threshold is expressed as a percentage (0-100). For example, if you want OMEGAMON XE for DB2 PE to notify you when an application has used 80% of its allotment of database access threads, set the threshold to 80. The default threshold for MDBT is 85%.

**MDBW**

Monitors the number of database access threads that are waiting because MAXDBAT was reached.

OMEGAMON XE for DB2 PE displays the MDBW exception when the number of distributed database access threads waiting because the maximum has been reached exceeds the exception threshold. The maximum is set in DSNZPARM by the MAXDBAT parameter.

MDBW is a member of the system (SY) exception group. The exception threshold is expressed as an integer, that is, the number of threads waiting because MAXDBAT was reached. The default threshold for MDBW is 2.

**MSGE**

Displays DB2 and Internal Resource Lock Manager (IRLM) messages that were generated since the last OMEGAMON XE for DB2 PE cycle.

OMEGAMON XE for DB2 PE displays the DB2 and IRLM messages that have been written to the system log since the last OMEGAMON XE for DB2 PE cycle, or as many of the messages as the LROWS parameter for the terminal allows, whichever is less. To control which DB2 and IRLM messages the MSGE exception displays, see "Set DB2/IRLM Messages that MSGE Exception Monitors".

MSGE is a member of the DB2 system (SY) exception group. The default threshold for MSGE is N/A. If State is ON and new messages exist, OMEGAMON XE for DB2 PE displays the messages.

**PGUP**

Monitors the number of Page Update requests per second made by a thread.

The update count reflected in this exception is incremented each time a row in a page is updated. Updated pages are not necessarily written at commit, but rather later, asynchronously as determined by the DB2 Deferred Write algorithm. There is no direct immediate relationship between page updates and page writes.

The counters which DB2 maintains for this activity are updated throughout the life of the thread, and are reset at DB2 signon if the thread is reused.

PGUP is a member of the thread (TH) exception group. The default threshold for PGUP is 10 updates per second. The threshold can be any value between 1 and 1000 updates per second. If the active thread exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**POLU**

Provides information about POOL threads in use.

POLU is a member of the CICS (CI) exception group. The default threshold for POLU is 90% of the total number of POOL threads allowed. The
threshold can be any value between 1% and 100%. If the percentage of
POOL threads exceeds the threshold, OMEGAMON XE for DB2 PE
displays the exception.

**POLW** Provides information about CICS transactions waiting for a POOL thread.

POLW is a member of the CICS (CI) exception group. The default
threshold for POLW is two transactions. The threshold can be any value
between 1 and 99 transactions. If the number of transactions waiting for a
POOL thread exceeds the threshold, OMEGAMON XE for DB2 PE displays
the exception.

**PREF** Provides information about Sequential Prefetch read activity.

Unlike normal Read I/O, Sequential Prefetch Read I/O is performed
asynchronously with the user's request. It provides a read-ahead capability.
A single Sequential Prefetch I/O results in multiple pages being read.
Threads with excessive sequential prefetch rates might cause reduced
overall DB2 performance.

The counters which DB2 maintains for this activity are updated throughout
the life of the thread, and are reset during DB2 signon if the thread is
reused.

PREF is a member of the thread (TH) exception group. The default
threshold for PREF is 10 Prefetch requests per second. The threshold can be
any value between 1 and 100 Sequential Prefetch requests per second. If
the prefetch rate exceeds the threshold, OMEGAMON XE for DB2 PE
displays the exception.

**RELM** Provides information about the resource limit facility.

This exception analyzes the ratio of the resource limit high-water mark
(CPU seconds) to the current resource limit.

RELM is a member of the thread (TH) exception group. The default
threshold for RELM is 85 percent of the resource high-water mark (CPU
seconds). The threshold can be any value between 1 and 100 percent of the
resource limit. If the resource limit exceeds the threshold, OMEGAMON
XE for DB2 PE displays the exception.

**RIO** Provides information about the thread synchronous Read I/O rate.

Generally, this exception indicates excessive physical Read I/O on behalf of
a thread. Although a single SELECT might return a limited number of
rows, the pages searched might be enormous. I/O might be caused by
access path selection changes which occurred due to object changes
(indexes dropped or no longer clustered), or by inadvertent use of stage 2
(non-sargable) predicates. It might simply result from the fact that the SQL
is a set-oriented language, which operates on sets of data, rather than on
individual rows (records).

The counters which DB2 maintains for this activity are updated throughout
the life of the thread, and are reset during DB2 signon if the thread is
reused.

RIO is a member of the thread (TH) exception group. The default threshold
for RIO is 10 Read requests per second. The threshold can be any value
between 1 and 1000 synchronous Read requests per second. If the Read
I/O rate per second exceeds the threshold, OMEGAMON XE for DB2 PE
displays the exception.

**SPAC** Indicates that the number of ASIDs executing stored procedures exceeds
the threshold. The threshold is expressed as a count of address spaces capable of executing stored procedures. It can be an integer from 0 to 99. Stored procedures can be executed in any WLM-managed stored procedure address space. SPAC is a member of the DB2 system (SY) group. The default threshold is 3 and the default state is ON.

**STPE** Indicates that the number of stored procedures executing exceeds the threshold. The threshold is expressed as a count of stored procedures currently executing. It can be an integer from 0 to 99. STPE is a member of the DB2 system (SY) group. The default threshold is 10 and the default state is ON.

**SUSL** Detects the number of threads that could not continue execution and are suspended due to a locking conflict.

SUSL is a member of the DB2 system (SY) exception group. The default threshold for SUSL is five suspended threads. The threshold can be any value between 1 and 100 suspended threads. If the number of lock suspensions exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

**TCPU** Monitors the CPU rate (percent) of active threads.

For non-CICS threads, this is the CPU rate of the address space from which the thread originates. It includes both TCB and SRB time. For CICS threads, this is the CPU rate attributable to the thread originating from the CICS connection. It includes only TCB time incurred by the thread.

This exception limits its analysis of CPU use to DB2 connections that contain active threads. This exception does not report CPU use for connections with no active threads.

TCPU is a member of the thread (TH) exception group. The default threshold for TCPU is 20% of total processor utilization. The threshold can be any value between 1% and 100%. If CPU utilization exceeds the threshold value, OMEGAMON XE for DB2 PE displays the exception.

**THDQ** Detects users waiting for thread creation to occur.

OMEGAMON XE for DB2 PE displays this exception when the number of users queued and waiting for create-thread processing exceeds the exception threshold.

This exception might indicate that DB2 reached the CTHREAD value that controls the number of active threads.

THDQ is a member of the DB2 system (SY) exception group. The default threshold for THDQ is 2. The threshold is a value between 1 and 100 requests. If the number of requests queued and waiting for Create Thread processing exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**TMAX** Indicates when the number of active threads is approaching the maximum number allowed.

DB2 thread concurrency can be controlled by the CTHREAD value. CTHREAD defines the maximum number of concurrent threads allowed.

TMAX is a member of the DB2 system (SY) exception group. The default threshold for TMAX is 85% of the CTHREAD installation parameter. The threshold can be any value between 1 and 100%. If the ratio of active
threads to the CTHREAD parameter exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**TRCV**
Monitors the amount of data received by distributed threads from a remote DB2 subsystem.
OMEGAMON XE for DB2 PE displays the TRCV exception when it detects that a distributed thread has received an amount of data greater than the exception threshold.

TRCV is a member of the thread (TH) exception group. The exception threshold is expressed in KB. The default threshold for TRCV is 1000 KB.

**TRGD**
Indicates that the depth of the largest trigger stack exceeds the threshold. The threshold is expressed as the number of triggers in the largest trigger stack. It can be an integer from 0 to 99. TRGD is a member of the DB2 system (SY) group. The default is 1 and the default state is ON.

**TRGE**
Indicates that the number of triggers executing exceeds the threshold. The threshold is expressed as a count of triggers currently executing. It can be an integer from 0 to 99. TRGE is a member of the DB2 system (SY) group. The default threshold is 10 and the default state is ON.

**TSND**
Monitors the amount of data sent by distributed threads to a remote DB2 subsystem.
OMEGAMON XE for DB2 PE displays the TSND exception when it detects that a distributed thread has sent an amount of data greater than the exception threshold.

TSND is a member of the thread (TH) exception group. The exception threshold is expressed in KB. The default threshold for TSND is 1000 KB.

**UDFE**
Indicates that the number of user-defined functions executing exceeds the threshold. The threshold is expressed as a count of user functions currently executing. It can be an integer from 0 to 99. UDFE is a member of the DB2 system (SY) group. The default threshold is 10 and the default state is ON.

**UFAC**
Indicates that the number of ASIDs executing user functions exceeds the threshold. The threshold is expressed as a count of address spaces capable of executing user-defined functions. It can be an integer from 0 to 99. User-defined functions can be executed only from WLM-managed stored procedure address spaces. UFAC is a member of the DB2 system (SY) group. The default threshold is 3 and the default state is ON.

**UTIS**
 Warns when a DB2 utility was started but did not finish running due to abnormal termination. User should restart the utility with the corresponding phase.

UTIS is a member of the system (SY) exception group. The default state for UTIS is OFF. If State is ON and a DB2 utility has been started but has not yet completed running due to abnormal termination, OMEGAMON XE for DB2 PE displays the exception.

The next group of exceptions (VDIO, VEDR, VSRV, VTIO, and VUTL) share the following characteristics:
- They are in effect only when the object analysis collector is active.
- The collector will collect data from volumes that contain DB2 data sets that are currently MVS-allocated to the monitored DB2 subsystem.
All rates and ratios used in setting the exception thresholds are calculated using the object analysis collection interval elapsed time. For example, the total volume I/O rate is calculated by dividing the number of volume I/Os that occurred during the current collection interval by the elapsed time during the collection interval.

They are tripped only if there is I/O within the current collection interval from the DB2 being monitored.

**VDIO** Monitors volume DB2 I/O rate activity.

This exception warns you when a volume's DB2 I/O rate per second has reached a user-specified threshold. The threshold is expressed as the number of DB2 I/Os per second. It must be an integer between 0 and 9999.

VDIO is a member of the DB2 system (SY) exception group. The default threshold is 50, and the default state is ON.

**VEDR** Monitors volume data set extend activity.

This exception warns you when the data set-to-data set extent ratio of a volume reaches the user-specified threshold. The threshold is expressed as a ratio that represents the number of DB2 extents on the volume divided by the number of DB2 data sets. It must be an integer between 0 and 123.

VEDR is a member of the DB2 system (SY) exception group. The default threshold is 5, and the default state is ON.

**VSRV** Monitors volume service time.

This exception warns you when a volume's service time has reached a user-specified threshold. The threshold is expressed in milliseconds, and it must be an integer between 0 and 9999.

VSRV is a member of the DB2 system (SY) exception group. The default threshold is 30, and the default state is ON.

**VTIO** Monitors volume total I/O rate activity.

This exception warns you when a volume's total I/O rate per second has reached a user-specified threshold. The threshold is expressed as the total number of I/Os per second. It must be an integer between 0 and 9999.

VTIO is a member of the DB2 system (SY) exception group. The default threshold is 50, and the default state is ON.

**VUTL** Monitors volume utilization.

This exception warns you when a volume's utilization percentage has reached a user-specified threshold. The threshold is expressed as a percentage, and it must be an integer between 0 and 100.

VUTL is a member of the DB2 system (SY) exception group. The default threshold is 30, and the default state is ON.

**WCLM** Indicates when a thread has been waiting for more than the specified time for a resource to be drained of claimers.

WCLM is a member of the thread (TH) exception group. The default threshold for WCLM is 60 seconds. The threshold can be any value between 0 and 999999.99 seconds. If the time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.
**WDLK**
Indicates when a thread has been waiting for more than the specified time to acquire a drain lock.

WDLK is a member of the thread (TH) exception group. The default threshold for WDLK is 60 seconds. The threshold can be any value between 0 and 999999.99 seconds. If the time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**WGLK**
Wait for global lock time.
Indicates when a thread has been waiting for more than the specified time to acquire a global lock in a data sharing environment.

WGLK is a member of the thread (TH) exception group. The default threshold for WGLK is 60 seconds. The threshold can be any value between 0 and 999999.99 seconds. If the length of time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**WLGQ**
Indicates when a thread has been waiting for more than the specified time for an ARCHIVE LOG MODE(QUIESCE) command to complete.

WLGQ is a member of the thread (TH) exception group. The default threshold for WLGQ is 60 seconds. The threshold can be any value between 0 and 999999.99 seconds. If the time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**WSPS**
Stored procedure wait time.
Indicates when a thread has been waiting for more than the specified time for the stored procedures address space to become available in order for a stored procedure to be scheduled.

WSPS is a member of the thread (TH) exception group. The default threshold for WSPS is 100 seconds. The threshold can be any value between 0 and 999999.99 seconds. If the time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**WSRV**
Indicates when a thread has been waiting for more than the specified time for a DB2 service. DB2 service waits include
- Open/close data set
- SYSLGRNG update
- DFHSM recall
- Dataspace Manager services
- Define/Delete/Extend data set

WSRV is a member of the thread (TH) exception group. The default threshold for WSRV is 30 seconds. The threshold can be any value between 0 and 999999.99 seconds. If the time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**WTRE**
Indicates when a thread has been waiting for more than the specified time. This exception waits for 1 IRLM deadlock cycle before tripping.

WTRE is a member of the thread (TH) exception group. The default threshold for WTRE is 100 seconds. The threshold can be any value

*Note:* Stored procedure wait time is reported under class 1 time.
between 0 and 999999.99 seconds. If the length of time the thread is waiting exceeds the threshold, OMEGAMON XE for DB2 PE displays the exception.

**Current Status for Exceptions**

This panel provides information about the current characteristics of the selected exception group, their last and worst values, and the time when those values occurred.

From this panel, you can perform the following actions:

1. You can select the current status of a different exception group (All, Thread, CICS, IMS, or DB2 System).
2. You can select the status of tripped exceptions for a specific exception group (All, Thread, CICS, IMS, or DB2 System). For more information, see the description of panel “Status for Tripped Exceptions” on page 918.
3. You can reset the last or worst exceptions for a specific exception group (All, Thread, CICS, IMS, or DB2 System). For more information, see the description of panel “Reset Last and Worst Values” on page 920.

To change a characteristic of any exception in this panel, see “Profile Maintenance Facility”. 

---

Chapter 5. Monitoring 917
Navigation

For additional information about
• exception recommendations, move the cursor to the exception line and press F10 (Recommendation).
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

ARCM
   The name of the exception. (Here, ARCM.)

Threshold
   The current threshold value set for this exception.

Trip Value
   The value that caused this exception to trip.

Time Occurred
   The date and time the exception last exceeded its threshold.

Total Trips
   The number of times this exception exceeded its threshold during the current session.

Trips Since Reset
   The number of times this exception exceeded its threshold since the last and worst values were reset.

State
   The current state of the exception. OMEGAMON XE for DB2 PE is currently monitoring this exception (ON), not monitoring this exception (OFF), or testing this exception (TEST).

Last
   The value of the exception the last time it exceeded its threshold.

Worst
   The worst value the exception has reached during the current OMEGAMON XE for DB2 PE session.

Group
   The 2-character group to which this exception belongs (CI, CICS; IM, IMS; SY, DB2 system; or TH, thread).

Status for Tripped Exceptions
This panel displays the status of the selected OMEGAMON XE for DB2 PE exceptions that have tripped and the time when those values occurred.
To change a characteristic of any exception in this panel, see "Profile Maintenance Facility".

**Navigation**

For additional information about

- exception recommendations, move the cursor to the exception line and press F10.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**COMT**

The name of the exception. (In this case, COMT.)

**Threshold**

The current threshold value set for this exception.

**Trip Value**

The value that caused the exception to trip.
Time Occurred
The date and time the exception last exceeded its threshold.

Total Trips
The number of times this exception exceeded its threshold during the current session.

Trips Since Reset
The number of times this exception exceeded its threshold since the last and worst values were reset.

State
The current state of the exception. OMEGAMON XE for DB2 PE is currently monitoring this exception (ON), not monitoring this exception (OFF), or testing this exception (TEST).

Last
The value of the exception the last time it exceeded its threshold.

Worst
The worst value the exception has reached during the current OMEGAMON XE for DB2 PE session.

Group
The 2-character group to which this exception belongs (CI, CICS; IM, IMS; SY, DB2 system; or TH, thread).

Reset Last and Worst Values
Use this panel to reset the values displayed on the Current Tripped Exceptions panel for the exception group specified below the title line (all, thread, CICS, IMS, or system). In particular, the last and worst values and the time that they occurred are reset for each tripped exception.

Navigation
For additional information about other topics, use the PF keys.

Fields
After you remove the comment character, the Reset Last and Worst Values panel displays the message:

Last, Worst, and Trip Counter Values Are Reset

This message confirms that OMEGAMON XE for DB2 PE has reset the last and worst values for all tripped exceptions.
Thread Activity

Select this main menu option for summary and detail information about threads connected to DB2.

To view detail information of a specific thread, select a thread in one of the summary panels by placing the cursor on the appropriate line and pressing F11 (Zoom).

Threads Summary Excluding Idle Threads

This panel shows an overview of the activity of all active threads (excluding idle threads) that are connected to DB2.

<table>
<thead>
<tr>
<th></th>
<th>ZALLT</th>
<th>VTM</th>
<th>02</th>
<th>V5401P DC11 S 07/01/16 14:22:24 2</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>T.A</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>&gt;</td>
<td>Help PF1</td>
<td>Back PF3</td>
<td>Up PF7</td>
<td>Down PF8</td>
</tr>
</tbody>
</table>

Thread Activity: Enter a selection letter on the top line.

- *-All-Idle
- B-TSO
- C-CICS
- D-IMS
- E-Background
- F-Dist Allied
- G-Dist DBAC
- H-Util
- I-Inact
- J-Filter
- K-Functions
- L-Stored Proc
- M-Triggers
- N-Sysplex
- O-Enclaves
- P-Worksta
- Q-All+Idle

Each row provides information about an individual thread. Each column provides information about thread elapsed time, DB2 and MVS resource consumption, and DB2 activity.

Highlighting

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

<table>
<thead>
<tr>
<th>Field</th>
<th>Exception</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elapsed</td>
<td>ETIM</td>
<td>This thread has reached the Elapsed Time threshold value.</td>
</tr>
<tr>
<td>CPU</td>
<td>TCPU</td>
<td>The thread address space has excessive CPU utilization.</td>
</tr>
<tr>
<td>GetPg</td>
<td>GETP</td>
<td>The Getpage to Read I/O ratio indicates poor read efficiency.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Exception</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update</td>
<td>PGUP</td>
<td>The rate for system page updates is high.</td>
</tr>
<tr>
<td>Commit</td>
<td>COMT</td>
<td>The ratio of Commits to Updates indicates a low Commit frequency.</td>
</tr>
</tbody>
</table>

Navigation

For additional information about:
- the IMS connection, move the cursor to the IMS ID line and press F11 (Zoom). IMS releases V10, 11, 12, 13, 14, and 15 are supported.
- A particular thread, move the cursor to the thread information line and press F11 (Zoom).
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- Related topics, select one of the options on the top of the panel.
- Other topics, use the PF keys.

Fields

Elapsed

The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is dd-hh:mm.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

Planname or Package

The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.
CPU (if monitoring a local DB2 subsystem, or data sharing group with XCF component activated for remote CPU)
The CPU rate (percent) associated with the thread.

For non-CICS threads, this is the CPU rate of the address space from which the thread originates. For CICS threads, this is the CPU rate attributable to the thread originating from the CICS connection. For more information, see "Analyzing DB2 CPU Usage".

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

**Status**
The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status".

**GetPg**
The number of thread Getpage requests. Getpage requests are logical Read requests that might not actually result in physical I/O if the requested page is currently in the buffer pool.

DB2 resets the Getpage count at Create Thread and Signon. If Signon is not driven, the Getpage count is cumulative.

**Update**
The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2's internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Commit**
The number of times the thread successfully completed Commit processing.

DB2 resets the Commit count at Create Thread and Signon. If Signon is not driven, the count is cumulative.

**CORRID/JOBN**
This field is customizable by means of user mod TKANSAM(KO2M0002) and shows either:

**CORRID**
The correlation ID of the thread.

**JOBN**
The jobname of the thread.

For remote DB2 subsystems, the correlation ID is displayed instead of the job name.

**Thread Detail:**
This panel provides detailed information about the activity of a selected thread or parallel task.
A parallel task is created from an originating thread to process a part of a query. Thread activity is broken down into general status and resource consumption information, and buffer manager activity.

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

If the accounting trace classes are not active, the fields show N/A (not applicable) instead of a value.

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.
Attach: Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch: The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS: The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- Pool: The thread in use is a pool thread.
- Entry: The thread in use is a nonprotected entry thread.
- Prot: The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS: The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF: The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System: The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO: The TSO user ID and region ASID.

Utility: No additional information.

Db2: The Db2 subsystem identifier.

MVS: The MVS system identifier.

ORIGAUTH: The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package: The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection: The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type: The distributed thread type.
Distributed Allied
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:
USCAC001.02022A.A1FE8E04B9D4=8

System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Thread Activity:

Db2 Status
For definitions of all possible status values, see “DB2 Thread Status”.

MVS Status
The current MVS status of the thread:

Asid Notdisp
The address space in which the active task is not available for dispatch.

Db2 I/O Wait
The thread is waiting for the completion of Db2 database I/O.

Logical Swap
The address space is currently logically swapped out.

Swapped Out
The memory is physically swapped out.

Using CPU
The thread is currently using CPU cycles.

Wait-Dispatch
The task is waiting on the active CPU dispatching queue. It is available for use, but is not yet running on a processor.

WAIT-MISC
The thread is waiting for some other reason and is not on the available dispatch queue.

Note: If the panel displays a distributed database access thread, this field is blank.
Total Elapsed Time
The total elapsed time for the thread, in the format hh:mm:ss.th. Elapsed time is the time which has elapsed since thread creation or Db2 signon.

CP CPU Utilization
The central processor CPU rate (percent) associated with the thread.
For non-CICS threads, this is the central processor CPU rate of the address space from which the thread originates. For CICS threads, this is the central processor CPU rate attributable to the thread originating from the CICS connection. For more information about central processor CPU use, see "Analyzing Db2 CPU Usage".

Total CP CPU Time
The total central processor CPU time accumulated for the thread. This value includes only MVS TCB time. SRB time is not included.

SE CPU Time
The accumulated class 2 CPU time consumed while executing on an IBM specialty engine.

Total Parallel Tasks
The total number of parallel tasks that were created on behalf of this thread.

Current Parallel Tasks
The number of parallel tasks currently executing. To see information about these tasks, select option M-PARALLEL TASKS.

Thread Status
Valid values:
AC Execute in accelerator
AT Process autonomous procedure
D Termination due to allied task’s termination
DA DBaccess thread slot is available for new connection
DI Disconnected, no TCB associated with the Db2 thread. (Available for reuse.)
N In IDENTIFY or SIGNON status
ND IN IDENTIFY or SIGNON status with no TCB associated
PT Parallel task thread
QD Queued for termination due to allied task’s termination
QT CREATE THREAD request is queued
R2 Type2 inactive thread waiting for agent to become available
RA Active distributed thread performing remote access
RK Distributed thread invokes Kerberos services
RN Distributed thread waits for system conversation service task
RQ Distributed thread waits for dbaccess agent, due to MAXDBAT or DSN_PROFILE_ATTRIBUTES_TABLE
RX Distributed thread executes XA transaction
SP In stored procedure
SW Wait for a stored procedure to be scheduled
T Non-distributed allied thread
TD An allied thread is not associated with TCB
TN An allied thread is waiting for system conversation service task
TR An allied thread is active
N/A QW0148ST is not populated

User-Defined Functions:

TCB Time (SQL)
The accumulated CPU time consumed executing user-defined functions. This time does not include CPU time consumed on an IBM specialty engine. It consists of following parts:
- The accumulated CPU time consumed in Db2 when processing SQL statements that were issued by UDFs in a Db2 stored procedure or WLM address space. This time also includes the Db2 time required to connect or disconnect the UDF task. It is only calculated if accounting class 2 is active.
- The accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within Db2.

Wait for TCB Time
Total elapsed time spent waiting for an available TCB before the user-defined function could be scheduled.

Elapsed Time
Total elapsed time spent in user-defined functions, including time executing SQL statements.

Elapsed Time (SQL)
Total elapsed time spent in user-defined functions executing SQL statements.

SQL Events
Number of SQL entry/exit events performed by user-defined functions.

In-Db2 Times

Elapsed Time (Total)
The accumulated CPU time consumed executing user-defined functions. This time does not include CPU consumed on an IBM specialty engine. It consists of following parts:
- The accumulated CPU time used to satisfy UDF requests processed in a Db2 stored procedure or WLM address space. This time is only calculated if accounting class 1 is active.
- The accumulated CPU time consumed executing user-defined functions on the main application execution unit. This time represents class 1 and class 2 time, because these UDFs run entirely within Db2.

Elapsed Time (Current)
The total amount of time spent executing the currently active SQL statement. It is only calculated if monitor class 9 is activated.

CP CPU Time (Total)
The class 2 CPU time (in Db2). It indicates:

- The class 2 CPU time for the allied agent. This includes the accumulated class 2 TCB time for processing any stored procedures, user-defined functions, and triggers.
- The accumulated CPU time for processing parallel tasks. This is valid for query CP parallelism, sysplex query parallelism, and parallel tasks generated by utilities. Only CPU times of parallel tasks, running on the same member of the sysplex group as the originating task, are included. This CPU time does not include time that is consumed on an IBM specialty engine.

**CP CPU Time (Current)**

CPU time consumed for execution of the SQL statement. This value is not available for SQL statements that run under an SRB. Therefore, this value does not include time that is consumed on an IBM specialty engine. It is only calculated if monitor class 9 is activated.

**SE CPU Time (Total)**

The accumulated and consumed class 2 time on an IBM specialty engine (SE) that consists of times for non-nested, stored procedures, user-defined functions, triggers, and parallel tasks.

**SE CPU Time (Current)**

The total SE CPU time used by the currently active SQL statement. The value is always zero for database access threads.

**Stored Procedure CPU Time (Total)**

The accumulated CPU time that is used for executing stored procedure requests on the main application execution unit. This time does not include the time that is consumed on an IBM specialty engine. As these stored procedures run entirely in Db2, this time represents class 1 and class 2 time.

**UDF CP CPU Time (Total)**

Accumulated CPU time consumed executing user defined functions on the main application execution unit. This time does not include CPU consumed on an IBM specialty engine. Because these UDFs run entirely within Db2, this time represents class 1 and class 2 time. No current value will be provided.

**UDF IIP CPU Time (Total)**

Accumulated CPU time consumed executing user defined functions on the main application execution unit on an IBM specialty engine. Because these UDFs run entirely within Db2, this time represents class 1 and class 2 time. No current value will be provided.

**UDF Elapsed Time Main (Total)**

The accumulated CPU time consumed executing user-defined functions. This time does not include CPU consumed on an IBM specialty engine. It consists of following parts:

- The accumulated CPU time used to satisfy UDF requests processed in a Db2 stored procedure or WLM address space. This time is only calculated if accounting class 1 is active.
• The accumulated CPU time consumed executing user-defined functions
  on the main application execution unit. This time represents class 1 and
  class 2 time, because these UDFs run entirely within Db2.

Stored Procedures:

Total CPU
The CPU time (TCB time) spent in Db2 processing SQL statements issued
by stored procedures for this thread. This is an accumulated and consumed
time for stored procedures that consists of the following information:
• The CPU time accumulated in Db2 for processing SQL statements issued
  by stored procedures processed in a Db2 stored procedure or WLM
  address space. This time is only calculated if accounting class 2 is active
• In-Db2 time needed to connect and disconnect the SP task for non-SQL
  procedure stored procedures
• SQL procedure times are included in this time if the SQL procedure was
called on a nested task and was not invoked by the main application
  execution unit
• CPU time that is consumed when running stored procedure requests on
  the main application execution unit. This time does not include the CPU
time consumed on an IBM specialty engine.

Elapsed Time
Total elapsed time spent in stored procedures including time executing
SQL statements. This is an accumulated and consumed time for stored
procedures that consists of the following parts:
• The CPU time accumulated in Db2 for processing SQL CALL statements
  in the stored procedures or WLM address space. This time is only
calculated if accounting class 1 is active.
• The accumulated CPU time consumed when running stored procedure
  requests on the main application execution unit. This time does not
  include CPU time consumed on an IBM specialty engine. As these stored
  procedures run entirely within Db2, this time represents class 1 and class
  2 time.

Elapsed Time (SQL)
Total elapsed time spent for stored procedures executing SQL statements.

Wait for TCB Time
The total time waiting for an available TCB to schedule a stored procedure.

Wait Event Count
The number of wait trace events processed for an available TCB that are
needed in order to schedule a stored procedure.

Curr Wait TCB Time
The current time waiting for an available TCB to schedule a stored
procedure.

Triggers:

Trigger CPU Time
The accumulated CPU time consumed while executing under the control of
triggers. For triggers there is no distinction between class 1 and class 2
CPU time. All processing controlled by a trigger is within Db2.

Elapsed not in Enclave
The accumulated elapsed time used when executing under the control of a
trigger. This does not include the time used while in user-defined function
or stored procedures that are called from the trigger not under an enclave.

**TCB prior to Enclave**

The accumulated TCB time consumed before enclave creation time.

**SavePoints:**

**Savepoint Requests**

The number of savepoints set.

**Release Savepoints**

The number of savepoints deleted.

**Rollback Savepoints**

The number of rollback-to-savepoint requests issued.

**WorkFile:**

**Workfile Max Blocks**

Maximum number of workfile blocks being used by this agent at any
given point in time (traditional workfile use, DGTT and DGTT indexes).
DB2 12 and later.

**Workfile Curr Blocks**

Current number of workfile blocks being used by this agent (traditional
workfile use, DGTT and DGTT indexes). DB2 12 and later.

**In-Db2 Times:** In-Db2 times require an Accounting trace class 2. If this trace was
not active, N/A is displayed.

**Elapsed Time (Total)**

The total In-Db2 elapsed time for the thread, in the format *hh:mm:ss.tht*.

**Elapsed Time (Current)**

The total time spent executing the currently active SQL statement.

**CP CPU Time (Total)**

The total In-Db2 central processor CPU time for the thread. This includes
MVS TCB time only. SRB time is not included.

**CP CPU Time (Current)**

The total central processor CPU time used by the currently active SQL
statement, in the format *hh:mm:ss.tht*. The value is always zero for database
access threads.

**IIP CPU Time (Total)**

The total In-Db2 SE (Specialty Engine) CPU time for the thread.

**IIP CPU Time (Current)**

The total SE (Specialty Engine) CPU time used by the currently active SQL
statement in seconds. The value is always zero for database access threads.

**Stored Procedure CPU Time (Total)**

The CPU time (TCB time) spent in Db2 processing SQL statements issued
by Db2 stored procedures for this thread.

**Stored Procedure CPU Time (Current)**

The CPU time (TCB time) spent in Db2 processing SQL statements issued
by Db2 stored procedure that is currently active.

**UDF CP CPU Time (Total)**

The CPU time spent in Db2 processing SQL statements issued by user
defined functions for this thread. This time represents central processor
time only and does not include SE (Specialty Engine) time.

**UDF IIP CPU Time (Total)**
The amount of SE (Specialty Engine) CPU time spent in Db2 processing
SQL statements issued from user defined functions for this thread.

**UDF Elapsed Time Main (Total)**
The elapsed time by the user defined functions for this thread in the
format **hh:mm:ss.**

**Waits (Class 3):** Wait times require an Accounting trace class 3. If this trace is not
active, **N/A** is displayed. For each field described below the following statistics are
provided:
- **Count** is the total number of waits.
- **Total** is the total wait time that has elapsed.
- **Current** is the elapsed time waiting for the current event to complete.

**Synchronous I/O Wait**
Waits for synchronous I/O reads or writes.

**Asynchronous Read I/O Wait**
Waits for Read I/O performed under another thread (for example, list or
Sequential Prefetch).

**Asynchronous Write I/O Wait**
Waits for Write I/O performed under another thread (for example,
deferred writes).

**Local Lock/Latch Wait**
Waits for locks or latches.

**Page Latch Wait**
Waits for page latch.

**Drain Lock Wait**
Waits to acquire drain lock.

**Drain of Claims Wait**
Waits for claims to be released after acquiring drain lock.

**Archive Log Mode (Quiesce) Wait**
Wait for ARCHIVE LOG MODE(QUIESCE) command to complete.

**Archive Read from Tape Wait**
Waits for read of archive log from tape.

**Switch to Open/Close Wait**
Wait for switches to the OPEN/CLOSE service.

**Switch to SYSLGRNG Service Wait**
Wait for switches to the SYSLGRNG recording service.

**Switch to DMS Waits**
Wait for switches to the database-managed space (DMS).

**Other Service Waits**
Wait for switches to other Db2 service tasks.

**Force at Commit Waits**
Wait for force-at-commit Db2 service tasks.

**Log Write I/O Wait**
Waits due to Log write I/O.
Sync EX Unit Sw-com/abort/dealloc
Waits due to synchronous execution switch for Db2 commit, abort, or deallocation processing.

LOB Materialization
Waits for TCP/IP LOB and XML materialization.

Latch Contention Wait
Waits due to page latch contention.

Autonomous STP Wait (QWAC_AT_WAIT QWAC_AT_COUNT)
The amount of waits that are due to autonomous procedures.
This applies to Db2 11 and higher.

Parallel Query Sync Wait (QPAC_PQS_WAIT QPAC_PQS_COUNT)
The amount of waits after parallel query processing suspended waiting for parent/child to be synchronized.
This applies to DB2 11 and higher.

Asynch IXLCACHE/IXLFCOMP (QWAXIXLT)
The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Fast Insert Pipe Wait
The accumulated wait time for a pipe wait. DB2 12 and later.

Accelerator Wait (QWACAACW QPACAACC)
The accumulated wait time for requests to an accelerator. DB2 11 and later.

Total Class 3 Wait Time
The total class 3 wait time.

For Data Sharing Group members, the following waits are also displayed:

Global Child L-Locks (QWACAWTK QWACARNK)
Waits because of global contention for child L-locks.

Global Other L-Locks (QWACAWTM QWACARNM)
Waits because of global contention for other L-locks.

Global Pageset/Partition P-Locks (QWACAWTN QWACARNN)
Waits because of global contention for Pageset/Partition P-locks.

Global Page P-Locks (QWACAQTO QWACARNO)
Waits because of global contention for Page P-locks.

Global Other P-Locks (QWACAQTQ QWACARNQ)
Waits because of global contention for other P-locks.

Thread Lock/Claim/Drain Activity:
This panel provides detail information about current lock, claim, and drain activity of a selected thread.
Navigation

You can scroll through the information using F7 and F8.

For additional information about

- Related topics, select one of the options at the top of the panel.
- Other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.
CICS  The CICS jobname, task name, task number, terminal ID, and
thread type. The thread type is:
   Pool   The thread in use is a pool thread.
   Entry  The thread in use is a nonprotected entry thread.
   Prot   The thread in use is a protected thread. Protected threads
are defined in an RCT entry definition using the THRDS
operand.

IMS   The IMS region number, transaction name, region name, and
terminal ID (LTERM).

RRSAF  The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System  The originating Db2 job name and the resource manager that is the
source of the thread. An additional line below the Attach line
identifies the user thread, if any, being served by the system
thread.

TSO   The TSO user ID and region ASID.

Utility  No additional information.

Db2   The Db2 subsystem identifier.

MVS   The MVS system identifier.

ORIGAUTH  The original (primary) Db2 authorization identifier of the thread. This field
displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the
information in this panel applies.

Package  The Db2 package name of the active thread. Up to 18 characters of the
package name are returned.

Collection   The package collection identifier. This field is displayed only if a package
is being used.

Distributed thread identifier: The following fields are displayed if the thread has
a distributed relationship with a remote Db2 subsystem.

Type  The distributed thread type.

Distributed Allied    A requesting thread; one that has issued an SQL call to a remote
Db2 location.

Database Access    A responding thread; one that is serving a remote Db2 location by
responding to an SQL call.

Db2=   The Db2 subsystem ID, indicating the member of the data sharing group of
this thread.
Luwid  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E04B9D4=8

System

The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Lock count information:

Lock Requests

Requests to Internal Resource Lock Manager (IRLM) to obtain a lock on a resource.

Deadlocks Detected

The number of deadlocks detected.

Unlock Requests

Requests to IRLM to unlock a resource.

Timeouts Detected

The number of times that the suspension of a unit of work lasted longer than the IRLM timeout value.

Query Requests

Requests to IRLM to query a lock.

Suspends - Lock Only

Suspensions of a unit of work because a lock could not be obtained.

Change Requests

Requests to IRLM to change a lock.

Suspends - Latch Only

DB2 internal latch suspensions.

Other IRLM Requests

Requests to IRLM to perform a function other than those listed before.

Suspends - Other

Suspensions caused by something other than locks and latches.

Escalations to Shared

Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IS) lock to escalate to a shared (S) lock.

Escalations to Exclusive

Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IX) lock to escalate to an exclusive (X) lock.

Maximum Page/Row Locks

The maximum number of page or row locks held concurrently. This count cannot exceed the value of the NUMLKUS (locks per user) installation parameter.
Claim Requests
The number of claim requests.

Claims Failed
The number of unsuccessful claim requests.

Drain Requests
The number of drain requests.

Drains Failed
The number of unsuccessful drain requests.

Lock/Claims Causing a Thread to Wait:

This panel shows detail information about current locks that cause a selected thread to wait. It helps to determine if a thread is suspended and waiting because of a locking conflict.

When a thread is suspended, this panel provides the name of the lock/claim request causing the suspension. It also provides a list of all locks/claims currently held by other threads causing the thread to be suspended.

If accounting class 2 and class 3 are not available, N/A is displayed.

The locking information is divided into the following categories:
1. The name of the lock request causing the suspension.
2. A list of all locks which are causing the thread to wait.

HEX values are displayed for lock resources, if the resource is owned by a thread on a remote LPAR, and no OMPE task is available from that LPAR, or XCF is not setup correctly.

- about the locks that are owned by a thread, an SQL activity, a general thread activity, or a resource limit activity, or to go to the Db2 system console, type the appropriate option letter on the top line and press ENTER.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Navigation**

You can scroll through the information using F7 and F8.

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.
**Authid**
The Db2 authorization identifier of the active thread.

**Attach**
Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

- **Batch**
The MVS jobname and ASID.

  **Note:** For threads from remote Db2, the MVS job name is N/A.

- **CICS**
The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
  - **Pool**
The thread in use is a pool thread.
  - **Entry**
The thread in use is a nonprotected entry thread.
  - **Prot**
The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

- **IMS**
The IMS region number, transaction name, region name, and terminal ID (LTERM).

- **RRSAF**
The MVS job name and ASID.

  **Note:** For threads from remote Db2, the MVS job name is N/A.

- **System**
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

- **TSO**
The TSO user ID and region ASID.

- **Utility**
No additional information.

- **Db2**
The Db2 subsystem identifier.

- **MVS**
The MVS system identifier.

- **ORIGAUTH**
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Package identifier**: This information identifies the package to which the information in this panel applies.

**Package**
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**
The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier**: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.
Type  The distributed thread type.

Distributed Allied
  A requesting thread; one that has issued an SQL call to a remote DB2 location.

Database Access
  A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

Luwid  This value consists of two parts: the logical unit-of-work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
  luw-id=token

  The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
  USCA001.02D22A.A1FE80489D4=8

Drain information:

Type  The type of object being drained. Possible object types are:
  TS  Tablespace
  TS PART  Data Partition
  IX  Indexspace
  IX PART  Index Partition

Class  The drain class. Possible classes are:
  CS  Drain all CS read access to object.
  RR  Drain all RR access to object.
  Write  Drain all write access to object.

Resource
  The name of the resource being drained. This includes the database name, pageset name, and the partition number (if any).

Claim information:

Plan  The planname of the thread claiming the resource.

Connid
  The connection identifier of the thread claiming the resource.

Corrid  The correlation identifier of the thread claiming the resource.

Class  The claim class. Possible classes are:
  CS  Cursor Stability
  RR  Repeatable Read
  Write  Write access

Lock wait information:
**Type**  The lock type on which the thread is waiting. For more information about lock types, see "Lock Types and Lock Levels".

**Level**  The level or state (mode) of the lock request. This information describes the level of resource access demanded by the lock request. For more information about lock levels, see "Lock Types and Lock Levels".

**Resource**  The resource for which the user is waiting. The content of the Resource field is dependent on lock type.

The resource varies depending upon the type of lock held. This field displays the following resources:

<table>
<thead>
<tr>

PPSC  DB=database name PS=pageset name PT=partition
PPSP  DB=database name PS=pageset name PT=partition
PRLF  DB=database name PS=pageset name PT=partition
PSET  DB=database name PS=pageset name
PSPI  DB=dataset name PS=pageset name
RDRN  DB=dataset name PS=pageset name PT=partition
RGDA  DB=database name PS=pageset name PG=page
ROW   DB=database name PS=pageset name PG=page
RSTR  BMC-RSTP
SDBA  DB=dataset name PS=pageset name
SKCT  PLAN=plan name
SKPT  TOKEN is the consistency token (CONTOKEN) column from SYSIBM.SYSPACKAGE. Token=token
SPRC  SYS_PITR
SREC  DB=database name TS=tablespace name
TABL  DB=database name PS=pageset name
UNDT  Resource ID (in hexadecimal)
UTEX  UTEXEC
UTID  UID=utility identifier
UTOB  DB=database name PS=pageset name PT=partition
UTSE  UTSERIAL
WDRN  DB=database name PS=pageset name PT=partition

Note: DB=database name can be represented as a DBID=identifier, which is the decimal identifier of the database. PSID=identifier can be represented as PSID=identifier, which is the decimal identifier of the table space or index space.

For more information about lock resources, see "Lock Types and Lock Levels".

Wait For Lock Time
The time that DB2 has been waiting for the locked resource.

# To Repeat Lock Timeout
The number of times DB2 repeats the lock timeout.

IRLM Time Out Value
The maximum time that DB2 waits for a locked resource. When DB2 reaches the maximum value, it rolls back the unit of work.

Level The level or state (mode) of the lock request. This information describes
the level of resource access demanded by the lock request. For more information about lock levels, see "Tablespace lock levels" on page 1723.

Lock owner information:

Plan      The DB2 plan name of the active thread.
Connid    The DB2 connection identifier of the active thread.
Corrid    The DB2 correlation identifier of the active thread.
Lvl       The lock level owned.

Locks/Claims Owned By a Thread:

This panel provides detail information about all current locks and claims that are owned by a selected thread.

Fields

The fields are described in "Locking Conflicts" on page 1086, pane "Locks/Claims Owned by a Thread" on page 1090.

Thread Global Lock Activity:

This panel provides detail information about current locking activity of a selected thread in a data sharing environment.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan      The Db2 plan name of the active thread.
Connid    The Db2 connection identifier of the active thread.
**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  
The Db2 authorization identifier of the active thread.

**Attach**  
Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  
The MVS jobname and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**CICS**  
The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool**  
The thread in use is a pool thread.

- **Entry**  
The thread in use is a nonprotected entry thread.

- **Prot**  
The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS**  
The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF**  
The MVS job name and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**System**  
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**TSO**  
The TSO user ID and region ASID.

**Utility**  
No additional information.

**Db2**  
The Db2 subsystem identifier.

**MVS**  
The MVS system identifier.

**ORIGAUTH**  
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**  
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**  
The package collection identifier. This field is displayed only if a package is being used.
Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

**Type**  The distributed thread type.

**Distributed Allied**
A requesting thread; one that has issued an SQL call to a remote Db2 location.

**Database Access**
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

**Db2=**  The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

**Luwid**
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E04B9D4=8

**System**
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the *Attach* line identifies the user thread, if any, being served by the system thread.

Global lock information:

**P-lock Lock Requests**
Number of lock requests for P-locks. A P-lock is a physical lock used only in a data sharing environment to provide consistency of data cached in different DB2 subsystems.

**P-lock Unlock Requests**
Number of unlock requests for P-locks.

**P-lock Change Requests**
Number of change requests for P-locks.

**XES Lock Requests**
The number of lock requests (both logical and physical) that were propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests. Only the most restrictive lock for a particular resource is propagated to XES and the coupling facility.

**XES Unlock Requests**
The number of unlock requests (both logical and physical) that are propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests.

**XES Change Requests**
The number of change requests (both logical and physical) that were propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests.
Suspends - IRLM Global Cont
The number of suspends due to Internal Resource Lock Manager (IRLM) global resource contentions. IRLM lock states were in conflict and inter-system communication is required to resolve the conflict.

Suspends - XES Global Cont
The number of suspends due to MVS XES global resource contentions that were not IRLM-level contentions. The XES lock states were in conflict, but the IRLM lock states were not.

Suspends - False (and Conv)
Summation of false contentions and sync-to-async heuristic conversions. XES detects hash class contention when two different locks on different resources hash to the same entry in the coupling facility lock table. The requester is suspended until it is determined that no real lock contention exists.

Sync-to-async heuristic conversions are done when the XES determines that it is more efficient to drive the request asynchronously to the coupling facility.

Total L-lock Requests
The total number of L-lock requests. An L-lock is a logical lock used to control intra- and inter-DB2 data concurrency between transactions.

XES L-lock Req Percentage
The percentage of total L-lock requests that were propagated to MVS XES synchronously.

Incompatible Retained Locks
The number of global lock or change requests that failed because of an incompatible retained lock. Certain P-locks can be retained because of a system failure. Another DB2 member cannot access the data that the retained P-lock is protecting unless it requests a P-lock in a compatible state.

Notify Messages Sent
The number of notify messages sent.

Total Number False Cont
The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

SQL Call Being Executed:
This panel shows the current SQL statement that a DB2 thread is executing. OMEGAMON XE for DB2 PE automatically determines whether the SQL statement is dynamic or static and displays appropriate text to that effect.
Navigation

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: OMEGAMON XE for DB2 PE identifies the thread to which the information in this panel applies.

Plan The DB2 plan name of the active thread.

Connid The DB2 connection identifier of the active thread.

Corrid The DB2 correlation identifier of the active thread.

Authid The DB2 authorization identifier of the active thread.

Package identifier: This information identifies the package to which the information in this panel applies.

Package The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection The package collection identifier. This field is displayed only if a package is being used.

Connection Type

Batch The MVS jobname and ASID.
Note: For threads from remote Db2, the MVS job name is N/A.

CICS
The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
- **Pool** The thread in use is a pool thread.
- **Entry** The thread in use is a nonprotected entry thread.
- **Prot** The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS
The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF
The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO
The TSO user ID and region ASID.

Utility
No additional information.

Db2
The Db2 subsystem identifier.

MVS
The MVS system identifier.

ORIGAUTH
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Distributed thread identifier**: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

- **Type** The distributed thread type.
- **Distributed Allied** A requesting thread; one that has issued an SQL call to a remote DB2 location.
- **Database Access** A responding thread; one that is serving a remote DB2 location by responding to an SQL call.
- **Luwid** This value consists of two parts: the logical unit-of-work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
  \[luw-id=token\]

  The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
  \[USCAC001.02D22A.A1FE8E0489D4=8\]

**SQL call information**: The information that OMEGAMON XE for DB2 PE displays in this area varies slightly, depending on whether the SQL call is active or not. If
the call is active, OMEGAMON XE for DB2 PE displays the information described below with the actual text of the SQL call. If the call is not active, OMEGAMON XE for DB2 PE displays only the information described below.

**Thread Status**
The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status".

**SQL Request Type**
The type of the SQL request: dynamic SQL or static SQL.

**Total SQL Reqs**
The total number of SQL requests issued by the thread.

**SQL Call Type**
The SQL call type of the currently or previously active SQL call. This is the specific activity that DB2 is performing. For example, a dynamic SQL call can indicate PREPARE, EXECUTE, or OPEN CURSOR even though the original SQL statement might have been an SQL SELECT. A static SQL call can indicate OPEN CURSOR, CLOSE CURSOR, or FETCH even though the originating SQL statement was an SQL DECLARE CURSOR.

**SQL DBRM Name**
The database request module name containing the active call. The DBRM name is usually set to the application program name. It helps you to locate the program that is issuing the call if diagnosis is necessary.

**SQL Statement Number**
The DB2 precompiler statement number of the active SQL statement. The statement number, when used together with the DBRM name, helps you easily locate the specific SQL call for diagnostic purposes.

**Collection ID**
The Collection ID of the currently executing statement. This field is displayed only if the currently executing statement is contained in a package.

**Current SQL Counts:**
This panel provides counts of the various SQL activities, RID pool activities, and Parallel activities of an individual thread.

With this information, you can determine the activities that are using resources excessively. For example, a single SELECT command might result in many physical FETCH activities.

This information includes data definition statements and data manipulation statements. DB2 control counts are also supplied.

The panel also displays counts related to RID pool usage and parallel I/O activity.

Navigation

For additional information about
- an individual thread, for example, the locking activity or SQL activity of a thread, or the resource limit activity, type the appropriate option letter on the top line and press Enter.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.
Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**
The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier:** The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

**Type**
The distributed thread type.

- **Distributed Allied**
  A requesting thread; one that has issued an SQL call to a remote DB2 location.

- **Database Access**
  A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

**Luwid**
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

```
luw-id=token
```

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the **Luwid** field displays data such as the following:

```
USCAC001.02022A.A1FE8E0489D4=8
```

**SQL counts fields:**

- **Commit**
The number of times the thread successfully concluded Commit phase 2 processing.

- **Abort**
  A count of the number of times the thread has rolled back uncommitted data.

- **Select**
The number of SELECT requests.

- **Open Cursor**
The number of OPEN cursor statements issued by a thread.

- **Close Cursor**
The number of CLOSE cursor statements issued by a thread.

- **Fetch**
The number of FETCH requests.

- **Insert**
The number of INSERT statements executed by the thread.

- **Delete**
The number of DELETE statements issued by the thread.

- **Update**
The number of UPDATE statements executed by the thread.
Describe
The number of DESCRIBE statements issued by the thread.

Lock Table
A count of the number of LOCK TABLE statements issued by the application (not the total number of tables locked by the thread).

Prepare
The number of PREPARE statements issued by a thread.

Grant
The total number of times SQL GRANT requests were issued from within the program.

Revoke
The total number of times SQL REVOKE requests were issued from within the program.

Set Rules
The number of SET CURRENT RULES statements executed by the thread.

Increm Bind
A count of the number of times the plan active in the thread was rebound. PREPARES are not included. This value should be zero in a production environment. The plan can be rebound with VALIDATE(BIND) to prevent incremental binds.

Label/Comm On
The number of LABEL ON and COMMENT ON statements issued by the thread.

Set SQLID
The number of SET SQLID requests issued by the thread.

Set Host Var
The number of SET host variable requests executed by the thread.

Set Connection
The number of SET CONNECTION statements executed by the thread.

Set Degree
The number of SET CURRENT DEGREE statements executed by the thread.

Connect Type 1
The number of CONNECT type 1 statements executed by the thread.

Connect Type 2
The number of CONNECT type 2 statements executed by the thread.

Set Path
The number of SET CURRENT PATH statements executed by the thread.

Rename table
The number of RENAME TABLE statements executed by the thread.

Hold Locator
The number of HOLD LOCATOR statements executed by the thread.

Free Locator
The number of FREE LOCATOR statements executed by the thread.

Release
The number of RELEASE statements executed by the thread.
Assoc Locator
The number of ASSOCIATE LOCATOR statements executed by the thread.

Alloc Cursor
The number of ALLOCATE CURSOR statements executed by the thread.

Merge
The number of MERGE statements executed by the thread.

Rename Index
The number of RENAME INDEX statements executed by the thread.

Truncate Table
The number of TRUNCATE TABLE statements executed by the thread.

Refresh Table
Number of refresh table statements. DB2 12 and later. (Field name: QXTREFTBL)

Transfer Owner
Number of transfer ownership statements. DB2 12 and later. (Field name: QXTRNOWN)

Creates, Drops, Alters:

Table
The number of CREATE, DROP, or ALTER TABLE statements executed by the thread.

Index
The number of CREATE, DROP, or ALTER INDEX statements executed by the thread.

Table Space
The number of CREATE, DROP, or ALTER TABLESPACE statements executed by the thread.

Data Base
The number of CREATE, DROP, or ALTER DATABASE statements executed by the thread.

Storage Group
The number of CREATE, DROP, or ALTER STOGROUP statements executed by the thread.

Synonym
The number of CREATE or DROP SYNONYM statements executed by the thread.

View
The number of CREATE or DROP VIEW statements executed by the thread.

Alias
The number of CREATE or DROP ALIAS statements executed by the thread.

Function
The number of CREATE, DROP, or ALTER FUNCTION statements executed by the thread.

Procedure
The number of CREATE, DROP, or ALTER PROCEDURE statements executed by the thread.

Sequence
The number of CREATE, DROP, or ALTER PROCEDURE statements executed by the thread.
Role  The number of CREATE, DROP, or ROLE statements executed by the thread.

Trusted CTX  The number of CREATE, DROP, or ALTER TRUSTED CONTENT statements executed by the thread.

Mask/Perm  The number of CREATE, DROP, or ALTER MASK/PERM statements executed by the thread.

Variable  The number of CREATE, or DROP Variable statements executed by the thread. DB2 11 and above.

Trigger  The number of CREATE or DROP DISTINCT TRIGGER statements executed by the thread.

Dist Type  The number of CREATE or DROP DISTINCT TYPE statements executed by the thread.

Aux Table  The number of CREATE AUXILIARY TABLE statements executed by the thread.

Package  The number of the DROP PACKAGE statements executed by the thread.

JAR  The number of ALTER JAR statements executed by the thread.

Glob Temp Tab  The number of CREATE GLOBAL TEMPORARY TABLE statements executed by the thread.

Declare GTT  The number of DECLARE GLOBAL TEMPORARY TABLE statements executed by the thread.

RID List:

Successful  The number of times RID list processing used. This field is incremented once for a given table access for Index Access with list prefetch and for Multiple Index Access.

To Workfile (No Storage)  The number of times a RID list was overflowed to a work file because no RIDPOOL storage was available to hold the list of RIDs. DB2 10 and above.

Not Used (No Storage)  The number of times a RID list was not used for a given RID list process involving one index (Index Access with list prefetch) or involving multiple indexes (Multiple Index Access) because no storage was available to hold the list of RIDs.

To Workfile (Max Limit)  The number of times a RID list was overflowed to a work file because the number of RIDs exceeded one or more internal limits. DB2 10 and above.
Not Used (Max Limit)
The number of times one or more RID lists were not used for a given RID list process involving one index (Index Access with list prefetch) or involving multiple indexes (Multiple Index Access) because the number of RIDs exceeded one or more internal limits.

Interrupted (No Storage)
The number of times a RID list append for a Hybrid Join was interrupted because no RIDPOOL storage was available to hold the list of RIDs (that is, number of times DB2 interrupted the RID phase and switched to the Data phase). DB2 10 and above.

Skipped (Index Known)
The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing. DB2 10 and above.

Interrupted (Max Limit)
The number of times a RID list append for a Hybrid Join was interrupted because the number of RIDs exceeded one or more internal limits (that is, number of times DB2 interrupted the RID phase and switched to the Data phase). DB2 10 and above.

Skipped (Adaptive IX)
The number of times a DM is not called for RID list retrieval for multiple index access or LPF because it was not necessary due to Runtime Adaptive Index processing being able to predetermine the outcome. DB2 12 and later. (Field name: QXRSDMAD)

Query Parallelism fields:

Max Degree (Planned)
The planned maximum degree of parallelism for a parallel group. This value is the optimal degree of parallelism that can be obtained at execution time, after host variables or parameter markers are resolved, and before buffer pool negotiation and system negotiation are performed. DB2 11 and above.

Parallel Group Degenerated
Total number of parallel groups that changed to sequential mode during optimization, for reasons such as, the result of evaluation of a parallel group is that zero rows are returned, or a parallel group is partitioned on a single record. DB2 11 and above.

Max Degree (Estimated)
The estimated maximum degree of parallelism for a parallel group. This value is estimated at bind time, based on the cost formula. If a parallel group contains a host variable or parameter marker, the estimate is based on assumed values. DB2 11 and above.

Reform Parallelism (Config Chg)
The total number of parallel groups for which DB2 reformulated the parallel portion of the access path because the sysplex configuration was different from the sysplex configuration at bind time. This counter is only incremented by the parallelism coordinator at run time.

Max Degree (Executed)
Maximum degree of parallelism among the parallel groups to indicate the extent to which query parallelism applies.

Reform Parallelism (No Buf)
The total number of parallel groups for which DB2 reformulated the
parallel portion of the access path because there was not enough buffer pool resource. This counter is only incremented by the parallelism coordinator at run time.

**Ran Planned**
The total number of parallel groups that have a planned degree greater than one at run time, and were executed to the same degree because of sufficient storage on the buffer pool.

**Total Parallel Groups**
The total number of parallel groups executed.

**Ran Reduced (Storage)**
The total number of parallel groups that have a planned degree greater than one at run time, but were processed to a parallel degree less than planned because of a storage shortage or contention on the buffer pool.

**Groups Intended**
The total number of parallel groups that were intended to run across the data sharing group. This count is only incremented on the parallelism coordinator at run time.

**Ran Reduced (Negot)**
The total number of parallel groups for which the degree of parallelism was reduced as a result of parallel system negotiation because system resources were constrained. DB2 11 and above.

**Members Skipped**
The number of times that the parallelism coordinator had to bypass a DB2 when distributing tasks because there was not enough buffer pool storage on one or more DB2 members. This field is incremented only on the parallelism coordinator, and it is only incremented once per parallel group, even though it is possible that more than one DB2 had a buffer pool shortage for that parallel group. The purpose of this count is to indicate when there are not enough buffers on a member. Therefore, this count is incremented only when the buffer pool is defined to allow parallelism. For example, if VPXPSEQT = 0 on an assistant, DB2 does not send parallel work there, but this count is not incremented.

**Ran Seq (Cursor)**
The total number of parallel groups which fell back to sequential mode because the cursor may be used in UPDATE/DELETE.

**One DB2 (Coord=NO)**
The total number of parallel groups executed on a single DB2 due to the COORDINATOR subsystem parameter being set to NO. When the statement was bound, the COORDINATOR subsystem parameter was set to YES. This situation can also occur when a plan or package is bound on one DB2 where COORDINATOR=YES but is run on a DB2 where COORDINATOR=NO.

**Ran Seq (No Buffer)**
The total number of parallel groups that have a planned degree greater than one at run time, but fell back to sequential mode because of storage shortage or contention on the buffer pool.

**One DB2 (Isolation)**
The total number of parallel groups executed on a single DB2 due to repeatable-read or read-stability isolation.
Ran Seq (No ESA Sort)
The total number of parallel groups that fell back to sequential operation because of a lack of ESA sort support.

One DB2 (DCL GTT)
The total number of parallel groups that are part of a query block using a UDF and executed on a single DB2 due to the existence of a Declared Temporary Table in the application process. Neither the query block nor the parallel group references a Declared Temporary Table, and a parallel group may or may not use a UDF.

Ran Seq (Autonomous)
The total number of parallel groups that changed to sequential mode because they were executing under an autonomous procedure. DB2 11 and above.

Ran Seq (Negotiate)
The total number of parallel groups that changed to sequential mode as a result of parallel system negotiation because system resources were constrained. DB2 11 and above.

Ran Seq (No ESA Enc)
The total number of parallel groups executed in sequential because Z/OS enclave services were unavailable. DB2 9 only.

Miscellaneous fields:
Maximum LOB Storage
The maximum storage used for LOB values, in Megabytes.

Maximum XML Storage
The maximum storage used for XML values.

Maximum Nested SQL
Maximum level of nested SQL cascading because of Triggers, User-Defined Functions, or Stored Procedures.

Array Expansions
The number of times an array variable was expanded to be larger than 32KB. DB2 11 and above.

Sparse IX (Disabled)
The number of times that sparse index was disabled because of insufficient storage. DB2 11 and above.

Sparse IX (Built WF)
The number of times that sparse index built a physical work file for probing. DB2 11 and above.

Fetched 1 Block Only (QXR1BOAD)
The number of times 1 block is fetched and there were no further fetches. DB2 12 and later.

Trigger fields:
Statement Trigger
Number of times a Statement Trigger is activated.

Row Trigger
Number of times a Row Trigger is activated.
SQL Errors
Number of times an SQL error occurred during execution of a triggered action.

Stored procedures:
Executed
The number of CALL statements executed by the thread.

Timed Out
The number of times an SQL CALL timed out waiting to be scheduled. No TCB was available in the stored procedures address space or the procedure was in the STOP ACTION(QUEUE) state.

Rejected
The number of times an SQL CALL was rejected because the procedure was in the STOP ACTION(REJECT) state.

Abended
The number of times a stored procedure terminated abnormally.

User-defined functions (UDF) fields:
Executed
The number of user-defined functions (UDFs) executed.

Abended
The number of times a UDF abended.

Timed Out
The number of times a UDF timed out when waiting to be scheduled.

Rejected
The number of times a UDF was rejected.

Prepare Statistics:
Prepares (Copy Found)
The number of times that DB2 satisfied a prepare request by making a copy of a statement in the Prepared Statement Cache.

Prepare (Copy Not Found)
The number of times that DB2 searched the Prepared Statement Cache but could not find a suitable prepared statement.

Prepares (Catalog Found)
The number of times a PREPARE request is satisfied by making a copy from the stabilized statement in SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement is found in the prepared statement cache. DB2 12 and later. (Field name: QXSTSFND)

Prepare (Restrict IX)
The number of prepare statements for which the use of indexes was restricted because the indexes were in a pending state.

Literals (Parsed)
Number of times DB2 parsed dynamic statements because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

Literals (Replaced)
Number of times DB2 replaced at least one literal in a dynamic statement because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.
Literals (Matched)
Number of times DB2 found a matching reusable copy of a dynamic statement in cache because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

Literals (Duplicated)
Number of times DB2 created a duplicate stmt instance in the statement cache because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

KeepDyn (Prepared)
The number of times that DB2 did an implicit prepare for a statement bound with KEEPDYNAMIC(YES), because the Prepared Statement Cache did not contain a valid copy of the prepared statement.

KeepDyn (Avoided)
The number of times that DB2 did not prepare a statement bound with KEEPDYNAMIC(YES), because the Prepared Statement Cache contained a valid copy of the prepared statement.

KeepDyn (Exceed Limit)
The number of times that DB2 discarded a prepared statement from the Prepared Statement Cache, because the number of prepared statements in the cache exceeded the value of subsystem parameter MAXKEEPD.

KeepDyn (Invalidated)
The number of times that DB2 discarded a prepared statement from the Prepared Statement Cache, because a program executed a DROP, ALTER, or REVOKE statement against a dependent object.

Direct Row Access fields:

Direct Access
The number of times that DB2 used Direct Row Access to locate a record.

Index Used
The number of times that DB2 attempted to use Direct Row Access but reverted to using an Index to locate a record.

TS Scan Used
The number of times that DB2 attempted to use Direct row Access but reverted to using a Table Space scan to locate a record.

Row Processing:

Rows Fetched
The number of rows fetched.

Rows Inserted
The number of rows inserted.

Rows Updated
The number of rows updated.

Rows Deleted
The number of rows deleted.
Distributed Thread Detail (VTAM and TCP/IP Connections):

This panel provides information about VTAM APPC threads, TCP/IP threads, or RRSAF threads of an individual distributed thread. For VTAM APPC and TCP/IP conversations, it additionally includes statistics about the distributed activity of the thread.

VTAM APPC threads

The thread subtype determines the data that is displayed with the RSUM minor command.

This panel provides information about VTAM APPC conversations.

=========================================================

Fields

Distributed VTAM APPC Conversations

The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem. One line of output is displayed for each active conversation.

VTAM Luname

The VTAM logical unit name of the remote DB2 subsystem that is the partner on this VTAM APPC conversation.
VTAM Modename
The VTAM logmode in use by the APPC conversation. For database access threads, the logmode name exists and originates on the MVS system of the remote requester.

Last VTAM APPC Req
The most recent VTAM APPC request that was issued on the conversation.

Last VTAM APPC Qual
The most recent VTAM APPC qualifier that was issued on the conversation.

Time Since Last Req
The elapsed time since the last APPC command was issued on the conversation.

Conv Status
The status of the conversation.

WAIT-VTAM
The conversation is suspended and waiting for a VTAM response.

IN-VTAM
The conversation is active within VTAM.

NOT-ACTIVE
The conversation is inactive—neither waiting for a VTAM response nor active in VTAM.

VTAM Session ID
The VTAM session identifier in use by the conversation.

Distributed SQL statistics
The following group of fields occurs for each remote DB2 location with which the thread has communicated, either as a requester or a server. Each sent/received field generates two rows of output; the top row is the sent value, and the bottom row is the received value.

Remote Location Name
The name of a remote location with which the local DB2 has communicated.

Remote Location Luname
The logical unit name of the location specified in the “Remote Location Name” field. This field is not displayed for distributed TCP/IP threads.

Protocol Used
The type of distributed protocol being used. The values are SYSTEM, APPLICATION, or BOTH, depending on whether system directed access, application directed access, or both are being used.

Conversations Queued
The number of conversation requests queued by DDF waiting for allocation.

Conv Deallocated
The number of conversations deallocated.

Indoubt/Remote
The number of threads that went indoubt with the remote location as coordinator.
Dist Local Elapsed
The time the thread has spent waiting for a response to a remote SQL request (includes remote DB2 processing time, VTAM processing time, and network time). The time is calculated from the point of thread creation (or DB2 signon if the thread is reused). This field is displayed only for distributed allied threads.

SQL Sent/Recv
The number of SQL calls sent to and from the remote location since thread creation or DB2 signon.

Row Sent/Recv
The number of rows sent to and from the remote location since thread creation or DB2 signon.

Message Sent/Recv
The number of VTAM messages sent to and from the remote location since thread creation or DB2 signon.

Byte Sent/Recv
The number of bytes sent to and from the remote location since thread creation or DB2 signon.

Commit Sent/Recv
The number of Commits sent to and from the remote location since thread creation or DB2 signon.

Abort Sent/Recv
The number of aborts sent to and from the remote location since thread creation or DB2 signon.

Conv Sent/Recv
The number of conversations sent to and from the remote location since thread creation or DB2 signon.

Blocks Sent/Recv
The number of blocks sent and received using block fetch.
Distributed TCP/IP threads

This panel provides information about TCP/IP conversations.

Fields

**Distributed TCP/IP Data:** The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem. One line of output is displayed for each active conversation. TCP/IP activity is grouped by remote TCP/IP locations. The following fields are shown for each remote location with which this thread has communicated, as either a remote requestor (if a distributed allied thread) or server (if a database access thread).
Location
The IP address in dotted decimal notation.

PORT
The IP port number used in the connection.

Ctbuser
The binder’s AuthID.

Srvclsnam
The service class name as taken from the Accounting Record MVS Account Code and DDF Information Data Section (QMDA).

Prod ID
The Product ID parameter having the form PPPVVRRM, where PPP is the Product, VV is the Version, RR is the Release, and M is the Modification.

IP Addr
The IP address in Hexadecimal notation.

Workstation name
The end user's workstation name.

Account Loc Name
The DB2 LOCATION name for the DB2 system that created the QMDAINFO values if QMDALOCN is truncated.

Account Suffix
One of the following items apply:
• The MVS accounting string that is associated with the MVS address space of the DB2 SQL application.
• The account suffix. The maximum length of this field is 200 bytes. This environment variable is the user-supplied portion (suffix) of the accounting string.

Account String
The extended accounting string area.
• If QMDAASTR is defined by QMDAINFO, this area contains all the remaining bytes beyond position 142 for QMDAACCT.
• If QMDAASTR is defined by QMDASQLI, this area contains all the remaining bytes beyond position 200 for QMDASUFX.
• Otherwise, this area contains all bytes beyond position 247 for QMDAASTR.

This applies to DB2 11 or higher.

Transaction name
The name of the transaction.

TCP/IP Userid
The TCP/IP user ID.
Distributed RRSAF threads

This panel provides information about RRSAF conversations.

Distributed RRSAF Data: The Resource Recovery Services attachment facility (RRSAF) is a DB2 attachment facility that relies on a z/OS component called Resource Recovery Services (z/OS RRS). z/OS RRS provides system-wide services for coordinating two-phase commit operations across z/OS subsystems.

RRSAF information is limited to the following fields:

Ctbuser
The binder’s AuthID.

Workstation name
The end user’s workstation name. DB2 applications which use the RRSAF interface can invoke the DB2 DSNLI function SET_CLIENT_ID to pass this value.
**UserID**

The end user’s User ID. DB2 applications which use the RRSAF interface can invoke the DB2 DSNRLI function SET_CLIENT_ID to pass this value.

**Transaction name**

The name of the transaction. DB2 applications which use the RRSAF interface can invoke the DB2 DSNRLI function SET_CLIENT_ID to pass this value.

**Navigation**

For additional information about

* related topics, select one of the options at the top of the panel.
* other topics, use the PF keys.

**Fields**

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan** The Db2 plan name of the active thread.

**Connid**

The Db2 connection identifier of the active thread.

**Corrid** The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**

The Db2 authorization identifier of the active thread.

**Attach** Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package** The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**

The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier:** The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

**Type** The distributed thread type:

**Distributed Allied** A requesting thread that has issued an SQL call to a remote DB2 location.

**Database Access** A responding thread that is serving a remote DB2 location by responding to an SQL call.
Location
The remote location name.

Luwid  Logical unit of work indicator for the distributed thread. It has the following format (separated by periods):

network-name.originating-VTAM-luname.unique-identifier=token

**network-name**  
The network name

**originating-VTAM-luname**  
The originating VTAM LUNAME

**unique-identifier**  
The unique identifier

**token**  
You can use the token instead of luwid in any DB2 command that accepts luwid as input.

Threads with DB2 Connect gateway connections:

OMEGAMON XE for DB2 PE provides information about DB2 Connect Servers through a variety of panels. Some of these panels are documented in this topic.

Other DB2 Connect Server information is shown in panels that are documented in "DB2 Connect Server" on page 1430.

For a selected distributed database access thread (DBAT) the Distributed Thread Detail panel shows thread details. If the selected thread is currently inactive, the message THREAD NOT FOUND is displayed.

**DB2 Connect Server:**

This panel shows information about a DB2 Connect server that is related to the previously selected Distributed Database Access Thread (DBAT).

If the distributed thread does not have a connection through a DB2 Connect gateway, or if the Performance Expert Agent for DB2 Connect Monitoring (PE Agent) is not installed or not running on the DB2 Connect Server, the message No DB2 Connect server data available is displayed.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
Pool  The thread in use is a pool thread.

Entry  The thread in use is a nonprotected entry thread.

Prot  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS  The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF  The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System  The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO  The TSO user ID and region ASID.

Utility  No additional information.

Db2  The Db2 subsystem identifier.

MVS  The MVS system identifier.

ORIGAUTH  The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package  The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection  The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type  The distributed thread type.

Distributed Allied  A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access  A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=  The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the *Luwid* field displays data like in the following example:

```
USCAC001.02D22A.A1FE8E04B9D4=8
```

**System**

The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the *Attach* line identifies the user thread, if any, being served by the system thread.

**DB2C Master**

Shows the name of the member of the data sharing group that controls DB2 Connect monitoring for the group. If N/A is shown, the DB2C Master is currently being changed. For more information, see the description of panel “Redirect Monitoring to Another DB2” on page 900.

**DB2 Connect Server Information:**

**Name**

Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**IP Address**

Shows the current IP address.

**Node Name**

Shows the name of the node being monitored by the database system monitor. It identifies the database server node being monitored.

**Node Number**

Shows the number assigned to the node in the db2nodes.cfg file.

**Server Product/Version ID**

Shows the product and version that is running on the DB2 data server in the form *pppvvrrm*, where:

- *ppp* stands for SQL
- *vv* identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- *rr* identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- *m* identifies a 1-digit modification level

**Server Instance Name**

Shows the name of the database manager instance for which the snapshot was taken.

**Server Version**

Shows the version of the DB2 data server returning the information.

**Time Zone Displacement**

Shows the number of hours and minutes that the local time zone is displaced from Greenwich Mean Time (GMT).

**DB2 Connect Server - Overview:**

This panel shows application-, client-, and DB2 host-related information for the previously selected Distributed Database Access Thread (DBAT).

If the distributed thread does not have a connection through a DB2 Connect gateway, or if the Performance Expert Agent for DB2 Connect Monitoring (PE
Agent) is not installed or not running on the DB2 Connect Server, the message No DB2 Connect server data available is displayed.

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

Pool The thread in use is a pool thread.

Entry The thread in use is a nonprotected entry thread.

Prot The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO The TSO user ID and region ASID.

Utility No additional information.

Db2 The Db2 subsystem identifier.
### MVS
The MVS system identifier.

### ORIGAUTH
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

### Package identifier:
This information identifies the package to which the information in this panel applies.

#### Package
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

#### Collection
The package collection identifier. This field is displayed only if a package is being used.

### Distributed thread identifier:
The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

#### Type
The distributed thread type.

- **Distributed Allied**
  A requesting thread; one that has issued an SQL call to a remote Db2 location.

- **Database Access**
  A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

- **Db2=**
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

- **Luwid**
  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
  \[\text{luw-id}=\text{token}\]
  The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the *Luwid* field displays data like in the following example:
  \[\text{USCACO01.O2D22A.A1FE8E04B9D4}=8\]

- **System**
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the *Attach* line identifies the user thread, if any, being served by the system thread.

- **DB2C Master**
  Shows the name of the member of the data sharing group that controls DB2 Connect monitoring for the group. If N/A is shown, the DB2C Master is currently being changed. For more information, see the description of panel *Redirect Monitoring to Another DB2* on page 900.

### Application information:

#### Application Handle (agent ID)
Shows the system-wide unique ID for the application.

#### Application Name
Shows the name of the application running at the client as known to the DB2 Connect.
Application ID
Shows the identifier that is generated when the application connects to the database manager or when Distributed Database Connection Server (DDCS) receives a request to connect to a DRDA database.

Transaction ID
Shows the unique transaction identifier across all databases generated by a transaction manager in a two-phase-commit transaction.

Authorization ID
Shows the authorization ID of the user who invoked the application.

Code Page Used by Application
Shows the code page identifier.

Client Process ID
Shows the process ID of the client application that made the connection to the database.

Client Operation Platform
Shows the operating system on which the client application is running.

Client Communication Protocol
Shows the communication protocol that the client application is using to communicate with the server.

Host Coded Character Set ID
Shows the coded character set identifier (CCSID) of the host database.

Configuration Name of Client
Shows the NNAME in the database manager configuration file at the client node.

Client Product/Version ID
Shows the communication address of the client. It could be an SNA net ID and LU partner name, or an IP address and port number for TCP/IP.

Inbound Communication Address
Shows the product and version that is running on the client.

DCS Application Status
Shows the current status of the application.

Application Status Change Time
Shows the date and time the application entered its current status.

User Login ID
Shows the ID that the user specified when logging in to the operating system.

Sequence Number
Increments whenever a unit of work ends, that is, when a COMMIT or ROLLBACK terminates a unit of work.

Database Alias at Gateway
Shows the alias used at the DB2 Connect gateway to connect to the host database.

DCS Database Name
Shows the name of the remote database as cataloged in the DCS directory.

Outbound Application ID
Is generated when the application connects the DRDA host database.
Outbound Sequence Number
Is generated when the application connects the DRDA host database.

Outbound Communication Address
Shows the communication address of the target database.

Outbound Communication Protocol
Shows the communication protocol used between the DB2 Connect gateway and host.

Last Reset Timestamp
Shows the date and time that the monitor counters were reset for the application issuing the GET SNAPSHOT.

Application Idle Time
Shows the number of seconds since an application issued any requests to the server.

SQL Stmt
Shows the number of SQL statements that have been attempted since the latter of: application startup, database activation, or last reset.

Failed Stmt
Shows the number of SQL statements that were attempted, but failed.

Failed Stmt %
Shows the percentage of failed statements versus all SQL statements.

Open Cursor
Shows the number of cursors currently open for an application.

Commit
Shows the total number of SQL COMMIT statements that have been attempted.

Rollback
Shows the total number of SQL ROLLBACK statements that have been attempted.

Row
Shows the number of rows that have been selected and returned to the application.

Transmissions
Shows the number of data transmissions between DB2 Connect gateway and host that was used to process this DCS statement. (One data transmission consists of one send or one receive).

Client fields:

DB2 Connect First Connection
Shows the date and time at which the first connection to the host database was initiated from the DB2 Connect gateway.

Unit of Work Start Timestamp
Shows the date and time at which the unit of work first required database resources.

Unit of Work Stop Timestamp
Shows the date and time at which the most recent unit of work completed which occurs when database changes are committed or rolled back.

Previous UOW Completion Timestamp
Shows the time the unit of work completed.
**Unit of Work Completion Status**
Shows the status of the unit of work and how it stopped. It can have:
- Committed because of a COMMIT statement
- Rolled back because of a ROLLBACK statement
- Rolled back because of a deadlock
- Rolled back due to an abnormal termination
- Committed at normal application termination
- Unknown as a result of a FLUSH EVENT MONITOR command for which units of work were in progress.

**Elapsed Time DB2CONN Execution**
Shows the time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement.

**Most Recent UOW Elapsed Time**
Shows the elapsed execution time of the most recently completed unit of work.

**DB2 Host fields:**

**Database Name**
Shows the real name of the host database for which information is being collected or to which the application is connected. This is the name that was given to the database when it is created.

**Product/Version ID**
Shows the product and version that is running on the DB2 data server in the form pppvvvrmm, where:
- ppp stands for SQL
- vv identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- rr identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- mm identifies a 1-digit modification level

**Response Time**
For a DCS statement, this is the elapsed time between the time that the statement was sent from the DB2 Connect gateway to the host for processing and the time when the result was received from the host.

**Stmt Execution Elapsed Time**
For a DCS statement, this is the elapsed time spent processing an SQL request on a host database server.

**Inbound Byte Sent**
Shows the number of bytes sent by the DB2 Connect gateway to the client, excluding communication protocol overhead (for example, TCP/IP or SNA headers).

**Inbound Byte Received**
Shows the number of bytes received by the DB2 Connect gateway from the client, excluding communication protocol overhead (for example, TCP/IP or SNA headers).

**Outbound Byte Sent**
Shows the number of bytes sent by the DB2 Connect gateway to the host excluding communication protocol overhead (for example, TCP/IP or SNA headers).
Outbound Byte Received

Shows the number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead (for example, TCP/IP or SNA headers).

DB2 Connect Server - Statement Information:

This panel shows SQL statement-, time-, and network traffic-related information for the previously selected Distributed Database Access Thread (DBAT).

If the distributed thread does not have a connection through a DB2 Connect gateway, or if the Performance Expert Agent for DB2 Connect Monitoring (PE Agent) is not installed or not running on the DB2 Connect Server, the message No DB2 Connect server data available is displayed.
Navigation

For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

Pool The thread in use is a pool thread.

Entry The thread in use is a nonprotected entry thread.

Prot The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO The TSO user ID and region ASID.

Utility No additional information.

Db2 The Db2 subsystem identifier.
MVS  The MVS system identifier.

ORIGAUTH  
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier:  This information identifies the package to which the information in this panel applies.

Package  
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection  
The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier:  The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type  
The distributed thread type.

Distributed Allied  
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access  
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=  
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid  
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:  

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E94B9D4=8

System  
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

DB2C Master  
Shows the name of the member of the data sharing group that controls DB2 Connect monitoring for the group. If N/A is shown, the DB2C Master is currently being changed. For more information, see the description of panel "Redirect Monitoring to Another DB2" on page 900.

SQL statements:

Section Number  
Shows the internal section number in the package for the SQL statement that is currently processing or has processed most recently.
**Query Cost Estimate**
Shows the estimated cost, in “timerons”, for a query, as determined by the SQL compiler.

**Query Number of Rows Estimate**
Shows the estimated number of rows that is returned by a query.

**Statement Operation**
Shows the statement operation that is currently being processed or has processed most recently (if none is currently running).

**Number of Successful Fetches**
For statement snapshot monitoring and statement event type, this is the number of successful fetches performed on a specific cursor.

**Blocking Cursor**
Indicates whether the statement being executed is using a blocking cursor.

**Outbound Blocking Cursor**
Indicates whether blocking is used for data transfer from DRDA server to the DB2 Connect gateway for a particular query.

**Application Creator**
Shows the authorization ID of the user who precompiled the application.

**Package Name**
Shows the name of the package that contains the SQL statement that is currently executing.

**Stmt Trans: No of Transmissions**
Shows the number of data transmissions between the DB2 Connect gateway and the host that was used to process this DCS statement.

**Stmt Trans: No of Statements**
Shows the number of SQL statements that have been attempted since the latter of: application startup, database activation, or last reset.

**Time fields:**

**Statement Start Timestamp**
Shows the date and time at which the statement operation started execution.

**Statement Stop Timestamp**
Shows the date and time at which the statement operation stopped execution.

**Time Spent on Gateway Processing**
Shows the time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement.

**Host Response Time**
For a DCS statement, this is the elapsed time between the time that the statement was sent from the DB2 Connect gateway to the host for processing and the time when the result was received from the host.

**Most Recent Stmt Elapsed Time**
Shows the elapsed execution time of the most recently completed statement.
Stmt Elapsed Execution Time
For a DCS statement, this is the elapsed time spent processing an SQL request on a host database server.

Local: System CPU Time
Shows the total system CPU time, in seconds and microseconds, used by the statement that is currently executing.

Local: User CPU Time
Shows the total user CPU time, in seconds and microseconds, used by the statement that is currently executing.

Network Statistics fields:
Inbound Number of Bytes Sent
Shows the number of bytes sent by the DB2 Connect gateway to the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

Inbound Number of Bytes Received
Shows the number of bytes received by the DB2 Connect gateway from the client, excluding communication protocol overhead, such as TCP/IP or SNA headers.

Outbound Number of Bytes Sent
Shows the number of bytes sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

Outbound Number of Bytes Received
Shows the number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead, such as TCP/IP or SNA headers.

DB2 Connect Server - Package Statistics:
This panel shows package statistics for the previously selected Distributed Database Access Thread (DBAT).

If the distributed thread does not have a connection through a DB2 Connect gateway, or if the Performance Expert Agent for DB2 Connect Monitoring (PE Agent) is not installed or not running on the DB2 Connect Server, the message No DB2 Connect server data available is displayed.
### Navigation

| Attach              | Depending on the type of connection, the appropriate information is displayed.         |
|                    | Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads). |
Connection Type

**Batch**  The MVS jobname and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**CICS**  The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
- **Pool**  The thread in use is a pool thread.
- **Entry**  The thread in use is a nonprotected entry thread.
- **Prot**  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS**  The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF**  The MVS job name and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**System**  The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**TSO**  The TSO user ID and region ASID.

**Utility**  No additional information.

**Db2**  The Db2 subsystem identifier.

**MVS**  The MVS system identifier.

**ORIGAUTH**  The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**  The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**  The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier:** The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

**Type**  The distributed thread type.

**Distributed Allied**  A requesting thread; one that has issued an SQL call to a remote Db2 location.
Database Access
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2= The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:
USCACO01.02022A.A1FE8E0489D4=8

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

DB2C Master Shows the name of the member of the data sharing group that controls DB2 Connect monitoring for the group. If N/A is shown, the DB2C Master is currently being changed. For more information, see the description of panel "Redirect Monitoring to Another DB2" on page 900.

Outbound data fields:

Outbound Data Sent Shows the number of bytes sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

Outbound Data Received Shows the number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

Outbound Data Sent Top Shows the maximum number of bytes sent by the DB2 Connect gateway to the host.

On statement level, this is the maximum value on a per statement base measured during the processing of all statements against the Database Connection Services (DCS) database.

On data transmission level, this is the maximum value occurring in the DCS application during the processing of all statements that used the displayed number of data transmissions.

Outbound Data Received Top Shows the maximum number of bytes received per statement by the DB2 Connect gateway from the host during the processing of all statements against this DCS database, or in this DCS application, that used this number of data transmissions.

Outbound Data Sent Bottom Shows the lowest number of bytes sent per statement by the DB2 Connect
gateway to the host during the processing of all statements against this DCS database, or in this DCS application, that used this number of data transmissions.

**Outbound Data Received Bottom**
Shows the lowest number of bytes received per statement by the DB2 Connect gateway from the host during the processing of all statements against this DCS database, or in this DCS application, that used this number of data transmissions.

**Outbound data sent/received fields:**

**Statement Transaction: max data sent/received 128**
Shows the number of statements with outbound bytes sent/received from 1 through 128.

**Statement Transaction: max data sent/received 256**
Shows the number of statements with outbound bytes sent/received from 129 through 256.

**Statement Transaction: max data sent/received 512**
Shows the number of statements with outbound bytes sent/received from 257 through 512.

**Statement Transaction: max data sent/received 1024**
Shows the number of statements with outbound bytes sent/received from 513 through 1024.

**Statement Transaction: max data sent/received 2048**
Shows the number of statements with outbound bytes sent/received from 1025 through 2048.

**Statement Transaction: max data sent/received 4096**
Shows the number of statements with outbound bytes sent/received from 2049 through 4096.

**Statement Transaction: max data sent/received 8192**
Shows the number of statements with outbound bytes sent/received from 4097 through 8192.

**Statement Transaction: max data sent/received 16384**
Shows the number of statements with outbound bytes sent/received from 8193 through 16384.

**Statement Transaction: max data sent/received 31999**
Shows the number of statements with outbound bytes sent/received from 16385 through 31999.

**Statement Transaction: max data sent/received 64000**
Shows the number of statements with outbound bytes sent/received from 32000 through 64000.

**Statement Transaction: max data sent/received GT64K**
Shows the number of statements with outbound bytes sent/received greater than 64000.

**Network time fields:**

**Statement Transaction: max time 2ms**
Shows the number of statements whose network time was less then, or equal to, 2 milliseconds.
**Statement Transaction: max time 4ms**
Shows the number of statements whose network time was greater than 2 milliseconds but less than, or equal to, 4 milliseconds.

**Statement Transaction: max time 8ms**
Shows the number of statements whose network time was greater than 4 milliseconds but less than, or equal to, 8 milliseconds.

**Statement Transaction: max time 16ms**
Shows the number of statements whose network time was greater than 8 milliseconds but less than, or equal to, 16 milliseconds.

**Statement Transaction: max time 32ms**
Shows the number of statements whose network time was greater than 16 milliseconds but less than, or equal to, 32 milliseconds.

**Statement Transaction: max time GT32ms**
Shows the number of statements whose network time was greater than 32 milliseconds.

**Thread Buffer Pool Activity:**

This panel provides detailed information about buffer manager activity at the buffer pool level for an individual thread.
### Highlighting

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:
Table 92. Highlighted fields in Thread Buffer Pool Activity panel.

This table shows the fields and the exceptions these fields are related to. It also shows the reason for the corresponding exception.

</table>

**Fields**

**Thread identifier**: This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  The Db2 authorization identifier of the active thread.

**Attach**  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  The MVS jobname and ASID.

**Note**: For threads from remote Db2, the MVS job name is N/A.

**CICS**  The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool**  The thread in use is a pool thread.
- **Entry**  The thread in use is a nonprotected entry thread.
- **Prot**  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.
| **IMS** | The IMS region number, transaction name, region name, and terminal ID (LTERM). |
| **RRSAF** | The MVS job name and ASID.  
*Note:* For threads from remote Db2, the MVS job name is N/A. |
| **System** | The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the *Attach* line identifies the user thread, if any, being served by the system thread. |
| **TSO** | The TSO user ID and region ASID. |
| **Utility** | No additional information. |
| **Db2** | The Db2 subsystem identifier. |
| **MVS** | The MVS system identifier. |
| **ORIGAUTH** | The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid. |

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**  
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**  
The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier:** The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

**Type**  
The distributed thread type.

**Distributed Allied**  
A requesting thread; one that has issued an SQL call to a remote DB2 location.

**Database Access**  
A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

**Luwid**  
This value consists of two parts: the logical unit-of-work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:  

\[ \text{luw-id=token} \]

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the *Luwid* field displays data such as the following:  

\text{USCACO01.02D22A.A1FE8E0489D4*8}  

**System**  
The originating DB2 job name and the resource manager that is the source of the thread.
An additional line below the attachment identifier displays the user thread, if any, that is served by the system thread.

**Thread status:** The totals for all of the buffer pools in use by the thread are displayed, followed by the values for each individual buffer pool in use.

**Getpage Requests**
- The number of thread Getpage requests. The value includes conditional, unconditional, successful, and unsuccessful requests. This logical read request might not actually result in physical I/O of the page request currently in the buffer pool.

**Failed Getpage Requests**
- The number of times a conditional Getpage request could not be satisfied. Conditional Getpage, used only with queries being processed in parallel, will not wait for a page that is not currently in the buffer pool.

**Synchronous Read I/O**
- The number of synchronous Read I/O requests issued by the thread.

**Getpage/Read I/O**
- The number of Getpage requests divided by the number of synchronous Read I/Os. This value does not include Prefetch requests, because each prefetch request can return a variable number of pages (from one to 16).

**Page Updates**
- The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2's internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Seq Prefetch Requests**
- The number of Prefetch requests issued by the thread.
  - Unlike normal Read I/O, Sequential Prefetch Read I/O is performed asynchronously with the user's request. It provides a read-ahead capability. A single sequential prefetch I/O results in multiple pages being read. Threads with excessive Sequential Prefetch rates can cause reduced overall DB2 performance.

**List Prefetch Requests**
- The number of List Prefetch requests issued by the thread.

**Dynamic Prefetch Requests**
- The number of Dynamic Prefetch requests made.

**Prefetch Pages Read**
- The number of pages read asynchronously for prefetch.

**Immediate Writes**
- The number of immediate (synchronous) writes to DASD.

**BP Hit Percentage**
- The percentage of Getpage requests issued by the thread for which the data was already in the buffer pool.
Thread Group Buffer Pool Activity:

This panel provides a summary of group buffer pool usage for an individual thread.

This panel is only available in a data sharing environment.

<table>

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  The Db2 authorization identifier of the active thread.

**Attach**  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  The MVS jobname and ASID.

**Note:** For threads from remote Db2, the MVS job name is N/A.

**CICS**  The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool**  The thread in use is a pool thread.
- **Entry**  The thread in use is a nonprotected entry thread.
- **Prot**  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS**  The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF**  The MVS job name and ASID.

**Note:** For threads from remote Db2, the MVS job name is N/A.

**System**

The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

**TSO**  The TSO user ID and region ASID.

**Utility**  No additional information.

**Db2**  The Db2 subsystem identifier.
MVS  The MVS system identifier.

ORIGAUTH  
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package  
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection  
The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type  
The distributed thread type.

Distributed Allied  
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access  
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=  
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid  
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format: 

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E9489D4=8

System  
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Group buffer pool information:

Group Buffer Pool  
The group buffer pool ID.

Reads - Cross-Invalidation: Data Returned  
The number of reads to the group buffer pool required because the page in the member’s buffer pool was invalidated, where the data was found and returned to the member.

Reads - Page Not Found: Data Returned  
The number of reads to the group buffer pool required because the page was not in the member’s buffer pool, where the data was found and returned to the member.
Reads - Cross-Invalidation: Data not in GBP-R/W Int
The number of reads to the group buffer pool required because the page in the member's buffer pool was invalidated, where
- the data was not found in the group buffer pool and the member had to go to DASD to read the page, and
- other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

Reads - Page Not Found: Data not in GBP-R/W Int
The number of reads to the group buffer pool required because the page was not in the member's buffer pool, where
- the data was not found in the group buffer pool and the member had to go to DASD to read the page, and
- other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

Reads - Cross-Invalidation: Data not in GBP-No R/W Int
The number of reads to the group buffer pool required because the page in the member's buffer pool was invalidated, where
- the data was not found in the group buffer pool and the member had to go to DASD to read the page, and
- no other member had read/write interest in the pageset, so DB2 did not have to register the page, since another member cannot cause a cross-invalidation by updating a page.

Reads - Page Not Found: Data not in GBP-No R/W Int
The number of reads to the group buffer pool required because the page was not in the member's buffer pool, where
- the data was not found in the group buffer pool and the member had to go to DASD to read the page, and
- no other member had read/write interest in the pageset, so DB2 did not have to register the page, since another member cannot cause a cross-invalidation by updating a page.

Read Hit Percentage
The percentage of all Reads to the group buffer pool for which the needed data was found and returned to the member.

Read-to-Write Percentage
The ratio of reads to writes expressed as a percentage for the group buffer pool.

Changed Pages Written
The number of changed pages written to the group buffer pool. Pages can be forced out before the application commits if a buffer pool threshold is reached, or when P-lock negotiation forces the pages on the vertical Deferred Write queue to be written to the group buffer pool.

Clean Pages Written
The number of clean pages written to the group buffer pool. DB2 writes clean pages for pagesets and partitions defined with GBPCACHE ALL.

Thread Package Summary:
This panel shows a summary of activity that has occurred for all packages/DBRMs that have been executed by this thread.
It provides information collected for Accounting trace classes 7 and 8. If these DB2 traces are not active, this information is not available.

<table>
<thead>
<tr>

<td>Same as other thread detail panels.</td>
</tr>
</tbody>
</table>

Navigation

For additional information about
- a specific package/DBRM, move the cursor to the required line and press F11 (Zoom). For more information, see the description of panel “Package Detail” on page 1003.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

**Thread identifier**: This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.
Authid
The Db2 authorization identifier of the active thread.

Attach
Depending on the type of connection, the appropriate information is displayed.
Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type
Batch
The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS
The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
- Pool The thread in use is a pool thread.
- Entry The thread in use is a nonprotected entry thread.
- Prot The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS
The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF
The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO
The TSO user ID and region ASID.

Utility
No additional information.

Db2
The Db2 subsystem identifier.

MVS
The MVS system identifier.

ORIGAUTH
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection
The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.
Type  The distributed thread type.

**Distributed Allied**
A requesting thread; one that has issued an SQL call to a remote DB2 location.

**Database Access**
A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

**Luwig**
This value consists of two parts: the logical unit-of-work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

```
luw-id=token
```

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the *Luwig* field displays data such as the following:

```
USCAC001.02D22A.A1FE8E94B9D4=8
```

**Package list:** For each entry in the package list, the display indicates the location, collection, and package that were bound into the plan.

**Location**
The name of the location where the package was bound. For remote packages, times displayed represent the time spent locally to execute the remote package.

**Collection**
The package collection identifier. This field is displayed only if a package is being used.

**Package**
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Package/DBRM information:**

**Program**
Program filtering input field. You can enter a specific package or DBRM that you want to display in the panel. You can use wildcard characters in this field. For example, enter `DSNESM*` to display all packages or DBRMs that begin with DSNESM.

**Package/DBRM**
The name of the program for which data is reported. Up to 18 characters of the package name are returned. An asterisk (*) is displayed after the program name of the last executed program.

**SQL Requests**
The number of SQL statements issued in this package or DBRM.

**Total Elapsed Time**
The total elapsed time while executing in this package or DBRM. This field requires an Accounting trace class 7. If this trace is not active, N/A is displayed.

**Total CPU Time**
The total CPU time used while executing in this package or DBRM. This field requires an Accounting trace class 7. If this trace is not active, N/A is displayed.
Waits  The total number of times that the thread had to wait for a class 8 event to complete while executing in this package or DBRM. This field requires an Accounting trace class 8. If this trace is not active, N/A is displayed.

Total Wait Time  The total time spent waiting for a class 8 event to complete while executing in this package or DBRM. This field requires an Accounting trace class 8. If this trace is not active, N/A is displayed.

Package Detail:

This panel provides detailed information about the activity that has occurred for specific packages/DBRMs that have been executed by a particular thread.

It provides information collected for accounting classes 7 and 8. If these DB2 traces are not active, this information is not available.
Highlighting

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

Table 95. Highlighted fields in Package Detail panel.

This table shows the fields and the exceptions these fields are related to. It also shows the reason for the corresponding exception.

<table>

To return to the Thread Package Summary panel, press F3.

Fields

**Thread identifier**: This information identifies the thread to which the information in this panel applies.

**Plan**  
The Db2 plan name of the active thread.

**Connid**  
The Db2 connection identifier of the active thread.

**Corrid**  
The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  
The Db2 authorization identifier of the active thread.

**Attach**  
Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  
The MVS jobname and ASID.
Note: For threads from remote Db2, the MVS job name is N/A.
