| Collection | The package collection identifier. This field is displayed only if a package is being used. |

**Distributed thread identifier:** The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

<table>
<thead>
<tr>
<th>Type</th>
<th>The distributed thread type.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Distributed Allied</td>
</tr>
<tr>
<td></td>
<td>Database Access</td>
</tr>
<tr>
<td></td>
<td>Db2</td>
</tr>
</tbody>
</table>

A requesting thread; one that has issued an SQL call to a remote Db2 location.

A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

The Db2 subsystem ID, indicating the member of the data sharing group of this thread.
Luwid  This value consists of two parts: the logical unit of work ID (luw-id) and a
token. The token can be used in place of the luw-id in any Db2 command
that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME,
and a unique identifier (separated by periods). Thus, the Luwid field
displays data like in the following example:
USCACO01.02D22A.A1FE6E04B9D4=8

System  The originating Db2 job name and the resource manager that is the source
of the thread. An additional line below the Attach line identifies the user
thread, if any, being served by the system thread.

Package information:

Program  The program name for which data is reported. Up to 18 characters of the
package name are returned.

Type  The program type can be:
• PACKAGE
• DBRM
• PACKAGE-STORPROC, which means that the program is a package that
was loaded by a stored procedure.

Location  The name of the location where the package is executed. For remote
packages, times displayed represent the time spent locally to execute the
remote package.

Token  The consistency token.

Collection  The package collection ID. This field is displayed only if the program type
is PACKAGE.

SQL Request Count  The number of SQL statements issued. All DCL, DDL, and DML SQL
statements as well as some Statistic Counters from DSNDQXST are
included. COMMIT and ROLLBACK/ABORT are not included.

In-DB2 Times: In-DB2 times require an Accounting trace class 7. If this trace is not
active, N/A is displayed.

In-DB2 elapsed time  The elapsed time while processing this package or DBRM:
Total  The total time the thread spends processing this package or DBRM.
Current  The total time spent processing the currently active SQL statement.

In-DB2 CPU time  The CPU time spent processing this package or DBRM.
Total  The total time the thread spends processing this package or DBRM.
Current  The total time spent processing the currently active SQL statement.
Waits: Wait times require an Accounting trace class 8. If this trace is not active, N/A is displayed. The following Statistics information is provided for each field described below:

**Count**  The total number of waits.
**Total**  The total wait time.
**Current**  The elapsed time waiting for the current event to complete.

**Synchronous I/O Wait**
Waits for synchronous I/O reads or writes.

**Asynchronous Read I/O Wait**
Waits for Read I/O performed under another thread (for example, list or Sequential Prefetch).

**Asynchronous Write I/O Wait**
Waits for Write I/O performed under another thread (for example, deferred writes).

**Local Lock/Latch Wait**
Waits for locks or latches.

**Page Latch Wait**
Waits for page latch.

**Drain Lock Wait**
Waits to acquire drain lock.

**Drain of Claims Wait**
Waits for claims to be released after acquiring drain lock.

**Global Lock Wait**
Waits for global locks in a data sharing environment.

**Global Parent L-Lock Wait**
Waits for global parent L-locks in a data sharing environment.

**Global Child L-Locks (QWACAWTK QWACARNK)**
Waits because of global contention for child L-locks.

**Global Other L-Locks (QWACAWTM QWACARNM)**
Waits because of global contention for other L-locks.

**Global Pageset/Partition P-Locks (QWACAWTN QWACARNN)**
Waits because of global contention for Pageset/Partition P-locks.

**Global Page P-Locks (QWACAQTO QWACARNO)**
Waits because of global contention for Page P-locks.

**Global Other P-Locks (QWACAQTQ QWACARNQ)**
Waits because of global contention for other P-locks.

**Inter-System Message Send Wait**
Waits for sending messages to other members in the data sharing group.

**DB2 Service Task Wait**
Waits for DB2 services. The following types of DB2 services are included:
- Open/close of data set
- DFHSM recall of a data set
- SYSLGRNG update
- Define/extend/delete of data set
• Commit phase 2 for read only threads.
Starting from DB2 11, waits that are associated with autonomous procedures are also included.

Archive Log Mode(Quiesce) Wait
Wait for ARCHIVE LOG MODE(QUIESCE) command to complete.

Archive Read from Tape Wait
Waits for read of archive log from tape.

Current I/O Wait Resource
If the thread is currently waiting for an I/O to complete, the resource will be identified here.

Parallel Query Sync Wait (QPAC_PQS_WAIT QPAC_PQS_COUNT)
The amount of waits after parallel query processing suspended waiting for parent/child to be synchronized.
This applies to DB2 11 and higher.

LOB Materialization Wait (QPACALBW QPACALBC)
Waits for TCP/IP LOB and XML materialization.

Accelerator Wait (QWACAACW QPACAACC)
The accumulated wait time for requests to an accelerator. DB2 11 and later.

Pipe Wait (QOAC_PIPE_WAIT QPACPIPEWAIT_COUNT)
The accumulated wait time for a pipe while this package is being executed. DB2 12 and later.

Total Class 3 Wait Time
The total class 3 wait time.

Thread Resource Limit Statistics:

This panel shows information about the parameters that control and administer the thread resource limit facility (governor). This DB2 governor facility applies to dynamic SQL calls only.
Highlighting

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

Table 96. Highlighted fields on Thread Resource Limit Statistics panel

<table>
<thead>
<tr>
<th>Fields</th>
<th>Exception</th>
<th>Reason</th>

<tbody>
<tr>
<td>Resource Limit High Water Mark (CPU)</td>
<td>RELM</td>
<td>The ratio of CPU consumption to the resource limit indicates a high resource usage.</td>
</tr>
</tbody>
</table>

**Navigation**

For additional information about
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan** The Db2 plan name of the active thread.

**Connid**

The Db2 connection identifier of the active thread.

**Corrid** The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**

The Db2 authorization identifier of the active thread.

**Attach** Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch** The MVS jobname and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**CICS** The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool** The thread in use is a pool thread.
- **Entry** The thread in use is a nonprotected entry thread.
- **Prot** The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS** The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF** The MVS job name and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**System** The originating Db2 job name and the resource manager that is the
source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**TSO**  The TSO user ID and region ASID.

**Utility**  No additional information.

**Db2**  The Db2 subsystem identifier.

**MVS**  The MVS system identifier.

**ORIGAUTH**  The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**  The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**  The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier:** The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

**Type**  The distributed thread type.

**Distributed Allied**  A requesting thread; one that has issued an SQL call to a remote DB2 location.

**Database Access**  A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

**Luwid**  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:

\[
\text{luw-id}=\text{token}
\]

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

```
USCAC001.02D22A.A1FE8E04B9D4=8
```

**Resource limit information:**

**Resource Limit Table Name in Use**  The name of the DB2 resource limit specification table (RLST) currently in use by the DB2 subsystem.

**Resource Limit Origin**  The origin of the resource limit in effect for this thread, if resource limiting is active. The origin is determined by the hierarchical precedence order within the resource limit specification table (RLST). The possible origins are:

**Auth/Plan**  Table entry containing matching authid and plan name.
Authid
Table entry containing matching authid, and plan name was blank.

Planname
Table entry containing matching plan name, and authid was blank.

Blank Entry
Table entry containing blank plan name and authid.

Install
No table entry exists; the value in effect was determined from the RLFERR/RLFERRD parameter of the DSNZPARM module.

I/O Error
Resource limit table I/O error; the value in effect was determined from the RLFERR/RLFERRD parameter of the DSNZPARM module.

Sysadm/Sysopr
Table entry is install SYSADM or SYSOPR. No limits apply to these authorization groups.

Auth/Coll/Pkg
Table entry containing matching authid, collection and package.

Auth Any Pkg
Table entry containing matching authid and collection, and blank package.

Auth any Coll
Table entry containing matching authid and package, and blank collection.

Auth Any Pkg/Coll
Table entry containing matching authid and blank collection and package.

Pkg/Coll Any Auth
Table entry containing matching package and collection.

Any Auth/Pkg
Table entry containing matching collection and blank authid and package.

Any Auth/Coll
Table entry containing matching package and blank authid and collection.

Any Auth/Coll/Pkg
Table entry containing blank authid, collection and package.

Resource Limit in Effect (SUs)
The resource limit in MVS service units for the thread. Express® DB2 limits in service units. If the origin is Sysadm/Sysopr or the ASUTIME parameter is NULL, no limits apply.

Resource Limit CPU Time per SU
The number of CPU seconds per service unit. The number of CPU seconds per service unit depends upon the CPU model in use. This is helpful in understanding the actual CPU time allowed by the resource limit specified (in SUs). This value is expressed in seconds.

Resource Limit in Effect (CPU secs)
The resource limit in effect in CPU seconds. This is the actual CPU time allowed, based on the service units limit specified in the DB2 resource limit
table. This value is expressed in seconds. If the origin is Sysadm/Sysopr or the ASUTIME parameter is NULL, no limits apply.

**Resource Limit High Water Mark (CPU)**

The highest CPU time used for a single dynamic request since thread creation. This value is expressed in seconds. This value can be higher than the value of Resource Limit in Effect (CPU secs) because of the logic for checking the high-water mark of the DB2 subsystem. This field will display a high-water mark value even if the thread is not governed by the Resource Limit Facility. (In that case, the Ratio of HWM to Resource Limit will be No Limit.)

**Ratio of HWM to Resource Limit (CPU)**

The ratio/percentage of the CPU high-water mark (HWM) to the CPU resource limit in effect. This value can be higher than 100% because of the logic for checking the high-water mark of the DB2 subsystem.

**Current Parallel Task Summary:**

This panel provides information about the activity of parallel tasks that are executing on behalf of a thread.

Parallel tasks are created when CPU parallelism is selected as the method for processing an SQL query. Internally, parallel tasks are displayed as DB2 system threads.

---

**Navigation**

For more information about

- A particular parallel task, move the cursor to the task information line and press F11 (Zoom). For more information, see the description of panel “Thread Detail” on page 923.
- Exceptions that have tripped, type E.A on the top line of the panel.
- Related topics, select one of the options at the top of the panel.
- Other topics, use the PF keys.
Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

Pool The thread in use is a pool thread.

Entry The thread in use is a nonprotected entry thread.

Prot The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO The TSO user ID and region ASID.

Utility No additional information.

Db2 The Db2 subsystem identifier.

MVS The MVS system identifier.

ORIGAUTH The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.
**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**
The package collection identifier. This field is displayed only if a package is being used.

**Elapsed**
The time elapsed since the parallel task was created. When the task’s elapsed time exceeds 24 hours, the format is *dd-hh:mm*.

**CPU Time**
The total central processor CPU time accumulated for the thread. This value includes only MVS TCB time. SRB time is not included.

**Status**
The current DB2 status of the parallel task. For definitions of all possible status values, see "DB2 Thread Status".

**GetPg**
The number of Getpage requests for the parallel task.

Getpage requests are logical Read requests that might not actually result in physical I/O if the requested page is currently in the buffer pool. DB2 resets this count at Create Thread and Signon.

**Read I/O**
The number of synchronous Read I/O requests.

**Prefetch**
The number of Sequential, List, and Dynamic Prefetch requests.

**Waits**
The total number of times that the parallel task had to wait for a class 3 event to complete. If Accounting trace class 3 is not active, N/A is displayed.

**Wait Time**
The total elapsed time that the parallel task had to wait for a class 3 event to complete.

**Utility Detail Information:**

This panel provides detailed information about the activity of an individual utility. The information includes the relative utility statement position, the contents of the currently executing utility statement, and data specific to a particular utility.

For detailed information about a utility that has been started but not completed because of an abnormal termination (status UTIL-STOP on the Utility Summary panel), the "Stopped Utility Detail Information" on page 1018 panel is displayed.
Navigation

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

Pool The thread in use is a pool thread.

Entry The thread in use is a nonprotected entry thread.
Prot  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS  The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF  The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System  The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO  The TSO user ID and region ASID.

Utility  No additional information.

Db2  The Db2 subsystem identifier.

MVS  The MVS system identifier.

ORIGAUTH  The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package  The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection  The package collection identifier. This field is displayed only if a package is being used.

Utility information:

Utility  The name of the DB2 utility.

UtilID  The identifier that defines the utility to DB2. Each utility that has been started and is not yet terminated must have a unique utility ID.

UserID  The authorization ID of the invoker of the DB2 utility.

Phase  The executing phase of the DB2 utility.

Count  The total number of items (such as records or pages) that have been processed. The type of item depends on the utility and its phase.

Share Level  The share level of the tablespace accessed by utilities. The share level can be exclusive control, share read access, or share write access.

Output data set  The name of the output data set currently in use. If the utility is not MERGECOPY or COPY, this field is not displayed.
Input data set
The name of the input data set currently referenced by the utility. If the utility is not LOAD, this field is not displayed.

Loading data records into table
The name of the table into which the data records are being loaded. If the utility is not LOAD, this field is not displayed.

Current utility statement in SYSIN
The utility statement that is currently in execution.

Utility statement
The contents of the executing utility statement.

Stopped Utility Detail Information:
This panel provides detailed information about a utility that was started but has not yet completed running because of abnormal termination.

The output on the display identifies the stopped utility. Furthermore, the utility name, the utility ID, the last executed utility phase, pages or record count that is processed, utility job name, utility start time, and the current utility statement position in SYSIN are displayed.

In this panel, there are no highlighted fields.

---

- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

Fields

**Thread identifier:** OMEGAMON XE for DB2 PE identifies the thread to which the information in this panel applies.

**Plan** The plan name of the stopped utility. It is always DSNUTIL.

**Connid** The connection identifier of the invoker of the stopped utility.

**Corrid** The correlation identifier of the invoker of the stopped utility.
Authid
The authorization identifier of the invoker of the stopped utility.

Job Name
The job name of the stopped utility.
This applies only to DB2 11 or higher.

UserId
The authorization identifier of the invoker of the stopped utility.

Utility information:
Utility The name of the DB2 utility.
UtilID The identifier that defines the utility to DB2. Each utility that has been started and is not yet terminated must have a unique utility ID.
Phase The executing phase of the DB2 utility.
Count The total number of items (such as records or pages) that have been processed. The type of item depends on the utility and its phase.

Current utility statement in SYSIN
The utility statement position that is currently in execution.

Objects Used By Thread:
This panel shows Getpage and I/O activity for the DB2 objects used by the selected thread.

<table>

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

Pool The thread in use is a pool thread.

Entry The thread in use is a nonprotected entry thread.

Prot The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO The TSO user ID and region ASID.

Utility No additional information.

Db2 The Db2 subsystem identifier.

MVS The MVS system identifier.

ORIGAUTH The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.
**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**
The package collection identifier. This field is displayed only if a package is being used.

**Object information:**

**Database**
The name of the database for which thread activity has occurred.

**Spacename**
The name of the space for which thread activity has occurred.

**Dsn**
The sequence number of the data set for which thread activity has occurred.

**Volume**
The name of the volume that contains the DB2 object if the thread is performing I/O on that database/space. If OMEGAMON detects that the values for “Sync Read”, “Sequential Prefetch”, “List Prefetch” or “Dynamic Prefetch” are zero, the name of the buffer pool assigned to the object will be displayed instead, indicating the data was available without performing any I/O.

**Getpage**
The number of Getpage requests made by the thread.

**Sync Read**
The number of synchronous reads made by the thread.

**Sequential Prefetch**
The number of Sequential Prefetch Read I/Os made by the thread.

**List Prefetch**
The number of List Prefetch Read I/Os made by the thread.

**Dynamic Prefetch**
The number of Dynamic Prefetch Read I/Os made by the thread.
Cancel Thread:

Highlighting

The following table shows the field that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

Table 97. Highlighted fields in Cancel Thread panel.

This table shows the field and the exception this field is related to. It also shows the reason for the exception.

Navigation

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan  The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.
Attach  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  The MVS jobname and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**CICS**  The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool**  The thread in use is a pool thread.
- **Entry**  The thread in use is a nonprotected entry thread.
- **Prot**  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS**  The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF**  The MVS job name and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**System**  The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**TSO**  The TSO user ID and region ASID.

**Utility**  No additional information.

**Db2**  The Db2 subsystem identifier.

**MVS**  The MVS system identifier.

**ORIGAUTH**  The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**  The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**  The package collection identifier. This field is displayed only if a package is being used.

**Distributed thread identifier:** The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

**Type**  The distributed thread type.
Distributed Allied
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the LuwId field displays data like in the following example:
USCAC001.02D22A.A1FE8E0489D4=8

System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Cancel fields:

CANCEL
The type of cancel command to be performed. You can specify the following values:

TOKEN
The token shown will be used to issue the cancel command:
CANCEL THREAD(token).

LUWID
The luwid shown will be used to issue the cancel command:
CANCEL DDF THREAD(luwid) for all DB2 versions.

Token
The token of the specific thread to be canceled. It is unique for the DB2 subsystem.

Luwid
The logical unit of work identifier of the thread to be canceled. Two or more distributed threads can have the same luwid.

DB2 System Console and Message Traffic:

This panel shows Db2 subsystem console messages and Internal Resource Lock Manager (IRLM) messages. You can also issue Db2 commands from this panel.

Note: If MGSUBSYS=ACTIVE is defined in the OMEGAMON XE for DB2 PE Collector Realtime Customer Options (OMPEOPTS) during configuration and customization, you can view messages when you select the DB2 CONSOLE option on the OMEGAMON Classic Interface Realtime main menu.
This panel might require special authorization before you can enter DB2 commands. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Then follow the instructions to issue DB2 commands.

Navigation

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Commands

DCMD

When you type a DB2 command and press Enter, OMEGAMON XE for DB2 PE displays a message that indicates whether the command was issued successfully. (Do not include the subsystem recognition character in the DB2 command. OMEGAMON XE for DB2 PE does this for you automatically.) When OMEGAMON XE for DB2 PE executes DCMD, it comments out the DCMD command to prevent accidental re-execution. To issue another DB2 command, replace the comment character (>) with a hyphen (-) and enter the command as described before.
DCNS10
Displays the last $nn$ DB2 and IRLM messages. In this case, it displays the last 10 messages.

Data Sets Used by Thread:
This panel shows data set I/O activity for the DB2 objects used by the selected thread.

Navigation
You can scroll through the information using F7 and F8.

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

**Thread identifier**: This information identifies the thread to which the information in this panel applies.

**Plan** The Db2 plan name of the active thread.

**Connid** The Db2 connection identifier of the active thread.

**Corrid** The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid** The Db2 authorization identifier of the active thread.

**Attach** Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

- **Batch** The MVS jobname and ASID.
  - **Note:** For threads from remote Db2, the MVS job name is N/A.

- **CICS** The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
  - **Pool** The thread in use is a pool thread.
  - **Entry** The thread in use is a nonprotected entry thread.
  - **Prot** The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

- **IMS** The IMS region number, transaction name, region name, and terminal ID (LTERM).

- **RRSAF** The MVS job name and ASID.
  - **Note:** For threads from remote Db2, the MVS job name is N/A.

- **System** The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

- **TSO** The TSO user ID and region ASID.

- **Utility** No additional information.

- **Db2** The Db2 subsystem identifier.

- **MVS** The MVS system identifier.

- **ORIGAUTH** The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.
**Package identifier:** This information identifies the package to which the information in this panel applies.

**Package**
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

**Collection**
The package collection identifier. This field is displayed only if a package is being used.

**Database**
The name of the database for which thread activity has occurred.

**Spacename**
The name of the table space for which thread activity has occurred.

**Dsn**
The name of the data set for which thread activity has occurred.

**Sync I/O delay**
The average I/O delay (in milliseconds) for synchronous I/O.

**Sync I/O count**
The number of synchronous reads made by the thread.

**Async I/O delay**
The average I/O delay (in milliseconds) for asynchronous I/O.

**Async I/O count**
The number of asynchronous read requests made by the thread.

**Usage with Remote Threads (DSG)**
To retrieve I/O data from remote threads, the following conditions must be met:
- XCF must be active. To activate XCF, update RKD2PAR(OMPEOPTS) and add option XCFMODE=ACTIVE.
- An OMEGAMON XE server must be running on every LPAR in the Data Sharing Group.
- All OMEGAMON XE servers must use the same XCF group name.
- The remote DB2 I/O access must be activated. To activate DB2 remote I/O, update RKD2PAR(OMPEOPTS) and add option DB2REMIO=YES.

The maximum number for retrieving data sets for remote threads is 695. If this number is exceeded, the list of data sets is preceded by a message indicating the total number that is allocated.

**Specify Application Trace:**
Use this panel to specify the trace criteria for the application to be traced and to specify a data set where trace data will be stored so that you can analyze it later.
Navigation

You can scroll through the information using F7 and F8.

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

The fields are described in “Application Trace Facility (ATF)” on page 1341, panel “Specify Application Trace” on page 1343.

Enclave Detail Information:

This panel provides detailed information about the attributes of a thread running under an individual enclave. This information includes the information provided by the PLAN major command. It also provides information provided by the "enc" minor command.

1030 IBM Db2 Performance Expert on z/OS
The first few lines identify the thread. This information is issued by the PLAN major command. The help panel for the ZTDTL panel contains detailed information about this display. The data displayed by the "enc" minor command is detailed below.

If a remote DB2 is being monitored, enclave information is not available. Message Enclave information not available from remote DB2 is displayed instead of the information following the "enc" minor command.

**Navigation**

You can scroll through the information using F7 and F8.

For additional information about.
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

**Fields**

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan** The Db2 plan name of the active thread.

**Connid**
The Db2 connection identifier of the active thread.

**Corrid** The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**
The Db2 authorization identifier of the active thread.

**Attach** Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch** The MVS jobname and ASID.

**Note:** For threads from remote Db, the MVS job name is N/A.

**CICS** The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

**Pool** The thread in use is a pool thread.

**Entry** The thread in use is a nonprotected entry thread.

**Prot** The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS** The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF**
The MVS job name and ASID.
Note: For threads from remote Db2, the MVS job name is N/A.

System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO The TSO user ID and region ASID.

Utility No additional information.

Db2 The Db2 subsystem identifier.

MVS The MVS system identifier.

ORIGAUTH The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection The package collection identifier. This field is displayed only if a package is being used.

Initial Enclave After applying the DB2 APARs PM12256 and PM28626 and the z/OS APAR OA35146, more than one enclave can be used by DB2 for the same Distributed Thread. The initial enclave is shown.

Enclave Token This is the hexadecimal representation of an 8-byte field. An enclave is an anchor for a transaction that can be spread across multiple dispatchable units in multiple address spaces.

Enclave Type The enclave type describes the condition of an enclave. An enclave can be of one of the following types:

Dependent This enclave is created by IWMECREA. It is a continuation of the transaction for the owning address space.

Original Independent This enclave is created by IWMECREA. It is an independent transaction.

Foreign Independent This enclave is created by IWMIMPT. It is a continuation of an independent enclave on another system.

Foreign Dependent This enclave is created by IWMIMPT. It is a continuation of a dependent enclave on another system.

Inactive Enclave This enclave is currently in an inactive enclave queue because SRM
did not find any work unit that is associated with the enclave. When a work unit joins the enclave, it is moved back to the active queue.

**Currently Promoted**
This enclave is currently promoted due to a chronic resource contention.

**Continuation Independent**
This enclave is a continuation of an independent enclave.

**Owning System**
The originating system for the enclave.

**Owning Job**
The originating jobname for the enclave.

**WLM Mode**

- **Goal** - Workload manager is monitoring and classifying work. It is periodically adjusting dispatching priorities to meet the service policies (Goals) associated with that work.
- **Compatibility** - Workload manager is monitoring and classifying work. However the dispatching priorities are set according to values in IEAIPSxx member of SYS1.PARMLIB.

**Enclave CPU Time**
Total CPU time associated with the Enclave.

**Service period information:** For more information, see “Defining Service Classes and Performance Goals” in z/OS MVS Planning: Workload Management.

**Service Period(s) This Class**
A 1-character number ranging from 1 to 8. This is the number of service periods which have been defined for this service class.

**Current Period for This Thread**
A 1-character number ranging from 1 to 8. This is the current service period definition that is controlling the work.

**Performance Index This Period**
A number computed to two decimal places.

A Performance Index less than one is an indication that the goal for this service class period is being exceeded. The service class period might be considered as a "donor", giving up CPU or pageable storage for other more important service class periods on the system.

A Performance Index greater than one is an indication that the goal for this service class period is not being met. Depending on the importance, this Service class period might be considered for additional services to meet the defined goal.

**Period Number**
A 1-character column ranging from 1 to 8.

**Importance**
A 1-character column ranging from 1 to 5. The importance level 1 is most important. This indicates to WLM how important it is to meet this performance period goal.

**Duration in Service Units**
A numeric column. All defined periods except the last period have a
duration. The duration is expressed in service units so as to be portable among different processor speeds. After the work has used the service units defined for that period, WLM switches to the goals defined in the next period.

**Percentile**
A numeric percentage column. This column is only valid for a percentile response time goal.

**Response Time Goal or Velocity %**
A numeric column. This column is only valid for percentile response time goals, average response time goals or velocity goals. For response time goals, this is the time value. For Velocity goals, this is the acceptable amount of delay for work when work is ready to run.

**Response Time Unit**
A character column. This column contains the time unit that the response time goals are expressed in. Possible values are: blank, Millisecs, Seconds, Minutes and Hours.

**Goal Description**
A character column. This column describes the type of goal set for this service period. Possible values are:
- Percentile response time goal
- Average response time goal
- Velocity goal
- Discretionary goal
- System goal

**Service class information:** For more information, see “Defining Service Classes and Performance Goals” in z/OS MVS Planning: Workload Management.

**CPU Critical**
A Yes or No value indicates whether long term CPU protection is assigned to this class.

**Storage Protection**
A Yes or No value indicates whether long term storage protection is assigned to this class.

**Service Class Name**
An eight character name for a group of work within a workload having similar performance characteristics.

**Service Class Description**
A 32-character field that describes the service class.

**Workload Name**
An 8-character field that contains the name of the workload associated with this service class.

**Workload Description**
A 32-character field that describes the workload associated with this service class.

**Resource Group Name**
An 8-character field that contains the name of the resource group associated with this service class.
Resource Group Description
A 32-character field that describes the resource group associated with this service class.

Report Class Name
An 8-character field that contains the name of the report class associated with this service class.

Report Class Description
A 32-character field that describes the report class associated with this Service Class.

WLM application environment:

Application Environment Name
A 32-character field that contains the name assigned to the environment. This name can be the WLM ENVIRONMENT specified as part of the SQL CREATE PROCEDURE syntax.

Description
A 32-character field that describes the WLM ENVIRONMENT

Subsystem Type
For DB2 threads, this value is always DB2.

WLM Started Task Procedure Name
An 8-character field that contains the name of the server address space in which this enclave is executing.

Start Parameters
A 115-character field that contains any parameters to be passed to the stored procedure.

Classification work qualifiers:

Subsystem Type
The primary qualifier used to classify work on the system. Examples are JES, ASCH, OMVS, STC, TSO, and DDF.

Correlation
A name associated with the user/program creating the work request.

Proc Name
An 18-character field that contains the DB2 stored SQL procedure name associated with the work request.

Trans Program Name
An 8-character field that contains the transaction name for the work request, as known by the work manager.

Userld
An 8-character field that contains the User ID associated with the work request.

Transaction Class
An 8-character field that contains a class name within a subsystem. This can be any meaningful value that the installation can recognize and specify to match the value presented by the work manager.

Network ID
An 8-character field that contains the network identifier associated with the requestor.
Logical Unit Name
An 8-character field that contains the local LU name associated with the requestor.

Plan Name
An 8-character field that contains the DB2 plan name associated with the requestor.

Package Name
An 8-character field that contains the DB2 package name associated with the requestor.

Connection
An 8-character field that contains the connection type associated with the requestor.

Collection
An 18-character field that contains the collection name associated with the requestor.

Function Name
An 8-character field that contains the function name associated with the requestor.

Subsystem Name
An 8-character field that contains the subsystem name associated with the requestor.

Accounting Info
The first sixteen characters passed as accounting information on the batch jobcard.

Subsystem Parm
The first sixteen characters passed as a subsystem parameter. This is site defined information.

Perform
An eight-character field that contains the performance group number (PGN) associated with the request. The number can be 1 - 999.

Subsystem Priority
An numeric field that contains the priority associated with the request.

Scheduling Env
A 16-character field that contains the scheduling environment associated with the work request.

Subsys Coll Name
An 8-character field that contains the subsystem collection name associated with the request. A subsystem collection is a named group of related subsystem address spaces.

Process Name
A 32-character field that contains the process name associated with the work request.

Performance index input data: Depending on the type of performance goal for the current period, Certain input numbers are used to compute the performance index.

Velocity Goal
Total Usings (U) - This is a sum of the number of times the work for the service class period is allowed to use WLM managed resources.
Total Delays (D) - This is a sum of the number of times the work for the service class period is delayed for lack of WLM managed resources.

The formula for Actual Velocity (V) is:
\[ V = \frac{U}{U + D} \]

Compute Performance Index (PI) using the goal velocity (G)
\[ PI = \frac{G}{V} \]

**Average Response Time Goal**
Completed Trans (C) - This is a count of all completed transactions that have run for this Service Class Period.

Total Elapsed Seconds (T) - This is a sum of the time used to complete the transactions which have run for this Service Class Period.

Average Response Time (A) - \[ A = \frac{T}{C} \]

Compute Performance Index (PI) using the Goal Response Time (G) - \[ PI = \frac{A}{G} \]

**Percentile Response Time Goal**
Percentile Performance Index is found by examining the distribution of response times in the percentage array (PA).

Total Transactions (TT) - \[ TT = \text{Sum}(PA) \]

Compute Goal (G) Using the Goal Percentile (GP) - \[ G = TT \times GP \]

Sum the array again, until you reach or surpass the Goal (G). The corresponding percentage is the Performance Index (PI) to two decimal places.

**Long Names:**

This panel shows the long names for the connection ID and the package name of a selected thread.

With this information, you can uniquely identify the individual owners of the various threads.

On the display, the first few lines of output identify the thread. This information is issued by using the PLAN major command.

By using the *lnam* minor command, the information on the following panel is displayed.
Navigation

You can scroll through the information using F7 and F8.

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.
Fields

Collection ID
The name of the collection ID.

Package name
The name of the package.

End User ID
The name of the end user.

End User TXID
The transaction name of the end user.

End User WS Name
The workstation name of the end user.

Trusted Context
The name of the trusted context.

Role Name
The name of the role that is associated to the author ID.

Original Appl ID
The authorization ID.

Original OPID
The original operator ID.

Authorization ID
Original application user ID.

Correlation Token
The correlation token.

Account Location
The DB2 LOCATION name of the DB2 system that creates the QMDAINFO values if QMDALOCN is truncated.

Account Information
The maximum length of this field is 200 bytes. You can specify this suffix for the accounting string.

Account String
The extended accounting string area.
- If QMDAASTR is defined by QMDAINFO, this area contains all the remaining bytes beyond position 142 for QMDAACCT.
- If QMDAASTR is defined by QMDASQLI, this area contains all the remaining bytes beyond position 200 for QMDASUFX.
- Otherwise, this area contains all bytes beyond position 247.
Thread Accelerator Detail:

This panel formats Accelerator activity for the selected thread.

---

**Navigation**

For additional information about
- a particular thread, move the cursor to the thread information line and press F11 (Zoom).
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Number of Accelerators accessed**

The number of Accelerators that are utilized by this thread. This is followed by a list of information for each Accelerator.

**Name** The name of the Accelerator.

**CPU Times**

The CPU time that is consumed within the Accelerator device.

**Elapsed Times**

---
TCP/IP Services
The total elapsed time from the time DB2 started processing requests until the requests are complete.

Accelerator
The total elapsed time that the thread is processed on the Accelerator. The Accelerator time is a subset of the TCP/IP time.

Accumulated Wait
The total wait time within the Accelerator.

Connects
The number of times the DB2 thread connected to the Accelerator.

Requests
The number of requests this thread made to the Accelerator.

Timeouts
The number of requests that failed due to a timeout while waiting for the Accelerator.

Failures
The total number of failed Accelerator requests. This number includes any timeout errors.

The following fields are related to data transfer between DB2 and the Accelerator.

Bytes Sent
The count of bytes of data that is sent to the Accelerator.

Bytes Received
The count of bytes of data that is received from the Accelerator.

Messages Sent
The count of messages that are sent to the Accelerator.

Messages Received
The count of messages that are received from the Accelerator.

Blocks Sent
The count of blocks that are sent to the Accelerator.

Blocks Received
The count of blocks that are received from the Accelerator.

Rows Sent
The count of data rows that are sent to the Accelerator.

Rows Received
The count of data rows that are received from the Accelerator.

TSO Thread Summary
This panel provides an overview of the activity of all foreground TSO threads connected to DB2.

Each row provides information about an individual thread, including information about thread response time, DB2 and MVS resource consumption, and DB2 activity.
Highlighting

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

Table 98. Highlighted fields in TSO Thread Summary panel. This table shows the fields and the exceptions these fields are related to. It also shows the reason for the corresponding exception.

<table>
<thead>
<tr>
<th>Field</th>
<th>Exception</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elapsed</td>
<td>ETIM</td>
<td>This thread has reached the Elapsed Time threshold value.</td>
</tr>
<tr>
<td>CPU</td>
<td>TCPU</td>
<td>The thread address space has excessive CPU utilization.</td>
</tr>
<tr>
<td>GetPg</td>
<td>GETP</td>
<td>The Getpage to Read I/O ratio indicates poor read efficiency.</td>
</tr>
<tr>
<td>Update</td>
<td>PGUP</td>
<td>The rate for system page updates is high.</td>
</tr>
<tr>
<td>Commit</td>
<td>COMT</td>
<td>The number of updates since the last successful commit is high.</td>
</tr>
</tbody>
</table>

Navigation

For additional information about

* a particular thread, move the cursor to the thread information line and press F11 (Zoom).
* A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
* related topics, select one of the options on the top of the panel.
* other topics, use the PF keys.
Fields

Elapsed
The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is dd-hh:mm.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.
O This thread is the originating thread that invoked autonomous procedures.
P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.
X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

Planname or Package
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

CPU (if monitoring a local DB2 subsystem or a data sharing group with XCF component activated for remote CPU)
The CPU rate (percent) that is associated with the thread. Database access threads run in MVS SRB mode. The displayed rate is SRB time (no TCB time).

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

Status
The current DB2 status of the thread. For definitions of all possible status values, see “DB2 Thread Status”.

GetPg
The number of thread Getpage requests.

This logical read request might not actually result in physical I/O if the requested page is currently in the buffer pool.

Update
The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2's internal Deferred Write algorithm, not...
immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Commit**

The number of times the thread successfully completed commit processing.

If a QMF thread user exits from a query panel to other than the home panel, tablespace locks defined with DEALLOCATE(COMMIT) will be retained until Commit is effected. This is also true of SPUFI users who do not specify AUTOCOMMIT, or who specify DEFER on completion of a transaction.

**Userid**

The TSO user ID of the active thread user.

**CICS Thread Summary**

This panel provides an overview of DB2 thread activity that is originating from connected CICS regions.

It provides information about the activity of each CICS region attached to DB2. It also presents information about individual CICS threads that are active in DB2. The display lines are ordered by thread elapsed time (total time since thread creation or reuse) and include information about the DB2 activity.

If monitoring a single remote DB2, the CICA command cannot display the information in this panel. The message Remote DB2 is not supported for this command is displayed.

Navigation

For additional information about:

- Which exceptions have tripped, type E.C to find out details.
- The resource control table (RCT) for a specific CICS region, move the cursor to a CICS job name and press F11 (Zoom).
- A particular thread, move the cursor to the thread information line and press F11 (Zoom).
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- Related topics, select one of the options on the top of the panel.
- Other topics, use the PF keys.

Fields

CICS connection information:

CICS RELS

The CICS release of the connected CICS region:

- 6.4.0 For CICS Transaction Server 3.1
- 6.5.0 For CICS Transaction Server 3.2
- 6.6.0 For CICS Transaction Server 4.1
- 6.7.0 For CICS Transaction Server 4.2
- 6.8.0 For CICS Transaction Server 5.1
- 6.9.0 For CICS Transaction Server 5.2
Jobname
The job name of the connected CICS region.
For remote threads, this fields displays the correlation ID up to 8 characters.

Total CPU
The total CPU rate (percent) of the CICS region connected to DB2. This includes both TCB and SRB time. For more information about CPU use, see "Analyzing DB2 CPU Usage".

Note: The following fields do not include data of parallel task threads that is initiated by another thread that is originating from the CICS connection:
- Total CPU
- DB2 CPU
- Pct. of THRDMAX
- Active Threads

DB2 CPU
The total CPU rate (percent) that is attributable to active threads originating from the CICS connection. This value is a subset of the total CICS region CPU utilization. For more information about CPU use, see "Analyzing DB2 CPU Usage".

Pct. of THRDMAX
The percentage of THRDMAX (CICS maximum threads) that the current threads have reached.

Active Threads
The number of active threads originating from the CICS connection. This value includes outstanding Create Thread requests not yet satisfied by DB2. This value excludes threads originating from the CICS connection that are waiting for reuse.

Commit Rate/Sec
The number of DB2 Commits per second originating from the CICS connection.

The Commit rate is computed by determining the number of commits that occurred since the previous OMEGAMON cycle divided by the elapsed time since the previous cycle.

RO Commit Rate/Sec
The number of DB2 read-only Commits per second originating from the CICS connection.

This rate is computed by determining the number of read-only Commits that occurred since the previous OMEGAMON cycle divided by the elapsed time since the previous cycle.

Note: The following fields do not include data of parallel task threads that is initiated by another thread that is originating from the CICS connection:
- Total CPU
- DB2 CPU
- Pct. of THRDMAX
- Active Threads

CICS thread information:
Elapsed
The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is *dd-hh:mm*.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

- **T**  This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.
- **O**  This thread is the originating thread that invoked autonomous procedures.
- **P**  This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.
- **X**  This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

Plannname
The DB2 plan name of the active thread.

Tran  The CICS transaction identifier active in the thread.

CPU (if monitoring a DB2 subsystem or a data sharing group member)
The CPU rate (percent) attributable to the thread.

For more information about CPU use, see "Analyzing DB2 CPU Usage".

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

Status  The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status".

GetPg  The number of thread Getpage requests. This logical read request might not actually result in physical I/O if the requested page is currently in the buffer pool.

Update  The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2’s internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

Commit  The number of times the thread successfully completed Commit processing.
Jobname | Corrid
You can customize this field by using the OMPEOPTS option CICSCORR. It shows one of the following field names:

**Jobname**
The jobname of the connected CICS region (by default).
For remote threads, this field shows the correlation ID up to 8 characters.

**Corrid**
The correlation ID of the CICS thread if OMPEOPTS member in RKD2PAR has the following setting: CICSCORR=YES.

**CICS RCT Summary**:
This panel provides summary information about the CICS-DB2 connection, as defined in the CICS resource control table (RCT), for the attached CICS region job name.

---

**Navigation**

For additional information about:
- **How to limit the RCT entries displayed:**
  - To display all CICS DB2ENTRYs starting with VX, enter DB2ENTRY=VX* which shows VX01, VX05, VXAA, VXZ, and so on.
  - To display all plan names with any character in the third position, enter PLANNAME=YZ?PLAN which shows YZAPLAN, YZ2PLAN, YZQPLAN, and so on.
• An RCT entry definition, move the cursor to one of the lines under DB2ENTRY and press F11 (Zoom). By default, all RCT entries for the region are displayed. For more information, see the description of panel “CICS RCT Detail” on page 1051.

• Other topics, use the PF keys.

Fields

CICS  The CICS job name. If you enter a different job name, the corresponding RCT summary information is displayed.

RELEASE
Identifies the internal release number of the CICS system:

6.4.0  For CICS Transaction Server 3.1
6.5.0  For CICS Transaction Server 3.2
6.6.0  For CICS Transaction Server 4.1
6.7.0  For CICS Transaction Server 4.2
6.8.0  For CICS Transaction Server 5.1
6.9.0  For CICS Transaction Server 5.2

DB2CONN Name
The RCT name in use by the CICS jobname.

Statistics Dest (SHDDEST)
The transient data destination used for the shutdown statistics when the attachment facility is stopped.

Error MSG Dest 1, 2, or 3 (ERRDEST)
The identifier of the DFHDCT destination for unsolicited error messages. As many as three destination IDs can be assigned.

Attachment Standby Mode
The attachment standby mode for this CICS region. Possible values are: STANDBY, CEX2STRT, CEX2TERM, DB2MAINT, MSBACTIV, RESYNC, or N/A.

CICS Auth Name (SIGNID)
The authorization ID used when the attachment connects to DB2.

THRD Purge Time Interval
Specifies the length of the protected thread purge cycle in the format: MINUTES : SECONDS.

Tasks on Ready Queue
The number of tasks that are on ready queue (waiting to be scheduled).

Maximum Threads (THRDMAX)
The maximum number of threads that can be created between CICS and DB2 within this RCT.

HWM Tasks on Ready Queue
The high-water mark (HWM) of tasks on ready queue.

Active MVS Subtasks
The number of MVS subtasks that are active.

Number of Free Connections
The number of free connections available.
HWM Active MVS Subtasks
The high-water mark (HWM) of MVS subtasks that are active.

Thread Error Action
The action that will be taken when thread is in error condition. Possible values: ABEND, N906D, N906, or N/A.

Connect Error Action
The action that will be taken when connection is failed. Possible values ABEND, SQLCODE, or N/A.

Thread Reuse Limit
The REUSELIMIT parameter specifies the maximum number of times a thread can be reused before it is terminated. This limit applies to all DB2 threads whether they are protected or unprotected. CICS42 and above.

Total Threads in POOL/ENT
Total threads in POOL and DB2ENTRYs. CICS52 and above.

DB2ENTRY
The identifier of a classification of transactions within this CICS job. When there are multiple transactions with the same RCT definition, this field will display the ID of the first transaction.

PLANNAME
The name of the specific plan for which you want to display statistical information. Use this field to reduce the number of lines displayed at the bottom of the panel.

The following fields are displayed for each command, entry, and pool RCT definition that exists within the resource control table.

DB2ENTRY
The identifier of a classification of transactions within this CICS job. When there are multiple transactions with the same RCT definition, this field displays the ID of the first transaction.

Calls
The number of DB2 calls generated by transactions that share an RCT definition since the attach facility was started.

Waits
The number of DB2 waits experienced by transactions that share an RCT definition since the attach facility was started.

Aborts
The number of aborts experienced by transactions that share an RCT definition since the attach facility was started.

THRDA
The maximum number of active threads for this RCT entry.

THRDS
The number of MVS TCBs that will be attached (for use by the RCT definition) to the transactions when the attach facility is started.

TCB Time
The CPU time (in seconds) used by transactions originating from this RCT definition. This time represents CP time only and does not include zIIP time.

REUSE
The number of times CICS transactions using DB2ENTRY were able to reuse an already created DB2 thread.
CICS RCT Detail:

This panel provides information about the CICS resource control table (RCT) entry definition selected from the CICS RCT Summary panel.

The output includes RCT entry parameters in use, thread information, and miscellaneous statistics.

</tr>
</tbody>
</table>

Transaction ID (TXID)
The transaction IDs of all CICS transactions that are defined in the RCT entry definition being viewed.

DB2ENTRY Name
The identifier of the transaction or transaction group being viewed.

Plan Name (PLAN)
The name of the plan assigned to the transactions.
Thread TCB Prty (DPMODE)
The MVS dispatching priority of thread TCBs relative to the CICS main TCB. Possible values: High or Low.

Plan Alloc Exit (PLNEXIT)
The name of the exit program that can dynamically allocate the planname for the transaction ID when the first SQL call is issued.

Rollbck on Deadlok (ROLBE)
Determine whether CICS issues a syncpoint rollback when the transaction experiences an Internal Resource Lock Manager (IRLM)-detected deadlock or timeout.

Yes  CICS will roll back all DB2 work and all CICS-protected resources to the last syncpoint.
No   CICS will roll back only the incomplete SQL call that was involved in the deadlock/timeout.

Thread Wait (TWAIT)
The action to take if no thread is available to execute a DB2-CICS transaction.

Pool  If all threads are in use, DB2 places this transaction in the pool; if all pool threads are in use, DB2 places this transaction in a queue.
Yes  If all threads are in use, the transaction waits until a thread is available.
No   If all threads are in use, the transaction abends.

DB2 Accounting Reason
The reason for DB2 Accounting. DB2 accounting is done by one of the following:

UOW  Account for each unit of work (UOW)
TASK Account for each task
TXID  Account for each Transaction ID change
NONE  No accounting

AUTHID
The authorization identifier if used by transaction(s).

Thread Limit (THRDA)
The maximum number of active threads for this RCT entry.

Prot Thread Limit (THRDS)
The number of MVS TCBs that will be attached (for use by the RCT definition) to the transactions when the attach facility is started.

Authorization Opt. (AUTH)
The type of authorization ID required to execute the DB2 plan for transactions that are originating from the RCT definition.

Group
The group

OPID  A sign-on operator ID
SignID  A sign-on ID
Term  The terminal ID
TxID  The transaction ID
Userid
The user's sign-on ID
xxxxxx  A character string
*  Indicates a null value

Statistics information:

Count of Calls
The number of DB2 calls generated by the transactions since the CICS-DB2
attach was started.

Current Free TCBs
The number of currently free task control blocks (TCBs) to be reconnected
with threads.

Count of Commits
The number of Commits completed since the attach facility was started.

Current Active TCBs
The number of currently active threads.

Count of Authorizations
The number of times authorization has been invoked for the threads
defined to the transactions.

Current Total TCB Time
The CP time (in seconds) used by currently active threads. This time
represents CP time only and does not include zIIP time.

Count of Aborts
The number of aborts experienced by the transactions since the attach
facility was started.

Current Active Threads
The number of transactions that are currently active in DB2 or are waiting
for a thread (TWAIT=YES).

Count of RO Commits
The number of read-only Commits since the attach facility was started.

Highwater Active Thread
The high-water mark of active threads.

Count of Waits/Ovflw Pool
The number of transactions that are waiting for a thread, or that have
overflowed into the pool.

Current Waits/Ovflw Pool
The number of times that all available threads for the entry were busy, and
the transaction had to wait or be diverted to the pool. This condition
depends on the setting of the Thread Wait (TWAIT) field.

Count of Tasks
The total number of tasks using this DB2ENTRY.

Current Protected Thread
The currently protected thread count.
Count of Partial SignOns
The total count of signons.

Highwater Protected Thread
The high-water mark of protected threads.

Count of Thread Terminates
The number of times a thread terminated.

Current ReadyQue Thread
The number of threads waiting to be executed.

Count of Thread Creates
The number of times a thread is created.

Highwater ReadyQue Thread
High-water mark of threads waiting to be executed.

Count of Thread Reuse
The number of times CICS transactions using the DB2ENTRY were able to reuse an already created DB2 thread.

Current User Request
The total count of user requests.

Count of Thread Limit Hits
The number of times the thread reuse limit is hit.

Highwater User Request
High-water mark of user requests.

**IMS Thread Summary**
This panel provides an overview of DB2 thread activity originating from connected IMS subsystems.

It provides information about a connection level about all IMS subsystems identified to DB2. This panel also presents information about individual IMS threads (such as thread elapsed time, DB2 and MVS resource consumption, and DB2 activity).
**Highlighting**

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

*Table 100. Highlighted fields in IMS Thread Summary panel.*

This table shows the fields and the exceptions these fields are related to. It also shows the reason for the corresponding exception.

<table>
<thead>
<tr>

</tbody>
</table>

**Navigation**

For additional information about

- the IMS connection, move the cursor to the IMS ID line and press F11 (Zoom). For more information, see the description of panel “IMS Connection Detail Information” on page 1057.
- a particular thread, move the cursor to the thread line and press F11 (Zoom).
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.

**Fields**

IMS connection information:
IMS ID
The name of the IMS subsystem connected to DB2. If the IMS subsystem is DL/I batch, OMEGAMON XE for DB2 PE displays the characters DLIBATCH.

CPU%
The total CPU rate (percent) of IMS regions within the IMS subsystem that have active threads to DB2.

This value excludes data of parallel task threads that are initiated by another thread that is originating from the IMS connection.

For more information about CPU use, see "Analyzing DB2 CPU Usage."

Connection
The total number of regions from the IMS subsystem connected to DB2 (dependent and control).

Threads
The total number of threads connected from the IMS subsystem.

This value excludes data of parallel task threads that are initiated by another thread that is originating from the IMS connection.

IMS thread information:

Elapsed
The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is dd-hh:mm.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

Because SQL calls might be interspersed with IMS DLI calls and other activity, this wall clock time value need not solely reflect DB2 processing.

Planname or Package
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

Jobid
The name of the dependent or control region in which the thread is active.

For remote DB2 subsystems, the correlation ID is displayed instead of the name of the dependent or control region.
CPU (if monitoring a DB2 subsystem or data sharing group member)

The current CPU rate (percent) of the IMS region in which the thread is active.

This might include non-DB2 TCB activity. For more information about CPU use, see "Analyzing DB2 CPU Usage".

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)

The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

Status

The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status".

GetPg

The number of thread Getpage requests. This logical read request might not actually result in physical I/O if the requested page is currently in the buffer pool.

Update

The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2's internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

Commit

The number of times the thread successfully completed commit processing. If MODE is MULT is specified on the IMS TRANSACT macro which defines the transaction or a WFI region is used, multiple messages might be processed before a commit point is reached, and page locks and DEALLOCATE(COMMIT) tablespace and SKCT locks are released.

Connid

The DB2 connection identifier of the active thread. The connection ID is the same as the IMS ID. It is used to relate an individual thread to the IMS system specified by the IMS ID under IMS Connection Information above.

IMS Connection Detail Information:

This panel provides information about the IMS control region and all dependent regions active with DB2, including the IMS region type, the program name active in the region, the contents of the subsystem member (SSM) and the status of the dependent region.

This panel does not apply to DLIBATCH jobs.
Navigation

For additional information about
• the thread, move the cursor to the dependent region name and press F11 (Zoom).
• other topics, use the PF keys.

Fields

Region
The name of the IMS control or dependent region.

Type
The IMS region type:
- BMP  Message-driven batch region
- CNTL Control region
- FP   Fast Path region
- MPP  Message processing region

Crc
The command recognition character used to pass commands to the external subsystem.

Lit
The name of the language interface token.

Rtt
The name of the resource translation table. This table maps the IMS application names to DB2 plan names. If this entry is omitted, the DB2 plan name is the IMS application program name.

Module
The name of the interface control module

Err
The type of error option specification in use.

Psb
The PSB name active in the IMS dependent region. This field applies only to dependent regions (not to the control region).

Status
The current DB2 status of the thread. For definitions of all possible status values, see [DB2 Thread Status]

Background Thread Summary
This panel provides an overview of the activity of all background threads connected to DB2.
The top part of the panel summarizes all background jobs currently connected to DB2. The bottom part of the panel summarizes the activity of each background thread (ordered by elapsed time since thread creation or reuse).

**Highlighting**

The following table shows the fields that might be highlighted in the panel above to indicate that an exception that is related to this field exceeded its threshold value:

*Table 101. Highlighted fields in Background Thread Summary panel.*

This table shows the fields and the exceptions these fields are related to. It also shows the reason for the corresponding exception.

<table>
<thead>
<tr>
<th>Field</th>

**Navigation**

For additional information about

- summary information about individual threads that originated from a particular background job, place the cursor to the line that contains that job and press F11 (Zoom).
The information might not be displayed if individual threads do not work the address space of the background job, for example, if threads work inside of a DB2 address space.

- detail information about a particular thread, place the cursor to the line that contains that thread and press F1 (Zoom).
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Background connection information:**

**Job Name**

The name of the background job connected to DB2.

**CPU %**

The total CPU usage rate (percent) of background jobs that have active threads to DB2. For more information, see “Analyzing DB2 CPU Usage”.

**Connection**

The number of connections to DB2 that originated from this background thread.

**Active Threads**

The number of active threads that originated from the background connection.

This value excludes parallel task threads that are initiated by another thread that is originating from the background connection.

**Background thread information:**

**Elapsed**

The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is *dd-hh:mm*.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

**Planname**

or
Package
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

CPU (if monitoring a DB2 subsystem or a data sharing group member)
The current CPU rate (percent) of the batch or utility region from which the active thread originates. This includes both TCB and SRB time.

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

Status
The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status".

GetPg
The number of thread Getpage requests.

Getpage requests are logical Read requests that might not actually result in physical I/O if the requested page is currently in the buffer pool. DB2 resets this count at thread creation and signon.

Update
The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2's internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

Commit
The number of times the thread successfully completed Commit processing.

DB2 resets the Commit count at thread creation and signon. If Signon is not driven, the count is cumulative.

Jobname
The name of the connected batch job or utility.

For remote DB2 subsystems, the correlation ID is displayed instead of the job name.

Distributed Allied Thread Summary
This panel is one of two summary displays that provide performance information related to Distributed Data Facility (DDF) thread activity. Use this information to identify excessive resource use by distributed allied threads (those used to issue SQL requests to a remote DB2 location).
Navigation

For additional information about
• a particular thread, move the cursor to the required line and press F11 (Zoom).
• A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Plannname or Package

The DB2 plan name of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

If a thread accesses multiple remote locations, it will generate a line of output for each location.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.
O This thread is the originating thread that invoked autonomous procedures.
P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.
X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

Status The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status"
Remote Luname
The VTAM logical unit name of the remote DB2 subsystem to which the thread has issued an SQL request.

Cv
The number of VTAM APPC allocate conversation requests that have been issued to the remote DB2 subsystem since thread creation (or DB2 signon if the thread is reused).

SQL Sent
The number of SQL calls sent to the remote location since thread creation or DB2 signon.

Dist Local Elapsed
The total time the thread has spent waiting for responses to remote SQL requests since thread creation or DB2 signon (includes remote DB2 processing time, VTAM processing time, and network time).

Remote CPU
The CPU time in seconds that has been used in processing the thread's SQL requests at the remote location since thread creation or DB2 signon.

This field applies only to system directed access (private protocols). If application directed access (DRDA protocols) is used, this field will be 0.

For DB2 10 and above, N/A is displayed.

Distributed Database Access Thread Summary
This panel is one of two summary displays that provide performance information related to Distributed Data Facility (DDF) activity. Use this information to identify excessive resource use by distributed database access threads (server threads responding to SQL requests from a remote DB2 location).

Navigation
For additional information about

- a particular thread, move the cursor to the thread line and press F11 (Zoom).
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.
Fields

Elapsed
The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is dd-hh:mm.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

WrkSta or Pln/Ath or Pkg/Ath
One of following information is displayed:

WrkSta
The name of the workstation, if it is set by the application.

Pln/Ath or Pkg/Ath
The DB2 plan (Pln) or package (Pkg) name of the active thread, if an optional USERMOD is applied to your system. (see member rhilev.TKANSAM(KQ2MOD02). This USERMOD can control whether the workstation name is displayed on the summary screen. The plan or package name is followed by a slash (/) and the DB2 thread authorization identifier (Ath) of the active thread.

CPU (if monitoring a local DB2 subsystem or a data sharing group with XCF component activated for remote CPU)
The CPU rate (percent) that is associated with the thread. Database access threads run in MVS SRB mode. The displayed rate is SRB time (no TCB time).

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

Status The current DB2 status of the thread. For definitions of all possible status values, see "DB2 Thread Status".

Remote Luname
The VTAM logical unit name of the requesting DB2 subsystem whose SQL request is being serviced by the thread.

GetPg The number of Getpage requests issued by the thread since thread creation.
SQL Recv

The number of SQL calls received from the requesting location since thread creation.

Rows Sent

The number of rows sent to the requesting location since thread creation.

Utility Summary

This panel provides information about all active utilities and utilities that have been started but have not yet completed because of abnormal termination.

If monitoring a remote DB2, this utility is not supported. The message UTIL Remote DB2 is not supported for this command is displayed.

<table>
<thead>
<tr>
<th>Utility Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ Elapsed</td>
</tr>
<tr>
<td>+ 00:01:05.8</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Navigation

For additional information about
- a particular DB2 utility, move the cursor to the utility information line and press F11 (Zoom). The "Utility Detail Information" panel is displayed (or the "Stopped Utility Detail Information" panel for utilities whose status is UTIL-STOP).
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see "Switching among DB2 subsystems and data sharing group members" on page 891.
- related topics, select one of the options on the top of the panel.

**Fields**

**Elapsed**

The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is *dd-hh:mm*.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

When status field displays UTIL-STOP, this field is N/A (not applicable).

**Utility** The name of the DB2 utility.

**Utilid** The identifier that defines the utility to DB2. Each utility that has been started and is not yet terminated must have a unique utility ID.

**Phase** The executing phase of the DB2 utility. If the utility is stopped, you must specify this phase when you restart it.

**Count** The total number of items (such as records or pages) that have been processed. The type of item depends on the utility and its phase.

**Status** The status of the DB2 utility. The status is UTIL-STOP if the DB2 utility has been started but has not yet completed running because of abnormal termination. For more information, refer to "DB2 Thread Status".

**CPU** The current CPU rate of the DB2 utility job. When status field displays UTIL-STOP, this field is not applicable.

**Inactive Threads**

This panel shows information about inactive threads. The information is collected from a DB2 display thread command.

A distributed thread is accessing a remote site on behalf of a request from another location. The thread is currently an inactive connection (type 2 inactive thread). It is waiting for an agent to become available.
Each row displays information about an individual inactive thread. The columns are ordered by location name initially.

<table>

Navigation

For additional information about a different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see "Switching among DB2 subsystems and data sharing group members" on page 891.

other types of threads, select one of the options at the top of the panel.
other other topics, use the PF keys.

Fields

Location

The network address of the remote location. This value might be blank.

If the connection with the requester is through SNA, this field contains the relational database name of the requester or the VTAM LU name of the requester, a dash (-) delimiter, and the LU name of the requester.
If the connection with the requester is through TCP/IP, this field contains the IP address of the requester.

**Authid**
The authorization identifier that is associated with a signed-on connection.

**Corrid**
The correlation identifier.

If the application requester is a DB2 system, this is the same correlation ID assigned at the requestor.

If the application requester is not DB2, this is the name of the job, task, or process that is being serviced.

**Plan**
The plan name that is associated with the thread. For distributed database access threads, this field contains one of the following values:

- **DISTSERV**
  For threads that use application-directed access from a non-DB2 requester, a plan name is not identified.

**requester-value**
For threads that use system-directed access or application-directed access from a DB2 requester, this value is the plan name that is being executed at the requesting location.

**Token**
The thread token that is assigned to the thread.

**LUW ID**
The output is in the format of text=num

- **text**
The global logical unit of work ID (LUWID).

- **num**
The local token that identifies the thread. This token can be used in place of the LUWID in any DB2 command that accepts LUWID as input.

**Member**
The data sharing group member name for this DB2 subsystem. For DB2 subsystems that do not belong to a data sharing group, N/P is displayed.

**Connection Name**
The connection name that is used to establish the thread. For distributed database access threads, this field contains the following information:

**requester-value**
For threads that access the server from a DB2 for z/OS requester, this value is the connection name of the thread at the requesting location.

**SERVER**
For threads that access the server from a non-DB2 for z/OS requester, a connection name is not identified.

**blank**
For threads where the originating task is running on the same DB2 subsystem, this value is blank.

**End User ID**
The user ID of the end user.

**Workstation ID**
The name of the workstation.

**Transaction ID**
The name of the client application.
Correlation TKN
The correlation token consists of the following components:

- **ip-address**
  The length of the IP address can be from 3 to 39 characters.

- **port-address**
  The length of the port address can be from 1 to 8 characters.

- **unique-id**
  The length of the unique ID is 12 characters.

Accounting Text
The client end-user accounting information. This information is provided if the appropriate information is provided by the client system and if DB2 recognizes the format of the information.

Filter Options For Thread Activity Displays
Use this panel to save filter criteria to a specified profile, to activate a different profile, or to specify filter criteria that you want to use in the thread activity panels for the remainder of the session. You can use these filtering options together with the thread commands. If more than one parameter is specified, the requests are connected using a logical AND operator. To specify a reset, type character R in column 1 in front of THFL.

**Note:** You cannot use filtering criteria for the Utility panel (option: H-UTILITY).

To view this panel select option J on a thread activity panel such as "Threads Summary Excluding Idle Threads" on page 921. The content of this panel is identical to panel "Filter Options For Thread Activity Displays" on page 1514.
Thread Activity: Enter a selection letter on the top line.

Filter Options For Thread Activity Displays

To save filters in the user profile remove the > from the PPRF command and optionally add a 2 character profile suffix. Use IPRF for install profile

To change profiles remove the > from the CPRF command and enter the 2 character suffix. Use CPFI to switch to installation profile

A-All-Idle B-TSO C-CICS D-IMS E-Background F-Dist Allied
G-Dist DBAC H-Util I-Inact *-Filter K-Functions L-Stored Proc
M-Triggers N-Sysplex O-Enclaves P-Worksta Q-All+Idle

To specify the values to be used as filtering criteria for Thread Activity displays. Wildcard values * (multiple characters) or +? (single character) may be specified for character values.

SHORTCUT TO SPECIFY FILTER CRITERIA ON THREAD ACTIVITY PANELS

If you already know the available filter criteria, you can bypass the Filter Options panel and enter the criteria directly on any thread activity panel. The following example shows a partial Threads Summary Excluding Idle Threads panel. The criteria (here: PLAN=KO2PLAN) is entered on the “command line” following the (panel-specific) identifier THDA. To remove the criteria, overtype them with space characters and press Enter.

Note the status information about filtering and the profile in use.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Note: For details about operators and wildcard characters use online help F1 (Help). Most fields are only applicable for active threads.

The following fields enable OMEGAMON XE for DB2 PE to send filters to DB2 as well as to apply “post-filtering” of data returned from DB2. These filters can improve the performance in your environment.

The following fields provide filtering within DB2:

PLAN  The DB2 plan name of the active thread. You can specify up to 8 characters.

AUTHID

The DB2 thread authorization identifier of the active thread. You can specify up to 8 characters.

CONNID

The DB2 connection identifier of the active thread. You can specify up to 8 characters.

LOCATION

The name of the location requesting information. You can specify up to 16 characters. The field will either filter on the requesting location (QW01488L, for example, for distributed database access threads), or the DB2 location (QW01488L) if the requesting location field is not filled by DB2.

PARENTACE

The agent control element (ACE) token. Specify the parent ACE for the parallel task. You can specify up to 8 digits. A value of 0 filters out child parallel tasks from the Thread Activity displays.
CORRID
The correlation identifier. You can specify up to 12 characters. If the application requestor is a DB2 system, this is the same correlation ID assigned at the requestor. If the application requestor is not DB2, this is the name of the job, task, or process that is being serviced.

Note: This field is case sensitive. It is not converted to uppercase.

ENDUSERID
The end user’s work station user ID. You can specify up to 16 characters. This can be different from the authorization ID used to connect to DB2. It contains blanks if the client does not supply this information.

Note: This field is case sensitive. It is not converted to uppercase.

WORKSTATION
The workstation identifier. You can specify up to 18 characters. It contains blanks if the client does not supply this information.

Note: This field is case sensitive. It is not converted to uppercase.

TRANSACTIONID
The name of the transaction or application that the end user is running. It identifies the application that is currently running, not the product that is used to run the application. You can specify up to 32 characters. This field contains blanks if the client does not supply this information.

Note: This field is case sensitive. It is not converted to uppercase.

The following fields enable filtering of the data returned from DB2 and are applied by OMEGAMON XE for DB2 PE:

PACKAGE/DBRM
The DB2 package name or DBRM name of the active thread. You can specify up to 8 characters.

COLLECTION
The package collection identifier of the active thread. You can specify up to 18 characters.

DB2STAT
The DB2 status. You can specify up to 12 characters. For definitions of all possible status values, see "DB2 Thread Status".

GETPAGES
The number of Getpage requests issued by the active thread since thread creation. You can specify up to 9 digits.

UPDATES
The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2’s internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative. This file is applicable for active threads only. You can specify up to 9 digits.
COMMTS
The number of times the thread successfully completed commit processing.
DB2 resets the commit count at thread create and signon. If signon is not
driven, the count is cumulative. You can specify up to 9 digits.

ELAPTIME
The elapsed time since thread creation. You can specify up to 9 digits.

ELAPTIME/COMMIT
Average elapsed time between commits. If the number of commits is zero
this field is the same as ELAPTIME. You can specify up to 9 digits.

DB2TIME
The total In-DB2 elapsed time in seconds for an active thread. You can
specify up to 9 digits.

DB2TIME/COMMIT
Average In-DB2 elapsed time between commits. If the number of commits
is zero this field is the same as DB2TIME. You can specify up to 9 digits.

PROCESSING-IN-DB2
Values YES, NO or blank.

YES Only threads that are in a status that is active in DB2 are shown. If
a thread is executing in the application it is not shown. The
following thread statuses are processing in DB2:
• IN-DB2
• IN-TRIGGER
• IN-COMMAND
• IN-STOR-PROC
• IN-USER-FUNC
• IN-TERM-THRD
• WAIT-LOCK
• WAIT-GLBLOCK
• WAIT-MSGSENQ
• WAIT-ARCHIVE
• WAIT-REMSQL
• WAIT-CONVLRM
• WAIT-TERM-TH
• WAIT-SP-STOP
• WAIT-SP-SCHD
• SP/UDF-INACT
• WAIT-SYNC-IO
• WAIT-SERVICE
• WAIT-ASYNCRD
• WAIT-ASYNCWR
• WAIT-LOGQSCE
• WAIT-PGLATCH
• WAIT-DRNLLOCK
• WAIT-CLAIMER
• WAIT-ARCREAD
• WAIT-LOCKPIP
• WAIT-LOCKPQS
• WAIT-SWITCH
• WAIT-ACCEL
• WAIT-LOB
• WAIT-COMMIT
• WAIT-CL3LOCK
• IN-SQL-SORT
- IN-SQL-CALL
- WAIT-REMREQ
- IN-BIND-DYNM
- IN-ACCEL
- IN-AUTO-PROC

**NO** Only threads that are not in an active status in DB2 are shown.

**Blank** This filter is not used.

Threads accelerated by the IBM Db2 Analytics Accelerator for z/OS are considered as being processed in DB2.

**THREADLIM**

A numeric value causing OMEGAMON XE for DB2 PE to stop retrieving instrumentation records from DB2. This field can have a positive impact on realtime and system performance, but can also result in an incomplete thread list if it is less than the number of threads actually running in DB2 at the time the list is retrieved. The default setting (blank or 0) allows all records retrieved by DB2 to flow to OMEGAMON XE for DB2 PE. You can specify up to 9 digits.

**Functions Thread Summary**

This panel provides information about threads that are executing user-defined functions.

Each row provides information about an individual thread, including information about jobname, ASID, CPU utilization, number of connections and number of threads.

<td>CPU</td>
<td>TCPU</td>
<td>The thread address space has excessive CPU utilization.</td>
</tr>
</tbody>
</table>

**Navigation**

For additional information about

- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Job Name**

The name of the WLM stored procedure address space.

**ASID**

The address space identifier of the WLM stored procedure address space.

**CPU%**

The percentage of CPU time utilized.

**Connection**

The number of connections.

**Threads**

The number of threads.

**Elapsed**

The elapsed time since the function thread was created or reused.

**Planname or Package**

The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

**Schema**

The schema name of the user-defined function.

**Function**

The name of the user-defined function.

**CPU**

This field is displayed if you are monitoring a DB2 subsystem or a data sharing member.

The CPU rate in percent that is attributable to the user-defined function thread.

For more information about CPU use, see "Analyzing DB2 CPU Usage".

**DB2**

This field is displayed if you are monitoring a data sharing group.

The name of the DB2 subsystem that is currently monitored.

**ASID**

The ASID of the WLM stored procedure address space in which the user-defined function is executing.
CORRID

The correlation ID of the user-defined function.

**Stored Procedures Thread Summary**

This panel provides information about threads that are executing stored procedures.

Each row provides information about an individual thread, including information about jobname, ASID, CPU utilization, number of connections and number of threads.

**Note:** To display WLM address spaces, the OMEGAMON XE for DB2 PE started task must have been given Read access authority in the RACF profile MVSADMIN.WLM.POLICY for the general resource class FACILITY. If the OMEGAMON XE for DB2 PE started task has a user ID associated with it, use that user ID instead of the started task name. The following RACF commands show an example:

```
PERMIT MVSADMIN.WLM.POLICY CLASS(FACILITY) ID(user_id) ACCESS(READ)
SETROPTS RACLIST(FACILITY) REFRESH
ALTUSER user_id OMVS(UID(0))
```

<table>

For additional information about

- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost
row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

**Job Name**
The name of the job executing the stored procedure.

**ASID**
The address space identifier of the stored procedure.

**CPU%**
The percentage of CPU time utilized.

**Connection**
The number of connections.

**Threads**
The number of threads.

**Elapsed**
The elapsed time since the stored procedure was executed.

**Plannname or Package**
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

**Schema**
The schema name of the stored procedure.

**Store Proc Name**
The name of the stored procedure.

**CPU**
This field is displayed if you are monitoring a DB2 subsystem or a data sharing member.
The CPU rate in percent that is attributable to the user-defined function thread.

For more information about CPU use, see "Analyzing DB2 CPU Usage".

**DB2**
This field is displayed if you are monitoring a data sharing group.
The name of the DB2 subsystem that is currently monitored.

**ASID**
The ASID of the stored procedure address space.

**CORRID**
The correlation ID of the job running the stored procedure.

**Triggers Thread Summary**
This panel provides an overview of the activity of all threads that are currently connected to DB2 and that are running a trigger. Each row of the display relates to an individual trigger thread.
Navigation

For additional information about

- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

Trigger Name
The name of the job executing the trigger.

In DB2 Elapsed
The total In-DB2 elapsed time in seconds for the triggers.

In DB2 CPU
The total In-DB2 CPU time in seconds for the trigger.

SQL Requests
The number of SQL statements issued in the trigger.

Waits
The total number of times that the thread had to wait for a class 8 event to complete while executing the trigger. This field requires an Accounting trace class 8. If this trace is not active, N/A is displayed.

In DB2 Wait Time
The total time that the thread waited.

Plannname

or

Package
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

Jobname
The name of the job that is executing the trigger.

For remote DB2 subsystems, the correlation ID is displayed instead of the job name.
Sysplex Parallel Thread Summary
This panel shows an overview of the activity of all parallel tasks with an originating thread on another DB2 in the data sharing group.

Each row provides information about an individual thread, including information about thread response time, DB2 and MVS resource consumption, and DB2 activity.

<table>

Navigation

For additional information about
• a particular thread, move the cursor to the thread information line and press F11 (Zoom).
• A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Elapsed
The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is dd-hh:mm.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

Plannname
or Package
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

CPU (if monitoring a DB2 subsystem or a data sharing group member)
The current CPU rate (percent) of the TSO address space from which the thread originates. This includes both TCB and SRB time. For more information about CPU use, see “Analyzing DB2 CPU Usage”

DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

Status The current DB2 status of the thread. For definitions of all possible status values, see “DB2 Thread Status”
**GetPg**  The number of thread Getpage requests.

This logical read request might not actually result in physical I/O if the requested page is currently in the buffer pool.

**Update**

The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2’s internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Commit**

The number of times the thread successfully completed commit processing.

If a QMF thread user exits from a query panel to other than the home panel, tablespace locks defined with DEALLOCATE(COMMIT) will be retained until Commit is effected. This is also true of SPUFI users who do not specify AUTOCOMMIT, or who specify DEFER on completion of a transaction.

**Userid**

The TSO user ID of the active thread user.

**Enclave Thread Summary**

This panel provides an overview of the activity of all threads connected to DB2 having an associated enclave token.

The enclave token is associated with an individual thread. In DB2, stored procedure and DDF threads are classified into a Workload Manager (WLM) service class and assigned an enclave token. After the thread has been associated with a service class, it begins to receive resources according to the service class periods defined for the service class.

WLM makes "give" and "take" decisions about resources according to two things:
1. The defined importance for the service class period.
2. The computed performance index (PI) for the service class period.

The service class periods that have low importance and a low number for PI are likely to be considered as "DONORS" for WLM resources on a heavily loaded system.
Each row displays information about an individual thread. The columns are ordered by Thread Elapsed Time (total time since thread creation or reuse), and includes information about the Elapsed Time, Plan Name, Jobname, AuthID, CPU%, Performance Index for the Service Class Period, Service Class Name, Service Class Period Number and Thread Status.

**Highlighting**

Highlighted fields indicate that exceptions related to those fields have tripped. To determine which exceptions have tripped, type E.A on the top line of the panel to display the Exception Messages for Thread Exceptions panel.

**Navigation**

For additional information about

- detailed information about a thread, place the cursor anywhere on the data for that thread and press F11 (Zoom). This will display the Enclave Detail panel.
- A different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Elapsed**

The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is \textit{dd-hh:mm}.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

* This thread is a parallel task that is initiated on behalf of another (originating) thread to process a query request in parallel.

O This thread is the originating thread that invoked autonomous procedures.
This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity performed for this (originating) thread is reflected under the parallel tasks.

This thread is a parallel task that is initiated on behalf of another (originating) thread on another DB2 for sysplex parallelism.

**Planname or Package**
The DB2 plan name (or package name) of the active thread. If you selected option T from the Realtime Main Menu, this panel shows the information by plan. If you selected option U, this panel shows the information by package.

**Jobname**
The name of the active job. For Distributed threads, this column might contain other identifying data, such as an executable program name.

For remote DB2 subsystems, the correlation ID is displayed instead of the job name.

**AuthID**
The DB2 thread authorization identifier of the active thread.

**CPU (if monitoring a DB2 subsystem or a data sharing group member)**
The CPU rate (percent) associated with the database access thread. For non-CICS threads, this is the CPU rate of the address space from which the thread originates. For CICS threads, this is the CPU rate attributable to the thread originating from the CICS connection.

**DB2 (if monitoring a data sharing group or remote DB2 subsystem while XCF component is not activated for remote CPU)**
The DB2 subsystem name of the data sharing group member that is currently monitored.

You can use the Tab key to move to a detail line and to select this detail line for drill down.

**P/I**
The computed Performance Index for the Service Class Period. N/A in compatibility mode.

**SvcClass**
The Service Class name the enclave work has been classified into. N/A in compatibility mode.

**Pd#**
The Service Class Period Number for the enclave. N/A in Compatibility mode.

**Status**
The current DB2 status of the thread.

**Threads Having Remote ID Information**
This panel provides an overview of the activity of all threads connected to DB2 having an associated Workstation ID, End User User ID or End User Transaction ID.
Thread Activity: Enter a selection letter on the top line.

A-All-Idle  B-TOSO  C-CICS  D-IMS  E-Background  F-Dist Allied
>  G-Dist DBAC  H-Util  I-Inact  J-Filter  K-Functions  L-Stored Proc

Each row provides information about an individual thread, including information about thread response time, DB2 and MVS resource consumption, and DB2 activity. The columns are ordered by Thread Elapsed Time (total time since thread creation or reuse).

**Navigation**

For additional information about:

- a particular thread, move the cursor to the thread information line and press F11 (Zoom).
- exceptions that have tripped, type E.A on the top of the panel.
- a different DB2 subsystem, data sharing group, or member of a data sharing group, enter the name of a DB2 subsystem, group, or member in the topmost row and press Enter. For more information, see “Switching among DB2 subsystems and data sharing group members” on page 891.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Elapsed**

The elapsed time since thread creation, or since DB2 signon if the thread is reused. When the elapsed time of the thread exceeds 24 hours, the format is *dd-hh:mm*.

If this thread is involved in parallel processing or if it invoked autonomous procedures, one of the following identifiers is displayed after the elapsed time:

- **O** This thread is the originating thread that invoked autonomous procedures.
- **P** This thread is the parent or the originating thread of the parallel...
tasks that are created to process a query request in parallel.
Activity performed for this (originating) thread is reflected under
the parallel tasks.

X This thread is a parallel task that is initiated on behalf of another
(originating) thread on another DB2 for sysplex parallelism.

Workstation ID
The end user's workstation name. This field contains blanks if the client
did not supply this information.

End User UserID
The end user's workstation user ID. This can be different from the
authorization ID used to connect to DB2. This field contains blanks if the
client did not supply this information.

End User Transaction Name
The transaction or application name that the end user is running. This
identifies the application that is currently running, not the product that is
used to run the application. This field contains blanks if the client did not
supply this information.

Threads Summary Including Idle Threads
This panel shows an overview of the activity of all threads (including idle threads)
that are connected to DB2.
Locking Conflicts

Select this main menu option for information about locking conflicts.

**Locking Conflicts panel**

This panel shows existing DB2 locking contentions. It provides information about the owners and waiters currently involved in locking conflicts.

A locking conflict exists when a DB2 thread owning a resource causes another DB2 thread to wait. In general, when DB2 cannot satisfy a request for the resource, the requester will be suspended.

A suspended lock resource always has an owning thread. Multiple threads may be waiting for the same resource. It may also have one or more global owners that have global interest in the resource.
When **S** mode is used in data sharing environment, lock resources that are waited by a local thread will be displayed. All global owners and all local threads that are involved in this locking conflict are displayed.

When **G** mode is used in data sharing environment, lock resources that are waited by a local or remote thread will be displayed. All the global owners and all local and remote threads that are involved in the locking conflict are displayed.

The plan names of all threads for which the elapsed time exception has tripped are highlighted. For more information about current thread exceptions, type **E.A** on the top line of the panel to display the Exception Messages for Thread Exceptions panel.

```
+OWN DSNESPCS MIS ROW U DB=DSNDB04 PS=RLOCKTSG PG=00000002/01
```

For more information about lock resources, see "Lock Types and Lock Levels".

### Highlighting

OMEGAMON XE for DB2 PE highlights some fields in this panel to draw your attention to their current status:

**Table 106. Highlighted fields in Locking Conflicts panel**

<table>
<thead>
<tr>
<th>Field</th>
<th>Exception</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan</td>
<td>ETIM</td>
<td>Elapsed time is high.</td>
</tr>
</tbody>
</table>

### Navigation

For additional information about
- a lock owner, move the cursor to the lock owner line and press F11 (Zoom).
- a lock waiter, move the cursor to the lock waiter line and press F11 (Zoom).
- other topics, use the PF keys.

**Note:** Thread information is not available if the thread is owned by the other member of the data sharing group.

### Fields

The output lines are displayed in descending order, with those reflecting the greatest degree of conflict displayed first.

**Stat** The status of the thread can be one of the following:
- **OWN** indicates that the thread is a lock owner.
- WAIT indicates that the thread is suspended because the lock it requested is owned by another thread.

**Plan**  
The name of the DB2 plan that is currently active in this thread.

**Corrid**  
The DB2 correlation identifier for the thread involved in the locking conflict.

**Type**  
The type of lock that is owned or requested and is unavailable. For more information about lock types, see "Lock Types and Lock Levels".

**Lvl**  
The level at which the lock is owned or was requested. The level of a lock requested is frequently the reason for lock suspensions. For more information about lock levels, see "Lock Types and Lock Levels".

**Resource**  
Identifies the resource that is currently locked by the lock owner, or the lock resource causing the lock to be suspended. The resource varies depending upon the type of lock held.

**Note:** DB=database name can be represented as a DBID=identifier, which is the decimal identifier of the database. PSID=identifier can be represented as PSID=identifier, which is the decimal identifier of the table space. HEX values are displayed for lock resources if the resource is owned by a thread on a remote LPAR, and no OMPE task is available from that LPAR, or XCF is not set up correctly. If the owner is a thread running on some other member of the data sharing group, the DB2 subsystem name is displayed.

**Locks/Claims Owned by a Thread**
This panel shows lock and claim information of a specific thread. Use this information to analyze locks and claims, for example, the number of locks owned, the type and level of the locks, and the object of the locks.

The locking information is divided into the following categories:
1. The totals of all the types of locks owned by the thread, as well as the percentage of total locks allowed that are currently held (the percent of the DB2 parameter NUMLKUS).
2. The type, level and object of each lock. HEX values are displayed for lock resources, if the resource is owned by a thread on a remote LPAR, and no OMPE task is available from that LPAR, or XCF is not setup correctly.

The claim information displays all of the claims currently owned by the thread. Claims are used to inform DB2 that an object is being accessed.
### LOCKS/CLAIMS OWNED BY A THREAD

**PLAN**
- **Thread:** Plan=DISTSERV Connid=SERVER Corrid=db2jcc_appli Authid=HONG

Navigation

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

**Thread identifier**: This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  The Db2 authorization identifier of the active thread.

**Attach**  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  The MVS jobname and ASID.

**Note**: For threads from remote Db2, the MVS job name is N/A.
### CICS
The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool**: The thread in use is a pool thread.
- **Entry**: The thread in use is a nonprotected entry thread.
- **Prot**: The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

### IMS
The IMS region number, transaction name, region name, and terminal ID (LTERM).

### RRSAF
The MVS job name and ASID.

**Note**: For threads from remote Db2, the MVS job name is N/A.

### System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

### TSO
The TSO user ID and region ASID.

### Utility
No additional information.

### Db2
The Db2 subsystem identifier.

### MVS
The MVS system identifier.

### ORIGAUTH
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

### Package identifier: This information identifies the package to which the information in this panel applies.

### Package
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

### Collection
The package collection identifier. This field is displayed only if a package is being used.

### Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

### Type
The distributed thread type.

- **Distributed Allied**: A requesting thread; one that has issued an SQL call to a remote DB2 location.

- **Database Access**: A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

- **Luwid**: This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
USCAC001.02D22A.A1FE8E0489D4=8

System
The originating DB2 job name and the resource manager that is the source of the thread.

An additional line below the attachment identifier displays the user thread, if any, that is served by the system thread.

Lock ownership information: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Percent NUMLKUS
The current percentage of NUMLKUS reached by the thread. NUMLKUS is an installation parameter in DSNZPARM that specifies the maximum number of page, row, LOB, or XML locks that can be held by a single process at any one time. It includes locks for both, the DB2 catalog and directory and for user data.

Total Locks Owned
The total number of all locks owned by the thread. This includes all lock types.

Total Catalog Locks
Total of all catalog locks owned. This number includes any locks owned on a page or tablespace in database DSNDB06. This is the total of the catalog pageset and page locks.

Pageset and Dataset Locks
The total number of pageset locks held. This excludes pageset locks in which the lock object is a pageset owned by the catalog database or the directory database. Lock types included are PSET and DSET.

Catalog Pageset Locks
The total number of pageset locks in which the object of the lock is a pageset owned by the catalog (DSNDB06) database (PSET).

Page/Row Locks
Total number of page, row, LOB, and XML locks owned by the thread. It includes DPAG, IPAG, ROW, LOB, and XML locks. It includes any of the listed locks in which the lock object is owned by the catalog database or the directory database.

Catalog Page/Row Locks
The total number of page and row locks on the catalog (DSNDB06) database. This includes data page (DPAG), index page (IPAG), and row (ROW) locks.

Directory and Other Locks
The total number of directory and other locks owned by the thread. Directory locks are issued against resources contained in the DSNDB01 directory database.

Bind ACQUIRE Option
The ACQUIRE option specified at BIND time: ALLOCATE or USE. This allows you to control when the allocation of tablespace locks is to occur. If
ACQUIRE(USE) is specified, tablespace locks will be acquired when the resource is used by the application. When ACQUIRE(ALLOCATE) is specified, all tablespace locks will be obtained at plan allocation time. Dynamic SQL users (QMF, SPUFI) always execute with the ACQUIRE(USE) option.

Bind RELEASE Option (Static) (QW01243F)

The RELEASE option specified at BIND time: COMMIT or DEALLOCATE.

The RELEASE option controls when tablespace and SKCT locks are freed. RELEASE(COMMIT) causes these locks to be released at each commit point. RELEASE(DEALLOCATE) causes these locks to be freed at application termination. Page locks are always released at commit time, regardless of the release option.

ISOLATION Option

The ISOLATION option specifies when the plan is bound.

The isolation parameter allows you to control the data consistency in the pages that the plan accesses. It has an effect on the number of page or row locks held concurrently by an application. The available options are:

Cursor Stability (CS)

Causes a page lock acquired for read processing to be released when the application subsequently accesses data contained on another data page. (Page locks acquired as a result of update activity are always retained until commit.)

Read Stability (RS)

Is similar to Repeatable Read but this isolation option allows to insert new rows or update rows that did not satisfy the original search condition of the application.

Repeatable Read (RR)

Causes all application locks obtained for read processing to be retained until application commit time.

RR with X-lock

Means Repeatable Read with X-lock.

RS with X-lock

Means Read Stability with X-lock.

Uncommitted Read (UR)

Causes data to be read without acquiring locks. This can result in accessing data that has been updated but not yet committed. It applies only to read-only operations: SELECT, SELECT INTO, or FETCH from a read-only result table. Use this isolation level only when:

- Data consistency is not necessary or inconsistencies already exist
- Errors cannot occur with its use, such as with a reference table that is rarely updated

Type

The lock type owned. Every lock type owned by the thread will be displayed. For more information about lock types, lock levels, and lock resources, see "Lock Types and Lock Levels".

Level

The lock levels of the various lock types owned. All lock levels owned within a lock type will be listed. Lock levels can occur repetitively for a single lock type due to the different resources owned by the locks.
**Resource**
The resource that is the object of the lock. The content of this field is dependent on lock type. For data page (DPAG) and index page (IPAG) locks, the resource does not contain the actual data page number that is locked; it lists the database and pageset owning the data or index page lock. The **Number** field then displays how many data or index page locks exist within the resource (pageset) listed.

**Number**
The number of locks meeting the type, level, and resource description of the lock.

**Claim information:**

**Type**
The type of object being claimed. Possible object types are:
- **TS** Tablespace
- **TS LPRT** Tablespace logical partition
- **TS PART** Data Partition
- **IX** Indexspace
- **IX LPRT** Indexspace logical partition
- **IX PART** Index Partition

**Class**
The claim class. Possible claim classes are:
- **CS** Cursor Stability
- **RR** Repeatable Read
- **WRITE** Write access

**Resource**
The name of the object which is locked or claimed. The resource name can include the database name, the pageset name, the partition number, the page number, the record ID, the collection ID, the package name, or the plan name.

**Note:** DB=database name and PS=pageset name can be represented as a DBID=identifier or PSID=identifier correspondingly. DBID represents the decimal identifier of the database. PSID represents the decimal identifier of the table space or the index space.
Thread Lock/Claim/Drain Activity
This panel provides a summary of lock related activity for an individual thread.

---

Highlighting

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.
Authid
The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.
Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type
Batch The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

CICS The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
Pool The thread in use is a pool thread.
Entry The thread in use is a nonprotected entry thread.
Prot The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO The TSO user ID and region ASID.

Utility No additional information.

Db2 The Db2 subsystem identifier.

MVS The MVS system identifier.

ORIGAUTH The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.
Type  The distributed thread type.

**Distributed Allied**
A requesting thread; one that has issued an SQL call to a remote Db2 location.

**Database Access**
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=  The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format: 

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCACO01.02D22A.A1FEBE0489D4=8

System  The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

**Lock count information:**

**Lock Requests**
Requests to Internal Resource Lock Manager (IRLM) to obtain a lock on a resource.

**Deadlocks Detected**
The number of deadlocks detected.

**Unlock Requests**
Requests to IRLM to unlock a resource.

**Timeouts Detected**
The number of times that the suspension of a unit of work lasted longer than the IRLM timeout value.

**Query Requests**
Requests to IRLM to query a lock.

**Suspends - Lock Only**
Suspensions of a unit of work because a lock could not be obtained.

**Change Requests**
Requests to IRLM to change a lock.

**Suspends - Latch Only**
DB2 internal latch suspensions.

**Other IRLM Requests**
Requests to IRLM to perform a function other than those listed before.

**Suspends - Other**
Suspensions caused by something other than locks and latches.
Escalations to Shared
Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IS) lock to escalate to a shared (S) lock.

Escalations to Exclusive
Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IX) lock to escalate to an exclusive (X) lock.

Maximum Page/Row Locks
The maximum number of page or row locks held concurrently. This count cannot exceed the value of the NUMLKUS (locks per user) installation parameter.

Claim Requests
The number of claim requests.

Claims Failed
The number of unsuccessful claim requests.

Drain Requests
The number of drain requests.

Drains Failed
The number of unsuccessful drain requests.

Thread activity: Locks/Claims causing a thread to wait
This panel shows information about the locks that cause a thread to wait. You can use this information to determine whether a selected thread is suspended and waiting because of a locking conflict.

When a thread is suspended, this panel provides the name of the lock/claim request causing the suspension. It also provides a list of all locks/claims currently held by other threads causing the thread to be suspended.

If accounting class 2 and class 3 are not available, N/A is displayed.

The locking information is divided into the following categories:
1. The name of the lock request causing the suspension.
2. A list of all locks which are causing the thread to wait.

HEX values are displayed for lock resources, if the resource is owned by a thread on a remote LPAR, and no OMPE task is available from that LPAR, or XCF is not setup correctly.
Highlighting

Highlighted fields indicate that an exception relating to that field is tripped.

To display the Exception Messages for Thread Exceptions panel, type E.A. On this panel, you can determine the exceptions that have tripped.

Table 109. Highlighted fields on Locks/Claims Causing a Thread to Wait panel

For additional information about

- about the locks that are owned by a thread, an SQL activity, a general thread activity, or a resource limit activity, or to go to the Db2 system console, type the appropriate option letter on the top line and press ENTER.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  The Db2 authorization identifier of the active thread.

**Attach**  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Connection Type**

**Batch**  The MVS jobname and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**CICS**  The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:

- **Pool**  The thread in use is a pool thread.
- **Entry**  The thread in use is a nonprotected entry thread.
- **Prot**  The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

**IMS**  The IMS region number, transaction name, region name, and terminal ID (LTERM).

**RRSAF**  The MVS job name and ASID.

*Note:* For threads from remote Db2, the MVS job name is N/A.

**System**  The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**TSO**  The TSO user ID and region ASID.
Utility  No additional information.

Db2  The Db2 subsystem identifier.

MVS  The MVS system identifier.

ORIGAUTH
The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package
The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection
The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Type  The distributed thread type.

Distributed Allied
A requesting thread; one that has issued an SQL call to a remote DB2 location.

Database Access
A responding thread; one that is serving a remote DB2 location by responding to an SQL call.

Luwig
This value consists of two parts: the logical unit-of-work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format: 
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwig field displays data such as the following:
USCAC001.02D22A.A1FE8E04B9D4=8

Drain information:

Type  The type of object being drained. Possible object types are:

TS  Tablespace

TS PART  Data Partition

IX  Indexspace

IX PART  Index Partition

Class  The drain class. Possible classes are:

CS  Drain all CS read access to object.

RR  Drain all RR access to object.

Write  Drain all write access to object.
Resource
The name of the resource being drained. This includes the database name, pageset name, and the partition number (if any).

Claim information:
Plan The planname of the thread claiming the resource.
Connid The connection identifier of the thread claiming the resource.
Corrid The correlation identifier of the thread claiming the resource.
Class The claim class. Possible classes are:
   CS  Cursor Stability
   RR  Repeatable Read
   Write  Write access

Lock wait information:
Type The lock type on which the thread is waiting. For more information about lock types, see "Lock Types and Lock Levels".
Level The level or state (mode) of the lock request. This information describes the level of resource access demanded by the lock request. For more information about lock levels, see "Lock Types and Lock Levels".
Resource The resource for which the user is waiting. The content of the Resource field is dependent on lock type.
The resource varies depending upon the type of lock held. This field displays the following resources:

<table>
<thead>
<tr>
<th>Lock Type</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALBP</td>
<td>BP=buffer pool ID</td>

RSTR BMC-RSTP
SDBA DB=dataset name PS=pageset name
SKCT PLAN=plan name
SKPT
TOKEN is the consistency token (CONTOKEN) column from SYSIBM.SYSPACKAGE. Token=token
SPRC SYS_PITR
SREC DB=database name TS=tablespace name
TABL DB=database name PS=pageset name
UNDT Resource ID (in hexadecimal)
UTEX UTEXEC
UTID UID=utility identifier
UTOB DB=database name PS=pageset name PT=partition
UTSE UTSEPARATOR
WDRN

DB=database name PS=pageset name PT=partition

Note: DB=database name can be represented as a DBID=identifier, which is the decimal identifier of the database. PSID=identifier can be represented as PSID=identifier, which is the decimal identifier of the table space or index space.

For more information about lock resources, see “Lock Types and Lock Levels”.

Wait For Lock Time
The time that DB2 has been waiting for the locked resource.

# To Repeat Lock Timeout
The number of times DB2 repeats the lock timeout.

IRLM Time Out Value
The maximum time that DB2 waits for a locked resource. When DB2 reaches the maximum value, it rolls back the unit of work.

Level
The level or state (mode) of the lock request. This information describes the level of resource access demanded by the lock request. For more information about lock levels, see “Tablespace lock levels” on page 1723.

Lock owner information:

Plan
The DB2 plan name of the active thread.

Connid
The DB2 connection identifier of the active thread.

Corrid
The DB2 correlation identifier of the active thread.

Lvl
The lock level owned.

Thread Global Lock Activity
This panel provides a summary of global locking activity for an individual thread.

This panel is only available in a data sharing environment. The information provided by this panel can help you in properly sizing the coupling facility lock structure and reducing global lock contentions for transactions.
Highlighting

OMEGAMON XE for DB2 PE highlights some fields in this panel to draw your attention to their current status:

Table 110. Highlighted fields on Thread Global Lock Activity panel

<table>
<thead>
<tr>
<th>Field</th>
<th>Exception</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan</td>
<td>Any</td>
<td>Same as the other thread detail panels.</td>
</tr>
</tbody>
</table>

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan    The Db2 plan name of the active thread.

Connid  The Db2 connection identifier of the active thread.

Corrid  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid  The Db2 authorization identifier of the active thread.

Attach  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Connection Type

Batch    The MVS jobname and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.
CICS  The CICS jobname, task name, task number, terminal ID, and thread type. The thread type is:
  Pool   The thread in use is a pool thread.
  Entry  The thread in use is a nonprotected entry thread.
  Prot   The thread in use is a protected thread. Protected threads are defined in an RCT entry definition using the THRDS operand.

IMS    The IMS region number, transaction name, region name, and terminal ID (LTERM).

RRSAF  The MVS job name and ASID.

Note: For threads from remote Db2, the MVS job name is N/A.

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

TSO    The TSO user ID and region ASID.

Utility No additional information.

Db2    The Db2 subsystem identifier.

MVS    The MVS system identifier.

ORIGAUTH The original (primary) Db2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Package identifier: This information identifies the package to which the information in this panel applies.

Package The Db2 package name of the active thread. Up to 18 characters of the package name are returned.

Collection The package collection identifier. This field is displayed only if a package is being used.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type    The distributed thread type.

Distributed Allied A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=    The Db2 subsystem ID, indicating the member of the data sharing group of this thread.
**Luwid**  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E0489D4=8

**System**

The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**Global lock information:**

**P-lock Lock Requests**

Number of lock requests for P-locks. A P-lock is a physical lock used only in a data sharing environment to provide consistency of data cached in different DB2 subsystems.

**P-lock Unlock Requests**

Number of unlock requests for P-locks.

**P-lock Change Requests**

Number of change requests for P-locks.

**XES Lock Requests**

The number of lock requests (both logical and physical) that were propagated to MVS XES synchronously under the caller’s execution unit. This count does not include suspended requests. Only the most restrictive lock for a particular resource is propagated to XES and the coupling facility.

**XES Unlock Requests**

The number of unlock requests (both logical and physical) that are propagated to MVS XES synchronously under the caller’s execution unit. This count does not include suspended requests.

**XES Change Requests**

The number of change requests (both logical and physical) that were propagated to MVS XES synchronously under the caller’s execution unit. This count does not include suspended requests.

**Suspends - IRLM Global Cont**

The number of suspends due to Internal Resource Lock Manager (IRLM) global resource contentions. IRLM lock states were in conflict and inter-system communication is required to resolve the conflict.

**Suspends - XES Global Cont**

The number of suspends due to MVS XES global resource contentions that were not IRLM-level contentions. The XES lock states were in conflict, but the IRLM lock states were not.

**Suspends - False (and Conv)**

Summation of false contentions and sync-to-async heuristic conversions.
XES detects hash class contention when two different locks on different resources hash to the same entry in the coupling facility lock table. The requester is suspended until it is determined that no real lock contention exists.

Sync-to-async heuristic conversions are done when the XES determines that it is more efficient to drive the request asynchronously to the coupling facility.

**Total L-lock Requests**
The total number of L-lock requests. An L-lock is a logical lock used to control intra- and inter-DB2 data concurrency between transactions.

**XES L-lock Req Percentage**
The percentage of total L-lock requests that were propagated to MVS XES synchronously.

**Incompatible Retained Locks**
The number of global lock or change requests that failed because of an incompatible retained lock. Certain P-locks can be retained because of a system failure. Another DB2 member cannot access the data that the retained P-lock is protecting unless it requests a P-lock in a compatible state.

**Notify Messages Sent**
The number of notify messages sent.

**Total Number False Content.**
The total number of false contentions for LOCK and UNLOCK requests. A false contention occurs when different resource names hash to the same entry in the coupling facility (CF) lock table. The CF detects contention within the hash entry, and XES uses intersystem messaging to determine that no actual resource contention exists.

**Resource Managers and Other DB2 Subsystem Information menu**
Select this main menu option for information about the DB2 resource managers and other system-related information.

This menu provides access to the panels that display subsystem level information about DB2. The information covers DB2 resource managers, current trace activity, DSNZPARM parameters, and DBM1 storage management statistics.
Navigation

The following menu options are available:

BUFFER MANAGER
Provides information about the performance of the DB2 buffer manager and the activity in each of the buffer pools.

For more information, see the description of panel “Buffer Manager Information” on page 1113.

For more information, see the description of panel “Group Buffer Pool Information” on page 1125.

LOG MANAGER
Provides information about the active logging and archival activity of the DB2 log manager.

For more information, see the description of panel “DB2 Log Manager Information” on page 1129.

EDM POOL
Provides information about the activity in and performance of the EDM pool.

For more information, see the description of panel “EDM Pool Information” on page 1136.

BIND STATISTICS
Displays bind operation counts.

For more information, see the description of panel “Bind Statistics” on page 1177.

SUBSYSTEM MANAGER
Displays workload-related information about the monitored DB2 subsystem.

For more information, see the description of panel “DB2 Subsystem Support Manager Statistics” on page 1180.
ACTIVE TRACES
Displays summary and detail information about the DB2 traces that are currently active.
For more information, see the description of panel “Active Trace Summary” on page 1183.

DSNZP ARM
Displays the settings of the installation options in the DSNZP ARM module.
For more information, see the description of panel “DSNZP ARM Parameters” on page 1188 and subsequent DSNZPARM-related panels.

LOCK/CLAIM/DRAIN
Displays information about current locking activity and claim and drain statistics.
For more information, see the description of panel “Lock Manager Information” on page 1278.
For more information, see the description of panel “Global Lock Statistics” on page 1280.

SQL/RID POOL/PARALLEL
Displays information about current SQL activity, RID pool accesses, parallelism, and stored procedure information.
For more information, see the description of panel “SQL/RID Pool/Parallelism/Stored Procedure Information” on page 1283.

OPEN/CLOSE STATISTICS
Provides information about open and close data set activity occurring within the DB2 subsystem.
For more information, see the description of panel “Open/Close Statistics” on page 1303.

DB2 COMMANDS
Provides information about DB2 command activity.
For more information, see the description of panel “DB2 Command Statistics” on page 1305.

DB2 Storage
Provides statistics information about DBM1 (DB2 database services address space) virtual and real storage and MVS storage performance.
For more information, see the description of panel “DB2 Storage” on page 1309.

Accelerator
Displays a list of the available accelerators. You can sort this list.
For more information, see the description of panel “Accelerator Statistics Overview” on page 1327.

GBP Cache Struct
Provides information about a group buffer pool across all DB2 members in the data sharing group.
For more information, see the description of panel “GBP Coupling Facility Cache Structure Statistics Summary” on page 1322 and “GBP Coupling Facility Cache Structure Statistics” on page 1324.
**Buffer Manager Information**

This panel provides information about the performance of the DB2 buffer manager and the activity in each of the buffer pools.

This information helps you analyze buffer pool utilization.

### Navigation

For additional information about

- a buffer pool, move the cursor to the buffer pool line and press F11 (Zoom). For more information, see the description of panel "Buffer Pool Detail" on page 1114.
- other topics, use the PF keys.

### Fields

**Current Number Open Datasets**

The number of data sets that are currently open in DB2.

**High Water Mark Open Datasets**

The largest number of data sets that were open simultaneously in DB2 since DB2 started.
Maximum Number Open Datasets Allowed
Determined how much initial memory to allocate for the data sets at
startup time (defined by DSNZPARM DSNLX). The maximum number of
data sets that can be open at one time is determined by TION SIZE, which
is specified in SYS1.PARMLIB(ALLOCxx).

Open Dataset Count in Active Pools
The total number of opens issued for the buffer pools that are currently
active. This value represents the number of times the data sets have been
opened (and reopened) since DB2 started. (Buffer pools not currently in
use might have issued opens that are not reflected in this count.)

Pool ID
The ID of the buffer pool.

VP Size
The number of buffers allocated for an active virtual buffer pool.

Pages Alloc
The number of pages currently allocated to the buffer pool. If a buffer pool
is in use, Pages Alloc will be between the minimum and maximum values.
Otherwise, it will be zero.

Pages In Use
The number of 4K, 8K, 16K, or 32K pages that are currently in use by the
buffer pool.

Getp Rate
The number of Getpage requests per second made by the buffer pool.

Read I/O Rate
The total number of Read I/Os per second made by the buffer pool.

Prefetch Req Rate
The number of Sequential Prefetch and List Prefetch requests per second
made by the buffer pool.

Write I/O Rate
The number of Write I/Os per second.

Buffer Pool Detail
This panel provides detailed information about the current activity in the specified
DB2 buffer pool.

If a buffer pool is defined but currently not used by DB2, the value 0 is displayed
for all fields 0 except for the field VP Sizew. If the buffer pool is used by DB2, the
accumulated counts are displayed.

Navigation

For additional information about

- buffer pool contents, select option A-BUFFER POOL at the top of the panel.
- pageset information about the selected buffer pool, select option C-Buffer Pool Snapshot. For more information, see the description of panel “Buffer Pool Snapshot Open Pagesets” on page 1123.
- near-term history activity, select option H-HISTORICAL at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval

This field displays REALTIME to indicate that you are looking at the realtime
version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start**
The start time of the report interval currently displayed.

**Report Interval**
The time in the last cycle (for example, between two presses of the Enter key).

**End**
The end time of the current report interval is displayed.

**Virtual Buffer Pool Size**
The number of buffers that are allocated for an active virtual buffer pool.

**VPOOL Frame Size (QDBPFRAM)**
For the Frame Size attribute, you can specify the values 4K, 1M, or 2G.
This applies to DB2 11 and higher.

**VPOOL Buffers Allocated**
The number of virtual buffer pool pages that are allocated at the end of the interval.

**Minimum VPOOL Size (QDBPVPMI)**
The VPSIZEMIN attribute.
This applies to DB2 11 and higher.

**VPOOL Buffers in Use**
The number of virtual buffer pool pages that are used at the end of the interval. This value is a snapshot value of the current number of non-stealable buffers. A buffer is called non-stealable, if one of the following conditions apply:
- It has an outstanding GETPAGE. This means that someone is currently looking at this page.
- It is updated, however, it is not yet written to DASD.

**Maximum VPOOL Size (QDBPVPMA)**
The VPSIZEMAX attribute.
This applies to DB2 11 and higher.

**VPOOL Buffers to be Del**
The number of pages that can be deleted from an active virtual buffer pool as a result of pool contraction.

**Auto Size**
Determines whether Auto Size is used. You can specify Y (YES) or N (NO).

**Use Count**
The number of open tablespaces or indexspaces in this buffer pool.

**Page Fix**
Determines whether a page is fixed in real storage when it is first used. You can specify Y (YES) or N (NO).

**VP Sequential Thresh**
Sequential Steal threshold for the virtual buffer pool VPSEQT. The percentage of the virtual buffer pool that can be occupied by sequentially accessed pages. If set to zero, prefetch is disabled.

**Deferred Write Thresh**
Deferred Write threshold for the virtual buffer pool DWQT. Write
operations are scheduled when the percentage of unavailable pages in the virtual buffer pool exceeds this threshold to decrease the unavailable pages to 10% below the threshold.

**Vert Deferred Write Thresh**
Vertical Deferred Write threshold for the virtual buffer pool VDWQT. The percentage of the buffer pool that might be occupied by updated pages from a single data set.

**VP Parallel Seq Thresh**
Parallel I/O sequential threshold VPPSEQT. This threshold determines how much of the virtual buffer pool might be used for parallel I/O operations. It is expressed as a percentage of VPSEQT. If set to zero, I/O parallelism is disabled.

**Sysplex Parallel Thresh**
Virtual buffer pool assisting parallel sequential threshold. This threshold determines how much of the virtual buffer pool might support parallel I/O operations from another DB2 in a data sharing group.

**Getpages per Sync I/O**
The ratio of Getpage requests to Read I/Os.

**Pages Written per Write I/O**
The ratio of pages written to physical I/Os.

**Prefetch per I/O**
The ratio of Prefetch requests to physical I/Os.

**Pages Read per Prefetch**
The ratio of pages read by Prefetch processing to total Prefetch requests.

**Seq Prefetch per I/O**
The ratio of pages read by Sequential Prefetch to Sequential Prefetch I/O.

**Pages Read per Seq Prefetch**
The ratio of pages read by Sequential Prefetch to Sequential Prefetch requests.

**List Prefetch per I/O**
The ratio of List Prefetch requests to List Prefetch I/Os.

**Pages Read per List Prefetch**
The ratio of pages read by List Prefetch to List Prefetch requests.

**Dyn Prefetch per I/O**
The ratio of Dynamic Prefetch request to Dynamic Prefetch I/Os.

**Pages Read per Dyn Prefetch**
The ratio of pages read by Dynamic Prefetch to Dynamic Prefetch request.

**Max Concur Prefetch I/O**
The highest number of concurrent prefetch I/O streams that were allocated to support I/O parallelism.

**Workfile Maximum**
The maximum number of work files that are allocated during sort/merge processing during the current statistics period.

**BP Hit % - Random**
The percentage of times that DB2 performed a Getpage operation with a random request and the page was already in the buffer pool. A DASD read was not required.
BP Hit % - Sequential
The percentage of times that DB2 performed a Getpage operation with a sequential request and the page was already in the buffer pool. A DASD read was not required.

Virtual Page Steal Method
Determines when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Valid values:

- LRU  “Least Recently Used” objects are removed first.
- FIFO Oldest objects are removed first (First-In-First-Out).
- NONE Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

Random Getpage Buffer Hit
The number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain. DB2 11.1 and later. (Field name: QBSTRHS)

LWM Buffers on SLRU
The minimum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval. DB2 11.1 and later. (Field name: QBSTSMIN)

HWM Buffers on SLRU
The maximum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low water mark (LWM) within an interval. DB2 11.1 and later. (Field name: QBSTSMAX)

For each of the following fields, the following statistics values are provided:

TOTAL QUANTITY
Total quantity, which reflects the amount of activities since DB2 was started.

INTERVAL QUANTITY
Interval quantity, which reflects the amount of activities during the last cycle.

/SECOND
Rate per second during the last cycle. The number under /SECOND (in parentheses) is the number of seconds in the interval.

/THREAD
Rate per thread during the last cycle. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
Rate per Commit during the last cycle. The number under /COMMIT (in parentheses) is the number of commit requests (including abort requests) during the interval.

Getpage Requests
The number of Getpage requests for the buffer pool.

Getpage Requests - Sequential
The number of Getpage requests issued by sequential access requestors.
Getpage Requests - Random
The number of Getpage requests issued by random access requestors.

Getpage Requests - Seq Ovfl
The number of sequential GETPAGE requests using overflowed buffers. DB2 12 and later.

Getpage Requests - Random Ovfl
The number of non-sequential GETPAGE requests using overflowed buffers. DB2 12 and later.

Getpage Failed - VPOOL Full
The number of Getpage failures due to unavailable buffers because the virtual buffer pool is full.

Getpage Failed - Cond Request
The number of conditional getpage requests that cannot be satisfied for this buffer pool. A conditional getpage is used with parallel I/O processing only.

Getpage Failed - Cond SeqReq
The number of conditional sequential getpage requests that failed because the page is not in the buffer pool.
This applies to DB2 9 or higher.

Sync Read I/O Operations
Synchronous read operations done by DB2.

Sync Read I/Os - Sequential
The number of synchronous Read I/O operations performed by sequential requests.

Sync Read I/Os - Random
The number of synchronous Read I/O operations performed by random requests.

Sync Read I/Os - Seq Ovfl
The number of synchronous Read I/O operations performed for sequential GETPAGE requests using overflowed buffers. DB2 12 and later.

Sync Read I/Os - Random Ovfl
The number of synchronous Read I/O operations performed for non-sequential GETPAGE requests using overflowed buffers. DB2 12 and later.

Pages Read via Seq Prefetch
The pages that are read as a result of sequential prefetch requests.

Seq Prefetch I/O Operations
The number of asynchronous read I/Os that are caused by sequential prefetch.

Sequential Prefetch Requests
Sequential prefetch requests for the buffer pool.

Pages Read via List Prefetch
The pages read as a result of list prefetch requests.

List Prefetch I/O Operations
The number of asynchronous read I/Os caused by list prefetch.

List Prefetch Requests
The List prefetch requests for the buffer pool.
Pages Read via Dyn Prefetch
The pages read as a result of dynamic prefetch requests. Dynamic prefetch is triggered because of sequential detection.

Dyn Prefetch I/O Operations
The number of asynchronous read I/Os caused by dynamic prefetch.

Dyn Prefetch Requests
The number of dynamic prefetch requests for the buffer pool.

Prefetch Failed - No Buffer
Failures of prefetch because the sequential prefetch threshold (SPTH) is reached.

Prefetch Failed - No Engine
Failures of prefetch because the maximum number of concurrent prefetches is reached. You cannot change this maximum value.

Parallel Group Requests
The number of requests made for processing queries in parallel.

Prefetch I/O Streams Reduced
The number of requested prefetch I/O streams that are denied because of a buffer pool shortage. This applies only for non-work file pagesets for queries that are processed in parallel.

Parallelism Downgraded
The number of times the requested number of buffers to allow a parallel group to run to the planned degree cannot be allocated because of a buffer pool shortage.

Prefetch Quan Reduced to 1/2
The number of times the sequential prefetch quantity is reduced from normal to one-half of normal. This is done to continue to allow execution concurrently with parallel I/O.

Prefetch Quan Reduced to 1/4
The number of times the sequential prefetch quantity is reduced from one-half to one-quarter of normal.

Pages Added to LPL
The number of times one or more pages are added to logical page lists (LPL). (Field name: QBSTLPL)

Length of SLRU=VPSEQT
The number of times when the length of the sequential least-recently-used (SLRU) chain equals the sequential steal threshold VPSEQT. DB11 and later. (Field name: QBSTHST)

Pages Updated
The number of updates to pages in the buffer pool.

Pages Written
The number of buffer pool pages written to DASD.

Page-in Required for Write I/O
The number of page-ins that are required for write I/O operations.

Write I/O Operations
The number of Write operations performed by media manager for both synchronous and asynchronous I/O.

Immediate (Sync) Writes
Immediate writes to DASD. This value is incremented when 97.5% of the
buffer pool pages are used. In addition, DB2 might flag buffer pool pages for immediate write during checkpoint processing and when a database is stopped.

Consider the value of Data Manager Threshold Reached (DMTH) when interpreting this value. If DMTH is zero, this value is probably insignificant.

**Vert Defer Wrt Threshold Reached**
The number of times the vertical write threshold is hit.

**Deferred Write Threshold Reached**
The Deferred Write Threshold (DWTH) is reached. This occurs in the following situations:
- If DB2 uses 50% of the buffer pool.
- If a data set has updated 10% of the buffer pool pages or 64 pages. At this threshold, DB2 forces writes to free pool space.

**Data Manager Threshold Reached**
Data manager threshold (DMTH) is reached. This occurs when DB2 uses 95% of the buffer pool minimum value and begins to operate at the row level instead of the page level. When this occurs, CPU usage increases considerably.

**Successful VPOOL Expand/Contract**
The number of successful virtual pool expansions or contractions because of the ALTER BUFFERPOOL command.

**VPOOL Expand Failed**
The number of virtual buffer pool expansion failures.

**Successful Dataset Opens**
The number of data set open operations that are successful.

**DFHSM Recall**
Attempts to access data sets that are migrated by DFHSM.

**DFHSM Recall Timeouts**
Unsuccessful attempts to recall data sets because the timeout threshold (DSNZPARM RECALLD) is exceeded.

**Sort Merge Passes**
The number of merge passes for DB2 sort/merge processing.

**Sort/Merge Workfile Requests**
The number of work files requested during sort/merge processing.

**Sort/Merge Workfile Requests Denied**
The number of requests for work files that are denied during merge processing because of insufficient buffer resources.

**Sort Merge Pass - Buff Short**
The number of times that sort/merge cannot efficiently perform because of insufficient buffer resources. This field is incremented when the number of work files allowed is less than the number of work files requested.

**Workfile Prefetch Disabled**
The number of times a workfile prefetch is not scheduled because the prefetch quantity is zero.

**Workfile Create Failed - No Buff**
The number of times a work file is not created because of insufficient buffers (MVS/XA only).
**Destructive Read Requests**

The number of pages that are requested for destructive read processing.

**Destructive Read Page Dequeue**

The number of pages that are dequeued for destructive read processing.

**Buffer Pool Snapshot Open Pagesets**

This panel shows pageset information about specified buffer pools.

**Navigation**

For additional information about:

- a particular pageset, move the cursor to the required pageset name line and press F1 (Zoom). For more information, see the "Buffer Pool Snapshot Datasets" on page 1124 panel.
- other topics, use the PF keys.

**Fields**

**Pageset Name**

Name of open pagesets in the buffer pool. The pageset name consists of DBname.TSname for a tablespace, or DBname.ISname for an indexspace.

**Pageset Type**

Pageset type, which is either tablespace or indexspace.

**Use Count**

Number of applications currently accessing the pageset.

**Open DS**

Number of data sets open for the pageset.

**VP Pgs Current**

Number of pages currently in the virtual buffer pool for this data set.

**VP Pgs Changed**

Number of dirty pages currently in the virtual buffer pool for this data set.

**GRP Dep**

Indicates whether the object is group buffer pool dependent.
**Buffer Pool Snapshot Datasets**

This panel provides detailed information for each open data set in the buffer pool.

---

**Navigating**

For additional information about other topics, use the PF keys.

**Fields**

**BP**  
Buffer pool name.

**Pageset Name**  
Name of the pageset. The pageset name comprises DBname.TSname for a tablespace, or DBname.ISname for an indexspace.

**Type**  
Pageset type, either tablespace or indexspace.

**Open Datasets**  
Number of data sets open for the pageset.

The following fields below are displayed for each open data set:

**Dataset Name**  
The name of the data set associated with this pageset piece.

**VP Pages Current**  
Number of pages currently in the virtual buffer pool for this data set.

**VP Pages Maximum**  
Maximum number of pages concurrently in the virtual buffer pool for this data set - high-water mark since the last **DISPLAY BUFFERPOOL** command with the LSTATS option was issued.

**VP Pages Changed**  
Number of dirty pages currently in the virtual buffer pool for this data set.

**VP Pages Changed Maximum**  
Maximum number of dirty pages concurrently in the virtual buffer pool for this data set - high-water mark since the last **DISPLAY BUFFERPOOL** command with the LSTATS option was issued.

The following data set statistics are available only if there was activity for the data set since it was last displayed using the **DISPLAY BUFFERPOOL** command. These
values match the data set statistics kept by DB2, which are incremented since the
data set was last displayed using the DISPLAY BUFFERPOOL command. If all values
are zero, N/A is displayed for these fields.

**Sync I/O Total Pages**
Total number of pages read or written synchronously for the data set.

**Sync I/O Average Delay**
Average synchronous I/O delay in milliseconds for pages in the data set.

**Sync I/O Maximum Delay**
Maximum synchronous I/O delay in milliseconds for pages in the data set.

**Async I/O Average Delay**
Average asynchronous I/O delay in milliseconds for pages in the data set.

**Async I/O Maximum Delay**
Maximum asynchronous I/O delay in milliseconds for pages in the data set.

**Async I/O Total Pages**
Total number of pages read or written asynchronously for the data set.

**Async I/O Total I/O Count**
Total number of asynchronous I/Os issued for the data set.

**Group BP Dependent**
Indicates whether the pageset or partition is dependent upon the group
buffer pool from either
- active inter-DB2 read/write interest
- changed pages in the group buffer pool that have not yet been castout to
  DASD

This field applies only in a data sharing environment.

**Group Interest Level**
The highest interest level of all data sharing group members interested in a
pageset or partition that is in the group buffer pool. This field applies only
in a data sharing environment. Possible values:

- **R/O**  Read-only interest
- **R/W**  Read/write interest (higher)

**Group BP Cache Level**
Displays the default GBPCACHE option specified on CREATE
TABLESPACE SQL statement. The default is CHANGED, which specifies
that only updated pages are written to the group buffer pool. ALL specifies
that pages are to be cached in the group buffer pool as they are read from
DASD. This field applies only to a data sharing environment.

**Group Buffer Pool Information**
This panel provides information about group buffer pools that a DB2 member
connected to.

This panel is only available in a data sharing environment.
### Navigation

For additional information about

- a group buffer pool, move the cursor to the buffer pool line and press F11 (Zoom). For more information, see the description of panel “Group Buffer Pool Detail” on page 1127.
- buffer pools, enter A in the top line.
- other topics, use the PF keys.

### Fields

**Pool ID**

The group buffer pool identifier.

**Read Rate**

The number of reads per second to the group buffer pool.

**Read Hit %**

The percentage of all Reads to the group buffer pool for which the needed data was found and returned to the member.

**Pages Not Returned - R/W Int %**

The percentage of all Reads to the group buffer pool where

- the data was not found in the group buffer pool and the member had to go to DASD to read the page, and
- other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

**Read/Write Failed**

The number of Read or Write requests to the group buffer pool that failed because of a lack of storage resources.

**Write Rate**

The number of Writes per second to the group buffer pool.

**Pages Castout**

The number of pages that this member has castout to DASD from the group buffer pool.

</table>
| > Help PF1 | Back PF3 | Up PF7 | Down PF8 | > |}

For additional information about:
- Buffer pool contents, select option **A-BUFFER POOL** at the top of the panel.
- Near-term history activity, select option **H-HISTORICAL** at the top of the panel.
- Other topics, use the PF keys.

**Fields**

If a group buffer pool is not currently in use by DB2, all fields are zero. OMEGAMON XE for DB2 PE displays accumulated counts again when DB2 is using the group buffer pool.

**Collection Interval**

This field displays **REALTIME** to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start**

The start time of the report interval currently displayed.

**Report Interval**

The time in the last cycle (for example, between two presses of the Enter key).
End  The end time of the report interval currently displayed.

Read Hit %
The percentage of all Reads to the group buffer pool for which the needed data was found and returned to the member.

For each of the following fields, the following statistics values are provided:

**TOTAL QUANTITY**
Total quantity, which reflects the amount of activities since DB2 was started.

**INTERVAL QUANTITY**
Interval quantity, which reflects the amount of activities during the last cycle.

/SECOND
Rate per second during the last cycle. The number under /SECOND (in parentheses) is the number of seconds in the interval.

/THREAD
Rate per thread during the last cycle. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
Rate per Commit during the last cycle. The number under /COMMIT (in parentheses) is the number of commit requests (including abort requests) during the interval.

**Reads - Cross Invalidation: Data Returned**
The number of reads to the group buffer pool required because the page in the member’s buffer pool was invalidated, where the data was found and returned to the member.

**Reads - Cross Invalidation: Data not in GBP-R/W Interest**
The number of reads to the group buffer pool required because the page in the member’s buffer pool was invalidated, where:
- The data was not found in the group buffer pool and the member had to go to DASD to read the page
- Other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

**Reads - Page Not Found: Data Returned**
The number of reads to the group buffer pool required because the page was not in the member’s buffer pool where the data was found and returned to the member.

**Reads - Page Not Found: Data not in GBP-R/W Interest**
The number of reads to the group buffer pool required because the page was not in the member’s buffer pool, where:
- The data was not found in the group buffer pool and the member had to go to DASD to read the page
- Other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

**Writes - Synchronous: Changed Pages**
The number of changed pages that are synchronously written to the group buffer pool. Pages can be forced out before the application commits if a
buffer pool threshold is reached, or when P-lock negotiation forces the pages on the Vertical Deferred Write queue to be written to the group buffer pool.

**Writes - Synchronous: Clean Pages**
The number of clean pages that are synchronously written to the group buffer pool. DB2 writes clean pages for pagesets and partitions defined with GBPCACHE ALL.

**Writes - Asynchronous: Changed Pages**
The number of changed pages asynchronously written to the group buffer pool. Pages can be forced out before the application commits if a buffer pool threshold is reached, or when P-lock negotiation forces the pages on the Vertical Deferred Write queue to be written to the group buffer pool.

**Writes - Asynchronous: Clean Pages**
The number of clean pages asynchronously written to the group buffer pool. DB2 writes clean pages for pagesets and partitions defined with GBPCACHE ALL.

**Write Failed - No Storage**
The number of group buffer pool write requests that failed because of a shortage of coupling facility resources.

**Pages Castout to DASD**
The number of pages that this member has castout to DASD from the group buffer pool.

**GBP Castout Threshold Reached**
The number of times that castout was initiated because the group buffer pool castout threshold was reached.

**Castout Class Threshold Reached**
The number of times that castout was initiated because the castout class threshold was reached.

**Other Requests**
The number of other requests.

**DB2 Log Manager Information**
This panel shows information about the active logging and archiving activity of the DB2 log manager.

The panel shows current statistics about log read and write activity and read and write log allocations. The panel also provides information regarding where DB2 is in the checkpoint cycle.
OMEGAMON XE for DB2 PE highlights some fields in this panel to draw your attention to their current status:

**Navigation**

For additional information about

- a particular log data set, move the cursor to the log data set name line and press F11 (Zoom). For more information, see the description of panel “DB2 Log Dataset Information” on page 1134.
- Near-term history activity, select option H-HISTORICAL at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Collection Interval**

This field displays REALTIME to indicate that you are looking at the real-time version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start**

The start time of the report interval currently displayed.

**Report Interval**

The time in the last cycle (for example, between two presses of the Enter key).

**End**

The end time of the report interval currently displayed.

**Logging Mode**

The logging mode in use: DUAL or SINGLE. The logging mode is specified in the TWOACTV parameter of the DSNZPARM module.

**Archiving Mode**

The archiving mode: DUAL or SINGLE. The archiving mode is specified in the TWOARCH parameter of the DSNZPARM module.

**Number of Logs Defined**

The number of logs defined to DB2 at installation.

**Number of Logs Available**

The number of logs available that are not archived, that is, the number that are ready for use.

**Checkpoint Frequency**

The number of log records DB2 will write between checkpoints.

**Records until Checkpoint**

The number of log records to write until the next checkpoint.

**Input Buffer Size**

The size of the log buffer for reading. The buffer size is specified in the INBUFF parameter of the DSNZPARM module.

**Output Buffer Size**

The size of the log buffer for writing. The buffer size is specified in the OUTBUFF parameter of the DSNZPARM module.
Write Threshold
The number of 4K buffers that would normally be filled before a physical I/O is performed. This number is specified in the WRTHRSH parameter of the DSNZPARM module.

Current Log Record RBA
The relative byte address (RBA) of the record that was being logged at the end of the interval.

Primary Active Log
The data set name of the primary log.

Secondary Active Log
The data set name of the second copy of a dual logged log.

Archive in Progress
The data set name of the active archive log, if an archive is in progress.

For each of the following fields, the following statistics values are provided:

TOTAL QUANTITY
Total quantity, which reflects the amount of activities since DB2 was started.

INTERVAL QUANTITY
Interval quantity, which reflects the amount of activities during the last cycle.

/SECOND
Rate per second during the last cycle. The number under /SECOND (in parentheses) is the number of seconds in the interval.

/THREAD
Rate per thread during the last cycle. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
Rate per Commit during the last cycle. The number under /COMMIT (in parentheses) is the number of commit requests (including abort requests) during the interval.

Reads from Output Buffers
The Reads that were satisfied from the output buffers.

Reads from Active Log
The Reads that were satisfied from the active log.

Reads from Archive Log
The Reads that were satisfied from the archive log.

Reads Delayed - Tape Contention
The number of reads delayed because a tape volume was already in use.

Reads Delayed - No Tape Unit
Number of archive log reads that were delayed because of unavailable tape units, or because the maximum amount of read parallelism is being used (not likely).

Look-Ahead Tape Mounts Attempted
Number of look-ahead tape mounts attempted.

Look-Ahead Tape Mounts Performed
Number of successful look-ahead tape mounts.
Write NOWAIT Requests
   The times DB2 externalized log records asynchronously.

Write FORCE Requests
   The times DB2 externalized log records synchronously.

Write Delayed - No Buffer
   DB2 attempts to place log records in the output buffer when no log buffer could be found.

Write Active Log Buffers
   Calls to the log write routine.

Active Log CIs Created
   Active log control intervals created.

Archive Log Read Allocations
   Archive read allocations, which reflect archive log open/close activity.

Archive Log Write Allocations
   Archive write allocations, which reflect archive log open/close activity.

Archive Log CIs Offloaded
   Number of active log control intervals offloaded to archive data sets.

BSDS Access Requests
   Calls to the bootstrap data set access routine.

Checkpoints
   The number of checkpoints DB2 takes since startup.

IFI Abends
   The count of IFI abends.

IFI Unrecog Func
   The count of IFI unrecognized functions.

IFI Command Reqs
   The count of IFI command requests.

IFI READA Reqs
   The count of IFI READA requests.

IFI READS Reqs
   The count of IFI READS requests.

IFI WRITE Reqs
   The count of IFI WRITE requests.

Data Capture Invoked
   The number of log records retrieved for which data capture processing is invoked.

Data Capture READS
   The number of data capture log reads for processing IFI requests for IFCID 0185.

Data Capture Rec Returned
   The number of data capture log records returned.

Data Capture Row Returned
   The number of data capture data rows returned.

Data Capture Desc Returned
   The number of data capture data descriptions returned.
Data Capture Desc Performed
The number of data capture descriptors performed.

Data Capture Table Returned
The number of data capture tables returned.

Rollup (Threshold)
The number of rollup accounting records that are written because the rollup threshold is exceeded.

Rollup (Storage)
The number of rollup accounting records that are written because the rollup accounting storage threshold is exceeded.

Rollup (Stallness)
The number of rollup accounting records that are written because the staleness threshold is exceeded.

Rollup (Non Qual)
The number of records that failed to qualify for accounting rollup because all rollup key fields are NULL, or NULL values are not permitted.

DB2 Log Dataset Information
This panel shows information about the activity of the DB2 log manager in the area of active logging and archival.

The current statistics about log read and write activity and read and write log allocations are shown. In addition, information where DB2 is in the checkpoint cycle is shown.

For additional information about other topics, use the PF keys.

**Fields**

**Primary Active Log Is**
   The data set name of the active log.

**Log Percent Used**
   The percentage of the active log that has been filled.

**Log Dataset Size**
   The number of bytes in the log data set.

**Beginning Log RBA**
   The beginning RBA address of the active log data set.

**Ending Log RBA**
   The ending RBA address of the active log data set.

**Current Log RBA**
   The current RBA address of the active log data set.

**Log Volser**
   The volume serial(s) of the active log data set.

**Secondary Active Log Is**
   The data set name of the secondary log.

**Log Percent Used**
   The percentage of the secondary log that has been filled.

**Log Dataset Size**
   The number of bytes in the secondary log data set.

**Beginning Log RBA**
   The beginning RBA address of the secondary log data set.

**Ending Log RBA**
   The ending RBA address of the secondary log data set.

**Current Log RBA**
   The current RBA address of the secondary log data set.

**Log Volser**
   The volume serial(s) of the secondary log data set.

**Archive In Progress For**
   The data set name of the active archive log.

**Begin RBA**
   The beginning RBA of the archive log.

**End RBA to Archive**
   The last RBA to be archived.
**High RBA Archived**
The last RBA written to the archive log.

**Percent Archive Complete**
The amount of the archival that has completed.

**Output Device Type**
The device type of the archive log.

**Output Volser**
The volser(s) of the archive log.

**EDM Pool Information**
This panel provides information about the activity in the EDM pool and its performance.

Depending on the DB2 version that is used, the content of this panel is different.

The following panel shows the display of DB2 10:

```
<table>
<thead>
<tr>

<td>The utilization of the EDM pool has reached or exceeded its threshold.</td>
</tr>
</tbody>
</table>

### Navigation

For additional information about

- the contents of the EDM pool, select option **A-EDM Pool Snapshot**. For more information, see the description of panel "EDM Pool Snapshot Summary" on page 1143.
- the corresponding near-term history display, enter H on the top line and press Enter.
- other topics, use the PF keys.

**Fields**

Collection Interval

In this field, always REALTIME is displayed to indicate that you are...
looking at the realtime version of this panel instead of the corresponding near-term history panel. On the EDM Pool Information panel, the collection interval and the report interval are the same.

**Start**  The start time of the report interval that is currently displayed.

**Report Interval**  The amount of time in the last cycle, for example, the time between two presses of the Enter key.

**End**  The end time of the report interval that is currently displayed.

**Pool Usage**  The following types of EDM pools are available:

- EDM Database Descriptor (DBD) Pool
- EDM Statement (STMT) Pool
- EDM Skeleton (SKEL) Pool

For the above pool types, the following information is displayed. It is based on a snapshot of the data that is taken at the end of the report interval.

**Pages**  The number of pages that is dedicated to a particular type of pool usage.

**PCT**  The percentage of the EDM pool dedicated to that type of usage.

**Total**  The total number of pages in this type of type of EDM pool. For DB2 12 the Total Pages is based on DSNZPARM configured Maximum.

**Held**  The number of pages held in this type of type of EDM pool.

**CT Held**  Pages held in RDS pool for the cursor tables. This applies only to DB2 9, below and above the bar usage.

**PT Held**  Pages held in RDS pool for the package tables. This applies only to DB2 9, below and above the bar usage.

**SKCT Held**  Pages held in SKEL pool for skeleton cursor tables.

**DBD Held**  Pages held in DBD pool.

**STMT Held**  Pages held in STMT pool.

**Stealable**  The total number of pages that can be reused.

**Free**  The number of pages currently not used by any object in this type of EDM pool.

**In Use**  The number of pages that are used in this type of EDM pool. This applies only to DBD and SKEL pools.

The percentage of DBD In Use is calculated like this:

\[ \frac{(\text{In Use} - \text{Stealable/Reusable})}{\text{Total}} \times 100 \]
The percentage of SKEL in Use is calculated like this:

\[
\frac{(SKCTs + SKPTs) - Stealable/Reusable}{Total} \times 100
\]

**xProc Request (QISEKSPG)**
The total number of requests for PROCS.
This applies to DB2 10.

**xProc Total Allocation (QISEKSPA)**
The total number of pages that are allocated for xPROCS.
This applies to DB2 10.

**Shareable Static SQL Requests (QISEKSPG)**
The number of shareable static SQL statement requests.
This applies to DB2 11 or higher.

**Total Allocation Shareable Static SQL (QISEKSPA8)**
The total storage that is allocated to shareable static SQL statements.
This applies to DB2 11 or higher.

**SKEL Reusable (QISEKLRU)**
The total number of SKPT and SKCT pages that can be reused.
This applies to DB2 10 or higher.

**DBD Reusable (QISEDRLRU)**
The total number of DBD pages that can be reused.
This applies to DB2 10 or higher.

**Plan Below the Bar Allocation (QISESQCB)**
The amount of storage below the bar that is allocated for plans.
This applies to DB2 10 or higher.

**Package Below the Bar Allocation (QISESQKB)**
The amount of storage below the bar that is allocated for packages.
This applies to DB2 10 or higher.

**Plan Above the Bar Allocation (QISESQCA)**
The amount of storage above the bar that is allocated for plans.
This applies to DB2 10 or higher.

**Package Above the Bar Allocation (QISESQKA)**
The amount of storage above the bar that is allocated for packages.
This applies to DB2 10 or higher.

For each of the following fields, the following statistics are provided:

**TOTAL QUANTITY**
The amount of activities that occurred since DB2 is started.

**INTERVAL QUANTITY**
The amount of activities that occur during the interval.

/SECOND
Rate per second. The number under /SECOND (in parentheses) is the number of seconds in the interval.

/THREAD
Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.
/COMMIT
Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.

Failures due to DBD Pool Full
Failures that occurred because the DBD pool is full. DB2 10 and DB2 11 only.

Failures due to STMT Pool Full
Failures that occurred because the STMT pool is full. DB2 10 and DB2 11 only.

Failures due to SKEL Pool Full
Failures that occurred because the SKEL pool is full. DB2 10 and DB2 11 only.

Database Descriptor (DBD) Reqs
Requests for database descriptors.

DBD Loads
Database descriptors that have to be loaded from DASD.

% of DBD Loads from DASD
The percentage of DBD requests that result in DT loads from DASD.
This value should be kept low. 20% or lower is considered acceptable.

Cursor Table (CT) Reqs
Requests for cursor tables.

CT Loads
Cursor tables that have to be loaded from DASD.

% of CT Loads from DASD
The percentage of CT requests that resulted in CT loads from DASD.
This value should be kept low. 20% or lower is considered acceptable.

Package Table (PT) Reqs
Requests for package tables.

PT Loads
Package tables that had to be loaded from DASD.

% of PT Loads from DASD
The percentage of PT requests that result in PT loads from DASD.
This value should be kept low. 20% or lower is considered acceptable.

Dynamic SQL (DSC) Reqs
Requests to cache dynamic SQL.

DSC Loads
Dynamic SQL caches that had to be loaded from DASD.

CATALOG Loads
Dynamic SQL cache statements that had to be loaded from CATALOG. DB2 12 and later. (Field name: QISEDPSF)

% of CATALOG Loads into Pool
The percentage of dynamic SQL cache requests that resulted in CATALOG loads into the EDMpool. The higher the value, the more stabilized queries from catalog are used to avoid full prepare. Formula for calculation: QISEDPSF/QISEDSG. DB2 12 and later.
% of DSC Loads into pool
The percentage of dynamic SQL cache requests that result in DSC loads into the EDM pool.

This value should be kept low. 40% or lower is considered acceptable.

Number of Statements
The number of statements in the EDM pool.

EDM Pool Snapshot Summary
This panel provides information about the contents of the EDM pool.

This information is summarized into the following categories:
• Database descriptors (DBDs)
• Cursor tables (CTs)
• Package tables (PTs)
• Skeleton cursor tables (SKCTs)
• Authorization caching (CACHE)
• Skeleton package tables (SKPTs)
• Dynamic SQL caching (SQL CACHE)
• Static SQL caching (SSC)
• Free storage (FREE).

The following panel applies to version 10 and version 11 of OMEGAMON for Db2 PE.

<table>
<thead>
<tr>

Navigation

For additional information about
• a particular EDM pool, move the cursor to the required line and press F11 (Zoom).
• other topics, use the PF keys.
Fields

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel and each time you reinitiate collection by entering a hyphen (-) to the left of the EDSN command.

EDM Storage Type

A type of EDM storage. Possible values:

- **DBDs**  Database descriptors
- **FREEDBD**  Free database descriptors.
- **CACHE**  Authorization cache storage
- **SKCTs**  Skeleton cursor tables
- **SKPTs**  Skeleton package tables

**Static SQL Cache**  
Static SQL cache storage

EDM Snapshot Database Descriptors

This panel provides information about the database descriptors (DBDs) that are using some portion of the EDM pool.

One line of output is produced for each DBD that was residing in the pool when the displayed data was collected.

<table>
<thead>
<tr>

For additional information about other topics, use the PF keys.

**Fields**

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.
**DBD Name**
The name of a DBD that resided in the EDM pool when the displayed data was collected.

**Pages Alloc**
The number of pages allocated for the DBD.

**DBD Size**
The actual size (in bytes) of the DBD.

**EDM Snapshot Cursor Tables**
This panel provides information about the cursor tables (CTs) that are using some portion of the EDM pool.

One line of output is produced for each CT that was residing in the pool when the displayed data was collected.

<table>

**Navigation**
For additional information about other topics, use the PF keys.

**Fields**
Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

**Plannname**
The name of a plan that owns a CT that resides in the EDM pool.

**Connid**
The connection ID of a thread that owns a CT.

**Corrid**
The correlation ID of a thread that owns a CT.

**Authid**
The authorization ID of a thread that owns a CT.

**Pages Alloc**
The number of CT pages allocated for the thread.

**Bytes Used**
The number of bytes actually in use by the CTs that are owned by the thread.
EDM Snapshot Package Table Summary

This panel provides summary information for package tables (PTs) that are using some portion of the EDM pool.

One line of output is produced for each active thread located that is using PT storage.

To sort output by display column move the cursor under the display column headings you want to sort and press the sort key (PF10).

<table>
<thead>
<tr>

Navigation

For additional information about
• package tables in use by the thread, move the cursor to the line you want and press F11 (Zoom).
• other topics, use the PF keys.

Fields

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

Planname
The thread planname that owns package table storage within the EDM pool.

Connid
The thread connection identifier that owns package table storage within the EDM pool.

Corrid
The thread correlation identifier that owns package table storage within the EDM pool.

Package Count
The number of package tables in use by the thread at time of collection.

Pages Alloc
The number of EDM pages allocated for package tables in use by the thread.

Avg Pages Package
The average number of EDM pages used by a single package table in use by the thread.
Max Pages Package
The maximum number of EDM pages used by a single package table in use by the thread.

Bytes Used
The number of bytes actually used within the EDM pages allocated for package tables in use by the thread.

EDM Snapshot Package Table Detail
This panel provides detailed information for package tables (PTs) that are used by an active thread. For each package table, one line of output is produced.

To sort the output by display column, move the cursor under the heading of the display column of your choice and press the sort key (PF10).

Fields
Each field reflects the data that is available when the collection is started. Each time you are navigating to the panel from the EDM Snapshot Summary display, data is collected by OMEGAMON for Db2 PE and PM and the panel is refreshed.

Plannname
The plan name of the thread that is using the package tables.

Connid
The connection ID of the thread that is using the package tables.

Corrid
The correlation ID of the thread that is using the package tables.

Authid
The authentication ID of the thread that is using the package tables.

Collection ID
The collection identifier of the package table that is specified during the bind of the plan.

Package ID
The identifier of the package table that is specified during the bind of the plan.

Pages Alloc
The number of EDM pages that is allocated for the package table.

Bytes used
The number of bytes that is actually used within the EDM pages that are allocated for the package table.
EDM Snapshot Skeleton Cursor Tables
This panel provides information about the skeleton cursor tables (SKCTs) that are using some portion of the EDM pool.

One line of output is produced for each SKCT that was residing in the pool when the displayed data was collected.

<table>
<thead>
<tr>

</tbody>
</table>

Navigation
For additional information about other topics, use the PF keys.

Fields
Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

Planname
The name of a plan that owns an SKCT that resides in the EDM pool.

Pages Alloc
The number of SKCT pages that are allocated for the plan.

Bytes Used
The number of bytes actually in use by the SKCT that is owned by the plan.

EDM Snapshot Authorization Cache Storage
This panel provides information about DB2 authorization cache storage residing in the EDM pool.

One line of output is produced for each planname which has authorization cache storage allocated at the time the display data was collected. DB2 uses authorization cache storage to cache frequently used authorization identifiers, thus enabling authorization processing to be bypassed. As a result, processing costs associated with signon processing can be minimized. The size of cache storage might be specified when a plan is bound.

To sort output by display column move the cursor under the display column heading you want to sort and press the sort key (PF10).
Navigation

For additional information about other topics, use the PF keys.

Fields

Each field reflects the data that was available when collection was executed. OMEGAMON collects data and refreshes the panel each time you navigate to the panel.

Total Cache Pages Allocated
The total number of cache pages allocated in the EDM pool.

Total Cache Pages Used
The total number of cache pages that contain authorization data enabling authorization to be bypassed.

Total Number of Plans Cached
The total number of plans that have cache storage allocated.

Percent of Cache Used
The percentage of total cache storage containing authorization ID information.

Planname
The planname that has cache storage allocated in the EDM pool.

Cache Size
The number of EDM bytes allocated for cache storage for the plan.

% Used
The percentage of cache storage for the plan in use that contains authorization ID information.

EDM Snapshot Skeleton Package Table Summary
This panel provides information about the skeleton package tables (SKPTs that are using some portion of the EDM pool).

One line of output is produced for each SKPT collection identifier located in the pool when the display data was collected.
To sort output by display column move the cursor under the display column heading you want to sort and press the sort key (PF10).

Navigation

For additional information about detailed skeleton package table information, move the cursor to the line you want and press F11 (Zoom).
- other topics, use the PF keys.

Fields

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

Collection ID

The collection identifier located in the pool. This value was specified when the package tables were bound.

Package Count

The number of skeleton package tables located in the pool containing the collection identifier.

Pages Alloc

The total number of EDM pool pages allocated for skeleton package tables containing the collection identifier.

Avg Pages Package

The average number of EDM pages per skeleton package table for the collection identifier.

Max Pages Package

The size of the largest skeleton package table in the EDM pool for the collection identifier.

Bytes Used

The number of bytes actually in use by skeleton package table information within the EDM pool pages allocated for the collection identifier.
**EDM Snapshot Skeleton Package Table Detail**

This panel provides detailed information for skeleton package tables (SKPTs) that are owned by a single collection identifier that is using some portion of the EDM pool. For each skeleton package table, one line of output is produced.

To sort the output by display column, move the cursor under the heading of the display column of your choice and press the sort key (PF10).

**Fields**

Each field reflects the data that is available when the collection is started. Each time you are navigating to the EDM Snapshot Skeleton Package Table Summary display, data is collected by OMEGAMON for Db2 PE and PM and the panel is refreshed.

**Collection ID**

The identifier of the collection that owns the skeleton package tables that are located in the pool.

**Package ID**

The identifier of the skeleton package table.

**Pages Alloc**

The total number of EDM pool pages that are allocated for the skeleton package table.

**Bytes Used**

The number of bytes that is actually used by the skeleton package table information within the EDM pool pages that are allocated for the skeleton package table.
**Dynamic SQL Cache by Authid**

This panel provides information about the dynamic SQL cache by Authid. You can also look at the dynamic SQL cache by end user ID, transaction ID, or by workstation name.

With this panel, you can identify problem statements in the dynamic SQL cache.

One line of output is produced for each authorization identifier (Auth ID) that is located in the cache when the displayed data is collected.

To sort the output by column, move the cursor under a column heading and press the sort key (PF10).

<table>
<thead>
<tr>

</table>

**Navigation**

For additional information about

- detailed dynamic SQL cache information for an authorization ID, move the cursor to the required line and press F11 (Zoom).
- other topics, use the PF keys.

**Fields**

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

**Authorization ID**

The current SQLID of the user who did the initial PREPARE.

**Entries**

The number of dynamic SQL statements that are cached for each authorization ID.

**CPU Time**

The accumulated CPU time of all statements that are associated with the authorization ID. This time includes CPU that is consumed on an IBM specialty engine for all statements associated with this authorization ID.

**Elapsed Time**

The accumulated elapsed time that is used for all statements that are associated with this authorization ID.

**Wait Time**

The accumulated wait time that is used for all statements that are associated with the authorization ID including the following items:
GetPages

The accumulated GET PAGES for all statements that are associated with the authorization ID.

Dynamic SQL Cache by Transaction ID

This panel provides information about the dynamic SQL cache by transaction ID. You can also look at the dynamic SQL cache by authid, end user ID, or workstation name.

With this panel, you can identify problem statements in the dynamic SQL cache.

One line of output is produced for each transaction identifier that owns the SQL cache storage when the displayed data is collected.

To sort output by display column, move the cursor under the column heading you want and press the sort key (PF10).

Navigation

For additional information about
- detailed dynamic SQL cache information for an transaction ID, move the cursor to the line you want and press F11 (Zoom).
- other topics, use the PF keys.

**Fields**

**Transaction Id**
The transaction ID that is used to execute the dynamic SQL statement. Only the first 18-bytes of the transaction ID are displayed.

**Entries**
The number of dynamic SQL statements that are cached for each transaction ID.

**CPU Time**
The accumulated CPU time of all statements that are associated with the transaction ID. This time includes CPU that is consumed on an IBM specialty engine for all statements that are associated with this transaction ID.

**Elapsed Time**
The accumulated elapsed time that is used for all statements that are associated with this transaction ID.

**Wait Time**
The accumulated wait time that is used for all statements that are associated with the authorization ID including the following items:
- Wait for Synch I/O (QW0316W1)
- Wait for Lock/Latch (QW0316W2)
- Wait Synch Exec Switch (QW0316W3)
- Wait for Global Locks (QW0316W4)

**Navigation**

For additional information about

- detailed dynamic SQL cache information for a workstation name, move the cursor to the line you want and press F11 (Zoom).
- other topics, use the PF keys.

**Fields**

**Workstation ID**

The workstation name that is used to execute the dynamic SQL statement.

**Entries**

The number of dynamic SQL statements that are cached for each workstation name.

**CPU Time**

The accumulated CPU time of all statements that are associated with the workstation name. This time includes CPU that is consumed on an IBM specialty engine for all statements that are associated with this workstation name.

**Elapsed Time**

The accumulated elapsed time that is used for all statements that are associated with this workstation name.

**Wait Time**

The accumulated wait time that is used for all statements that are associated with the authorization ID including the following items:
- Wait for Synch I/O (QW0316W1)
- Wait for Lock/Latch (QW0316W2)
- Wait Synch Exec Switch (QW0316W3)
- Wait for Global Locks (QW0316W4)

- Wait Other Thread Write (QW0316W6)
- Wait for Latch Req (QW0316W7)
- Wait Time Page Latch (QW0316W8)
- Wait for Drain Lock (QW0316W9)
- Wait for Drain/Claim (QW0316WA)
- Wait for Log Writer (QW0316WB)
Wait global child L-Locks (QW0316WC)
Wait global other L-Locks (QW0316WD)
Wait global P/P P-Locks (QW0316WE)
Wait global page P-Locks (QW0316WF)
Wait global other P-Locks (QW0316WG)
Wait for PQS (QW0316_PQS_WAIT)
Wait for PIPE (QW0316_PIPE_WAIT)

GetPages
The accumulated GET PAGES for all statements that are associated with
the workstation name.

Dynamic SQL Cache Statistics by End User ID
This panel provides information about the dynamic SQL cache by end user ID. You
can also look at the dynamic SQL cache by authid, end user ID, or transaction ID.

With this panel, you can identify problem statements in the dynamic SQL cache.

One line of output is produced for each end user ID that owns the SQL cache
storage when the displayed data is collected.

To sort the output by column, move the cursor under a column heading and press
the sort key (PF10).

<table>
<thead>
<tr>

the line you want and press F11 (Zoom).
other topics, use the PF keys.

Fields
End user ID
The end user ID that is used to execute the dynamic SQL statement.
Entries
The number of dynamic SQL statements that are cached for each end user ID.
CPU Time
The accumulated CPU time of all statements that are associated with the
end user ID. This time includes CPU that is consumed on an IBM specialty
engine for all statements that are associated with this end user ID.
**Elapsed Time**
The accumulated elapsed time that is used for all statements that are associated with this end user ID.

**Wait Time**
The accumulated wait time that is used for all statements that are associated with the authorization ID including the following items:
- Wait for Synch I/O (QW0316W1)
- Wait for Lock/Latch (QW0316W2)
- Wait Synch Exec Switch (QW0316W3)
- Wait for Global Locks (QW0316W4)
- Wait Other Thread Read (QW0316W5)
- Wait Other Thread Write (QW0316W6)
- Wait for Latch Req (QW0316W7)
- Wait Time Page Latch (QW0316W8)
- Wait for Drain Lock (QW0316W9)
- Wait for Drain/Claim (QW0316WA)
- Wait for Log Writer (QW0316WB)
- Wait global child L-Locks (QW0316WC)
- Wait global other L-Locks (QW0316WD)
- Wait global P/P P-Locks (QW0316WE)
- Wait global page P-Locks (QW0316WF)
- Wait global other P-Locks (QW0316WG)
- Wait for PQS (QW0316_PQS_WAIT)
- Wait for PIPE (QW0316_PIPE_WAIT)

**GetPages**
The accumulated GET PAGES for all statements that are associated with the end user ID.

**Dynamic SQL Cache Statement Summary by Key Field**
This panel displays the statements in dynamic SQL cache that belong to a specific key value. The key type and the key value are displayed in the heading like this: key_type : key_value.

The following key types are supported:

**Key type**
- **Key value**

<table>
<thead>
<tr>
<th>Key type</th>
<th>Key value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization ID</td>
<td>QW0316X4</td>

<td>QW0316XF</td>
</tr>
<tr>
<td>End User ID</td>
<td>QW0316XE</td>
</tr>
</tbody>
</table>

With this panel, you can identify problem statements in the dynamic SQL cache.

To sort the output by column, move the cursor under a column heading and press the sort key (PF10).
Navigation

For additional information about

- detailed dynamic SQL cache information for an transaction ID, move the cursor
to the line you want and press F11 (Zoom).
- the statistics detail for a particular statement, place the cursor on the row that
contains the statement and press PF11.
- other topics, use the PF keys.

Fields

Each field reflects the data that is available when collection is executed.

Length

The statement length of the SQL text in dynamic SQL cache.

CPU Time

The accumulated CPU time. This time includes CPU time that is consumed
on an IBM specialty engine.

SQL text

The first 60 bytes of the SQL text of the statement.

ACEL

IDAA flag.

DPS

Dynamic Plan Stability flag (dynamic SQL only). DB2 12 only.

Dynamic SQL Cache Statistics

This panel provides additional details about the dynamic SQL cache.

The statistical data requires that monitor class 1 and IFCID 318 are started. This
might be accomplished by starting the Near Term History collector.

With this panel, you can identify problem statements in the dynamic SQL cache.

One line of output is produced for each unique dynamic SQL statement.

To sort output by display column move the cursor under the display column
heading you want and press the sort key (PF10).
### Navigation

For additional information about
- the dynamic SQL statement and statistics, move the cursor to the required line and press F11 (Zoom).
- other topics, use the PF keys.

### Fields

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

**Times Exec.**

The number of times that an SQL statement in cache was executed. For a cursor statement, this number represents the number of OPENs.

**CPU Time**

The accumulated CPU time used while executing in DB2.

**Elapsed Time**

The accumulated elapsed time for the SQL statement.

**Wait Time**

The accumulated time spent waiting in DB2 for all causes.

**Get - Pages**

The number of Getpage requests performed for the SQL statement.

**Sync Reads**

The number of synchronous Buffer Read operations performed for the SQL statement.

**Sync Writes**

The number of synchronous Buffer Write operations performed for the SQL statement.

The following panel shows the display of DB2 10:
Navigation

You can scroll through the information using F7 and F8 (if the information requires more than one panel).

For more information about

- a particular static SQL cache, move the cursor to the respective information line and press F11 (Zoom). For more information, see the description of panel "EDM Snapshot Static SQL Cache Statement Detail" on page 1165.
Fields

Total 31-bit xPROC storage for static SQL Statements
Total 31-bit xPROC storage that is used for static SQL statements (31-bit DBM1private variable pool).
This applies to DB10.

Total Allocation for Shareable Static SQL
The total allocated shareable storage for static SQL statements.
This applies to DB2 11 or higher.

Total number of statements in static SQL Cache
The count of SQL statements in the static SQL cache.

Times Exec.
The number of times that an SQL statement in cache was executed.

CPU Time
The accumulated CPU time used while executing in DB2. This time includes CPU that is consumed on an IBM specialty engine.

Elapsed Time
The accumulated elapsed time for the SQL statement.

Wait Time (Derived)
The accumulated time spent waiting in DB2 for all causes.

QPW0401SI Accumulated wait for synchronous I/O
QPW0401LK Accumulated wait for lock
QPW0401EU Accumulated wait for synchronous execution unit switch
QPW0401GL Accumulated wait time for global locks
QPW0401OR Accumulated wait time for read activity done by another thread
QPW0401OW Accumulated wait time for write activity done by another thread
QPW0401LH Accumulated wait time for latch req
QPW0401PL Accumulated wait for page latch
QPW0401DL Accumulated wait for drain lock
QPW0401CM Accumulated wait for drain lock waiting for for claims to be released
QPW0401LW Accumulated wait for log writer
QPW0401WC Accumulated wait for global child L-Locks. DB2 12 and later..
QPW0401WD Accumulated wait for global other L-Locks. DB2 12 and later.
QPW0401WE Accumulated wait for global P/P P-Locks. DB2 12 and later.
QPW0401WF Accumulated wait for global page P-Locks. DB2 12 and later.
QPW0401WG Accumulated wait for global other P-Locks. DB2 12 and later.
QPW0401WH Accumulated wait for PIPE locks. DB2 12 and later.
QPW0401WPQS Accumulated wait for PQS locks. DB2 12 and later.
GetPages

The number of Getpage requests performed for the SQL statement.

Sync Reads

The number of synchronous Buffer Read operations performed for the SQL statement.

Static SQL Cache Statistics with Package Information

The statistical data requires that monitor class 1 and icid 400 are started.

This panel organizes static SQL cache data by key fields. You can sort the fields to group similar SQL records together.

For the package and collection IDs, only the first 17-bytes are displayed. If the data is longer than 17 bytes, a plus (+) sign is shown to indicate that the actual data is longer than the data that is displayed in the panel. For an example, see the following panel.

With the information on this panel, database administrators can locate particular ZPARMS according to DB2 installation panels, so they can view related ZPARMS of the DB2 subsystem.

The following panel shows the display of DB2 10:

<table>
<thead>
<tr>

The following panel shows the display of DB2 11 and later.
Navigation

For additional information about

• the statistics detail for a particular statement, place the cursor on the row that contains the statement and press PF1.
• other topics, use the PF keys.

Fields

The following fields are displayed for Static SQL cache:

**Total 31-bit xPROC Storage for Static SQL Statements**

The total 31-bit xPROC storage for static SQL statements (31-bit DBM1 private variable pool).

This applies to DB2 10.

**Total Allocation for Shareable Static SQL**

The total allocated shareable storage for static SQL statements.

This applies to DB2 11 and higher.

**Total Number of Statements in Static SQL Cache**

The count of static SQL statements in cache.

The following fields are displayed for each static SQL statement:

**Execs**   The number of executions.

**StmtID**  The statement identifier.

**CPU Time**

The accumulated in-DB2 CPU time. This time includes CPU that is consumed on an IBM specialty engine.
Elapsed Time
The accumulated in-DB2 elapsed time.

Package
The first 17 bytes of the package ID.

Collection ID
The first 17 bytes of the collection ID.

ACEL
IDAA flag.

EDM Snapshot Static SQL Cache Statement Detail
This panel provides static SQL cache statement detail.

The statistical data requires that monitor class 1 and ifcid 400 are started.

Navigation
You can scroll through the information using F7 and F8 (if the information requires more than one panel).
For additional options
• select one of the options from the panel
• use the PF keys.

**Fields**

**Insert Date / Insert Time**
The date and the time when the SQL statement is inserted in the EDM pool.

**Update Date / Update Time**
The date and the time when the SQL statement is last updated.

**Statement Number**
The number of the statement from the DB2 catalog.

**Times Executed**
The number of times this static SQL statement is executed.

**Getpages**
The number of pages that are returned.

**Rows Examined**
The number of rows that are examined.

**Rows Processed**
The number of rows that are processed.

**Sorts Performed**
The number of rows that are sorted.

**Index Scans**
The number of index scans that are performed.

**Tablespace Scans**
The number of tablespace scans that are performed.

**Buffer Writes**
The number of Buffer Write operations that are performed.

**Parallel Groups Created**
The number of parallel groups that are created.

**AVG Actual Degree**
The average actual degree of parallelism for all parallel groups. This value is calculated at execution time after buffer pool negotiation and system negotiation are taken into account.

This applies to DB2 11 and higher.

**AVG Estimated Degree**
The average estimated degree of parallelism for all parallel groups. The values for the estimated degree are calculated at bind time. They are based on the cost formula. The value for the average estimated degree is calculated at execution time.

This applies to DB2 11 and higher.

**AVG Planned Degree**
The average planned maximum degree of parallelism for all parallel groups. This value is calculated at execution time. It is the optimal degree of parallelism that can be obtained at execution time after host variables or parameter markers are resolved and before buffer pool negotiation and system negotiation are performed.
This applies to DB2 11 and higher.

# RIDs Not Used/Storage
The number of times a RID list is not used because there is not enough storage available to hold the list of RIDs.

# RIDs Not Used/Limit
The number of times a RID list is not used because the number of RIDs exceeds the DB2 limits.

# RIDs Overflow/Storage
The number of times that a RID list overflows to a work file because a RID pool storage is not available to hold the list of RIDs.

This applies to DB2 11 and higher.

# RIDs Overflow/Limit
The number of times that a RID list overflows to a work file because the number of RIDs exceeds internal limits.

This applies to DB2 11 and higher.

# RIDs HB Join/Storage
The number of times that appending to a RID list for a hybrid join is interrupted because a RID pool storage is not available to hold the list of RIDs.

This applies to DB2 11 and higher.

# RIDs HB Join/Limit
The number of times that appending to a RID list for a hybrid join is interrupted because the number of RIDs exceeds internal limits.

This applies to DB2 11 and higher.

# RIDs No IX Access
The number of times that RID list retrieval for multiple index access is not done because DB2 cannot determine the outcome of index ANDing or ORing.

This applies to DB2 11 and higher.

Elapsed Time
The accumulated In-DB2 elapsed time.

CPU Time
The accumulated In-DB2 CPU time. This time includes CPU consumed on a Specialty Engine (SE).

Wait for Sync I/O
The accumulated waiting time for synchronous I/O.

Wait for Lock
The accumulated waiting time for lock.

Sync Exec Switch
The accumulated waiting time for a synchronous execution unit switch.

Wait time Log writer
The accumulated waiting time for log writers.

Wait Othr Thread Read
The accumulated wait time for read activity done by another thread.
Wait Othr Thread Write
The accumulated waiting time for writing activity that is done by another thread.

Wait time for Latches
The accumulated waiting time for latch requests.

Wait time Page Latch
The accumulated waiting time for page latches.

Wait time Drain Lock
The accumulated waiting time for drain locks.

Wait time drain/claim
The accumulated waiting time for drain locks that are waiting for claims to be released.

Wait Glb L-Locks
The accumulated waiting time for global locks.

Wait Glb P/P P-Locks
Accumulated wait for global P/P P-Locks for the statement. DB2 12 or later.

Wait Glb Child L-Locks
Accumulated wait for global child L-Locks for the statement. DB2 12 or later.

Wait Glb Page P-Locks
Accumulated wait for global page P-Locks for the statement. DB2 12 or later.

Wait Glb Other L-Locks
Accumulated wait for global other L-Locks for the statement. DB2 12 or later.

Wait Glb Other P-Locks
Accumulated wait for global other P-Locks for the statement. DB2 12 or later.

Wait for PIPE lock
Accumulated wait for pipe wait. DB2 12 or later.

Wait for PQS lock
Accumulated time waiting for parallel queries to synchronize between parent and child tasks. DB2 12 or later.

Total Wait Time
A summary of all waiting times.

Expansion Reason
The reason that caused the expansion. The query contains an implicit query transformation that is caused by one of the following items:

A  The SYSIBMADM.GET_ARCHIVE built-in global variable.
B  The current temporal BUSINESS_TIME special register.
S  The current temporal SYSTEM_TIME special register.
SB The current temporal BUSINESS_TIME special register and the current temporal SYSTEM_TIME special register.
  The query does not contain an implicit query transformation that is caused by the current temporal BUSINESS_TIME special register,
the current temporal SYSTEM_TIME special register, or the SYSIBMADM.GET_ARCHIVE built-in global variable.

N/A No data available.

**ACCEL Eligible**
Statement is eligible to run on an accelerator. DB2 11 or later.

**Consistency token**
The consistency token of the package for this static SQL statement.

**Collection**
The collection ID of the package for this static SQL statement.

**Package**
The package ID for this static SQL statement.

**SQL Text**
If it can be found in the DB2 catalog tables for this statement, the SQL text is displayed.

Navigation

For additional information about other topics, use the PF keys.

Fields

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

Insert Date/Time
The date and the time when the statement is inserted into the cache.

Update Date/Time
The date and the time when the statement is updated in the cache.

Collection Began Date/Time
The date and the time when the dynamic SQL cache statistics collection begins.

Statement Token
Unique statement identifier generated for uniquely identifying a statement in the prepared statement cache.

Times Executed
The number of times the SQL statement has been executed. For a cursor statement, this number represents the number of OPENs.

Getpages
The number of Getpage requests performed for the SQL statement.

Rows Examined
The number of rows examined for the SQL statement.

Rows Processed
The number of rows processed for the SQL statement. For example, the number of rows returned for a SELECT, or the number of rows affected by an INSERT, UPDATE, or DELETE.

Sorts Performed
The number of sorts performed for the SQL statement.
Index Scans
The number of index scans performed for the SQL statement.

Tablespace Scans
The number of tablespace scans performed for the SQL statement.

Synchronous Buffer Reads
The number of synchronous Buffer Read operations performed for the SQL statement.

Synchronous Writes
The number of synchronous Buffer Write operations performed for the SQL statement.

Number of Current Users
The number of current users of the statement. Current users have prepared or executed the statement during their current unit of work.

Copies of Statement
The number of copies of the statement that is owned by all threads in the system.

Parallel Groups Created
The number of parallel groups created for the SQL statement.

AVG Actual Degree
The average parallel group actual degree. It is obtained at execution time after considering the buffer pool negotiation and the system negotiation.

AVG Estimated Degree
The average parallel group estimated degree. This is the bind time estimated parallel group degree that is based on the cost formula. If the parallel group contains a host variable or a parameter marker, the bind time estimates the parallel group degree based on a valid assumption value.

AVG Planned Degree
The average parallel group plan degree. This is the ideal parallel group degree that is obtained at execution time after the host variable or the parameter marker value is plug-in and before buffer pool negotiation and system negotiation are performed.

# RIDs Not Used/Storage
The number of times that a RID list is not used because enough storage is not available to hold the list of RIDs.

# RIDs not Used/Limit
The number of times that a RID list is not used because the number of RIDs exceeded one or more internal DB2 limits.

# RIDs Overflow/Storage
The number of times a RID list is overflowed to a work file because a RIDPOOL storage is not available to hold the list of the RIDs.

# RIDs Overflow/Limit
The number of times a RID list is overflowed to a work file because the number of RIDs exceeded one or more internal limits.
This applies to DB2 11 and higher.

# RIDs HB Join/Storage
The number of times a RID list append for a Hybrid Join is interrupted
because a RIDPOOL storage is not available to hold the list of RIDs, for example, the number of times DB2 interrupts the RID phase and switches to the Data phase.

This applies to DB2 11 and higher.

# RIDs HB Join/Limit
The number of times a RID list append for a Hybrid Join is interrupted because the number of RIDs exceeded one or more internal limits, for example, the number of times DB2 interrupts the RID phase and switches to the Data phase.

This applies to DB2 11 and higher.

RIDs No IX Access
The number of times a RID list retrieval for multiple index access is skipped because DB2 can predetermine the outcome of index ANDing or ORing.

Elapsed Time
The accumulated elapsed time used for the SQL statement.

CPU Time
The accumulated CPU time for the SQL statement. This includes CPU that is consumed on an IBM specialty engine.

The following wait time fields are only collected when Accounting trace class 3 is active.

Wait for Synch I/O
The accumulated wait time for synchronous I/O operations.

Wait for Lock/Latch
The accumulated wait time for lock and latch requests.

Synch Exec Switch
The accumulated wait time for synchronous execution unit switch.

Wait for Log Writer
The accumulated wait time for log writers.

Wait Othr Thread Read
The accumulated wait time for read activity performed by another thread.

Wait Othr Thread Write
The accumulated wait time for write activity performed by another thread.

Wait for Latch Req
The accumulated wait time for Latch requests.

Wait Time Page Latch
The accumulated wait time for Page latches.

Wait for Drain Lock
The accumulated wait time for Drain locks.

Wait for Drain/Claim
The accumulated wait time for Drain locks that are waiting for claims to be released.

Wait for Glb L-Locks
The accumulated wait time for global locks.
Wait Glb P/P P-Locks
Accumulated wait for global P/P P-Locks for the statement. DB2 12 or later.

Wait Glb Child L-Locks
Accumulated wait for global child L-Locks for the statement. DB2 12 or later.

Wait Glb Page P-Locks
Accumulated wait for global page P-Locks for the statement. DB2 12 or later.

Wait Glb Other L-Locks
Accumulated wait for global other L-Locks for the statement. DB2 12 or later.

Wait Glb Other P-Locks
Accumulated wait for global other P-Locks for the statement. DB2 12 or later.

Wait for PIPE lock
Accumulated wait for pipe wait. DB2 12 or later.

Wait for PQS lock
Accumulated time waiting for parallel queries to synchronize between parent and child tasks. DB2 12 or later.

Isolation Bind
ISOLATION BIND is in effect on initial PREPARE; it does not reflect ISOLATION specified in the WITH clause

UR: ISOLATION(UR)
Uncommitted Read

CS: ISOLATION(CS)
Cursor stability

RS: ISOLATION(RS)
Read stability

RR: ISOLATION(RR)
Repeatable read

Currentdata Bind
The status of the CURRENTDATA BIND option:
• CURRENTDATA(YES)
• CURRENTDATA(NO)

Dynamic rules Bind
The status of the DYNAMICRULES BIND option:
• DYNAMICRULES(BIND)
• DYNAMICRULES(RUN)

Current Degree
The status of CURRENT DEGREE special register value:
• CURRENT DEGREE = 'ANY'
• CURRENT DEGREE = '1'

Current Rules
The status of CURRENT RULES special register value:
• CURRENT RULES = 'DB2'
• CURRENT RULES = 'SQL'

Current Precision
The status of CURRENT PRECISION special register value:
• CURRENT PRECISION = 'DEC31'
• CURRENT PRECISION = 'DEC15'

Cursor Hold
If YES, the statement was prepared for a held cursor. If NO, the statement was not prepared for a held cursor.

Concentrate Statement
An indicator of the cache literal replacement.
N No literal replacement was done.
R Literals were replaced in the statement.
D Same as R, but the cached statement is a duplicate cache entry instance, because a cache match failed because of literal reusability criteria.

Status of statement
The status of the statement. The statement has actually been removed from the cache, but current users might still have an active copy.

BYDROP
The statement was invalidated by DROP or ALTER.

BYREVOKE
The statement was invalidated by REVOKE.

BYLRU
The statement was invalidated by LRU.

Expansion Reason
The reason that caused the expansion. The query contains an implicit query transformation that is caused by one of the following items:
A The SYSIBMADM.GET_ARCHIVE built-in global variable.
B The current temporal BUSINESS_TIME special register.
S The current temporal SYSTEM_TIME special register.
SB The current temporal BUSINESS_TIME special register and the current temporal SYSTEM_TIME special register.
'' The query does not contain an implicit query transformation that is caused by the current temporal BUSINESS_TIME special register, the current temporal SYSTEM_TIME special register, or the SYSIBMADM.GET_ARCHIVE built-in global variable.
N/A No data available.

ACCEL Eligible
Statement is eligible to run on an accelerator.

Stabilized StmtID
Stabilized dynamic query statement ID. DB2 12 and higher.
(QW0316_SDQ_STMTID)

Query Hash ID
Hash ID of a stabilized dynamic query. DB2 12 and higher.
(QW0316_QUERY_HASH_ID)
Hash ID Version
Version of stabilized dynamic query's hash ID. DB2 12 and higher.
(QW0316_QUERY_HASH_VER)

Program Name
The name of the program. The value is provided on RRS sign-on or
resign-on.

Transaction Name
The name of the transaction. The value is provided on RRS sign-on or
resign-on.

Stabilization Grp
Group ID of a stabilized dynamic query. DB2 12 or higher. (Field name:
QW0316_STBLGRP)

Workstation Name
The name of the workstation. The value is provided on RRS sign-on or
resign-on.

End User ID
The identification (ID) of the end user. The value is provided on RRS
sign-on or resign-on.

Prepare ID
The primary authorization ID of the user who did the initial PREPARE.

User Group
The current SQLID of the user who did the initial PREPARE.

Object Qualifier
The object qualifier for unqualified table names.

Ref Table Qualifier
The table qualifier.

Ref Table
The name of the table.

DSG Member
The data sharing DB2 member that cached the SQL statement.

Appl Data
An identification string that is provided by the user.

Schema
The special register of the current schema.

SQL Statement
The text of the SQL statement.

If the text of the SQL statement is no longer available from the SQL
statement cache because of a fast changing SQL statement cache, a message
is displayed instead of the text of the SQL statement.

EDM Snapshot Free Storage
This panel provides information about the free storage that is currently available
(as of the time of data collection) in the EDM pool.

The EDM Snapshot Free Storage panel shows information about DBD. Depending
on the type you are using, information is shown about RDS below, RDS above, or
SKEL.
Navigation

For additional information about other topics, use the PF keys.

Fields

Each field reflects the data that was available when collection was executed. OMEGAMON XE for DB2 PE collects data and refreshes the panel each time you navigate to the panel.

Total DBD Free Pages
The number of pages of free storage that were available in the EDM pool when the displayed data was collected.

Total DBD Free Entries
The number of free storage entries that were available when the displayed data was collected.

Largest Contiguous Free Entries
The number of pages in each of the largest contiguous free storage entries in the EDM pool when the displayed data was collected. (Displays up to 5 values.)

Bind Statistics
This panel shows information about bind activities, for example, the number of automatic binds, automatic bind failures, static binds, and static bind failures.
**Navigation**

For additional information about
- Near-term history activity, select option **H-HISTORICAL** at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Collection Interval**

This field displays REALTIME to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start** The start time of the report interval currently displayed.

**Report Interval**

The time in the last cycle (for example, between two presses of the Enter key).

**End** The end time of the report interval currently displayed.
For each of the following fields, the following statistics values are provided:

**TOTAL QUANTITY**
Total quantity, which reflects the amount of activities since DB2 was started.

**INTERVAL QUANTITY**
Interval quantity, which reflects the amount of activities during the last cycle.

**/SECOND**
Rate per second during the last cycle. The number under /SECOND (in parentheses) is the number of seconds in the interval.

**/THREAD**
Rate per thread during the last cycle. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

**/COMMIT**
Rate per Commit during the last cycle. The number under /COMMIT (in parentheses) is the number of commit requests (including abort requests) during the interval.

**Automatic Bind Plan Attempts**
The attempts of DB2 to perform an automatic bind of a plan.

**Automatic Bind Plan Successes**
The successful attempts of DB2 to perform an automatic bind of a plan.

**Automatic Bind Pkg Attempts**
The attempts of DB2 to perform an automatic bind of a package.

**Automatic Bind Pkg Successes**
The successful attempts of DB2 to perform an automatic bind of a package.

**Static Bind Plan Attempts**
Represents the Bind subcommands issued, including the Bind Plan Add and Bind Plan Replace subcommands.

**Static Bind Plan Successes**
Represents the Bind subcommands that succeeded.

**Static Bind Pkg Attempts**
Represents the bind package subcommands issued, including the Bind Package Add and Bind Package Replace subcommands.

**Static Bind Pkg Successes**
Represents the bind package subcommands that succeeded.

**Rebind Plan Attempts**
Attempts to rebind a plan.

**Rebind Plan Successes**
Successful attempts to rebind a plan.

**Rebind Pkg Attempts**
Attempts to rebind a package.

**Rebind Pkg Successes**
Successful attempts to rebind a package.

**Free Plan Attempts**
Attempts to free a plan.
Free Plan Successes
Successful attempts to free a plan.

Free Pkg Attempts
Attempts to free a package.

Free Pkg Successes
Successful attempts to free a package.

Plan Allocation Attempts
The requests from the attachment facility to DB2 to allocate a bound plan for a user.

Plan Allocation Successes
Successful plan allocation attempts.

Package Allocation Attempts
The requests from the attachment facility to DB2 to allocate a bound package for a user.

Package Allocation Successes
Successful package allocation attempts.

Auth Check Attempts
Authorization checks for all plans

Auth Check Successes
Successful authorization checks.

Auth Check Using Cache
Successful authorization checks that were performed using cache.

Auth Check Public Authority
Successful authorization checks that were performed based upon execute authority granted to public.

Test Bounds (No Plan ID)
Bind subcommands that were issued without a plan ID.

**DB2 Subsystem Support Manager Statistics**
This panel shows workload-related information about the monitored DB2 subsystem. The panel includes statistics related to Create Thread, Signon, Commit, and abnormal termination activity.
Navigation

For additional information about
- Near-term history activity, select option H-HISTORICAL at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval
This field displays REALTIME to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

Start The start time of the report interval currently displayed.

Report Interval
The time in the last cycle (for example, between two presses of the Enter key).

End The end time of the report interval currently displayed.

For each of the following fields, three statistics values are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects the amount of activities during the last cycle.
- Rate per second, which is the rate at which activities occurred during the last cycle. The number under /SECOND (in parentheses) is the number of seconds that made up the interval/cycle.
Identify Requests
Successful connections to DB2 from an allied address space.

Signon Requests
Successful requests to identify a new user for IMS or CICS. Thread Signon processing is applicable only in CICS-DB2 and IMS-DB2 attachment environments.

Create Thread Requests
Successful Create Thread requests.

Create Thread Waits
Create Thread requests that had to wait because no thread was available.

Terminate Thread Requests
Successful thread terminations.

Single Phase Commit Requests
Successful Commit requests that took place in a single-phase commit environment, for example, TSO.

Read Only Commit Requests
Commit requests that were read-only. Each of these requests increments the statistics field for phase 1 commits and the statistics field for read-only commits.

Commit Phase 1 Requests
Commit phase 1 requests in a two-phase-commit environment, for example, CICS and IMS.

Commit Phase 2 Requests
Commit phase 2 requests in a two-phase-commit environment, for example, CICS and IMS.

Abort Requests
Events that resulted in successfully backing out a unit of recovery.

Total Commit Requests
Includes single-phase, read-only, and phase 2 Commit requests.

Indoubt Threads
A thread goes indoubt in the CICS/IMS attachment to DB2 when one of the two subsystems goes down between Commit phase 1 and Commit phase 2.

Indoubts Resolved
Successful resolutions, either automatic or manual, of indoubt threads.

Abends Detected - End of Task
Tasks that abended while connected to DB2.

Abends Detected - End of Memory
The number of times a non-DB2 address space was deleted by MVS while connected to DB2.

High Water Mark for IDFORE
The maximum number of users that are identified to DB2 from TSO foreground at the same time.

High Water Mark for IDBACK
The maximum number of concurrent connections identified to DB2 from batch.
High Water Mark for CTHREAD

The maximum number of allied threads that are allocated concurrently.

Active Trace Summary

This panel provides information about the DB2 traces that are currently active. Each active trace is listed with identifying data, such as type, class, and destination.

Navigation

For more information about one of the following items, perform the corresponding task below:

- A particular trace, move the cursor to a trace information line and press F11 (Zoom). For more information, see the description of panel "Active Trace Detail."
- Other topics, use the PF keys.

Fields

Type  The trace type.

TNO   The internal DB2 trace number assigned to the trace.

Trace Class  The active trace class(es) that are in use by this trace entry.

Destination  The destinations that are in use by this trace entry.

Plannname  The planname qualifying the trace. If the trace was not qualified with a planname, this field contains an asterisk (*).

Authid  The authorization identifier used to qualify the trace. If the trace was not qualified with an authorization identifier, this field contains an asterisk (*).

Active Trace Detail

This panel shows DB2 trace activity at a detailed (IFCID) level. With this information you can determine how much overhead was incurred in the traces.
Navigation

For additional information about other topics, use the PF keys.

Fields

Trace Qualifications:

Number   The internal DB2 trace number assigned to the trace.
Type     The trace type.
Destination The destinations that are assigned to the trace on this line.
ASID     Specifies the address space for which trace data is collected.
Class    The active trace class(es) on this trace.
Rmids    The resource manager IDs (Rmids) specified when the trace was started. If the trace was qualified with no Rmids, this field contains an asterisk (*).
Tdata    The trace headers that are in use by this trace entry.
Plan  The plan name qualifying the trace. If the trace was not qualified with a Plan, this field contains an asterisk (*).

Location  The location name qualifying the remote trace. If the trace was not qualified with a location, this field contains an asterisk (*).

Authid  The authorization identifier (Authid) qualifying the trace. If the trace was not qualified with an authorization identifier, this field contains an asterisk (*).

Wrkstn  The workstation name (Wrkstn) qualifying the trace. If the trace was not qualified with a workstation name, this field contains an asterisk (*).

Connid  The connection name (Connid) qualifying the trace. If the trace was not qualified with a connection name, this field contains an asterisk (*).

Appname  The application name (Appname) qualifying the trace. If the trace was not qualified with an application name, this field contains an asterisk (*).

Corrid  The correlation name (Corrid) qualifying the trace. If the trace was not qualified with a correlation name, this field contains an asterisk (*).

Userid  The user name (Userid) qualifying the trace. If the trace was not qualified with a user name, this field contains an asterisk (*).

Pkgloc  The location name of the package (Pkgloc) qualifying the trace. If the trace was not qualified with the location name of the package, this field contains an asterisk (*).

Pkgcol  The collection name of the package (Pkgcol) qualifying the trace. If the trace was not qualified with the collection name of the package, this field contains an asterisk (*).

Pkgprog  The DBRM or program name (Pkgprog) qualifying the trace. If the trace was not qualified with a DBRM or program name, this field contains an asterisk (*).

Role  The connection role name qualifying the trace. If the trace was not qualified with a connection role name, this field contains an asterisk (*).

Audit Policy Names(AUDTPLCY)  Specifies a list of up to eight audit policy names (AUDTPLCY) for which trace information is gathered.

Miscellaneous trace information:  The following fields are displayed if the Trace Destination field contains an OPx destination.

JOBNAME  The jobname that started the trace.

ASID  The address space ID of the job that started the trace.

PLANNAME  The plan name of the thread that is using the OPx destination.
AUTHID
The authorization identifier of the thread that started the trace. For active trace requests in use by OMEGAMON XE for DB2 PE, the authorization ID is that of the O2CI address space, not the authorization ID of the user issuing the start trace request.

CONNID
The connection ID of the thread that is using the OPx destination.

CORRID
The correlation ID of the thread that is using the OPx destination.

BUFSIZE
The buffer size value that was used when the trace was started.

Exclude Trace Qualifications:
XPlan
The exclude filtering for the plan name (XPlan). If the trace was not qualified with an XPlan, this field contains NONE.

XLoc
The exclude filtering for the location name (XLoc) qualifying the remote trace. If the trace was not qualified with an XLoc, this field contains NONE.

XAuthid
The exclude filtering for authorization identifier (Xauthid). If the trace was not qualified with an XAuthid, this field contains NONE.

XWrkstn
The exclude filtering for workstation name (XWrkstn). If the trace was not qualified with an XWrkstn, this field contains NONE.

XConnid
The exclude filtering for connection name (XConnid). If the trace was not qualified with an XConnid, this field contains NONE.

XAppname
The exclude filtering for application name (XAppname). If the trace was not qualified with an XAppname, this field contains NONE.

XCorrid
The exclude filtering for correlation name (XCorrid). If the trace was not qualified with an XCorrid, this field contains NONE.

XUserid
The exclude filtering for user name (XUserid). If the trace was not qualified with an XUserid, this field contains NONE.

XPkgloc
The exclude filtering for the location name of the package (XPkgloc). If the trace was not qualified with an XPkgloc, this field contains NONE.

XPkgcol
The exclude filtering for the collection name of the package (XPkgcol). If the trace was not qualified with an XPkgcol, this field contains NONE.

XPkgprog
The exclude filtering for DBRM or program name (XPkgprog). If the trace was not qualified with a XPkgprog, this field contains NONE.

XRole
The exclude filtering for connection role name (XRole). If the trace was not qualified with a XRole, this field contains NONE.
IFCID information:

Total IFCIDs Active
The total number of trace IFCIDs activated by the trace entry.

IFCID
The number of an active IFCID.

IFCID Description
The description of the IFCID on this line.

IRLM Startup Options and CSA Usage
This panel shows the Internal Resource Lock Manager (IRLM)'s startup options and current common storage (CSA/ECSA) usage.

Navigation
For additional information about other topics, use the PF keys.

Fields
IRLM Proc
The MVS jobname associated with the IRLM address space.

IRLM Subsys
The IRLM MVS subsystem name.

Cross Memory
OMEGAMON XE for DB2 PE displays YES if IRLM is using cross memory services to communicate with the attached subsystems. NO is displayed if IRLM is using common storage (CSA/ECSA) for all locking requests. You can override this option at IRLM startup using the PC= parameter.

Identifier
The IRLM identifier specified at startup.

Deadlock Time
The length of a local deadlock detection cycle, which is the number of seconds that will elapse before the IRLM will check for deadlocks on a single DB2 subsystem.

Deadlock Cycle
The number of local deadlock detection cycles that will elapse before the IRLM will perform a global deadlock check on all subsystems that are using that IRLM.
Maximum ECSA
The maximum amount of CSA/ECSA that IRLM can use if IRLMPC = NO.
(See the Cross Memory field.)

Current Used ECSA
The amount of CSA/ECSA that IRLM is currently using.

High Water Mark ECSA
The largest amount of CSA/ECSA that IRLM has used since startup.

Current Percentage ECSA
The percentage of Maximum ECSA that IRLM is currently using.

Subsystems Sharing IRLM
The number of subsystems using the IRLM.

IRLM Internal Trace
The status of the internal trace (extremely high overhead). ON if the trace is turned on. OFF if the trace is turned off. This option is specified at IRLM startup using the ITRACE parameter.

Data sharing options:

XCF Group Name
The name of the cross-system coupling facility (XCF) group in which this IRLM belongs. This option is specified at IRLM startup using the GROUP= parameter.

Max Users
The maximum number of systems in the data sharing group. This option is specified at IRLM startup using the MAXUSRS= parameter. It is used to determine the size of each hash entry in the global lock structure.

DSNZPARM Thread Parameters
This panel displays the values that are specified in the DSNZPARM module for thread management parameters. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

+ Data Def Timeout (DDLTOX) 1
+ (INDEX_CLEANUP_THREADS) 10

Fields

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module specified for DB2 startup and the date on which this module was assembled.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**DSNTIPE-Thread Management 1**

**Max Users (CTHREAD) (QWP1CT)**

The maximum number of concurrent allied threads that might be active in DB2 from all sources. This includes threads for IMS, CICS, TSO (foreground and batch), RRSAF, and utilities.

**Max Remote Active (MAXDBAT) (QWP1RMT)**

The maximum number of distributed database access threads (DBATs) that can actively process SQL requests.

**Max Remote Connected (CONDBAT) (QWP1CDB)**

The maximum number of remote connected threads.
Max TSO Connect (IDFORE) (QWP1IDF)
The maximum number of concurrent connections from TSO foreground users that might access DB2 at one time.

Max Batch Connect (IDBACK) (QWP1IDB)
The maximum number of concurrent connections from batch jobs and utilities that might access DB2 at one time.

Max Kept Dyn Stmts (MAXKEEPD) (QWP4MXKD)
The maximum number of prepared dynamic statements saved past commit when dynamic statement caching is enabled.

Max Open File Refs (MAXOFILR) (QWP1MOFR)
The maximum number of concurrently open data sets for processing.

DSNTIPE-Thread Management 2

(REALSTORAGE_MANAGEMENT) (QWP4STMN)
This parameter determines whether DB2 storage is monitored.

Valid values:
A (AUTO)
N (ON)
O (OFF)

Contract Thread STG (CONTSTOR) (QWP4CONT)
This parameter determines whether thread CT Long Storage Pool is contracted.

Valid values:
NO
YES

Manage Thread Storage (MINSTOR) (QWP4MSTG)
This parameter determines whether DB2 is using storage management algorithms that minimize the amount of working storage that is consumed by individual threads. DB2 10 and DB2 11 only.

(PAGEABLE_1MB_FOR_THREADS) (QWP4P1MT)
Specifies whether DB2 may use 1 MB pageable storage when allocating hvshared above-the-bar object storage for thread pools and thread stack. Valid options are:

NO DB2 cannot not use 1 MB pageable storage for these objects.
YES DB2 may use 1 MB pageable storage for these objects. YES requires a level of z/OS that supports 1 MB pageable objects for hvshared. Sufficient real storage should be available to avoid performance issues related to paging. YES is the default for PAGEABLE_1MB_FOR_THREADS, but is enabled only if realstorage_management=off.

Z PARM NAME
PAGEABLE_1MB_FOR_THREADS.

DB2 12 and later.

Long Running Reader (LRDRTHLD) (QWP4LRTH)
This parameter determines the number of minutes that a READ claim is held by an agent before an IFCID 0313 record is written to report it as a long-running reader.

Data Def Timeout (DDLTOX) (QWP4DDLTO)
This parameter determines the SQL data definition time out factor.
**INDEX CLEANUP THREADS (QWP4IXCU)**

This parameter determines the maximum number of threads that can be created to process the cleanup of pseudo-deleted index entries on this subsystem on a data sharing member. Pseudo-deleted entries in an index are those that are logically deleted but still physically present in the index.

Valid values:
Integers between 0 - 128

Default: 10

DB2 11 and later.

**DSNZPARM Trace Parameters**

This panel shows traces, classes, the size of the internal trace table, and the size of the monitor trace buffer as specified in DSNZPARM for automatic startup. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

Fields

The DSNZ command displays the following lines to reflect the usage of the DB2 SET SYSPARM command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

DSNZPARM Module
The name of the DSNZPARM module that is specified for DB2 startup.

Initial Module
The name of the initial DSNZPARM load module.

Previous Module
The name of the previous DSNZPARM load module.

Assembly Date
The date on which this module was assembled.

DSNTIPN-Trace Parameters

Audit Trace (AUDITST) (QWP1AUDT)
This parameter determines the start options of the audit trace (4 bytes are used as bits 1-32).

Valid values:

- Asterisk (*)
  All bits are set to the value 1.
- NO
  The bit string consists of zero values.
- 1-32
  If any class between 1 and 32 is defined, the NTH bit in the string from left to right is set to 1. This means it is turned on.
- YES
  The default of class 1 is used.

Trace Auto Start (TRACSTR) (QWP1TRST)
This parameter determines the start trace options for global trace classes (4 bytes are used as bits 1-32).

Valid values:

- Asterisk (*)
  All bits are set to the value 1.
- NO
  The bit string consists of zero values.
- 1-32
  If any class between 1 and 32 is defined, the NTH bit in the string from left to right is set to 1. This means it is turned on.
- YES
  The default of class 1, 3, and 4 is used.

Trace Size (TRACTBL) (QWP1TRSZ)
This parameter determines the size of the trace table.

SMF Accounting (SMFACCT) (QWP1SMFA)
This parameter determines the SMF accounting start options (4 bytes are used as bits 1-32).
Valid values:

**Asterisk (*)**
All bits are set to the value 1.

**NO**
The bit string consists of zero values.

**1-32**
If any class between 1 and 32 is defined, the NTH bit in the string from left to right is set to 1. This means it is turned on.

**YES**
The default of class 1 is used.

**SMF Statistics (SMFSTAT) (QWP1SMFS)**
This parameter determines the SMF start options (4 bytes are used as bits 1-32).

Valid values:

**Asterisk (*)**
All bits are set to the value 1.

**NO**
The bit string consists of zero values.

**1-32**
If any class between 1 and 32 is defined, the NTH bit in the string from left to right is set to 1. This means it is turned on.

**YES**
The default of class 1 is used.

**Statistics Time (STATIME) (QWP1STIM)**
This parameter determines the time interval in minutes between the collection of statistics. At the end of this interval, statistics records are written.

**Statistics Sync (SYNCVAL) (QWP1SYNV)**
This parameter determines when DB2 statistics recording is synchronized, for example, 15 minutes past the hour.

Valid values:

**1-59 minutes**

**Dataset Stats Time (DSSTIME) (QWP1DTIM)**
This parameter determines the time interval in minutes before DB2 resets data set statistics that are collected for online performance monitors by using IFI reads requests for IFCID 0199.

**Monitor Trace (MON) (QWP1MON )**
This parameter determines the monitor tracing start options (4 bytes are used as bits 1-32).

Valid values:

**Asterisk (*)**
All bits are set to the value 1.

**NO**
The bit string consists of zero values.

**1-32**
If any class between 1 and 32 is defined, the NTH bit in the string from left to right is set to 1. This means it is turned on.

**YES**
The default of class 1 is used.

**Monitor Size (MONSIZE) (QWP1MONS)**
This parameter determines the monitor buffer size.

**UNICODE IFCIDs (UIFCIDS) (QWP1_UNICODE)**
This parameter determines whether fields that contain the characters %U in the comments are coded in Unicode (UTF-8).
Valid values:

1=YES The trace is coded in Unicode.
0=NO The trace is not coded in Unicode.

**DDF-RRSAF Accum (ACCUMACC) (QWP1ACCU)**
This parameter determines whether to roll up accounting data by end user for DDF or RRSAF threads.

Valid values:

NO
YES

**Aggregation Fields (ACCUMUID) (QWP1ACID)**
This parameter determines the subset of end user fields by which accounting data is aggregated.

Valid values:

0 End user ID, transaction name, and workstation name.
1 End user ID
2 End user transaction name
3 End user workstation name
4 End user ID and transaction name
5 End user ID and workstation name
6 End user transaction name and workstation name.

This value is ignored, if the parameter DDF-RRSAF Accum is set to NO.

**Compress SMF Recs (SMFCOMP) (QWP1CSMF)**
This parameter determines whether DB2 is compressing trace records that are written to SMF.

**DSNZPARNM Logging Parameters**
This panel shows information about the logging parameters that are specified in the DSNZPARM module. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

### Fields

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.

**DSNTIPL-Active LogParms**

**Output Buffer Size (QWP2OBPS)**

The OUTBUFF subsystem parameter determines the size of the output buffer that is used for writing active log data sets.

Valid values:

400K to 400000K
(REMOTE_COPY_SW_ACCEL) (QWP2RCSA)

Specifies whether DB2 uses software (SW) to control the remote copy process for active log output in peer-to-peer remote copy (PPRC) environments.

Valid values:
DISABLE (default)
ENABLE

DB2 12 and later.

DSNTIPL1-Checkpoint Parameters

Checkpoint Type (QWP1LOGT)

The CHKTYPE subsystem parameter indicates whether the interval between log checkpoints is based on the number of written log records, the time between checkpoints, or both.

Valid values:
SINGLE(LOGRECS or MINUTES)
BOTH

Check Frequent (QWP1LOGL)

The CHKFREQ subsystem parameter determines how many log records are created before log checkpoints occur.

Valid values:
1,000 - 16,000,000 (if CHKTYPE is SINGLE/LOGRECS)
1 - 60 (if CHKTYPE is SINGLE/MINUTES)
NOTUSED (if CHKTYPE is BOTH).
NOTUSED is displayed as 0.

Default:
500000

Records/Checkpoint (QWP1LOGR)

The RECORDS/CHECKPOINT parameter determines how many log records are created between log checkpoints.

Valid values:
1,000 - 99,999,999 (if CHKTYPE is BOTH)
NOTUSED (if CHKTYPE is SINGLE)
NOTUSED is displayed as 0.

Default:
NOTUSED(0)

Minutes/Checkpoint (QWP1LOGM)

The MINUTES/CHECKPOINT parameter determines how many minutes are passing between log checkpoints.

Valid values:
1 - 1439 (if CHKTYPE is BOTH)
NOTUSED (if CHKTYPE is SINGLE)
NOTUSED is displayed as 0.

Default:
NOTUSED(0)
UR Check Freq (QWP1URCK)
The URCHKTH subsystem parameter determines the number of checkpoint cycles to be completed before a warning message is issued to the console by DB2 for an uncommitted unit of recovery (UR).

If you do not want these warning messages to be issued, you can disable this option.
Valid values: 0 to 255
Default: 5

Log Apply Storage V9 (QWP1FLBZ)
This parameter determines the maximum amount of dsn1dbm1 storage that can be used for fast log application.

This value is used by DB2 during the log application phase of the recover utility. This field corresponds to the field log apply storage on the installation panel DSNTIPL.

UR Log Write Check (QWP1LWCK)
The URLGWTH subsystem parameter determines the number of log records that are written before a warning message is issued to the console by an uncommitted unit of recovery (UR).

If you do not want these warning messages to be issued, you can disable this option.
Valid values: 0 to 1000K
Default: 10K

Limit Backout (QWP1LMBO)
The LBACKOUT subsystem parameter determines whether DB2 postpones backward-log processing for some units of work.
Valid values: AUTO YES LIGHT LIGHTAUTO NO
Default: AUTO

Backout Duration (QWP1BDUR)
The BACKODUR subsystem parameter determines the number of log records that are backed out during a restart. This value is applied when the LIMIT BACKOUT field is set to AUTO, YES, LIGHT, or LIGHTAUTO.
Valid values: 0 to 255
Default: 5
RO Switch Chkpts (QWP1FREQ)
The PCLOSEN subsystem parameter determines the number of consecutive DB2 checkpoints that are allowed after a page set or partition is updated. After the specified number of checkpoints occurred, DB2 converts the page set or partition from read-write to read-only.

Valid values:
1 to 32767

Default:
10 checkpoints

RO Switch Time (QWP1TMR)
The PCLOSET subsystem parameter determines the number of minutes that can elapse after a page set or partition is updated. After the specified number of minutes, DB2 converts the set or partition from read-write to read-only.

Valid values:
1 to 32767

Default:
10 minutes

Levelid Update Freq (QWP1DFRQ)
The DLDFREQ subsystem parameter determines whether the level ID of a page set or partition is to be updated at DB2-determined checkpoint intervals.

- If level ID updates for down-level detection are enabled (ON), 5 is displayed.
- If level-ID updates for down-level detection are disabled, (OFF), 0 is displayed.

Valid values:
ON
OFF

DSNZPARM Archiving Parameters
This panel shows information about the parameters that affect DB2 archiving. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.
Navigation

For additional information about

• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

The DSNZ command displays the following lines to reflect the usage of the DB2 SET SYSPARM command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

DSNZPARAM Module

The name of the DSNZPARAM module that is specified for DB2 startup.
**Initial Module**
The name of the initial DSNZPARM load module.

**Previous Module**
The name of the previous DSNZPARM load module.

**Assembly Date**
The date on which this module was assembled.

**DSNTIPA-Archive Log Parameters**

**Allocation Unit (QWP3CYL/QWP3TRCK)**
The ALCUNIT subsystem parameter determines the unit type that is used by DB2 to allocate space for archive data sets.

*Valid values:*
- BLK (BLOCK)
- CYL (CYLINDER)
- TRK (TRACK)

*Default:*
- BLK

**Primary Quantity (QWP3RISP)**
The PRIQTY subsystem parameter determines the amount of primary space that is allocated for a disk data set. The units for this parameter are specified in the ALLOCATION UNITS field.

*Valid values:*
- Blank
- 1 to 999999

*Default:*
- Blank

**Secondary Quantity (QWP3SECS)**
The SECQTY subsystem parameter determines the amount of secondary space that is allocated for a disk data set. The units for this parameter are specified in the ALLOCATION UNITS field.

*Valid values:*
- Blank
- 1 to 999999

*Default:*
- Blank

**Catalog Archive Data Set (CATALOG) (QWP3CTLG)**
The value of the CATALOG DATA field specifies whether archive log data sets on tape are to be cataloged.

*Valid values:*
- YES, NO

*Default:*
- NO

DB2 10 and DB2 11 only.
Device Type 1 (QWP3UNT1)
The UNIT subsystem parameter determines the device type or the unit name that is used for storing the first copy of archive log data sets.

Valid values:
Device type
Unit name

Default:
TAPE

Device Type 2 (QWP3UNT2)
The UNIT2 subsystem parameter determines the device type or the unit name that is used for storing the second copy of archive log data sets.

Valid values:
Device type
Unit name

Default:
None

Block Size (QWP3BKSZ)
The BLKSIZE subsystem parameter determines the block size that is used for the archive log data set.

Valid values:
8192 to 28672

Default:
24576

Read Tape Units (QWP2MRTU)
The MAXRTU subsystem parameter determines the maximum number of dedicated tape units that can be allocated to concurrently read archive log tape volumes.

Valid values:
1 to 99

Default:
2

Tape Unit Dealloc Period (QWP2DMIN:QWP2DSEC)
The DEALLCT subsystem parameter determines the length of time that an archive read tape unit can remain unused before it is deallocated.

The time is displayed like this: Minutes : Seconds

Valid values:
Minutes
Seconds
1440
NOLIMIT

Default:
0

Recording Max (QWP2ARCL)
The MAXARCH subsystem parameter determines the maximum number of archive log volumes that are recorded in the BSDS.
If you have a dual archive, this number is for each log data set. For example, if 500 is specified as the maximum number, allow 500 COPY-1 and 500 COPY-2 data sets in the BSDS.

Valid values:
10 to 10000

Default:
10000

**Write to Oper (QWP3WTOR)**

The ARCWTOR subsystem parameter determines whether DB2 sends a message to the operator and waits for a reply before attempting to mount an archive log data set.

Valid values:
NO
YES

Default:
YES

**Retention Period (QWP3RETN)**

The ARCRETN subsystem parameter determines the retention period. This is the number of days that DB2 retains archive log data sets.

The retention period is added to the current date to calculate the expiration date of the archive log data sets.

Valid values:
0 to 9999

Default:
9999

**Quiesce Period (QWP3MQP)**

The QUIESCE subsystem parameter determines the maximum amount of time in seconds that DB2 is allowed to attempt a full system quiesce.

Valid values:
1 to 999

Default:
5

**Compact Data (QWP3COMP)**

The COMPACT subsystem parameter determines whether data that is written to archive logs is compacted.

Valid values:
NO
YES

Default:
NO

**Single Volume (QWP3SVOL)**

The SVOLARC subsystem parameter determines whether a single volume is used by DB2 for disk archives.
When archiving to disk, the number of online storage volumes for the specified UNIT name is used to determine a count of candidate volumes up to 15.

Valid values:
NO
YES

Default:
NO

DSNTIPH-System Resource

Number of Active Logs (QWP2DUAL)
The TWOACTV subsystem parameter determines the number of copies of the active log that is maintained by DB2.

Valid values:
1 (single locking)
2 (dual locking)

Default:
2

Number of Archive Logs (QWP2ADL)
The TWOARCH subsystem parameter determines the number of copies of the archive log that is produced by DB2 during offloading.

Valid values:
1
2

Default:
2

ARC1 Prefix (QWP3RE1N)
The ARCPFX1 subsystem parameter determines the prefix that is used for the first copy of the archive log data set.

Valid values:
Valid data set name prefix
1 to 35 characters

Default:
DSNCAT.ARCHLOG1 or DSNCAT.DSN1.ARCLG1

ARC2 Prefix (QWP3RE2N)
The ARCPFX2 subsystem parameter specifies the prefix that is used for the second copy of the archive log data set. If you use single logging, accept the default value.

Valid values:
Valid data set name prefix
1 to 35 characters

Default:
DSNCAT.ARCHLOG2 or DSNCAT.DSN1.ARCLG2
**Timestamp Archives (QWP3DTIM)**

The TSTAMP subsystem parameter determines whether the DB2 archive log data set name contains the date and time that the archive log data set is created.

Valid values:

- NO
- YES
- EXT

Default: NO

**Dual BSDS Mode (QWP2DBSD)**

The dual BSDS mode.

Valid values:

- NO
- YES

**DSNZPARM Authorization, RLF and DDF Parameters**

This panel shows information about the parameters that affect DB2 access and security. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

• other topics, use the PF keys.

Fields

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.

**DSNTIPO-Operator Functions**

**WTO Route Codes (ROUTCDE) (QWP1SMRC)**

This parameter determines the z/OS console routing codes that are assigned to messages that are not solicited from a specific console.

Valid values:

2 bytes are used as bits 1-16

**Recall Data Base (RECALL) (QWP4HRCL)**

This parameter determines whether DFSMSHsm automatic recall is performed for DB2 databases.

**Recall Delay (RECALLD) (QWP4HRCD)**

This parameter determines the maximum length of time in seconds that a program can be delayed for a DFSMSHsm recall.

**Auto Bind (ABIND) (QWP4ABN)**

This parameter determines whether plans or packages can be rebound automatically.

Valid values:

**COEXIST**

Automatic rebind is performed in a data sharing coexistence environment if one of the following conditions are met:

• The plan or package is marked as invalid.

• The plan or package was last bound at the current release level. It is now running on a subsystem at the previous release level.

**DISABLE**

You must explicitly bind any invalid plan or package before it can be used.

**ENABLE** Automatic rebind is performed on plans or packages.
Explain Processing (ABEXP) (QWP4ABX)
This parameter determines whether EXPLAIN is allowed during AUTOBIND.

Dprop Support (EDPROP) (QWP4ENF)
DPROP support only.

Change Data Capture (CHGDC) (QWP4CDC)
This parameter determines the enablement of change data capture.

Site Type (SITETYP) (QWP4MSTY)
This parameter determines whether this system runs at the local site.

Tracker Site (TRKRSITE) (QWP4TRKR)
This parameter determines whether this subsystem is a remote tracker site for another DB2 system.

Read Copy2 Archive (ARC2FRST) (QWP2ARC2)
This parameter determines whether the COPY2 archives are read first when the DB2 subsystem is started.

(PROFILE_AUTOSTART) (QWP1PFSY)
Specifies whether start profile command processing is automatically initiated as part of DB2 startup.

• 0=NO
• 1=YES

DB2 12 and later.

DSNTIP-Protection 1

Archive Log RACF (PROTECT) (QWP3RTCT)
This parameter determines the RACF protection.

Use Protection (AUTH) (QWP4AUTH)
This parameter determines whether the DB2 authorization is enabled or disabled.

Valid values:
E=ENABLE(YES)
D=DISABLE(NO)

Default:
E

Plan Auth Cache (AUTHCACH) (QWP4AUCA)
This parameter determines the authorization cache size.

Package Auth Cache (CACHEPAC) (QWP4PAC)
This parameter determines the size of package authorization cache.

Routine Auth Cache (CACHERAC) (QWP4RAC)
This parameter determines the amount of storage that is allocated to the caching of authorization information for all routines on this subsystem.

Default:
32K

Auth Exit Limit (AEXITLIM) (QWP4ACAN)
This parameter determines the abend count for the access control authorization exit.
**Auth Exit Check (AUTHEXIT_CHECK) (QWP4RACK)**

This parameter determines the authorization exit check.

Valid values:
- **P**=PRIMARY
- **D**=DB2

DB2 11 and later.

**AUTHEXIT_CACHEREFRESH) (QWP4AECR)**

This parameter determines the authorization exit cache refresh.

Valid values:
- **A**=ALL
- **N**=NONE

DB2 11 and later.

**DSNTIP1-Protection 2**

**System Admin 1 (SYSADM) (QWP4SADM)**
The system administrator user ID 1.

If QWP4SADM_OFF is not set to 0, this value is truncated. If QWP4SADM is truncated, this is the offset from the beginning of QWP4 TO QWP4SADM_LEN.

If QWP4SADM_OFF is not set to 0, use the following fields:
- Length of QWP4SADM_VAR
- System Administrator user ID 1

**System Admin 2 (SYSADM2) (QWP4ADM2)**
The system administrator user ID 1.

If QWP4ADM2_OFF is not set to 0, this value is truncated. If QWP4ADM2 is truncated, this is the offset from the beginning of QWP4 TO QWP4ADM2_LEN.

If QWP4ADM2_OFF is not set to 0, use the following fields:
- Length of QWP4ADM2_VAR
- System Administrator user ID 2

**System Operator 1 (SYSOPR1) (QWP4OPR1)**
The system operator user ID 1.

If QWP4OPR1_OFF is not set to 0, this value is truncated. If QWP4OPR1 is truncated, this is the offset from the beginning of QWP4 TO QWP4OPR1_LEN.

If QWP4OPR1_OFF is not set to 0, use the following fields:
- Length of QWP4OPR1_VAR
- System Operator user ID 1.

**System Operator 2 (SYSOPR2) (QWP4OPR2)**
The system operator user ID 1.

If QWP4OPR2_OFF is not set to 0, this value is truncated. If QWP4OPR2 is truncated, this is the offset from the beginning of QWP4 TO QWP4OPR2_LEN.

If QWP4OPR2_OFF is not set to 0, use the following fields:
- Length of QWP4OPR2_VAR
• System Operator user ID 2.

**Security Admin 1 (SEADM1) (QWP4SECA1_E)**  
The security administrator 1 authorization ID.

If QWP4SECA1_OFF is not set to 0, this value is truncated. If the authorization is held by a role, this value is blank.

**Sec Admin1 Type (SEADM1_TYPE) (QWP4SECA1_TYPE)**  
The security administrator type 1 authorization ID.

'' Authorization ID
L Role

**Security Admin 2 (SEADM2) (QWP4SECA2_E)**  
The security administrator type 2 authorization ID.

If QWP4SECA1_OFF is not set to 0, this value is truncated. If the authorization is held by a role, this value is blank.

**Sec Admin2 Type (SEADM2_TYPE) (QWP4SECA2_TYPE)**  
The security administrator type 2 authorization ID.

'' Authorization ID
L Role

(SEPARATE_SECURITY) (QWP4SEPS)  
Specifies whether to separate DB2 security administrator duties from the DB2 system administrator duties.

Revoke:
Y SYSADM cannot manage security objects such as roles and trusted contexts. SYSCTRL cannot manage roles.
N SECADM or ACCESSCTRL AUTHORITY is required for security administration.

**Unknown Authid (DEFLTID) (QWP4DFID)**  
The system administrator default user ID.

If QWP4DFID_OFF is not set to 0, this value is truncated. If QWP4DFID is truncated, this is the offset from the beginning of QWP4 TO QWP4DFID_LEN.

If QWP4DFID_OFF is not set to 0, use the following fields:

• LENGTH OF QWP4DFID_VAR
• SYSTEM DEFAULT USER ID.

**Resource Authid (RLFAUTH) (QWP1RLFA)**  
The resource limit specification table authorization ID.

If QWP1RLFA_OFF is not set to 0, this value is truncated. If QWP1RLFA is truncated, this value is the offset from the beginning of QWP1 TO QWP1RLFA_LEN.

Use the following fields if QWP1RLFA_OFF is not set to 0:

• Length of QWP1RLFA_VAR
• Resource limit specification table authorization ID

**Bind New Package (BINDNV) (QWP4BNVA)**  
When adding a new package or a new version of an existing package to a collection, one of the following authorities is required:
• BINDADD AUTHORITY
• BIND AUTHORITY

DBADM Create Auth (DBACRVW) (QWP4CRVW)
Specifies whether an authorization ID with DBADM authority can create a view or an alias for another authorization ID. Valid values are YES or NO. The default value is NO.

(REVOKE_DEPENDENT_PRIVILEGES) (QWP4RVDP)
Specifies whether to include dependent privileges on REVOKE:
Y Dependent privileges are included.
N Dependent privileges are not included.
S The REVOKE statement specification is used.

DSNTIPR-DDF 1
DDF Startup Option (DDF) QWP9STRRT
The facility start parameter.

Resync Interval (RESYNC) (QWP9RYC )
The minutes between resynchronization periods.

DDF Threads (CMTSTAT) (QWP9CMST)
The status of the DDF thread.

Max Type1 Inactive Thrds (MAXTYPE1) (QWP9MAX1)
Specifies the maximum type 1 inactive threads that are allowed by DB2. 0 indicates that type 1 inactive connections are not allowed.

Idle Thread Timeout (IDTHTOIN) (QWP9TTO )
The approximate time in seconds that an active server thread can remain dormant before it is cancelled.

Extended Security (EXTSEC) (QWP1SCER)
This parameter determines the contents of the error message that is returned to a network client when a DDF connection request fails due to a security error. It also determines whether you can update an RACF password by using the DRDA change password function.
Y Detailed error information is returned. You can update the password by using the DRDA function.
N A generic error message is returned. You cannot update the RACF password by using the DRDA function.

DSNTIP5-DDF2
TCP/IP Already Verified (TCPALVER) (QWP9TCPA)
Specifies whether already verified connections are accepted from TCP/IP clients.
Valid values: YES or NO. If connections are not accepted, additional criteria might apply.

Extended Option for TCPALVER (QWP9TCPVE)
If YES is specified, user ID and password are required. These values must be AES-encrypted including RACF passtickets, or a KERBEROS ticket is required, or the connection is protected by one of the following options:
• AT-TLS policy (ensured via a DB2 SECPORT)
• IPSEC tunnel
Extra Blocks Req (EXTRAREQ) (QWP1EXBR)
The maximum number of extra query blocks that DB2 can request from a remote DRDA server.

Extra Blocks Srv (EXTRASRV) (QWP1EXBS)
The maximum number of extra query blocks that DB2 can return to a remote DRDA requester.

Hop Site Authorization (HOPAUTH) V9 (QWP4HOP)
For a non-DB2 requester that executes a package at a DB2 server that sends an SQL statement to another DB2 server, you can specify one of the following options:

ON  The authorization ID of the package owner is used for static SQL, and the ID of the process runner is used for dynamic SQL.

OFF The authorization ID of the process runner is used for all statements.

TCP/IP Keepalive (TCPKPALV) (QWP9TCKA)
Determines whether to override the TCP/IP stack Keepalive value. The default value is 120.

You can specify the following values:

ENABLE The TCP/IP value is not overwritten.

DISABLE Keep alive probing is disabled.

1-65534 (SECONDS) The TCP/IP stack Keepalive value should be replaced with the value that is displayed in this field.

Pool Thread Timeout (POOLINAC) (QWP9INAC)
Specifies the time in seconds that a DBAT can remain idle in the pool before it is terminated. If this parameter is set to 0, a DBAT is terminated instead of going into the pool if there is a sufficient number of threads in the pool to process the number of type 2 inactive threads that is currently existing.

Valid values: 0-9999.

Default: 120.

Conn Queue Max Depth (MAXCONQN) (QWP9MCONQN)
The maximum depth for the connection request queue of connections that are waiting for a DBAT to process a request. The minimum value is 1.

OFF The queue is limited only by CONDBAT.

ON The depth of the queue corresponds to the maximum value that is specified for MAXDBAT.

Conn Queue Max Wait (MAXCONQW) (QWP9MCONQW)
The maximum time in seconds for a connection to wait for a DBAT to process its request.

OFF The connection waits indefinitely.

ON The time value that is specified for IDTHTOIN is used. However, if IDTHTOIN is set to 0, a warning MNOTE is issued. It states that MAXONT is set to OFF because IDTHTOIN is set to 0. The minimum numeric value is 5. The maximum value is 3600 seconds.
This is the default value.

**DSNTIP04 - Resource Limit Facility**

**RLF Auto Start (RLF) (QWP1RLF)**
This parameter determines whether the resource limit facility (governor) starts automatically each time DB2 is started.

**RLF Scope (RFLENABLE)**
The level of RLF governing:

- **DYNAMIC**
  Dynamic SQL only

- **STATIC**
  Static SQL only

- **ALL** Both, dynamic and static SQL

  DB2 12 and later.

**RLST Name Suffix (RLFTBL) (QWP1RLFT)**
This parameter determines the suffix that is used for the default resource limit specification table (RLST). The default RLST is used when the resource limit facility (governor) is started automatically or when the governor is started without a specified suffix.

**RLST Access Error (RLFERR) (QWP1RLFR)**
This parameter determines what DB2 is doing if the governor encounters a condition that prevents it from accessing the resource limit specification table. This setting applies also if DB2 cannot find an applicable row in the resource limit specification table. An applicable row applies to the authorization ID, plan or package name, and the name of the logical unit of work of the query user.

**RLST Access Err SSQL (RLFERRSTC)**
The action taken by DB2 when the governor cannot use the resource limit:

- **NOLIMIT**
  The static SQL statements run without limit.

- **NORUN**
  The static SQL statements terminated with an SQL error code. A number from 1 to 5000000 represents the number of CPU service units allowed for a query.

  DB2 12 and later.

**RLST Access Err RemDSQL (RLFERRD) (QWP9RLER)**
Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement.

- **NOLIMIT**
  This is the default. It allows all dynamic SQL statements to run without limit.

- **NORUN**
  Terminates all dynamic SQL statements immediately with an SQL error code. A number from 1 to 5000000 is the default limit. If the limit is exceeded, the SQL statement is terminated.
RLST Access Err RemSSQL (RLFERRDSTC)

Shows what DB2 does when the governor cannot access the resource limit specification table or when no row in the table matches the currently running statement:

**NOLIMIT**
- This is the default. It allows all static SQL statements to run without limit.

**NORUN**
- Terminates all static SQL statements immediately with an SQL error code. A number from 1 to 500000 is the default limit; if the limit is exceeded, the SQL statement is terminated.

DB2 12 and later.

**DSNZPARNM IRLM Parameters**

This panel shows information about the Internal Resource Lock Manager (IRLM) with which DB2 communicates. It shows the name of the DSNZPARNM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

### Fields

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

#### DSNZPARM Module

The name of the DSNZPARM module that is specified for DB2 startup.
Initial Module
The name of the initial DSNZPARM load module.

Previous Module
The name of the previous DSNZPARM load module.

Assembly Date
The date on which this module was assembled.

DSNTIP1-IRLM 1

Subsystem Name (IRLMSID) (QWP4ISID)
The name of the IRLM subsystem that is known to z/OS.

Resource Timeout (IRLMRWT) (QWP4TOUT)
The maximum amount of time in seconds that DB2 is waiting for the release of a locked resource.

Auto Start (IRLMAUT) (QWP4IAUT)
The IRLM start mode. OMEGAMON XE for DB2 PE displays YES if DB2 starts IRLM automatically or NO if it does not.

Proc Name (IRLMPRC) (QWP4IPRC)
The name of the IRLM procedure that is used by DB2 to start IRLM automatically.

Time to Autostart (IRLMSWT) (QWP4ISWT)
The time in seconds that DB2 waits for IRLM to start.

If this time expires and IRLM did not yet start, DB2 stops. This applies regardless whether IRLM is started automatically or not.

U Lock for RR or RS (RRULOCK) (QWP4RRU)
Determines whether the update (U) lock is used when using repeatable read (RR) or read stability (RS) isolation to access a table.

Valid values:
NO
YES

X Lock for Searched U/D (XLKUPDLT) (QWP4XLUD)
Use X lock for searched update or delete. If subsystem parameter XLKUPDLT is set to NO, this bit is off. If subsystem parameter XLKUPDLT is set to YES or TARGET, see QWP4XLUS.

IMS BMP Timeout (BMPTOUT) (QWP4WBMP)
Timeout multiplier for BMP a connection.

DL/I Batch Timeout (DLITOUT) (QWP4WDLI)
Timeout multiplier for DL/I batch connection.

Retain Lock Timeout (RETLWAIT) (QWP4WAIT)
Multiplier for determining how long a transaction waits for incompatible retained locks. This value is multiplied by the normal timeout multiplier of the connection.

If agents do not wait for incompatible retained locks, the value of this parameter is 0. The default is 0.

Utility Timeout (UTIMOUT)
Number of IRLM resource timeout intervals that a utility waits for a lock or claims to be released.

DSNTIPJ-IRLM 2
Locks per Table (NUMLKTS) (QWP4LKTS)
The maximum number of page or row locks that can be held concurrently by a thread against a single table space for which LOCKSIZE ANY is specified before DB2 escalates the locking level to a table space lock.

The value 0 deactivates this feature.

Locks Per User (NUMLKUS) (QWP4LKUS)
The maximum number of page or row locks that can be held concurrently by a thread against all table spaces in the system including locks against data and index pages. Each lock averages 540 bytes. If this limit is reached, DB2 issues a return code RESOURCE UNAVAILABLE.

Deadlock Time (QWP5DLOK)
The time (in seconds or milliseconds) of the local deadlock detection cycle. Values between 1 and 5 are seconds. Values between 100 and 5000 are milliseconds. The initial value is retrieved from the IRLMPROC DEADLOK parameter. This value can be changed dynamically with the MODIFY irlmproc,SET,DEADLOCK=nnnn command.

Deadlock Cycle (QWP5DCYC)
The number of local deadlock cycles that must expire before the IRLM performs global deadlock detection processing. This value is retrieved from the IRLMPROC DEADLOK parameter. In a data sharing environment, IRLM synchronizes all DEADLOK values in the group to the values specified on the most recent IRLM to join the group. The DEADLOK values can be changed by starting a member with the required values.

Other IRLM Processing parameters

PC Yes Specified (QWP5PCY)
Indicates whether the IRLM is to use the cross-address-space program call. This value is retrieved from the IRLMPROC PC parameter.

Current Timeout Interval (QWP5TVAL)
The initial value is retrieved from the Timeout Interval (IRLMRWT). The current value can be changed dynamically with the MODIFY irlmproc,SET,TIMEOUT=nnnn,subsystem-name command.

IRLM Maximum CSA Allowed (QWP5MCSA)
The maximum amount of common service area (CSA) and extended CSA (ECSA) that the IRLM for this DB2 uses for its lock control block structure. This value is retrieved from the IRLMPROC MAXCSA parameter.

CF Lock Table Hash Entries (QWP5HASH)
The number of lock table entries (LTE) that IRLM has allocated in the XCF LOCK structure. The initial value is calculated by the IRLM based on IRLMPROC parameters and the XCF LOCK structure size. This value can be changed dynamically with the MODIFY irlmproc,SET,LTE=nnnn command.

CF Pending Hash Entries (QWP5PHSH)
The number of LOCK HASH entries (LTE) that this IRLM can use on the next connect to the XCF LOCK structure. This value is set by MODIFY irlmproc,SET,LTE=nnnn command and exists until the next time the IRLM connects to the XCF LOCK structure or a subsequent MODIFY irlmproc,SET,LTE=nnnn command is issued.

CF Lock Table List Entries (QWP5RLE)
The number of entries (RLE) in the list of update locks that are currently held in the XCF LOCK structure. This list is sometimes called the “modify
lock list” or “record list table”. The initial value is calculated by the IRLM based on IRLMPROC parameters and the XCF LOCK structure size. This value can be changed dynamically with the MODIFY irlmproc,SET,LTE=nnnn command or a XCF LOCK structure resizing.

Max 31-bit IRLM Private Storage (QWP5BPM)
From a total of 2G virtual storage, a maximum amount of 31-bit IRLM private storage is available for normal operations in IRLM. IRLM reserves an additional 10% of the total 2G virtual storage for use by requests in IRLM. DB2 11 and later.

Max 64-bit IRLM Private Storage (QWP5APM)
From the total storage that is set as the MEMLIMIT, a maximum amount of 64-bit IRLM private storage is available for normal operations in IRLM. IRLM reserves an additional 10% of the total MEMLIMIT storage for use by requests that must be completed in IRLM. DB2 11 and later.

DSNZPARM Storage Parameters
This panel shows virtual storage allocations for the DB2 buffer pools and the Environmental Descriptor Manager (EDM) pool. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

- other topics, use the PF keys.

**Fields**

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.
Max Open Dataset (DSMAX) (QWP4DSMX)
The maximum number of concurrently open data sets before deferred close.

This value is not an absolute limit. It is rather a target level of maximum open data sets that is used by the Deferred Close process of DB2. The practical limit depends on available storage below 16MB.

Valid values:
0-100000

EDM Statement Cache (EDMSTMTC) (QWP4ESTC)
The maximum size (in KB) of the statement cache that can be used by EDM. This value is either the DB2 startup value or a value (above the DB2 startup value) that you can specify with the SET SYSPARM command.

EDM DBD Cache (EDMDBDC) (QWP4EDBC)
The minimum size (in KB) of the DBD cache that can be used by EDM. This value is either the DB2 startup value or a value (above the DB2 startup value) that you can specify with the SET SYSPARM command.

EDM Limit Below the Bar (EDMPOOL) (QWP4EDPL)
Maximum size of the EDM Pool that is in below-the-bar storage. DB2 10 and DB2 11 only.

(EDM_SKELETON_POOL) (QWP4SKLC)
The EDM skeleton pool size in bytes (K=1024 bytes, M=1024 x 1024 bytes).

Sort Pool Size (SRTPOOL) (QWP4SPOL)
The size of the sort pool, KB.

(MAXSORT_IN_MEMORY) (QWP4MIMTS)
The maximum in-memory sort size. DB2 10 and later.

RID Pool Size (MAXRBLK) (QWP4RMAX)
The maximum number of RID blocks in bytes. If this value is zero, access path selections that require the RID pool (including List Prefetch and hybrid joins) will not be used.

DSNTIPD-Sizes

(LOB_INLINE_LENGTH) (QWP1LBIL)
The default number of bytes of a LOB that are stored in the base table.

User LOB Value STG (LOBVALA) (QWP1LVA)
The maximum number of kilobytes that a user can use to store LOB values. This field corresponds to field "User LOB Value Storage" on installation panel DSNTIP7. DB2 10 and DB2 11 only

System LOB Value STG (LOBVALS) (QWP1LVS)
The maximum number of megabytes that a subsystem can use to store LOB values. This field corresponds to field "System Value Storage" in DSN6SYSP. DB2 10 and DB2 11 only.

User XML Value STG (XMLVALA) (QWP1XVA)
Maximum amount of memory in KB for each user for storing XML values. DB2 10 and DB2 11 only.

System XML Value STG (XMLVALS) (QWP1XVS)
Maximum amount of memory in MB for the system for storing XML values. DB2 10 and DB2 11 only.
DSNZPARM Data set and Database Parameters
This panel shows information about the data set and database-related installation parameters in the DSNZPARM module. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

  • other topics, use the PF keys.

Fields

The DSNZ command displays the following lines to reflect the usage of the DB2 SET SYSPARM command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

DSNZPARM Module
  The name of the DSNZPARM module that is specified for DB2 startup.

Initial Module
  The name of the initial DSNZPARM load module.

Previous Module
  The name of the previous DSNZPARM load module.

Assembly Date
  The date on which this module was assembled.

DSNTIP7-SQL Object Default 1

Reordered Row Format (RRF) (QWP4RRF)
  This parameter determines whether reordered row format is enabled.

  YES    Enables reordered row format.

  DB2 10 and DB2 11 only.

(OBJECT_CREATE_FORMAT) (QWP4OBCF)
  This parameter determines whether new table spaces and indexes are created in one of the following formats:

  1    Extended log record format

  0    Basic log record format
If RBA尔斯W format is not specified, this parameter converts existing table
spaces and indexes that use extended log record addressing to basic log
record addressing and vice versa. DB2 11 and later.

**Utility Object Conversion (UTILITY_OBJECT_CONVERSION) (QWP4UTOC)**

This parameter determines whether CI SIZE=PAGE is used when
DB2-managed data sets are defined.

**Vary DS Control Interval (DSVCI) (QWP1VVCI)**

This parameter determines whether CI SIZE=PAGE is used when
DB2-managed data sets are defined.

**Table Space Allocation (TSQTY) (QWP1TSQT)**

This parameter determines the default values in KB for PRIQTY and
SEQQTY for table spaces.

**Index Space Allocation (IXQTY) (QWP1IXQT)**

This parameter determines the default values in KB for PRIQTY and
SEQQTY for index spaces.

**Optimize Extent Sizing (MGEXTSZ) (QWP1MESZ)**

This parameter determines whether a sliding scale for secondary space
allocations for DB2-managed data sets is enabled.

**DSNTIP71-SQL Object Default 2**

**Default Partition Segsize (DPSEGSZ) (QWP1DPSS)**

This parameter determines the default segment size that is used for a
partitioned table space when the CREATE TABLESPACE statement does
not include the SEGSIZE parameter.

**Pct Free for Update (PCTFREE_UPD) (QWP4PFUP)**

This parameter determines the default percentage of each page that DB2
leaves as free space for updates when you create a table space without
specifying the FOR UPDATE CLAUSE of the PCTFREE option and a table
within that table space is populated. DB2 11 and later. DB2 11 and later.

**(PAGESET_PAGENUM) (QWP4PSPN)**

Specifies whether range-partitioned table spaces and associated indexes
will be created to use absolute page numbers across partitions or relative
page numbers.

<table>
<thead>
<tr>
<th>A</th>
<th>Absolute page numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>Relative page numbers</td>
</tr>
</tbody>
</table>

DB2 12 and later.

**(RETRY_STOPPED_OBJECTS) (QWP4RSO)**

This parameter determines whether new indexes are padded
Valid values:

**NO**  New indexes are not padded unless the PADDED option is included in the CREATE INDEX statement.

**YES**  New indexes are padded unless the NOT PADDED option is included in the CREATE INDEX statement.

Default:
**NO**

**(INDEX MEMORY CONTROL) (QWP4IXMC)**
Shows the amount of memory that DB2 should allocate for fast traversing of DB2 indexes:

1 = AUTO (default)  
DB2 sets the upper limit of the storage to 20% of the currently allocated buffer pools.

0 = DISABLE  
DB2 returns any existing storage allocated for fast index traversal and does not allocate any further storage for this purpose.

10 - 200000  
Indicates the storage limit for fast index traversal in megabytes.

DB2 12 and later.

**(DDL_MATERIALIZATION) (QWP4DDLM)**
Specifies when DB2 materializes changes to the definition of an object.  
Valid values are:

**ALWAYS IMMEDIATE** (default)  
Changes are materialized at the time the request is executed, and the containing table space is placed in the AREO* or REORP status.

**ALWAYS PENDING**  
Changes are not materialized at the time that the request is executed, and the affected objects are available until it is convenient to implement changes. The containing table space is placed in the AREO* status.

DB2 12 and later.

**(DEFAULT_INSERT_ALGORITHM) (QWP4DINA)**
Specifies the default algorithm for inserting data into table spaces. Valid values:

**BASIC(1)** (default)  
The basic insert algorithm is used.

**FAST(2)**  
The fast insert algorithm is used.

DB2 12 and later.

**Define Data Sets (IMPDSDEF) (QWP1DIDS)**
This parameter determines the underlying data sets when a table space that is in an implicitly created database is created.

**Use Data Compression (IMPTSCMP) (QWP1CITS)**
This parameter determines whether data compression in table spaces in implicitly defined databases is used.
Define Data Sets (IMPDSDEF) (QWP1DIDS)
This parameter determines the underlying data sets when a table space that is in an implicitly created database is created.

Use Data Compression (IMPTSCMP) (QWP1CITS)
This parameter determines whether data compression in table spaces in implicitly defined databases is used.

(PREVENT_ALERTTB_LIMITKEY) (QWP4XPKE)
Determines whether DB2 disallows altering the limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. This alter operation places the table space in REORG-pending (REORG) restrictive status, and the data is not available until the affected partitions are reorganized. Use PREVENT_ALERTTB_LIMITKEY to avoid this data unavailability.

NO  Specifies that you can alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. NO is the default.

YES Specifies that it is not permitted to alter a limit key by using an ALTER TABLE statement for index-controlled partitioned table spaces. An ALTER TABLE statement must not attempt to alter the limit key for an index-controlled partitioned table.

DB2 11 and later.

(IX_TB_PART_CONV_EXCLUDE) (QWP4XPKE)
This parameter determines whether to include all columns in the partitioning key during the conversion from index-controlled partitioning to table-controlled partitioning.

Rename Table (RENAMETABLE) (QWP4ERTS)
Specifies whether the RENAME TABLE statement should extend to tables that are referenced in a view definition or the definition of an SQL table function:

ALLOW_DEP_VIEW_SQLTUDF
  YES

DISALLOW_DEP_VIEW_SQLTUDF
  NO

DB2 12 and later.

DSNTIP91-Workfile Database

Max Temp STG/AGENT (MAXTEMPS) (QWP4WFAL)
Specifies the maximum number of megabytes of temporary storage in the work file database that can be used by a single agent at any given time for all temporary tables. If 0 is specified, a limit is not enforced.

Valid values:
0 - 2147483647

Default: 0
Separate Work Files (WFDBSEP) (QWP4WFDBSEP)

This parameter determines whether DB2 provides an unconditional separation of table spaces in the work file database based on the allocation attributes of the table spaces.

Valid values:

**YES**  DB2 directs declared global temporary table (DGTT) work only to DB2-managed (STOGROUP) work file table spaces that are defined with a non-zero SECQTY and work file work only to other work file table spaces (DB2-managed table spaces that are defined with zero SECQTY or user-managed table spaces).

If a table space with the preferred allocation type is not available, an error message is issued by DB2.

**NO**  DB2 attempts to direct (DGTT) work to DB2-managed (STOGROUP) work file table spaces that are defined with a non-zero SECQTY and work file work to any other work file table space (DB2-managed table spaces that are defined with zero SECQTY or user-managed table spaces).

If a table space with the preferred allocation type is available, DB2 selects a table space with a non-preferred allocation type.

Default: NO

Max Temp RID (MAXTEMPS_RID) (QWP4WFRD)

The maximum number of RID blocks of temporary storage in the work file database that a single RID list can use at any point in time.

(WFSTGUSE_AGENT_THRESHOLD) (QWP4WFAT)

Determines the percentage of the space that is available in the work file database on this DB2 subsystem or in this data sharing member that can be consumed by a single agent before a warning message is issued.

Space in the work file database can be configured for temporary (DGTT-ORIENTED) work and for sort work including CGTTS and trigger transition tables.

Valid values:

**0**  Agent-level space-usage alerts for the work file database are not issued by DB2.

This is the default setting.

**1 - 100**  If DSN6SPRM.WFDBSEP is set to YES, a warning message is issued by DB2 if the percentage of the total temporary work file space or the percentage of the total sort work file space that is consumed by an agent exceeds the specified threshold.

If DSN6SPRM.WFDBSEP is set to NO, a warning message is issued by DB2 if the percentage of the entire work file space (temporary and sort) that is consumed by an agent exceeds the specified threshold.

If DSN6SPRM.MAXTEMPS is greater than 0 and if the threshold that is specified for DSN6SPRM.MAXTEMPS is exceeded before the threshold that is specified for the WFSTGUSE_AGENT is reached, the warning message is not issued because MAXTEMPS is
reached first by the agent. This results in an error message 
"Resource unavailable" with the SQL code -904.

DB2 11 and later.

(WFSTGUSE_SYSTEM_THRESHOLD) (QWP4WFST)
Determines the percentage of the space that is available in the work file
database on this DB2 subsystem or in this data sharing member that can be
consumed by all agents before a warning message is issued.

Valid values:
0 System-level space-usage alerts for the work file database are not
issued by DB2.
1 - 100 If DSN6SPRM.WFDBSEP is set to YES, a warning message is
issued by DB2 if the percentage of total temporary work file space
or the percentage of total sort work file space that is consumed by
all agents exceeds the specified threshold.

If DSN6SPRM.WFDBSEP is set to NO, a warning message is issued
by DB2 if the percentage of the entire work file space (temporary
and sort) that is consumed by all agents exceeds the specified
threshold.

The default setting is 90. DB2 11 and later.

DSNTIPS-Auto Start DB/TS

Restart or Defer (RESTART) (QWP7STR )
This parameter determines whether DB2 databases are started
automatically or are deferred.

Valid values:
NO The specified databases and page sets are deferred.
YES The specified databases are started automatically.

Auto Start Type (LIST or ALL) (SWP7STR )
This parameter determines the DB2 databases that are started or deferred.

Valid values:
ALL When DB2 starts, all databases are started automatically.
LIST When DB2 starts, a list of databases and table spaces and indexes
is displayed. The databases and table spaces and indexes of this
list are started automatically or they are deferred.

DSNZPRM Data Definition Control Support Parameters
This panel shows information about the Data Definition Control Support (DDCS)
installation parameters in the DSNZPRM module. It shows the name of the
DSNZPRM module that is specified for DB2 startup and the date on which the
module is assembled. It also shows a list of the default values of the DB2
application.

If a field is not available for the current DB2 release, the string N/A is displayed.
For other conditions, for example, if specific DB2 traces are not started or control
block data is not available, the string N/P is displayed.
**Navigation**

For additional information about

- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.

**DSNTIPZ-Data Def Control**

**Install DDCNTL Support (RGFINSTL) (QWP4REGI)**

Determines whether data definition control support is used.

**Control All Applications (RGFDEDPL) (QWP4REGD)**

Determines whether only registered packages or plans can use DDL.
Require Full Names (RGFFULLQ) (QWP4REGQ)
Determines whether two-part names are required for every object that is registered in ORT.

Unregistered DDL Default (RGFDEFLT) (QWP4REGU)
This is a flag for unregistered DDL default.
00 Unregistered DDL are prohibited.
1X Unregistered DDL can be used.
X1 Consult the art for unregistered DDL.

ART/ORT Escape Char (RGFESCP) (QWP4ESC)
The DDCS escape character for a search of the application registration table (ART) or the object registration table (ORT). This character is shown in both display and hexadecimal formats.

Registration Owner (RGFCOLID) (QWP4REGC)
Displays the owner of the application registration table and the object registration table.
If QWP4REGC_OFF is not set to 0, this value is truncated. If QWP4REGC is truncated, this is the offset from the beginning of QWP4 TO QWP4REGC_LEN.
If QWP4REGC_OFF is not set to 0, use the following fields:
• LENGTH OF QWP4REGC_VAR
• DDL REGISTRATION TABLE OWNER

Registration Database (RGFDBNAM) (QWP4REGN)
Specifies the name of the database that contains the registration tables.

Appl Registration Table (RGFNMPR) (QWP4REGA)
Specifies the name of the application registration table.
If QWP4REGA_OFF is not set to 0, this value is truncated. If QWP4REGA is truncated, this is the offset from the beginning of QWP4 TO QWP4REGA_LEN.
If QWP4REGA_OFF is not set to 0, use the following fields:
• LENGTH OF QWP4REGA_VAR
• DDL REGISTRATION APPLICATION REGISTRATION TABLE NAME

Object Registration Table (RGFNMORT) (QWP4REGO)
Specifies the name of the object registration table.
If QWP4REGO_OFF is not set to 0, this value is truncated. If QWP4REGO is truncated, this is the offset from the beginning of QWP4 TO QWP4REGO_LEN.
If QWP4REGO_OFF is not set to 0, use the following fields:
• LENGTH OF QWP4REGO_VAR
• DDL REGISTRATION OBJECT REGISTRATION TABLE NAME

DSNZPARAM Data Sharing Parameters
This panel shows information about the data sharing installation parameters in the DSNZPARAM module. It shows the name of the DSNZPARAM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.
If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.

**DSNTIPK-Data Sharing Parm**

The name of a new or of an existing DB2 data sharing group.

**Navigation**

For additional information about

- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

The DSNZ command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.

**DSNTIPK-Data Sharing Parm**

**Group Name (GRPNAME) (QWPAGRPN)**

The name of a new or of an existing DB2 data sharing group.
Member name (MEMBNAME) (QWPAMBRN)
The name of a new or of an existing DB2 data sharing member. This field displays N/A if data sharing is not enabled.

Coordinator (COORDNTR) (QWPACOOR)
Determines whether this DB2 can send parallel tasks to eligible DB2 members.
Valid values: Y (Yes) or N (No).
Default: Yes
DB2 10 only.

Assistant (ASSIST) (QWPAAASST)
Determines whether this DB2 can assist parallel processing at BIND time and at RUN time.
To be used as an assistant at RUN time, the threshold of the VPPSEQT and the VPXPSEQT buffer pool must be greater than 0.
Valid values: Y (Yes) or N (No)If YES, this member can assist in parallel processing.
DB2 10 only.

Data Sharing (DSHARE) (QWPADSHR)
Determines whether DB2 data sharing is enabled.
Valid values: YES or NO.

Random Attach (RANDOMATT) (QWPARAND)
The flag whether this DB2 is eligible for the random group attach.
Valid values: Y (Yes) or N (No).

(DEL_CFSTRUCTS_ON_RESTART) (QWP1DCFS)
During restart, it is attempted to delete CF structures including the SCA, IRLM LOCK structures and allocated group buffer pools.

PEER_RECOVERY (QWPAPPEERREC)
Specifies whether the data sharing member participates in data sharing peer recovery. Valid values
NONE (default) Does not participate in peer recovery. Use this option if you have configured the z/OS Automatic Restart Manager (ARM) to restart failed DB2 members.
RECOVER Member is recovered by a peer member if it fails.
ASSIST Member attempts to initiate peer recovery for other failed members. When this member detects a failure it attempts to initiate a LIGHT(YES) restart for the failed member. if it has not already been initiated to recover the retained locks.
BOTH Both RECOVER and ASSIST options are activated for this member
DB2 12 and later.
DSNZP ARM Stored Procedures Parameters
This panel shows information about the use of stored procedures in the DB2 system. It shows the name of the DSNZP ARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

Navigation
For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields
The DSNZ command displays the following lines to reflect the usage of the DB2 SET SYSPARM command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

DSNZP ARM Module
The name of the DSNZP ARM module that is specified for DB2 startup.

Initial Module
The name of the initial DSNZP ARM load module.

Previous Module
The name of the previous DSNZP ARM load module.
Assembly Date
The date on which this module was assembled.

DSNTIPX-Routine Parameters

Max Abend Count (STORMXAB) (QWP1SPAB)
The number of times a stored procedure can terminate abnormally before
DB2 stops it, and rejects any further requests. Use the DB2 command START
PROCEDURE to remove the stopped status.

Timeout Value (STORTIME) (QWP1SPTO)
The number of seconds to wait for an SQL CALL statement to be assigned
for execution in the DB2 stored procedures address space.
If this value is set to 0, the request waits until a TCB is available and is not
subject to timeout.

WLM Environment (WLMENV) (QWP1WLME)
This is the default WLM environment for user-defined functions and stored
procedures. This value is used by DB2 if the WLM environment is not
specified in a CREATE function or a CREATE PROCEDURE statement.

Max Open Cursors (MAX_NUM_CUR) (QWP4MXNC)
The maximum number of open cursors per thread.

Max Stored Procs (MAX_ST_PROC) (QWP4MXSP)
The maximum number of active stored procedures per thread.

Maximum LE Tokens (LEMAX) (QWP4LEM)
The maximum number of language environment tokens that are active at
any time.
Valid values: 0 - 50.
Default: 20
DB2 10 and DB2 11 only.

(BIF_COMPATIBILITY) (QWP4BIF_COMPAT)
The BIF compatibility subsystem parameter specifies whether the built-in
functions and specifications are to return results in the DB2 10 format or
revert to the pre-version 10 format. BIF_COMPATIBILITY can have the
following values:
CURRENT
V9
V9_TRIM
V9_DECIMAL_VARCHAR
N/P

Admin Scheduler (ADMTPROC) (QWP4ADMT)
The name of the JCL procedure that is used to start the DB2 administrative
scheduler task address space.

DSNZPARM Application Parameters
This panel shows information about the parameters that affect the default settings
of the DB2 application. It shows the name of the DSNZPARM module that is
specified for DB2 startup and the date on which the module is assembled. It also
shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed.
For other conditions, for example, if specific DB2 traces are not started or control
block data is not available, the string N/P is displayed.

### Navigation

For additional information about related topics, select one of the options on the top of the panel. For other topics, use the PF keys.
Fields

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**
The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**
The name of the initial DSNZPARM load module.

**Previous Module**
The name of the previous DSNZPARM load module.

**Assembly Date**
The date on which this module was assembled.

**DSNTIPF-Application Default 1**

**Language Default (QWPBLANG)**
This parameter determines the programming language that is used for your site.

Valid values:
- ASM
- C
- COBOL
- COB2
- CPP
- FORTRAN
- IBMCOB
- PLI

Default: IBMCOB

**Decimal Point (QWPBDEC)**
This parameter determines the decimal point for numbers.

Valid values:
- COMMA (,)
- PERIOD (.)

Default: PERIOD

**String delimiter (QWPBDL)**
This parameter determines the string delimiter that is used for COBOL.

Valid values:
- APOST (')
- DEFAULT
- QUOTE (*)

Default: DEFAULT

**SQL string delimiter (QWPBSDL)**
This parameter determines the character that is used to delimit character strings in dynamic SQL.

Valid values:
- APOST (')
- DEFAULT
- QUOTE (*)
Dist SQL Str Delimiter (QWPBDSD)
This parameter determines the string delimiter that is used for bind operations at this DB2 site if the requester does not provide this information for DB2.

Valid values:
APOST (')
QUOTE ('"')

Default: APOST

Mixed Data (QWPBGRAF)
This parameter determines how the EBCDIC CCSID fields and the ASCII CCSID fields are interpreted by DB2. The MIXED DATA option does not affect the UNICODE CCSID field. Regardless of the setting for MIXED DATA, UNICODE UTF-8 data is considered as mixed data. Therefore UNICODE UTF-8 data is processed according to the rules for mixed data.

Valid values:
NO
YES

Default: NO

Single Byte (QWPBSID), Mixed Byte (QWPBMID), and Double Byte (QWPBGID) CCSID
The coded character set identifier (CCSID) for Single Byte Character Set (SBCS), Mixed Byte Character Set (MBCS), and Double Byte Character Set (DBCS).

This parameter determines the default CCSID for EBCDIC-encoded character data that is stored in your DB2 subsystem or in your data sharing system. This value is used by DB2 to perform the conversion of character data that is received from external sources including other database management systems.

Choose this value carefully to avoid the loss of data integrity. The values that you select for EBCDIC CCSID and ASCII CCSID are closely related.

Valid values:
1 to 65533

Default: None

DSNHDECP:
SCCSID (single byte)
MCCSID (mixed byte)
GCCSID (double byte)

ASCII SBCS CCSID (QWPBASID), ASCII MBCS CCSID (QWPBAMID), and ASCII GBCS CCSID (QWPBAGID)
Coded character set identifier (CCSID) for ASCII Single Byte Character Set, (ASCSCSID), ASCII Mixed Byte Character Set, and ASCII Double Byte Character Set.

This parameter determines the default coded character set identifier (CCSID) for ASCII-encoded character data that is stored in your DB2
subsystem or in your data sharing system. This value is used by DB2 to convert character data that is received from external sources including other database management systems.

You must specify a value for this field even if you do not use ASCII-encoded objects.

Choose this value carefully to prevent the loss of data integrity.

Valid values:
1 to 65533

Default: None

DSNHDECP:
ASCCSID (single-byte)
AMCCSID (mixed)
AGCCSID (graphic)

UNICODE SBCS CCSID (QWPBUSID), UNICODE MBCS CCSID (QWPBUMID), and UNICODE GBCS CCSID (QWPBUGID)
Coded character set identifier (CCSID) for ASCII Single Byte Character Set, ASCII Mixed Byte Character Set, and ASCII Double Byte Character Set.

This parameter determines the CCSID that is used for Unicode data.

Valid values:
1208

Default: 1208

DSNHDECP:
USCCSID (367 for single-byte)
UMCCSID (1208 for mixed)
UGCCSID (1200 for graphic)

Def Encoding Scheme (QWPBENS)
This parameter determines the default format in which the data is stored in DB2.

Valid values:
ASCII
EBCDIC
UNICODE

Default: EBCDIC

Application Encoding (QWPBAPSC)
This parameter determines the default application encoding scheme of the system. It determines how data is interpreted by DB2. For example, if your default application encoding scheme is set to 37 and your EBCDIC coded character is set to 500, DB2 converts all data coming into the system to 500 from 37 before using it. This includes, but is not limited to, SQL statement text and host variables.

Valid values:
ASCII
EBCDIC
UNICODE
CCSID (1 to 65533)
Default: EBCDIC

**Locale LC_TYPE (QWPBLCTP)**

This parameter determines the system LOCALE LC_CTYPE.

A locale is the part of your system environment that depends on the language and on cultural conventions. An LC_CTYPE is a subset of a locale that applies to character functions.

Valid values:

A valid locale of 0 to 50 characters.

Default: Blank

**DEF_DECFLOAT_ROUND_MODE (QWPBDDRM)**

This parameter determines the default rounding mode for decimal floating-point values.

Valid values:

- ROUND_CEILING
- ROUND_DOWN
- ROUND_FLOOR
- ROUND_HALF_DOWN
- ROUND_HALF_EVEN
- ROUND_HALF_UP
- ROUND_UP.

Default: ROUND_HALF_EVEN

**DSNTIP4-Application Default 2**

**Minimum Divide Scale (QWP4DIV3)**

This parameter determines whether to retain at least three digits to the right of the decimal point after any decimal division.

Valid values:

- NO
- YES

Default: NO

**Decimal Arithmetic (QWPBARTH)**

This parameter determines the rules that are used if both operands in a decimal operation have a precision of 15 or less.

Valid values:

- DEC15
- DEC31
- 15
- 1
- DPP.S

Default: DEC15

**Use for DynamicRules (QWPBDRLS)**

This parameter determines whether DB2 is using the application programming default values that are specified on this panel or the values of the DB2 precompiler options for dynamic SQL statements. These are bound by using DYNAMICRULES bind, define, or invoke behavior.

Valid values:

- NO
- YES
Default: YES

Describe for Static (QWP4DSST)
This parameter determines whether DB2 is building a DESCRIBE SQL descriptor area (SQLDA) when binding static SQL statements. With DESCRIBE SQLDAs, DESCRIBE requests for static SQL statements can be executed successfully.

The DESCSTAT subsystem parameter provides the default value for the DESCSTAT BIND or REBIND option. The value of the DESCSTAT BIND or REBIND option always overrides the DESCSTAT subsystem parameter value.

Except for the following scenarios, a DESCRIBE request cannot be issued against a static SQL statement.

In a distributed environment, where DB2 for z/OS is the server and the requester supports extended dynamic SQL
In this scenario, a DESCRIBE request that is executed on an SQL statement in the extended dynamic package is considered by DB2 as a DESCRIBE on a static SQL statement in the DB2 package.

If a stored procedure result set is used by an application and a cursor must be allocated for this result set
In this scenario, the application can describe the cursor by using a DESCRIBE CURSOR statement. The SQL statement that is actually described is the statement for which the cursor is declared in the stored procedure. If that statement is static, a static SQL statement must be described.

Valid values:
NO
YES

Default: YES

Date Format (QWPBDATE)
This parameter determines the format that is used to represent dates in output.

Valid values:
EUR
ISO
JIS
LOCAL
USA

Default: ISO

Time Format (QWPBTIME)
This parameter determines the format that is used to represent time in output.

Valid values:
EUR
ISO
JIS
LOCAL
USA

Default: ISO
Local Date Length (QWPBDLEN)
If you use a locally defined date exit routine, this parameter determines the length of the longest field that is required to hold a date.

To use your own default date format, you must also enter LOCAL for the DATE FORMAT field on panel DSNTIP4.

Valid values:
0
10
254

Default: 0

Local Time Length (QWPBTLEN)
This parameter determines the time length default for the local format.

To use one of the following time formats that are provided by IBM, keep the default value of 0:
EUR
ISO
JIS
USA

Valid values:
0
8
254

Default: 0

Impl Time Zone (QWPBIMTZ)
This parameter determines the implicit time zone that is used when a time zone is not provided.

This parameter applies to DB2 table columns and routing parameters that are declared with TIMESTAMP WITH TIME ZONE data types.

Valid values:
CURRENT
SESSION
-12:59 to +14:00

Default: CURRENT

STD SQL Language (QWPBSQNL)
This parameter determines the SQL standard that is used in writing application programs. Specifically, the parameter specifies whether the SQL language conforms to those portions of the 1992 ANSI SQL standard that are implemented by DB2.

Valid values:
NO
YES

Default: NO

Pad Nul-Terminated (QWPBPAD)
This parameter determines whether output host variables that are nul-terminated strings are padded with blanks and a nul-terminator.

Valid values:
DSNTIPF-Application Default 3

APPL COMPAT LEVEL (QWP4APCO)

This parameter determines the default release level of the APPLCOMPAT BIND and REBIND option.

Tip:

- Set all DB2 data sharing members to the same value.
- This system parameter is the default value when binding packages without explicitly specifying the APPLCOMPAT bind option. Ensure that all applications are ready for new compatibility behavior before you change the default value.

Valid values:

- V10R1
- V11R1

Default:

- V11R1 after migration.
- V12R1 for a new installation.

DB2 11 and later.

DSNZPARM Data Parameters

This panel shows information about the parameters that affect the default settings of the DB2 application. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

### Navigation

For additional information about

- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

### Fields

The DSNZ command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.
Assembly Date
The date on which this module was assembled.

DSNTIPA2-Data

Catalog Alias (QWP6CATN)
The value of the CATALOG ALIAS field determines the high-level qualifier for VSAM data sets that are used by the DB2 catalog and directory.

Valid values:
1 to 8 characters

Default: DSNCAT

SMS DAT Data Class (QWP4CDDC), SMS DAT Mgmt Class (QWP4CDMC), SMS DAT Storage Class (QWP4CDSC)
The DIRECTORY AND CATALOG DATA field determines the explicit Storage Management Subsystem (SMS) classes that are used to define VSAM data sets for the DB2 catalog and directory. Your SMS storage administrator defines these SMS classes.

To use ACS routines for defining these data sets, leave this field blank.

SMS IX Data Class (QWP4CXDC), SMS IX Management Class (QWP4CXMC), SMS IX STO Class (QWP4CXSC)
The DIRECTORY AND CATALOG INDEXES field determines the explicit Storage Management Subsystem (SMS) classes that are used to define VSAM data sets for DB2 catalog and directory indexes. Your SMS storage administrator defines these SMS classes.

To use ACS routines for defining these data sets, leave this field blank.

Compress SPT01 (COMPRESS_SPT01) (QWP4CS01)
The COMPRESS_SPT01 subsystem parameter determines whether the SPT01 directory table space is compressed.

Valid values: NO, YES.

Default: NO

(COMPRESS_DIRLOB) (QWP4CDRL)
Specifies whether DB2 compresses LOB table spaces in the DB2 directory the next time that the table spaces are reorganized. Valid values:

NO LOB table spaces in the DB2 directory are not compressed
YES LOB table spaces in the DB2 directory are compressed the next time they are reorganized.

DB2 12 and later.

(SPT01_INLINE_LENGTH) (QWP4S1IL)
The SPT01_INLINE_LENGTH subsystem parameter defines the maximum length of LOB column data in the SPT01 directory table space that is maintained in the base table. The length is specified in single-byte characters.

In a data sharing environment, all members must use the same setting for this parameter.

Valid values:

NOINLINE
1 to 32138
Default: 32138

**DSNTIP03-Default Startup**

**Parameter Module (QWP1ZPNM)**
The PARAMETER MODULE parameter defines the member name of the load module that is used for DB2 subsystem parameters.

Valid values:
1 to 8 characters

Default: DSNZPARM

**Access Control (ACCESS_CNTL_MODULE) (QWP1DXAC)**
This parameter defines the member name of the load module that is used for the DB2 access control exit routine.

Valid values:
For installation: 1 - 8 characters
For migration: DSNX@XAC

Default: DSNX@XAC

**Identify Auth (IDAUTH_MODULE) (QWP1DATH)**
This parameter determines the member name of the load module that is used for the DB2 connection authorization exit routine.

Valid values:
For installation: 1 - 8 characters
For migration: DSN3@ATH

Default: DSN3@ATH

**Signon (SIGNON_MODULE) (QWP1DSGN)**
This parameter determines the member name of the load module that is used for the DB2 sign-on exit routine.

Valid values:
For installation: 1 - 8 characters
For migration: DSN3@SGN

Default: DSN3@SGN

**DSNTIPM-MVS Parameters**

**Subsystem Name (SSID) (QWPBSSID)**
This parameter determines the z/OS subsystem name for DB2.

Valid values:
1 to 4 characters

The first character must be a letter (A - Z)
or one of the following symbols: $, $, or @.

The other characters must be any letter from A to Z,
integers from 0 - 9,
or any of the following symbols: $, $, or @.

Default: DSN1

**Suppress Soft Errors (SUPERRS) (QWP4SAE)**
This parameter determines whether DB2 is recording errors such as invalid
decimal data or arithmetic exceptions, and whether SQLCODEs are issued for these errors. These errors are recorded in the operating system data set SYS1.LOGREC.

Valid values:

NO
YES

Default: YES

**DSNZPARM Performance and Optimization Parameters**

This panel shows information about the parameters that affect DB2 performance and optimization. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

### Navigation

For additional information about

- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.
Fields

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.

**Previous Module**

The name of the previous DSNZPARM load module.

**Assembly Date**

The date on which this module was assembled.

**DSNTIP8-Perf and Optimization 1**

**Cache Dynamic SQL (QWP4CDYN)**

The CACHEDYN subsystem parameter determines whether prepared static SQL statements or dynamic SQL statements are cached for later use by eligible application processes.

Valid Values:

- **NO**
- **YES**

Default: **YES**

**(CACHEDYN_STABILIZATION)**

This ZPARM specifies how DB2 is to stabilize cached dynamic SQL statement. When a statement is stabilized, the current SQLID, statement text, and runtime structures are written to catalog tables. If a dynamic SQL statement is not present in the dynamic SQL statement cache, DB2 will load the runtime structures from catalog table rather than performing a full prepare. This extends the stability and reliability of performance of a dynamic SQL. It can have the following values:

**CAPTURE**

Statements may be stabilized through the **-START DYNQUERY** command using both **MONITOR(NO)** and **MONITOR(YES)**. DB2 will not load stabilized statements from **SYSDYNQRY**.

**LOAD**

Statements may not be stabilized via any means. The **-START DYNQUERY** command will fail, and any **MONITOR(YES)** commands in progress will not stabilize statements, even if stabilization criteria are matched. During long prepare, DB2 will attempt to load stabilized statements from **SYSDYNQRY** with which to run.

**BOTH**

Statements may be stabilized through the **-START DYNQUERY** command via both **MONITOR(NO)** and **MONITOR(YES)**. During long prepare, DB2 will attempt to load stabilized statements from **SYSDYNQRY** with which to run. **BOTH** is the default setting.

**NONE**

Statements may not be stabilized via any means. The **-START DYNQUERY** command will fail, and any **MONITOR(YES)**
commands in progress will not stabilize statements, even if stabilization criteria are matched. DB2 will not load stabilized statements from SYSDYNQRY.

DB2 12 and later.

Optimization Hints (QWP4HINT)
The OPTHINTS subsystem parameter determines whether DB2 applies optimization hints when static SQL statements are bound or dynamic SQL statements are prepared.

Valid Values:
NO
YES

Default: NO

Evaluate Uncommitted (QWP4EVUN)
The EVALUNC subsystem parameter determines whether predicate evaluation is allowed on uncommitted data of other transactions. This parameter applies only to stage 1 predicate processing that uses table access for queries with isolation level RS or CS. Table access includes table space scan, index-to-data access, and RID-list processing.

Valid Values:
NO
YES

Default: NO

Skip Uncomm Inserts (QWP4SKUI)
The SKIPUNCI subsystem parameter determines whether statements ignore a row that is inserted by another transaction if the row is not yet detected as committed. A newly inserted row can be detected as committed only after the lock that is held on the row is released.

Valid Values:
NO
YES

Default: NO

Immediate Write (QWP4IMMW)
The IMMEDWRI subsystem parameter determines when updates to group buffer pool-dependent buffers are written to the coupling facility.

Valid Values:
NO
YES

Default: NO

Plan Management (QWP4PMGT)
The PLANMGMT subsystem parameter determines the default plan management policy that is used when the PLANMGMT option is not explicitly specified for the bind or the rebind of a package.

Valid Values:
BASIC
EXTENDED
OFF
Default: EXTENDED

Plan Mgmt Scope (QWP4PMSC)
The PLANMGMTSCOPE subsystem parameter determines the default plan management scope that is used when the PLANMGMTSCOPE option is not explicitly specified for the bind or rebind of a package.

The value in this field is meaningful only when the value of the PLAN MANAGEMENT field is set to BASIC or EXTENDED.

Valid Values:
A (ALL)
D (DYNAMIC)
S (STATIC)

Default: S (STATIC)

Pkgrel Commit (PKGREL_COMMIT) (QWP4PKRC)
YES indicates that the following operations on a package that are bound with RELEASE(DEALLOCATE) are permitted while the package is active and allocated by DB2:

- BIND and REBIND requests, including AUTOMATIC REBIND
- Data definition language changes to objects that are statically referenced by the package

DB2 11 and later.

(XML_RANDOMIZE_DOCID) (QWP1XRDI)
The XML_RANDOMIZE_DOCID subsystem parameter determines whether DB2 is sequentially or randomly generating the DOCID values for XML columns.

This parameter does not affect existing tables that have XML columns. These tables continue to generate DOCIDs in the order that is specified by the XML_RANDOMIZE_DOCID parameter when the table is created or in sequential order if the parameter was not specified.

Valid Values:
NO
YES

Default: NO

Real Time Stats (STATSINT) (QWP4INTE)
The time interval that DB2 waits before it attempts to write out page set statistics to the real-time statistics tables. This value is between 1 and 65535 minutes.

Disable EDM RTS (QWP4DEDR)
The DISABLE_EDMRTS subsystem parameter determines whether the collection of real-time statistics is disabled by the environmental description manager (EDM). Real-time statistics is tracking when packages were last used.

Valid Values:
NO
YES

Default: NO

Statistics Feedback (STATFDBK_SCOPE) (QWP4SFBS)
Specifies the scope of SQL statements for which DB2 is to recommend statistics. Possible values are:

- All (default): Statistics recommended for all SQL statements.
- Dynamic: Statistics recommended only for dynamically processed SQL statements.
- None: DB2 does not recommend statistics.
- Static: Statistics recommended only for statically processed SQL statements, that is, those that are bound to a package.

DB2 11 and later.

**STATFDBK_PROFILE (QWP4SFPR)**

Specifies whether statistics recommendations identified during query optimization directly result in modifications to statistics profiles.

Valid values:
- YES
- NO

Default: YES.

DB2 12 and later.

**DSNTIP81-Perf and Optimization 2**

**Current Degree (CDSSRDEF)**

The CDSSRDEF subsystem parameter determines the default value that is used for the CURRENT DEGREE special register. The default value is used when a degree is not explicitly set in the SQL statement SET CURRENT DEGREE.

Valid Values:
- 1
- ANY

Default: 1

**Max Degree (PARAMDEG)**

The PARAMDEG subsystem parameter determines the maximum degree of parallelism that is allowed for a parallel group. If you specify a value for this parameter, you limit the degree of parallelism so that DB2 does not create too many parallel tasks that use virtual storage.

Valid Values:
- 0 to 254

Default: 0

**Max Degree for DPSI (PARAMDEG_DPSI)**

The PARAMDEG_DPSI system parameter determines the maximum degree of parallelism that you can specify for a parallel group in which a data partitioned secondary index (DPSI) is used to drive parallelism.

A DPSI is a nonpartitioning index that is physically partitioned according to the partitioning scheme of the table. If you specify a value that is greater than 0 for this parameter, you limit the degree of parallelism for DPSIs so that DB2 does not create too many parallel tasks that use virtual storage.

Valid Values:
0-254
DISABLE

Default: 0

Parallel Efficiency (PARA_EFF)
The PARA_EFF subsystem parameter determines the efficiency that DB2 assumes for parallelism when DB2 chooses an access path. The integer value that is used for this parameter represents a percentage efficiency.

Valid Values:
0 ÷ 100

Default: 50

Star Join Queries (STARJOIN)
The STARJOIN subsystem parameter determines whether star join processing is enabled.

Valid Values:
DISABLE
ENABLE
1 to 32768

Default: DISABLE
ZPARM: DSN6SPRM STARJOIN

Max Data Caching (MXDTCACH)
The MXDTCACH subsystem parameter determines the maximum amount of memory in MB that is allocated for data caching per thread.

Valid Values:
0 to 512

Default: 20

Current Refresh Age (REFSHAGE)
The REFSHAGE subsystem parameter determines the default value for the CURRENT REFRESH AGE special register. The default value is used when no value is explicitly set by using the SET CURRENT REFRESH AGE statement.

Valid Values:
0
ANY

Default: 0

Current Maint Types (MAINTYPE)
The MAINTYPE subsystem parameter determines the default value for the CURRENT MAINTAINED TABLE TYPES FOR > OPTIMIZATION special register. This value is used when no value is explicitly set by using the SQL statement SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION.

Valid Values:
ALL
NONE
SYSTEM
USER
Default: SYSTEM

DSNTIP82-Query Accelerator Refs

ACCELERATOR STARTUP (ACCEL) (QWP4ACCS)
This parameter determines whether accelerator servers are used with a
DB2 subsystem, and how the accelerator servers are enabled and started.

Before you can start an accelerator server, it must be enabled.

You can modify this parameter online, however, if you change the setting
from NO or COMMAND to AUTO, you must stop and restart DB2 to
activate the new setting.

Valid Values:
A (AUTO)
C (COMMAND)
N (NO)

Default: NO

(GET_ACCEL_ARCHIVE) (QWP4CGAA)
The GET_ACCEL_ARCHIVE subsystem parameter determines the default
value that is used for the CURRENT GET_ACCEL_ARCHIVE special
register.

The GET_ACCEL_ARCHIVE subsystem parameter is used when no value
is explicitly set for the CURRENT GET_ACCEL_ARCHIVE special register
by the SQL statement SET CURRENT GET_ACCEL_ARCHIVE.

Valid Values:
NO
YES

Default: NO

(QUERY_ACCEL_OPTIONS) - None (QWP4QACO)
The QUERY_ACCEL_OPTIONS subsystem parameter determines whether
certain types of queries are allowed to execute on an accelerator server.

Valid options:
YES Query offloading is restricted to the standard SQL statements
NO Options are set to the following list of possible values:
1, 2, 3, 4, 5, 6, 7

Valid Values:

Default: NONE
NONE

Query offloading is restricted to the standard SQL statements.

1 The queries that include data that is encoded by the multi-byte
character set EBCDIC encoding scheme is not blocked from
executing on IBM Db2 Analytics Accelerator for z/OS although
IBM Db2 Analytics Accelerator for z/OS encodes the same data in
the UTF-8 UNICODE encoding scheme.

EBCDIC and UNICODE implement different collating sequences.
• The collating sequence for UNICODE is numeric, uppercase
characters, and lower case characters. (1, 2, 3, A, B, C, a, b, c).
In EBCDIC, the collating sequence is lower case, upper case, and numeric (a, b, c, A, B, C, 1, 2, 3).

There are also differences in collating for the national characters. This affects the ordering of data and the results from range predicates. Therefore, in the following cases, a query that is executed in DB2 might return a different result set than the same query executed in IBM Db2 Analytics Accelerator for z/OS:

- If the tables include character columns where more than one of these groups can be found in the column values
- If the SQL statements include range predicates or ordering on these columns

2 The queries that include an INSERT from SELECT statement, the select part is not blocked from executing on IBM Db2 Analytics Accelerator for z/OS although the data operated on by the SELECT might not be current in IBM Db2 Analytics Accelerator for z/OS.

3 The queries that include DB2 byte-based string functions on data that is encoded by multi-byte character sets encoding schemes, for example, UNICODE, are not blocked from executing on IBM Db2 Analytics Accelerator for z/OS although IBM Db2 Analytics Accelerator for z/OS supports only character-based string functions.

If the data on which the string function is specified contains only single-byte characters, executing the function on IBM Db2 Analytics Accelerator for z/OS returns the same result as executing the function on DB2 no matter what encoding scheme is used for the data. However, if the data contains multi-byte characters, the results is not the same.

4 Queries that include DB2 byte-based string functions on data encoded by multi-byte character sets encoding schemes (like UNICODE) are not blocked from running on IDAA although IDAA supports only character-based string functions.

If the data on which the string function is specified contains only single-byte characters, running the function on IDAA returns the same result as running the function on DB2 irrespective of what encoding scheme is used for the data. However, if the data contains multi-byte characters, the results is not the same.

5 SYSTEM_TIME temporal queries are offloaded to an accelerator. DB2 12 and later.

6 Queries that reference timestamp columns with precision of 12 are offloaded to an accelerator. DB2 12 and later.

**Note:** Option 4 cannot be specified in combination with option 7.
7 Queries that reference an expression with a DATE data type that uses a LOCAL format are not blocked from running on IDAA. IDAA uses the yyyyymmdd format to interpret the input and output date value.

Specify option 7 only when you also specify LOCAL as the setting for the DSNHDECP.DATE parameter and your LOCAL date exit defines the specific yyyyymmdd date format. Otherwise, queries may return yyyyymmdd date format or unpredictable results. DB2 12 and later.

(QUERY_ACCELERATION) (QWP4CQAC)
The QUERY_ACCELERATION subsystem parameter determines the default value that is used for the CURRENT QUERY ACCELERATION special register.

The QUERY_ACCELERATION subsystem parameter is used when no value is explicitly set for the CURRENT QUERY ACCELERATION special register by the SQL statement SET CURRENT QUERY ACCELERATION.

Valid Values:
1, 2, 3, 4, 5

Default: 1

1 (NONE)
Determines that query acceleration is not used.

2 (ENABLE)
Determines that queries are accelerated if DB2 determines that acceleration is of advantage.

If an accelerator failure occurs while a query is running, or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

3 (ENABLE_WITH_FAILBACK)
Determines that queries are accelerated if DB2 determines that acceleration is of advantage.

If the accelerator returns an error during PREPARE or first OPEN for the query, DB2 executes the query without the accelerator.

If the accelerator returns an error during FETCH or a subsequent OPEN, DB2 returns the error to the user. The query is not executed.

4 (ELIGIBLE)
Determines that queries are accelerated if they are eligible for acceleration.

DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by DB2. If an accelerator failure occurs while a query is running, or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

5 (ALL)
Determines that queries are accelerated if they are eligible for acceleration.

DB2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration
are not executed by DB2. An SQL error is returned. If an accelerator failure occurs while a query is running, or if the accelerator returns an error, DB2 returns a negative SQLCODE to the application.

**DSNZPARM Buffer Pool Parameters**

This panel shows information about the parameters that affect DB2 buffer pool default settings. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

**Fields**

The **DSNZ** command displays the following lines to reflect the usage of the DB2 **SET SYSPARM** command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

**DSNZPARM Module**

The name of the DSNZPARM module that is specified for DB2 startup.

**Initial Module**

The name of the initial DSNZPARM load module.
Previous Module
The name of the previous DSNZPARM load module.

Assembly Date
The date on which this module was assembled.

DSNTIP1-Buffer Pools

4KBP for User Data (TBSBPOOL)
Default 4KB Buffer Pool for:
- Table spaces with a 4KB page size in implicitly created databases
- Explicitly created table spaces with a 4KB page size and no buffer pool clause specified in the CREATE TABLESPACE statement.

This field corresponds to the field "Default 4-KB Buffer Pool for user data" on the installation panel DSNTIP1.
ZPARM name: TBSBPOOL in DSN6SYSP.

8KBP for User Data (TBSBP8K)
Default 8KB Buffer Pool for:
- Table spaces with a 8KB page size in implicitly created databases
- Explicitly created table spaces with a 8KB page size and no buffer pool clause specified in the CREATE TABLESPACE statement.

This field corresponds to the field "Default 8-KB Buffer Pool for user data" on the installation panel DSNTIP1.
ZPARM name: TBSBP8K in DSN6SYSP.

16KBP for User Data (TBSBP16K)
Default 16KB Buffer Pool for:
- Table spaces with a 16KB page size in implicitly created databases
- Explicitly created table spaces with a 16KB page size and no buffer pool clause specified in the CREATE TABLESPACE statement.

This field corresponds to the field "Default 16-KB Buffer Pool for user data" on the installation panel DSNTIP1.
ZPARM name: TBSBP16K in DSN6SYSP.

32KBP for User Data (TBSBP32K)
Default 32KB Buffer Pool for:
- Table spaces with a 32KB page size in implicitly created databases
- Explicitly created table spaces with a 32KB page size and no buffer pool clause specified in the CREATE TABLESPACE statement.

This field corresponds to the field "Default 32-KB Buffer Pool for User Data" on the installation panel DSNTIP1.
ZPARM name: TBSBP32K in DSN6SYSP.

BP for LOB Data (TBSBPLOB)
Name of the buffer pool that is used for implicitly created LOB table spaces.
This field corresponds to the field "Default Buffer Pool for User LOB Data" on installation panel DSNTIP1.
ZPARM name: TBSBPLOB in DSN6SYSP
**BP for XML data (TBSBPXML)**
Name of the buffer pool that is used for XML table spaces.
This field corresponds to the field "Default Buffer Pool for User XML Data" on the installation panel DSNTIP1.
ZPARM name: TBSBPXML in DSN6SYSP.

**BP for indexes (IDXBPPOOL)**
Default buffer pool for user index spaces.
This field corresponds to the field "Default Buffer Pool for User Indexes" on the installation panel DSNTIP1.
ZPARM name: IDXBPPOOL in DSN6SYSP.

**DSNZPARM Utility Parameters**
This panel displays information about the parameters that affect DB2 utility default settings. It shows the name of the DSNZPARM module that is specified for DB2 startup and the date on which the module is assembled. It also shows a list of the default values of the DB2 application.
If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.

Fields

The DSNZ command displays the following lines to reflect the usage of the DB2 SET SYSPARM command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

DSNZPARM Module
The name of the DSNZPARM module that is specified for DB2 startup.

Initial Module
The name of the initial DSNZPARM load module.

Previous Module
The name of the previous DSNZPARM load module.

Assembly Date
The date on which this module was assembled.

DSNTIP6 - Utility Parms 1

Temp DS Unit Name (VOLTDEVT) (QWP4VDTY)
This parameter determines the device type for temporary data sets.

(UTIL_TEMP_STORCLAS) (QWP4CHEC)
This parameter determines the name of the SMS storage class that is used by DB2 to define temporary shadow data sets. A blank value indicates that the temporary shadow data sets are defined in the same storage class as the production page set.

Statistics History (STATHIST) (QWP4STHT)
This parameter determines the default for the statistics history. Depending on the specified value, catalog changes that are made by DB2 are recorded in the catalog history tables.

Valid values:
ALL All changes are recorded.
NONE Changes are not recorded.
SPACE All changes that are related to space are recorded.
ACCESSPATH All changes that are related to accesspath are recorded.

Default: NONE

Statistics Rollup (STATROLL) (QWP4STRL)
This parameter determines the default for the statistics rollup. It controls whether the RUNSTATS utility aggregates partition-level statistics.

Valid values:
NO
YES

Utility Timeout (UTIMOUT) (QWP4UTO)
This parameter determines the utility timeout factor.

UT Sort Data Allocation (UTSORTAL) (QWP3SRAL)
Indicates that the utility will use sortnum elimination logic for sort tasks.

Valid values:
NO
YES

YES is the default. DB2 10 and DB2 11 only.

Ignore Sortnum Stmt (IGNSORTN) (QWP4IGSN)
This parameter determines whether the SORTNUM keyword specification in a UT JOB STMT is ignored.
Valid values:
NO
YES

Set Check Pending (CHECK_SETCHKP) (QWP4CSCP)
Specifies whether the check data and the check LOB utilities should place inconsistent objects in a check pending status. When these utilities detect an inconsistency in an object, they write a diagnostic message and end with return code 4.
Valid values:
YES The object is placed in check pending status
NO (default) The object is not placed in check pending status. Objects that are already in check pending status remain so.

NO
YES

DB2 10 and DB2 11 only.

UT DB2 Sort Use (DB2SORT)
Enables the use of the DB2 sort product from utilities when it is installed. DFSORT is used otherwise. Valid values are ENABLE (default) and DISABLE. DB2 10 and DB2 11 only.

Template Time (TEMPLATE_TIME) (QWP4TPTM)
This parameter determines the default setting for the TIME option of the DB2 UTILITIES TEMPLATE statement.
Valid values:
LOCAL
UTC (Coordinated universal time)

Default: UTC.

DB2 11 and later.

Max Utils Parallel (PARAMDEG_UTIL) (QWP4UMD)
This parameter determines the maximum degree of parallelism that is allowed when a DB2 utility is driving parallelism.
Valid values:
0 (Unlimited)
1 To 32767

Default: 99

DB2 11 and later.

DSNTIP6 - UtilityParms 2
(COPY_FASTREPLICATION) (QWP4CYFR)
This parameter specifies for the COPY utility whether FlashCopy fast replication is preferred, required, or not used for the creation of the FlashCopy image copy.

Valid values:

Preferred
The COPY utility directs DSS COPY to use fast replication if available.

Required
The COPY utility directs DSS COPY to only use fast replication, ensuring that object copies occur as fast as possible. Resource contention and unavailability are reduced.

None
The COPY utility directs DSS COPY not to use fast replication.

DB2 12 and later.

Fast Restore (REC_FASTREPLICATION) (QWP4RFRP)
This parameter determines whether FlashCopy® is used by the RECOVER utility to recover from a FlashCopy image copy.

If you use BACKUP SYSTEM to create system-level backup copies, using FlashCopy for restoring might cause BACKUP SYSTEM to fail because cascading FlashCopy is not supported.

Valid values:

NONE
Standard input and output is used to restore the FlashCopy image copy.

PREFERRED
FlashCopy is only used if FlashCopy support is available.

REQUIRED
FlashCopy is used to recover from a FlashCopy image copy to ensure that copies are recovered as fast as possible. However, recovery fails if FlashCopy support is not available.

Default: PREFERRED

(FLASHCOPY_PPRC) (QWP4FCPPRC)
This parameter determines the behavior for DFSMSDSS FlashCopy requests by DB2 utilities when the target disk storage volume is the primary device in a peer-to-peer remote copy (PPRC) relationship. A PPRC relationship exists when a DB2 utility is using DFSMSDSS FlashCopy technology to create a FlashCopy image copy or shadow data sets (for the online check utility) and the target disk storage volume is mirrored by another disk device on a different system.

The FlashCopy PPRC option pertains to COPY, REORG TABLESPACE, REORG INDEX, REBUILD INDEX, LOAD, RECOVER, and the CHECK utilities.

Valid values:

Blank
Mirroring is not preserved by DFSMSDSS.

NONE
Mirroring is not preserved by DFSMSDSS when it is processing a
DB2 utilities request, even if all configuration requirements for preserving the mirror operation are met.

**PREFERRED**

DFSMSDSS allows the volume pair to go into duplex pending state when processing a DB2 utilities request only if it is required.

**REQUIRED**

DFSMSDSS does not permit the PPRC volume pair to go into duplex pending state when processing a DB2 utilities request.

Default: REQUIRED

**Default Template (FCCOPYDDN) (QWP4FCCD)**

Offset from the beginning of QWP4 to QWP4FCCD.

Fields for the FCOPYDDN subsystem parameter: Length of QWP4FCCD_VAR.

This parameter determines the default settings of the FCCOPYDDN subsystem parameter for the COPY, LOAD, REBUILD INDEX, REORG INDEX, and REORG TABLESPACE UTILITY CONTROL statements when the FlashCopy parameter is set to YES or CONSISTENT.

FCCOPYDDN determines a DB2 utilities template data set name expression that is used to derive the COPY DATA SET NAME that is allocated by the utility during operation.

**Copy (FLASHCOPY_COPY) (QWP4FCCP)**

This parameter determines whether the COPY utility is using FLASHCOPY=YES and the system parameter settings for FCCOPYDDN when these keywords are not included in the utility control statement.

Valid values:

- NO
- YES

**DEFAULT: NO**

**Load (FLASHCOPY_LOAD) (QWP4FCLD)**

This parameter defines whether the LOAD utility is using FLASHCOPY=YES and the system parameter setting for FCCOPYDDN when these keywords are not included in the utility control statement.

Valid values:

- NO
- YES

**DEFAULT: NO**

**(FLASHCOPY_REORG_TS) (QWP4FROT)**

This parameter determines whether the REORG TABLESPACE utility is using FLASHCOPY=YES and the system parameter setting for FCCOPYDDN when these keywords are not included in the utility control statement.

Valid values:

- NO
- YES

**DEFAULT: NO**
**FLASHCOPY_REBUILD_INDEX** (QWP4FRBI)
This parameter determines whether the REBUILD INDEX utility is using
FLASHCOPY=YES and the system parameter setting for FCCOPYDDN
when these keywords are not included in the UTILITY CONTROL
statement.

Valid values:
- **NO**
- **YES**

**DEFAULT:** NO

**FLASHCOPY_REORG_INDEX** (QWP4FROI)
This parameter determines whether the REORG INDEX utility is using
FLASHCOPY=YES and the system parameter setting for FCCOPYDDN
when these keywords are not included in the UTILITY CONTROL
statement.

Valid values:
- **NO**
- **YES**

**DEFAULT:** NO

**DSNTIP6 - Utility Parms 3**

**SYSTEM_LEVEL_BACKUPS** (QWP4SLBU)
This parameter determines whether the RECOVER utility is using
system-level backup copies as a recovery base additional to image copies
and concurrent copies for object-level recoveries. If you do not want
system-level backup copies with the BACKUP SYSTEM utility, specify NO.

For more information, see the chapter Recover in the *DB2 10 for z/OS,
Utility Guide and Reference, SC19-2984-08*.

Valid values:
- **NO**
- **YES**

Default: NO

**RESTORE_RECOVER_FROMDUMP** (QWP4RRFD)
This parameter determines for the restore system and the RECOVER
utilities whether the system-level backup that is selected as the recovery
base is used from the disk copy of the system-level backup (NO) or from
the dump on tape (YES).

Valid values:
- **NO**
- **YES**

Default: NO

**UTILS_DUMP_CLASS_NAME** (QWP4RSDC)
This parameter determines the name of the DFSMSHSM dump clas that is
used by the Restore System Utility to restore from a system-level backup
that is dumped to tape.

**Max Tape Units (RESTORE_TAPEUNITS)** (QWP4RSMT)
This parameter determines the maximum number of tape units or tape
Drives that the Restore System Utility can use to restore from a system-level backup that is dumped to tape.

Valid values:
0 (No limit)  
1-255  

(REORG_IGNORE_FREE_SPACE) (QWP4RIFS)  
This parameter specifies whether the Reorg Tablespace Utility should ignore the PCTFREE and FREEPAGE values while reloading data rows into a PBG table space in the following circumstances:
• When a subset of the PBG partitions are reorganized  
• When the table in the PBG table space as LOB columns  
The default is NO (PCTFREE and FREEPAGE values are honored).  

DB2 10 and DB2 11 only.

Alternate Copy Pool (ALTERNATE_CP) (QWP4BSACP)  
Specifies an optional alternate SMS copy pool for the DB2 BACKUP SYSTEM utility.

Valid values:
blank (default)  

1-16 alphanumeric characters  
DB2 BACKUP SYSTEM uses the standard copy pool only.

DB2 12 and later.

DB Backup STG Group (UTIL_DBBSG) (QWP4UDBSG)  
Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the DB copy pool.

Valid values:
blank (default)  

DB2 BACKUP SYSTEM requests that DFSMShsm uses the copy pool backup storage group that is associated with each storage group in the copy pool.

Valid SMS storage group name  
DB2 BACKUP SYSTEM requests that DFSMShsm uses the specified copy pool backup storage group. The specified storage group must be defined with the COPY POOL BACKUP attribute.

DB2 12 and later.

LOG Backup STG Group (UTIL_LGBSG) (QWP4ULBSG)  
Specifies an optional backup SMS storage group to be used by the DB2 BACKUP SYSTEM utility for the LOG copy pool.

Valid values:
blank (default)
DB2 BACKUP SYSTEM requests that DFSMShsm uses the copy pool backup storage group that is associated with each storage group in the copy pool.

Valid SMS storage group name
DB2 BACKUP SYSTEM requests that DFSMShsm uses the specified copy pool backup storage group. The specified storage group must be defined with the COPY POOL BACKUP attribute.

DB2 12 and later.

(UTILS_HSM_MSGDS_HLQ) (QWP4UHMD)
Shows the high level qualifier (HLQ) for data sets (DS) to be allocated by the DB2 BACKUP SYSTEM and RESTORE SYSTEM utilities to receive messages from the Data Facility Hierarchical Storage Manager (DFHSM) and the IBM Data Facility Data Set Services (DFDSS).

Valid values:
• blank (default)
• Valid data set qualifier of 1 to 6 characters

DB2 12 and later.

DSNTIP63 - Utility Parms 4

(REORG_PART_SORT_NPSI) (QWP4RPSN)
This parameter determines the default method of building a non-partitioned secondary index (NPSI) during REORG TABLESPACE PART. This setting is used when the SORTNPSI keyword is not provided in the utility control statement.

The SORTNPSI keyword determines whether REORG TABLESPACE PART is sorting all keys of a NPSI. This setting is ignored for a REORG that is not part-level or a REORG with no NPSIS.

Valid values:
• AUTO If sorting all keys of the NPSI(s) improves the elapsed time and the CPU performance, all keys are sorted.
• NO If sorting all keys of the NPSI(s) improves the elapsed time and the CPU performance, all keys are sorted.
• YES Only the keys of the NPSI(s) that are in the scope of the REORG are sorted.

Default: AUTO

(REORG_LIST_PROCESSING) (QWP4RLPR)
This parameter determines the default setting for the parallel option of the DB2 REORG TABLESPACE utility if the REORG TABLESPACE control statement does not include the parallel keyword. Depending on the value, the type of processing for partitioned table spaces is selected.

The DB2 REORG TABLESPACE utility can process partitions that are specified in the INPUT LISTDEF STATEMENT like this:

Valid values:
• PARALLEL YES All partitions are processed in a single utility execution
PARALLEL NO
Each partition is processed in a separate utility execution

Default:
PARALLEL YES
DB2 11 and later.

(REORG_MAPPING_DATABASE) (QWP4RMDB)
This parameter determines the default database that is used by REORG TABLESPACE SHRLEVEL CHANGE to create the mapping table. When a REORG TABLESPACE SHRLEVEL CHANGE REQUEST is processed, the REORG UTILITY can create its own mapping table and mapping index or it can process user input.

If this parameter is set to a valid database, REORG allocates the mapping table in the specified database.

If this parameter is set to NULL, REORG allocates the mapping table in an implicitly defined database.

(REORG_DROP_PBG_PARTS) (QWP4RPBG)
This parameter determines whether REORG removes trailing empty partitions when operating on an entire partitioned by growth (PBG) table space. An empty trailing partition occurs when REORG moves all data records from a partition into lower numbered partitions.

This parameter is only used if REORG runs against an entire PBG table space. It is ignored by REORGs of non-PBG table spaces and for partition-level REORGs of PBG table spaces.

Valid values:
ENABLE If there is any trailing empty partition after REORG is completed, it is removed.
DISABLE The number of PBG partitions that is present after REORG is completed is equal or greater than the number of partitions that was present before REORG was run. Even if REORG can relocate all data records into the lowest numbered partitions, trailing empty PBG partitions are retained.

Default:
DISABLE
DB2 11 and later.

DSNZPARM Other System Parameters
This panel shows information about the installation parameters that affect DB2 subsystem default settings. These system parameters are not displayed from DB2 installation panels.

If a field is not available for the current DB2 release, the string N/A is displayed. For other conditions, for example, if specific DB2 traces are not started or control block data is not available, the string N/P is displayed.
DSNZPARM INFORMATION: Enter a selection letter on the top line.

Fields

The DSNZ command displays the following lines to reflect the usage of the DB2 SET SYSPARM command. To each of these lines, the corresponding date on which this particular module is assembled is displayed.

DSNZPARM Module
The DSNZPARM module name specified for DB2 startup.

Initial Module
The name of the initial DSNZPARM load module.

Previous Module
The name of the previous DSNZPARM load module.

Assembly Date
The date on which this module was assembled.
From DSN6SYSP

Size of Local Trace Table (TRACLOC)
Determines a multiple of 4K that determines the size of the local trace tables.

Parallel Task AcctRollup
Indicates whether to roll up the accounting trace of the query parallel tasks into the accounting trace of the originating task. Valid values:
- **Yes**: The originating task cuts an additional accounting trace record with all the roll-up values from parallel tasks.
  - This is the default value.
- **No**: Each parallel task produces its own accounting trace.

Measured Usage Pricing
Indicates whether DB2 is tracking for measured usage pricing.
Default value: NO

DB2 OTC License Term (OTC_LICENSE)
Determines whether this DB2 subsystem or data sharing member operates under an OTC license. The terms of the OTC license are accepted. Valid values:
- **Not used**: Indicates that an OTC license is not in effect on this DB2.
  - This is the default value.
- **Terms accepted**: Indicates that an OTC license is in effect on the DB2 and that the owner accepts the terms of that license. To view the terms, see the member DSNTIPO1 of the SDSNSPPFP target library for this version of DB2.

Trackmod Implicit TS
Determines whether DB2 tracks modifications to the pages of implicitly created table spaces.
This setting pertains only to the base table spaces. It is not used for implicitly created LOB or XML table spaces. Valid values:
- **Yes**: Implicit table spaces are created. DB2 tracks changed pages in the space map pages to improve the performance of incremental image copy.
- **No**: DB2 does not track changed pages in the space map pages. To determine whether a page is changed, the LRSN value is used.

Max DSSIZE Implicit TS
Determines the maximum DSSIZE in gigabytes that can be used by DB2 for creating each partition of an implicitly created base table space.

From DSN6LOGP

Offload Option
Determines whether online initiation of the offload process is used. Valid values: YES or NO.
- Default: YES
MSS Volume Group 1 Name
The name of the mass storage system volume group 1. DB2 10 only.

MSS Volume Group 2 Name
The name of the mass storage system volume group 2. DB2 10 only.

From DSN6PRM

Enable Database Check
Determines whether additional internal checking is performed to
determine whether the database manager is producing defective data or
index records. Internal checking increases the cost of a database request,
however, it provides early detection of system errors that might produce
incorrect data. Valid values: YES or NO.
Default: NO.

Utility Cache Option
Determines whether the sequential prestage function of 3990 sequential
caching for utilities is used.
DB2 10 only.

3990-3 Seq Cache
Determines whether sequential mode to read cached data from a 3990
controller is used.
DB2 10 only.

Disable Code Page Protect
Determines whether Code Page Protect is used.

Varchar from Index
Determines whether DB2 can return data from an index key for a varying
length column. DB2 10 only.

Outer Join Perf Enh
Determines whether outer join performance enhancements are used. DB2
10 only.

Minimum RID Lists
The minimum number of RID blocks in the DB2 subsystem.

NPAGES Threshold
The NPAGES threshold for optimizer.

Star Join Threshold
Determines the minimum number of tables in a query block before DB2
considers the query block for star join. Star join must be enabled before
DB2 can use this system parameter. Valid values:

0   Star join is enabled for a query block with 10 or more tables.
    This is the default setting.

1,2,3   Star joins is enabled.

4-225   Star join is enabled if the query block contains a minimum of this
        number of tables.

226-32767   Star join is not enabled.
SMS Data Class for TS
The SMS data class name that is used by DB2 when a cluster for a table space is defined. If this value is blank, a data class name is not used. DB2 10 only.

SMS Data Class for IX
The SMS data class name that is used by DB2 when a cluster for an index is defined. If this value is blank, a data class name is not used. DB2 10 only.

MIN SCALE DECIMAL DIVIDE
The minimum scale for the result of a decimal division.
Valid values: None (default), 3, or 6. If 3 or 6 is specified, this parameter overrides the DECDIV3 parameter.

Max RDS OP Pool (QWP4MXOS)
The maximum amount of RDS op pool storage in MB to be used by the DB2 Optimizer. Valid values: 0 to 100. If 0 is specified, DB2 uses the maximum of 100. Default: 20.

Max CPU Sec OP Use (QWP4MXOC)
The maximum amount of CPU time in seconds to be used by the DB2 Optimizer. Valid values: 0 to 500. If 0 is specified, DB2 uses the maximum of 500. Default: 100.

Disable SQLWARN1,5 (QWP4DSCM)
Do not set SQLWARN1, SQLWARN4 and SQLWARN5 after the scrollable cursor has been successfully opened. DB2 10 only.

Max Entry Seclabel Cache (QWP4SCLC)
Maximum number of entries in the SECLABEL cache. Used to avoid RACROUTE REQUEST=DIRAUTH REQUESTS.

Max Numb in IN-List (QWP4INLP)
The maximum number of elements in an IN-List for an in-list predicate to be optimized. If the IN-List contains this number or fewer elements, it is optimized in the following ways:
- The IN-List predicated is pushed down into a materialized view or table expression
- A correlated IN-List predicate in a subquery that is generated by transitive closure can be moved up to the parent query block.
Valid values: 0 to 5000. 0 means that no optimization occurs. The default is 50.

Recover to Point-in-Time (QWP4RPTC)
Recover to Point-In-Time with consistency.

(UNION_COLNAME_7) (QWP4UNM7)
The SQLNAME field in the SQLDA after a query describe in which the result table is the result of a union, is the name of the column from the first subquery of the union.

Statistics Cluster
Defines whether enhanced clustering is used. DB2 10 only.

(CACHEDYN_FREELOCAL)
Determines whether statements from the dynamic statement cache can be freed by DB2 to relieve storage constraints below the 2GB bar.
This parameter applies only for packages or plans that are bound with KEEPDYNAMIC(YES).

Valid values:

- 0  Statements cannot be freed from the cache.
- 1  Statements can be freed from the cache.

DB2 10 and DB2 11 only.

**MAX_CONCURRENT_PKG_OPS**

The maximum number of package requests that can be processed simultaneously.

**HONOR_KEEPDICTIONARY** (QWP4HKPD)

Valid values: YES, NO.

**INDEX_IO_PARALLELISM**

Determines whether index I/O parallelism is enabled. DB2 10 and DB2 11 only.

**Z/OS Metrics**

Determines whether the gathering of Z/OS metrics through the RMF interface is enabled.

**OPT I/O Weighting**

Determines whether the optimizer I/O weighting is enabled. DB2 10 only.

**Enable Pair-wise Join**

Determines whether pair-wise join is enabled.

**REALSTORAGE_MAX** (QWP4RSMX)

Maximum amount of real plus auxiliary storage that can be used.

**RESTRICT_ALT_COL_FOR_DCC** (QWP4RACD)

Restrict_Alt_Col_For_DCC.

**DISALLOW_DEFAULT_COLLID** (QWP4DDCI)

Disallow default collection ID. DB2 10 only.

**I/O Scheduling feature**

Determines whether the I/O scheduling feature is activated.

**Correlation ID Monitor** (QWP4OZCI)

Online system parameter correlation ID monitor.

**User ID Monitor**

Online system parameter user ID monitor.

If QWP4OZUS_OFF is not 0, this value is truncated. If QWP4OZUS is truncated, this is the offset from the beginning of QWP4 TO QWP4OZUS_LEN.

**Value for Trigger Drain** (QWP4TDDN)

Value for trigger drain.

**Max # of DDS withhold** (QWP4MDDN)

Maximum number of DDS with HOLD.

**Field Procs for TB Block**

The number of field procs for Describe Table Block.

**Max NotFound Hash Records** (QWP4KNFC)

Maximum number of "Not Found" hash records.
Max Extend Service Tasks (QWPPEST)
Maximum extend service tasks.

Max ZIVLEMPEL Dict Entry (QWP4MDE)
Maximum number of ZIVLEMPEL dictionary entries.

ProjectZ Insert Threshold (QWP4ZTN)
Project Z insertion threshold.

Default index type (S) (QWP4DXTP)
Default index type (type 1 or type 2).

(OPT1ROWBLOCKSORT)
Determines for queries that use the option Optimize For 1 Row whether all access paths that require sorting are blocked if there is at least one access path that avoids sorting.

Valid values:

Enable
If the option Optimize For 1 Row is used with a query, the option Sort Access Paths is disabled if a No-Sort choice is available.

Disable
It is unlikely that Sort Access Paths is chosen by DB2. However, a Sort Access Path might win.

(SUBQ_MIDX)
Determines whether Multiple Index Access for queries that have subquery predicates is enabled.

(ACCELMODEL) (QWP4ACMO)
Specifies whether to enable the modeling of query workloads for evaluating the potential savings for both accumulated elapsed time and processor time if the plan is run on an accelerator server.

Only queries that DB2 deems eligible to run on an accelerator server are included in the accelerator-related fields of accounting trace IFCID 3. Valid values are:

NO (default)
Modeling is not done.

YES
Modeling is done. This value applies only when the following requirements are also met:

• The value of the QUERY ACCELRATION subsystem parameter value is NONE, ENABLE, ENABLE WITH FAILBACK or ELIGIBLE
• The CURRENT GET_ACCEL_ARCHIVE special register value is NO.
• The GET_ACCEL_ARCHIVE subsystem parameter value is NO
If other values are specified, DB2 tries to accelerate queries instead of doing accelerator modeling.

(AUTH_COMPATIBILITY) (QWP4AUTCSU)
The AUTH_COMPATIBILITY parameter specifies whether the default authorization check is overridden when users request to use the UNLOAD utility. Valid values:

NO for blank (default)
Indicates that AUTH_COMPATIBILITY has no effect and that there is no authorization check override.
YES for SELECT_FOR_UNLOAD
When this value is specified, the UNLOAD utility checks if the user has the SELECT privilege on the target table. When this value is not specified, the UNLOAD utility checks if the user has the UNLOAD privilege on the target table.

DB2 12 and later.

(CHECK_FASTREPLICATION) (QWP4CFRP)
Specify the type of replication to be used by DSSCOPY when invoked by the DB2 check utilities to copy objects to shadow data sets. The check utilities use DSSCOPY to copy DB2 objects to shadow data sets for processing and can stipulate fast replication as either preferred or required. Valid values are:

REQUIRED (default)
The check utilities force DSSCOPY to use fast replication ensuring that object copies occur as quickly as possible. This reduces the opportunity for resource contention and unavailability. This option causes the check to fail if flash copy cannot be used.

PREFERRED
The check utilities direct DSSCOPY to use fast replication only if flash copy support is available.

NONE

XML_RESTRICT_EMPTY_TAG (QWP4NOET)
Specifies whether DB2 always serializes an empty XML element using a start-element tag followed by an end-element tag.

Valid values are NO and YES. NO is the default.

A value of NO means that DB2 serializes an empty XML element in either of the following ways:
• As a start-element tag followed by an end-element tag. For example
  <emptyElement></emptyElement>
• As an empty-element tag. For example:
  <emptyElement/>

A value of YES means that DB2 always serializes an empty XML element as a start-element tag followed by an end-element tag. For example:
  <emptyElement></emptyElement>

DB2 12 and later.

(PREVENT_NEW_IXCTRL_PART) (QWP4PCIP)
The PREVENT_NEW_IXCTRL_PART subsystem parameter determines whether DB2 disallows the creation of new index-controlled partitioned tables. This subsystem parameter ensures that new partitioned tables use table-controlled partitioning, which is the preferred partitioning method for non-universal tablespaces. Valid values:

NO Specifies that new index-controlled partitioned tables can be created.

YES Specifies that new partitioned table spaces must use table-controlled partitioning. A CREATE INDEX statement must not attempt to create an index-controlled partitioned table.
(SUPPRESS_HINT_SQLCODE_DYN) (QWP4SHDE)
Specifies whether DB2 suppresses SQLCODE +394 and SQLCODE +395 when specified access paths are applied for dynamic SQL statements.

NO (default)
Specifies that DB2 issues SQLCODEs +394 and +395 for statement-level access paths and PLAN_TABLE access paths.

STMT
Specifies that DB2 suppresses SQLCODEs +394 and +395 for statement-level access paths for dynamic SQL statement.

ALL
Specifies that DB2 suppresses SQLCODEs +394 and +395 for statement-level access paths and PLAN_TABLE access paths for dynamic SQL statements.

The SUPPRESS_HINT_SQLCODE_DYN subsystem parameter does not apply to static SQL statements or dynamic EXPLAIN statements.

(LIKE BLANK INSIGNIFICANT) (QWP4LBIN)
Specifies whether blanks are significant when applying the LIKE predicate to a string. If set, the blank insignificant behavior applies. Valid values: YES, NO. The default is NO.

(SIMULATED_CPU_COUNT) (QWP4NCPU)
Specifies the number of CPUs that are being simulated. This parameter is to be used for DB2 optimization modeling only. Valid values are OFF and numbers 1 - 255. The parameter is online changeable.

The default value, OFF, means that DB2 optimizes for the number of CPUs on which it is running. This setting is recommended for production environments.

(SIMULATED_CPU_SPEED) (QWP4CPUM)
Specifies the microseconds of execution time for tasks or service request blocks (SRBs) per service unit for the CPU that is being simulated. This parameter is used only for DB2 optimization modeling. Valid values:

OFF
DB2 optimizes for the CPU on which it is running. Use this setting in production environments.

1 - 2,147,483,647
Microseconds of execution time for tasks or service request blocks (SRBs) per service unit for the CPU that is being simulated. For values 1 - 27, DB2 uses a value of 27.

(MATERIALIZE_NODET_SQLTIDF) (QWP4MNSU)
Specifies whether the DB2 database manager materializes the result of a user-defined SQL table function that is defined as NOT DETERMINISTIC. Valid values are:

NO (default)
The DB2 database manager does not materialize the result of a user-defined SQL table function that is defined as NOT DETERMINISTIC.

YES
The DB2 database manager materializes the result of a user-defined SQL table function that is defined as NOT DETERMINISTIC. Use this setting to avoid errors in processing SQL statements that reference those user-defined SQL table functions

DB2 12 and later.
Enable SQL Interrupt

Determines whether SQL Interrupt processing is enabled.

Typically, this parameter is not modified unless remote client systems experience SQL interrupt-oriented failures and a disablement of the DB2 SQL Interrupt support is required until the remote client systems can be modified to tolerate this behaviour.

Default: Enable.

(PRIVATE_PROTOCOL)

Determines the DB2 behaviour that is relative to legacy private protocol usage.

NO

Does not allow private protocol-related behaviour.

Indicates that plan owner-based package execution authorization semantics that might affect DB2 for z/OS DRDA requester systems that might rely on it are not honored.

Secondary IDs are utilized to determine package execution privileges that are relative to remote DB2 for z/OS applications.

This is the default value.

AUTH

Allows private protocol-related plan owner-based package authorization behaviour.

Indicates that plan owner-based package execution authorization semantics are honored for the benefit of DB2 for z/OS DRDA requester systems that might rely on it.

Secondary IDs are not utilized to determine package execution privileges that are relative to remote DB2 for z/OS applications.

(DDF_COMPATIBILITY) (QWP9DDFCIP)

Determines whether DDF behavior for compatibility with previous releases is enabled.

Valid options are:

IDNTFY_V10_PRIOR_VER (DB2 10 only) IDNTFY_V11_PRIOR_VER (DB2 11 only)

Return information to ALL remote clients to reflect new-function support and product signature of previous version from where DB2 was migrated. DB2 identifies itself as the previous version. Does not apply in NFM. Applies only in CMn/ENFM and CMn*/ENFM*.

IDNTFY_V12_PRIOR_VER (DB2 12 only)

Specifies a DB2 12 server for which the new function has not been activated to identify itself to all remote clients as a DB2 11 server in new-function mode.

null

The DDF_COMPATIBILITY parameter has no effect and DB2 12 new function behavior is used for all applications.

DISABLE_IMPCAST_JV

Specifies that the DB2 for z/OS server disables implicit casting of input host variables from numeric data types to string data types, or from string data types to numeric data types, when the
application is a Java client application that uses the IBM Data
Server Driver for JDBC and SQLJ. If DISABLE_IMPCAST_JV is not
specified, DB2 enables implicit casting of input host variables from
numeric data types to string data types, or from string data types
to numeric data types.

**IGNORE_TZ**
Specifies that the time zone information is ignored during
boundary error checking for TIMESTAMP WITH TIME ZONE
input variables when the target data type is TIMESTAMP and the
client driver is IBM Data Server Driver for JDBC and SQLJ.
IGNORE_TZ is deprecated. In DB2 11, IGNORE_TZ is effective
only if application compatibility is set to V10R1. DB2 V12 and later.

**SP_PARMS_NJV**
Specifies that when a non-Java client application calls a DB2 for
z/OS stored procedure, DB2 returns output argument values with
data types that match the data types of the corresponding CALL
statement arguments, unless either of the following conditions are
true:

- The non-Java client is Version 10 or later.
- The stored procedure uses a parameter data type that was
  introduced in DB2 10 (XML, TIMESTAMP WITH TIMEZONE, or
  TIMESTAMP with precision greater than 6).

If either condition is true, DB2 returns output parameter values
with data types that match the data types of the parameters in the
stored procedure definition.

If SP_PARMS_NJV is not specified, DB2 returns output parameter
values with data types that match the data types of the parameters
in the stored procedure definition.

SP_PARMS_NJV is deprecated. DB2 ignores this value if
application compatibility is set to V11R1 or later.

From DSNHDECP

**DB2 Supplied DECP Indic (DB2SUPLD) (QWPBDB2S)**
DB2-supplied DECP indication.

**Charset Default (CHARSET) (QWPBCHAR)**
Character set default. DB2 10 only.

**Others**

**Space Above DB2 Leave Available**
The amount of space that is kept available by DB2 for critical tasks.

**Space Reserved for Critical Work**
The amount of space that is reserved for critical work that must be
completed.

**Space Reserved for z/OS Functions**
The amount of space that is reserved for z/OS functions.

**Extended Datestamp Indicator**
Determines whether the time stamp archive log data sets with the date in
the format YYYYDDDD are used.
New Function Mode
Determines whether subsystem is in the New Function mode.

Lock Manager Information
This panel shows information about current locking activity and claims and drains.

**Navigation**

For additional information about

- global lock information, select option **B-GLOBAL LOCK STATISTICS** at the top of the panel.
- Near-term history activity, select option **H-HISTORICAL** at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Collection Interval**

This field displays REALTIME to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start**
The start time of the report interval currently displayed.

**Report Interval**
The time in the last cycle (for example, between two presses of the Enter key).

**End**
The end time of the report interval currently displayed.
For each of the following fields, the following statistics values are provided:

**TOTAL QUANTITY**
Total quantity, which reflects the amount of activities since DB2 was started.

**INTERVAL QUANTITY**
Interval quantity, which reflects the amount of activities during the last cycle.

**/SECOND**
Rate per second during the last cycle. The number under /SECOND (in parentheses) is the number of seconds in the interval.

**/THREAD**
Rate per thread during the last cycle. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

**/COMMIT**
Rate per Commit during the last cycle. The number under /COMMIT (in parentheses) is the number of commit requests (including abort requests) during the interval.

**Lock manager information:**

Deadlocks detected
The number of deadlocks detected.

Timeouts detected
Occasions when suspension of a unit of work lasted longer than the Internal Resource Lock Manager (IRLM) timeout value.

Susp detected - lock only
Suspensions of a unit of work because a lock could not be obtained.

Susp detected - latch only
Db2 internal latch suspensions.

Susp detected - other
Suspensions caused by something other than locks and latches.

Lock escalations - to shared
Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IS) lock to escalate to a shared (S) lock.

Lock escalations - to exclusive
Occasions when the allowable number of locks per tablespace was exceeded, causing a page (ix) lock to escalate to an exclusive (x) lock.

Lock requests
Requests to IRLM to obtain a lock on a resource.

Unlock requests
Requests to IRLM to unlock a resource.

Query requests
Requests to IRLM to query a lock.

Change requests
Requests to IRLM to change a lock.

Other irlm requests
Requests to IRLM to perform a function other than those listed before.
Claim/drain information:

Claim requests
Number of claim requests.

Unsuccessful claim requests
Number of unsuccessful claim requests.

Drain requests
Number of drain requests.

Unsuccessful drain requests
Number of unsuccessful drain requests.

Global Lock Statistics
This panel shows information about current global locking activity in a data sharing environment.

Navigation
For additional information about:

- Lock information, select option A-LOCK STATISTICS at the top of the top of the panel.
• Near-term history activity, select option **H-HISTORICAL** at the top of the panel.
• Other topics, use the PF keys.

**Fields**

**Collection Interval**
This field displays **REALTIME** to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start**
The start time of the interval currently displayed.

**Report Interval**
This field determines the report interval. It is set on the Near-Term History Report Option panel.

**End**
The end time of the interval currently displayed.

**Total Global Contention**
The percent of synchronous XES lock, change, or unlock requests that resulted in global contention.

**False Contention Percentage**
The rate of false contentions to real contentions. This number should be no more than 50%.

**P-Lock/Notify Engines**
The number of engines available for P-lock exit or notify exit requests.

For each of the following fields, the following statistics values are provided:

**TOTAL QUANTITY**
Total quantity, which reflects the amount of activities since DB2 was started.

**INTERVAL QUANTITY**
Interval quantity, which reflects the amount of activities during the last cycle.

**/SECOND**
Rate per second during the last cycle. The number under **/SECOND** (in parentheses) is the number of seconds in the interval.

**/THREAD**
Rate per thread during the last cycle. The number under **/THREAD** (in parentheses) is the number of Create Threads during the interval.

**/COMMIT**
Rate per Commit during the last cycle. The number under **/COMMIT** (in parentheses) is the number of commit requests (including abort requests) during the interval.

**P-lock Lock Requests**
Number of lock requests for P-locks.

**P-lock Change Requests**
Number of change requests for P-locks.

**P-lock Unlock Requests**
Number of unlock requests for P-locks.

**XES Lock Requests**
The number of lock requests (both logical and physical) that are propagated to MVS XES synchronously under the caller’s execution unit.
This count does not include suspended requests. Only the most restrictive lock for a particular resource is propagated to XES and the coupling facility.

**XES Change Requests**
The number of change requests (both logical and physical) that are propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests.

**XES Unlock Requests**
The number of unlock requests (both logical and physical) that are propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests.

**XES Asynchronous Requests**
The number of L-locks and P-locks propagated to XES asynchronously. This occurs when a new inter-DB2 interest occurs on a parent resource or when a request completes after the requestor's execution unit has been suspended.

**Suspends-IRLM Global Contention**
The number of suspends due to Internal Resource Lock Manager (IRLM) global resource contentions. IRLM lock states were in conflict and inter-system communication is required to resolve the conflict.

**Suspends-XES Global Contention**
The number of suspends due to MVS XES global resource contentions that were not IRLM-level contentions. The XES lock states were in conflict, but the IRLM lock states were not.

**Suspends-False Contention**
The number of suspends caused by MVS XES false contentions. XES detects hash class contention when two different locks on different resources hash to the same entry in the coupling facility lock table. The requester is suspended until it is determined that no real lock contention exists.

**Negotiate Pageset P-Locks**
The number of times this DB2 member was driven to negotiate a pageset/partition P-lock because of changing inter-DB2 interest levels on the pageset/partition.

**Negotiate Page P-Locks**
The number of times this DB2 member was driven to negotiate a page P-lock because of inter-DB2 P-lock contention.

**Negotiate Other P-Locks**
The number of times this DB2 member was driven to negotiate a P-lock type other than pageset/partition or page.

**Negotiate P-Lock Change**
The number of times a P-lock change request was issued during P-lock negotiation.

**Incompatible Retained Locks**
The number of global lock or change requests that failed because of an incompatible retained lock. Certain P-locks can be retained because of a system failure. Another DB2 member cannot access the data that the retained P-lock is protecting unless it requests a P-lock in a compatible state.
**Notify Messages Sent**

The number of notify messages sent.

**Notify Messages Received**

The number of notify messages received.

**Engine Not Available**

The number of times an engine was not available for a P-lock exit or a notify exit request.

**Very Conditional Rejections**

The number of rejections of very conditional requests which could not get processed because of the heuristic algorithm used by XES.

**SQL/RID Pool/Parallelism/Stored Procedure Information**

This panel shows information about the current SQL, RID pool, Parallelism, and Stored Procedure activities.

**Navigation**

For additional information about

- Near-term history activity, select option **H-HISTORICAL** at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Collection Interval**

This field displays REALTIME to indicate that you are looking at the real-time version of this panel and not at the corresponding near-term history panel.

The collection interval and the report interval are the same in this panel.

**Start** The start time of the report interval currently displayed.

**Report Interval**

The time in the last cycle (for example, between two presses of the Enter key).

**End** The end time of the report interval currently displayed.

**Maximum Degree of Parallelism Executed**

The maximum degree of parallel I/O processing for all parallel groups. This is a high-water mark.

For each field described below the following statistics are provided:

- The amount of activities that occur during the interval.
- Rate per minute during the last cycle. The number under /MINUTE is the number of minutes in the interval.
• Rate per thread during the last cycle. The number under /THREAD is the number of Create Threads during the interval.
• Rate per Commit during the last cycle. The number under /COMMIT is the number of commit requests (including abort requests) during the interval.
• Percentage of DML, DCL, or DDL during the last cycle.

SQL Manipulative (DML):

SELECT
SELECT statements executed to retrieve rows from a DB2 table.

INSERT
INSERT statements executed to add rows to a DB2 table.

UPDATE
UPDATE statements executed to alter existing rows in a DB2 table.

MERGE
The number of times a MERGE statement is executed.

DELETE
DELETE statements executed to remove rows from a DB2 table.

DESCRIBE
DESCRIBE statements executed to obtain information about prepared SQL statements.

DESCRIBE TABLE
DESCRIBE TABLE statements executed to obtain information about a table or view.

PREPARE
Occasions when SQL statements were dynamically prepared for execution.

OPEN CURSOR
OPEN statements executed to prepare cursors for subsequent Fetch operations.

FETCH
FETCH statements executed to retrieve rows from DB2 tables.

CLOSE CURSOR
CLOSE statements executed to close previously opened cursors.

REFRESH TABLE
Number of refresh table statements. DB2 12 and later. (Field name: QXTREFTBL)

Total DML
All data manipulative language statements.

SQL Control (DCL):

CALL
CALL statements executed to invoke a stored procedure.

CONNECT (Type 1)
CONNECT (Type 1) statements executed to connect an application process to a designated server.

CONNECT (Type 2)
CONNECT (Type 2) statements executed to connect an application process to a designated server.
GRANT
GRANT statements issued to extend DB2 privileges to users.

LOCK TABLE
LOCK TABLE statements issued to lock a tablespace or table in a segmented tablespace.

RELEASE
RELEASE statements executed to place one or more connections in the released state.

REVOKE
REVOKE statements issued to revoke users’ DB2 privileges.

SET CONNECTION
SET CONNECTION statements executed to establish the application server of the process.

SET CURRENT DEGREE
SET CURRENT DEGREE statements executed to assign a value to the CURRENT DEGREE special register.

SET CURRENT RULES
SET CURRENT RULE statements executed to assign a value to the current rules special register.

SET CURRENT SQLID
SET CURRENT SQLID statements issued to change your current authorization ID.

SET HOST VARIABLE
SET host-variable statements issued.

SET CURRENT PATH
SET CURRENT PATH statements issued to assign a value to the CURRENT PATH special register.

SET CURRENT PRECISION
The number of Set Current Precision statements.

ASSOCIATE LOCATOR
The number of ASSOCIATE LOCATOR statements issued.

ALLOCATE CURSOR
The number of ALLOCATE CURSOR statements issued.

HOLD LOCATOR
The number of Hold Locator statements.

FREE LOCATOR
The number of Free Locator statements.

TRANSFER OWNERSHIP
Number of transfer ownership statements. DB2 12 and later. (Field name: QXTRNOWN)

Total DCL
All data control language statements.

SQL Definitional (DDL):
CREATE TABLE
CREATE TABLE statements issued to define a DB2 table.
CREATE GBL TEMP TABLE
   The number of Create Global Temporary Table statements issued to create a description of a temporary table at the current server.

DCL GBL TEMP TABLE TH
   The number of SQL Declare Global Temporary Table statements.

CREATE AUX TABLE
   The number of Create Auxiliary Table statements.

CREATE INDEX
   CREATE INDEX statements issued to establish indexes on DB2 tables.

CREATE TABLESPACE
   CREATE TABLESPACE statements issued to establish DB2 tablespaces.

CREATE DATABASE
   CREATE DATABASE statements issued to establish DB2 databases.

CREATE STOGROUP
   CREATE STOGROUP statements issued to establish DB2 storage groups.

CREATE SYNONYM
   CREATE SYNONYM statements issued to create alternate names for DB2 tables and views.

CREATE VIEW
   CREATE VIEW statements issued to establish views of DB2 tables.

CREATE ALIAS
   CREATE ALIAS statements issued to achieve "location transparency" of DB2 tables. This field is used primarily to refer to tables and views from remote DB2 subsystems in a distributed environment.

CREATE TRIGGER
   CREATE TRIGGER statements issued to define a trigger in a schema and build a trigger package at the current server.

CREATE DISTINCT TYPE
   CREATE DISTINCT TYPE statements issued to define a distinct type, which is a data type that a user defines. A distinct type must be sourced on one of the built-in data types.

CREATE FUNCTION
   CREATE FUNCTION statements issued to register a user-defined function with an application server. You can register the following types of functions with this statement: external scalar, external table, and sourced.

CREATE PROCEDURE
   CREATE PROCEDURE statements issued to define a stored procedure.

CREATE SEQUENCE
   The number of Create Sequence statements.

CREATE ROLE
   The number of Create Role statements.

CREATE TRUSTED CTX
   The number of Create Trusted CTX statements.

CREATE MASK/PERM
   The number of Create Mask or Create Permission statements.

CREATE VARIABLE
   The number of Create Variable statements. DB2 11 and later.
DROP TABLE
   DROP TABLE statements issued to remove tables from DB2 databases.

DROP INDEX
   DROP INDEX statements issued to remove indexes from DB2 tables.

DROP TABLESPACE
   DROP TABLESPACE statements issued to delete tablespaces.

DROP DATABASE
   DROP DATABASE statements issued to delete databases.

DROP STOGROUP
   DROP STOGROUP statements issued to delete storage group definitions.

DROP SYNONYM
   DROP SYNONYM statements issued to delete alternative table names and
   view names.

DROP VIEW
   DROP VIEW statements issued to delete table views.

DROP ALIAS
   DROP ALIAS statements issued to delete view and table aliases from the
   DB2 catalog.

DROP PACKAGE
   DROP PACKAGE statements issued to delete packages.

DROP TRIGGER
   DROP TRIGGER statements issued to delete triggers.

DROP FUNCTION
   DROP FUNCTION statements issued to delete user-defined functions.

DROP DISTINCT TYPE
   DROP DISTINCT TYPE statements issued to delete user-defined data
   types.

DROP PROCEDURE
   DROP PROCEDURE statements issued to delete stored procedures.

DROP SEQUENCE
   The number of Drop Sequence statements.

DROP TRUSTED CTX
   The number of Drop Trusted CTX statements.

DROP ROLE
   The number of Drop Role statements.

DROP MASK/PERM
   The number of Drop Mask or Drop Permission statements.

DROP VARIABLE
   The number of Drop Variable statements. DB2 11 and later.

ALTER TABLE
   ALTER TABLE statements issued to change table attributes.

ALTER INDEX
   ALTER INDEX statements issued to change index attributes.

ALTER TABLESPACE
   Alter Tablespace statements issued to change tablespace attributes.
ALTER STOGROUP
ALTER STOGROUP statements issued to add devices to and delete devices from storage groups.

ALTER VIEW
Number of Alter View statements.

ALTER DATABASE
ALTER DATABASE statements issued to change database attributes.

ALTER FUNCTION
ALTER FUNCTION statements issued to change the description of an external scalar or external table function at the current server.

ALTER PROCEDURE
ALTER PROCEDURE statements issued to change the description of a stored procedure at the current server.

ALTER SEQUENCE
The number of Alter Sequence statements.

ALTER TRUSTED CTX
The number of Alter Trusted CTX statements.

ALTER JAR
The number of Alter Jar statements.

ALTER MASK/PERM
The number of Alter Mask or Alter Permission statements.

RENAME TABLE
RENAME TABLE statements issued to rename an existing table.

RENAME INDEX
The number of Rename Index statements.

TRUNCATED TABLE
The number of Truncated Table statements issued to rename an existing table.

COMMENT ON
COMMENT ON statements issued to add or replace comments for user-defined objects (tables, views, columns, and sets of columns) in the DB2 catalog.

LABEL ON
LABEL ON statements issued to add or replace labels in DB2 catalog descriptions of tables, views, columns, and sets of columns.

Total DDL
All Data Definition Language statements.

RID List Processing: For each field described below the following statistics are provided:
- The amount of activities that occur during the interval.
- Rate per minute.
- Rate per thread.
- Rate per Commit.

For high water mark fields, N/A is displayed for rate fields. For interval quantity fields, the high water mark value is displayed at the end of the interval.
Successful
Number of times RID list processing was used when accessing a DB2 table. This field is incremented once for a given table access for Index Access with list prefetch and for Multiple Index Access.

Not Used (No Storage)
Number of times RID list processing was terminated because of insufficient storage to hold the list of RIDs.

Not Used (Max Limit)
Number of times RID list processing was terminated because the number of RIDs would exceed a RID limit or threshold.

To WF (No Storage)
The number of times a RID list overflows to a work file because RIDPOOL storage is not available to hold the list of RIDs.

To WF (Max Limit)
The number of times a RID list overflows to a work file because the number of RIDs exceeds internal limits.

Interrupted (No Stor)
The number of times a RID list append for a Hybrid Join is interrupted because RIDPOOL storage is not available to hold the list of RIDs. This is the number of times DB2 interrupted the RID phase and switched to the Data phase.

Interrupted (Max Lmt)
The number of times a RID list append for a Hybrid Join is interrupted because the number of RIDs exceeds internal limits. This is the number of times DB2 interrupted the RID phase and switched to the Data phase.

Skipped (Adaptive IX)
The number of times a DM is not called for RID list retrieval for multiple index access or LPF because it was not necessary due to Runtime Adaptive Index processing being able to predetermine the outcome. DB2 12 and later. (Field name: QXRSDMAD)

Skipped (Index Known)
The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

Term (No Storage)
The number of times RID list processing exhausted virtual storage.

Term (> RDS Limit)
The number of times RID list processing terminated because the number of RID entries was greater than the RDS limit. The RDS limit is the maximum (25% of table size, number of RIDs that can fit into the guaranteed number of RID blocks).

Term (> DM Limit)
The number of times RID list processing terminated because the number of RID entries was greater than the DM limit. The DM limit is approximately 26 million RIDs.

Term (> PROC Limit)
The number of times the maximum RID pool storage was exceeded. The default maximum RID pool size is the minimum (install value pool size, 10GB).
HWM RID Blks Inuse
The number of RID blocks currently in use.

Curr RID Blks Inuse
The highest number of RID blocks in use at any one time since DB2 startup time.

HWM RID Blks in WF
The highest number of RID blocks overflowed (stored) to a work file at any time since DB2 startup.

Curr RID Blks in WF
The number of RID blocks currently residing in work file storage.

Query Parallelism: For each field described below the following statistics are provided:
• Total quantity, which reflects the amount of activities since DB2 was started.
• Interval quantity, which reflect activity during the last cycle.
• Rate per minute during the last cycle.
• Rate per thread during the last cycle.
• Rate per Commit during the last cycle.

HWM degree Parallelism
Maximum degree of parallelism among the parallel groups to indicate the extent to which query parallelism applies.

Max Degree (Planned)
The planned maximum degree of parallelism for a parallel group. This value is the optimal degree of parallelism that can be obtained at execution time after host variables or parameter markers are resolved and before buffer pool negotiation and system negotiation are performed. DB2 11 and later.

Max Degree (Estimated)
The estimated maximum degree of parallelism for a parallel group. This value is estimated at bind time, based on the cost formula. If a parallel group contains a host variable or parameter marker, the estimate is based on assumed values. DB2 11 and later.

Max Degree (Executed)
Total number of parallel groups executed.

Ran Planned
Total number of parallel groups that have a planned degree greater than one at run time and were executed to the same degree because of sufficient storage on the buffer pool.

Ran Reduced (Storage)
Total number of parallel groups that have a planned degree greater than one at run time but were processed to a parallel degree less than planned because of a storage shortage or contention on the buffer pool.

Ran Reduced (Negotia)
Number of parallel group degree to be reduced due to system negotiation result of system stress level. DB2 11 and later.

Ran Seq (Cursor)
Total number of parallel groups which fell back to sequential mode because the cursor might be used in UPDATE/DELETE.
Ran Seq (No Buffer)
Total number of parallel groups that have a planned degree greater than one at run time, but fell back to sequential mode because of storage shortage or contention on the buffer pool.

Ran Seq (No ESA Sort)
Total number of parallel groups which fell back to sequential mode due to lack of ESA sort support.

Ran Seq (No ESA Enc)
Total number of parallel groups executed in sequential mode due to the unavailable enclave. This applies only to DB2 9.

Ran Seq (Autonomous)
Total number of parallel groups which fell back to sequential mode due to executing under an autonomous procedure. This applies only to DB2 11 or higher.

Ran Seq (Negotiate)
Number of parallel groups that is degenerated to sequential mode due to system negotiation result of system stress level.
This applies only to DB2 11 or higher.

One DB2 (Coord=No)
Total number of parallel groups that are executed on a single DB2 because the COORDINATOR subsystem parameter is set to NO. When the statement is bound, the COORDINATOR subsystem parameter is set to YES. This situation might also occur when a plan or package is bound on a DB2 where the COORDINATOR subsystem parameter is set to YES, but is run on a DB2 where the subsystem parameter COORDINATOR is set to NO.

One DB2 (Isolation)
Total number of parallel groups that are executed on a single DB2 because of repeatable-read or read-stability isolation.

One DB2 (DCL GTT)
Total number of parallel groups that are part of a query block. The query block is using an UDF. It is executed on a single DB2 because a Declared Temporary Table exists in the application process. Neither the query block nor the parallel group is referencing a Declared Temporary Table. A parallel group might use or might not use an UDF.

Groups Intended
Total number of parallel groups that are intended to run across the data sharing group. This count is only incremented on the parallelism coordinator at run time.

Groups Skipped
The number of times that the parallelism coordinator must bypass a DB2 when distributing tasks because there is not enough buffer pool storage on one or more DB2 members.

This field is incremented only on the parallelism coordinator. It is only incremented once per parallel group even though it is possible that more than one DB2 systems have a buffer pool shortage for that parallel group. The purpose of this count is to indicate when there are not enough buffers on a member. Therefore, this count is incremented only when the buffer
pool is defined to allow parallelism. For example, if VXPSET is set to 0 on an assistant, DB2 does not send parallel work to the assistant, but this count is not incremented.

**Reform (Config)**
Total number of parallel groups for which DB2 reformulated the parallel portion of the access path because the sysplex configuration is different from the sysplex configuration at bind time. This counter is only incremented by the parallelism coordinator at run time.

**Reform (No Buffer)**
Total number of parallel groups for which DB2 reformulated the parallel portion of the access path because there was not enough buffer pool resource. This counter is only incremented by the parallelism coordinator at run time.

**Miscellaneous**

**Incremental Bind**
Occurrences of incremental bind, which take place upon execution of a DB2 plan that is bound as VALIDATE(RUN).

**Max SQL Levels**
The maximum level of nested SQL cascading. This includes cascading because of triggers, UDFs, and stored procedures.

**Max LOB Storage (MB)**
Maximum storage that is used for LOB values.

**Max XML Storage**
Maximum storage that is used for XML values.

**Array Expansions**
The number of times an array variable is expanded beyond 32K.
This applies to DB2 11 or higher.

**Sparse IX (Disabled)**
The number of times that sparse index is disabled because of insufficient storage.
This applies to DB2 11 or higher.

**Sparse IX (Built WF)**
The number of times that sparse index built a physical work file for probing.
This applies to DB2 11 or higher.

**Fetched 1 Block Only (QXR1BOARD)**
The number of times 1 block is fetched and there were no further fetches. DB2 12 and later.

**Pipes Allocated (QISTINPA)**
The number of data manager fast insert pipes that were allocated since DB2 restart. DB2 12 and later.

**Pipes Disabled (QISTINPD)**
The number of data manager fast insert pipes that were disabled since DB2 restart. DB2 12 and later.

**Stored procedures**: For each field described below the following statistics are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects activity during the last cycle.
- Rate per minute during the last cycle.
- Rate per thread during the last cycle.
- Rate per Commit during the last cycle.

**Abended**

CALL statements executed to invoke a stored procedure that terminated abnormally.

**Timed Out**

CALL statements executed to invoke a stored procedure that timed out while waiting to be scheduled.

**Rejected**

CALL statements executed to invoke a stored procedure that was in the STOP ACTION(REJECT) state.

**User Defined Functions:** For each field described below the following statistics are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects activity during the last cycle.
- Rate per minute during the last cycle.
- Rate per thread during the last cycle.
- Rate per Commit during the last cycle.

**Executed**

The number of user-defined functions (UDFs) executed.

**Abended**

The number of times a UDF abended.

**Timed Out**

The number of times a UDF timed out when waiting to be scheduled.

**Rejected**

The number of times a UDF was rejected.

**Triggers:** For each field described below the following statistics are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects activity during the last cycle.
- Rate per minute during the last cycle.
- Rate per thread during the last cycle.
- Rate per Commit during the last cycle.

**Stmt Triggers Executed**

The number of times a statement trigger was activated.

**Row Triggers Activated**

The number of times a row trigger was activated.

**SQL Error in Trigger**

The number of times an SQL error occurred during execution of a triggered action.

**Dynamic SQL**
Prepares (Copy Found)
The number of times a PREPARE request is satisfied by making a copy from the prepared statement cache.

Prepares (Catalog Found)
The number of times a PREPARE request is satisfied by making a copy from the stabilized statement in SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement is found in the prepared statement cache. DB2 12 and later. (Field name: QXSTSFND)

Prepares (Copy NFound)
The number of times a PREPARE request is received but a matching statement is not found in the prepared statement cache. Cache search is only done for DML SQL and only if cache option is active.

Prepares (Restrict IX)
The number of PREPARE requests for which the use of index/indexes are restricted because the index is in a pending state.

KeepDyn (Implicit)
The number of times the following actions occurred:
- An implicit PREPARE is performed because the KEEPDYNAMIC(YES) option is used
- An OPEN, EXECUTE, or DESCRIBE of a dynamic statement occurred after a COMMIT, however, DB2 no longer had a valid copy of the executable version of the prepared statement.

KeepDyn (Avoided)
The number of times that a PREPARE is avoided because KEEPDYNAMIC(YES) is used together with prepared statement caching, and DB2 still had the copy of the executable version of the prepared statement.

KeepDyn (Exceed Limit)
The number of times that an executable copy of a prepared statement is discarded because the MAXKEEPD system limit is exceeded.

KeepDyn (Invalidated)
The number of times that a prepared statement is purged from the cache because a DROP, ALTER, or REVOKE statement is issued on a dependent object.

Literals (Parsed)
The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior is in effect for the prepare of the statement for the dynamic statement cache.

Literals (Replaced)
The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS is in effect for the prepare of the statement for dynamic statement cache.

Literals (Matched)
The number of times DB2 found a matching reusable copy of a dynamic statement in statement cache during preparation of a statement that had literals replaced because of CONCENTRATE.

Literals (Duplicated)
The number of times DB2 created a duplicate statement instance in the statement cache for a dynamic statement that had literals replaced by
CONCENTRATE STATEMENTS WITH LITERALS behavior and the duplicate statement instance was needed because a cache match failed because of literal reusability criteria.

Row ID
Successful
The number of times that direct row access was successful.

Revert to Index
The number of times an attempt to use direct row access reverted to using an index to locate a record.

Revert to TS Scan
The number of times an attempt to use direct row access reverted to using a table space scan to locate a record.

Rows Processing
Rows Fetched
The number of fetched rows.

Rows Inserted
The number of inserted rows.

Rows Updated
The number of updated rows.

Rows Deleted
The number of deleted rows.

Currently Committed
Insert Rows Skipped
The number of rows that are skipped by read transactions because uncommitted inserts are performed when current committed read is in effect for fetch operations.

Delete Rows Accessed
The number of rows that are skipped by read transactions because uncommitted deletes are performed when current committed read is in effect for fetch operations.

Update Rows Accessed
The number of rows that are accessed by read transactions while uncommitted updates existed because currently committed read behavior is in effect for fetch operation.

Workfile Database (WFDB)
Curr WFDB For TS (KB)
Current total storage (KB) that is configured for all table spaces in the WFDB.

This applies to DB2 11 or higher.

DGTT WF configured (KB)
Total preferred STORAGE (KB) that is configured for DGTTs in the WFDB.

This applies to DB2 11 or higher.
WF Stor Configed (KB)
Total preferred STORAGE (KB) that is configured for work files in the WFDB.
This applies to DB2 11 or higher.

System WKDB threshold
The value in percent (%) for the threshold of the system-level WFDB space usage alert.
Valid values: 0 - 100
This applies to DB2 11 or higher.

Max Total Storage
The maximum total storage (KBs) that is used in the WFDB at system level for DGTTs and work files since DB2 is started. After restart, this value starts again with 0.

HWM DGTT WF Stor (KB)
The highest total storage (KB) that is used for DGTTs by all agents on the system since DB2 is started.
This applies to DB2 11 or higher.

HWM WF Storage (KB)
The highest total storage (KB) that is used for work files by all agents on the system since DB2 is started.
This applies to DB2 11 or higher.

Curr DGTT WF Stor (KB)
Current total storage (KB) that is used for DGTTs by all agents on the system since DB2 is started.
This applies to DB2 11 or higher.

Curr WF Storage (KB)
The current total storage (KB) that is used for work files by all agents on the system since DB2 started.
This applies to DB2 11 or higher.

Storage in 4K TS
Current 4KB table space storage that is used (KB).

Storage in 32K TS
Current 32KB table space storage that is used (KB).

32K used instead of 4K
The number of times a 32KB page TS is used when a 4KB page TS is to be preferred but not available.

4K used instead of 32K
The number of times a 4KB page TS is used when a 32KB page TS is to be preferred but not available.

HWM DM WF Count
High watermark count (maximum number) of SORT-related DM in-memory work files that are active at any point in time since DB2 is started.
HWM NSort WF Count
High watermark count (maximum number) of non-SORT-related DM in-memory work files that are active at any point in time since DB2 is started.

This applies to DB2 11 or higher.

Curr DM WF Count
The number of times SORT-related DM in-memory work files are currently active.

Curr NSort WF Count
The number of times non-SORT related DM in-memory work files are currently active.

This applies to DB2 11 or higher.

HWM DM WF size (KB)
High watermark count of maximum space in KB that is used for the active DM In-Memory work files at any point in time since DB2 is started.

Curr DM WF size (KB)
Total space in KB that is used for the currently active DM In-Memory work files.

HWM Sort WF Count
High watermark count (maximum number) of Sort-Inmem work files that are active at any point in time since DB2 is started.

Curr Sort WF Count
The number of times Sort-Inmem work files are currently active.

HWM Sort WF size (KB)
High watermark count of maximum space that is used for the active Sort-Inmem work files at any point in time since DB2 is started.

Curr Sort WF size (KB)
Total Space that is used for the currently active Sort-Inmem work files.

WF Overflow to TS
The number of times the type-2 in-memory work files overflow into a physical tablespace since DB2 is started.

This applies to DB2 11 or higher.

WF Not Created(NoStor)
The number of times a work file is not created as any type of DM in-memory work file because of critical storage conditions since DB2 is started.

This applies to DB2 11 or higher.

Agent Max Storage
The limit of the maximum storage per agent (KB).

Number of Max Exceeded
The number of times the maximum storage limit is exceeded.

Agent WFDB threshold
The value for the threshold of the agent-level WFDB space usage alert.

Valid values: 0 - 100.

This applies to DB2 11 or higher.
HWM WFDB by Thread(KB)

The highest amount of WFDB storage (KB) that is used by any thread on the system since DB2 is started.

This applies to DB2 11 or higher.

Open/Close Statistics

This panel shows information about open and close data set activity and information about Deferred Close activity.

Open/Close Statistics

Collection Interval

+ Collection Interval: REALTIME
+ Report Interval: 4 sec

Maximum Number of Open Datasets (DSMAX) = 20000
+ Checkpoints to Pseudo-Close (PCLOSEN) = 5
+ Elapsed Time to Pseudo-Close (PCLOSET) = 10
+ Current Number Open Datasets = 154
+ High Water Mark Open Datasets = 154
+ High Water Mark Not-in-use Datasets = 150
+ Current Number Not-in-use Datasets = 150

Not-in-use Datasets Requested | 58047 | 7 | 1.75 | 7.00 | 1.17
Not-in-use Datasets Closed | 0 | 0 | .00 | .00 | .00
Datasets Converted to Read-Only | 94 | 0 | .00 | .00 | .00

Navigation

For additional information about
- Near-term history activity, select option H-HISTORICAL at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval

This field displays REALTIME to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

Start

The start time of the report interval currently displayed.

Report Interval

The time in the last cycle (for example, between two presses of the Enter key).

End

The end time of the report interval currently displayed.

Maximum Number of Open Datasets (DSMAX)

The value specified for the installation parameter DSMAX. DB2 uses this value to determine when the drain process should be initiated to close unused data sets.
Checkpoints to Pseudo-Close (PCLOSEN)
The number of consecutive checkpoints that a data set or partition must go through since it was last updated before being selected for pseudo-close, that is, the state changed from read-write to read-only.

Elapsed Time to Pseudo-Close (PCLOSET)
The time in minutes that must elapse since a data set or partition was last updated before it can be selected for pseudo-close.

Current Number Open Datasets
The current number of open data sets.

High Water Open Datasets
The maximum number of data sets open at any one time since DB2 was started.

High Water Mark Not-in-use Datasets
The maximum number of pagesets specified with CLOSE(YES) that are not in use but are not physically closed.

Current Number Not-in-use Datasets
The current number of open pagesets specified with CLOSE(YES) that are not in use but are not physically closed.

For each of the following fields, the following statistics values are provided:

TOTAL QUANTITY
Total quantity, which reflects the amount of activities since DB2 was started.

INTERVAL QUANTITY
Interval quantity, which reflects the amount of activities during the last cycle.

/SECOND
Rate per second during the last cycle. The number under /SECOND (in parentheses) is the number of seconds in the interval.

/THREAD
Rate per thread during the last cycle. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
Rate per Commit during the last cycle. The number under /COMMIT (in parentheses) is the number of commit requests (including abort requests) during the interval.

Not-in-use Datasets Requested
Number of requests to open a data set that was on the deferred close queue. When this occurs, a physical data set Open is not necessary.

Not-in-use Datasets Closed
Number of not-in-use data sets that were closed because the total number of open data sets reached the Deferred Close threshold. The Deferred Close threshold is based on the smaller of the values of DSMAX or the MVS DD limit.

Datasets Converted to Read-Only
The number of infrequently updated data sets converted from read-write to read-only (pseudo-close). The SYSLGRNG entry is closed at this time.
DB2 Command Statistics
This panel shows information about current DB2 command activity.

For additional information about

- Near-term history activity, select option **H-HISTORICAL** at the top of the panel.
- other topics, use the PF keys.

Fields

- Total Quantity - activity since DB2 was started.
- Interval Quantity - activity during the last cycle.
- Rate per second during the last cycle.
- Percentage of total commands since DB2 was started.

**ALTER BUFFERPOOL**

**ALTER BUFFERPOOL** commands executed to alter attributes for active or inactive buffer pools.

**ALTER GROUP BUFFERPOOL**

**ALTER GROUP BUFFERPOOL** commands executed to alter attributes of group buffer pools.

**ARCHIVE LOG**

**ARCHIVE LOG** commands executed to initiate a DB2 active log switch.

**CANCEL DDF THREAD**

**CANCEL DDF THREAD** commands executed to cancel a thread.

**DISPLAY ARCHIVE**

**DISPLAY ARCHIVE** commands executed to display input archive log information.

**DISPLAY BUFFERPOOL**

**DISPLAY BUFFERPOOL** commands executed to display statistics for active or inactive buffer pools.
DISPLAY DATABASE

DISPLAY DATABASE commands executed to display status information about
tables and indexspaces within a database.

DISPLAY GROUP

DISPLAY GROUP commands executed to display statistics about the data
sharing group to which the DB2 subsystem belongs.

DISPLAY GROUP BUFFERPOOL

DISPLAY GROUP BUFFERPOOL commands executed to display attributes of
group buffer pools.

DISPLAY LOCATION

DISPLAY LOCATION commands executed to display statistics about threads
with distributed relationships.

DISPLAY PROCEDURE

DISPLAY PROCEDURE commands executed to display statistics about stored
procedures.

DISPLAY RLIMIT

DISPLAY RLIMIT commands executed to display the current status of the
resource limit facility.

DISPLAY THREAD

DISPLAY THREAD commands executed to display status information about
DB2 threads.

DISPLAY TRACE

DISPLAY TRACE commands executed to display a list of active traces.

DISPLAY UTILITY

DISPLAY UTILITY commands executed to display status information about
DB2 utility jobs.

MODIFY TRACE

MODIFY TRACE commands executed to change the IFCID being traced for
an active trace.

RECOVER BSDS

RECOVER BSDS commands executed to recover a boot strap data set that has
been disabled by an error.

RECOVER INDOUBT

RECOVER INDOUBT commands executed to recover threads left in the indoubt
status.

RESET GENERICLU

RESET GENERICLU commands executed to purge information stored by
VTAM in the coupling facility for one or more partners of a particular DB2
subsystem.

RESET INDOUBT

RESET INDOUBT commands executed to purge indoubt thread information.

SET ARCHIVE

SET ARCHIVE commands executed to change the maximum tape units and
the de-allocation time parameters originally set in the installation
parameters.

START DATABASE

START DATABASE commands executed to make stopped databases available
for use.
START DB2
START DB2 commands executed.

START DDF
START DDF commands executed to start the distributed data facility.

START PROCEDURE
START PROCEDURE commands executed to activate the definition of a stored
procedure which was stopped, or refreshes a stored procedure that is
cached.

START RLIMIT
START RLIMIT commands executed to start the resource limit facility.

START TRACE
START TRACE commands executed to begin collection of DB2 trace records.

STOP DATABASE
STOP DATABASE commands executed to make specified databases
unavailable for use.

STOP DB2
STOP DB2 commands executed.

STOP DDF
STOP DDF commands executed to stop the distributed data facility.

STOP PROCEDURE
STOP PROCEDURE commands executed to prevent DB2 from accepting SQL
CALL statements for one or more stored procedure.

STOP RLIMIT
STOP RLIMIT commands executed to stop the resource limit facility.

STOP TRACE
STOP TRACE commands executed to stop collection of DB2 trace records.

TERM UTILITY
TERM UTILITY commands executed to terminate execution of a utility job.

SET LOG
Set Log commands that are executed to modify the checkpoint frequency
that are specified during installation.

DISPLAY ACCEL
Display Accelerator commands that are executed to display details about
accelerators that are connected to the current subsystem.

START ACCEL
Start Accelerator commands that are executed to activate an accelerator.

STOP ACCEL
Stop Accelerator commands that are executed to deactivate an accelerator.

SET SYSPARM
The number of DB2 SET SYSPARM commands that are issued. This includes
normal and abnormal completion of the command.

DISPLAY DDF
The number of DB2 DISPLAY DDF commands that are issued. This includes
normal and abnormal completion of the command.

ACCESS DATABASE
The number of DB2 ACCESS DATABASE commands that are issued. This
includes normal and abnormal completion of the command.
START PROFILE
The number of DB2 START PROFILE commands that are issued. This includes normal and abnormal completion of the command.

STOP PROFILE
The number of DB2 STOP PROFILE commands that are issued. This includes normal and abnormal completion of the command.

DISPLAY PROFILE
The number of DB2 DISPLAY PROFILE commands that are issued. This includes normal and abnormal completion of the command.

MODIFY DDF
The number of DB2 MODIFY DDF commands that are issued. This includes normal and abnormal completion of the command.

This field is only displayed for DB2 10 or above.

ACTIVATE FUNCTION LEVEL (Q9STCTEN)
The number of DB2 ACTIVATE FUNCTION LEVEL commands issued. This includes normal and abnormal completion of the command. DB2 12 and later.

START DYNQUERYCAPTURE (Q9STCTSQ)
The number of DB2 START DYNQUERYCAPTURE commands issued. This includes normal and abnormal completion of the command. DB2 12 and later.

STOP DYNQUERYCAPTURE (QSTCTXQ)
The number of DB2 STOP DYNQUERYCAPTURE commands issued. This includes normal and abnormal completion of the command. DB2 12 and later.

DISPLAY DYNQUERYCAPTURE (Q9STCTDQ)
The number of DB2 DISPLAY DYNQUERYCAPTURE commands issued. This includes normal and abnormal completion of the command. This field only shown for DB2 12 and later.

UNRECOGNIZED COMMAND
Number of unrecognized commands.

Total All DB2 commands.

DB2 Storage
This menu option provides access to realtime DB2 storage management performance and statistics information.

The statistics data shown in the following panels is based on and derived from IFCID 225 performance data. When the menu option is invoked, data is requested from DB2 through READS, derived fields are calculated, and the requested data is displayed. To ensure consistency among data on subsequent panels, this data is kept in memory and is used as long as option M (DB2 Storage) is invoked again. If the Enter key is pressed on any of the panels, the data is refreshed and consistently used on all subsequent panels.

If data for certain fields on subsequent panels is not available or cannot be calculated because of differences of the installed DB2 version, the contents are marked as N/A.

The following panels are accessible:

• “Address Space Summary” on page 1310
Address Space Summary
This panel provides summary information about the size and usage of the DBM1 and DIST address spaces.

This panel is accessible only on OMEGAMON XE for DB2 PE systems monitoring DB2 version 10 and higher. For more information, see “DB2 Storage” on page 1309.

Navigation

You can scroll through the information using F7 and F8 (if the information requires more than one panel).

For additional options
- select one of the options from the panel. The same snapshot of DB2 performance data is used as long as Enter is not pressed.
- use the PF keys.

Fields

Address Space Name
Shows the address space names DBM1 and DIST (QW0225AN).

Average Thread Footprint (MB)
Shows the average size of all threads in the address space.

Maximum Number of Thread
Shows the maximum number of threads in the address space.

Castout Buffer Storage (MB)
Shows the size of the castout buffer.

24-Bit Low Private
Shows the amount of private MVS storage below the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs (QW0225LO).

24-Bit High Private
Shows the amount of private MVS storage below the 16 MB line. This storage is obtained from top downward, usually for authorized programs (QW0225HI).

High Address 24-Bit Private Region
Shows the current high address of the 24-bit private region (QW0225TP).

31-Bit Extended Low Private
Shows the amount of private MVS storage above the 16 MB line. This storage is obtained from bottom upward, usually for unauthorized programs (QW0225EL).

31-Bit Extended High Private
Shows the amount of private MVS storage above the 16 MB line. This storage is obtained from top downward, usually for authorized programs (QW0225EH).

High Address 31-bit Private Region
Shows the current high address of 31-bit private region (QW0225EP).

Extended Region Size
Shows the size of the MVS extended region (QW0225TP).

31-Bit Storage Reserved for Must-Complete Operation
Shows the size of the 31-bit storage reserved for operations that must be completed (QW0225CR).

31-Bit Storage Reserved for Z/OS Use
Shows the size of the 31-bit storage reserved for MVS (QW0225MV).

Storage Cushion Warning to Contract
Shows the storage cushion warning to contract (QW0225SO).
Storage Cushion
  Shows the sum of QW0225SO, QW0225CR, and QW0225MV.

Total 31-Bit Getmained Stack
  Shows the total size of the 31-bit getmained stack (QW0225GS).

Total 31-Bit Stack In Use
  Shows the total size of the 31-bit stack in use (QW0225SU).

Total 31-Bit Variable Pool Storage
  Shows the total size of the 31-bit variable pool storage (QW0225VR).

Total 31-Bit Fixed Pool Storage
  Shows the total size of the 31-bit fixed pool storage (QW0225FX).

Total 31-Bit Getmained Storage
  Shows the total size of the 31-bit getmained storage (QW0225GM).

Total 31-Bit Storage (MB)
  Shows the total size of the 31-bit storage.

Amount of Available 31-Bit Storage
  Shows the amount of available 31-bit storage (QW0225AV).

Total 64-Bit Private Variable Pool Storage
  Shows the total size of the 64-bit private variable pool storage (QW0225VA).

Total 64-Bit Private Fixed Pool Storage
  Shows the total size of the 64-bit private fixed pool storage (QW0225FA).

Total 64-Bit Private Getmained Storage
  Shows the total size of the 64-bit private getmained storage (QW0225GA).

Total 64-Bit Private Storage for Storage
  Shows the total size of the 64-bit private storage allocated for storage manager control structures (QW0225SM).

Real 4K Frames In Use
  Shows the number of real 4K frames in use for 31- and 64-bit private pools (QW0225RL).

Real 4K Frames In Use (64-Bit)
  Shows the number of real 4K frames in use for 64-bit private pools (available in z/OS version 1.11 and later) (QW0225HVPagesInReal).

Real 4K Frames In Use (64-Bit Private)
  Shows the number of real 4K frames in use for 64-bit private storage. This field is a subset of Real 4K Frames In Use (64-Bit) (QW0225HVPagesInReal) and does not include buffer pool storage (QW0225PriStg_Real). This field is available in z/OS version 1.10 (and maintenance) or later.

HWM of Real 4K Frames
  Shows the high-water mark for the number of real 4K frames in use for 64-bit private pools (available in z/OS version 1.11 and later) (QW0225HVGPagesInReal).

4K Auxiliary Slots In Use
  Shows the number of 4K auxiliary slots in use for 31- and 64-bit private pools (QW0225AX).
4K Auxiliary Frames In Use (64-Bit)
Shows the number of 4K auxiliary frames in use for 64-bit private pools (available in z/OS version 1.11 and later).

4K Auxiliary Frames In Use (64-Bit Private)
Shows the number of 4K auxiliary slots in use for 64-bit private storage (QW0225PriStg_Aux). This field does not include buffer pool storage. It only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS version 1.10 (and maintenance) or later.

HWM of 4K Auxiliary Frames
Shows the high-water mark for the number of 4K auxiliary frames in use.

Real 2G Frames in Use (64-bit) (QW0225HVPagesInReal2G)
Number of real 2G frames in use for 64-bit private (available in >= z/OS 1.11). DB2 12 and later.

Thread Information
This panel provides information about threads, DBATs, and various engines.

This panel is accessible only on OMEGAMON XE for DB2 PE systems monitoring DB2 version 10 and higher. For more information, see “DB2 Storage” on page 1309.

Navigation
You can scroll through the information using F7 and F8 (if the information requires more than one panel).

For additional options
• select one of the options from the panel. The same snapshot of DB2 performance data is used as long as Enter is not pressed.
• use the PF keys.

Fields
Active Threads
Shows the number of active threads (QW0225AT).

Active and Disconnected DBATs
Shows the number of active and disconnected DBATs (QW0225DB).

Prefetch Engines
Shows the number of prefetch engines (QW0225PF).
Deferred Write Engines
   Shows the number of deferred write engines (QW0225DW).

Castout Engines
   Shows the number of castout engines (QW0225CE).

GBP Write Engines
   Shows the number of GBP write engines (QW0225GW).

P-Lock/Notify Exit Engines
   Shows the number of P-lock/notify exit engines (QW0225PL).

Active Parallel Child Threads
   Shows the number of active parallel child threads (QW0225PT).

Shared and Common Storage
This panel provides information about the shared and common storage areas.

This panel is accessible only on OMEGAMON XE for DB2 PE systems monitoring DB2 version 10 and higher. For more information, see "DB2 Storage" on page 1309.
Navigation

You can scroll through the information using F7 and F8 (if the information requires more than one panel).

For additional options
• select one of the options from the panel. The same snapshot of DB2 performance data is used as long as Enter is not pressed.
• use the PF keys.

Fields

MVS Extended CSA Size

Shows the MVS extended CSA size (QW0225EC).
Total 31-Bit Common Fixed Pool Storage
Shows the total size of the 31-bit common fixed pool storage (QW0225FC).

Total 31-Bit Common Variable Pool Storage
Shows the total size of the 31-bit common variable pool storage (QW0225VC).

Total 31-Bit Common Getmained Storage
Shows the total size of the 31-bit common getmained storage (QW0225GC).

Total 64-Bit Common Fixed Pool Storage
Shows the total size of the 64-bit common fixed pool storage (QW0225FCG).

Total 64-Bit Common Variable Pool Storage
Shows the total size of the 64-bit common variable pool storage (QW0225VCG).

Total 64-Bit Common Getmained Storage
Shows the total size of the 64-bit common getmained storage (QW0225GCG).

Total 64-Bit Common Storage for SM Cntl Struct
Shows the total size of the 64-bit common storage allocated for storage manager control structures (QW0225SMC).

Total 64-Bit Shared Storage for SM Cntl Struct
Shows the total size of the 64-bit shared storage for storage manager control structures (QW0225SMS).

Total 64-Bit Shared Variable Pool Storage
Shows the total size of the 64-bit shared variable pool storage (QW0225SV).

Total 64-Bit Shared Fixed Pool Storage
Shows the total size of the 64-bit shared fixed pool storage (QW0225SF).

Total 64-Bit Shared Getmained Storage
Shows the total size of the 64-bit shared getmained storage (QW0225SF).

Total 64-Bit Shared System Agent Stack
Shows the total size of the 64-bit shared storage allocated for system agent stack use (QW0225GSG_SYS).

Total 64-Bit Shared System Agent Stack In Use
Shows the total size of the 64-bit shared system agent stack that is in use (QW0225SUG_SYS).

Total 64-Bit Shared Non-System Agent Stack
Shows the total size of the 64-bit shared storage allocated for non-system agent stack use (QW0225GSG).

Total 64-Bit Shared Non-System Agent Stack In Use
Shows the total size of the 64-bit shared non-system agent stack that is in use (QW0225SUG).

Number of Shared Memory Objects
Shows the number of shared memory objects allocated for this MVS LPAR (QW0225SHRNOMB).

Number of 64-Bit Shared Memory Pages
Shows the number of 64-bit shared memory pages allocated for this MVS LPAR (this count includes hidden pages) (QW0225SHRPAGES).
High Water Mark 64-Bit Shared Bytes
Shows the high-water mark of the 64-bit shared bytes for this MVS LPAR (QW0225SHRGBYTES).

Number of 64-Bit Shared Pages In Real Storage
Shows the number of 64-bit shared pages backed in real storage (4K pages) for this MVS LPAR (QW0225SHRINREAL).

Number of Auxiliary Slots for 64-Bit Shared Storage
Shows the number of auxiliary slots used for 64-bit shared storage for this MVS LPAR (QW0225SHRAUXSLOTS).

Number of 64-Bit Paged-in Shared Pages
Shows the number of 64-bit shared pages paged in from auxiliary storage for this MVS LPAR (QW0225SHRPAGEINS).

Number of 64-Bit Paged-out Shared Pages
Shows the number of 64-bit shared pages paged out to auxiliary storage for this MVS LPAR (QW0225SHRPAGEOUTS).

Number of 4K Frames in Use for 64-Bit Shared Storage
Shows the number of real 4K frames in use for 64-bit shared storage (QW0225ShrStg_Real). This field does not include shared stack storage. This information is recorded at the subsystem level. This field is available in z/OS version 1.10 (and maintenance) or later.

Number of 4K Auxiliary Slots for 64-Bit Shared Storage
Shows the number of 4K auxiliary slots in use for 64-bit shared storage (QW0225ShrStg_Aux). This field does not include shared stack storage. This information is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS version 1.10 (and maintenance) or later.

Number of 4K Frames in Use for 64-Bit Shared Stack
Shows the number of real 4K frames in use for 64-bit shared stack storage (QW0225ShrStkStg_Real). This information is recorded at the subsystem level. This field is available in z/OS version 1.10 (and maintenance) or later.

Number of 4K Auxiliary Slots for 64-Bit Shared Stack
Shows the number of 4K auxiliary slots in use for 64-bit shared stack storage (QW0225ShrStkStg_Aux). This information is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS version 1.10 (and maintenance) or later.

Number of 4K Frames in Use for 64-Bit Common Storage
Shows the number of real 4K frames in use for 64-bit common storage (QW0225ComStg_Real). This information is recorded at the subsystem level. This field is available in z/OS version 1.10 (and maintenance) or later.

Number of 4K Auxiliary Slots for 64-Bit Common Storage
Shows the number of 4K auxiliary slots in use for 64-bit common storage (QW0225ComStg_Aux). This information is recorded at the subsystem level. This field only includes auxiliary slots occupied by pages that are paged out. This field is available in z/OS version 1.10 (and maintenance) or later.
Log Mgr Write Buffer Frames in REAL
Shows the number of frames in real storage that are used for log manager write buffers.

This applies to DB2 11 and higher.

Log Mgr Write Buffer Frames in AUX
Shows the number of auxiliary frames that are used for log manager write buffers.

This applies to DB2 11 and higher.

Log Manager Control Frames in REAL
Shows the number of frames in real storage that are used for log manager control structures.

This applies to DB2 11 and higher.

Log Manager Control Frames in Aux
Shows the number of frames in auxiliary storage that are used for log manager control structures.

This applies to DB2 11 and higher.

Statement Cache and XProc Detail
This panel provides information about the usage of the SQL statement cache and the xProc storage.

This panel is accessible only on OMEGAMON XE for DB2 PE systems monitoring DB2 version 10 and higher. For more information, see “DB2 Storage” on page 1309.

Navigation
You can scroll through the information using F7 and F8 (if the information requires more than one panel).

For additional options
- select one of the options from the panel. The same snapshot of DB2 performance data is used as long as Enter is not pressed.
- use the PF keys.
Fields

**Total xPROC Storage for Dynamic SQL**
Shows the total size of the xPROC storage for dynamic SQL that is used by active threads and globally cached statements.

This applies to DB2 10.

**Allocated xPROC Storage for Dynamic SQL**
Shows the size of the allocated xPROC storage for globally cached statements.

This applies to DB2 10.

**High Water Mark xPROC Storage for Dynamic SQL**
Shows the largest amount of allocated xPROC storage so far.

This applies to DB2 10.

**Total xPROC Storage for Static SQL**
Shows the size of the total xPROC storage that is used for static SQL statements.

This applies to DB2 10.

**Total Allocated Shareable Storage for Dynamic SQL**
Shows the total allocated sharable storage for dynamic SQL used by active threads (64-bit shared system variable pools).

This applies to DB2 11 or higher.

**Total Requested Shareable Storage for Dynamic SQL**
Shows the total requested sharable storage for dynamic SQL used by active threads (64-bit shared system variable pools).

This applies to DB2 11 or higher.

**HWM Requested Shareable Storage for Dynamic SQL**
Shows the total allocated sharable storage for static SQL statements (64-bit shared system variable pools).

This applies to DB2 11 or higher.

**Total Allocated Shareable Storage for Static SQL**
Shows the high water mark of total requested sharable storage for dynamic SQL used by active threads (64-bit shared system variable pools).

This applies to DB2 11 or higher.

**Number of Stmts in 64-Bit Storage**
Shows the number of statements in the 64-bit agent local pool (64-bit shared agent local variable pools).

**Number of Stmts in 64-bit storage when interval HWM Is Set**
Shows the number of statements at the time a new interval High Water Mark is set for 64-bit shared agent local variable pools (default statistics interval: 1 minute).

**Total Stmt Cache Storage(64-Bit)**
Shows the allocated statement cache storage that is in 64-bit agent local pools (64-bit shared agent local variable pools).

**High Water Mark for Stmt Cache Storage(64-Bit) This Interval**
Shows the largest amount of allocated statement cache storage in 64-bit shared agent local pools in this interval (default statistics interval: 1 minute).
Timestamp of High Water Mark 64-Bit Local Pools
Shows the timestamp when the largest amount of storage in 64-bit agent local pools was allocated after the last IFCID 0225 record was written (64-bit shared agent local variable pools).

Total 64-Bit Statement 2G Cache Block Storage
Shows the total statement cache storage blocks above the bar (64-bit shared variable pool).

Stmt Cache Hash Entry Allocation (QW0225DMH)
The amount of storage that is allocated for hashing entries in the dynamic statement cache. DB2 12 and later.

Pool Detail
This panel displays data for DB2 10 and higher.

This panel is accessible only on OMEGAMON XE for DB2 PE systems monitoring DB2 version 10 and higher. For more information, see “DB2 Storage” on page 1309.

Fields
Total Agent Local Storage
Shows the total agent local storage (31-bit DBM1 private variable pools) (QW0225AL).

Total System Agent Storage
Shows the total system agent storage (31-bit DBM1 private variable pools) (QW0225AS).

Total Buffer Manager Storage Blocks
Shows the total buffer manager storage blocks (31-bit DBM1 private variable pools) (QW0225BB).
Total Agent Local Storage (64-Bit)
Shows the total size of the agent-related 64-bit local storage (64-bit shared variable pools) (QW0225ALG).

Total System Agent Storage (64-Bit)
Shows the total size of the 64-bit storage used by system agents (64-bit shared variable pools) (QW0225ASG).

Total RID Pool Storage (64-Bit)
Shows the total size of the RID pool storage (64-bit shared fixed pool) (QW0225RP).

Total Compression Dictionary Storage (64-Bit)
Shows the total compression dictionary storage (64-bit DBM1 private getmained) (QW0225CD).

Total Array Variable Storage
Shows the total array variable storage.
This applies to DB2 11 and higher.

IRLM Storage Usage
This panel shows the usage of IRLM storage.

This panel displays data for DB2 11 and higher.

Fields

Currently Used ECSA (QW0225I_BBECSA)
The amount of ECSA that is currently used. This value is the total of all ECSA IRLM pools.

ECISA High Water Mark (QW0225I_BBESCAH)
The highest amount of ECSA that is used so far. This value is the total of all ECSA IRLM pools.

Currently Used 31-bit IRLM Private (QW0225I_BBPVT)
The amount of 31-bit IRLM private storage that is currently in used. This value is the total of all 31-bit IRLM private pools.
High Water Mark for 31-bit IRLM Private (QW0225I_BBPVH)
The highest amount of 31-bit IRLM private storage that is used so far. This value is the total of all 31-bit IRLM private pools.

Threshold 31-Bit IRLM Private Storage (QW0225I_BPMAX)
The maximum amount of virtual 31-bit IRLM private storage that is available for normal IRLM execution. If this value is exceeded, only requests for storage tasks that must be completed are granted.

Currently Used 64-bit IRLM Private (QW0225I_ABPVT)
The amount of 64-bit IRLM private storage that is currently used. This value is the total of all 64-bit IRLM private pools.

High Water Mark for 64-bit IRLM Private (QW0225I_ABPVH)
The highest amount of 64-bit IRLM private storage that is used so far. This value is the total of all 64-bit IRLM private pools.

Threshold 64-Bit IRLM Private Storage (QW0225I_APMAX)
The maximum amount of virtual 64-bit IRLM private storage that is available for normal IRLM execution. If this value is exceeded, only requests for storage tasks that must be completed are granted.

Currently used 64-bit common (QW0225I_ABCSA)
The amount of 64-bit common storage that is currently used. This value is the total of all 64-bit common IRLM pools.

High Water Mark for 64-bit common (QW0225I_ABCSH)
The highest amount of 64-bit common storage that is used so far. This value is the total of all 64-bit common IRLM pools.

GBP Coupling Facility Cache Structure Statistics Summary
This panel shows a summary of the DB2 group buffer pool (GBP) coupling facility cache structure statistics. It can be displayed in S mode or in G mode. In S mode, a summary of the Group Buffer Pools of the current member is displayed. In G mode, a summary of the Group Buffer Pools of all members is displayed.

The following panel shows a summary of the GBP Coupling Facility Cache Structure Statistics in S mode.

---

The following panel shows a summary of the GBP Coupling Facility Cache Structure Statistics in G mode.
### GBP Coupling Facility Cache Structure Statistics Summary

### Navigation

You can browse details of a group buffer pool or the TOTAL values by moving the cursor to the appropriate line in the panel and pressing PF11 (Zoom).

For additional information about:

- G mode in S mode or vice versa, replace the letter S with G or vice versa.
- other members of the data sharing group or other DB2 subsystems that are monitored by the current server, type over the DB2 SSID.
- the details of a particular GBP cache structure statistics, move the cursor to the GBP of your choice and click F11 (Zoom).
- other topics, use the PF keys.

### Fields

**GBPName**

The name of the group buffer pool.

**ReadMiss**

The Read Miss Cache Full Counter shows the number of times that a coupling facility read request specifies a page for which a directory entry does not exist or is not created because the storage in the group buffer pool is insufficient.
A nonzero value in this field indicates that the size of the backing coupling facility cache structure might be too small to support the current workload.

**WriteMiss**

The Write Miss Cache Full Counter shows the number of times a coupling facility write request is not completed because the storage in the group buffer pool is insufficient.

The value in this field indicates that the data page resources of the coupling facility are faster consumed than the DB2 castout process can free them. For information about alleviating this condition, see *DB2 Data Sharing: Planning and Administration*.

**XIDirRClm**

The XI Directory Entry Reclaim Counter shows the number of times a directory is reclaimed (stolen) and cross-validation (XI) signals are sent because the named page is cached in one or more DB2 buffer pools. This means that the stolen directory entry has registered DB2 interest.

A high number might indicate a problem. Check the hit ratio of the group buffer pool to determine whether the lack of directory entries might be causing excessive reads from the group buffer pool.

**CastOut**

The Castout Counter shows the number of castout operations that are performed. Castout is the process of writing pages from the group buffer pool to DASD.

**DirEntry**

The Directory Entry Counter shows the number of directory entries that are allocated for the coupling facility cache structure (DB2 group buffer pool). A directory entry contains control information for one database page. The directory entry is used by the coupling facility to determine where to send cross-validation signals when a page of data is changed or when the directory entry must be reused.

This value is a snapshot value. It is not affected by an incremental display or a cumulative display.

**DataEntry**

The Data Entry Counter shows the number of data entries that are allocated for the coupling facility cache structure (DB2 group buffer pool). The data entries are the actual places where the data page resides.

This value is a snapshot value. It is not affected by an incremental display or a cumulative display.

**TotChnge**

The Total Changed Counter shows a snapshot value of the current number of changed pages. This value is not affected by an incremental display or a cumulative display.

**GBP Coupling Facility Cache Structure Statistics**

This panel shows detail information about DB2 Group Buffer Pool (GBP) coupling facility cache structure statistics.

Total values are depicted in KB with a scale of 1000.
GBP COUPLING FACILITY CACHE STRUCTURE STATISTICS

+ Group Buffer Pool Name            GBP8K0
+ Explicit XI Counter              0

+ Write Miss Cache Full Counter 2 0
+ Directory Entry Counter 2 0
+ Data Entry Counter 2 0
+ Total Changed Counter 2 0

Navigation

You can view other GBP data without going back to the summary display panel by replacing the member name and the GBP name.

For additional information about

- data that is related to the member MBR1 of the same data sharing group and the group buffer pool GBP1, replace SN12 :GBP8K0 with MBR1 :GBP1. If the names of the member and the group buffer pool have less than 8 characters, they must be padded with blanks.
- other topics, use the PF keys.

Fields

Group Buffer Pool Name
The name of the group buffer pool.

Explicit XI Counter
The Explicit XI Counter shows the number of times that:
- a request is made to the coupling facility to explicitly cross-invalidate a page
- XI signals are sent because the named page is cached in one or more DB2 buffer pools.

Read Hit Counter
The Read Hit Counter shows the number of times that a page is returned on a coupling facility read request.
**Read Miss Directory Hit Counter**
The Read Miss Directory Hit counter shows the number of times that a coupling facility read request specifies a page for which a directory entry exists, however, data is not cached for that page.

**Read Miss Assign Suppressed Counter**
The Read Miss Assignment Suppressed Counter shows the number of times that a coupling facility read request specifies a page for which a directory entry does not exist or is not created. DB2 does not create a directory entry if it does not need to register the page to the coupling facility for cross-invalidation (XI) because no other DB2 in the group has read or write interest in the page set or partition. This counter also represents the number of times that pages are deregistered due to buffer stealing.

**Read Miss Name Assigned Counter**
The Read Miss Name Assigned Counter shows the number of times that a coupling facility read request specifies a page for which a directory entry is created.

**Read Miss Cache Full Counter**
The Read Miss Cache Full Counter shows the number of times that a coupling facility read request specifies a page for which a directory entry does not exist or is not created because the storage in the group buffer pool is insufficient.

A nonzero value in this field indicates that the size of the backing coupling facility cache structure might be too small to support the current workload.

**Changed Page Write Hit Counter**
The Changed Page Write Hit Counter shows the number of times a coupling facility write request for a changed page is completed successfully.

**Clean Page Write Hit Counter**
The Clean Page Write Hit counter shows the number of times a coupling facility write request for a clean page is completed successfully.

**Write Miss Cache Full Counter**
The Write Miss Cache Full Counter shows the number of times a coupling facility write request is not completed because the storage in the group buffer pool is insufficient.

The value in this field indicates that the data page resources of the coupling facility are faster consumed than the DB2 castout process can free them. For information about alleviating this condition, see *DB2 Data Sharing: Planning and Administration*.

**Directory Entry Reclaim Counter**
The Directory Entry Reclaim Counter shows the number of times a name assignment requires that a directory entry is reclaimed by the coupling facility.

**Data Entry Reclaim Counter**
The Data Entry Reclaim Counter shows the number of times a name assignment requires that a data page is reclaimed by the coupling facility.

**XI Dir Entry Reclaim Counter**
The XI Directory Entry Reclaim Counter shows the number of times a directory is reclaimed (stolen) and cross-invalidation (XI) signals are sent...
because the named page is cached in one or more DB2 buffer pools. This means that the stolen directory entry has registered DB2 interest.

A high number might indicate a problem. Check the hit ratio of the group buffer pool to determine whether the lack of directory entries might be causing excessive reads from the group buffer pool.

**Castout Counter**
The Castout Counter shows the number of castout operations that are performed. Castout is the process of writing pages from the group buffer pool to DASD.

**Directory Entry Counter**
The Directory Entry Counter shows the number of directory entries that are allocated for the coupling facility cache structure (DB2 group buffer pool). A directory entry contains control information for one database page. The directory entry is used by the coupling facility to determine where to send cross-validation signals when a page of data is changed or when the directory entry must be reused.

This value is a snapshot value. It is not affected by an incremental display or a cumulative display.

**Data Entry Counter**
The Data Entry Counter shows the number of data entries that are allocated for the coupling facility cache structure (DB2 group buffer pool). The data entries are the actual places where the data page resides.

This value is a snapshot value. It is not affected by an incremental display or a cumulative display.

**Total Changed Counter**
The Total Changed Counter shows a snapshot value of the current number of changed pages. This value is not affected by an incremental display or a cumulative display.

**Changed Page Write Hit Counter 2**
The Changed Page Write Hit Counter 2 for the secondary group buffer pool shows the number of successfully completed coupling facility write requests for changed pages.

**Write Miss Cache Full Counter 2**
The Write Miss Cache Full Counter for the secondary group buffer pool shows the number of coupling facility write requests that cannot complete because the coupling facility storage resources are insufficient.

**Directory Entry Counter 2**
The Directory Entry Counter for the secondary group buffer pool shows a snapshot value of the number of allocated directory entries.

**Data Entry Counter 2**
The Data Entry Counter for the secondary group buffer pool shows a snapshot value of the number of allocated data entries.

**Total Changed Counter 2**
The Total Changed Counter for the secondary group buffer pool shows a snapshot value of the number of allocated data entries that are currently in changed state.

**Accelerator Statistics Overview**
This panel displays the Analytics Accelerators that are available in the current DB2 subsystem. With this information, you can analyze the usage of the devices.
Navigation

For additional information about

• a particular Analytics Accelerator, move the cursor to the Analytics Accelerator line and press F11 (Zoom).
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

For each of the available accelerators, the following information is displayed on the Accelerator Summary panel:

Number of accelerators defined
   The number of accelerators that are defined on the system.

Name   The name of the Accelerator.

Product
   The product ID.

State   The state of the Accelerator.

Repl. State
   The state of Replication processing on this Accelerator.

Requests
   The number of Accelerator requests that are processed since the Accelerator was started.

Active   The number of active requests that are processed on the Accelerator.

Max Actv
   The high water mark of concurrent requests on the Accelerator.

Accelerator Statistics Detail
Depending on the version of the Analytics Accelerator that you are using, the information about the activity of a specified Analytics Accelerator is different. The version number of the Analytics Accelerator is displayed in the Product ID field.

Accelerator Detail

If the product ID is lower than AQT04010, the Accelerator Detail panel is displayed. It might look like this:
**Accelerator Detail**

Fields

Collection Interval
The value REALTIME indicates that the collection interval and the report interval are the same.

Start
The start time of the report interval that is currently displayed.

Report Interval
The amount of time in the last cycle, for example, the time inbetween the Enter key was pressed twice.

End
The end time of the report interval that is currently displayed.

Name (Q8STNAME)
The name of the Accelerator.

State (Q8STSTATE)
The current state of the Accelerator. The following list shows the values for the state:
INITIALIZED
INITING
ONLINE
PAUSED
OFFLINE
STOPPED
MAINTENANCE

Product ID (Q8STPRID)
The internal product ID. It includes the version of the Accelerator.

Curr Active Requests
The number of requests that are currently processed on the Accelerator.

Max Active Requests
The high water mark of concurrent active requests on the Accelerator.

Avg Coord CPU
The average percentage of the time that the CPU is busy for the Accelerator coordinator node.

Avg Worker CPU
The average percentage of the time that the CPU is busy for the Accelerator worker node.

Total Num Processors
The total number of processors for all the nodes in the Accelerator.

Processing Capacity
The total capacity of the processors in the Accelerator.

Act Worker Nodes
The number of worker nodes that are defined in the Accelerator.

Avg Queue Wait Time (MS)
The average time that a query is queued in the Accelerator.

Max Queue Wait Time (MS)
The maximum time that a query is queued in the Accelerator.

Query Queue Len 3 HR Avg
The average length of a queue during the past 3 hours.

Query Queue Len 24 HR Avg
The average length of a queue during the past 24 hours.
Max Query Queue Len
The maximum queue time a query is queued.

Avail Disk (MB)
The amount of disk space that is available on Accelerator.

DB Disk In Use (MB)
The amount of disk space that is used by database objects.

In-use Disk
The percentage of disk space that is used.

The following statistics are displayed for the fields below in tabular format:

TOTAL QUANTITY
The amount of activity since DB2 was started.

INTERVAL QUANTITY
The amount of activity during the last cycle.

/ SECOND (594)
The rate per second during the last cycle. The value in parentheses indicates the number of seconds in the interval.

These are the fields for which the statistics above are displayed:

Successful Requests
The number of query requests sent by this DB2 that are successfully completed since the Accelerator is started.

Failed Reqs Since Start
The number of query requests that are sent by this DB2 since the Accelerator is started that failed for any reason.

Failed Reqs Inv State
The number of query requests that are sent by this DB2 since the Accelerator is started that failed because the Accelerator is in an invalid state. This value is a subset of the value in the field Failed Reqs Since Start.

Total Num Accel Connects
The number of connections that are started between this DB2 subsystem and the Accelerator.

Total Num Accel Requests
The number of requests that are sent to the Accelerator from this DB2 subsystem.

Total Timed Out Reqs
The number of requests that failed due to a timeout while waiting for the Accelerator.

Total Failed Reqs
The total number of failed Accelerator requests. This number includes any timeout errors.

Num Bytes Sent
The count of bytes of data that is sent to the Accelerator.

Num Bytes Received
The count of bytes of data that is received from the Accelerator.

Num Messages Sent
The count of messages that are sent to the Accelerator.
Num Messages Received
The count of messages that are received from the Accelerator.

Num Blocks Sent
The count of blocks that are sent to the Accelerator.

Num Blocks Received
The count of blocks that are received from the Accelerator.

Num Rows Sent
The count of data rows that are sent to the Accelerator.

Num Rows Received
The count of data rows that are received from the Accelerator.

The following statistics are displayed for the fields below in tabular format:

Total Times
The amount of time that is consumed since the Accelerator is activated.

Interval Times
The amount of time that is consumed in the current interval.

These are the fields for which the statistics above are displayed:

In DB2 CPU Time
The CPU time that is consumed within the Analytics Accelerator.

TCP/IP Services Elapsed Time (Q8STTELA)
The total elapsed time from the time DB2 started to process requests until the requests are complete.

Accel CPU Time (Q8STACPU)
This is the CPU time consumed within the Accelerator device.

Accel Elapsed Time (Q8STAELE)
The total elapsed time that the thread is processed on the Accelerator. The Accelerator time is a subset of the In-DB2 time.

Accum Wait Time (Q8STAWAT)
The total wait time within the Accelerator.

Accelerator Detail Subsystem Perspective

If the product ID is greater than or equal to AQT04010, the Accelerator Detail Subsystem Perspective panel is displayed. It shows information from the perspective of the individual DB2 subsystem. It might look like this:
ZID4

+ Report Interval:   23 sec  End: 01/29/15 13:45:49.26

+ Name  VNMPS52

Chapter 5. Monitoring 1333
Navigation

For more information about

* an aggregation of accelerator details of all DB2 subsystems that are connected to the Analytics Accelerator, select the option **B-ACCELERATOR PERSPECTIVE**.
* related topics, select one of the options at the top of the panel.
* other topics, use the PF keys.

Fields

**Collection Interval**

The value REALTIME indicates that the collection interval and the report interval are the same.

**Start**
The start time of the report interval that is currently displayed.

**Report Interval**
The amount of time in the last cycle, for example, the time inbetween the Enter key was pressed twice.

**End**
The end time of the report interval that is currently displayed.

**Name (Q8STNAME)**
The name of the Accelerator.

**State (Q8STTATE)**
The current state of the Accelerator. The following list shows the values for the state:

- INITIALIZED
- INITING
- ONLINE
- PAUSED
- OFFLINE
- STOPPED
- MAINTENANCE

**Product ID (Q8STPRID)**
The internal product ID. It includes the version of the Accelerator.
Server Start Time (Q8STTART)  
The time the Accelerator server process is started.

Status Change Time (Q8STTATC)  
The time the last status change is recorded.

Curr Active Queries (Q8STNCQS)  
The number of queries that are processed currently on behalf of this DB2.

Max Active Queries (Q8STMNQS)  
The maximum number of concurrent queries that are processed on behalf of this DB2.

Replication State (Q8STCSS)  
The state of replication processing for this DB2.

Replication Latency (Q8STCRL)  
The replication latency for this DB2.

Replication Status Change (Q8STTLSC)  
The time the last replication status change is recorded.

Disk in Use This DB2 (Q8STDSDKB)  
The amount of disk space that is used by database objects.

The following statistics are displayed for the fields below in tabular format:

<table>
<thead>
<tr>
<th>Field Description</th>
<th>Statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTAL QUANTITY</td>
<td>The amount of activity since the Accelerator is activated.</td>
</tr>
<tr>
<td>INTERVAL QUANTITY</td>
<td>The amount of activity during the last cycle.</td>
</tr>
<tr>
<td>/SECOND (1)</td>
<td>The rate per second during the last cycle. The value in parentheses indicates the number of seconds in the interval.</td>
</tr>
</tbody>
</table>

These are the fields for which the statistics above are displayed:

Successful Requests (Q8STSREQ)  
The number of query requests sent by this DB2 since the Accelerator is started that completed successfully.

Failed Requests (Q8STFREQ)  
The number of query requests sent by this DB2 since the Accelerator is started that failed for any reason.

Total Num Accel Connects (Q8STCONN)  
The number of connections that are started between this DB2 subsystem and the Accelerator.

Total Num Accel Requests (Q8STREQ)  
The number of requests that are sent to the Accelerator from this DB2 subsystem.

Total Timed Out Reqs (Q8STTOUT)  
The number of requests that failed due to a timeout waiting for the Accelerator.

Total Failed Reqs (Q8STFAIL)  
The total number of failed Accelerator requests. This number includes any timeout errors.
Number Bytes Sent
The number of bytes of data that is sent to the Accelerator.

Number Bytes Received (Q8STBYTR)
The number of bytes that are received.

Number Messages Sent (Q8STMSG)
The number of messages that are sent to the Accelerator.

Number Messages Received (Q8STMSGR)
The number of messages that are received from the Accelerator.

Number Blocks Sent (Q8STBLKS)
The number of blocks that are sent to the Accelerator.

Number Blocks Received (Q8STBLKR)
The number of blocks that are received by the Accelerator.

Number Rows Sent (Q8STROWS)
The number of data rows that are sent to the Accelerator.

Number Rows Received (Q8STROWR)
The number of data rows that are received by the Accelerator.

The following set of statistic fields is related to replication processing. If replication is not configured for this Accelerator, these fields are not displayed.

Log Records Read (Q8STNLRS)
The total number of log records that is read by capture agents on this DB2.

Log Records Read Accel Tables (Q8STNLTS)
The number of log records that are read by capture agents on this DB2 for tables that reside in this Accelerator.

Log Record Bytes Processed (Q8STNBS)
The number of bytes that are processed by capture agents for this DB2.

Rows Inserted Accel Tables (Q8STNIS)
The number of inserted rows that are processed by capture agents on this DB2 for tables that reside in this Accelerator.

Rows Updated Accel Tables (Q8STNUS)
The number of updated rows that are processed by capture agents on this DB2 for tables that reside in this Accelerator.

Rows Deleted Accel Tables (Q8STNDS)
The number of inserted rows that are processed by capture agents on this DB2 for tables that reside in this Accelerator.

The following statistics are displayed for the fields below in tabular format:

TOTAL QUANTITY
The amount of time that is consumed since the Accelerator is activated.

INTERVAL QUANTITY
The amount of time that is consumed in the current interval.

These are the fields for which the statistics above are displayed.

TCP/IP Services Elapsed Time (Q8STTELA)
The total elapsed time from the time DB2 started to process a request until the time the request is completed.
CPU Time Executing Queries (Q8STTCQS)
The CPU time that is consumed by the Analytics Accelerator for processing queries.

CPU Time for Replication (Q8STTCCS)
The CPU time that is consumed by the Analytics Accelerator for replication.

CPU Time for Load/Archive/Restore (Q8STTCMS)
The CPU time that is consumed by the Analytics Accelerator for maintenance.

Accel Elapsed Time (Q8STAELA)
The total elapsed time that the thread is processed on the Analytics Accelerator. The Accelerator time is a subset of the In DB2 time.

Accum Wait Time (Q8STAWAT)
The total wait time within the Analytics Accelerator.

Statements sent to Accelerator
Insert The number of Insert statements issued for IDT (Q8STINSC) objects from DB2 to the accelerator.

Update The number of Update statements issued for IDT (Q8STUPDC) objects from DB2 to the accelerator.

Delete This is the number of Delete statements issued for IDT (Q8STDELC) objects from DB2 to the accelerator.

Drop The number of Drop statements issued for IDT (Q8STDRTC) objects from DB2 to the accelerator.

Create The number of Create statements issued for IDT (Q8STCRRTC) objects from DB2 to the accelerator.

Commit The number of Commit statements issued for IDT (Q8STCMTC) objects from DB2 to the accelerator.

Rollback This is the number of Rollback statements issued for (Q8STRBKC) IDT objects from DB2 to the accelerator.

Open The number of Open statements issued for IDT (Q8STOPNC) objects from DB2 to the accelerator.

Accelerator Detail Accelerator Perspective
This panel displays detailed information that is aggregated across all DB2 subsystems that are connected to the Analytics Accelerator.
Navigation

For more information about
• the activity in the specified Analytics Accelerator, select the option **A-DB2 PERSPECTIVE**.
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.
Fields

Collection Interval
The value REALTIME indicates that the collection interval and the report interval are the same.

Start
The start time of the report interval that is currently displayed.

Report Interval
The amount of time in the last cycle, for example, the time inbetween the Enter key was pressed twice.

End
The end time of the report interval that is currently displayed.

Name (Q8STNAME)
The name of the Accelerator.

State (Q8STTATE)
The current state of the Accelerator. The following list shows the values for the state:
- INITIALIZED
- INITING
- ONLINE
- PAUSED
- OFFLINE
- STOPPED
- MAINTENANCE

Product ID (Q8STPRID)
The internal product ID. It includes the version of the Accelerator.

Server Start Time (Q8STTART)
The time the Accelerator server process is started.

Status Change Time (Q8STTATC)
The time the last status change is recorded.

Curr Active Queries (Q8STNCQS)
The number of queries that are processed currently on behalf of this DB2.

Max Active Queries (Q8STMNQ5S)
The maximum number of concurrent queries that are processed on behalf of this DB2.

Avg Coord CPU (Q8STCCPU_64)
The utilization of the CPU on the coordinator node.

Avg Worker CPU (Q8STWCPU_64)
The utilization of the CPU on worker nodes.

Total Num Processors (Q8STCORS)
The total number of CPU cores that are available for worker nodes.

Act Worker Nodes (Q8STWNOD_64)
The number of nodes that are active.

Current Queue Length (Q8STCQL)
The length of the waiting work queue.

Max Queue Length
The high watermark of the query queue length at the accelerator.

Avg Queue Wait Time (MS) (Q8STQUEW)
The average waiting time in a work queue.
Max Queue Wait Time (MS)
The maximum waiting time in a work queue.

Disk Space for All DB2 (MB) (Q8STDSDKA)
The storage that is available on the disk.

Disk In Use All DB2 (MB) (Q8STDSA)
The total disk space that is used in all databases.

The following statistics are displayed for the fields below in tabular format:

TOTAL QUANTITY
The amount of activity since DB2 was started.

INTERVAL QUANTITY
The amount of activity during the last cycle.

/ SECOND (594)
The rate per second during the last cycle. The value in parentheses indicates the number of seconds in the interval.

These are the fields for which the statistics above are displayed:

Successful Requests
The number of query requests sent by this DB2 that are successfully completed since the Accelerator is started.

Failed Reqs Since Start
The number of query requests that are sent by this DB2 since the Accelerator is started that failed for any reason.

The following set of statistic fields is related to replication processing. If replication is not configured for this Accelerator, these fields are not displayed.

Log Records Read (Q8STNLRS)
The total number of log records that is read by capture agents on this DB2.

Log Records Read Accel Tables (Q8STNLTS)
The number of log records that are read by capture agents on this DB2 for tables that reside in this Accelerator.

Log Record Bytes Processed (Q8STNBS)
The number of bytes that are processed by capture agents for this DB2.

Rows Inserted Accel Tables (Q8STNIS)
The number of inserted rows that are processed by capture agents on this DB2 for tables that reside in this Accelerator.

Rows Updated Accel Tables (Q8STNUS)
The number of updated rows that are processed by capture agents on this DB2 for tables that reside in this Accelerator.

Rows Deleted Accel Tables (Q8STNDS)
The number of inserted rows that are processed by capture agents on this DB2 for tables that reside in this Accelerator.

The following statistics are displayed for the fields below in tabular format:

TOTAL QUANTITY
The amount of time that is consumed since the Accelerator is activated.

INTERVAL QUANTITY
The amount of time that is consumed in the current interval.
These are the fields for which the statistics above are displayed.

**CPU Time Executing Queries (Q8STTCQS)**
- The CPU time that is consumed by the Analytics Accelerator for processing queries.

**CPU Time for Replication (Q8STTCCS)**
- The CPU time that is consumed by the Analytics Accelerator for replication.

**CPU Time for Load/Archive/Restore (Q8STTCMS)**
- The CPU time that is consumed by the Analytics Accelerator for maintenance.

### Application Trace Facility (ATF)

Select this main menu option to access the Application Trace Facility (ATF) to trace the execution of a DB2 application.

The information gathered in these traces helps in the analysis of application flow and resource consumption. The Application Trace Facility provides the following types of performance information:

- SQL trace information including static host variables and dynamic parameter markers
- Sort activity information
- Pageset access and scan information
- Locking information
- Application In-DB2 time and In-DB2 CPU time

The data that is collected by the Application Trace Facility is stored in a VSAM file or resident in memory. If the data is not stored in a VSAM file, it is only available for the current OMEGAMON for Db2 PE session.

All Application Trace Facility (ATF) panels show the current state of an application trace, including a possible trace data set full condition, as ABENDED, ACTIVE, INACTIVE, or DSN FULL. A state of INIT-XXX might be shown briefly during early stages of initialization. For more information, see the description of panel “View the Active In-Memory Non-Dataset Trace” on page 1348.

### Application Trace Facility Menu

This menu provides access to panels from which you can start an application trace, store trace data, review the data collected by an application trace, stop an application trace, and release the storage data set.

You can use this panel to specify the criteria for the application to be traced and to store the trace output. Trace output can have the following formats:

**In memory trace**
- Trace data is stored in the virtual storage of the OMEGAMON for Db2 PE address space. It is limited to the total amount of storage that is available. The storage is owned by the VTAM session that started the trace. The trace starts as soon as you are completing the start request. If the VTAM session terminates while the trace is running, the trace is terminated and the trace output is lost. When the trace is completed, the data is only available to the VTAM session that started the trace. If the VTAM session terminates, or if you request another in memory application trace, the trace is discarded.
To control the TRACE request, select option **B - VIEW TRACE**. To terminate the trace or to view the trace contents, select option **C - Stop Trace**.

**VSAM Dataset Trace**
The trace is written to a VSAM dataset. It is limited by the size of the dataset. You can define whether the trace is to run immediately or to be deferred (scheduled) for execution at a later time. If the trace is started or scheduled, the VTAM session that requests the trace does not need to stay active for the trace to complete successfully. Information about the trace is maintained for the duration of the OMEGAMON for Db2 PE address space, unless it is manually deleted. You can view the trace data from any VTAM session.

To control the trace, select option **H - QUEUED Traces** and select the appropriate element.

---

**Navigation**

The following menu options are available. To select an item, enter the appropriate letter on the command line of the panel. For example, you might want to enter **A** to specify a trace.

**A - Specify Trace**
Provides a fill-in-the-blank panel to identify the application to trace. Select this option to specify or to start an active trace. You can also capture the trace output for later viewing in a dataset.

For more information, see the description of panel “Specify Application Trace” on page 1343.

**B - View Trace**
Shows an overview of the trace status and output information that is generated by the trace.

This option is only available for traces that are not written to a VSAM dataset.

For more information, see the description of panel “View the Active In-Memory Non-Dataset Trace” on page 1348.

**C - Stop Trace**
Stops the active trace of the specified application.
This option is only available for traces that are not written to a VSAM dataset.
For more information, see the “Stop In-Memory Non-Dataset Trace Requests” on page 1350 panel.

D - Select Dataset
Select this option to select a data set that previously captured trace output.

This option is deprecated in version 5.2.0 and subsequent versions. To select a data set that contains previously captured trace output, enter option H to manage traces that are written to a VSAM data set.
For more information, see the description of panel “Select Data Set and Trace Parameters” on page 1350.

E - View Dataset
Select this option to view the data in the selected trace data set.

This option is deprecated in version 5.2.0 and subsequent versions. To view the data in the selected trace data set, enter option H to manage traces that are written to a VSAM data set.
For more information, see the description of panel “Application Trace Thread Summary - View Dataset” on page 1352.

F - Stop View
Select this option to release a previously selected trace data set from OMEGAMON for Db2 PE.

This option is deprecated in version 5.2.0 and subsequent versions. To release a selected trace data set from OMEGAMON for Db2 PE, enter option H to manage traces that are written to a VSAM data set.
For more information, see the description of panel “Stop Viewing Trace Dataset” on page 1354.

G - CREATE DSN
Select this option to create a new VSAM linear data set for storing the trace output.

For more information, see the description of panel “Create Application Trace Data Set Name” on page 1354.

H - QUEUED TRACES
Select this option to manage the queue of application trace requests that are written to a VSAM dataset.

You can use the 3270 Tab key in panels that permit for data entry. The 3270 Tab key eases the navigation in panels with multiple data entry fields.

Specify Application Trace:

Use this panel to specify the criteria for the application to be traced and the data set to which the trace data is to be stored for later analysis.

All ATF panels display the current trace status. The following values might be displayed:

ACTIVE
The application trace is active.

INACTIVE
The application trace is inactive.
You can trace up to five individual plans or all plans (threads) executing in the DB2 system. To limit trace overhead incurred by the DB2 subsystem and OMEGAMON XE for DB2 PE, qualify your trace request as much as possible. To qualify a trace request, enter the required information for only one of the connection types (TSO, batch, CICS, or IMS).

**Note:** Use SMP/E USERMOD if you want to change default options and limits listed below. See TKANSAM(KO2MOD01) for more information.

**Navigation**

For additional options, use the PF keys.

**Fields**

**DSN**  
The name of a VSAM data set. If you want trace data to be saved for later viewing, enter the name of a preallocated, preformatted data set; otherwise, leave this field blank.

For considerations about sizing VSAM data sets for various record types and output devices, see *Configuration and Customization*.

For procedures about customizing the Application Trace Facility, see *Configuration and Customization*. The ATF uses only the primary extent of a data set; it does not use secondary extents. Keep this in mind when considering space requirements for the trace data.
MODE
Defines whether trace data is appended to existing data in the VSAM data set that is specified in the DSN field. You can use the following values:

APPEND
Any previously collected trace data is retained and new data is appended to the end of existing data.
This is the default value.

REUSE
Deletes existing trace data from a data set before new trace data is added.

You can change the default value by adding the keyword ATFMODE to the member OMPEOPTS in the rhlrev.RKD2PAR(OMPEOPTS) data set. Valid values for the keyword ATFMODE are APPEND or REUSE.

PLANNAME
The DB2 plan names of the application threads to be traced. To trace all thread activity, set the plan name to ALL. This field is required.
The specification of individual plan names and individual authorization IDs is restricted such that you can specify either up to five plan names and one authorization ID or one plan name and up to five authorization IDs.

AUTHID
The DB2 authorization IDs of the application (threads) to be traced. This field is optional, however, you should supply one or more authorization IDs to limit trace overhead and the amount of data collected.
See also PLANNAME for possible restrictions.

TSOUSER
The TSO user ID of the application (thread) to be traced if the application originates from a DB2 TSO connection. This limits the amount of trace data collected and overhead incurred.

JOBNAME
The jobname of the application (thread) to be traced if the application originates from a DB2 batch (TSO background) connection. This limits the amount of trace data collected and overhead incurred.

CICSTRAN
The transaction ID of the application (thread) to be traced if the application originates from a DB2 CICS connection. This limits the amount of trace data collected and overhead incurred.

CICSCONN
The DB2 connection ID of the CICS region from which the application (thread) originates. This limits the amount of trace data collected and overhead incurred.

PSBNAME
The IMS PSB name of the application (thread) if the application originates from the DB2 IMS connection. This limits the amount of trace data collected and overhead incurred.

IMSID
The IMSID of the IMS region from which the application (thread) originates. This limits the amount of trace data collected and overhead incurred.
SMF  Specifies whether the trace data will be written out to SMF in addition to the capture. The default is N. SMF and GTF are mutually exclusive fields. You can specify N for both fields, but not Y.

GTF  Specifies whether the trace data will be written out to GTF in addition to the capture. The default is N. SMF and GTF are mutually exclusive fields. You can specify N for both fields, but not Y.

STATSQL  Specify Yes to enable display of static SQL statements.

SQLDATA  Specify No to inhibit collection of DB2 SQL trace records. This reduces the number of captured trace records and associated overhead.

SQLDATA activates the following IFCIDs:
- 58 END OF SQL STATEMENT EXECUTION
- 59 START OF FETCH SQL STATEMENT EXEC
- 60 START OF SELECT SQL STATEMENT EXEC
- 61 START OF INSERT, UPDATE, DELETE SQL
- 62 START OF DDL STATEMENT EXECUTION
- 63 SQL STATEMENT TO BE PARSED
- 64 START PREPARE SQL STATEMENT EXEC
- 65 START OPEN CURSOR STATIC/DYN SQL
- 66 START CLOSE CURSOR STATIC/DYN SQL
- 177 SUCCESSFUL PACKAGE ALLOCATION
- 233 START/END CALL TO USER ROUTINE

LOCKDATA  Specify NO to inhibit collection of DB2 lock trace records. This reduces the number of captured trace records and associated overhead.

LOCKDATA activates the IFCID 21 DETAIL LOCK REQ.ON RETURN FROM IRLM.

SCANDATA  Specify NO to inhibit collection of DB2 scan trace records. This reduces the number of captured trace records and associated overhead.

SCANDATA activates the following IFCID(s):
- 15 INPUT MATCH./NON-MATCH.INDEX SCAN
- 16 INPUT TO THE FIRST INSERT
- 17 INPUT TO SEQUENTIAL SCAN
- 18 END INDEX SCAN, INSERT, SEQ. SCAN
- 221 PARALLEL DEGREE FOR PARALLEL GROUP
- 222 PARALLEL GROUP ELAPSED TIME
- 231 PARALLEL GROUP COMPLETION

THRDDATA  Specify NO to inhibit collection of DB2 thread trace records. This reduces the number of captured trace records and associated overhead.

THRDDATA activates the following IFCID(s):
- 68 BEGINNING OF A ROLLBACK REQUEST
- 69 ENDING OF A ROLLBACK REQUEST
- 70 BEGIN COMMIT PHASE 2 REQUEST
- 71 END COMMIT PHASE 2 REQUEST
- 73 ENDING OF A CREATE THREAD REQUEST
- 74 BEGINNING OF TERM. THREAD REQUEST

**CONNDATA**
Specify NO to inhibit collection of DB2 connection trace records. This reduces the number of captured trace records and associated overhead. CONNDATA activates the following IFCID(s):
- 84 BEGIN PHASE 1 COMMIT REQUEST
- 85 END PHASE 1 COMMIT REQUEST
- 86 BEGINNING OF SIGNON REQUEST
- 87 ENDING OF SIGNON REQUEST
- 88 BEGINNING OF A SYNC REQUEST
- 89 ENDING OF A SYNC REQUEST
- 95 SORT STARTED
- 96 SORT ENDED

**HOSTVARS**
Specify Y to enable input HOSTVAR data collection. The default is N. HOSTVARS activates the IFCID 247 SQLDA AND INPUT HOST VARIABLE DATA.

**MEMSIZE**
Specifies the amount of virtual memory to be used for the collection work area. You can specify a value from 1 to 4 MB.

The default value is 2 MB.

**TIME**
The time (in minutes) that OMEGAMON XE for DB2 PE will trace the application. The default is 5 minutes. The trace time can be any value from 1 through 60 minutes. The length of the application trace should be minimized to limit the resource utilization (CPU, memory) required by the facility.

**FLUSH**
The interval at which ATF processing will flush those Unit of Work (UOW) records that are complete and write them to the VSAM data set. The default is 300 seconds (5 minutes).

**DEFERRED**
Optionally, you can defer the start of the trace request by specifying the following fields:

**STDAT**
The date (in mm/dd/yyyy or dd.mm.yyyy format) the trace request is to start. You can specify the current date or a date in the future.

**STTIME**
The time (in 24 hour format) the trace is to start. This field is required, if STDAT is specified.

If STDAT represents the current date, STTIME must be a time in the future.

If STDAT is for a future date, this field must be a valid time.
If the OMEGAMON Collector Address Space is stopped, all scheduled requests will be lost. Both fields must be entered for the request to be deferred. Deferred requests must be written to VSAM datasets.

Deferred information cannot be entered when the ATF command is entered from the Thread Detail display.

When you complete the fields in this panel and press Enter, OMEGAMON XE for DB2 PE displays a confirmation panel that contains the values you supplied. To start the application trace using these values, press Enter. To change the values without starting a trace, press F3.

**View the Active In-Memory Non-Dataset Trace:**

This panel shows information about the status of the current trace and a summary of the application (DB2 thread) information that is being collected.

All ATF screens display the Current Trace Status. The basic status values are INACTIVE or ACTIVE. Plans are listed in descending order of in-DB2 CPU time used.

To view unit of work summary information for a traced application thread, place the cursor on the line of a plan name and press PF11.

</table>

After an in-memory trace is started successfully, you can view the trace output by using option **B - View Trace** from the main menu.

**Navigation**

For additional information about

- a particular thread, move the cursor to the thread line and press F11 (Zoom). For more information, see the description of panel **"Application Trace Unit of Work Activity Summary"** on page 1360.

- other topics, use the PF keys.

**Fields**

**Trace Status**

The current status of the trace:
ACTIVE
The trace is still collecting data.

INACTIVE
The time specified on the trace request has elapsed and application trace collection has terminated.

Trace Time Remaining
The time remaining if the trace is still active. If the trace is inactive, this field contains zeros.

Trace Start Time
The time the trace started.

Trace Start Date
The date the trace started.

Trace End Time
The time the trace stopped if trace status is inactive. If the trace is still active, this field contains zeros.

Trace End Date
The date the trace stopped if trace status is inactive. If the trace is still active, this field contains zeros.

Trace Time Limit
The trace time limit specified when the trace was started.

Trace Request Information:
This section displays the request criteria that you specified in the Specify Application Trace panel. For example:
PLANNAME
AUTHID
TSOUSER
STATSQL
HOSTVARS

ATF summary data collected:
This section displays the ATF summary data that is collected since the start of the ATF in-memory trace. The summary data is organized by planname.

Planname
The DB2 plan name of the thread.

Connid
The DB2 connection identifier of the thread.

Corrid
The DB2 correlation identifier of the thread.

Authid
The DB2 authorization identifier of the thread.

InDB2 CPU
The CPU time (in seconds) used by the thread while executing in DB2.

SQL
The total number of SQL statements issued by the thread.

Commits
The total number of Commits that occurred for the thread.

Aborts
The total number of aborts that occurred for the thread.
Stop In-Memory Non-Dataset Trace Requests:

Use this panel to manually stop an application trace that is currently active.

A application trace is normally terminated after the trace time limit that is specified during the trace request has expired.

Stopping trace collection does not delete trace information collected. It simply stops the active trace request. All data collected before trace termination is still available for viewing.

Navigation

For additional options, use the PF keys.

Fields

OMEGAMON XE for DB2 PE does not display any fields on the Stop Application Trace Request panel.

Select Data Set and Trace Parameters:

Use this panel to specify a data set with application trace data so that you can view the trace data. You can also specify selection criteria to limit the data to be reported.
The data set must be a VSAM data set that was used to capture an application trace (by specifying the data set name on the Specify Application Trace panel).

You can limit the data to be reported by applying one or more selection criteria. For example, you can specify a time period, individual plan names or authorization IDs, or qualify a connection type. If no selection criteria are applied, all trace data from the specified data set are reported. By applying selection criteria, you also limit the reporting overhead incurred by OMEGAMON XE for DB2 PE.

Navigation

For additional options, use the PF keys.

Fields

DSN  The name of the VSAM data set that contains the captured trace information. This field is required.

STARTDATE  The starting date delimiting the records to be displayed.

STARTTIME  The starting time delimiting the records to be displayed.

ENDDATE  The ending date delimiting the records to be displayed.

ENDTIME  The ending time delimiting the records to be displayed.
DB2ID
The identifier of the DB2 subsystem to be displayed.

MVSID
The identifier of the MVS where the monitored DB2 resides.

PLANNAME
DB2 plan names to be displayed.

AUTHID
DB2 authorization IDs to be displayed.

TSOUSER
The TSO user ID of the application (thread), if the application originates from a DB2 TSO connection.

JOBNAME
The jobname of the application (thread), if the application originates from a DB2 batch (TSO background) connection.

CICSTRAN
The transaction ID of the application (thread), if the application originates from a DB2 CICS connection.

CICSCONN
The DB2 connection ID of the CICS region from which the application (thread) originates.

PSBNAME
The IMS PSB name of the application (thread), if the application originates from the DB2 IMS connection.

IMSID
The IMSID of the IMS region from which the application (thread) originates.

STATIC SQL(Y/N)
Specifying Y or N determines whether static SQL text is retrieved from the catalog table.

Host Variable(Y/N)
Specifying Y or N determines whether input host variable information is retrieved from the VSAM dataset and displayed on panel ZATD1.

This option applies only to the VSAM ATF. To control whether input host variable data is collected into a VSAM dataset, use the HOSTVARS option on the panels ZATRQ or ZATRQ2.

Application Trace Thread Summary - View Dataset:
This panel shows information about the specified trace request and a summary of application (DB2 thread) information that is being captured in this data set.
Each time you navigate to this panel and each time you press Enter, the data set information is refreshed.

**Navigation**

For additional information about

- a particular thread, move the cursor to the thread line and press F11 (Zoom). For more information, see the description of panel "Application Trace Unit of Work Activity Summary" on page 1360.
- other topics, use the PF keys.

**Fields**

**Trace parameters:** This section displays the specified data set name and the specified trace request information, similar to the Application Trace Thread Summary panel.

**Thread information:** This section shows a summary of thread activities for the specified trace request.

**Plannname**

The DB2 plan name of the thread.

**Connid**

The DB2 connection identifier of the thread.

**Corrid**

The DB2 correlation identifier of the thread.

**Authid**

The DB2 authorization ID of the thread.

**DB2**

The identifier of the DB2 subsystem that is monitored.

**MVS**

The identifier of the MVS where the monitored DB2 resides.

**InDB2 CPU**

The CPU time (in seconds) used by the thread while executing in DB2.

**Commits**

The total number of Commits located for the thread.

**Aborts**

The total number of aborts located for the thread.
Stop Viewing Trace Dataset:

Use this panel to release a data set that was previously selected on the Select Dataset and Trace Parameters panel.

Releasing a data set makes it available for redefinition and recreation. The data will still be available for viewing after the data set is released.

Navigation

For additional options, use the PF keys.

Create Application Trace Data Set Name:

Use this panel to create a VSAM linear data set that can be used as the target for application trace output data.

Navigation

For additional options, use the PF keys.

Fields

**DSN**  The name of the dataset to be created.

**SIZE**  The size of the dataset (in MB). The maximum value is 2048.

**VOLUME**  The volume serial number of the volume on which the dataset is to be placed.
Processing Traces Written to VSAM Datasets:

This panel shows information about the status of the current trace and a summary of the application (DB2 thread) information that is collected.

Navigation

For individual information about:

- A particular trace entry, move the cursor to the trace description line and press F11 (Zoom).
- Related topics, select one of the options at the top of the panel.
- Other topics, use the PF keys.

Fields

Status  The current state of the trace request. The following values might be displayed:

  Pending  The request is awaiting processing.

  Scheduled  The request starts at the scheduled time.

  Executing  The trace request is currently executing.

  Complete  The request has completed. Warning might be displayed.

  Failed  The trace execution cannot be started.

  Obsolete  The VSAM dataset that is used for this completed trace is overwritten by a subsequent trace.

SSID  The DB2 subsystem that the trace collects data from.

Scheduled Start

The following fields contain information about the scheduled or the actual start date and time of the trace.

Date  The start date for this trace if a deferred date is specified in the
trace request. If no start date is specified and if the request is pending, the date is displayed like this: 00/00/0000. When the trace starts executing, the actual start date is displayed.

**Time**  The start time for this trace if a deferred time is specified in the trace request. If no start time is specified and if the request is pending, the time is displayed like this: 00:00. When the trace starts executing, the actual start time is displayed.

**Completion**
The following fields contain information about the actual completion date and time of the trace.

**Date**  The date the trace completed.

**Time**  The time the trace completed.

**Owner**
The owner ID of the trace. If a logon exit is provided, this field displays the USERID from that exit. If a logon exit is not provided, this field contains the VTAM LUNAME of the VTAM session.

**First Plan**
The name that is specified for the first plan in the trace request.

**First AUTHID**
The first author ID that is specified in the trace request. If an author ID is not specified, this field is blank.

**VSAM Trace Entry Detail:**
This panel shows information about the status of the selected trace and a summary of the application (DB2 thread) information that is collected.

The information includes counts of the number of records that are collected and lost. If the counts of records that are lost are not zeros, it indicates that the rate at which DB2 generates the records is too fast for the capture facility. In this case, you should specify more selection criteria to restrict the data.
Navigation

For additional information about:

- Managing the trace output, select one of the options at the top of the panel.
- Other topics, use the PF keys.

Fields

**Queued Request Owner**
This field displays the USERID that is used to log on to OMEGAMON for Db2 PE or the VTAM Terminal ID that the request is issued from if external security is disabled for the OMEGAMON for Db2 PE server.

**Type**
This field identifies the type of queued request. Valid values:

- **Immediate**
  This request is queued for execution. The queue is processed

- **Scheduled**
  This request is scheduled to be executed at a particular time.

**Trace Status**
The following trace information is available:

- **OBSOLETE**
The VSAM dataset used for this trace has been overwritten by > a subsequent trace, so the trace data cannot be confirmed.

- **ABENDED**
The trace is terminated due to ABEND.

- **ACTIVE**
The trace is still collecting data.

- **INACTIVE**
The time that is specified in the trace request elapsed and the application trace collection terminated.
DSN FULL
The VSAM data set that is used for storing the trace data is full.

Trace Time Remaining
The time remaining if the trace is still active. If the trace is inactive, this field contains zero.

Trace Start Time
The time the trace started.

Trace Start Date
The date the trace started.

Trace End Time
The time the trace ended.

Trace End Date
The date the trace ended.

Trace Time Limit
The trace time limit that is specified when the trace is started.

DSN
The specified name of the data set that holds data to be captured.

Trace records captured
The number of records that are captured.

Trace records lost
The number of trace records that are lost.

If a nonzero value is displayed in this field, DB2 generated trace records too fast for the capture facility. You can use trace criteria to limit the amount of data to be captured.

UOW records captured
The number of Unit of Work (UOW) records that are captured.

UOW records lost
The number of UOW records that are lost.

If a nonzero value is displayed in this field, DB2 generated UOW records too fast for the capture facility. You can use trace criteria to limit the amount of data to be captured.

Viewing Dataset:

This panel displays the trace selection criteria and the application trace output that is generated from data that is contained in the selected input dataset.

All ATF screens display the current trace status. The following values are available:

ACTIVE or INACTIVE
Basic status values.

DSN FULL
The output file ran out of space.

INIT-XXX
This value is displayed briefly during various stages of initialization.

ABENDED
The job abended.

Plans are displayed in descending order based on in-DB2 CPU time used.
The section Trace parameters displays the specified data set name and the specified trace request information, similar to the Application Trace Thread Summary panel.

The section Thread information shows a summary of thread activities for the specified trace request.

**Navigation**

To view a summary of the unit of work for a traced application thread, place the cursor on a plan name and press PF11.

**Fields**

**Plannname**
The DB plan name of the thread.

**Connid**
The DB2 connection identifier of the thread.

**Corrid**
The DB2 correlation identifier of the thread.

**Authid**
The DB2 authorization ID of the thread.

**DB2**
The identifier of the DB2 subsystem that is monitored.

**MVS**
The identifier of the MVS where the monitored DB2 resides.

**InDB2 CPU**
The CPU time (in seconds) that is used by the thread while running in DB2.

**Commits**
The total number of Commits that are located for the thread.
The numbers that are displayed for Commits do not include implicit actions that are associated with task termination.

**Aborts**
The total number of aborts that are located for the thread.
The numbers that are displayed for Aborts do not include implicit actions that are associated with task termination.

**Deleting Entries:**

This panel is displayed to delete the currently selected trace entry. It will not delete the dataset, but will remove the entry from the list of managed traces.
If the trace is not yet executing, you can delete the entry by removing the character > in front of the ATQX command and pressing the Enter key.

If the trace is currently executing, an error message is issued. You must use option D to stop the trace before you can delete it.

```
ATQX + Owner = WDRI  State = Complete
+ First Plan = WAYNEPLN  First Authid =
+ Dataset = WDRI.V51OBETA.DS4.ATF
>
To delete this ATF Request, remove the ">" preceding the following command and press the ENTER key. Note, if the status is EXECUTING, the ATQX command will stop the the trace, but NOT delete the entry.
>
>ATQX
```

**Stopping Traces:**

This panel is used to stop a VSAM Trace request, before the requested duration completes.

If the trace is executing, you can stop the trace by removing the character > in front of the ATQX command and pressing the Enter key.

If the trace is not yet executing, an error message is displayed.

```
ATQS + Owner = WDRI  State = Executing
+ First Plan = WAYNEPLN  First Authid =
+ Dataset = WDRI.V51OBETA.DS4.ATF
>
To stop this TRACE Request, remove the ">" preceding the following command and press the ENTER key. Note, if the status is not EXECUTING, the ATQS command will fail.
>
>ATQS
```

**Application Trace Unit of Work Activity Summary**

This panel summarizes thread unit of work activity information for the selected thread.

A single line of output is produced for every commit or abort (either in-flight or complete) that has associated SQL activity. You can evaluate application resource use on a thread unit of work basis.
The unit of work is defined by a commit or thread abort. It shows a single line of information for every commit or abort located for the thread.

All ATF screens display the Current Trace Status. The basic status values are INACTIVE or ACTIVE. The status DSN FULL is displayed if the output file has run out of space. The status INIT-XXX is displayed briefly during various stages of initialization. The status ABENDED might also be displayed.

Unit of work entries are displayed in LIFO (last in first out) order. When you view trace data that is stored in a VSAM dataset, units of work are also sorted by date of occurrence.

An asterisk (*) in column 2 indicates that this UOW ended with COMMIT.

**Navigation**

For additional information about

- a particular unit of work, move the cursor to the required line and press F11 (Zoom). For more information, see the description of panel “Application Trace Program Summary (with activity counts)” on page 1362.
- other topics, use the PF keys.

**Fields**

**Planname**
The DB2 plan name of the application.

**Connid**
The DB2 connection identifier of the application.

**Corrid**
The DB2 correlation identifier of the application.

**Authid**
The DB2 authorization identifier of the application.

**Date**
The date on which the Commit or abort (unit of work) occurred. This field is displayed only when you are viewing trace data from a data set.

**Start Time**
The start time of the DB2 Commit/abort (unit of work).

**Progname**
The first application program name located for the thread Commit or abort (unit of work).
**InDB2 Time**
The In-DB2 time for the thread Commit or abort (unit of work).

**InDB2 CPU**
The In-DB2 CPU time for the thread Commit or abort (unit of work). For parallel task activity, this value represents the sum of the parent and child tasks.

**SQL**
The number of SQL calls issued in the DB2 unit of work.

**Sorts**
The number of sorts processed in the DB2 unit of work.

**Locks**
The number of locks acquired in the DB2 unit of work. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows**
The number of rows processed in the DB2 unit of work. For parallel task activity, this value represents the sum of the parent and child tasks.

**Application Trace Program Summary (with activity counts):**
This panel shows information about the traced application thread unit of work at the program level (with activity counts).

OMEGAMON XE for DB2 PE shows a single line summary of each program that executed at least one SQL call during the trace.

---

**Navigation**
For additional information about

- a particular program, move the cursor to the program line and press F11 (Zoom). For more information, see the description of panel “Application Trace Program Detail” on page 1363.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Planname**
The DB2 plan name of the application.

**Connid**
The DB2 connection identifier of the application.

**Corrid**
The DB2 correlation identifier of the application.

**Authid**
The DB2 authorization identifier of the application.
Prognome
The application program name invoked by application.

InDB2 Time
The elapsed time incurred while executing in DB2.

InDB2 CPU
The CPU time incurred while executing in DB2. The value is expressed in 1000ths of seconds. For parallel task activity, this value represents the sum of the parent and child tasks.

SQL
The total number of SQL requests issued by the program.

Sorts
The total number of sorts because of SQL activity issued by the program.

Locks
The total number of locks that were acquired by SQL statements issued by the program. For parallel task activity, this value represents the sum of the parent and child tasks.

Pages
The total number of pages that were referenced (scanned) by the program. For parallel task activity, this value represents the sum of the parent and child tasks.

Rows
The total number of rows that were examined (scanned) by the program. For parallel task activity, this value represents the sum of the parent and child tasks.

Application Trace Program Detail:

This panel shows application trace detail information at the program level for a traced application thread unit of work.

Following the thread information, the display is logically broken down into four areas for easy evaluation of program efficiency and DB2 resource usage: SQL, sort, lock, and scan.

Navigation

For additional options, use the PF keys.
Fields

Thread information:

Planname
The DB2 plan name of the application.

Connid
The DB2 connection identifier of the application.

Corrid
The DB2 correlation identifier of the application.

Authid
The DB2 authorization identifier of the application.

Program Name
The application program name for which information is being displayed.

SQL summary information:

SQL Call
The SQL statement type.

Stmt#
The statement number of the SQL statement. This is the actual SQL statement number generated by the DB2 precompiler and is contained in the precompiler program output listing.

Count
The total number of executions of the SQL statement.

InDB2 Time
The elapsed time spent executing in DB2 to process the SQL statements.

InDB2 CPU
The elapsed CPU time used executing in DB2 to process the SQL statements. For parallel task activity, this value represents the sum of the parent and child tasks.

Avg Time
The average elapsed time spent executing in DB2 per SQL statement.

Avg CPU
The average CPU time used while executing in DB2 to process the SQL statement.

Sort summary information:

SQL Call
The SQL statement causing sort processing to be invoked.

Stmt#
The SQL statement number causing sort processing to be invoked.

Count
The number of times that the SQL statement invoked a sort.

Sort Time
The elapsed time spent in sort processing that is required to satisfy the call.

Recs
The total number of records sorted.

Reads
The number of records retrieved from a work file during sort processing.

Inserts
The number of records inserted into a work file during sort processing.

Wfiles
The number of logical workfiles used during sort processing.
**Lock summary information:** No data is displayed in this area if you set LOCKDATA equals NO in the Specify Application Trace panel. For parallel task activity, these values include locks held by both parent and child tasks. For more information about lock types, lock levels, and lock resources, see "Lock Types and Lock Levels".

- **Type** The lock type owned. Every lock type owned by the thread is displayed.
- **Level** The lock levels of the various lock types owned. All lock levels owned within a lock type are listed. Lock levels can occur repetitively for a single lock type because of the different resources owned by the locks.
- **Resource** The resource that is the object of the lock. The content of the Resource field is dependent on lock type. For data page (DPAG) and index page (IPAG) locks, the resource does not contain the actual data page number that is locked; it lists the database and pageset that own the data or index page lock. The Count field displays how many data or index page locks exist within the resource (pageset) listed.
- **Count** The number of locks meeting the type, level, and resource description of the lock.

**Scan summary information:** No data is displayed in this area if you set SCANDATA equals NO in the Specify Application Trace panel. For parallel task activity, these values represent the sum of the parent and child tasks.

- **Scan Type** The type of scan to which the following statistics are related.
  - **Index** Index scan
  - **Sequential** Sequential data tablespace scan
  - **Insert** San for a space to insert a new row
  - **Hash** San used for directory DSND01 database access
- **DBID** The identifier of the database that was the object of the scan.
- **Scan Count** The number of scans of the corresponding scan type generated by program SQL activity.
- **PSID** The identifier of the pageset that was the object of the scan.
- **Data Type** The type of statistics displayed:
  - **INDX** Index pageset
  - **DATA** Data pageset
  - **WORK** Data workfile (DSND07) pageset
- **Rows Process** The number of rows processed by the Data Manager. This count can include some rows that belong to a table other than the referenced table (such rows are rejected before the Data Manager applies the qualifying stage 1 predicates).
- **Rows Looked** The number of rows examined by the Data Manager. This count includes
only rows that belong to the referenced table, and to which the Data Manager applied the stage 1 predicates.

**Rows Qual/DM**
The number of rows qualified by the Data Manager (stage 1).

**Rows Qual/RD**
The number of rows qualified by the Relational Data Manager (stage 2).

**Rows Update**
The number of rows updated.

**Rows Insert**
The number of rows inserted.

**Rows De/REF**
The number of rows deleted or set to null because of enforcement of defined referential integrity constraints.

**Pages Scand**
The total number of pages scanned by the Data Manager.

**Pages Sc/REF**
The total number of pages scanned because of enforcement of defined referential integrity constraints.

**Sync Reads**
The number of synchronous buffer reads (DB2 field name: QW0058SR).

**Get Pages**
The number of Getpage operations (DB2 field name: QW0058GP).

**Buffer Writes**
The number of buffer writes (DB2 field name: QW0058WT).

**Parall Groups**
The number of parallel groups created (DB2 field name: QW0058PG).

**SyncWait**
The accumulated wait for synchronous I/O (DB2 field name: QW0058SI).

**LockWait**
The accumulated wait for locks (DB2 field name: QW0058LK).

**UnitWait**
The accumulated wait time for synchronous execution unit switches (DB2 field name: QW0058EU).

**ReadWait**
The accumulated wait time for read activity done by another thread (DB2 field name: QW0058OR).

**WriteWait**
The accumulated wait time for write activity done by another thread (DB2 field name: QW0058OW).

**RID Number**
The number of times RID list was not used because the number of RIDs would have exceeded DB2 limits (DB2 field name: QW0058RL).
RID Store

The number of times a RID list was not used because there is not enough storage available to hold the list of RIDs (DB2 field name: QW0058RS).

Application Trace SQL Index:

This panel shows one line of summary information about each SQL statement associated with the unit of work you are investigating.

The SQL calls are presented in the order of their execution.

You can select a particular call for detailed analysis by placing the cursor on that line and pressing the zoom key.

Navigation

For additional information about
- a particular SQL statement, move the cursor to the statement line and press F11 (Zoom).
- other topics, use the PF keys.

Fields

Plannname
The DB2 plan name of the active thread.

Connid
The DB2 connection identifier of the active thread.

Corrid
The DB2 correlation identifier of the active thread.

Authid
The DB2 authorization identifier of the active thread.

Call Type
The SQL statement type.

Stmt#
The SQL statement number. This is the actual statement number generated by the DB2 precompiler; it is contained in the precompiler program output listing.
**Program**
The program name in which the SQL statement was executed.

**Count**
The number of times this statement was executed consecutively.

**InDB2 Time**
The elapsed time spent executing the SQL statement (or group of statements if Count is greater than 1).

**MRet**
The maximum return code encountered when executing the SQL statement.

**Rws Pc**
The total number of index/data/work rows of all record types processed by the Data Manager. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rws DM**
The total number of index/data/work rows qualified by the Data Manager. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rws RD**
The total number of index/data/work rows qualified by the Relational Data Manager. For parallel task activity, this value represents the sum of the parent and child tasks.

**Application Trace SQL Detail:**

This panel shows information about the traced application at the SQL statement level. It also shows the text of all dynamic SQL calls.

Depending on the SQL data, the information that is displayed in this panel varies.
The data is refreshed each time you press Enter, which shows details for another SQL call.

When the detail pertains to a dynamic SQL call (SQL Call is PREPARE), the panel also shows the text of the call and access path information. You can view both dynamic and static SQL call text in the panel described in "SQL Call Being Executed" on page 948.
Fields

Planname
The DB2 plan name of the active thread.

Connid
The DB2 connection identifier of the active thread.

Corrid
The DB2 correlation identifier of the active thread.

Authid
The DB2 authorization identifier of the active thread.

Control
The next SQL statement that OMEGAMON XE for DB2 PE displays. This panel initially displays the first SQL statement collected for the thread. Use these keywords to control the display:

FIRST  First SQL statement encountered for the thread.
LAST   Last SQL statement encountered for the thread.
NEXT   Next SQL statement encountered for the thread.
PREV   Previous SQL statement encountered for the thread.

nnnnn
The nnnnn (1-99999) entry after the currently displayed SQL statement.

-nnnnn
The nnnnn (1-99999) entry before the currently displayed SQL statement.

Snnnnn
Statement number nnnnn.

Current
The relative number of the SQL statement currently being displayed. This is relative to the total number of calls located for the DB2 unit of work.

Total Number of SQL Calls
The total number of SQL calls located for the DB2 unit of work.

Start Time
The time the SQL statement was issued.

Progname
The name of program that issued the SQL statement.

SQL Call
The SQL statement type.

Stmt#
The SQL statement precompiler statement number.

Retcode
The SQL statement return code returned to the application in the SQLCA.

InDB2 Time
The elapsed wall clock time spent executing the SQL call.

InDB2 CPU
The CPU time used executing the SQL statement. For parallel task activity, this value represents the sum of the parent and child tasks.

Data Type
The type of statistics displayed:
INDEX  Index pageset
DATA   Data pageset
WORK   Data workfile (DSNDB07) pageset

**Rows Proc**
The number of rows processed by the Data Manager for the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows Looked**
The number of rows looked at/examined by the Data Manager for the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows Qual/DM**
The number of rows qualified by the Data Manager for the statement (stage 1). For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows Qual/RD**
The number of rows qualified by the Relational Data Manager for the statement (stage 2). For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows Update**
The number of rows updated by the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows Insert**
The number of rows inserted by the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows Delete**
The number of rows deleted by the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Rows De/Ref**
The number of rows deleted or set to null because of enforcement of defined referential integrity constraints for the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Pages Scand**
The total number of pages scanned by the Data Manager for the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Pages Sc/Ref**
The total number of pages scanned because of enforcement of defined referential integrity constraints for the statement. For parallel task activity, this value represents the sum of the parent and child tasks.

**Sync Reads**
The number of synchronous buffer reads (DB2 field name: QW0058SR).

**Get Pages**
The number of Getpage operations (DB2 field name: QW0058GP).

**Buffer Writes**
The number of buffer writes (DB2 field name: QW0058WT).
Parall Groups
The number of parallel groups created (DB2 field name: QW0058PG).

RID Number
The number of times RID list was not used because the number of RIDs would have exceeded DB2 limits (DB2 field name: QW0058RL).

RID Store
The number of times a RID list was not used because there is not enough storage available to hold the list of RIDs (DB2 field name: QW0058RS).

Num sorts
The number of sorts (DB2 field name: QW0058ST).

Num IXScan
The number of index scans (DB2 field name: QW0058IS).

Num TSScan
The number of table space scans (DB2 field name: QW0058TB).

SyncWait
The accumulated wait for synchronous I/O (DB2 field name: QW0058SI).

LockWait
The accumulated wait for locks (DB2 field name: QW0058LK).

UnitWait
The accumulated wait time for synchronous execution unit switches (DB2 field name: QW0058EU).

ReadWait
The accumulated wait time for read activity done by another thread (DB2 field name: QW0058OR).

WriteWait
The accumulated wait time for write activity done by another thread (DB2 field name: QW0058OW).

GLockWait
The accumulated wait time for global locks (DB2 field name: QW0058GL).

LatchWait
The accumulated wait time for latches (DB2 field name: QW0058LH).

PgLatchWait
Accumulated wait time for page latches (DB2 field name: QW0058PA).

DrainLokWait
Accumulated wait time for drain locks (DB2 field name: QW0058DA).

ClaimWait
Accumulated wait time for claim counts (DB2 field name: QW0058CL).

LogWrtWait
Accumulated wait time for log writers (DB2 field name: QW0058LG).

Static SQL call text or Dynamic SQL call text The complete text of the SQL statement is displayed in this area if it is a static or dynamic call. You can view both dynamic and static SQL call text in the panel described in “SQL Call Being Executed” on page 948.
Miniplan Generated by DB2: Access path information is displayed in this area if the SQL statement is a PREPARE for a SELECT, UPDATE, INSERT, or DELETE statement. A plan for each select block within the prepared SQL statement is provided.

Estimated Cost
The cost factor generated by the DB2 Optimizer for this SQL statement.

Table
The name of the table being accessed.

Access Type
The method in which the table is accessed. Possible values:

INDEX
Index will be used to access table data.

INDEX (ONE-FETCH)
Index will be used to determine which data page is needed for processing. This type of access is used for processing MIN and MAX functions.

INDEX (IN KEYWORD)
Index will be used to access table data for processing the IN keyword in SQL statements.

INDEX (PAGE RANGE)
Index will be used to access table data in a particular page range.

SEQUENTIAL SCAN
All pages in the tablespace (or table, if the tablespace is segmented) will be accessed sequentially.

SEQUENTIAL SCAN (PAGE RANGE)
All pages within a particular page range of the partitioned tablespace will be accessed sequentially.

Index
The name of the index used. If more than one index is used, only the first index is displayed.

Matching Cols
The number of index keys used in the index scan.

Join Method
Type of join being performed. Possible values are NESTED LOOP, HYBRID, and MERGE SCAN.

Table Type
Indicates whether the table is the INNER or OUTER table for the join processing.

Sort Activity
The reason for the sort. If no sort is performed, this field will not be displayed. Possible values:

UNIQ Sort to remove duplicate rows.

JOIN Sort needed for join processing.

ORDER Sort needed to satisfy Order By clause.

GROUP Sort needed to satisfy Group By clause.
UNIQ(C)
Sort to remove duplicate rows (composite table).

JOIN(C)
Sort needed for join processing (composite table).

ORDER(C)
Sort needed to satisfy Order By clause (composite table).

GROUP(C)
Sort needed to satisfy Group By clause (composite table).

Prefetch Activity
The type of prefetch activity being performed. If no prefetch is performed, this field will not be displayed. Possible values:

SEQUENTIAL
Sequential prefetch.

LIST  List Prefetch for one or more indexes.

Access Degree
The degree of parallelism used by the query. This is the number of parallel I/O streams determined by the optimizer at PREPARE time. The actual number of I/O streams used at execution time can be different.

Access Group ID
The parallel group identifier used for accessing the new table. This is the identifier for a group of consecutive parallel operations. These parallel operations have the same number of I/O streams. The value is determined at PREPARE time and might be changed at execution time.

Parallel Mode
The type of parallel processing to be used. Possible values are CPU for CPU parallelism or I/O for I/O parallelism.

Join Degree
The degree of parallelism used in joining the composite table with the new table. This is the number of parallel I/O streams used for the join. The value is set at PREPARE time and might change at execution time.

Join Group ID
The value used to identify the parallel group when DB2 joins the composite table with the new table. This is determined at PREPARE time and could be different at execution time.

Data type conversion is done internally. For certain uncommon data types, internal SQLTYPE(integer) is displayed.

The following SQL data types of the host variable are supported:

DATE
TIME
TIMESTAMP
DATALINK
NUL-TERMINATED GRAPHIC STRING
BLOB
CLOB
DBCLOB
VARYING-LENGTH CHARACTER STRING
Application Trace Lock Detail:

This panel shows a summary of all locks that are acquired as a result of the SQL statement.
The data is refreshed each time you press Enter, which shows details for another SQL call. For parallel task activity, these values include locks held by parent and child tasks.

**Navigation**

For additional information about
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Note:** No data is shown if you specified LOCKDATA=NO in the Specify Application Trace panel.

**Planname**

The DB2 plan name of the active thread.

**Connid**

The DB2 connection identifier of the active thread.

**Corrid**

The DB2 correlation identifier of the active thread.
Authid
The DB2 authorization identifier of the active thread.

Control
The next SQL statement that OMEGAMON XE for DB2 PE displays. This panel initially displays the first SQL statement collected for the thread. Use these keywords to control the display:

FIRST First SQL statement encountered for the thread.
LAST Last SQL statement encountered for the thread.
NEXT Next SQL statement encountered for the thread.
PREV Previous SQL statement encountered for the thread.

nnnnn
The nnnnn (1-99999) entry after the currently displayed SQL statement.

-nnnnn
The nnnnn (1-99999) entry before the currently displayed SQL statement.

Snnnnn
Statement number nnnnn.

Current
The relative number of the SQL statement currently being displayed. This is relative to the total number of calls located for the DB2 unit of work.

Total Number of SQL Calls
The total number of SQL calls located for the DB2 unit of work.

Start Time
The time the SQL statement was issued.

Programe
The name of program that issued the SQL statement.

SQL Call
The SQL statement type.

Stmt# The SQL statement precompiler statement number.
PSET The total number of pageset locks acquired by the SQL statement.
DPAG The total number of datapage locks acquired by the SQL statement.
IPAG The total number of index page locks acquired by the SQL statement.
OTHER The total number of other types of locks acquired by the SQL statement.

Locks Acquired and Locks Owned information: For more information about lock types, lock levels, and lock resources, see "Lock Types and Lock Levels".

TYPE The lock type owned. Every lock type owned by the thread will be displayed.

LEVEL The lock levels of the various lock types owned. All lock levels owned within a lock type will be listed. Lock levels can be displayed repetitively for a single lock type because of the different resources owned by the locks.
RESOURCE
The resource that is the object of the lock. The content of the Resource field is dependent on lock type. For data page (DPAG) and index page (IPAG) locks, the resource does not contain the actual data page number that is locked; it lists the database and pageset that own the data or index page lock. The Count field will then display how many data or index page locks exist within the resource (pageset) listed.

Note: When you are using an ATF trace from VSAM, and the resource is a table or a datapage in a segmented tablespace, OMEGAMON XE for DB2 PE will not translate the PSID number (page set ID) to the table name. Instead, OMEGAMON XE for DB2 PE displays the OBID of the DB2 table. (This is because OMEGAMON XE for DB2 PE uses IFCIDs 105 and 107 to translate the object identifiers from lock records, and those IFCIDs do not contain OBID-TABLENAME pairs.)

You can execute the following SQL statement to determine the DB2 table name from the displayed PSID.

```
SELECT NAME, CREATOR
FROM SYSTBL.SYSTABLES
WHERE DBNAME = 'dbname' AND OBID = nn
```

COUNT
The number of locks meeting the type, level, and resource description of the lock.

Application Trace Event Detail:

This panel shows detailed information about the flow of an application. The information is shown as a series of DB2 events. Each line describes a single event or action. You can control the order by using keywords.
The data is refreshed each time you press Enter, which shows details for another SQL call.

**Navigation**

For additional information about
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Plannename**

The DB2 plan name of the active thread.
Connid
The DB2 connection identifier of the active thread.

Corrid
The DB2 correlation identifier of the active thread.

Authid
The DB2 authorization identifier of the active thread.

Control
The next SQL statement that OMEGAMON XE for DB2 PE displays. This panel initially displays the first SQL statement collected for the thread. Use these keywords to control the display:

FIRST First SQL statement encountered for the thread.
LAST Last SQL statement encountered for the thread.
NEXT Next SQL statement encountered for the thread.
PREV Previous SQL statement encountered for the thread.
+nnnnn The nnnnn (1-99999) entry after the currently displayed SQL statement.
-nnnnn The nnnnn (1-99999) entry before the currently displayed SQL statement.
Snnnnn Statement number nnnnn.
TOP Display the first LROWS (number of logical rows) records for the current SQL statement.
BOTTOM Display the last LROWS records for the current SQL statement.
UP Scroll up about LROWS records from the current display for the current SQL statement.
DOWN Scroll down about LROWS records from the current display for the current SQL statement.

Current
The relative number of the SQL statement currently being displayed. This is relative to the total number of calls located for the DB2 unit of work.

Total Number of SQL Calls
The total number of SQL calls located for the DB2 unit of work.

Event Time
The time the event described started.

TN For parallel processing, this field contains the task number of the child task to which this event applies. For a parent task, or where there is no parallel task activity, this field is blank. The task numbers are assigned arbitrarily at display time to help you distinguish the activity of particular child tasks. Task numbers are not provided by DB2. Events relating to each child task are grouped together following those of the parent task.

Event Type
The DB2 event description. The events displayed are as follows:

• Create Thread
- End Abort Request
- End Alter Database
- End Alter Function
- End Alter Index
- End Alter JAR
- End Alter Mask
- End Alter Permission
- End Alter Procedure
- End Alter Sequence

**Event resource information:** Additional information related to the event listed. The following table lists and briefly describes all possible event tokens that can occur in this field.

<table>
<thead>
<tr>
<th>Event Token</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual=nn</td>
<td>Actual degree of parallelism used.</td>
</tr>
<tr>
<td>ALBP</td>
<td>Alter buffer pool lock.</td>
</tr>
</tbody>
</table>
BIND=nn
   Degree of parallelism at bind time.

BMBA
   Buffer manager SCA MBA L-lock.

BPPS
   A buffer manager pageset P-lock.

CCAT
   CATMAINT convert catalog lock.

CDIR
   CATMAINT convert directory block.

CDRN
   Cursor stability read drain lock.

CMIG
   CATMAINT migration block.

COLL
   Collection lock.

D=x
   Lock duration. Possible values:

   ALC
      Lock is held until the thread is terminated or until the plan is
deallocated.

   CMT
      Lock is held until Commit is processed.

   CM+
      Lock is held until Commit is processed, unless Lock is needed to
maintain the position of the cursor that was opened with the Hold
attribute.

   FRE
      Duration to free all locks.

   INT
      Lock is held as long as DB2 has interest in the resource. The lock is
not dependent on thread Commit or deallocation. This duration is
used only for P-locks.

   MNL
      A lock of short duration that DB2 acquires to do things like
authorization checking.

   MN+
      A lock of short duration that DB2 acquires to temporarily change
from CS to RR during bind or DDL.

   PLN
      Lock is held until plan is deallocated.

   UND
      Undetermined duration.

DB=x
   Database name.

DBEX
   Database exception LPL/GRECP lock.

DGTT
   DGTT URID lock

DPAG
   Data page lock. For more information, see "Lock Types and Lock Levels".

DSET
   Partitioned lock. For more information, see "Lock Types and Lock Levels".

DTBS
   Database lock. For more information, see "Lock Types and Lock Levels".

GRBP
   Group buffer pool start/stop lock.

HASH
   Hash anchor lock.

IEOF
   Index end of file lock.

IPAG
   Index page lock. For more information, see "Lock Types and Lock Levels".

IS
   Intent share lock. For more information, see "Lock Types and Lock Levels".
IX  Intent exclusive lock. For more information, see “Lock Types and Lock Levels”.
MDEL  Mass delete lock.
NAME=StoredProcedure-Name SQLCODE=SqlCode
   The name Stored Procedure and its return code.
PAGES=n
   Number of pages scanned.
PCDB  DDF CDB P-lock.
PDBD  DBD P-lock.
PDSO  Pageset or partitioned pageset open lock. For more information, see “Lock Types and Lock Levels”.
PGM=x
   DBRM name.
PPAG  Page P-lock.
PPSC  Page set/Partition castout P-lock.
PPSP  Page set/Partition P-lock.
PRLF  RLF P-lock.
PS=x
   For scan activity, the name of the indexspace or tablespace that caused the lock.
   For lock activity, the name of the pageset that caused the lock.
PSET  Pageset lock. For more information, see “Lock Types and Lock Levels”.
PSPI  Pageset piece lock. For more information, see “Lock Types and Lock Levels”.
RDRN  Repeatable read drain lock.
RECS=n
   Number of records sorted.
ROW  Row lock.
ROWS=n
   Number of rows processed.
RSIZE=n
   Sort record size (in bytes).
Run=nn
   Degree of parallelism at runtime.
RSIZE=n
   Sort record size (in bytes).
RSTR  SCA access for restart/redo lock.
S  Shared lock. For more information, see “Lock Types and Lock Levels”.
SDBA  Start/stop lock. For more information, see “Lock Types and Lock Levels”.
SIX  Share with intent exclusive lock. For more information, see “Lock Types and Lock Levels”.
SKCT  Skeleton cursor table lock. For more information, see "Lock Types and Lock Levels".

SKPT  Skeleton package table lock. For more information, see "Lock Types and Lock Levels".

SPRC  System Level PIT Recovery lock.

SQLCode | SQL code from the CALL to the stored procedure.

SREC  Log range lock. For more information, see "Lock Types and Lock Levels".

STMT=n  DBRM statement number.

TABL  Table lock. For more information, see "Lock Types and Lock Levels".

U   Update. For more information, see "Lock Types and Lock Levels".

UNDT  Undetermined lock. For more information, see "Lock Types and Lock Levels".

UTSE  Utility serialization lock. For more information, see "Lock Types and Lock Levels".

WDRN  Write drain lock.

X   Exclusive lock. For more information, see "Lock Types and Lock Levels".

### Distributed Data Facility

Select this main menu option for information about distributed database activity.

Additional Distributed Data Facility (DDF) information can be accessed through the Thread Activity and the Resource Managers and Other DB2 Subsystem Information main menu options. For more information, see "Thread Activity" on page 921 and "Resource Managers and Other DB2 Subsystem Information menu" on page 1110.

### Distributed Data Facility Statistics

This panel shows statistics about DDF activity, formatted by remote DB2 location.

Each remote DB2 that has acted as a requester or a server to the monitored (local) DB2 is displayed, together with such statistics as number of transactions sent and received. Miscellaneous information about the local DB2 subsystem, such as send rate and receive rate, is also provided.
For additional information about related topics, select one of the options at the top of the panel. For other topics, use the PF keys.

### Fields

**Collection Interval**
- This field displays REALTIME to indicate that you are looking at the realtime version of this panel and not at the corresponding near-term history panel. The collection interval and the report interval are the same in this panel.

**Start**
- The start time of the first report interval in this display.

**Report Interval**
- The time in the last cycle (for example, between two presses of the Enter key).

**End**
- The end time of the last report interval in this display.

**Location Name**
- The DDF location name of the DB2 subsystem being monitored.

**DDF Status**
- The status of the Distributed Database Facility: ACTIVE or NOT ACTIVE.

**DDF CPU Rate**
- The CPU rate of the DDF address space. Includes both MVS TCB and SRB time.

**Dist Allied Threads**
- The number of distributed allied threads that are currently active.
Active DBATs
The number of currently active database access threads.

Inactive DBATs
The number of currently inactive database access threads.

DDF Send Rate
The rate at which data is being sent by DDF, in bytes, KB, MB, GB per second.

DDF Receive Rate
The rate at which data is being received by DDF, in bytes, KB, MB, GB per second.

Resync Attempts
The number of resynchronization connects attempted with all remote locations. Used only for two-phase commit.

Resync Successes
The number of resynchronization connects that succeeded with all remote locations. Used only for two-phase commit.

Cold Start Connections
The number of Cold Start connections with all remote locations. Used only for two-phase commit.

Warm Start Connections
The number of Warm Start connections with all remote locations. Used only for two-phase commit.

DBATs Queued
Number of times a database access thread (DBAT) had to wait because the maximum number of concurrent DBATs (MAXDBAT) was reached.

Conversation Dealloc
The number of conversations deallocated because the ZPARM limit for maximum connected remote threads (both active and inactive) was reached.

HWM Remote Connections
The high-water mark (HWM) of inactive and active remote threads.

HWM Active DBATs
The high-water mark (HWM) of active database access threads (DBATs). If the INACTIVE option is specified, it is possible for this value and the current number of active DBATs to exceed MAXDBAT. This occurs because DB2 allows CONNECTs to be processed even if MAXDBAT has been exceeded. After connect processing is complete, if MAXDBAT is still exceeded, then the DBAT is made inactive.

Max DB Access (MAXDBAT)
The maximum number of database access threads allowed for the DB2 being monitored (determined by the setting of MAXDBAT in DSNZPARM).

HWM Inactive DBATs
The high-water mark (HWM) of inactive database access threads (DBATs).

Remote statistics: The following group of fields occurs for each remote DB2 location with which the local DB2 subsystem has communicated, either as a requester or a responder, since the local DB2 was started.
**Remote Location Name**
The name of a remote location with which the local DB2 has communicated. The statistics immediately below this field pertain to this location.

**Conversations Queued**
The number of conversations queued by DDF since the local DB2 was started.

**Indoubts/Remote**
The number of threads that became indoubt with the remote location as coordinator.

Each of the following sent/received fields generates two rows of output; the top row is the sent value, and the bottom row is the received value.

**SQL Sent/Recv**
The number of SQL calls sent to and from the remote location since the local DB2 was started.

**Row Sent/Recv**
The number of rows sent to and from the remote location since the local DB2 was started.

**Message Sent/Recv**
The number of VTAM messages sent to and from the remote location since the local DB2 was started.

**Byte Sent/Recv**
The number of bytes sent to and from the remote location since the local DB2 was started.

**Commit Sent/Recv**
The number of Commits sent to and from the remote location since the local DB2 was started.

**Abort Sent/Recv**
The number of aborts sent to and from the remote location since the local DB2 was started.

**Conv Sent/Recv**
The number of conversations sent to and from the remote location since the local DB2 was started.

**Blocks Sent/Recv**
The number of blocks sent to and from the remote location, if using block mode.

**Distributed Data Facility VTAM Summary**
This panel provides DDF VTAM-related information, including high-level analysis of active VTAM sessions, active VTAM APPC conversations, and the number of active threads.

Information is presented for each remote DB2 location that has a current connection to the local DB2 subsystem being monitored.
Navigation

For additional information about

• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

VTAM Luname
The VTAM logical unit name in use by DDF.

VTAM Acbname
The VTAM access control block name for the logical unit in use by DDF.

VTAM Modetab
The VTAM mode entry table name in use by DDF.

VTAM Sessions
The number of active VTAM sessions that are currently allocated.

VTAM Version
The version of VTAM that is in use.

VTAM Conversations
The number of active VTAM APPC conversations that are currently allocated.

Remote Location Name
The name of a remote location in which active VTAM sessions exist.

Remote Luname
The logical unit name for the remote location in this row.

VTAM Ver
The version of VTAM in use by this remote location.

VTAM Session
The number of active VTAM sessions between this remote DB2 location and the local DB2.

DIST Thread
The number of active distributed allied threads with conversations between this remote DB2 location and the local DB2 subsystem.
**DIST Conv**
The number of active conversations that are in use by the distributed allied threads connected to this remote DB2 and the local DB2.

**DBAC Thread**
The number of active database access threads with conversations between this remote DB2 and the local DB2.

**DBAC Conv**
The number of active conversations that are using the database access threads connected to this remote DB2 and the local DB2.

**Distributed Data Facility VTAM Detail**
This panel shows information about DDF activities from the perspective of active VTAM sessions.

DIST (distributed allied) and DBAC (database access) conversation types are always displayed at the top of the panel. Output is sorted by elapsed time of threads owning the conversations. If a thread owns multiple conversations, the plan name is displayed only for the first conversation. The Planname field is blank for all other conversations owned by the thread.

### Navigation
For additional information about
- the thread that owns a particular conversation, move the cursor to the required line and press F11 (Zoom).
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

### Fields

#### VTAM Session ID
The VTAM session ID of the active VTAM session.

#### Conv Type
The conversation type.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBAC</td>
<td>A conversation owned by a database access thread.</td>
</tr>
<tr>
<td>DIST</td>
<td>A conversation owned by a distributed allied thread.</td>
</tr>
<tr>
<td>SYST</td>
<td>A system conversation between two DB2 subsystems.</td>
</tr>
<tr>
<td>AVAL</td>
<td>No conversation on this active VTAM session.</td>
</tr>
</tbody>
</table>
VTAM Luname
The logical unit name of the remote DB2 location that is the partner logical unit for the active VTAM session.

VTAM Logmode
The VTAM logmode entry name in use by the session.

Time Since Last Req
The time that has elapsed since the last VTAM APPC request was issued on the active conversation (hh:mm:ss)

Conv Status
The status of the conversation:
- WAIT-VTAM
  The conversation is suspended and waiting for a VTAM response.
- IN-VTAM
  The conversation is active within VTAM.
- NOT ACTIVE
  The conversation is inactive (neither active nor waiting for a VTAM response).

Planname
The plan name of the thread that owns the conversation using this VTAM session. If this field is blank for a DIST or DBAC conversation type, the plan name is the same as the one immediately before.
If Conv Type is SYST, this field is blank because no plan is involved.

Object Analysis
Select this main menu option for information about DB2 object allocations, object activities, volume activities, and data set extend activities.

Object analysis collection must be started, otherwise no information is provided. For more information, see the description of panel “Start Object Analysis Collection” on page 1429 and panel “Stop Object Analysis Collection” on page 1430.

Object analysis collection requires that the OMEGAMON XE for DB2 PE Event Collection Manager (EVENTMGR) is started. For more information, see Configuration and Customization.

Note: OMEGAMON XE for DB2 PE provides object analysis data only for active DB2 objects. Data is not available for objects that are not open.

Note: Object analysis can only be performed on a single DB2 subsystem, no matter whether the subsystem is a member of a data sharing group or not.

Object Allocation Summary
This panel shows allocation-related information at the database level.

It displays only databases that contain spaces that are currently allocated to the DB2 subsystem being monitored (if a database is stopped it will not be displayed in the panel).

You can use the default settings of the Object Allocation Summary, or you can limit the data that is displayed by modifying the Display options.
If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

**Navigation**

For additional information about

- a particular database, move the cursor to the database line and press F11 (Zoom). For more information, see the description of panel “Database Allocations” on page 1396.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Total Databases**

The number of databases that are allocated to the monitored DB2.

**Total Spaces**

The number of spaces that are allocated to the monitored DB2.

**Total Datasets**

The number of data sets that are allocated to the monitored DB2.

**Database**

The name of a database.

**Spaces**

The number of spaces owned by the database and currently allocated to DB2.

**Tblsp**

The number of spaces that are tablespaces currently allocated to DB2.

**Indxs**

The number of spaces that are indexspaces currently allocated to DB2.
# DSNs
The number of data sets that are allocated for the spaces owned by the database.

# Extents
The number of data set extents allocated by the data sets.

# Ext/DNS
The average number of extents per data set for the database.

# Max ExtS
The largest number of extents per data set for the database.

## Database Allocations:

This panel provides allocation information for all spacenames owned by a particular database.

OMEGAMON XE for DB2 PE will sort on that column.

![Database Allocations Table](image)

### Navigation

For additional information about
- a particular space, move the cursor to the spacenane line and press F11 (Zoom).
- related display options, select option **C-Display Options**. For more information, see the description of panel “Display Options For Database Allocations And Database Activity Displays” on page 1409.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.
Fields

Database
The name of the database that owns the spacenames in the display.

Total Spaces
The number of spaces in this database.

Total Datasets
The number of data sets in this database.

Spacename
The name of a space that is owned by the database and allocated to DB2.

Type
The spacename type. Possible values:

- **INDX** An index
- **IXCL** A clone of an index
- **LBTS** A LOB tablespace
- **PTIX** A partitioned index
- **PTTS** A partitioned tablespace
- **SEGM** A segmented tablespace
- **TBLS** A simple tablespace
- **TSCL** A clone of an universal tablespace
- **TSPG** A partition by growth universal tablespace
- **TSPR** A partition by range universal tablespace
- **XMTS** An XML tablespace
- **UNDT** Undetermined
  This can occur if the database DBD is currently not loaded in the EDM pool.

BP
The identifier of the buffer pool in use by the spacename.

Vols
The number of volumes in use by the spacename.

DSNs
The number of data sets that are allocated for the spacename.

Exts
The number of data set extents allocated by the data sets.

Exts/DSN
The average number of extents per data set for the spacename.

Max Exts
The largest number of extents per data set for the spacename.

Spacename Allocations:

This panel provides allocation-related information at the spacename level.

It displays only data sets that are currently allocated to DB2 and are owned by the spacename displayed.
OBJECT ANALYSIS: Enter a selection letter on the top line.

SPACENAME ALLOCATIONS

OJA2
+ Database = DSNDB01  Spacename = SPT01  Type = PART BY GROWTH TS
+ Datasets = 1  Volumes = 6  Exts = 21
+ Space = 5910 Trks
+ *
  + DSN  Vols  Exts  Fmt  Pg  High  High  %  In Use  Dataset  Space
  + 001  6  21 00210B  00210B  100.0%  5910 Trks

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation

For additional information about
- a particular data set, move the cursor to the DSN line and press F11 (Zoom). For more information, see the description of panel “Dataset Allocations” on page 1399.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

Fields

Database
The name of the database that owns the spacename.

Spacename
The name of the space about which information is displayed.

Type
The spacename type. Possible values:
- INDX  An index
- IXCL  A clone of an index
- L BTS  A LOB tablespace
- PTIX  A partitioned index
- PTTS  A partitioned tablespace
- SEGM  A segmented tablespace
- TBLS  A simple tablespace
- TSCL  A clone of an universal tablespace
- TSPG  A partition by growth universal tablespace
- TSPR  A partition by range universal tablespace
- XMTS  An XML tablespace
UNDT
Undetermined
This can occur if the database DBD is currently not loaded in the
EDM pool.

Datasets
The number of data sets in use by the spacename.

Volumes
The number of volumes in use by the data set.

Exts
The number of data set extents allocated by all data sets in use by the
spacename.

Space
The total amount of space allocated by the spacename.

DSN
The sequence number of the data set.

Vols
The number of volumes that the data set resides on.

Exts
The number of extents allocated by the data set.

High Fmt Pg
The highest page number formatted in the data set. This value is displayed
in hexadecimal.

High Alloc Pg
The highest page number allocated in the data set. This value is displayed
in hexadecimal.

% In Use
The percentage of pages in use for the data set. This value is computed by
dividing High Fmt Pg by High Alloc Pg.

Dataset Space
The total amount of space allocated by the data set. This value is expressed
in tracks.

Dataset Allocations:
This panel provides allocation information for a single DB2 data set.

This display helps you evaluate data set size, data set extents, and data set
placement.
### DATASET ALLOCATIONS

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

**Navigation**

For additional information about
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Database**
- The name of the database that owns the space.

**Spacename**
- The name of the space that owns the data set.

**Type**
- The spacename type. Possible values:
  - **INDX** An index
  - **IXCL** A clone of an index
  - **LBTS** A LOB tablespace
  - **PTIX** A partitioned index
  - **PTTS** A partitioned tablespace
SEGMA
A segmented tablespace

TBLS  A simple tablespace

TSCL  A clone of an universal tablespace

TSPG  A partition by growth universal tablespace

TSPR  A partition by range universal tablespace

XMTS  An XML tablespace

UNDT  Undetermined
This can occur if the database DBD is currently not loaded in the EDM pool.

Dataset
The sequence number of the selected data set.

Volumes
The number of volumes in use by the data set.

Exts  The number of data set extents allocated by the data set.

Space  The total amount of space currently allocated by the data set.

Extent  The sequence number of the extent.

Volume
The volume in which the extent is allocated.

Low CCHH
The beginning cylinder and head address on the volume where the extent
is located.

High CCHH
The ending cylinder and head address on the volume where the extent is
located.

Low Page
The beginning page number contained in the extent. This value is
displayed in hexadecimal.

High Page
The ending page number contained in the extent. This value is displayed
in hexadecimal.

Extent Space
The amount of space allocated by the extent. This value is expressed in
tracks.

Display Options For Object Activity Summary And Object Allocation Summary Displays:

Use this panel to specify filtering criteria for the output that is displayed in the Object Activity Summary and Object Allocation Summary panels.

You can specify more than one filter option.
DISPLAY OPTIONS FOR OBJECT ACTIVITY SUMMARY AND OBJECT ALLOCATION SUMMARY DISPLAYS

OJOO

+ Following options applied to both displays:
  : DATABASE=_______ Filter display output by database name

+ Following options applied to OBJECT ALLOCATION SUMMARY display
  : EXTSDSN>_______ Filter display output by extents/dataset ratio
  : MAXEXTS>_______ " by max extents/dataset

+ Following options applied to OBJECT ACTIVITY SUMMARY display
  : PERCGETP>_______ Filter display output by % of getpage activity
  : PERCIO>_______ " by % of I/O activity
  : RATE=_______ Display activity rates or counts (yes/no)

Navigation

For additional information about other topics, use the PF keys.

Fields

DATABASE=

Type a database name (maximum 8 characters) if you want to limit the displayed information to a particular database or group of databases.

You can specify a wildcard by typing a question mark (?), or you can use an asterisk (*) for generic filtering. For example, DSNDB* would select all databases that begin with DSNDB, and DSN??06 would select all databases that begin with DSN, end with 06, and have any two characters in between.

EXTSDSN>

If you want to display object allocation information that applies only to databases with more than n extents per data set, enter a number that is greater than 0.

MAXEXTS>

If you want to display object allocation information that applies only to databases with data sets containing more than n total extents, enter a number that is greater than 0.

PERCGETP>

If you want to display object activity information that applies only to databases with a percentage of total Getpages that is greater than n, enter a number from 0 to 100.

PERCIO>

If you want to display object activity information that applies only to databases with a percentage of total I/O that is greater than n, enter a number from 0 to 100.

RATE=

If you want to display object activity information as rates rather than counts, enter YES. The default is NO. Rates are calculated dividing each count field by the interval elapsed time.
**Object Activity Summary**

This panel shows a high-level analysis of Getpage and I/O activity from a DB2 database perspective.

<table>

For additional information about

- a particular database, move the cursor to the database line and press F11 (Zoom). For more information, see the description of panel “Database Activity” on page 1404.
- related display options, select option E-Display Options. For more information, see the description of panel “Display Options For Object Activity Summary And Object Allocation Summary Displays” on page 1401.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Interval Time**

The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

**Interval Elapsed**

The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

**Total Getpage**

The total number of Getpage requests since the beginning of the collection interval.

**Total I/O**

The total number of I/O requests since the beginning of the collection interval.

**Database**

The name of a database that has incurred Getpage or I/O activity.

**% of Getp**

The percentage of total Getpage activity that is applicable to the database.
% of I/O
The percentage of total I/O activity that is applicable to the database.

Getp per RIO
The Getpage to Read I/O ratio for the database. This ratio is computed by dividing Getpage by Sync Read + Pre Fetch.

Getpage
The number of Getpage requests for the database.

Sync Read
The number of synchronous reads for the database.

Pre Fetch
The number of prefetch Read I/Os for the database.

Async Write
The number of asynchronous writes for the database.

Other Write
The number of immediate and format writes for the database.

Database Activity:
This panel shows activity information about spaces that have incurred Getpage or I/O activity during the current collection interval. This panel formats Getpage and I/O activity for spaces owned by a single database.

<table>
<thead>
<tr>

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation
For additional information about
- a particular space, move the cursor to the spacename line and press F11 (Zoom). For more information, see the description of panel “Spacename Activity” on page 1407.
- related thread activity, select option C-Thread Activity. For more information, see the description of panel “Thread Activity by Database” on page 1405.
• related display options, select option **D-Display Options**. For more information, see the description of panel "Display Options For Database Allocations And Database Activity Displays" on page 1409.

• related topics, select one of the options on the top of the panel.

• other topics, use the PF keys.

### Fields

**Interval Time**

The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

**Interval Elapsed**

The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

**Total Getpage**

The total number of Getpage requests since the beginning of the collection interval.

**Total I/O**

The total number of I/O requests since the beginning of the collection interval.

**Database**

The name of the database that owns the spacenames in the display.

**Spacename**

The name of a space that has incurred Getpage/IO activity.

**% of Getp**

The percentage of total Getpage activity that is applicable to the spacename.

**% of I/O**

The percentage of total I/O activity that is applicable to the spacename.

**Getp per RIO**

The Getpage to Read I/O ratio for the spacename. This ratio is computed by dividing Getpage by Sync Read + Pre Fetch.

**Getpage**

The number of Getpage requests for the spacename.

**Sync Read**

The number of synchronous Reads for the spacename.

**Pre Fetch**

The number of prefetch Read I/Os for the spacename.

**Async Write**

The number of asynchronous Writes for the spacename.

**Other Write**

The number of immediate and format Writes for the spacename.

### Thread Activity by Database:

This panel shows activity information for each thread that generated I/O activity for a selected DB2 database during the collection interval.
If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

**Navigation**

For additional information about other topics, use the PF keys.

**Fields**

**Interval Time**

The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

**Interval Elapsed**

The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

**Total Getpage**

The total number of Getpage requests since the beginning of the collection interval.

**Total I/O**

The total number of I/O requests since the beginning of the collection interval.

**Database**

The name of the selected database for which thread activity has occurred.

**Plannname**

The name of the plan associated with the thread.

**Authid**

The authid associated with the thread.

**Correlation**

The correlation ID associated with the thread.

**Getpage**

The number of Getpage requests made by the thread.

**Sync Read**

The number synchronous reads made by the thread.
Sequential Prefetch
The number of Sequential Prefetch Read I/Os made by the thread.

List Prefetch
The number of List Prefetch Read I/Os made by the thread.

Spacename Activity:
This panel shows activity information about data sets that have incurred Getpage and I/O activity during the current collection interval. This panel formats Getpage and I/O activity for a single spacename.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation
For additional information about
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

Fields
Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Total Getpage
The total number of Getpage requests since the beginning of the collection interval.

Total I/O
The total number of I/O requests since the beginning of the collection interval.

Database
The name of the database that owns the spacename (and data sets) in the display.
Spacename
The name of the space that contains the data sets in the display.

DSN
The sequence number of a data set that incurred I/O activity.

% of Getp
The percentage of total Getpage activity that is applicable to the spacename.

% of I/O
The percentage of total I/O activity that is applicable to the spacename.

Getp per RIO
The Getpage to Read I/O ratio for the spacename. This ratio is computed by dividing Getpage by Sync Read + Pre Fetch.

Getpage
The number of Getpage requests for the spacename.

Sync Read
The number of synchronous reads for the spacename.

Pre Fetch
The number of prefetch Read I/Os for the spacename.

Async Write
The number of asynchronous writes for the spacename.

Other Write
The number of immediate and format writes for the spacename.

Thread Activity by Spacename:
This panel shows thread activity information for each thread that generated I/O activity to the spacename during the collection interval. Use this information to analyze which threads are generating I/O activity for a selected spacename.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation
For additional information about other topics, use the PF keys.
Fields

Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Total Getpage
The total number of Getpage requests since the beginning of the collection interval.

Total I/O
The total number of I/O requests since the beginning of the collection interval.

Database
The name of the selected database for which thread activity has occurred.

Spacename
The name of the selected spacename for which thread activity has occurred.

Planname
The name of the plan associated with the thread.

Authid
The authid associated with the thread.

Correlation
The correlation ID associated with the thread.

Getpage
The number of Getpage requests made by the thread.

Sync Read
The number synchronous reads made by the thread.

Sequential Prefetch
The number of Sequential Prefetch Read I/Os made by the thread.

List Prefetch
The number of List Prefetch Read I/Os made by the thread.

Display Options For Database Allocations And Database Activity Displays:
Use this panel to specify filtering criteria for the output that is displayed in the Database Allocations and Database Activity panels.
Navigation

For additional information about other topics, use the PF keys.

Fields

**SPACENAM=**

Enter a spacename (maximum 8 characters) if you want to limit the displayed information to a particular space or group of spaces.

You can specify a wildcard by entering a question mark (?), or you can use an asterisk (*) for generic filtering. For example, DSN* would select all databases that begin with DSN, and DSN??010 would select all databases that begin with DSN, end with 010, and have any two characters in between.

**BPID=**

If you want to display database allocation and activity information that applies only to a particular buffer pool, enter the buffer pool ID.

**Note:** Omit the ‘BP’ prefix when you specify the buffer pool ID.

4KB 0, 1, 2, ..., 49
8KB 8K0, 8K1, 8K2, ..., 8K9
16KB 16K0, 16K1, 16K2, ..., 16K9
32KB 32K, 32K1, 32K2, ..., 32K9

**EXTSDSN>**

If you want to display database allocation information that applies only to spaces with more than \( n \) extents per data set, enter a number that is greater than 0.

**MAXEXTS>**

If you want to display object allocation information that applies only to spaces with more than \( n \) total extents per data set, enter a number that is greater than 0.
TYPE=
If you want to limit the displayed information to a particular object type, enter one of the following values:

INDX  An index
IXCL  A clone of an index
LBTS  A LOB tablespace
PTIX  A partitioned index
PTTS  A partitioned tablespace
SEGM  A segmented tablespace
TBLS  A simple tablespace
TSCL  A clone of a universal tablespace
TSPG  A partition by growth universal tablespace
TSPR  A partition by range universal tablespace
XMTS  An XML tablespace
UNDT  Undetermined

This can occur if the database DBD is currently not loaded in the EDM pool.

PERCGETP>
If you want to display database activity information that applies only to spaces with a percentage of total Getpage that is greater than \( n \), enter a number from 0 - 100.

PERCIO>
If you want to display database activity information that applies only to spaces with a percentage of total I/O that is greater than \( n \), enter a number from 0 - 100.

RATE=
If you want to display database activity information as rates rather than counts, enter YES. The default is NO. Rates are calculated dividing each count field by the interval elapsed time.

Volume Activity Summary
This panel shows activity information of volumes that contain DB2 objects that are currently allocated and available for use by the DB2 being monitored. Use this information to evaluate the DASD performance by volume.
OBJECT ANALYSIS: Enter a selection letter on the top line.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

**Navigation**

For additional information about:

- a particular volume, move the cursor to the volume line and press F11 (Zoom). For more information, see the description of panel “Volume Database Activity” on page 1413.
- related display options, select option E-Display Options. For more information, see the description of panel “Display Options For Volume Activity Summary Display” on page 1427.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

**Fields**

**Interval Time**

The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

**Interval Elapsed**

The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

**Volume**

The name of a volume that contains DB2 objects.

**Unit**

The address of the volume.

**Vol Util%**

The volume utilization percentage. This value represents the percentage of time the volume is actually in use.
Vol Serv
The average service time for the volume since the beginning of the collection interval. This field is the sum of the average IOS pending time, the average IOS connect time, and the average IOS disconnect time for the volume. It does not include IOS queue time.

Total I/O
The total number of I/Os for this volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

DB2 I/O
The total number of I/Os (for this volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

% DB2 I/O
The percentage of total DB2 I/O that is attributable to the volume. This value is derived by dividing the volume DB2 I/O count by the total DB2 I/O count.

Alloc DSNs
The number of physical DB2 data sets currently allocated as a result of the DB2 spaces residing on the volume.

Alloc Exts
The number of data set extents currently allocated as a result of the DB2 data sets residing on the volume.

Exts/DSN
The average number of allocated extents per allocated data set on the volume.

Volume Database Activity:
This panel shows activity information of each database that has incurred I/O to a single volume. Use this information to analyze I/O activity from a DB2 database perspective.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.
Navigation

For additional information about

- a particular database, move the cursor to the database line and press F1 (Zoom). For more information, see the description of panel "Volume Spacename Activity" on page 1417.
- related topics, select one of the options on the top of the panel.
- other topics, use the PF keys.

Fields

Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Volume/Unit
The name and address of the volume.

Total I/O Rate/sec
The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

Device Type
The device type of the volume displayed.

DB2 I/O Rate/sec
The total number of I/Os per second (for the volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

Database
The name of a database that contains one or more objects residing on the volume.

DSNs
The number of data sets that have incurred I/O to the volume since the beginning of the collection interval.

Exts
The number of allocated extents that have incurred I/O to the volume since the beginning of the collection interval.

Vol Use%
The percentage of DB2 I/O activity to the volume that is attributable to the database. This ratio is computed by dividing the total I/O rate for the database by the total DB2 I/O rate to the volume.

Total I/O Rate
The total I/O rate (per second) that is attributable to the database for the time elapsed.

Read I/O Rate
The Read I/O rate (per second) that is attributable to the database for the time elapsed.

Write I/O Rate
The Write I/O rate (per second) that is attributable to the database for the time elapsed.
Total I/O Count
The total I/O count that is attributable to the database for the time elapsed.

Read I/O Count
The number of reads that are attributable to the database for the time elapsed.

Write I/O Count
The number of writes that are attributable to the database for the time elapsed.

Volume Service:
This panel shows a breakdown of volume service time by the various IOS service-time components. Use this information to analyze service times for a single DASD volume.

<table>
<thead>
<tr>

Fields

Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Volume/Unit
The name and address of the volume.

Total I/O Rate/sec
The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

Device Type
The device type of the volume displayed.

DB2 I/O Rate/sec
The total number of I/Os per second (for the volume) originating from the
DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

Vol Serv
The average service time for the volume since the beginning of the collection interval. This field is the sum of the average IOS pending time, the average IOS connect time, and the average IOS disconnect time for the volume. It does not include IOS queue time.

Pending
The average IOS pending time for the volume. This is a subset of total volume service time.

Connect
The average IOS connect time for the volume. This is a subset of total volume service time.

Disconnect
The average IOS disconnect time for the volume. This is a subset of total volume service time.

Thread Activity by Volume:
This panel shows activity information for each thread that generated I/O activity to the selected volume during the collection interval. Use this information to determine which DB2 threads are generating I/O on the selected volume.

Fields
Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Volume/Unit
The name and address of the volume.
Total I/O Rate/sec
The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

Device Type
The device type of the volume displayed.

DB2 I/O Rate/Sec
The total number of I/Os per second (for the volume) that originated from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

Plannname
The name of the plan associated with the thread.

Authid
The authid associated with the thread.

Correlation
The correlation ID associated with the thread.

Total I/O Rate
The total I/O rate (per second) that is attributable to the volume for the time elapsed.

Read I/O Rate
The Read I/O rate (per second) that is attributable to the volume for the time elapsed.

Write I/O Rate
The Write I/O rate (per second) that is attributable to the volume for the time elapsed.

Total I/O Count
The total I/O count that is attributable to the volume for the time elapsed.

Read I/O Count
The Read I/O count that is attributable to the volume for the time elapsed.

Write I/O Count
The Write I/O count that is attributable to the volume for the time elapsed.

Volume Spacename Activity:
This panel shows activity information for each spacename owned by the database that incurred I/O activity to the volume during the collection interval. Use this information to analyze I/O activity for a single volume from a DB2 database/spacename perspective.
If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

**Navigation**

For additional information about
- a particular spacename, move the cursor to the spacename line and press F11 (Zoom). For more information, see the description of panel “Volume Dataset Activity” on page 1421.
- related topics, select one of the options at the top of the panel.

**Fields**

**Interval Time**
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

**Interval Elapsed**
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

**Volume/Unit**
The name and address of the volume.

**Total I/O Rate/sec**
The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

**Device Type**
The device type of the volume displayed.

**DB2 I/O Rate/sec**
The total number of I/Os per second (for the volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

**Database**
The name of the selected database.
Spacename
The name of a space that has incurred I/O activity since the beginning of the collection interval.

DSNs
The number of data sets that have incurred I/O to the volume since the beginning of the collection interval.

Exts
The number of allocated extents that have incurred I/O activity since the beginning of the collection interval.

Vol Use %
The percentage of DB2 I/O activity to the volume that is attributable to the spacename. This ratio is computed by dividing the total I/O rate for the database/spacename by the total database I/O rate to the volume.

Total I/O Rate
The total I/O rate (per second) that is attributable to the space for the time elapsed.

Read I/O Rate
The Read I/O rate (per second) that is attributable to the space for the time elapsed.

Write I/O Rate
The Write I/O rate (per second) that is attributable to the space for the time elapsed.

Total I/O Count
The total I/O count that is attributable to the space for the time elapsed.

Read I/O Count
The number of reads that are attributable to the space for the time elapsed.

Write I/O Count
The number of writes that are attributable to the space for the time elapsed.

Volume Thread Activity by Database:

This panel shows volume activity information for each thread that generated I/O activity to the database during the collection interval. Use this information to analyze which threads are generating I/O activity for a single volume from a DB2 database perspective.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation
For additional information about
- a particular data set, move the cursor to the DSN line and press F11 (Zoom). For more information, see the description of panel "Volume Dataset/Extent Activity" on page 1424.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields
Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Volume/Unit
The name and address of the volume.

Total I/O Rate/sec
The total number of I/Os per second for the volume. This value is from an
MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

Device Type
The device type of the volume displayed.

DB2 I/O Rate/sec
The total number of I/Os per second (for the volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

Database
The name of the selected database.

Spacename
The name of the selected space.

DSN
The number of a data set that incurred I/O activity.

Exts
The number of allocated extents that have incurred I/O activity since the beginning of the collection interval.

Vol Use %
The percentage of DB2 I/O activity to the volume that is attributable to the spacename. This ratio is computed by dividing the total I/O rate for the database/spacename by the total spacename I/O rate to the volume.

Total I/O Rate
The total I/O rate (per second) that is attributable to the space for the time elapsed.

Read I/O Rate
The Read I/O rate (per second) that is attributable to the space for the time elapsed.

Write I/O Rate
The Write I/O rate (per second) that is attributable to the space for the time elapsed.

Total I/O Count
The total I/O count that is attributable to the space for the time elapsed.

Read I/O Count
The number of reads that are attributable to the space for the time elapsed.

Write I/O Count
The number of writes that are attributable to the space for the time elapsed.

Volume Thread Activity by Spacename:

This panel shows volume activity information for each thread that generated I/O activity to the spacename during the collection interval. Use this information to analyze which threads are generating I/O activity for a single volume from a DB2 spacename perspective.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

#### Navigation

For additional information about other topics, use the PF keys.

#### Fields

**Interval Time**

The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

**Interval Elapsed**

The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

**Volume/Unit**

The name and address of the volume.

**Total I/O Rate/sec**

The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

**Device Type**

The device type of the volume displayed.

**DB2 I/O Rate/sec**

The total number of I/Os per second (for the volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

**Database**

The name of the database for which thread activity has occurred.

**Spacename**

The name of the space for which thread activity has occurred.

**Planname**

The name of the plan associated with the thread.

**Authid**

The authid associated with the thread.

**Correlation**

The correlation ID associated with the thread.
Total I/O Rate
The total I/O rate (per second) that is attributable to the spacename for the time elapsed.

Read I/O Rate
The Read I/O rate (per second) that is attributable to the spacename for the time elapsed.

Write I/O Rate
The Write I/O rate (per second) that is attributable to the spacename for the time elapsed.

Total I/O Count
The total I/O count that is attributable to the spacename for the time elapsed.

Read I/O Count
The Read I/O count that is attributable to the spacename for the time elapsed.

Write I/O Count
The Write I/O count that is attributable to the spacename for the time elapsed.

Volume Dataset/Extent Activity:
This panel shows activity information for each extend that incurred I/O activity to a single volume during the collection interval. Use this information to analyze I/O activity for a single volume from a DB2 database/spacename/data set perspective.

| OBJECT ANALYSIS: Enter a selection letter on the top line. |
| + C-THREAD ACTIVITY |
| VOLUME DATASET/EXTENT ACTIVITY |
| OJV4 |
| + Interval Time = 00:05:00 | Interval Elapsed = 00:02:59 |
| + Volume/Unit = PMO5DB/4C2F | Total I/O Rate/sec = .0 |
| + Device Type = 3390 | DB2 I/O Rate/sec = .0 |
| + Database = DSN00212 | Spacename = F00 | DSN = 001 |
| + * |
| + Low Extent | High Extent | Page/CCHH | Page/CCHH |
| + ------ | ------ | ----- | ----- |
| + 001 | 000000 | 000000 | 0.0 |
| + 06870000 | 0687000E | 2 | 1 | 1 |

If you move the cursor to any entry in a column and press FI0, OMEGAMON XE for DB2 PE will sort on that column.

Navigation
For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.
Fields

Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Volume/Unit
The name and address of the volume.

Total I/O Rate/sec
The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

Device Type
The device type of the volume displayed.

DB2 I/O Rate/sec
The total number of I/Os per second (for the volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

Database
The name of the selected database.

Spacename
The name of the selected space.

DSN
The sequence number of the selected data set.

Extent
The number of an extent that incurred I/O activity.

Each of the following fields includes two values for each extent. The values are displayed one above the other; for example, the Read I/O rate is displayed above the Read I/O count.

Low Page/CCHH
The starting page number (top line) and cylinder/head address (bottom line) of the extent.

High Page/CCHH
The ending page number (top line) and cylinder/head address (bottom line) of the extent.

Total I/O Rates/Counts
The total I/O rate per second (top line) and count (bottom line) that is attributable to the extent for the time elapsed.

Read I/O Rates/Counts
The Read I/O rate per second (top line) and count (bottom line) that is attributable to the extent for the time elapsed.

Write I/O Rates/Counts
The Write I/O rate per second (top line) and count (bottom line) that is attributable to the extent for the time elapsed.
Volume Thread Activity by Dataset:

This panel shows volume activity information for each thread that generated I/O activity to the data set during the collection interval. Use this information to analyze which threads are generating I/O activity for a single volume from a DB2 data set perspective.

If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation

For additional information about other topics, use the PF keys.

Fields

Interval Time
The collection interval currently in use by the object analysis collector. At the end of this time interval, the collector resets its collection statistics.

Interval Elapsed
The elapsed time within the current collection interval. It is the period of time for which the displayed information is applicable.

Volume/Unit
The name and address of the volume.

Total I/O Rate/sec
The total number of I/Os per second for the volume. This value is from an MVS perspective. If the volume is shared by multiple MVS systems, this value might not reflect all I/O activity to the volume.

Device Type
The device type of the volume displayed.

DB2 I/O Rate/sec
The total number of I/Os per second (for the volume) originating from the DB2 subsystem being monitored. This is a subset of total I/Os per second if I/O to the volume is also occurring from address spaces other than the DB2 subsystem being monitored.

Database
The name of the database for which thread activity has occurred.
Spacename
The name of the space for which thread activity has occurred.

DSN
The name of the data set for which thread activity has occurred.

Plannname
The name of the plan associated with the thread.

Authid
The authid associated with the thread.

Correlation
The correlation ID associated with the thread.

Total I/O Rate
The total I/O rate (per second) that is attributable to the data set for the time elapsed.

Read I/O Rate
The Read I/O rate (per second) that is attributable to the data set for the time elapsed.

Write I/O Rate
The Write I/O rate (per second) that is attributable to the data set for the time elapsed.

Total I/O Count
The total I/O count that is attributable to the data set for the time elapsed.

Read I/O Count
The Read I/O count that is attributable to the data set for the time elapsed.

Write I/O Count
The Write I/O count that is attributable to the data set for the time elapsed.

Display Options For Volume Activity Summary Display:

Use this panel to specify filtering criteria for the output that is displayed in the Volume Activity Summary panel.

<table>

  * by volume DB2 I/O rate
- DB2PERC
  * by volume total DB2 I/O %
- RATE
  Display Volume rates or counts (yes/no)

Navigation

For additional information about other topics, use the PF keys.
Fields

**VOLUME**=

Enter a volume name (maximum 6 characters) if you want to limit the displayed information to a particular volume or group of volumes.

You can specify a wildcard by entering a question mark (?), or you can use an asterisk (*) for generic filtering. For example, VOL* would select all volumes that begin with VOL, and VOL??2 would select all volumes that begin with VOL, end with 2, and have any two characters in between.

**UNIT**=

If you want to display only volume activity information that applies to a particular volume address or group of addresses, enter a value (maximum 4 characters).

You can specify a wildcard by entering a question mark (?), or you can use an asterisk (*) for generic filtering.

**VOLUTIL**

If you want to display only volume activity information where the volume utilization is greater than n percent, enter a number from 0 to 100.

**VOLSERV**

If you want to display only volume activity information where the average volume service time is greater than n, enter a number from 0 to 1000.

**TOTALIO**

If you want to display only volume activity information where the volume's total I/O rate per second is greater than n, enter a number from 0 to 999.

**DB2IO**

If you want to display only volume activity information where the volume's DB2 I/O rate per second is greater than n, enter a number from 0 to 999.

**DB2PERC**

If you want to display only volume activity information where the percentage of total DB2 I/O attributable to the volume is greater than n percent, enter a number from 0 to 100.

**RATE**=

If you want to display volume activity information as rates rather than counts, enter YES. The default is NO. Rates are calculated dividing each count field by the interval elapsed time.

**Dataset Extend Activity**

This panel shows activity information for each database/spacename/data set that has acquired additional extents since object analysis collection was started. Use this information to analyze data set extent activity.
If you move the cursor to any entry in a column and press F10, OMEGAMON XE for DB2 PE will sort on that column.

Navigation

For additional information about
• related topics, select one of the options on the top of the panel.
• other topics, use the PF keys.

Fields

Database
The name of a database that owns the space that incurred extend activity.

Spacename
The name of a space that incurred extend activity.

DSN
The relative number of a data set that incurred extend activity.

Accumulated Extents
The number of data set extents allocated since object analysis collection was started.

Start Object Analysis Collection
Use this panel to start the object analysis collector for the monitored DB2. This collector gathers data that is displayed on the object analysis panels.
Navigation
For additional options, use the PF keys.

**Stop Object Analysis Collection**
Use this panel to stop the object analysis collector for the monitored DB2.

```
> Help PF1
> OJTM VTM Q2 V540.4P SE12 11/06/13 11:10:26 2
                          Back PF3
> OBJECT ANALYSIS: Enter a selection letter on the top line.
> A-START +STOP
> STOP OBJECT ANALYSIS COLLECTORS
> To STOP Object Analysis and Volume Analysis collectors remove the '>
> preceding the following command and press the ENTER key
> OJTM
```

Navigation
For additional options, use the PF keys.

**DB2 Connect Server**
Select this main menu option for information about DB2 Connect Servers that serve as DB2 Connect gateways and are connected to the selected DB2 subsystem.

Other DB2 Connect Server information is displayed in panels that are documented in "Thread Activity" on page 921 and "Resource Managers and Other DB2 Subsystem Information menu" on page 1110.

The DB2 Connect Server panel lists all DB2 Connect Servers that serve as DB2 Connect gateways and are connected to the selected DB2 subsystem. If no DB2 Connect Server is connected to the selected DB2 subsystem, message No DB2 Connect Server connections is displayed.

```
> Help PF1  Up PF7  Down PF8  Zoom PF11
> IBM-590C1A1DE1 9.76.24.33  N/P  ACTIVE  DB2
> IBM-590C1A1... 9.65.68.52  N/P  INACTIVE  N/P
> IBM-588F56F... 9.76.6.137  N/P  INACTIVE  N/P
```

Navigation
You can scroll through the list using F7 and F8, or select a particular list item and press F11 (Zoom). For more information, see the description of panel "DB2 Connect/Gateway Statistics" on page 1432.
Fields

DB2C Master
Shows the name of the member of the data sharing group that controls DB2 Connect monitoring for the group. If N/A is shown, the DB2C Master is currently being changed. For more information, see the description of panel “Redirect Monitoring to Another DB2” on page 900.

Name
Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.

IP Address
Shows the current IP address.

Node Name
Shows the name of the node being monitored by the database system monitor. It identifies the database server node being monitored.

Status
Shows whether the server is active or inactive.

Server Name
Shows the name of the database manager instance for which the snapshot was taken.

If the system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.
**DB2 Connect/Gateway Statistics**

This panel shows statistics details about a selected DB2 Connect gateway.

**Navigation**

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Name**  Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**IP Addr**  Shows the current IP address.

**Srv Inst Name**  Shows the name of the database manager instance for which the snapshot was taken.

**Gateway Snapshot Time**  Shows the date and time when the snapshot of displayed data was taken.

**DB2 Connect information:**
Name  Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.

IP Address  Shows the current IP address.

Node Name  Shows the name of the node being monitored by the database system monitor. It identifies the database server node being monitored.

Node Number  Shows the number assigned to the node in the db2nodes.cfg file.

Srv Product/Version ID  Shows the product and version that is running on the DB2 data server in the form pppvvvrnm, where:
  • ppp stands for SQL
  • vv identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
  • rr identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
  • m identifies a 1-digit modification level

Srv Instance Name  Shows the name of the database manager instance for which the snapshot was taken.

Srv Version  Shows the version of the DB2 data server returning the information.

Time Zone Displacement  Shows the number of hours and minutes that the local time zone is displaced from Greenwich Mean Time (GMT).

Server Status  Shows whether the DB2 data server is active or inactive.

Connections:

Current  Shows the number of applications that are currently connected to the database.

Attempted  Shows the total number of current connections initiated from remote clients to the instance of the database manager that is being monitored.

Wait for Host Reply  Shows the current number of connections to the host databases that are handled by the DB2 Connect gateway and are waiting for a reply from the host.

Wait for Client Send Request  Shows the current number of connections to the host databases that are handled by the DB2 Connect gateway and are waiting for the client to send a request.

Remote Connection  Shows the current number of connections initiated from remote clients to the instance of the database manager that is being monitored.
Remote Conn Executing In DBM
Shows the number of remote applications that are currently connected to a
database and are processing a unit of work within the database manager
instance being monitored.

DB2 Connect Agents:
Registered
Shows the number of agents that are registered in the database manager
instance that is being monitored.

Max Registered
Shows the maximum number of agents that the database manager has
registered at the same time since it was started.

Wait for Token
Shows the number of agents waiting for a token so they can perform a
transaction in the database manager.

Max Wait for Token
Shows the maximum number of agents that have been waiting for a token
at the same time since the database manager was started.

From Pool
Shows the maximum number of agents that have been waiting for a token
at the same time since the database manager was started.

Create Empty Pool
Shows the number of agents created because the agent pool was empty.

Stolen
Shows the number of times that agents are stolen from an application.

Idle
Shows the number of agents in the agent pool that are currently
unassigned to an application.

Max Coordinating
Shows the maximum number of coordinating agents working at one time.

Max Overflow
Shows the number of times a request to create a new agent was received
when the MAXAGENTS configuration parameter had already been
reached.

Inactive DRDA
Shows the number of connections made by a subagent to the database at
the node.

Connection Switch
Shows the number of times that an agent from the agent pool was primed
with a connection and was stolen for use with a different DRDA database.

Private Memory
Shows the amount of private memory that the instance of the database
manager has committed at the time of the snapshot.

Sorts:
Sort Heap Allocated
Shows the total number of allocated pages of sort heap space for all sorts
at the level chosen and at the time of the snapshot was taken.
**DB2 Connect/Gateway Tasks List**

This panel shows DB2 Connect/Gateway task list information about a selected DB2 Connect gateway. Use this panel to display further details for a selected task.

**Navigation**

You can scroll through the list using F7 and F8, or select a particular list item and press F11 (Zoom) for additional information. See “DB2 Connect/Gateway Task Detail fields” on page 1436.

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Name**  Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**IP Addr**  Shows the current IP address.

**Srv Inst Name**  Shows the name of the database manager instance for which the snapshot was taken.
Gateway Snapshot Time
Shows the date and time when the snapshot of displayed data was taken.

Task list column headers:

Process Name
Shows the name of the process (truncated to 15 characters, if it is longer).

Process Owner Name
Shows the session ID that owns the process.

Gateway Process ID
Shows the numerical identifier that uniquely distinguishes a running process.

User Process Time
Shows the total user CPU time, in seconds and microseconds, used by the database manager agent process, the unit of work, or the statement.

System Process Time
Shows the total system CPU time, in seconds and microseconds, used by the database manager agent process, the unit of work, or the statement.

CPU% Usage
Shows the percentage of time that a process used the CPU since the last update.

Memory Usage
Shows the current working set of a process, in KB.

DB2 Connect/Gateway Task Detail fields
The DB2 Connect/Gateway Task Detail panel shows further details about a selected task.

> *****************************************************
---

Process Time (User)
Shows the user process time.
Process Time (System)
Shows the system process time.

Process Time (Total)
Shows the total process time (sum of user and system process time).

**DB2 Connect/Gateway Performance**
This panel shows performance information about a selected DB2 Connect gateway.

---

**Navigation**
For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Name**  Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**IP Addr**  Shows the current IP address.

**Srv Inst Name**  Shows the name of the database manager instance for which the snapshot was taken.

**Gateway Snapshot Time**  Shows the date and time when the snapshot of displayed data was taken.

**Total Statement Time**  For a DCS statement, this field shows the elapsed time between the time the statement was sent from the DB2 Connect gateway to the host for processing and the time at which the result was received from the host.

**Time in DB2 Connect**  For a DCS statement, this field shows the elapsed time for processing an SQL request at a host database server.

**Time on DB2 Host**  Shows the total time, in seconds and microseconds, that was spent executing a particular statement in the SQL cache.
Time in Network Connection
Shows the total time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement.

DB2 Connect/Gateway Package Statistics
This panel shows package statistics information about a selected DB2 Connect gateway.

Navigation
For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields
Name      Shows the name in the database manager configuration file at the client node. It identifies the client node that is running the application.
IP Addr    Shows the current IP address.
Srv Inst Name Shows the name of the database manager instance for which the snapshot was taken.
Gateway Snapshot Time Shows the date and time when the snapshot of displayed data was taken.
Parent DB Name Shows the name of the remote database to which the remote application is connected.
Statement Group Shows the number of statements with outbound bytes.
Network Time Shows the difference between the value for the TIMES FOR SAMPLE SQL STATEMENT - TOTAL STATEMENT TIME field and the value of the TIMES FOR SAMPLE SQL STATEMENT - TIME ON DB2 HOST field.
Average Network Time
Shows the result of the value for the NETWORK TIME field, divided by the number of SQL chains being transferred.

Average Response Size Outbound
Shows the number of bytes per SQL statement received by the DB2 Connect gateway from the host, excluding communication protocol overhead, divided by the number of SQL chains being transferred.

Average Request Size Outbound
Shows the number of bytes per SQL statement sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, divided by the number of SQL chains being transferred.

Address Space Information
Select this main menu option for information about DB2 address spaces.

Address Space Information and OMEGAMON Commands menu
This menu shows actual address space information. Use this menu to navigate to detailed information about address spaces or to issue OMEGAMON XE for DB2 PE commands.

The address space names shown in the above figure are samples. Your actual address space names are shown in the panel.

If the Distributed Data Facility is not active, N/A is displayed next to the letter D.

Navigation
For additional information about
• related topics, select one of the options from the menu.
• other topics, use the PF keys.

Virtual Storage Map
This panel shows the amount of virtual storage currently in use and the amount available for use in the specified address space.
This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.

**Navigation**

For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.
Fields

DA41MSTR
   The name of the job running in this address space. (In this case, DA41MSTR.)

ASID   The address space identification number.

collected at
   The time at which OMEGAMON XE for DB2 PE collected the information for this virtual storage map.

System Area (extended)
   The size of the system area in the extended private area.

Available (extended)
   The amount of extended private area available for use. The boundary between the extended private area available for the user and the extended private area for the system is labeled Extended User Area Limit on the map.

User area (extended)
   The size of the user area in the extended private area.

System Area (private)
   The size of the system area in the private area.

Available (private)
   The amount of private area available for use. The boundary between the private area available for the user and the private area for the system is labeled User Area Limit on the map.

User area (private)
   The size of the user area in the private area.

DB2 Address Space Allocated DDnames and Datasets
This panel shows all ddnames allocated to a jobstep and their corresponding device addresses, data set names, and volume serial numbers (including dynamically allocated ddnames) for the specified address space.

This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.
Navigation

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

**DA41MSTR**

The name of the job running in this address space. (In this case, DA41MSTR.)

**ASID**

The address space identification number.

**collected at**

The time at which OMEGAMON XE for DB2 PE collected the information for this address space.

**DDname**

The ddnames allocated to this job. If the **DDname** field is blank, the data set is part of a concatenation with preceding data sets.

**Addr**

The addresses of the devices allocated to this job.

**VolSer**

The volume serial numbers of the devices allocated to this job.

**Sta,Dsp**

The status and disposition of the devices allocated to this job.

**DSname**

The names of the data sets allocated to this job.

You can type a 2- or 3-digit number after DDNS (DDNSnn or DDNNnn) to suppress the display of the first \(m\) or \(m\n\) lines of output. This ability is useful if all of the ddnames do not fit on one panel.

If you type an **X** before DDNS (XDDNS), OMEGAMON XE for DB2 PE displays the following additional information about the ddname:
• LRECL
• BLKSZ
• RECFM
• ORG
• Password protection
• Number of EXCPs for each data set
• TIoT address for each TCB group

No additional SRBs are scheduled to display this information. OMEGAMON XE for DB2 PE collected all of the data when you selected this panel but only displays it when you type the X.

**Job Information and Start Time**

This panel displays miscellaneous information about the specified address space.

This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.

---

**Navigation**

For additional information about

• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

**Fields**

**DA41MSTR**

The name of the job running in this address space. (In this case, DA41MSTR.)

**ASID**

The address space identification number.

**collected at**

The time at which OMEGAMON XE for DB2 PE collected the information for this address space.

**Job started at**

The time and date on which this job started executing.

**MSGCLASS**

The system message class associated with the job.

**Jobpack Area Modules**

This panel displays information about the modules currently loaded into the user's jobpack area for the specified address space.
This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.

**Navigation**

For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**DA41MSTR**

The name of the job running in this address space. (In this case, DA41MSTR.)

**ASID**

The address space identification number.

**collected at**

The time at which OMEGAMON XE for DB2 PE collected the information about these modules.
Module
The module names allocated to this address space.
Entry
The entry points of the modules allocated to this user.
Length
The length of the modules allocated to this user.
Users
The number of users currently using this module.
Attributes
The attributes associated with this module.

You can type a 2- or 3-digit number after MODS (MODSn or MODnmm) to suppress the display of the first nn or nnn lines of output. This is useful if all of the module names do not fit on one panel.

Region and Program Information
This panel displays information available from the private area.

---

This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

DA41MSTR
The name of the job running in this address space. (In this case, DA41MSTR.)

ASID
The address space identification number.

collected at
The time at which OMEGAMON XE for DB2 PE collected the information for this address space.

Job Step Pgm
The name of the job step program currently executing.

TCBs
The number of TCBs currently attached.

Datasets
The number of data sets currently in use.

Modules
The number of modules currently in use.

Step started at
The time the current step started executing.

now in step # n of m
The number of the current step and the total number of steps in the job.

Each of the following fields is displayed twice: once to describe the region below the 16 MB line and once to describe the region above that line.

Total private region
The total size of the private area, including areas that cannot be allocated.

Unused
The amount of the total private area not currently in use.

Region requested
The amount specified on the REGION JCL parameter.

Region limit
The region limit that the IEALIMIT exit imposes.

Low PVT in use
The storage that the REGION parameter limits. This includes all of the user subpools.

Unallocated
The storage not allocated to subpools.

Free
The storage allocated to subpools but not currently GETMAINed.

High PVT in use
Includes LSQA, SWA, and subpools 229 and 230. This value is allocated from the top of the user's region downward and is not limited by the REGION JCL parameter.
Start of SYSREG
The beginning address of the area of storage reserved for use by the region control task.

End of SYSREG
The ending address of the area of storage reserved for use by the region control task.

Start of low PVT
The beginning address of the storage that the REGION parameter limits.

End of low PVT
The ending address of the storage that the REGION parameter limits.

Current top
The highest allocated address in the low PVT area at the current time.

Limit of region
The ending address of the low PVT area.

Start of high PVT
The beginning address of the high PVT area.

End of high PVT
The ending address of the high PVT area.

DB2 Storage Allocated by Subpool
This panel shows information about current virtual storage allocations for each storage subpool for the specified address space.

This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.
### Navigation

For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

### Fields

**Subpool Information**

**DA41MSTR**  
The name of the job running in this address space.

**ASID**  
The address space identification number.

**collected at**  
The time at which OMEGAMON XE for DB2 PE collected the information for these modules.

**Sbp-K**  
Subpool number and protect key (decimal). Subpools are displayed for the jobstep TCB and below.
Alloc  Amount of virtual storage currently allocated to the subpool (in 4K increments).
Real   Amount of real storage supporting the virtual allocation.
#Blks  Number of allocated blocks.
Addr   The address of the first block allocated.
Free   Number of free bytes (hex) within the allocation.
#Blks  Number of free blocks.
Mxfree Size (hex) of the largest free block within the subpool.
Program Program name of the TCB associated with these subpools.
Own|Shr  Status of the subpool, owned or shared.

Task Private Area Summary
PVT-Lo Task private storage below the 16M line.
PVT-Hi Task private storage above the line.
Subtot Summary of private storage above and below the line.

Address Space Private Area Summary
Tot-Lo Total private area allocated below the line for all tasks in the address space.
Tot-Hi Total private area allocated above the line for all tasks in the address space.
Totals Total private area allocated for all tasks in the address space, both above and below the line.

You can type a 2-digit number after SUBP (SUBPnn) to suppress the display of the first nn lines of output. This ability is useful if all of the subpool names do not fit on one panel.

If you want to display subpools for all TCBs within the address space type an X before SUBP (XSUBP).

Task Control Block Structure
This panel displays the current TCB structure for the target user (the DB2 system services address space, DB2 database services address space, DB2 Internal Resource Lock Manager (IRLM) address space, or the DDF address space).

This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

DA41MSTR

The name of the job running in this address space. (In this case, DA41MSTR.)

ASID

The address space identification number.

collected at

The time at which OMEGAMON XE for DB2 PE collected the information for this TCB structure.

Program

Load module name of the most recently created request block (RB) for each TCB.

Mother

The program name of the mother TCB of the program TCB.

Daughter

The program name of the daughter TCB of the program TCB.

Sister

The program name of the oldest sister TCB of the program TCB.

Jobstep

The name of the current job step.

Figure 6 on page 1451 shows a graphic representation of the information about a typical TCB structure shown on the DB2 Address Space TCB Structure panel.
If you type an A before TCBS (ATCBS), OMEGAMON XE for DB2 PE displays the actual TCB address under each TCB program name. This information can be useful if several TCBs in the same step invoke the same program. If you type an X before TCBS (XTCBS), OMEGAMON XE for DB2 PE displays two extra lines for each TCB. The first line shows the storage protect key for the TCB and indicates whether the address space is APF authorized.

The second line indicates that the TCB is either DISPATCHABLE or NON-DISPATCHABLE. For those TCBs that cannot be dispatched, a short explanation is displayed to indicate which non-dispatchability bit was set.

You can type a 2-digit number after TCBS (TCBSnn) to suppress the display of the first nn lines of output. This ability is useful if all of the TCB names do not fit on one panel.

**Local System Queue Area**

This panel shows the amount of local system queue area (LSQA) storage that is currently allocated and the amount of storage that is available to be used above and below the 16M line in the specified address space.

This panel requires special authorization because its use causes additional system overhead to collect the necessary data. Type /PWD on the top line of the panel, enter a valid password when requested, then press Enter. Thereafter, OMEGAMON XE for DB2 PE displays the requested information.

**Figure 6. Typical TCB Structure**

Chapter 5. Monitoring
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

DA41MSTR
  The name of the job that is running in this address space. (In this case, DA41MSTR.)

ASID
  The address space identification number.

collected at
  The time at which OMEGAMON XE for DB2 PE collected the information for this TCB structure.

Allocated
  The size of the storage which is currently in use.

Percent Allocated
  The percentage of allocated memory versus the whole amount of memory (Allocated / Available * 100).

Available
  The overall available LSQA storage, this includes the allocated LSQA/SWA that is available plus the available user private.

Largest available
  The largest available contiguous storage area.

Available For User Pvt
  The LSQA eligible storage that is available for the private usage of the user.

OMEGAMON Commands

Use this panel to issue session and maintenance commands that are not on the OMEGAMON XE for DB2 PE product panels.

For information about security levels of authorized commands, see Configuration and Customization.

Navigation

For additional information about other topics, use the PF keys.

Commands

The fields in this panel vary according to the command issued. To issue a command that begins with a forward slash (/), type the command on the top line of the panel and press Enter. To issue a command that begins with a period (.) or
any letter, type the command on any line of the general display area (any line below the prompt) and press Enter. The commands you can issue are described below in alphabetical order.

...bb  Clears the panel from the command down to the end of the logical panel (b indicates a blank).

====  Draws a separator line across the panel.

The format is:

c====aa

This command repeats the characters aa across the panel. You can use any two characters as a separator line.

On the 3279 color terminal with extended color on, the optional label c specifies the color of the separator line with the first letter of the color name. It can be: (R)ed, (B)lue, (G)reen, (W)hite, (T)urquoise, (Y)ellow, or (P)ink.

For example, the following command creates a line of red pluses across the panel preceded by 4 equal signs.

R====++

The line looks like this:

+++++++++++++++++++++++++++

/ATTN  Emulates the PA1 (program attention) key. /ATTN clears the panel, resets your password to zero, returns to default basic color settings, and turns off extended color.

/AUP  Enables (/AUP ON) or disables (/AUP OFF) automatic update mode. /AUP applies in VTAM mode only. Automatic update mode is similar to running OMEGAMON XE for DB2 PE in dedicated mode, because the panel updates at regular intervals without pressing Enter. .AUP performs the same functions.

Important: Some network programs do not support automatic update mode (for example, a program that emulates a terminal for your OMEGAMON XE for DB2 PE VTAM mode session).

.AUP  Enables (.AUPON) or disables (.AUPOFF) automatic update mode. If you type .AUP (without ON or OFF), OMEGAMON XE for DB2 PE displays the current automatic update mode status. .AUP applies in VTAM mode only. Automatic update mode is similar to running OMEGAMON XE for DB2 PE in dedicated mode, because the panel updates at regular intervals without pressing Enter. /AUP performs the same functions.

Important: Some network programs do not support automatic update mode (for example, a program that emulates a terminal for your OMEGAMON XE for DB2 PE VTAM mode session).

/BOTTOM  Scrolls to the bottom of the logical panel.

CN  Allocate/open (.CN OP) a secondary console, deallocate/close (.CN CL) a secondary console, swap master/secondary consoles (.CN SW), or set the address of the secondary console (.CNxxx).
In dedicated mode, you can set up a secondary OMEGAMON XE for DB2 PE console to be used for output only. The secondary console echos everything that is displayed on the primary console, but accepts no commands or input of any kind.

The secondary console must be the same terminal type as the primary console.

/D  Scrolls down the amount specified by its argument (/D cccc)

/D is an alias for /DOWN. See the description of the /DOWN command for information about the command arguments.

.D  Deletes nn lines (.Dbb nn) on the physical panel.

This command deletes lines beginning with the current line.

/DCL  Deletes all comment lines in the panel.

If you want to delete only those comment lines below a certain point in the panel, use the equivalent immediate command instead.

.DCL  Deletes all comment lines below its entry line.

If you want to delete all comment lines in the panel, use the equivalent INFO-line command instead. Unlike most other immediate commands, .DCL disappears after it executes.

.DDb  Deletes a block of data.

To delete a block of data from the physical panel, enter .DD on the first line of the block and .DD on the last line.

For example, the following command deletes 4 lines. The first blank line and the succeeding 3 lines are deleted and removed from the panel.

/DDb
  DISK  SYSB24  TS0021  SYSB21  MVS21
  DSKB  MVS21  PROD05  SYSA24
  .Dbb  150  334  D8B

DDEV

Displays DASD device statistics for all or specified volumes.

**Note:** RMF must be active to use this command because the data displayed is from RMF.

You must use the DDEV minor commands to specify the criteria under which the device statistics are displayed.

PDSK  Displays statistics for devices whose names meet a specified pattern. Type PDSK on a separate line after DDEV. You can use PDSK to display statistics for the following:

- All devices using PDSK and an asterisk (*).
  
  Example:
  
  DDEV
  PDSK*  

- A specific device using PDSK and a volume name. (volser).
  
  Example:
  
  DDEV
  PDSK OMON22

- A group of devices using PDSK and part of a volume name followed by the asterisk wildcard character (*).
Example:
DDEV
PDSK OMON*

**XDSK** Displays statistics for devices that exceed a specified threshold. To specify thresholds, enter one or more of the following XDSK minor commands, either before you type **DDEV**, or between **DDEV** and **XDSK**:

**AVQnnn**
Specifies the average IOS queue depth. Average length > mn.n.

**RSPnnn**
Specifies the average total response time > nnn milliseconds.

**IOSnnn**
Specifies the average device queue time > nnn milliseconds.

**CONnnn**
Specifies the average device connect time > nnn milliseconds.

**DSCnnn**
Specifies the average device disconnect time > nnn milliseconds.

**DUTnnn**
Specifies the average device utilization > nnn %.

**PNDnnn**
Specifies average device request pending time > nnn milliseconds.

**Example:**
The following command displays statistics for devices whose utilization is greater than 30%.

DDEV
DUT 30
XDSK

Sample Output: The following example shows the fields displayed by the DDEV command (with either PDSK or XDSK). If you enter **DDEV** without a minor command, only the first line of output is displayed.

<table>
<thead>
<tr>
<th>DDEV Interval Start Time: 10:44:02</th>
<th>Elapsed: 3:30 MN</th>
<th>Length: 14</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdsk OMON* Volser Pattern</td>
<td>-----------------</td>
<td>------------</td>
</tr>
<tr>
<td>+ Volser I/O per second Util% Avg.Q Resp = IOSQ + Pend + Conn</td>
<td></td>
<td></td>
</tr>
<tr>
<td>+ 148 OMON27 .1 1.0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>+ 151 OMON28 .2 .6 12.5 .3 6.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>+ 153 OMON29 23.0 .2 2.0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Interval Start Time**
The start time of the RMF interval during which these statistics are being collected.

**Elapsed**
The number of minutes and seconds elapsed since the beginning of this RMF interval.
Length
The length of this RMF interval in minutes and seconds.

The first column contains the device address in hexadecimal notation (for example, 14B).

Volser Volume name.

I/O per second
I/O rate for this device.

Util % Device utilization percentage.

Avg Q Average I/O queue depth.

Resp Average total device response time in milliseconds.

IOSQ Average I/O queue time in milliseconds.

Pend Average pending time in milliseconds.

Conn Average connect time in milliseconds.

Disc Average disconnect time in milliseconds.

/DEF Sets definition mode (/DEF cccc).

ON Defines a panel space, which includes commands that comment themselves out or otherwise change form after execution. /DEF ON inhibits automatic updating of a dedicated or VTAM mode session. After you set definition mode with /DEF ON, it remains in effect until you issue /DEF OFF, or save or replace the panel space.

HOLD Same as ON argument, but definition mode remains in effect after you save a panel space. It is only canceled when you issue /DEF OFF. Use this option when you want to save two or more panels in a row without reactivating definition mode each time.

OFF Restores normal panel updating (cancels the effect of /DEF ON or /DEF HOLD).

DELT Deletes a panel space from main storage or the user’s panel space library (RKO2PCSV). It does not delete from the IBM-supplied panel space library (RKO2PROC).

The format is:
DELTc aaaaaaaa

c One of the following arguments that specifies the location of the panel space. Enter it in column 6:
I Deletes from main storage (in-storage) only.
D Deletes from RKO2PCSV only.
B or b Deletes from both main storage and RKO2PCSV (default).

aaaaaaa The panel space name you want to delete. Specify the name starting in column 8.

Note: OMEGAMON XE for Db2 PE does not substitute special characters for the DELT command. You must enter the real member name.
For example, the following command deletes panel space SAMPLE from main storage.

DELTI SAMPLE

/DOWN

Scrolls down the amount of lines specified by argument cccc.

/DOWN works only if the number of logical rows (LROWS) is defined to a number greater than the number of physical rows on this terminal. This definition can be changed with the LROWS startup parameter.

The format is:

/DOWN cccc

where cccc is one of the following:

- nnn: Scrolls nnn lines (from 1 - 999).
- BOT: Scrolls to the last logical row.
- CSR: Scrolls according to the current location of the cursor. If the cursor is on the INFO-line, the scroll amount is a page.
- MAX: Scrolls down the number of LROWS defined for your terminal.
- PAGE: Scrolls down so that the current cursor position is at the bottom of the physical panel. This is the default.

For example, the following command scrolls the display 24 lines (one panel and one line on a 3278 model 2 terminal).

/DOWN 24

If you assign the /DOWN command to a PF key (the default is F20), you can type any of the optional arguments on the INFO-line before you press the PF key. OMEGAMON XE for DB2 PE interprets the entry as if you type the command plus the argument.

/D is an alias for /DOWN.

.DSA

Sets and displays authorization to list or zap non-shareable data-only spaces. The .DSA command provides a mechanism to limit the scope of the listing and zapping commands to data-only spaces that have been defined by the owner as shareable by other address spaces.

Command operands:

- ON: Turns on data-only space authorization. Access is allowed to all data-only spaces.
- OFF: Turns off data-only space authorization. Access is restricted to shareable spaces only.

Entering .DSA with no operand displays the current status of data-only space authorization.

.EXP

Displays the expiration date after which OMEGAMON XE for DB2 PE will not function.

Product updates contain new features, support for new IBM releases, enhanced operations, and maintenance. It is in your best interest to reinstall the product each time it is updated to keep current with enhancements and updates. For more information, see Configuration and Customization.

.FGO

Provides fast access to panel space cccccc.
The .FGO (Fast GO) command is used when creating panel spaces to fetch the next panel space of a series. Panel spaces can be chained together and executed very quickly, bypassing the panel display and the OMEGAMON XE for DB2 PE cyclical wait.

.FGO has a conditional panel fetch feature that fetches a panel space only if a condition is true.

Command operands:

cccccccc
    Specifies the name of a panel space.

CPSER
    Compares the CPU serial number.

MODE
    Compares the 3-character OMEGAMON XE for DB2 PE mode ID as displayed on the INFO-line (for example, DED, VTS, VTM).

OPSYS
    Compares the 3-character ID for the operating system level (NSE, SE2, SP3, XA1).

SMFID
    Compares the 4-character SMF ID.

UNIT
    Compares the terminal address of the primary OMEGAMON XE for DB2 PE console (only in dedicated mode).

USER
    Compares the suffix of the user profile.

&VAR
    Sets any comparison. The keyword and argument can be any variable name set with the .VAR command or any OMEGAMON XE for DB2 PE-defined variable.

=  Keyword equals argument. The equal sign can be entered without blanks on either side of it.

EQ  Keyword equals argument. Same as equal sign (=).

GE  Keyword is greater than or equal to argument.

GT  Keyword is greater than argument.

LE  Keyword is less than or equal to argument.

LT  Keyword is less than argument.

NE  Keyword is not equal to argument.

argument
    The argument is a 1- to 8-character value to which OMEGAMON XE for DB2 PE compares the keyword.

Example:

To fetch panel space SAMPLE only if the terminal address 05E1, enter:

.FGO SAMPLE UNIT=05E1

or

.FGO SAMPLE UNIT EQ 05E1

To protect against the possibility of a looping condition caused by the .FGO command, OMEGAMON XE for DB2 PE limits the number of consecutive fetches allowed (64 by default). After the limit is reached, .FGO acts like
.SGO (Screen Go) so that executing panel spaces will display on each cycle. Therefore, if there was a loop caused by .FGO panel spaces, correct the condition and re-enable .FGO with the FGOLOOP keyword of the .SET command.

Because FGOLOOP=ON causes .FGO not to bypass the OMEGAMON XE for DB2 PE cycle and the terminal display, you can turn it on to test your panel space fetch routines.

If multiple .FGO commands are displayed on one panel, the last one that is executable takes precedence.

See also the .SGO command.

GDFN

Defines an exception group for exception analysis.

You can use GDFN to define a group to which exceptions can be assigned, to add exceptions to an existing group, to delete exceptions from a specific group, and to delete an entire group.

Note: An exception can be associated with only one group at a time. You can delete an exception from one group and reassign it to another group.

The format is:

GDFN GROUP=cc, NAME='cc..cc', LIST=cc,aa,
DELETE=EXCEPTION, DELETE=GROUP,POSITION=nn

GROUP=cc

The 2-character exception group ID. For an existing group, use this keyword to display only the entries for that group.

NAME='cc..cc'

A 25-character user-defined description of the exception group. Enclose in single quotes (') if there are blanks, special characters, or single quotes (') in the name.

LIST=cc,aa

Identifies the exceptions to be added to or deleted from the specified exception group.

DELETE=EXCEPTION

Causes the deletion of the exceptions specified with LIST= from the group specified by GROUP=.

POSITION=nn

Specifies the order of the display.

/H

Describes the HELP facilities.

/H is an alias for /HELP

/HELP

Describes the HELP facilities.

The help panel space informs you how to find out more about the functions, features, and operation of OMEGAMON XE for DB2 PE.

Note: This command works with or without a forward slash (/).

/HOLD

Controls the execution of OMEGAMON XE for DB2 PE commands.

/HOLD ON suspends command execution until you enter /HOLD OFF. /HOLD OFF returns to normal OMEGAMON XE for DB2 PE command execution.
The /HOLD command is designed for users of VM/PASSTHRU. If you are not a user of VM/PASSTHRU, /HOLD functions the same as placing the cursor in column 1, row 1.

.I Inserts \(nn\) blank lines (.Ibnn) in the panel.

.ILC Displays INFO-line commands or their help text.

The format is:

.ILC /cccccc

The variable /cccccc is an INFO-line command name. (The forward slash (/) is optional.) To display all of the INFO-line commands and their aliases, enter the .ILC command without a command name.

To display help text for a specific INFO-line command, enter .ILC followed by the command.

.LOG Controls the OMEGAMON XE for DB2 PE REPORT log:

.LOGOUT Prints the current log and leaves it open. The command comments itself out to prevent the log from automatically resetting again on the next cycle.

.LOGPUSH Saves the status of the log (ON or OFF), so that this status can be restored when you execute .LOGPOP. This capability can be used to manipulate the log's status in panel spaces invoked by .F60 or .S60, then return it to its original state after these panel routines are complete. One of the following messages is displayed on the same line as the command:

>> Log inactive. Status saved. <<

or

>> Log active. Status saved. <<

.LOGPOP Restores the log to the status in effect when you executed the last .LOGPUSH. One of the following messages is displayed on the same line as the command.

>> Log status restored to inactive. <<

or

>> Log status restored to active. <<

If you enter .LOG without an argument, OMEGAMON XE for DB2 PE displays the current status of the log.

/LOG is the equivalent INFO-line command; however, it does not accept the PUSH and POP arguments.

.LOGOUT Sends the current OMEGAMON XE for DB2 PE REPORT log to the printer.

/O is an alias for /LOG with the OUT argument.

OMEGAMON XE for DB2 PE dynamically allocates REPORT to a SYSOUT equals A file with FREE equals CLOSE. This means that every time you enter the /LOGOUT command, the REPORT log is automatically spun off.
.LOG performs the same functions as /LOG, and additionally accepts the PUSH and POP arguments.

LSCR Loads panel space members from the panel space library to main storage.
You can make panel spaces more available and more easily fetched by loading them into main storage with LSCR. For example, if a disk is not available, you can continue to invoke the panel spaces that you loaded into main storage with LSCR.

The format is:
LSCR cccccccc cccccccc . . . cccccccc

The variables cccccccc are panel space names. Specify panel space member names starting in column 8. You can load as many members as can fit on the input line.

For example, in the next command, OMEGAMON XE for DB2 PE attempts to load panel spaces ZZ1, ZZ2, and ZZ3 from the O2PROC data set to main storage.

LSCR ZZ1 ZZ2 ZZ3

If OMEGAMON XE for DB2 PE cannot find panel space ZZ1, it displays the following messages:
+ OB1507 Member not found - ZZ1
+ OB1508 2 members loaded

MCHN
Scans common storage.
This command requires special authorization because its use causes additional system overhead to collect the necessary data. Before OMEGAMON XE for DB2 PE displays this data, you must enter a valid password using the /PWD command.

MCHN scans the elements of a table for a string of hex or character values. If the scan is successful, OMEGAMON XE for DB2 PE displays the table element that contains the string.

MCHN searches the address space in which OMEGAMON XE for DB2 PE resides. Use this command primarily to examine the MVS common area. Use XMCH to search other address spaces.

The format is:
MCHN c addr,string,olen,chain,dlen

The format of the output:

- B or b hex and character (default)
- C character only
- X hex only

addr The address of the first table element that OMEGAMON XE for DB2 PE scans.

string The hex string that OMEGAMON XE for DB2 PE uses for the scan. If you enclose it in single quotes ('), OMEGAMON XE for DB2 PE assumes it is a character string.

Note: OMEGAMON XE for DB2 PE interprets two single quotes (' '), within a character string as a single quote (').
olen The offset (in hex bytes) to the string in the table element; the comparison starts at this point. You can precede olen by a plus sign (+) or a minus sign (-).

chain The offset (in hex bytes) to the chain pointer (the location in the table element that contains the address of the next table element). You can precede chain by a plus sign (+) or minus sign (-).

dlen The number of bytes (1 to 8 hex digits) that OMEGAMON XE for DB2 PE displays if the scan is successful. The display starts at the beginning of the string. The default is 16 \((X \cdot 10)\) bytes.

Ensure that addr is the starting point of a table element. The address at addr + chain points to the next table element. The scan ends when the value at addr + chain is one of the following:

- 0
- -1
- addr (the table is a ring)

You can specify, modify, or pre-define an address (addr) for a storage display or modification command. An address consists of an anchor, optional modifiers, and an optional pre-defined name.

An anchor is the base address of an address specification. It can be:

absolute
A hexadecimal number:

<table>
<thead>
<tr>
<th></th>
<th>1 to 6 digits</th>
<th>1 to 8 digits</th>
</tr>
</thead>
<tbody>
<tr>
<td>370</td>
<td>A</td>
<td>XA/ESA</td>
</tr>
</tbody>
</table>

symbolic
1- to 8-alphanumeric characters, including @, #, and $.

You can supply one or more modifiers to change the location that the anchor points to. A modifier can be:

offset A plus sign (+) or minus sign (-), followed by a hexadecimal number:

<table>
<thead>
<tr>
<th></th>
<th>1 to 6 digits</th>
<th>1 to 8 digits</th>
</tr>
</thead>
<tbody>
<tr>
<td>370</td>
<td>A</td>
<td>XA/ESA</td>
</tr>
</tbody>
</table>

This modifier specifies a location at a known offset (positive or negative) from the anchor address.

indirect
One of the following symbols:

<table>
<thead>
<tr>
<th></th>
<th>for 24-bit (370) addressing</th>
<th>for 31-bit (XA/ESA) addressing</th>
</tr>
</thead>
<tbody>
<tr>
<td>%</td>
<td></td>
<td></td>
</tr>
<tr>
<td>?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This modifier indicates that the location pointed to is itself an address.

You can use these modifiers to create powerful and versatile address expressions. For example, the following address expression locates the TIOI of the currently executing MVS task:

\(10\%+4\%+C\%\)
10% Treats the data at location X'10' as a 24-bit address. This is the address of the MVS CVT.

% This second % treats the data at the start of the CVT as a 24-bit address. The first word of the CVT contains the address of a doubleword (8 bytes). The doubleword contains:
  • the address of the next TCB to dispatch (bytes 0 to 3)
  • the address of the currently dispatched TCB (bytes 4 to 7)

+4% Adds X'04' to the address of the doubleword, and then treats the data at the displacement as a 24-bit address. This is the address of the currently dispatched TCB.

+c% Adds X'0C' to the address of the TCB, and then treats the data at the displacement as a 24-bit address. This is the address of the TIOT.

You can specify or reference an address by a name consisting of 1- to 8-alphanumeric characters, including @, #, and $. The following command specifies address names.

The example below shows a typical MCHN command. In this example, MCHN scans a table that starts at location AAB6C8 and looks for the string D6C30199 that begins at the eighth byte of the table element; the address of the next table element is in the fourth word. By default, this command displays 16 bytes of the table element in hex and character notation.

MCHN AAB6C8,D6C30199,8,4

The following output is displayed if the scan is successful:

Addr=007DA000
MCHN AAB6C8,D6C30199,8,4
+ 0000 E2E2C3E3 00000000 D6C30199 00000000 *SSCT OC r
*

MLST
Displays bytes of memory from commonly addressable storage.

This command requires special authorization because its use causes additional system overhead to collect the necessary data. Before OMEGamon XE for DB2 PE displays this data, you must enter a valid password using the /PWD command.

MLST displays the contents of commonly addressable storage such as the
  • common storage area (CSA)
  • system queue area (SQA)
  • nucleus

The format is:
MLSTc addr,dlenc

c The format of the output:
  B or b hex and character (default)
  C character only
  X hex only
The first address of storage that OMEGAMON XE for DB2 PE displays. For more information about how to specify an address, see the MCHN command.

**dlen**

The number (1 to 8 hex digits) of bytes that OMEGAMON XE for DB2 PE displays. The default is 16 (X'10') bytes.

The following examples show uses of the MLST command.

**MLST** lists 32 (X'20') bytes starting at address 1EB0 in character format:

MLSTC 1EB0,20

Typical output is:

MLSTC 1EB0,20 Addr= 00001EB0
+000 *............h.... .....167.........*

MLST lists 16 (X'10') bytes starting at address FF32D6 in both hex and character formats:

MLSTFF32C1+15,10

Typical output is:

MLSTFF32C1+15,10 Addr= 00FF32D6
+000 20280010 A1B00FF9 82F00FF 20400000 *....h.9b0... .*

**.MOD** Shows OMEGAMON XE for DB2 PE module names and addresses.

The optional suffix A (**MODA**) lists the module names in alphabetical order.

This command provides debugging information, including module names and start addresses. If OMEGAMON XE for DB2 PE encounters a program check, this information is useful to IBM Customer Support.

**MSCN**

Displays the location in storage of a specific string.

This command requires special authorization because its use causes additional system overhead to collect the necessary data. Before OMEGAMON XE for DB2 PE displays this data, you must enter a valid password using the /PWD command.

**MSCN** scans the common area and the address space in which OMEGAMON XE for DB2 PE resides for a string of hex or character values. If the scan is successful, OMEGAMON XE for DB2 PE displays the string. To scan the DB2 private area, use the XMSC command.

The format is:

MSCNc addr,string,slen dlen

**c**

The format of the output:

**B** or **b**  Hex and character (default)

**C**  Character only

**X**  Hex only
The first address of storage that OMEGAMON XE for DB2 PE scans. For more information about how to specify an address, see the \texttt{MCHN} command.

\textbf{string} The hex string OMEGAMON XE for DB2 PE uses for the scan. If you enclose it in single quotes ('), OMEGAMON XE for DB2 PE assumes it is a character string.

\textbf{Note}: OMEGAMON XE for DB2 PE interprets two single quotes ('') within a character string as a single quote ('').

\textbf{slen} The number (1 to 8 hex digits) of bytes that OMEGAMON XE for DB2 PE scans. The default is 256 (X'100') bytes.

\textbf{dlen} The number (1 to 8 hex digits) of bytes that OMEGAMON XE for DB2 PE displays if the scan is successful. The display starts at the beginning of string. The default is 16 (X'10') bytes.

In the next example, \texttt{MSCN} scans the first 1000 bytes of the TIOT entry for the character string \texttt{O2HELP} and displays 14 hex bytes starting at that point. The display is in both hex and character formats.

\texttt{MSCN 10%%+4%+C%,'O2HELP',1000,14}

Typical output is:
\begin{verbatim}
MSCN 10%%+4%+C%,'O2HELP',1000,14 Addr=0061701C
+ 0000 D6C3C8C5 D37D4040 60BCA000 80001B00 *O2HELP
*.......*
+ 0010 14010100 ......... *
\end{verbatim}

\textbf{MZAP} Modifies the contents of the common area or the OMEGAMON XE for DB2 PE private area.

This command requires special authorization because it can perform potentially dangerous functions. Before OMEGAMON XE for DB2 PE executes this command, you must enter a valid password using the /PWD command.

\textbf{Important}: \texttt{MZAP} is powerful. Use it with care.

\texttt{MZAP} modifies the contents of commonly addressable storage such as the

- common storage area (CSA)
- system queue area (SQA)
- nucleus

Note the following:

- Some commonly addressable storage requires no authorization or special key to modify; however, some areas are store-protected. To modify these areas you must supply the action character in the label field of the \texttt{MZAP} command. You can also use \texttt{MZAP} to zap storage in the OMEGAMON XE for DB2 PE address space for debugging purposes. You can zap as many bytes as fit on a line at one time, but the verify and replace code lengths must be the same.

- If you use \texttt{MZAP} to modify storage in the Pageable Link Pack Area (PLPA), \texttt{MZAP} automatically does a long-term page-fix to ensure that the storage remains modified. If the pagefix is necessary, OMEGAMON XE for DB2 PE displays the message:

\texttt{PAGE(S) FIXED}
With 370, **MZAP** cannot zap the PLPA of a processor that has PLPA protection.

The format is:

```
MZAP  addr,ver,rep
```

*a* If required, an action character in column 1:

- Changes to a comment character (>) after the command executes.
- Does not change to a comment character after the command executes. Use this action character to repeat the command.

**addr**

The address of the string OMEGAMON XE for DB2 PE might modify. For more information about how to specify an address, see the **MCHN** command.

**ver**

The verify string; OMEGAMON XE for DB2 PE modifies storage only if it finds this string at **addr**.

**rep**

The replacement string. If OMEGAMON XE for DB2 PE finds **ver** at **addr, rep** replaces **ver**.

The strings **ver** and **rep** must be the same length.

In the first example, **MZAP** changes a fullword at location 6764 from X’0A’ to X’64’.

**MZAP** 6744+20,0000000A,00000064

In the next example, **MZAP** changes an X’FF to X’00 at location EA65C0.

**MZAP**  EA65C0,FF,00

/O  Prints the existing OMEGAMON XE for DB2 PE REPORT log without closing the log.

The /O command is an alias for /LOG with the OUT argument. See the description of the /LOG command for complete information about the /O command.

**OSPC**  Lists the attributes of the owner of a data-only space.

The format is:

```
OSPC  spacename
```

where **spacename** is the name of the data-only space you want to list. If you do not enter a name, **OSPC** lists all data spaces and hiperspaces. You can also enter 1 to 7 characters, and **OSPC** displays any space names that begin with the specified character string.

**OSPC** displays the following information about the specified space: type of space, ASID of the owning TCB, jobname of the owning TCB, address of the owning TCB.

/P  Prints the current logical panel.

The /P command is an alias for /PRINT. See the description of the /PRINT command for complete information about this command.

**.PCS**  Displays OMEGAMON XE for DB2 PE program check statistics.
These statistics are used for debugging information. If OMEGAMON XE for DB2 PE takes a program check, this information is useful to IBM Customer Support.

**.PFK** Displays/resets PF key definitions.

The format is:

```
c.PFK nn=aaaaaa/*bbb...bbb
```

*(blank)*

Without operands, **.PFK** displays all current PF key settings. PF keys without assignments are not shown in the panel.

c Label E for redefining several PF keys at once.

nn PF key number.

aaaaaaa Screen space name (1 to 8 characters) or INFO-line command (/cccccc).

/*bbb... Comment of up to 32 characters (bbb...), following the forward slash (/) and asterisk (/*).

You can define up to 99 physical and logical PF keys.

The PF keys that you define with **.PFK** are in effect only for that OMEGAMON XE for DB2 PE session. At startup, OMEGAMON XE for DB2 PE executes the panel space @ZPFKDEF, which contains default PF key assignments. To make these assignments permanent, change them in the @ZPFKDEF panel space.

For example, the following command sets PF15 to issue the /STOP INFO-line command for this session.

```
.PFK 15=/STOP /* Stops OMEGAMON XE for DB2 PE
```

Type comment text following a forward slash (/) and asterisk (/*): Use the same format to assign panel space names to PF keys. For example, the following command sets PF26 to call the panel space DISKS for this session.

```
.PFK 26=DISKS /* DASD information
```

To delete a definition, enter a single underscore (_) for the definition. For example, the following command deletes the definition for PF18.

```
.PFK 18=_
```

You can redefine several PF keys at once without having to type the **.PFK** command for each one. To do so, use the following procedure.

1. Type **E.PFK** OMEGAMON XE for DB2 PE provides an extended display of all current PF key assignments, and inserts **.PFK** before each key number, as shown below.

```
+ PFK07=/UP /* SCROLL UP
+ PFK08=/DOWN /* SCROLL DOWN
- .
+ PFK11=/ZOOM /* ZOOMING FEATURE
```
2. For each new assignment, blank out the plus sign (+) in front of each .PFK and type the new assignment following the equal sign.

3. Press Enter.

The assignments remain in effect for the duration of the session.

If you want to call panel spaces with PF keys, allocate an O2PROC library.
To call a panel space assigned to a PF key, press the associated PF key or type its number on the INFO-line.

/PRINT
Prints the current logical panel.
When the panel prints, a >LOGGED< message is displayed on the INFO-line.
/P is an alias for /PRINT.

.PRM Displays current values of the OMEGAMON XE for DB2 PE startup command parameters.
This command displays applicable OMEGAMON XE for DB2 PE startup parameters in the following order.

IOMODE=cc
The current OMEGAMON XE for DB2 PE I/O mode. This is the 2-character code entered as the mode in the startup parameters.

SYS=cccc
The current OMEGAMON XE for DB2 PE system ID. This is the same system ID that is displayed on the INFO-line.

USER=cc
The user profile identifier. This is the same identifier that is displayed on the INFO-line.

ROWS=nn
The number of rows on the physical terminal.

LROWS=nnn
The number of logical rows for the output area.

COLS=nnn
The number of columns on the physical terminal.

UNIT=ccc
The terminal address of a dedicated OMEGAMON XE for DB2 PE session.

.PRT Prints the specified portion of the panel to the report file.
The format is:
.PRTc

Without an argument, .PRT prints a panel image from the INFO-line to the line that contains the .PRT command. After the partial panel prints, .PRT changes to a comment.
The optional argument H (.PRTH) prevents the .PRT command from commenting itself out so that it logs these lines continually.

/PWD Specifies an OMEGAMON XE for DB2 PE password or reauthorizes a session.
The format is:
/PWD userid

You can use the /PWD command in three ways. They are:
1. To authorize your session for internal security. Enter the /PWD command on the INFO-line. The system prompts you for a password.

   /PWD____________< You enter >
   _______________Enter Password< Result >

   The password is not displayed in the panel as you type it. It remains in effect until you reset it.

1. To reset the security level to 0 after your authorized session. Type /PWD on the INFO-line as in the example, but instead of entering a password, just press Enter. Authorization is cleared.

2. The /PWD command can be entered with your user ID to do the following:
   - Log onto an existing OMEGAMON XE for DB2 PE session and reauthorize external security to your level for the session.
   - In dedicated mode, gain access to external security.

When you use the /PWD command with your user ID to log onto an existing session, you cannot update your password.

See Configuration and Customization for details about the security features.

RENM

Renames a panel in RKO2PCSV or main storage.

RENM renames panel spaces only in main storage (in-storage) and RKO2PCSV. It does not rename IBM-supplied panel spaces in the library pointed to by the ddname O2PROC.

The new format is:

RENMc aaaaaaaa bbbbbbbb

c     Specifies the location of the renamed panel space.

   B or b Rename in both main storage and RKO2PCSV. This is the default.

   D Rename in RKO2PCSV only.

   I Rename in main storage (in-storage) only.

aaaaaaa The old name of the panel space.

bbbbbbbb The new name of the panel space.

Note: OMEGAMON XE for DB2 PE does not substitute special characters for the RENM command. You must enter the actual member name.

/REP

Replaces the existing saved panel space of the same name.

Use /REP in place of /SAVE if you want to replace an existing saved panel space in the user-defined panel space library pointed to by ddname RKO2PCSV.

The format is:

/REP ccccccdd,a
Specifies the panel space name (1 to 8 characters).

One of three arguments that might follow the panel space name. The argument is separated from the panel space name with a comma (,).

B  Replaces in both main storage and RKO2PCSV.
D  Replaces in RKO2PCSV only.
I  Replaces in main storage (in-storage) only.

The default is wherever OMEGAMON XE for DB2 PE finds the panel space.

OMEGAMON XE for DB2 PE substitutes a D for a dot (.) in panel names.

The size of the panel space is the number of lines to the last non-blank line in the panel space.

The following example replaces the current panel space SAMPLE with the currently-entered panel space in both main storage and RKO2PCSV.

/REP SAMPLE,B

The default cursor position is the first position of the INFO-line. However, if you want to save the cursor in any position in the panel, type /REP on the INFO-line but do not press Enter. Move the cursor to the position you want and then press Enter to execute /REP. The cursor displays in that position whenever OMEGAMON XE for DB2 PE invokes the panel.

If you want to look at or edit a panel using a text editor, be aware of the following:

- CURS=(n,m) is displayed at the top-left corner of the INFO-line to indicate the cursor position in the saved panel.
- The variable n specifies the cursor row position, and m specifies the column position.
- You can add or change the cursor position in a saved panel using a text editor by adding or changing CURS=(n,m)

Note: /R is not an alias for /REP. It is an alias for /RETURN. /REP does not have an alias.

/RESHOW

Displays a new copy of the current panel.

.RTN

Terminates an ASF or TSF sequence and returns to the calling panel space.

The .RTN command is required at the bottom of the last panel space in an automatic panel facility (ASF) or timed panel facility (TSF) sequence. It returns to the calling panel space and re-enables exception analysis for further automatic calls. You can turn on ASF from the Exception Logging panel (page Exception Logging Menu) or the panel that sets analysis options for individual exceptions (page Set Exception Analysis Options).

The format is:

n .RTNcc aaaaaaaa

n  The optional label n specifies the number of cycles to delay the return to the calling panel space. The value of n can be the numbers 1 to 9 or the letters A to Z (representing 10 to 35). Each
time the panel updates, \( n \) decrements by 1. When \( n=0 \), the current panel executes and OMEGAMON XE for DB2 PE fetches the next panel space.

For example, the following command returns to the calling panel space after 7 cycles.

\[ .\text{RTN} \]

\( cc \)  The variable \( cc \) is the NR (no reset) argument. It prevents the \( .\text{RTN} \) command from automatically resetting the automatic update interval and the log status.

\[ \texttt{aaaaaaa} \]

This optional argument specifies a panel space for ASF or TSF to return to other than the calling panel space.

The \( .\text{RTN} \) command automatically resets the automatic update interval and the log status to that in effect when the ASF or TSF sequence began, unless NR is specified (see \( cc \) above).

\( /S \)  Saves the specified new panel.

The format is:

\[ /S \texttt{cccccccc},a \]

\( /S \) is an alias for \( /\text{SAVE} \). See the description of the \( /\text{SAVE} \) command for complete information.

\( /\text{SAVE} \)  Saves the specified new panel.

The \( /\text{SAVE} \) command works only if you have an RKO2PCSV data set and \texttt{cccccccc} does not already exist. If \texttt{cccccccc} already exists, use \( /\text{REP} \).

The format is:

\[ /\text{SAVE} \texttt{cccccccc},a \]

\texttt{cccccccc}  Specifies the panel name (1 to 8 characters).

\texttt{a}  One of three arguments that might follow the panel space name. The argument is separated from the panel space with a comma (,).

\texttt{B}  Saves the panel space to both RKO2PCSV and main storage (in-storage panel facility).

\texttt{D or b}  Saves the panel space to RKO2PCSV only (default).

\texttt{I}  Saves the panel space to main storage only.

OMEGAMON XE for DB2 PE substitutes a D for a dot (.) in panel space names.

This next example saves the current panel SAMPLE in both main storage and RKO2PCSV.

\[ /\text{SAVE} \texttt{SAMPLE},b \]

The default cursor position is the first position of the INFO-line. However, if you want to save the cursor in any position in the panel, type \( /\text{SAVE} \) on the INFO-line but do not press Enter. Move the cursor to the position you want and then press Enter to execute \( /\text{SAVE} \). The cursor displays in that position whenever OMEGAMON XE for DB2 PE invokes the panel.
If you want to look at or edit a panel space using a text editor, be aware of the following:

- CURS=(n,m) is displayed at the top left corner of the INFO-line to indicate the cursor position in the saved panel.
- The variable n specifies the cursor row position, and m specifies the column position.
- You can add or change the cursor position in a saved panel using a text editor by adding or changing CURS=(n,m).

/S is an alias for /SAVE.

SCHN Scans data-only space control blocks for a string of data and displays the location.

Use SCHN to search chained control blocks located in a data-only space for the occurrence of a specific string of data. SCHN scans data-only space storage until either a match to the string is found, the chain loops, or the address of the next control block is zero.

The format is:

\texttt{SCHN jobname,spacename,addr,string,off1,off2,plen}

\textit{a} A required action character in column 1:

- Changes to a comment character (>) after the command executes.
- Does not change to a comment character after the command executes. Use this action character to repeat the command.

\textit{c} The format of the output:

- \texttt{B} or \texttt{b} hex and character (default)
- \texttt{C} character only
- \texttt{X} hex only

\textit{jobname} The jobname or ASID in decimal of the owner of the data-only space.

\textit{spacename} The name of the data-only space.

\textit{addr} The starting address of the scan. For more information about how to specify an address, see the \texttt{MCHN} command.

\textit{string} The comparison string for the scan, which can be either a hexadecimal string or a character string surrounded by single quotes (').

\textit{off1} The offset from the beginning of the control block to the location of the comparison string. This value might be preceded by a plus (+) or a minus (-) sign.

\textit{off2} The offset from the beginning of the control block to the fullword address of the next control block. This value might be preceded by a plus (+) or a minus (-) sign.

\textit{plen} The length of print display. The default is 1 line or 16 bytes.
**SCRN**  Lists panel member names.

The format is:

```
SCRNc aa bb
```

- **c** Enter one of the following arguments in column 6 to specify the source of the member list.
  - **B** or **b** Lists all panels in both disk data sets (RKO2PCSV) and main storage (default).
  - **C** Lists all panels in disk data sets only.
  - **X** Lists all panels in main storage (in-storage) only.

- **aa bb** Lists all panels beginning with characters *aa* to *bb* (start *aa* in column 8).
- **a** Lists all panels beginning with character(s) *a* (start *a* in column 8).

The following example lists all panels stored in both disk data sets and main storage that have names starting with C or D.

```
SCRNB C D
```

The next example lists all panels in main storage from PA to PA999999.

```
SCRNI PA*
```

or

```
SCRNI PA PA
```

**.SGO**  Goes to panel *cccccccc* on next update.

The format is:

```
n.SGO cccccccc keyword{=| aa }argument
```

With the **.SGO** command panels can branch to other panels.

For example, the following command fetches panel SAMPLE on the next cycle.

```
SGO SAMPLE
```

With the optional value *n* you can delay the fetch of panel *cccccccc* for *n* cycles. The value of *n* can be between 1 and 35. Use the numbers 1 to 9 or the letters A to Z (to represent 10 to 35 cycles). Each time the panel updates, *n* decrements by one. When *n* equals 0, panel *cccccccc* is fetched on the next cycle.

The next example delays fetch of panel SAMPLE for 11 cycles, and fetches it on the next cycle after *n* equals 0.

```
B.SGO SAMPLE
```

**Conditional Parameters**

The **.SGO** command also has a conditional panel fetch feature that fetches a panel only if a condition is true. The condition is expressed as follows:

```
.SGO cccccccc keyword{=| aa }argument
```

The *keyword* can be one of the following:

**CPSER=**

- Compares the CPU serial number.
MODE=
    Compares the 3-character OMEGAMON XE for DB2 PE mode ID
    (displayed on the INFO-line). For example, DED, VTS, VTT, VTM.

OPSYS=
    Compares the 3-character ID for the operating system level (XA1).

SMFID=
    Compares the 4-character SMF ID.

UNIT=
    Compares the terminal address of the primary OMEGAMON XE
    for DB2 PE console (only in dedicated mode).

USER=
    Compares the 2-character suffix of the user profile.

The relational operator is either an equal sign (=) or a 2-character operator
aa separated by blanks. The operator aa can be:

   EQ  Keyword equals argument. Same as equal sign (=).
   GE  Keyword is greater than or equal to argument.
   GT  Keyword is greater than argument.
   LE  Keyword is less than or equal to argument.
   LT  Keyword is less than argument.
   NE  Keyword is not equal to argument.

The argument is a 1- to 8-character value to which OMEGAMON XE for
DB2 PE compares the keyword.

For example, to fetch panel SAMPLE only if you are running in an XA
environment, enter:

    .SGO SAMPLE OPSYS=XA1

or

    .SGO SAMPLE OPSYS EQ XA1

Note: A blank is not a valid keyword, relation, or argument. Additionally,
if you use a variable as the keyword or argument, the variable cannot
begin with a blank.

When you use the 2-character operator aa instead of the equal sign =, there
must be at least one blank separating the keyword, operator, and
argument. The equal sign requires no separation.

If multiple .SGO commands are displayed on one panel, the last one that is
executable takes precedence.

See the .FG0 command for other methods to fetch panels.

SLST    Displays bytes of memory from data-only space storage.

The format is:

    aSLSTc jobname,spacename,addr,plen

    a    A required action character in column 1:
          - Changes to a comment character (>) after the command executes.
<      Does not change to a comment character after the command executes. Use this action character to repeat the command.

c     Specifies the format of the output:
   B or b  dump format (default)
   C     character only
   X     hex only

jobname
   The jobname or ASID in decimal of the owner of the data-only space.

spacename
   The name of the data-only space.

addr
   The starting address of the data. For more information about how to specify an address, see the MCHN command.

plen
   The number (1 to 8 hex digits) of bytes to print. The default is 16 (X'10') bytes or 1 line.

SLST lists memory from data-only spaces. When necessary, an SRB will be scheduled into the address space of the TCB owning the data-only space to be listed.

Here is an example of using SLST.
<SLST MYJOB, MYSPACE, 1000, 20
+Storage at 00001000 in dataspace MYSPACE, job MYJOB ASID=12
+ 0000   E3C5E2E3 40C4C1E3 C140E207 C1C3C540   *TEST DATA SPACE *
+ 0010   F0F1F2F3 F4F5F6F7 F8F9C1C2 C3C4C5C6   *0123456789ABCDEF*

SSCN  Scans data-only space storage for the occurrence of a specific string of data.

Command format:
ASSCNc jobname, spacename, addr, string, len1, len2

a     A required action character in column 1:
   -      Changes to a comment character (>) after the command executes.
   <      Does not change to a comment character after the command executes. Use this action character to repeat the command.

c     Specifies the format of the output:
   B or b  dump format (default)
   C     character only
   X     hex only

jobname
   The jobname or ASID in decimal of the owner of the data-only space.

spacename
   The name of the data-only space.

addr
The starting address of the scan. For more information about how to specify an address, see the \texttt{MCHN} command.

\textit{string} \quad The comparison string for the scan. Either a hexadecimal string or a character string surrounded by single quotes (').

\textit{len1} \quad The length to scan in hex. Default is 256 (\texttt{x'100'}) bytes.

\textit{len2} \quad The length of print display. Default is 1 line or 16 (\texttt{x'10'}) bytes.

\texttt{SSCN} scans data-only space storage until a match to the string is found or the length of storage specified is exhausted. When necessary, an SRB is scheduled into the address space of the TCB owning the data-only space to be scanned.

Following is a sample \texttt{SSCN} display.

```
<SLST MYJOB,MYSERVER,1000,20
+Storage at 00000000 in datasetspace MYSERVER, job MYJOB ASID=12
+ 0000  E3C5E2E3 40C4C1E3 C149E207 C1C35440  *TEST DATA SPACE *
+ 0010  F0F1F2F3 F4F5F6F7 F8F9F1C2 C3C4C5C6  *0123456789ABCDEF*

/STOP Stops OMEGAMON XE for DB2 PE.
STOP performs the same function.

STOP Stops OMEGAMON XE for DB2 PE.
/STOP performs the same function.

\texttt{SZAP} \quad Modifies the contents of data-only space storage.

\textbf{Caution:} \quad There is a potential integrity exposure with the use of \texttt{SZAP} on hiperspaces. \texttt{SZAP} uses HSPSERV to read in a page of data from the target hiperspace, check the data, alter the data, and finally use HSPSERV to write the page back to the hiperspace. If someone else is writing to the same page of the hiperspace during this process, the newly entered data could get lost. There is no available enqueue mechanism to guard against this exposure.

The format is:

```
-SZAP \textit{jobname},\textit{spacename},\textit{addr},\textit{vercode},\textit{repcode}
```

- \quad Action character required for execution.

\textit{jobname} \quad Jobname or ASID in decimal of the owner of the data-only space.

\textit{spacename} \quad The name of the data-only space.

\textit{addr} \quad The starting address of the data. For more information about how to specify an address, see the \texttt{MCHN} command.

\textit{vercode} \quad The current code to be verified in hexadecimal.

\textit{repcode} \quad The replacement code in hexadecimal.

The lengths of \textit{vercode} and \textit{repcode} must match.

When necessary, an SRB is scheduled into the address space of the TCB owning the data-only space to be zapped. Here is an example of using \texttt{SZAP}. 

1476 \quad IBM Db2 Performance Expert on z/OS
Scrolls to the top of the logical panel.

The times panel facility (TSF) schedules certain panel spaces not on an exception basis, but rather at specified times of day or at specified intervals. For example, you might want to issue a DB2 trace command automatically at 2:00 p.m. every weekday, and then turn it off again at 2:15. You can also invoke a panel space and have its commands executed and logged at regular intervals, such as every hour.

To use TSF, follow this procedure.

1. Create any panel spaces you want TSF to invoke. You can use the .SGO or .FGO command to chain panels together, and .RTN to end the cycle. Special considerations for creating panel spaces in TSF are discussed later in this topic.

2. Turn on TSF with the TSF keyword of the OPTN command.

3. The .TSF00 command lists all entries in the TSF table. The TSF table is delivered with 99 blank entries. For example:

   .TSF00
   + 1 Time=0000 SS=*NONE* DAY=DAILY
   + 2 Time=0000 SS=*NONE* DAY=DAILY
   + 3 Time=0000 SS=*NONE* DAY=DAILY
   + 4 Time=0000 SS=*NONE* DAY=DAILY

   Enter .TSFnn to display entry nn in the TSF table. To define an entry, type .TSF followed by the number of the entry. For example, type .TSF01 to produce:

   .TSF01 Time=0000 SS=*NONE* DAY=DAILY

   You can type the new entry over the current entry, press Enter, and the value is reset.

   If you want to change an entry that is not displayed on the physical panel, you can specify an argument to skip nn entries. Type .TSF00 20 to display entries 21 through 99 in the TSF table, skipping the first 20.

   Following are the keywords and valid entries.

---

**Time**

Specifies the time of day (from 0000 to 2400) to invoke the panel. **TIME=+nn** invokes the panel every **nn** minutes.

**Note:** The panel space does not execute while the **TIME=+nn** entry remains on your current panel.

**SL or SS**

Specifies the panel space to invoke if TSF is in effect. SS specifies the panel space to invoke, but does not turn on the log. SL automatically turns on the REPORT log when the panel is fetched, and panel space logging starts. You must specify either SS or SL for TSF to function.

**DAY**

Valid entries for day of week are MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY, SUNDAY, WEEKDAY, WEEKEND, and DAILY. The days of the month are also valid entries (numerals 1 through 31). The default value is DAILY. You can abbreviate the input as long as it is unique and the day of the week is recognized.
You can specify day combinations by enclosing the names of the days within parentheses, and by separating each day with either a comma or a blank.

Here is an example of five **TSF** entries.

<table>
<thead>
<tr>
<th>TSF</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TSF01</td>
<td>EXECUTES and logs panel space WENDSHFT at 6:00 p.m. daily.</td>
</tr>
<tr>
<td>TSF02</td>
<td>EXECUTES panel space WEEKSTRT at 6:00 a.m. every MONDAY.</td>
</tr>
<tr>
<td>TSF03</td>
<td>EXECUTES and logs panel space NOONTIME at 12:00 p.m. every Thursday and Friday</td>
</tr>
<tr>
<td>TSF04</td>
<td>EXECUTES panel space MONTHEND on the 30th of each month at 8:00 a.m.</td>
</tr>
<tr>
<td>TSF05</td>
<td>EXECUTES and logs panel space STATUS every 30 minutes every day.</td>
</tr>
</tbody>
</table>

**/U** Scrolls up the amount of lines specified by argument ****ccc****.

**/U** is an alias for **/UP**. See the description of the **/UP** command for complete information.

**/UP** Scrolls up the amount of lines specified by argument ****ccc****.

The **/UP** command works only if you set the number of logical rows (LROWS) to a number greater than the number of physical rows on this terminal when you initialize OMEGAMON XE for DB2 PE.

The format is:

```
/UP  cccc
```

**nmm** Scrolls **nmm** lines (from 1 to 999).

**CSR** Scrolls according to the current location of the cursor. If the cursor is on the INFO-line, the scroll amount is a page.

**MAX** Scrolls to the top of the panel.

**PAGE** Scrolls so that the current cursor position is at the top of the panel (default).

**TOP** Scrolls to the top of the panel.

The following example scrolls up 20 lines.

```
/UP  20
```

If you have assigned the **/UP** command to a PF key (the default is PF19), you can type any of the optional arguments on the INFO-line before you press the PF key, and OMEGAMON XE for DB2 PE interprets the entry as if you had typed the command plus the arguments.

**/U** is an alias for **/UP**.

**.VTM** Displays terminal ID and session information for all users logged onto OMEGAMON XE for DB2 PE in VTAM mode.
A user running in a multi-session environment moderated by O2VTAM can use this command to display information about other O2VTAM users. Operations personnel can use this command to monitor and manage access to the VTAM environment.

The `.VTM` command displays the following information: user ID, terminal ID, mode, session start date and time, date and time of last update. (User ID is displayed only if external security is being used to control logon access.)

### .WAT

Waits `nn` seconds (.WAT`nn`) before executing all commands below.

The `.WAT` command provides a delay mechanism for the execution of commands that require information from a currently executing command. This command is useful when you want a delay between operator commands.

### XGRP

Invokes exception analysis for exception group `cc`.

The format is:

```
XGRPcc
```

The XGRP command only invokes exceptions of a certain group. In this sense, it is merely a subset of the `EXSY` command.

The variable `cc` indicates the exception group type. These types are:

- `CI` CICS exceptions
- `IM` IMS exceptions
- `SY` system exceptions
- `TH` thread exceptions

### XGSW

Set exception group switch settings. In addition to the control available over each individual exception, you can override certain options for an entire exception group.

The format is:

```
XGSW GROUP=`cc` STATE=cccc
```

**GROUP**

Any two unique alphanumeric characters to specify the group. Use this keyword to display only entries for a particular group.

**STATE**

Controls whether the exception is in any of these five states:

- **ON** Invokes this exception during the current session.
- **OFF** Does NOT invoke this group of exceptions during the current session.
- **TEST** Forces a sample warning message, even if the exception condition is not presently occurring, for purposes of training or demonstration. (When a message has been displayed because of TEST mode, a `T` is displayed in column 2 of the message lines.)
- **NULL** Specifies the individual exception is to maintain control rather than the group switch. This is the default.
Scans DB2 storage.

This command requires special authorization because its use causes additional system overhead to collect the necessary data. Before OMEGAMON XE for DB2 PE displays this data, you must enter a valid password using the /PWD command.

XMCH scans the elements of a table for a string of hex or character values. If the scan is successful, OMEGAMON XE for DB2 PE displays the table element that contains the string.

Use XMCH to search DB2 address spaces. Use MCHN to search the address space in which OMEGAMON XE for DB2 PE resides.

The format is:

```
XMCh targ,addr,string,olen,chain,dlen
```

a An action character in column 1:

- Changes to a comment character (>) after the command executes.

< Does not change to a comment character after the command executes. Use this action character to repeat the command.

c The format of the output:

C character only

X hex only

targ The target DB2 address space. It can be:

nnnn decimal ASID number

cccccccc jobname

If you do not specify a DB2 address space, an error message is displayed.

addr The address of the first table element OMEGAMON XE for DB2 PE scans. For more information about how to specify an address, see the MCHN command.

string The hex string that OMEGAMON XE for DB2 PE uses for the scan. If you enclose it in single quotes ('), OMEGAMON XE for DB2 PE assumes it is a character string.

Note: OMEGAMON XE for DB2 PE interprets two single quotes (') within a character string as a single quote (').

olen The offset (in hex bytes) to the string in the table element; the comparison starts at this point. You can precede olen by a plus sign (+) or minus sign (-).

chain The offset (in hex bytes) to the chain pointer (the location in the table element that contains the address of the next table element). You can precede chain by a plus sign (+) or minus sign (-).

dlen The number of bytes (1 to 8 hex digits) that OMEGAMON XE for DB2 PE displays if the scan is successful. The display starts at the beginning of the table element. The default is 16 (X'10') bytes.
Ensure that $addr$ is the starting point of a table element. The address at $+\text{chain}$ points to the next table element. The scan ends when the value at $addr + \text{chain}$ is one of the following:

- 0
- -1
- $addr$ (the table is a ring)

The example below shows a typical XMCH command. In this example, XMCH scans a table in the target DB2 address space that starts at location AAB6C8 and looks for the string D6C30199 that begins at the eighth byte of the table element. The address of the next table element is in the fourth word. By default, this command displays 16 bytes of the table element in hex and character format.

```
>XMCH USER14,AAB6C8,D6C30199,8,4
```

The following output is displayed if the scan is successful:

```
>XMCH USER14,AAB6C8,D6C30199,8,4
>Storage at 007DA000 in USER14 ASID=21:
> 0000 E2E2C3E3 00000000 D6C30199 00000000 *SSCT OC r *
```

**XMLS**

Displays DB2 storage.

This command requires special authorization because its use causes additional system overhead to collect the necessary data. Before OMEGAMON XE for DB2 PE displays this data, you must enter a valid password using the `/PWD` command.

XMLS displays bytes of storage from a DB2 address space.

The format is:

```
 oXMLSc targ,addr,len
```

- $a$ is an action character in column 1:
  - - Changes to a comment character (>) after the command executes.
  - < Does not change to a comment character after the command executes. Use this action character to repeat the command.

- $c$ is the format of the output:
  - B or b hex and character (default)
  - C character only
  - X hex only

- $targ$ is the target DB2 address space. It can be:
  - $nnnn$ decimal ASID number
  - $cccccccc$ jobname

If you do not specify a DB2 address space, an error message is displayed.

- $addr$
The first address of storage that OMEGAMON XE for DB2 PE displays. For more information about how to specify an address, see the MCHN command.

len The number (1 to 8 hex digits) of bytes that OMEGAMON XE for DB2 PE displays. The default is 16 (X'10') bytes.

The following examples show uses of the XMLS command.

In the first example, XMLS displays 32 (X'20') bytes from address space 21, starting at address 1EB0, in character format.
-XMLSC 21,1EB0,20

Typical output is:
>XMLSC 21,1EB0,20
>storage at 00001EB0 ASID=21:
>0000 *ABCDEFGH IJKLMNOPQRSTUVWXYZ0123456

In the second example, XMLS displays 16 (X'10') bytes from the target DB2 address space specified by the jobname USER14, starting at 1EB0 in both hex and character formats.
-XMLS USER14,1EB0,10

Typical output is:
>XMLS USER14,1EB0,10
>storage at 00001EB0 in USER14 ASID=21:
>0000 C1C2C3C4 C5C6C7C8 09010203 D4D5D6D7 *ABCDEFHIJKLMNOP*

In the third example, XMLS displays 16 (X'10') bytes from address space 21, starting at FF32D6 in hex and character format. The less than symbol (<) prevents OMEGAMON XE for DB2 PE from commenting out the command.
<XMLSB 21,FF32C1+15,10

Typical output is:
<XMLSB 21,FF32C1+15,10
+storage at 00FF32D6 in DB2 ASID=21:
+0000 4AA800F7 D3700000 00000000 000000F8 *y..7L............8*

XMSC

Scans DB2 storage.

This command requires special authorization because its use causes additional system overhead to collect the necessary data. Before OMEGAMON XE for DB2 PE displays this data, you must enter a valid password using the /PWD command.

XMSC scans a DB2 address space for a string of hex or character values. If the scan is successful, OMEGAMON XE for DB2 PE displays the string.

The format is:
\texttt{aXMSc c targc,addr,string,slen,dlen}

\texttt{a} An action character in column 1:

- Changes to a comment character (>) after the command executes.
< Does not change to a comment character after the command executes. Use this action character to repeat the command.

c The format of the output:
- B or b hex and character (default)
- C character only
- X hex only

targ The target DB2 address space. It can be:
- nnnn decimal ASID number
- ccccccc jobname

If you do not specify a DB2 address space, an error message is displayed.

addr The start address of the scan. For more information about how to specify an address, see the MCHN command.

string The hex string that OMEGAMON XE for DB2 PE uses for the scan. If you enclose it in single quotes ('), OMEGAMON XE for DB2 PE assumes it is a character string.

Note: OMEGAMON XE for DB2 PE interprets two single quotes (') within a character string as a single quote (')

slen The number (1 to 8 hex digits) of bytes that OMEGAMON XE for DB2 PE scans. The default is 256 (X'100') bytes.

dlen The number of bytes (1 to 8 hex digits) that OMEGAMON XE for DB2 PE displays if the scan is successful. The display starts at the beginning of the table element. The default is 16 (X'10') bytes.

In the next example, XMSC scans 1000 bytes in the target DB2 address space specified by the jobname USER14, starting at location 515988 for the character string WORKAREA. If the scan is successful, OMEGAMON XE for DB2 PE displays 14 hex bytes in hex and character format starting at WORKAREA.

-XMSC USER14,515988,'WORKAREA',1000,14

The following output is displayed if the scan is successful:

> storage at 00515988 in USER14 ASID=21:
> 1B8 E60D9D02 C19C5C1 00000000 00000000 WORKAREA.......*
> 1C8 000C002C *....*

XMZP Modifies another user's private storage area.

This command requires special authorization because it can perform potentially dangerous functions. Before OMEGAMON XE for DB2 PE executes this command, you must enter a valid password using the /PWD command.

Important: XMZP is powerful. Use it with care.
XMZP modifies the contents of the indicated private storage area.

The format is:

\[ \text{aXMZP, target, address, verify, replacement} \]

- **a** An action character in column 1:
  - Changes to a comment character (>) after the command executes.
  - Does not change to a comment character after the command executes. Use this action character to repeat the command.

- **target** The target DB2 address space. It can be:
  - decimal ASID number
  - jobname

If you do not specify a DB2 address space, an error message is displayed.

- **address** The address of the string OMEGAMON XE for DB2 PE might modify. For more information about how to specify an address, see the \texttt{MCHN} command.

- **verify** The verify string; OMEGAMON XE for DB2 PE modifies storage only if OMEGAMON XE for DB2 PE finds this string at \texttt{address}. If OMEGAMON XE for DB2 PE does not find the string, it displays what is actually at \texttt{address}.

- **replacement** The replacement string. If OMEGAMON XE for DB2 PE finds \texttt{verify} at \texttt{address}, \texttt{replacement} replaces \texttt{verify}.

**Note:** The strings \texttt{verify} and \texttt{replacement} must be the same length.

In this example, XMZP changes a byte at location A0160 in the master scheduler address space.

\[-XMZP, *MASTER*, A0160, 0A, 64\]

In the next example, XMZP changes a halfword at C4834 in the PRODJOB address space from X’1854’ to X’0700’.

\[-XMZP, PRODJOB, C4834, 1854, 0700\]

- **ZAP** Displays the maintenance level of the OMEGAMON XE for DB2 PE realtime modules.

- **/ZOOM** Invokes the navigational zoom feature using the cursor as a pointer.

The zooming feature is designed to simplify the investigation of system conditions by supplying a detailed level of information at the touch of the zoom key. **/ZOOM** substitutes whatever value the cursor is on for a variable contained in a predefined panel space. The variable substitution allows the zooming panel space to have multiple uses.

To illustrate the use of the zooming feature, the following discusses three types of applications. First, you should be aware of the following points:
• By default, OMEGAMON XE for DB2 PE is delivered with the /ZOOM INFO-line command assigned to PF key F11 so you can use the zooming panel spaces with a single key. For this discussion, F11 is referred to as the zoom key.

• Zooming panel spaces must be set up before using /ZOOM. These panel spaces can contain one or more of the following variables.

&ZOOM
Data found at the cursor location.

&ZOOMA
Command argument field (columns 6 and 7).

&ZOOMC
Command or exception name field (columns 2 to 5).

&ZOOML
Command label field (column 1).

&ZOOMS
Originating panel space.

OMEGAMON XE for DB2 PE provides sample zooming panel spaces that you can use to become familiar with both the setup of a zooming panel space and the types of commands for which /ZOOM is most appropriate. To see the names of those panel spaces, use the SCRn command and look for panel spaces beginning with @Z.

Following are three illustrations of using the zooming feature:

1. This first example uses a panel space that is supplied on your OMEGAMON XE for DB2 PE tape. The example is easier to understand if you actually execute the commands on your system while you follow the discussion.

   a. Type the command THDA. THDA produces a list of active threads.

   

<table>
<thead>
<tr>
<th>THDA</th>
<th>ZALLT</th>
<th>VTAM 02</th>
<th>V500./C $DB2 mm/dd/yy</th>
<th>12:06:26</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ 00:53:59.05</td>
<td>PLAN0090</td>
<td>12.2%</td>
<td>In-DB2</td>
<td>6231</td>
</tr>
<tr>
<td>+ 00:12:37.16</td>
<td>PLAN0100</td>
<td>11.1%</td>
<td>In-SQL-Call</td>
<td>1943</td>
</tr>
<tr>
<td>+ 00:09:29.27</td>
<td>PLAN0001</td>
<td>2.0%</td>
<td>In-DB2</td>
<td>1111</td>
</tr>
</tbody>
</table>

   THDA &ZOOM ACT replaces the variable &ZOOM with the planname over the cursor. The result might look like this:

   

   PLAN &ZOOM ACT

   b. To examine one of the threads more closely, place your cursor under the planname you want to query, PLAN0001 in this case, and press F11. OMEGAMON XE for DB2 PE looks for a panel space starting with @ZSM and ending with the command name that precedes the cursor. OMEGAMON XE for DB2 PE finds the panel space @ZSMTHDA:

   

<table>
<thead>
<tr>
<th>THDA</th>
<th>ZALLT</th>
<th>VTAM 02</th>
<th>V500./C $DB2 mm/dd/yy</th>
<th>12:06:26</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ 00:53:59.05</td>
<td>PLAN0090</td>
<td>12.2%</td>
<td>In-DB2</td>
<td>6231</td>
</tr>
<tr>
<td>+ 00:12:37.16</td>
<td>PLAN0100</td>
<td>11.1%</td>
<td>In-SQL-Call</td>
<td>1943</td>
</tr>
<tr>
<td>+ 00:09:29.27</td>
<td>PLAN0001</td>
<td>2.0%</td>
<td>In-DB2</td>
<td>1111</td>
</tr>
</tbody>
</table>

   /ZOOM replaces the variable &ZOOM with the planname over the cursor. The result might look like this:
### Profile Maintenance Facility

Select this main menu option for information about the Profile Maintenance Facility.

### Customizing and storing session characteristics in profiles

Use the Profile Maintenance Facility to customize characteristics of your active OMEGAMON XE for DB2 PE session and to store these characteristics in a profile. You can also change and delete existing profiles.

Profiles are identified by 2-character profile suffixes. The profile to be used for an OMEGAMON XE for DB2 PE session can be specified in the panel described in “Logging on to the Classic Interface” on page 887 or as parameter of the Logon command (see “Directly logging on to the Classic Interface from native VTAM” on page 888).

c. You can now place your cursor on a different planname and press F11 again to receive the same detail on another thread. A zooming panel space can display more detailed analyses of any thread.

2. Suppose that the THDA command in example 1 was originally executed as part of a different panel space (not a zooming panel space) that you had been using. We will call that panel space THREADS. If the @ZSMTHDA panel space ended with the command, .SGO &ZOOMS, the &ZOOMS variable would pick up the value of the originating panel space (THREADS) and OMEGAMON XE for DB2 PE would return to THREADS after the @ZSMTHDA panel space executed.

3. Suppose that you have issued the exception analysis command, LEXY, and an exception condition is displayed (LEXY) that you want to investigate further. Assuming that you have a predefined panel space named @ZSMcccc where cccc is the name of the exception, place your cursor under the exception name on the LEXY panel and press F11. OMEGAMON XE for DB2 PE will execute the commands on your @ZSMcccc panel space to give you a detailed analysis of the condition.
The profile being in use in an active OMEGAMON XE for DB2 PE session is displayed on the top line of most panels after the version number (for example, V540.AZ indicates that the user profile AZ is in use).

The default IBM profile: OMEGAMON XE for DB2 PE contains a default profile, identified by the 2-character profile suffix #P. This profile contains session configuration options needed to initialize an OMEGAMON XE for DB2 PE session and default exception analysis thresholds.

The default IBM profile ensures that you can always initiate an OMEGAMON XE for DB2 PE session, even if no other profiles are defined. This profile is always available and cannot be changed.

The installation profile: A so called installation profile, identified by the 2-character profile suffix /I, can be set up during the installation of OMEGAMON XE for DB2 PE. This profile can contain a set of session and exception analysis options that the installer specifies for all OMEGAMON XE for DB2 PE sessions at your installation. The installation profile can contain overrides of IBM profile options and additional options that are installation-specific or that are not contained in the IBM profile.

If an installation profile exists, your OMEGAMON XE for DB2 PE session is started with a concatenation of the default IBM profile and the installation profile.

User profiles: OMEGAMON XE for DB2 PE users can create one or more user profiles, identified by two alphanumeric characters, to customize their individual OMEGAMON XE for DB2 PE sessions. A user profile can contain profile options that override options specified in the default IBM profile and the installation profile, as well as additional options.

Panels for profile management: You can customize and maintain profiles through the following panels:

- “Profile Maintenance menu” on page 1488
- “Set Display Options” on page 1488
- “Set Control Function Options” on page 1492
- “Set Printer and Routing Options” on page 1494
- “Set Exception Analysis Message Option” on page 1495
- “Set Performance Options” on page 1496
- “Set Background Exception Processing” on page 1497
- “Exception Analysis Options menu” on page 1498
- “Set Exception Analysis Options” on page 1498
- “List Profiles” on page 1506
- “Describe a Profile” on page 1506
- “Save New/Altered User Profile” on page 1507
- “Delete User Profile” on page 1508
- “Save New/Altered Installation Profile” on page 1508
- “Delete Installation Profile” on page 1509
- “Change Profile” on page 1510
- “Exception Logging menu” on page 1510
- “Set XLF Printer and Routing Options” on page 1511
- “Set DB2/IRLM Messages that MSGE Exception Monitors” on page 1513
Profile Maintenance menu

This menu is the first menu for the Profile Maintenance Facility. From this menu you can access panels to change the characteristics of exceptions, change options for the current OMEGAMON XE for DB2 PE session, save, delete, change, and list profiles, or add descriptions to profiles.

```
> Help PF1
> P.
> Type a selection letter on the top line and press ENTER.

===============================================================================
PROFILE MAINTENANCE MENU
_ A SESSION OPTIONS ..... Set session options
  B EXCEPTION ANALYSIS... Exception analysis options
  C LIST PROFILES ....... List profiles
  D DESCRIBE PROFILE .... Describe a profile
  E SAVE USER ............ Save new/altered user profile
  F DELETE USER .......... Delete user profile
  G SAVE INSTALL ........ Save new/altered installation profile
  H DELETE INSTALL ...... Delete installation profile
  I LOGGING ............... Exception and automatic screen logging
  J MESSAGES ............. Set DB2/IRLM messages that MSGE exception monitors
  L Filtering ............ Set Thread Filtering
===============================================================================
```

Navigation

For additional options
- select one of the options from the menu.
- use the PF keys.

Set Display Options

Use this panel to set options that control how OMEGAMON XE for DB2 PE operates on your terminal, such as colors, audible alarms, exception message logging (XLF), automatic panel logging (ASF), and the timed panel facility (TSF).
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

You can change the values on the Set Display Options panel. To modify a setting, move the cursor to the value you want to change, type the new value over the current value, and press Enter to record the change.

ASF The current status of the automatic panel facility (ASF). Permitted values are ON and OFF. The default is OFF.

BELL The current status of the audible alarm (ON or OFF). The default is OFF.

BELLINT The minimum interval for audible alarm. The default is 5.00 seconds. The maximum interval is 99.00 seconds.

DATEFORMAT The display format of the date. Specify the format as USA (mm/dd/yy) or EUROPEAN (dd/mm/yy). The default is USA.

FIRSTSCREEN The first panel that OMEGAMON XE for DB2 PE displays after the copyright panel. You cannot change this value. The panels are arranged for easy access to product information.

LOG The current status of the log function (ON or OFF). The default is OFF. When the log function is ON, the current logical panel is logged each time you press Enter (or at regular intervals, if you are in automatic update.
mode). See field PAGELIMIT in “Set Control Function Options” on page 1492 about the size of the REPORT file.

MINORCASE
The type of letters OMEGAMON XE for DB2 PE uses to display minor commands (upper or lower case). The default is LOWER.

SCREENCASE
The type of letters OMEGAMON XE for DB2 PE uses to display its output in the panel (upper or mixed case). The default is MIX.

SCROLL
The amount to scroll the page. The default is a full page (PAGE). It can also be the position of the cursor (CSR).

TSF
The current status of the timed panel facility (TSF). Permitted values are ON and OFF. The default is OFF.

XLF
The current status of the Exception Logging Facility (XLF). Permitted values are ON and OFF. The default is OFF.

ZEROS
The type of zero display. When this parameter is ON, OMEGAMON XE for DB2 PE displays the number 0 in fields that have a value of 0. When this parameter is OFF, OMEGAMON XE for DB2 PE displays a blank in these fields. OMEGAMON XE for DB2 PE does not save the value of this field in a profile. This value will return to the default each session.

Display
Determines the type of entries that are acceptable in several other fields in this panel. If you want to change the display settings and save the changes in a profile, Profile Definition Mode must be turned ON before you make the changes.

BASIC
Sets the intensity of field types (for example, major and minor commands) on monochrome terminals and non-EDS (extended data stream) color terminals. Permitted values are High and Low.

Note: When the BASIC display option is used on color devices that can support EDS, OMEGAMON XE for DB2 PE will treat that device as a 4-base color terminal (non-EDS).

HIGH
All fields are displayed in high intensity.

LOW
All fields are displayed in low intensity.

COLOR
For color EDS terminals only: Sets the color of each field. Color names are red, green, white, blue, pink, yellow, and turquoise.

Note: If you do not have a color terminal, setting Display to COLOR can cause your OMEGAMON XE for DB2 PE session to terminate.

If OMEGAMON XE for DB2 PE is provided a color value instead of an intensity value, or vice versa, it makes the following internal conversion:
- On a non-EDS terminal, values of green and blue translate to low intensity. All other color values translate to high intensity.
On an EDS terminal, a value of HI translates to the color red; a value of LO translates to the color green.

**ProfileDefinitionMode**
Controls the definition of color and highlighting within a user profile.

**OFF**
Changes affect only the current OMEGAMON XE for DB2 PE session.

**ON**
Intended when creating or changing a user profile. After defining the settings, issue a profile save command for these definitions to be saved and reused. Setting this keyword to ON permits to configure options for different types of terminals on the same panel. If you want to save color setting changes in a profile, Profile Definition Mode must be turned ON before you make the changes.

**ExtendedHighlighting**
Used only with devices that support the extended data stream.

**OFF**
Extended highlighting features are not available. Use with non-EDS devices.

**ON**
Extended highlighting features are available. When Display=COLOR, this value is automatically set to ON. (Extended attributes are not supported in ISPF mode.)

*CAUTION:*
Do not set ExtendedHighlighting to ON unless you have a terminal that supports an extended data stream (or unless you have ProfileDefinitionMode is ON). If you do this accidentally, you can get a PROGnnn or a panel erasure error. You can press the ATTN or PA1 key to resume the session, but be aware that this action also clears the current security authorization and the current panel.

**Major**
Controls color (LOW) or highlighting (HIGH) for major commands and their output.

**Minor**
Controls color (LOW) or highlighting (HIGH) for minor commands and their output.

**Immed**
Controls color (LOW) or highlighting (HIGH) for immediate commands and their output.

**Default**
Controls color (LOW) or highlighting (HIGH) for other unprotected fields (for example, error message text, help text).

**XACB Display Options**
Controls exception analysis message text. The fields Clr1 through Clr7 can be used as substitutes for the color names (Red, Blue, and so on) or highlighting (High and Low) when customizing exception messages with the XACB command.

The following table shows the possible variations of settings according to the type of terminal you are supporting.
<table>
<thead>
<tr>
<th>If you have...</th>
<th>and you want...</th>
<th>keywords and possible settings are...</th>

<tr>
<td>LOOPCOUNT</td>
<td>The maximum number of control blocks that can be tested when executing the Examine Address Space panels before OMEGAMON XE for DB2 PE detects a loop. The default is 15000. The maximum is 60000.</td>
</tr>
<tr>
<td>LOOPTIME</td>
<td>The threshold (in seconds and hundredths of seconds) for the</td>
</tr>
</tbody>
</table>
OMEGAMON XE for DB2 PE built in loop detection when executing the Examine Address Space panels. The default is 25.00. The maximum is 99.

PAGELIMIT
The size (in pages) of the REPORT file used to log OMEGAMON XE for DB2 PE panels. The default is 400. The maximum is 99999. This number decreases dynamically as the log prints to reflect the number of pages remaining in the log before this limit is reached. Consequently, be sure to check this parameter (and reset it, if necessary) before saving a profile.

PEEKSIZE
The size (in bytes) of the buffer for the Examine Address Space panels. The default is 32768. The maximum is 204800.

STATUSMODE
This setting does not apply to OMEGAMON XE for DB2 PE.

OCMDMASTER
Sets the default console ID if none was specified with the OCMD command. Default is ON.

ON Master console.
OFF Console 00.

Set Printer and Routing Options
Use this panel to set options that control the way OMEGAMON XE for DB2 PE logs output.

Navigation
For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

**Fields**

To modify an option, move the cursor between the name of the setting you want to change and the **Pending** column, type the new value, and press Enter. To save your changes, delete the comment character (>) next to **.LOGOUT** and press Enter. This releases the current log, moves the **Pending** values to the **Current** column, and reallocates the log using the new values.

**Note:** When a value is displayed within parentheses, it means that the field is inactive.

**.LOGOUT**

Prints the current log and leaves it open. OMEGAMON XE for DB2 PE places a comment character in front of **.LOGOUT** so that the log is reset only on cycles when you remove the comment character (>).

**copy**
The number of copies to print.

**ddnm**
Overrides the standard OMEGAMON XE for DB2 PE ddname. When DDNM is active, **sout** and its related parameters (copy, dest, dstu, form, and hold) are inactive. The ddname must be allocated within the O2CI started task JCL.

**dest**
The destination to receive the report. The default is NONE, which sends the output to the local printer. The device can be a terminal, a node, a remote workstation, a local device or group of devices, or a user ID.

**dstu**
The destination user ID to receive the report.

**fold**
Changes lowercase characters to uppercase. The default is YES.

**form**
The name of the form on which to print. The default is NONE. This means that OMEGAMON XE for DB2 PE uses the form defined as your installation's default. If you change NONE to some other value (such as HOLE), you can type an asterisk (\*) to return to NONE.

**hold**
Specifies that the output be placed in the hold queue. The default is NO.

**id1**
Requests separator pages and page headers that identify output from different OMEGAMON XE for DB2 PE sessions.

**id2**
Defines up to 16 characters to be shown on the left of the separator page, justified below the ID1 heading. ID1 must be set to use ID2.

**id3**
Defines up to 16 characters to be shown centered on the separator page, below the ID1 heading. ID1 must be set to use ID3.

**id4**
Defines up to 16 characters to be on the right of the separator page, justified below the ID1 heading. ID1 must be set to use ID4.

**lnct**
Sets the REPORT file line count. The default is 60 lines.

**sout**
Specifies the SYSOUT class for the output.

**Set Exception Analysis Message Option**

Use this panel to set a message that OMEGAMON XE for DB2 PE displays on the Exception Messages panels when no OMEGAMON XE for DB2 PE exceptions are tripping.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

XTXT  Sets the message text.

You can change the message that OMEGAMON XE for DB2 PE displays when no exceptions have exceeded their threshold values. To change the message, type the new message next to XTXT within single quotes (') and press Enter to record the change.

Set Performance Options

Use this panel to set certain performance options, such as how OMEGAMON XE for DB2 PE uses storage.

Because this panel contains options that can have a great effect on the system, this panel might require special authorization. If OMEGAMON XE for DB2 PE prompts you for authorization, first type /PWD on the top line of the panel. Then type your password and press Enter.
Navigation

For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

NONSWAP
This field does not apply to OMEGAMON XE for DB2 PE because OMEGAMON XE for DB2 PE always sets its storage to nonswappable.

PAGEFIX
Makes OMEGAMON XE for DB2 PE storage page-fixed (ON or OFF). The default is OFF.

RESERVE
Controls whether a DASD RESERVE is issued when OMEGAMON XE for DB2 PE saves a panel into its panel data set, RKO2PCSV, or a profile into its profile data set, RKO2PFSV (ON or OFF). The default is OFF.

If you change the setting of this option, the new setting takes effect immediately.

TSOPFIX
This field does not apply to OMEGAMON XE for DB2 PE. Use the PAGEFIX option.

Note: RESERVE is the only option that takes effect immediately if you change it. All other option settings take effect only after they are saved in a profile that is used in a subsequent session.

Set Background Exception Processing

Use this panel to turn background exception processing on and off.

When you set this option to OFF, CPU use will be reduced, assuming the XLF and ASF options are OFF and that foreground exception processing (EXSY/LEXSY) is OFF.

Important: When the command E. is used to fastpath to the exceptions panel, ZEXSY, an incorrect exception analysis can occur if XOPT is set to OFF. Hit Enter to refresh the panel and display the correct exception status.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

OMEGAMON XE for DB2 PE does not display any fields in this panel.

Exception Analysis Options menu

Use this menu to select the type of exception for which you want to set or change the exception analysis options.

===============================================================================

A SYSTEM .............. Set exception analysis options for System exceptions
B THREAD .............. Set exception analysis options for Thread exceptions
C CICS ................. Set exception analysis options for CICS exceptions
D IMS .................. Set exception analysis options for IMS exceptions
E SINGLE ............... Set options for individual exception

===============================================================================

Navigation

For additional options, choose one of the options from the menu.

Fields

When you choose an exception type (for example, Thread) from the Exception Analysis Options Menu, OMEGAMON XE for DB2 PE displays a list of the exceptions in that group. You can then select a specific exception to set or view its characteristics.

If you select the Single option, OMEGAMON XE for DB2 PE displays a panel on which you can enter the name of the exception you want to view or change.

Set Exception Analysis Options

Use this panel to view and change the current characteristics of an exception and to add, delete, or display filtering rules for THREAD exception processing.

The following example shows the exception analysis options for an ARCM exception:
SET EXCEPTION ANALYSIS OPTIONS FOR ARCM EXCEPTION

> Warns when thread backout processing is waiting for an archive tape mount.

> To change the value of an exception option, type the new value over the current one. Press ENTER to record the change.

Fields

cccc Exception name.

DISPLAY Parameters

State One of the following:

ON Checks for this exception condition during the current OMEGAMON XE for DB2 PE session.

OFF Does not check this exception condition during the current OMEGAMON XE for DB2 PE session.

TEST Sets exception analysis into a test mode for this exception condition.

If you set the exception state to TEST and you type the word FORCE after the exception name, OMEGAMON XE for DB2 PE displays the exception message text below the parameters with T in column 2 of the exception text and also on the Exception Messages panel.

Note: Because OMEGAMON XE for DB2 PE cannot provide a current value for the exception, the message text substitutes the value with an n variable.

Chapter 5. Monitoring 1499
**Group** Displays the 2-character exception group identifier.

- **CI** for CICS
- **SY** for system
- **TH** for thread

**Bell** Specifies whether the audible alarm on the terminal sounds when this exception occurs.

- **ON** The bell sounds. This works only if the system bell is set to ON on the Set Display Options panel.
- **OFF** The bell does not sound.

**BOX Parameters**

**Boxchar**
Specifies a box character enclosed in single quotes, or the string NO BOX (without quotes), which is the default. If Boxchar is NO BOX, OMEGAMON XE for DB2 PE does not place any box around the exception. Also, Boxclr and Boxattr is set to NONE.

Do not use a single quote (') as a box character, because it is the delimiter. To use an ampersand as a box character, type two ampersands (Boxchar is '&&').

**Boxclr** Sets the color or intensity of the exception box. (If you set Boxchar=NO BOX, OMEGAMON XE for DB2 PE sets Boxclr=NONE.)

On 4-color or noncolor terminals the value can be:

- **HI** Highlights the message.
- **LO** Does not highlight the message.
- **DEFAULT** Uses the value of the default field on the Set Display Options panel.

On 7-color terminals the value can be:

- **RE** Sets the box red.
- **BL** Sets the box blue.
- **YE** Sets the box yellow.
- **PI** Sets the box pink.
- **GR** Sets the box green.
- **TU** Sets the box turquoise.
- **WH** Sets the box white.
- **DEFAULT** Uses the value of the default field on the Set Display Options panel.

Boxclr can also be set to the variables Clr1 through Clr7. They are associated with the colors listed before and follow the same order. To set these values, see the Set Display Options panel.

**Boxattr**
For 7-color terminals, sets one of the following additional highlight
attributes (with extended color support) for the box. (If you set Boxchar at
NO BOX, OMEGAMON XE for DB2 PE sets Boxattr at NONE.)

**BLINK**
Turns on blinking for the exception.

**RVRS** Displays message in reverse video.

**UNDR** Underscores message.

**NONE** Uses the default extended highlight attributes.

*Note:* If you do not set color and highlighting attributes for the box, OMEGAMON XE for DB2 PE uses those that you set for the exception.

**THRESHOLD Parameters**

**Threshold**
Exception threshold. For exceptions that monitor an action, not a value, this setting is N/A.

**Display**
Sets the exception message display color or intensity.

The variables *Clr1* through *Clr7* specify the exception display color. Set the associated values with the Set Display Options panel.

On terminals that use extended color support (set with the XACB Display Options field on the Set Display Options panel), the color codes are:

- **RE** Sets message red.
- **BL** Sets message blue.
- **YE** Sets message yellow.
- **PI** Sets message pink.
- **GR** Sets message green.
- **TU** Sets message turquoise.
- **WH** Sets message white.
- **NONE** Specifies the hardware default colors.

On terminals that do not use extended color support, the intensity can be:

- **HI** Highlights the message.
- **LO** Does not highlight the message.

**Attribute**
For 7-color terminals, sets one of the following extended highlight attribute (with extended color support) for the exception.

**BLINK**
Turns on blinking for the exception.

**RVRS** Displays message in reverse video.

**UNDR** Underscores message.
NONE
Uses the default extended highlight attributes.

**CYCLE Parameters**

ExNcyc
Sets the frequency for checking the exception at every \( n \) OMEGAMON cycles. If this parameter is set to 0 or 1, exception checking will occur during every OMEGAMON cycle. If this field is set to a higher number, exception checking will only occur each time the specified number of cycles elapses. The default setting for ExNcyc is 0.

Stop
Sets a monitoring limit for an exception to \( n \) trips. After the exception trips \( n \) times, the exception will not monitor or display it during the current OMEGAMON XE for DB2 PE session, unless you reset this parameter. The (\( m \)) value indicates the number of times the exception has already tripped since you last reset the STOP parameter. The default value for STOP is 0, which means that there is no limit to the number of times the exception can be tested and displayed.

Cumulative
Indicates how many times the exception has tripped during the current OMEGAMON XE for DB2 PE session.

**XLF Parameters**

Auto
Controls the status of ASF (automated panel facility) for this exception. Can be ON or OFF.

Log
Controls the status of XLF (Exception Logging Facility) for this exception. Can be ON or OFF.

Limit
Limits the number of times XLF or ASF is invoked if the exception occurs. If you enter 0, no events are logged. If you enter NONE, the exception invokes XLF and/or ASF each time the exception occurs.

The number that is displayed in parentheses is the number of invocations remaining before the limit is reached. If Limit is NONE, the parenthetical value is not displayed, because there is no limit to the number of invocations.

Repeat
Specifies that the exception is to be logged each time the PERSIST threshold is reached (YES), or that it is to be logged only the first time the PERSIST threshold is reached (NO).

Persist
Specifies the number of OMEGAMON XE for DB2 PE cycles during which the exception must trip before XLF or ASF logs the exception and/or detail panel.

SS/SL
This parameter might first be displayed on your panel as SS. Change the parameter to SL for proper logging.
- SS specifies the screen space to invoke if ASF is in effect.
- SL logs the screen space execution on the REPORT LOG.

The following panels have been predefined for this purpose:

**ZCILOG**
Details about the CICS exceptions.
Exception Rules

Note that, before OMEGAMON XE for DB2 PE processes exception rules, it applies global exclude rules to exclude threads from all thread exception processing. You can specify your own exclude rules.

For the non-excluded threads OMEGAMON XE for DB2 PE processes rules for an exception in the order in which the rules are numbered on the Rules for an Exception panel. Once a thread meets the criteria of a rule, exception rule processing stops. Therefore, specific rules must precede the more general and inclusive rules. See the online help F1 (Help) for an example.

The following fields are displayed at the bottom of the panel when you select a THREAD type exception:

FUNCTION
Use this field to specify what you want to accomplish. Enter one of the following commands, followed by a rule number in parentheses:

Dis Displays the rules. You can specify a rule number, for example Dis(12), to access a particular rule without using the scroll key. You can specify an asterisk (*), for example Dis(*), to display all rules for an exception.

After rules are displayed, you can change the contents of any field.

Add Adds a new rule or changes the order of existing rules. For example, if you enter Add(03), a new rule is created after rule 2 and all following rules are renumbered.

Del Deletes a rule. For example, if you enter Del(05), rule 5 is deleted and all following rules are renumbered.

To change the order of existing rules, use Add to place the rule where you want it and Del to remove the rule from its previous position.

RULE The rule number.

Use the following thread exception rule parameters to specify the conditions under which you want each exception to trip or to be excluded.

PLAN The plan names for which this exception will trip.

AUTHID The authorization ID for which this exception will trip.

CONNTYPE The connection type for which this exception will trip. Possible values:

• Batch
- CICS
- Dist(ributed)
- IMS
- TSO
- Utility

CICSTRAN
The CICS transaction ID for which this exception will trip.
If you specify this parameter, you must also specify CONNTYPE=CICS.

CICSCONN
The CICS task name (job name) for which this exception will trip.
If you specify this parameter, you must also specify CONNTYPE=CICS.

PSBNAME
The IMS PSB name for which this exception will trip.
If you specify this parameter, you must also specify CONNTYPE=IMS.

IMSID
The IMS subsystem name for which this exception will trip.
If you specify this parameter, you must also specify CONNTYPE=IMS.

PACKDBRM
The name of the package or DBRM for which this exception will trip.

PAKCOLID
The name of the collection for which this exception will trip.

CORRID
The name of the correlation ID for which this exception will trip.

REQLOC
The name of the requesting location for which this exception will trip.

THRDTYPE
The number from the following list for which this exception will trip:
- 1 - normal threads
- 2 - allied distributed threads
- 3 - command threads
- 4 - distributed database access threads
- 5 - INDOUBT threads
- 6 - parallel task threads
- 8 - system threads

THRESHOLD
The threshold that the exception is to use. This value will override the value set with the XACB command.

EXCLUDE
Specifies whether to exclude thread exceptions with specified criteria from exception analysis reporting.
YES Excludes all thread exceptions with the specified parameters.
NO Includes all thread exceptions with the specified parameters.
Using Masking Characters

Masking is possible on the following fields:
- PLAN
- AUTHID
- CICSTRAN
- CICSCONN
- PSBNAME
- IMSID

Two types of masking are possible:
- A generic mask is defined by using an asterisk (*). This type of mask is used if you want to mask the first character or more of the field. For example, ABC* allows any value for that field that begins with the characters ABC.
- A single-character replacement mask is defined by using one or more question marks (?). This type of mask is used if specific positions within a field are to be masked. For example, MY???PLN allows for any characters in the places of the question marks. A possible value would be MY_ACT_PLN.

Detailed Exception Rules Example

This example explains the rules that you can define for ETIM exceptions. The ETIM exception critical threshold is 600 seconds. You notice that KO2PLAN threads are frequently tripping this threshold. Because it is normal for these threads to stay active for long periods of time, you are not concerned about their elapsed time.

To qualify the threads that cause this exception to trip, you can set up the following rules:

To qualify the threads that cause this exception to trip, you can set up the following rules:

<table>
<thead>
<tr>
<th>Rule</th>
<th>Plan</th>
<th>Authid</th>
<th>Conn</th>
<th>Threshold</th>
<th>Excl</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>KO2PLAN</td>
<td>OMEUSER</td>
<td>BATCH</td>
<td>300</td>
<td>NO</td>
</tr>
<tr>
<td>02</td>
<td>BATCH</td>
<td>1200</td>
<td>NO</td>
<td></td>
<td></td>
</tr>
<tr>
<td>03</td>
<td>KO2PLAN</td>
<td>YES</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Rule 1 identifies the group of threads for plan KO2PLAN. Because these jobs run fast, you specify the critical threshold as 300 seconds.
- Rule 2 specifies that the threshold for all other batch threads should have a much higher threshold of 1200 seconds.
- Rule 3 specifies that all remaining KO2PLAN threads are to be excluded from this exception.

The default critical ETIM threshold for all threads not affected by these rules is still 600 seconds.

If you would reverse the order of rules 1 and 3, rule 1 would nullify the criteria in rule 3 and would exclude all KO2PLAN threads from this exception.

If you would reverse the order of rules 1 and 2, the threshold of 1200 seconds for all batch threads would nullify the threshold of 300 seconds for the KO2PLAN batch threads.
List Profiles
This panel shows a list of all panel profiles available for use.

</tbody>
</table>

> To add a description to this profile, type the description between the single quotes that follow the colon on the last line. Press ENTER to record the change. To save the description with this profile, select SAVE USER or SAVE INSTALL from the Profile Maintenance Menu.

PPRF COMMENT
: 'USER PROFILE'

Navigation
For additional information about other topics, use the PF keys.

Fields
PPRF COMMENT
Adds a 1-line description to the current profile.

You must save the description in a profile for it will be displayed on the List Profiles panel. To save a description in a user profile, use the Save
New/Altered User Profile panel. To save a description with the installation profile, use the Save New/Altered Installation panel.

**Save New/Altered User Profile**
Use this panel to save a new or altered user profile. A saved user profile can be used in subsequent OMEGAMON XE for DB2 PE sessions.

You can change the setting of any user profile at any time during an OMEGAMON XE for DB2 PE session. OMEGAMON XE for DB2 PE only uses the changed setting during the current session.

If you want to use the changed settings during another OMEGAMON XE for DB2 PE session, save the profile by using the Save New/Altered User Profile panel.

---

**Navigation**

For additional options, use the PF keys.

**Fields**

**PPRF SAVE**

Saves the specified user profile. To specify a user profile, type a space followed by the profile's 2-character suffix after PPRF SAVE and press Enter. You can specify this suffix in the USER= startup parameter to start subsequent sessions.

When you press Enter, OMEGAMON XE for DB2 PE examines whether a profile with the specified name exists. If the profile does not exist, OMEGAMON XE for DB2 PE saves the profile with the specified name. If such a profile already exists, OMEGAMON XE for DB2 PE displays a confirmation panel, whether you want to replace the existing profile.

OMEGAMON XE for DB2 PE saves the profile in the rhilev.RKO2PFSV data set. However, OMEGAMON XE for DB2 PE does not permit to change the /C profile.
Delete User Profile

Use this panel to delete a user profile.

To delete the user profile, space over the comment character (>) that precedes PPRF DELETE. Then, type a space followed by the profile's 2-character suffix after PPRF DELETE. Press ENTER to record the change.

Navigation

For additional options, use the PF keys.

Fields

PPRF DELETE

Deletes the specified user profile.

To delete a user profile, type a space followed by the profile's 2-character suffix after PPRF DELETE and press Enter.

When you press Enter, OMEGAMON XE for DB2 PE examines whether a profile with the specified name exists. If the profile exists, you are asked to confirm the delete request. If the profile does not exist, OMEGAMON XE for DB2 PE displays a message. However, OMEGAMON XE for DB2 PE does not permit to delete the /C profile.

You can delete a profile at any time. An active session is not affected if the corresponding profile is deleted.

Save New/Altered Installation Profile

Use this panel to save a new or altered installation profile. A saved installation profile can be used in subsequent OMEGAMON XE for DB2 PE sessions.

You can change the setting of the installation profile at any time during an OMEGAMON XE for DB2 PE session. OMEGAMON XE for DB2 PE only uses the changed setting during the current session.

If you want to use the changed settings again during another OMEGAMON XE for DB2 PE session, save the profile by using the Save New/Altered Installation Profile panel.
Because this panel contains options that can have a great effect on the system, this panel might require special authorization. If OMEGAMON XE for DB2 PE prompts you for authorization, first type /PWD on the top line of the panel. Then type your password and press Enter.

**Navigation**

For additional options, use the PF keys.

**Fields**

**IPRF SAVE**

Saves the installation profile.

When you space over the comment character (replace it by a space character) and press Enter, OMEGAMON XE for DB2 PE displays a confirmation panel, whether you want to save the installation profile. Profiles that are saved with this panel automatically get the profile prefix /I).

**Delete Installation Profile**

Use this panel to delete the installation profile.

```
>IPRF DELETE
```

Because this panel contains options that can have a great effect on the system, this panel might require special authorization. If OMEGAMON XE for DB2 PE prompts you for authorization, first type /PWD on the top line of the panel. Then type your password and press Enter.

**Navigation**

For additional information about other topics, use the PF keys.

**Fields**

**IPRF DELETE**

Deletes the installation profile.

When you space over the comment character (replace it by a space character) and press Enter, OMEGAMON XE for DB2 PE asks you to confirm that you want to delete the installation profile. However, OMEGAMON XE for DB2 PE does not permit to delete the /C profile.

You can delete a profile at any time. An active session is not affected if the corresponding profile is deleted.
Change Profile
Use this panel to change the currently used profile to a different one.

Because this panel contains options that can have a great effect on the system, this panel might require special authorization. If OMEGAMON XE for DB2 PE prompts you for authorization, first type /PWD on the top line of the panel. Then type your password and press Enter.

Navigation
For additional information about other topics, use the PF keys.

Fields
CPRF xx
Changes the profile.

When you space over the comment character (replace it by a space character) and press Enter, OMEGAMON XE for DB2 PE asks you to confirm that you want to change the currently used profile.

Exception Logging menu
This menu provides navigation options to panels on which you can set printer and routing options for XLF and ASF.

In addition, this menu includes selections that turn logging on and off and cause the logs to be printed. (These selections do not navigate to other panels, but a message will be displayed on the menu to inform you that the action you requested has been performed, for example, EXCEPTION LOGGING FACILITY IS ON.)
Enter a selection letter on the top line.

EXCEPTION LOGGING

To log specific exceptions, first select the exception options from the Profile menu. For the exceptions you want to log, set LOG=ON for XLF and AUTO=ON for ASF. The screen named in the SL field will be logged when ASF is activated below and the specified exceptions are tripped.

A XLF OPTIONS ....... Set Exception Logging Facility printer/routing options
B XLF ON ............ Turn on Exception Logging Facility
C XLF OFF ............ Turn off Exception Logging Facility
D XLF PRINT ........ Print Exception Logging Facility log (XLFLOG)
E ASF OPTIONS ....... Set Automatic Screen Facility printer/routing options
F ASF ON ............ Turn on Automatic Screen Facility
G ASF OFF ............ Turn off Automatic Screen Facility
H ASF PRINT ........ Print Automatic Screen Facility log (REPORT)

Navigation

For additional options
• select one of the options from the menu.
• use the PF keys.

Set XLF Printer and Routing Options

Use this panel to set options that control how the Exception Logging Facility logs exception messages.

Note: If you selected option E (ASF Options) from the Exception Logging Menu, a panel very similar to this one is displayed. The option settings on the Set ASF Printer and Routing Options panel reflect the settings on the Set Printer and Routing Options panel (see “Set Printer and Routing Options” on page 1494). That is, there are two sets of options: one for exception logging (XLF) and one for all other output logging (including ASF).
Navigation

For additional options, use the PF keys.

Fields

To modify an option, move the cursor between the name of the setting you want to change and the **Pending** column, type the new value, and press Enter. To save your changes, delete the comment character (>) next to .XLFOUT and press Enter. This releases the current log, moves the **Pending** values to the **Current** column, and reallocates the log using the new values.

**Note:** When a value is displayed within parentheses, it means that the field is inactive.

**.XLFOUT**

Prints the current log and leaves it open. OMEGAMON XE for DB2 PE places a comment character (>) next to .XLFOUT so that the log is reset only on cycles when you remove the comment character (>).

**copy** The number of copies to print.

**ddnm** Overrides the standard OMEGAMON XE for DB2 PE ddname. When ddnm is active, sout and its related parameters (copy, dest, dstu, form, and hold) are inactive. The ddname must be allocated within the O2CI started task JCL.

**dest** The destination to receive the report. The default is NONE, which sends the output to the local printer. The device can be a terminal, a node, a remote workstation, a local device or group of devices, or a user ID.

**dstu** The destination user ID to receive the report.

**fold** Changes lowercase characters to uppercase. The default is YES.

**form** The name of the form on which to print. The default is NONE. This means

---

*IBM Db2 Performance Expert on z/OS*
that OMEGAMON XE for DB2 PE uses the form defined as your installation’s default. If you change NONE to some other value (such as HOLE), you can type an asterisk (*) to return to NONE.

**hold** Specifies that the output be placed in the hold queue. The default is NO.

**id1** Requests separator pages and page headers that identify output from different OMEGAMON XE for DB2 PE sessions.

**id2** Defines up to 16 characters to be shown on the left of the separator page, justified below the ID1 heading. ID1 must be set to use ID2.

**id3** Defines up to 16 characters to be shown centered on the separator page, below the ID1 heading. ID1 must be set to use ID3.

**id4** Defines up to 16 characters to be shown on the right of the separator page, justified below the ID1 heading. ID1 must be set to use ID4.

**lnct** Sets the XLFLOG file line count. The default is 60 lines.

**sout** Specifies the SYSOUT class for the output.

### Set DB2/IRLM Messages that MSGE Exception Monitors

Use this panel to add or delete the DB2 and IRLM messages that you want the MSGE exception to monitor.

<table>
<thead>
<tr>

: Delete =

> ===---------------------------------------------------------------------

### Navigation

For additional information about other topics, use the PF keys.

### Fields

**XMSG**

The lines below XMSG define the IDs of the DB2 and Internal Resource Lock Manager (IRLM) messages that OMEGAMON XE for DB2 PE exception analysis is tracking.

**Add** Type the ID of an additional DB2 or IRLM message that you want OMEGAMON XE for DB2 PE exception analysis to track, and press Enter. You can add more than one ID at a time by typing the IDs on the Add line with a space between them.

**Note:** If you want to add a group of messages that have the same initial characters, you can save time by entering only those characters. For example, if you enter DSN, XMSG will monitor all messages that begin with DSN.
Delete  Type the ID of a DB2 or IRLM message that you no longer want OMEGAMON XE for DB2 PE exception analysis to track and press Enter. You can delete more than one ID at a time by typing the IDs on the Delete line with a space between them.

Note: If you want to delete a group of messages that have the same initial characters, you can save time by entering only those characters. For example, if you enter DSN, XMSG will no longer monitor messages that begin with DSN.

Filter Options For Thread Activity Displays
Use this panel to save filter criteria to a specified profile, to activate a different profile, or to specify filter criteria that you want to use in the thread activity panels for the remainder of the session. You can use these filtering options together with the thread commands. If more than one parameter is specified, the requests are connected using a logical AND operator. To specify a reset, type character R in column 1 in front of THFL.

To view this panel select option L on panel “Profile Maintenance menu” on page 1488. The content of this panel is identical to panel “Filter Options For Thread Activity Displays” on page 1069.
Thread Filtering Specification

===============================================================================
Filter Options For Threads
> To save filters in the user profile remove the > from the PPRF command and
> optionally add a 2 character profile suffix. Use IPRF for install profile
> PPRF SAVE
> To change profiles remove the > from the CPRF command and enter the 2
> character suffix. Use CPFI to switch to installation profile
> CPRF xx
> TFL
>
+ Specify the values to be used as filtering criteria for Thread
+ Activity displays. Wildcard values * (multiple characters) or
+ ? (single character) may be specified for character values.
>
+ Specify the following filters to be applied within DB2
+ :
  PLAN     = _______ (plan name)
  AUTHID   = _______ (authorization id)
  CONNID   = _______ (connection id)
  LOCATION = ___________ (location)
  PARENTACE= _______ (parent ace for parallel tasks)
  CORRID   = _______ (correlation id)
  ENDUSERID= _______ (end user id)
  WORKSTATION= ___________ (workstation)
  TRANSACTIONID= ___________ (transaction id)
+ Specify the following filters to be applied within OMEGAMON
+ :
  PACKAGE/DBRM = _______ (name )
  COLLECTION   = ___________ (collect id)
  DB2STAT      = ___________ (db2 status)
  GETPAGES     > _______ (number of getpages)
  UPDATES      > _______ (number of page updates)
  COMMITS      > _______ (number of commits)
  ELAPTIME     > _______ (elapsed time - in seconds)
  ELAPTIME/COMMIT> _______ (elapsed time per commit)
  DB2TIME      > _______ (In DB2 time - in seconds)
  DB2TIME/COMMIT> _______ (In DB2 time per commit)
  PROCESSINGINDB2 = ___ (Status Active in DB2)
  THREADLIM    = _______ (Limit on number of threads returned)
===============================================================================

Fields

Note: For details about operators and wildcard characters use online help F1 (Help). Most fields are only applicable for active threads.

The following fields enable OMEGAMON XE for DB2 PE to send filters to DB2 as well as to apply “post-filtering” of data returned from DB2. These filters can improve the performance in your environment.

The following fields provide filtering within DB2:

**PLAN**  The DB2 plan name of the active thread. You can specify up to 8 characters.

**AUTHID**  The DB2 thread authorization identifier of the active thread. You can specify up to 8 characters.

**CONNID**  The DB2 connection identifier of the active thread. You can specify up to 8 characters.
LOCATION
The name of the location requesting information. You can specify up to 16 characters. The field will either filter on the requesting location (QW01488L, for example, for distributed database access threads), or the DB2 location (QW0148LN) if the requesting location field is not filled by DB2.

PARENTACE
The agent control element (ACE) token. Specify the parent ACE for the parallel task. You can specify up to 8 digits. A value of 0 filters out child parallel tasks from the Thread Activity displays.

CORRID
The correlation identifier. You can specify up to 12 characters. If the application requestor is a DB2 system, this is the same correlation ID assigned at the requestor. If the application requestor is not DB2, this is the name of the job, task, or process that is being serviced.

Note: This field is case sensitive. It is not converted to uppercase.

ENDUSERID
The end user's work station user ID. You can specify up to 16 characters. This can be different from the authorization ID used to connect to DB2. It contains blanks if the client does not supply this information.

Note: This field is case sensitive. It is not converted to uppercase.

WORKSTATION
The workstation identifier. You can specify up to 18 characters. It contains blanks if the client does not supply this information.

Note: This field is case sensitive. It is not converted to uppercase.

TRANSACTIONID
The name of the transaction or application that the end user is running. It identifies the application that is currently running, not the product that is used to run the application. You can specify up to 32 characters. This field contains blanks if the client does not supply this information.

Note: This field is case sensitive. It is not converted to uppercase.

The following fields enable filtering of the data returned from DB2 and are applied by OMEGAMON XE for DB2 PE:

PACKAGE/DBRM
The DB2 package name or DBRM name of the active thread. You can specify up to 8 characters.

COLLECTION
The package collection identifier of the active thread. You can specify up to 18 characters.

DB2STAT
The DB2 status. You can specify up to 12 characters. For definitions of all possible status values, see "DB2 Thread Status".

GETPAGES
The number of Getpage requests issued by the active thread since thread creation. You can specify up to 9 digits.
**UPDATES**
The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2’s internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative. This file is applicable for active threads only. You can specify up to 9 digits.

**COMMITS**
The number of times the thread successfully completed commit processing. DB2 resets the commit count at thread create and signon. If Signon is not driven, the count is cumulative. You can specify up to 9 digits.

**ELAPTIME**
The elapsed time since thread creation. You can specify up to 9 digits.

**ELAPTIME/COMMIT**
Average elapsed time between commits. If the number of commits is zero this field is the same as ELAPTIME. You can specify up to 9 digits.

**DB2TIME**
The total In-DB2 elapsed time in seconds for an active thread. You can specify up to 9 digits.

**DB2TIME/COMMIT**
Average In-DB2 elapsed time between commits. If the number of commits is zero this field is the same as DB2TIME. You can specify up to 9 digits.

**PROCESSING-IN-DB2**
Values YES, NO or blank.

**YES**
Only threads that are in a status that is active in DB2 are shown. If a thread is executing in the application it is not shown. The following thread statuses are processing in DB2:

- IN-DB2
- IN-TRIGGER
- IN-COMMAND
- IN-STOR-PROC
- IN-USER-FUNC
- IN-TERM-THRD
- WAIT-LOCK
- WAIT-GLBLOCK
- WAIT-MSGSEND
- WAIT-ARCHIVE
- WAIT-REMSQL
- WAIT-CONVLIM
- WAIT-TERM-TH
- WAIT-SP-STOP
- WAIT-SP-SCHD
- SP/UDF-INACT
- WAIT-SYNC-IO
- WAIT-SERVICE
- WAIT-ASYNCRD
- WAIT-ASYNCWR
- WAIT-LOGQSCE
- WAIT-PGLATCH
- WAIT-DRNLOCK
- WAIT-CLAIMER
- WAIT-ARCREAD
- WAIT-LOCKPIP
- WAIT-LOCKPQS
- WAIT-SWITCH
- WAIT-ACCEL
- WAIT-LOB
- WAIT-COMMIT
- WAIT-CL3LOCK
- IN-SQL-SORT
- IN-SQL-CALL
- WAIT-REMREQ
- IN-BIND-DYNM
- IN-ACCEL
- IN-AUTO-PROC

**NO** Only threads that are not in an active status in DB2 are shown.

**Blank** This filter is not used.

Threads accelerated by the IBM Db2 Analytics Accelerator for z/OS are considered as being processed in DB2.

**THREADLIM**
A numeric value causing OMEGAMON XE for DB2 PE to stop retrieving instrumentation records from DB2. This field can have a positive impact on realtime and system performance, but can also result in an incomplete thread list if it is less than the number of threads actually running in DB2 at the time the list is retrieved. The default setting (blank or 0) allows all records retrieved by DB2 to flow to OMEGAMON XE for DB2 PE. You can specify up to 9 digits.

**Near-term history information**
OMEGAMON XE for DB2 PE shows near-term history information about statistics and thread activities that were completed in the near past (opposed to snapshot information, which is periodically gathered and might even report information about currently active tasks).

Near-term history information is gathered and stored by the Near-Term History Data Collector of OMEGAMON XE for DB2 PE. Up to 96 intervals of recent DB2 activities can be stored. OMEGAMON XE for DB2 PE continuously deletes the oldest data to maintain the most recent intervals. The Configuration Tool is used to specify the intervals per hour and the maximum number of hours that data should be gathered and stored.

**Note:** To view near-term history information online, the Near-Term History Data Collector must be running. For instructions on starting the Near-Term History Data Collector, see [Configuration and Customization](#).

There are two panels for each type (for example, buffer pool) of near-term history data. One panel provides information for all the report intervals in storage. The other panel can be used to zoom in on one interval at a time for detailed information.
Near-term history data is stored in main memory, so it is available to all OMEGAMON XE for DB2 PE sessions as long as the Near-Term History Data Collector is running. If the collector is stopped and restarted, the near-term history data buckets will be empty and ready to begin saving data again.

Besides near-term history information, select this menu path for information about the Near-Term History Data Collector. One panel shows the current collection options (for example, collection interval and data storage selections). The other panel provides information about the data that has been collected since the Near-Term History Data Collector was started.

**Near-Term History Information menu**

This menu provides access to panels that display information about near-term history statistics, near-term thread history, and the Near-Term History Data Collector.

```

> NEAR-TERM HISTORY INFORMATION MENU

A STATISTICS ............ Near-Term History Statistics Information
B THREAD HISTORY........ Near-Term Thread History Information
C COLLECTOR INFORMATION .. Near-Term History Data Collector Information
```

**Navigation**

The Near-Term History Information menu displays navigation options to other panels.

**Statistics**

Provides access to the following near-term history statistics information:

- “Subsystem Support Manager Statistics Summary by Report Interval” on page 1521
- “Subsystem Support Manager Statistics Detail” on page 1522
- “Bind Statistics Summary by Report Interval” on page 1525
- “Bind Statistics Detail” on page 1526
- “Buffer Pool Statistics Summary by Report Interval” on page 1529
- “Buffer Pool Statistics Detail” on page 1531
- “Group Buffer Pool Statistics Summary by Report Interval” on page 1540
- “Group Buffer Pool Statistics Detail” on page 1541
- “Distributed Data Facility Statistics Summary by Report Interval” on page 1545
Thread History

Provides access to the following near-term thread history information:

- "Near-Term Thread History Filter Options" on page 1606
- "Near-Term Thread History Filter Options - Confirmation" on page 1609
- "Thread History By Report Interval" on page 1611
- "Thread History By Plan" on page 1613
- "Thread History By Authid" on page 1615
- "Thread History By Plan, Authid" on page 1616
- "Thread History By Authid, Plan" on page 1618
- "Thread History Summary" on page 1621
- "Thread History By Subinterval" on page 1624
- "Thread History By Correlation ID" on page 1626
- "Thread History Buffer Pool Summary" on page 1628
- "Thread History DB2 Time Summary" on page 1629
- "Thread History DB2 Lock/Scan/Sort Summary" on page 1631
- "Thread History Times Summary" on page 1633
- "Thread History Detail" on page 1634
- "Thread History Lock Waits" on page 1641
- "Thread History Lock/Claim/Drain Activity" on page 1651
- "Thread History Global Lock Activity" on page 1653
- "Thread History SQL Counts" on page 1660
- "Thread History Dynamic SQL Calls" on page 1656
- "Thread History Buffer Pool Activity" on page 1672
- "Thread History Resource Limit Statistics" on page 1675
- "Thread History Distributed Activity" on page 1677
- "Thread History Package Summary" on page 1682
- "Thread History Package Detail" on page 1684
- "Thread History Sort and Scan Activity" on page 1689
- "Thread History Group Buffer Pool Activity" on page 1692
Collector Information

Provides access to information about the activity of the current Near-Term History Data Collector and about the records that have been collected.

- “Near-Term History Data Collection Options” on page 1698
- “Near-Term History Data Record Information” on page 1700
- “Near-Term History Data Collector Dataset Status” on page 1702

Subsystem Support Manager Statistics Summary by Report Interval

This panel provides an overview of the DB2 activity that was recorded during a series of report intervals.

Navigation

For additional information about

- a report interval, move the cursor to the line you want and press F11 (Zoom). (Each date/time displayed reflects the end of an interval.)
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start

The start time of the first interval in this display.
Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

- **HOURLY**
  Data will be reported in hourly intervals.
- **NONE**
  Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

Create Thread/Minute
The number of successful Create Thread requests per minute.

Total Commit/Minute
The number of commit requests per minute.

Total Commits
Includes read-only, single-phase, and phase 2 commit requests.

Abort Reqs
The number of events that resulted in successfully backing out a unit of recovery.

Queued at Cthread
The number of Create Thread requests that had to wait because no thread was available.

Indoubt Threads
The number of indoubt threads. A unit of recovery (thread) goes indoubt when a failure occurs between commit phase 1 and commit phase 2.

EOT+EOM Abends
The total number of end-of-task and end-of-memory abends.

Subsystem Support Manager Statistics Detail:
This panel shows detailed information about DB2 activity during a selected report interval, including statistics related to Create Thread, Signon, Commit, and abnormal termination activity.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start  The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.
Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

**HOURLY**
Data will be reported in hourly intervals.

**NONE**
Data will be reported in the time unit specified by the collection interval.

End
The end time of the interval currently displayed.

Identify Requests
Successful connections to DB2 from an allied address space.

Signon Requests
Successful requests to identify a new user for IMS or CICS. Thread Signon processing is applicable only in CICS-DB2 and IMS-DB2 attachment environments.

Create Thread Requests
Successful Create Thread requests.

Create Thread Waits
Create thread requests that had to wait because no thread was available.

Terminate Thread Requests
Successful thread terminations.

Single Phase Commit Requests
Successful commit requests that took place in a single-phase commit environment, for example, TSO.

Read Only Commit Requests
A read-only commit occurs if no DB2 resources have been changed since the last commit for IMS or CICS applications. DB2 performs both phases of the commit process during phase 1.

Commit Phase 1 Requests
Commit phase 1 requests in a two-phase-commit environment, for example, CICS and IMS.

Commit Phase 2 Requests
Commit phase 2 requests in a two-phase-commit environment, for example, CICS and IMS.

Abort Requests
Events that resulted in successfully backing out a unit of recovery.

Total Commit Requests
Includes single-phase, read-only, and phase 2 commit requests.

Indoubt Threads
The number of indoubt threads. A thread goes indoubt when a failure occurs between commit phase 1 and commit phase 2.

Indoubts Resolved
Successful resolutions, either automatic or manual, of indoubt threads.

Abends Detected - End of Task
Tasks that abended while connected to DB2.
Abends Detected - End of Memory
The number of times a non-DB2 address space was deleted by MVS while connected to DB2.

High Water Mark for IDFORE
The maximum number of users that are identified to DB2 from TSO foreground at the same time.

High Water Mark for IDBACK
The maximum number of concurrent connections identified to DB2 from batch.

High Water Mark for CTHREAD
The maximum number of allied threads that are allocated concurrently.

Bind Statistics Summary by Report Interval
This panel provides an overview of the bind activity that was recorded during a series of report intervals.

Navigation
For additional information about
• a report interval, move the cursor to the required line and press F11 (Zoom).
  (Each date/time displayed reflects the end of an interval.)
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields
Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.
Start  The start time of the first interval in this display.

Report Interval  
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level  
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

- **HOURLY**  
  Data will be reported in hourly intervals.

- **NONE**  
  Data will be reported in the time unit specified by the collection interval.

End  The end time of the last interval in this display.

Interval  Provides the date and time that mark the end of the report interval.

Auto Bind Attempt  
The number of times an automatic bind was attempted.

Auto Bind Success  
The number of times an automatic bind attempt succeeded.

Static Bind Attempt  
The number of bind subcommands issued, including the Bind Add and Bind Replace subcommands for plans or packages.

Static Bind Success  
The number of bind subcommands that succeeded.

Rebind Attempt  
The number of attempts to rebind a plan or package.

Rebind Success  
The number of successful attempts to rebind a plan or package.

Free Attempt  
The number of attempts to free a plan or package.

Free Success  
The number of successful attempts to free a plan or package.

Bind Statistics Detail:

This panel shows detailed information about bind activity during a selected report interval.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.
Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

**HOURLY**
Data will be reported in hourly intervals.

**NONE**
Data will be reported in the time unit specified by the collection interval.

End
The end time of the interval currently displayed.

For each of the following fields, the following statistics are provided:

**INTERVAL QUANTITY**
The amount of activities that occur during the interval.

**/MINUTE**
Rate per minute. The number under /MINUTE (in parentheses) is the number of minutes in the interval.

**/THREAD**
Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

**/COMMIT**
Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.

**Automatic Bind Plan Attempts**
The attempts of DB2 to perform an automatic bind of a plan.

**Automatic Bind Plan Successes**
The successful attempts of DB2 to perform an automatic bind of a plan.

**Automatic Bind Pkg Attempts**
The attempts of DB2 to perform an automatic bind of a package.

**Automatic Bind Pkg Successes**
The successful attempts of DB2 to perform an automatic bind of a package.

**Static Bind Plan Attempts**
Represents the bind plan subcommands issued, including the Bind Plan Add and Bind Plan Replace subcommands.

**Static Bind Plan Successes**
Represents the bind plan subcommands that succeeded.

**Static Bind Pkg Attempts**
Represents the bind package subcommands issued, including the Bind Package Add and Bind Package Replace subcommands.

**Static Bind Pkg Successes**
Represents the bind package subcommands that succeeded.

**Rebind Plan Attempts**
Attempts to rebind a plan.

**Rebind Plan Successes**
Successful attempts to rebind a plan.

**Rebind Pkg Attempts**
Attempts to rebind a package.
Rebind Pkg Successes
Successful attempts to rebind a package.

Free Plan Attempts
Attempts to free a plan.

Free Plan Successes
Successful attempts to free a plan.

Free Pkg Attempts
Attempts to free a package.

Free Pkg Successes
Successful attempts to free a package.

Plan Allocation Attempts
The requests from the attachment facility to DB2 to allocate a bound plan for a user.

Plan Allocation Successes
Successful plan allocation attempts.

Package Allocation Attempts
The requests from the attachment facility to DB2 to allocate a bound package for a user.

Package Allocation Successes
Successful package allocation attempts.

Auth Check Attempts
Authorization checks for all plans.

Auth Check Successes
Successful authorization checks.

Auth Check Using Cache
Successful authorization checks that were performed using cache.

Auth Check Public Authority
Successful authorization checks that were performed based upon execute authority granted to public.

Test binds (No Plan ID)
Bind subcommands that were issued without a plan ID.

Buffer Pool Statistics Summary by Report Interval
This panel provides an overview of the buffer pool activity that was recorded during a series of report intervals.
### Highlighting

OMEGAMON XE for DB2 PE highlights some fields in this panel to draw your attention to their current status:

**Table 117. Highlighted fields in Buffer Pool Statistics Summary by Report Interval panel**

<table>
<thead>
<tr>
<th>Field</th>
<th>Exception</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pages in Use</td>
<td>BMTH</td>
<td>The percentage of pages in use has reached the predetermined threshold.</td>
</tr>
</tbody>
</table>

### Navigation

For additional information about

- another buffer pool, enter the buffer pool ID next to HBPS.
- a report interval, move the cursor to the required line and press F11 (Zoom).
  
  (Each date/time displayed reflects the end of an interval.)
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.
Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start
The start time of the first interval in this display.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.

NONE
Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

Pages in Use
A snapshot value of the current number of nonstealable buffers. A nonstealable buffer is either one which has an outstanding Getpage (that is, someone is currently looking at this page), or one which has been updated and not yet written out to DASD.

Prefetch Requests
The total number of Prefetch requests. This is the sum of Sequential, List, and Dynamic Prefetch requests.

Prefetch Failures
The number of Sequential Prefetch failures for the buffer pool during the interval. This includes failures that occurred because the SPTH threshold was reached and because the maximum number of concurrent prefetches was reached.

Getpages/Sync I/O
The ratio of Getpage requests to synchronized Read I/Os.

Pages/Write I/O
The ratio of page writes to physical I/Os.

DMTH
The number of times the Data Manager threshold was reached.

Buffer Pool Statistics Detail:

This panel provides detailed near-term history information about activity in a specified DB2 buffer pool during a selected report interval.

You can view information about a different buffer pool by entering a buffer pool ID (for example, 1 or 32K) next to HBPD.

- other topics, use the PF keys.
Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start  The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.

NONE
Data will be reported in the time unit specified by the collection interval.

End  The end time of the interval currently displayed.

Virtual Buffer Pool Size
The number of buffers allocated for an active virtual buffer pool.

VPOOL Frame Size (QDBPFRAM)
For the Frame Size attribute, you can specify the values 4K, 1M, or 2G.
This applies to DB2 11 and higher.

VPOOL Buffers Allocated
The number of virtual buffer pool pages that were allocated at the end of the interval.

Minimum VPOOL Size (QDBPVPMI)
The VPSIZEMIN attribute.
This applies to DB2 11 and higher.

VPOOL Buffers in Use
The number of virtual buffer pool pages that were in use (nonstealable) at the end of the interval.

Maximum VPOOL Size (QDBPVPMA)
The VPSIZEMAX attribute.
This applies to DB2 11 and higher.

VPOOL Buffers to be Del
The number of pages to be deleted from an active virtual buffer pool as a result of pool contraction.

Auto Size
Determines whether Auto Size is used. You can specify Y (YES) or N (NO).

Use Count
The number of open tablespaces or indexspaces in this buffer pool.

Page Fix
Determines whether a page is fixed in real storage when it is first used. You can specify Y (YES) or N (NO).
VP Sequential Thresh
Sequential Steal threshold for the virtual buffer pool VPSSEQT. The percentage of the virtual buffer pool that might be occupied by sequentially accessed pages. If set to zero, prefetch is disabled.

Vert Deferred Write Thresh
Vertical Deferred Write threshold for the virtual buffer pool VDWQT. The percentage of the buffer pool that might be occupied by updated pages from a single data set.

VP Parallel Seq Thresh
Parallel I/O sequential threshold VPPSEQT. This threshold determines how much of the virtual buffer pool might be used for parallel I/O operations. It is expressed as a percentage of VPSEQT. If set to zero, I/O parallelism is disabled.

Sysplex Parallel Thresh
Virtual buffer pool assisting parallel sequential threshold. This threshold determines how much of the virtual buffer pool might support parallel I/O operations from another DB2 in a data sharing group.

Getpages per Sync I/O
The ratio of Getpage requests to Read I/Os.

Pages Written per Write I/O
The ratio of page writes to physical I/Os.

Prefetch per I/O
The ratio of Prefetch requests to physical I/Os.

Pages Read per Prefetch
The ratio of pages read by Prefetch processing to total Prefetch requests. This includes both Sequential Prefetch and List Prefetch.

Seq Prefetch per I/O
The ratio of pages read by Sequential Prefetch to Sequential Prefetch I/O.

Pages Read per Seq Prefetch
The ratio of pages read by Sequential Prefetch requests to Sequential Prefetch requests.

List Prefetch per I/O
The ratio of List Prefetch requests to List Prefetch I/Os.

Pages Read per List Prefetch
The ratio of pages read by List Prefetch to List Prefetch requests.

Dyn Prefetch per I/O
The ratio of Dynamic Prefetch request to Dynamic Prefetch I/Os.

Pages Read per Dyn Prefetch
The ratio of pages read by Dynamic Prefetch to Dynamic Prefetch request.

Max Concur Prefetch I/O
The highest number of concurrent prefetch I/O streams that were allocated to support I/O parallelism.

Workfile Maximum
The maximum number of workfiles that have been allocated during sort/merge processing.
BP Hit % - Random
The percentage of times that DB2 performed a Getpage operation with a random request and the page was already in the buffer pool. A DASD read was not required.

Virtual Page Steal Method
Determines when and whether performance-critical objects in buffer pools are removed from buffer pools when the space is needed by other objects. Valid values:

- **LRU**  “Least Recently Used” objects are removed first.
- **FIFO**  Oldest objects are removed first (First-In-First-Out).
- **NONE**  Objects are not removed from buffer pool (no page stealing). This setting provides the highest availability for business-critical objects.

BP Hit % - Sequential
The percentage of times that DB2 performed a Getpage operation with a sequential request and the page was already in the buffer pool. A DASD read was not required.

Random Getpage Buffer Hit
The number of times that the random Getpage request has a buffer hit and the buffer is on the least-recently-used (SLRU) chain. DB2 11 and later. (Field name: QBSTRHS)

LWM Buffers on SLRU
The minimum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval. DB2 11 and later. (Field name: QBSTSMIN)

HWM Buffers on SLRU
The maximum number of buffers on the sequential least-recently-used (SLRU) chain in the last statistical period. This is the low-water mark (LWM) within an interval. DB2 11 and later. (Field name: QBSTSMAX)

For each of the following fields, the following statistics are provided:

**INTERVAL QUANTITY**
The amount of activities that occur during the interval.

**/MINUTE**
Rate per minute. The number under /MINUTE (in parentheses) is the number of minutes in the interval.

**/THREAD**
Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

**/COMMIT**
Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.

Getpage Requests
Getpage request operations for the buffer pool during the interval.

Getpage Requests - Sequential
Number of Getpage requests issued by sequential access requestors.

Getpage Requests - Random
Number of Getpage requests issued by random access requestors.
Getpage Requests - Seq Ovfl
The number of sequential GETPAGE requests using overflowed buffers. DB2 12 and later.

Getpage Requests - Random Ovfl
The number of non-sequential GETPAGE requests using overflowed buffers. DB2 12 and later.

Getpage Failed - VPOOL Full
Number of Getpage failures due to unavailable buffers because the virtual buffer pool was full.

Getpage Failed - Cond Request
Number of conditional Getpage requests that could not be satisfied for this buffer pool. A conditional Getpage is used with parallel I/O processing only.

Getpage Failed - Cond SeqReq
The number of conditional sequential getpage requests that failed because the page is not in the buffer pool.

Sync Read I/O Operations
Synchronous read operations done by DB2 during the interval.

Sync Read I/Os - Sequential
Number of synchronous Read I/O operations performed by sequential requests.

Sync Read I/Os - Random
Number of synchronous Read I/O operations performed by random requests.

Sync Read I/Os - Seq Ovfl
The number of synchronous Read I/O operations performed for sequential GETPAGE requests using overflowed buffers. DB2 12 and above. (QBSTASSE)

Sync Read I/Os - Random Ovfl
The number of synchronous Read I/O operations performed for non-sequential GETPAGE requests using overflowed buffers. DB12 and above. (QBSTASYN)

Page-in Required for Read I/O
Number of page-ins required for Read I/O.

Pages Read via Seq Prefetch
Pages read as a result of Sequential Prefetch requests.

Seq Prefetch I/O Operations
Number of asynchronous Read I/Os caused by Sequential Prefetch.

Sequential Prefetch Requests
Sequential Prefetch requests for the buffer pool during the interval.

Pages Read via List Prefetch
Number of pages read because of List Prefetch.

List Prefetch I/O Operations
Number of asynchronous Read I/Os caused by List Prefetch.

List Prefetch Requests
List Prefetch requests for the buffer pool during the interval.
Pages Read via Dyn Prefetch
Number of pages read because of Dynamic Prefetch. Dynamic prefetch is triggered because of sequential detection.

Dyn Prefetch I/O Operations
Number of asynchronous Read I/Os caused by Dynamic Prefetch.

Dyn Prefetch Requests
Dynamic Prefetch requests for the buffer pool.

Prefetch Failed - No Buffer
Failures of Sequential Prefetch because the Sequential Prefetch threshold (SPTH) was reached.

Prefetch Failed - No Engine
Failures of Sequential Prefetch because the maximum number of concurrent Sequential Prefetches was reached. (You cannot change this maximum value.)

Parallel Group Requests
Number of requests made for processing queries in parallel.

Prefetch I/O Streams Reduced
Number of requested prefetch I/O streams that were denied because of a buffer pool shortage. This applies only for nonworkfile pagesets for queries that are processed in parallel.

I/O Parallelism Downgraded
Number of times the requested number of buffers to allow a parallel group to run to the planned degree could not be allocated because of a buffer pool shortage.

Prefetch Quan Reduced to 1/2
Number of times the Sequential Prefetch quantity was reduced from normal to one-half of normal. This is done to continue to allow execution concurrently with parallel I/O.

Prefetch Quan Reduced to 1/4
Number of times the Sequential Prefetch quantity was reduced from one-half to one-quarter normal.

Pages Added to LPL
The number of times one or more pages are added to logical page lists (LPL). (Field name: QBSTLPL)

Length of SLRU=VPSEQT
The number of times when the length of the sequential least-recently-used (SLRU) chain equals the sequential steal threshold VPSEQT. DB11 and later. (Field name: QBSTHST)

Pages Updated
Updates to pages in the buffer pool during the interval.

Pages Written
Buffer pool pages written to DASD during the interval.

Page-in Required for Write I/O
Number of page-ins required for Write I/O operations.

Write I/O Operations
Writes performed by media manager for both synchronous and asynchronous I/O.
Immediate (Sync) Writes
immediate Writes to DASD during the interval. This value is incremented when 97.5% of the buffer pool pages are in use. In addition, DB2 might flag buffer pool pages for immediate Write during checkpoint processing and when a database is stopped.

Note: Consider the value of DMTH (Data Manager threshold) when interpreting this value. If DMTH is zero, this value is probably insignificant.

Write Engine Not Available
Writes that were deferred because DB2 reached its maximum number of concurrent Writes.

Vert Defer Wrt Thresh Reached
The number of times the Vertical Deferred Write threshold was reached.

Deferred Write Thresh Reached
Deferred Write threshold (DWTH) was reached. This occurs when DB2 uses 50% of the buffer pool minimum value, or if a data set has updated 10% of the pages or 64 pages, whichever is greater. At this threshold, DB2 forces writes in an effort to free pool space.

Data Manager Thresh Reached
Data Manager threshold (DMTH) was reached. This occurs when DB2 uses 95% of the buffer pool minimum value and begins to operate at the row level rather than the page level. When this occurs, CPU usage rises significantly.

Successful VPOOL Expand/Contr
Number of successful virtual buffer pool expansions or contractions because of the ALTER BUFFERPOOL command.

VPOOL Expand Failed
Number of virtual buffer pool expansion failures.

Successful Dataset Opens
The number of successful data set Open operations during the interval.

DFHSM Recall
Attempts to access data sets that were migrated by DFHSM.

DFHSM Recall Timeouts
Unsuccessful attempts to recall data sets because the timeout threshold (DSNZP ARM RECALLD) was exceeded.

Sort/Merge Passes
Number of merge passes for DB2 sort/merge processing.

Sort/Merge Workfile Requests
Number of workfiles requested during sort/merge processing.

Sort/Merge Workfile Req Denied
Number of requests for workfiles denied during sort/merge processing due to insufficient buffer resources.

Sort/Merge Pass - Buff Short
Number of times that sort/merge could not efficiently perform due to insufficient buffer resources. This field is incremented when the number of workfiles allowed is less than the number of workfiles requested.
**Workfile Prefetch Disabled**
Number of times workfile prefetch was not scheduled because the prefetch quantity was zero.

**Workfile Create Failed-No Buff**
Number of times a workfile was not created due to insufficient buffers (MVS/XA) only.

**Destructive Read Requests**
Number of pages requested for destructive read processing.

**Destructive Read Page Dequeue**
Number of pages dequeued for destructive read processing.

**Group Buffer Pool Statistics Summary by Report Interval**
This panel provides an overview of the group buffer pool activity that was recorded during a series of report intervals.

This panel is only available in a data sharing environment.

**Navigation**

For additional information about
- detailed statistics about a report interval, move the cursor to the line you want and press F11 (Zoom). Each date/time displayed reflects the end of an interval.
- a different buffer pool, enter a buffer pool ID next to HGBS.
- related topics, select one of the options from the menu.
- other topics, use the PF keys.

**Fields**

**Collection Interval**
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.
**Start**  The start time of the first interval in this display.

**Report Interval**  
This field determines the report interval. It is set on the Near-Term History Report Option panel.

**Combine Level**  
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

- **HOURLY**  
  Data will be reported in hourly intervals.

- **NONE**  
  Data will be reported in the time unit specified by the collection interval.

**End**  The end time of the last interval in this display.

**Interval**  
Provides the date and time that mark the end of the report interval.

**Total Reads**  
The total number of reads to the group buffer pool.

**Read Hit %**  
The percentage of all Reads to the group buffer pool for which the needed data was found and returned to the member.

**Pages Not Returned - R/W Int %**  
The percentage of all Reads to the group buffer pool where

- the data was not found in the group buffer pool and the member had to go to DASD to read the page, and
- other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

**Read/Write Failed**  
The number of Read or Write requests to the group buffer pool that failed because of a lack of storage resources.

**Total Writes**  
The total number of writes to the group buffer pool.

**Pages Castout**  
The number of pages that this member has castout to DASD from the group buffer pool.

**Group Buffer Pool Statistics Detail:**

This panel shows detailed near-term history information about activities in a specified DB2 group buffer pool during a specified report interval.

This panel is only available in a data sharing environment.

You can view information about a different group buffer pool by entering a buffer pool ID next to HGBD.

Fields

Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start

The start time of the first interval in this display.

Report Interval

This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level

This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:
DATA will be reported in hourly intervals.

None
DATA will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Allocated Size
The allocated size of the group buffer pool in 4KB blocks.

Current Directory/Data Ratio
The current ratio of directory entries to data pages.

Checkpoint Interval
The checkpoint interval for the group buffer pool, in minutes.

Pending Directory/Data Ratio
The pending ratio of directory entries to data pages. This value will be different from the current ratio if an ALTER GROUPBUFFERPOOL command has been issued with a new value for the RATIO parameter. The change will not take effect until the next time the group buffer pool is allocated.

GBP Castout Threshold
Group buffer pool castout threshold. When the number of changed pages in the group buffer pool exceeds this threshold, castout will be initiated. You can change this value with the GBPOOLT parameter on the ALTER GROUPBUFFERPOOL command.

Number Directory Entries
The actual number of allocated directory entries.

Castout Class Threshold
Group buffer pool castout class threshold. When the number of changed pages for a particular castout class exceeds this threshold, castout will be initiated. You can change this value with the CLASST parameter on the ALTER GROUPBUFFERPOOL command.

Number of Data Pages
The actual number of allocated data pages.

Read Hit %
The percentage of all Reads to the group buffer pool for which the needed data was found and returned to the member.

For each of the following fields, the following statistics are provided:

INTERVAL QUANTITY
The amount of activities that occur during the interval.

/Minute
Rate per minute. The number under /MINUTE (in parentheses) is the number of minutes in the interval.

/Thread
Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/Commit
Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.
Reads - Cross Invalidation: Data Returned
The number of reads to the group buffer pool required because the page in the member’s buffer pool was invalidated, where the data was found and returned to the member.

Reads - Cross Invalidation: Data not in GBP-R/W Interest
The number of reads to the group buffer pool required because the page in the member’s buffer pool was invalidated, where:
• The data was not found in the group buffer pool and the member had to go to DASD to read the page
• Other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

Reads - Page Not Found: Data Returned
The number of reads to the group buffer pool required because the page was not in the member’s buffer pool where the data was found and returned to the member.

Reads - Page Not Found: Data not in GBP-R/W Interest
The number of reads to the group buffer pool required because the page was not in the member’s buffer pool, where:
• The data was not found in the group buffer pool and the member had to go to DASD to read the page
• Other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

Writes - Synchronous: Changed Pages
The number of changed pages that are synchronously written to the group buffer pool. Pages can be forced out before the application commits if a buffer pool threshold is reached, or when P-lock negotiation forces the pages on the Vertical Deferred Write queue to be written to the group buffer pool.

Writes - Synchronous: Clean Pages
The number of clean pages that are synchronously written to the group buffer pool. DB2 writes clean pages for pagesets and partitions defined with GBPCACHE ALL.

Writes - Asynchronous: Changed Pages
The number of changed pages asynchronously written to the group buffer pool. Pages can be forced out before the application commits if a buffer pool threshold is reached, or when P-lock negotiation forces the pages on the Vertical Deferred Write queue to be written to the group buffer pool.

Writes - Asynchronous: Clean Pages
The number of clean pages asynchronously written to the group buffer pool. DB2 writes clean pages for pagesets and partitions defined with GBPCACHE ALL.

Write Failed - No Storage
The number of group buffer pool write requests that failed because of a shortage of coupling facility resources.

Pages Castout to DASD
The number of pages that this member has castout to DASD from the group buffer pool.

GBP Castout Threshold Reached
The number of times that castout was initiated because the group buffer pool castout threshold was reached.
Castout Class Threshold Reached

The number of times that castout was initiated because the castout class threshold was reached.

Other Requests

The number of other requests.

Distributed Data Facility Statistics Summary by Report Interval

This panel provides an overview of the DDF activity that was recorded during a series of report intervals.

Navigation

For additional information about

- a report interval, move the cursor to the required line and press F11 (Zoom). (Each date/time displayed reflects the end of an interval.)
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start

The start time of the first interval in this display.

Report Interval

This field determines the report interval. It is set on the Near-Term History Report Option panel.
Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

**HOURLY**
Data will be reported in hourly intervals.

**NONE**
Data will be reported in the time unit specified by the collection interval.

End  The end time of the last interval in this display.

Interval  Provides the date and time that mark the end of the report interval.

# of Rmts
The number of remote DB2s with which the local DB2 communicated during a given interval.

Total SQL
The total SQL calls sent and received by the local DB2.

Total Rows
The total rows of data sent and received by the local DB2.

Total Msgs
The total VTAM messages sent and received by the local DB2.

Total Bytes
The total bytes sent and received by the local DB2.

Total Commit
The total number of Commit operations performed. This is the sum of the single-phase and two-phase commits performed.

Total Abort
The total number of rollback operations performed. This is the sum of the single-phase rollback operations and two-phase backouts performed.

Total Conv
The total conversations sent and received by the local DB2.

Total ConvQ
The total number of conversations queued by DDF.

Distributed Data Facility Statistics Detail:

This panel provides detailed near-term history statistics about DDF activity for a selected report interval, formatted by remote DB2 location.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start
The start time of the interval currently displayed.

Report Interval

This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level

This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

HOURLY

Data will be reported in hourly intervals.

NONE

Data will be reported in the time unit specified by the collection interval.

End
The end time of the interval currently displayed.
DDF Send Rate
The rate at which data was sent by DDF, in bytes, KB, MB, GB per minute.

DDF Receive Rate
The rate at which data was received by DDF, in bytes, KB, MB, GB per minute.

Resync Attempts
The number of resynchronization connects attempted with all remote locations. Used only for two-phase commit.

Resync Successes
The number of resynchronization connects that succeeded with all remote locations. Used only for two-phase commit.

Cold Start Connections
The number of Cold Start connections with all remote locations. Used only for two-phase commit.

Warm Start Connections
The number of Warm Start connections with all remote locations. Used only for two-phase commit.

DBAT Queued
Number of times a database access thread (DBAT) had to wait because the maximum number of concurrent DBATs (MAXDBAT) was reached.

Conversation Dealloc
The number of conversations deallocated because the ZPARM limit for the maximum connected remote threads (both active and inactive) was reached.

HWM Remote Connections
The high-water mark (HWM) of inactive and active remote threads.

HWM Active DBATs
The high-water mark (HWM) of active database access threads (DBATs). If the INACTIVE option is specified, it is possible for this value and the current number of active DBATs to exceed MAXDBAT. This occurs because DB2 allows CONNECTs to be processed even if MAXDBAT has been exceeded. After connect processing is complete, if MAXDBAT is still exceeded, then the DBAT is made inactive.

HWM Inactive DBATs
The high-water mark (HWM) of inactive database access threads.

Max DB Access (MAXDBAT)
The maximum number of database access threads allowed for the DB2 being monitored (determined by the setting of MAXDBAT in DSNZPARM).

Remote statistics: The following group of fields occurs for each remote DB2 location with which the local DB2 subsystem communicated, either as a requester or a responder, during the report interval. Each sent/received field generates two rows of output; the top row is the sent value, and the bottom row is the received value.

Remote Location Name
The name of a remote location with which the local DB2 communicated. The statistics immediately below this field pertain to this location.

Conversations Queued
The number of conversations queued by DDF.
Indoubts/Remote
The number of threads that became indoubt with the remote location as coordinator.

SQL Sent/Recv
The number of SQL calls sent to and from the remote location.

Row Sent/Recv
The number of rows sent to and from the remote location.

Message Sent/Recv
The number of VTAM messages sent to and from the remote location.

Byte Sent/Recv
The number of bytes sent to and from the remote location.

Commit Sent/Recv
The number of commits sent to and from the remote location.

Abort Sent/Recv
The number of aborts sent to and from the remote location.

Conv Sent/Recv
The number of conversations sent to and from the remote location.

Blocks Sent/Recv
Number of blocks sent to and from the remote location, if using block fetch mode.

**EDM Pool Statistics Summary by Report Interval**

Navigation

For additional information about

- a report interval, move the cursor to the required line and press F11 (Zoom). (Each date/time displayed reflects the end of an interval.)
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start
The start time of the first interval in this display.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

- **HOURLY**
  Data will be reported in hourly intervals.
- **NONE**
  Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

DBD Pages
The number of pages used for database descriptors (DBDs).

DBD Load %
The percentage of DBD requests that resulted in DBD loads from DASD.

CT Pages
The number of pages used for cursor tables (CTs).

CT Load %
The percentage of CT requests that resulted in CT loads from DASD.
PT Pages
   The number of pages used for package tables (PTs).

PT Load%
   The percentage of PT requests that resulted in PT loads from DASD.

DSC Loads
   Dynamic SQL caches (DSCs) that had to be loaded from DASD.

DSC Load%
   The percentage of dynamic SQL cache requests that resulted in DSC loads
   into pool. This value should be kept low.

EDM Pool Statistics Detail:

This panel provides detailed information about the activity in and the performance
of the Environmental Descriptor Manager (EDM) pool during a specified report
interval.

Dependent on the DB2 version you are using, the content of the EDM POOL
STATISTICS DETAIL panel is different.

The following examples of this panel show the fields that are specific to a
particular DB2 version.

If DB2 11 is used, the EDM POOL STATISTICS DETAIL panel additionally displays
the following fields:

Shareable Static SQL Requests (QISEKSPG)
   The number of shareable static SQL statement requests.
   This applies to DB2 11 or higher.

Total Allocation Shareable Static SQL (QISEKSPA8)
   The total storage that is allocated to shareable static SQL statements.
   This applies to DB2 11 or higher.

For DB2 11 and later:

**Navigation**

For additional information about
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

The following fields are common to all DB2 versions:

**Collection Interval**

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

**Start**

The start time of the interval currently displayed.
Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.

NONE
Data will be reported in the time unit specified by the collection interval.

End
The end time of the interval currently displayed.

Pool Usage
The following types of EDM pools are available:
- EDM Database Descriptor (DBD) Pool
- EDM Statement (STMT) Pool
- EDM Skeleton (SKEL) Pool

For the above pool types, the following information is displayed. It is based on a snapshot of the data that is taken at the end of the report interval.

Pages
The number of pages that is dedicated to a particular type of pool usage.

PCT
The percentage of the EDM pool dedicated to that type of usage.

Total
The total number of pages in this type of type of EDM pool. For DB2 12 the Total Pages is based on DSNZPARM configured Maximum.

Held
The number of pages held in this type of type of EDM pool.

CT Held
Pages held in RDS pool for the cursor tables.
This applies only to DB2 9, below and above the bar usage.

PT Held
Pages held in RDS pool for the package tables.
This applies only to DB2 9, below and above the bar usage.

SKCT Held
Pages held in SKEL pool for skeleton cursor tables.

DBD Held
Pages held in DBD pool.

STMT Held
Pages held in STMT pool.

Stealable
The total number of pages that can be reused.

Free
The number of pages currently not used by any object in this type of EDM pool.

In Use
The number of pages that are used in this type of EDM pool.
This applies only to DBD and SKEL pools.

The percentage of DBD In Use is calculated like this:
\[((\text{In Use} - \text{ Stealable/Reusable})/\text{Total})\times100\]

The percentage of SKEL in Use is calculated like this:
\[((\text{SKCTs + SKPTs} - \text{ Stealable/Reusable})/\text{Total})\times100\]

\text{xProc Request}
\hspace{1cm} The total number of xProc requests.

\text{xProc Total Allocation}
\hspace{1cm} The total number of pages that are allocated for xProcs.

\text{Shareable Static SQL Requests (QISEKSPG)}
\hspace{1cm} The number of shareable static SQL statement requests.
\hspace{1cm} This applies to DB2 11 or higher.

\text{Total Allocation Shareable Static SQL (QISEKSPA8)}
\hspace{1cm} The total storage that is allocated to shareable static SQL statements.
\hspace{1cm} This applies to DB2 11 or higher.

\text{Plan Below the Bar Allocation}
\hspace{1cm} The amount of storage below the bar that was allocated for plans.

\text{Package Below the Bar Allocation}
\hspace{1cm} The amount of storage below the bar that was allocated for packages.

\text{Plan Above the Bar Allocation}
\hspace{1cm} The amount of storage above the bar that was allocated for plans.

\text{Package Above the Bar Allocation}
\hspace{1cm} The amount of storage above the bar that was allocated for packages.

\text{Failures due to DBD Pool Full}
\hspace{1cm} Failures that occurred because the DBD pool is full. DB2 10 and DB2 11 only.

\text{Failures due to STMT Pool Full}
\hspace{1cm} Failures that occurred because the STMT pool is full. DB2 10 and DB2 11 only.

\text{Failures due to SKEL Pool Full}
\hspace{1cm} Failures that occurred because the SKEL pool is full. DB2 10 and DB2 11 only.

For each of the following fields, the following statistics are provided:

\text{INTERVAL QUANTITY}
\hspace{1cm} The amount of activities that occur during the interval.

\text{/MINUTE}
\hspace{1cm} Rate per minute. The number under /MINUTE (in parentheses) is the number of minutes in the interval.

\text{/THREAD}
\hspace{1cm} Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

\text{/COMMIT}
\hspace{1cm} Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.
Database Descriptor (DBD) Reqs
The number of requests for database descriptors.

DBD Loads
The number of database descriptors that had to be loaded from DASD.

% of DBD Loads from DASD
The percentage of DBD requests that resulted in DBD loads from DASD.
This value should be kept low; 20% or lower is considered acceptable.

Cursor Table (CT) Reqs
The number of requests for cursor tables.

CT Loads
The number of cursor tables that had to be loaded from DASD.

% of CT Loads from DASD
The percentage of CT requests that resulted in CT loads from DASD. This value should be kept low; 20% or lower is considered acceptable.

Package Table (PT) Reqs
The number of requests for package tables.

PT Loads
The number of package tables that had to be loaded from DASD.

% of PT Loads from DASD
The percentage of PT requests that resulted in PT loads from DASD. This value should be kept low; 20% or lower is considered acceptable.

Dynamic Sql (DSC) Reqs
The number of requests to cache dynamic SQL.

DSC Loads
The number of dynamic SQL caches that had to be loaded from DASD.

CATALOG Loads
Dynamic SQL cache statements that had to be loaded from CATALOG.
DB2 12 and later. (Field name: QISEDPSF)

% of CATALOG Loads into Pool
The percentage of dynamic SQL cache requests that resulted in CATALOG loads into the EDMpool. The higher the value, the more stabilized queries from catalog are used to avoid full prepare. Formula for calculation: QISEDPSF/QISEDSG. DB2 12 and later.

% of DSC Loads into Pool
The percentage of dynamic SQL cache requests that resulted in DSC loads into pool. This value should be kept low.

PKG Search Not Found
If a package is bound by using a wild card (*) for the package names, in the form of PKLIST(COL1.*,COL2.*,....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a cached record was located during package binding.

PKG Search Not Found Insert
If a package is bound by using a wild card (*) for the package names, in
the form of PKLIST(COL1.*, COL2.*....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was removed from the cache during package binding.

**PKG Search Not Found Delete**

If a package is bound by using a wild card (*) for the package names, in the form of PKLIST(COL1.*, COL2.*....), EDM generates a NOT-FOUND record to avoid future I/O if a collection ID/package name combination does not exist.

This field shows how often a record was removed from the cache during package binding.

**Number of Statements**

The number of statements in the EDM pool.

**Log Manager Statistics Summary by Report Interval**

This panel shows an overview of the DB2 log manager activity that was recorded during a series of report intervals.

**Navigation**

For additional information about

- a report interval, move the cursor to the line you want and press F11 (Zoom). (Each date/time displayed reflects the end of an interval.)
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.
**Fields**

**Collection Interval**  
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

**Start**  
The start time of the first interval in this display.

**Report Interval**  
This field determines the report interval. It is set on the Near-Term History Report Option panel.

**Combine Level**  
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

- **HOURLY**  
  Data will be reported in hourly intervals.

- **NONE**  
  Data will be reported in the time unit specified by the collection interval.

**End**  
The end time of the last interval in this display.

**Interval**  
Provides the date and time that mark the end of the report interval.

**Total Reads**  
The number of times DB2 read a log record.

**Read Delay**  
The number of log reads that were delayed.

**Total Writes**  
The number of times DB2 externalized log records, both synchronously and asynchronously.

**Write Delay**  
The number of times DB2 tried to place log records in the output buffer but could not find an available buffer.

**BSDS Access**  
The number of times the bootstrap data set access routine was called.

**Archive Read Allocs**  
The number of archive read allocations, which is an indicator of archive log open/close activity.

**Archive Write Allocs**  
The number of archive write allocations, which is an indicator of archive log open/close activity.

**Log Manager Statistics Detail:**

This panel provides detailed information about the logging and archiving activity of the DB2 log manager during a selected report interval.
Navigation

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.
Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start
The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

   HOURLY
   Data will be reported in hourly intervals.

   NONE
   Data will be reported in the time unit specified by the collection interval.

End
The end time of the interval currently displayed.

High Used Log Record RBA
The relative byte address (RBA) of the record that was being logged at the end of the interval.

Number of Bytes Used
The number of bytes of the log data set that were used during the interval.

For each of the following fields, the following statistics are provided:

INTERVAL QUANTITY
The amount of activities that occur during the interval.

/MINUTE
Rate per minute. The number under /MINUTE (in parentheses) is the number of minutes in the interval.

/THREAD
Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.

Reads from Output Buffers
The Reads that were satisfied from the output buffers.

Reads from Active Log
The Reads that were satisfied from the active log.

Reads from Archive Log
The Reads that were satisfied from the archive log.

Reads Delayed - Tape Contention
The number of reads delayed because a tape volume was already in use.
Reads Delayed - No Tape Unit
Number of archive log reads that were delayed because of unavailable tape units, or because the maximum amount of read parallelism is being used (not likely).

Look-Ahead Tape Mounts Attempted
Number of look-ahead tape mounts attempted.

Look-Ahead Tape Mounts Performed
Number of successful look-ahead tape mounts.

Write NOWAIT Requests
The times DB2 externalized log records asynchronously.

Write FORCE Requests
The times DB2 externalized log records synchronously.

Write Delayed - No Buffer
DB2 attempts to place log records in the output buffer when no log buffer could be found.

Write Active Log Buffers
Calls to the log write routine.

Active Log CIs Created
Active log control intervals created.

Archive Log Read Allocations
Archive read allocations, which reflect archive log open/close activity.

Archive Log Write Allocations
Archive write allocations, which reflect archive log open/close activity.

Archive Log CIs Offloaded
Number of active log control intervals offloaded to archive data sets.

BSDS Access Requests
Calls to the bootstrap data set access routine.

Checkpoints
The number of checkpoints DB2 takes since startup.

IFI Abends
The count of IFI abends.

IFI Unrecog Func
The count of IFI unrecognized functions.

IFI Command Reqs
The count of IFI command requests.

IFI READA Reqs
The count of IFI READA requests.

IFI READS Reqs
The count of IFI READS requests.

IFI WRITE Reqs
The count of IFI WRITE requests.

Data Capture Invoked
The number of log records retrieved for which data capture processing is invoked.
Data Capture READS
   The number of data capture log reads for processing IFI requests for IFCID 0185.

Data Capture Rec Returned
   The number of data capture log records returned.

Data Capture Row Returned
   The number of data capture data rows returned.

Data Capture Desc Returned
   The number of data capture data descriptions returned.

Data Capture Desc Performed
   The number of data capture describes performed.

Data Capture Table Returned
   The number of data capture tables returned.

Rollup (Threshold)
   The number of rollup accounting records that are written because the rollup threshold is exceeded.

Rollup (Storage)
   The number of rollup accounting records that are written because the rollup accounting storage threshold is exceeded.

Rollup (Stallness)
   The number of rollup accounting records that are written because the staleness threshold is exceeded.

Rollup (Non Qual)
   The number of records that failed to qualify for accounting rollup because all rollup key fields are NULL, or NULL values are not permitted.

Open/Close Statistics Summary by Report Interval
   This panel shows an overview of the Open/Close activity that is recorded during a series of report intervals.
Navigation

For additional information about
• a report interval, move the cursor to the line you want and press F11 (Zoom).
  (Each date/time displayed reflects the end of an interval.)
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start
The start time of the first interval in this display.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.
NONE
Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

High Water Open DS
Maximum number of data sets open at any given time.

Current Open DS
The current number of open data sets.

Not-in-use DS Request
The number of requests to open a data set that was on the Deferred Close queue. When this occurs, a physical data set Open is not necessary.

Not-in-use DS Closed
Number of not-in-use data sets that were closed because the total number of open data sets reached the Deferred Close threshold. The Deferred Close threshold is based on the smaller of the values of DSMAX or the MVS DD limit.

DS Conv to Read-only
Number of infrequently updated data sets converted from a read-write state to a read-only state (pseudo-close). The SYSLGRNG entry is closed at this time.

Open/Close Statistics Detail:

This panel provides detailed information about open and close data set activity occurring within the DB2 subsystem during a selected report interval.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This
unit of time was specified when the Near-Term History Data Collector was
started.

Start
The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History
Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE,
the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.

NONE
Data will be reported in the time unit specified by the collection
interval.

End
The end time of the interval currently displayed.

Current Number Open Datasets
A snapshot value of the current number of open database data sets.

High-water Mark Open Datasets
The maximum number of data sets open at any one time since DB2 was
started.

High-water Mark Not-in-use Datasets
The maximum number of pagesets that are not in use but are not
physically closed.

Current Number Not-in-use Datasets
The current number of open pagesets that are not in use but are not
physically closed.

For each of the following fields, the following statistics are provided:

INTERVAL QUANTITY
The amount of activities that occur during the interval.

/MINUTE
Rate per minute. The number under /MINUTE (in parentheses) is the
number of minutes in the interval.

/THREAD
Rate per thread. The number under /THREAD (in parentheses) is the
number of Create Threads during the interval.

/COMMIT
Rate per Commit. The number under /COMMIT (in parentheses) is the
number of Commit requests (including abort requests) during the interval.
Not-in-use Datasets Requested
Number of requests to open a data set that was on the Deferred Close queue. When this occurs, a physical data set Open is not necessary.

Not-in-use Datasets Closed
Number of not-in-use data sets that were closed because the total number of open data sets reached the Deferred Close threshold. The Deferred Close threshold is based on the smaller of the values of DSMAX or the MVS DD limit.

Datasets Converted to Read-Only
Number of infrequently updated data sets converted from a Read-Write to a Read-Only state (pseudo-close). The SYSLGRNG entry is closed at this time.

SQL Statistics Summary by Report Interval
This panel shows an overview of the SQL activity that was recorded during a series of report intervals.

  Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

Manipulative (DML)
The quantity and rate per minute of DML (data manipulative language) statements during the interval.

Control (DCL)
The quantity and rate per minute of DCL (data control language) statements during the interval.

Definitional (DDL)
The quantity and rate per minute of DDL (Data Definition Language) statements during the interval.

SQL/RID Pool/I/O Parallelism Statistics Detail:

- Update Rows Accessed: 0 0.00 0.00 0.00
**Navigation**

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Collection Interval**

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

**Start**

The start time of the interval currently displayed.

**Report Interval**

This field determines the report interval. It is set on the Near-Term History Report Option panel.

**Combine Level**

This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

- **HOURLY**
  - Data will be reported in hourly intervals.

- **NONE**
  - Data will be reported in the time unit specified by the collection interval.

**End**

The end time of the interval currently displayed.

---

**Other topics, use the PF keys.**
Maximum Degree of Parallelism Executed

The maximum degree of parallel I/O processing for all parallel groups. This is a high-water mark.

For each field described below the following statistics are provided:

- The amount of activities that occur during the interval.
- Rate per minute during the last cycle. The number under /MINUTE is the number of minutes in the interval.
- Rate per thread during the last cycle. The number under /THREAD is the number of Create Threads during the interval.
- Rate per Commit during the last cycle. The number under /COMMIT is the number of commit requests (including abort requests) during the interval.
- Percentage of DML, DCL, or DDL during the last cycle.

SQL Manipulative (DML):

**SELECT**

SELECT statements executed to retrieve rows from a DB2 table.

**INSERT**

INSERT statements executed to add rows to a DB2 table.

**UPDATE**

UPDATE statements executed to alter existing rows in a DB2 table.

**MERGE**

The number of times a MERGE statement is executed.

**DELETE**

DELETE statements executed to remove rows from a DB2 table.

**DESCRIBE**

DESCRIBE statements executed to obtain information about prepared SQL statements.

**DESCRIBE TABLE**

DESCRIBE TABLE statements executed to obtain information about a table or view.

**PREPARE**

Occasions when SQL statements were dynamically prepared for execution.

**OPEN CURSOR**

OPEN statements executed to prepare cursors for subsequent Fetch operations.

**FETCH**

FETCH statements executed to retrieve rows from DB2 tables.

**CLOSE CURSOR**

CLOSE statements executed to close previously opened cursors.

**REFRESH TABLE**

Number of refresh table statements. DB2 12 and later. (Field name: QXTREFTBL)

**Total DML**

All data manipulative language statements.

SQL Control (DCL):

**CALL**

CALL statements executed to invoke a stored procedure.
CONNECT (Type 1)
CONNECT (Type 1) statements executed to connect an application process to a designated server.

CONNECT (Type 2)
CONNECT (Type 2) statements executed to connect an application process to a designated server.

GRANT
GRANT statements issued to extend DB2 privileges to users.

LOCK TABLE
LOCK TABLE statements issued to lock a tablespace or table in a segmented tablespace.

RELEASE
RELEASE statements executed to place one or more connections in the released state.

REVOKE
REVOKE statements issued to revoke users’ DB2 privileges.

SET CONNECTION
SET CONNECTION statements executed to establish the application server of the process.

SET CURRENT DEGREE
SET CURRENT DEGREE statements executed to assign a value to the CURRENT DEGREE special register.

SET CURRENT RULES
SET CURRENT RULE statements executed to assign a value to the current rules special register.

SET CURRENT SQLID
SET CURRENT SQLID statements issued to change your current authorization ID.

SET HOST VARIABLE
SET host-variable statements issued.

SET CURRENT PATH
SET CURRENT PATH statements issued to assign a value to the CURRENT PATH special register.

SET CURRENT PRECISION
The number of Set Current Precision statements.

ASSOCIATE LOCATOR
The number of ASSOCIATE LOCATOR statements issued.

ALLOCATE CURSOR
The number of ALLOCATE CURSOR statements issued.

HOLD LOCATOR
The number of Hold Locator statements.

FREE LOCATOR
The number of Free Locator statements.

TRANSFER OWNERSHIP
Number of transfer ownership statements. DB2 12 and later. (Field name: QXTRNOWN)
Total DCL
   All data control language statements.

SQL Definitional (DDL):

CREATE TABLE
   CREATE TABLE statements issued to define a DB2 table.

CREATE GBL TEMP TABLE
   The number of Create Global Temporary Table statements issued to create
   a description of a temporary table at the current server.

DCL GBL TEMP TABLE TH
   The number of SQL Declare Global Temporary Table statements.

CREATE AUX TABLE
   The number of Create Auxiliary Table statements.

CREATE INDEX
   CREATE INDEX statements issued to establish indexes on DB2 tables.

CREATE TABLESPACE
   CREATE TABLESPACE statements issued to establish DB2 tablespaces.

CREATE DATABASE
   CREATE DATABASE statements issued to establish DB2 databases.

CREATE STOGROUP
   CREATE STOGROUP statements issued to establish DB2 storage groups.

CREATE SYNONYM
   CREATE SYNONYM statements issued to create alternate names for DB2
   tables and views.

CREATE VIEW
   CREATE VIEW statements issued to establish views of DB2 tables.

CREATE ALIAS
   CREATE ALIAS statements issued to achieve "location transparency" of
   DB2 tables. This field is used primarily to refer to tables and views from
   remote DB2 subsystems in a distributed environment.

CREATE TRIGGER
   CREATE TRIGGER statements issued to define a trigger in a schema and
   build a trigger package at the current server.

CREATE DISTINCT TYPE
   CREATE DISTINCT TYPE statements issued to define a distinct type,
   which is a data type that a user defines. A distinct type must be sourced
   on one of the built-in data types.

CREATE FUNCTION
   CREATE FUNCTION statements issued to register a user-defined function
   with an application server. You can register the following types of
   functions with this statement: external scalar, external table, and sourced.

CREATE PROCEDURE
   CREATE PROCEDURE statements issued to define a stored procedure.

CREATE SEQUENCE
   The number of Create Sequence statements.

CREATE ROLE
   The number of Create Role statements.
CREATE TRUSTED CTX
The number of Create Trusted CTX statements.

CREATE MASK/PERM
The number of Create Mask or Create Permission statements.

CREATE VARIABLE
The number of Create Variable statements. DB2 11 and later.

DROP TABLE
DROP TABLE statements issued to remove tables from DB2 databases.

DROP INDEX
DROP INDEX statements issued to remove indexes from DB2 tables.

DROP TABLESPACE
DROP TABLESPACE statements issued to delete tablespaces.

DROP DATABASE
DROP DATABASE statements issued to delete databases.

DROP STOGROUP
DROP STOGROUP statements issued to delete storage group definitions.

DROP SYNONYM
DROP SYNONYM statements issued to delete alternative table names and view names.

DROP VIEW
DROP VIEW statements issued to delete table views.

DROP ALIAS
DROP ALIAS statements issued to delete view and table aliases from the DB2 catalog.

DROP PACKAGE
DROP PACKAGE statements issued to delete packages.

DROP TRIGGER
DROP TRIGGER statements issued to delete triggers.

DROP FUNCTION
DROP FUNCTION statements issued to delete user-defined functions.

DROP DISTINCT TYPE
DROP DISTINCT TYPE statements issued to delete user-defined data types.

DROP PROCEDURE
DROP PROCEDURE statements issued to delete stored procedures.

DROP SEQUENCE
The number of Drop Sequence statements.

DROP TRUSTED CTX
The number of Drop Trusted CTX statements.

DROP ROLE
The number of Drop Role statements.

DROP MASK/PERM
The number of Drop Mask or Drop Permission statements.

DROP VARIABLE
The number of Drop Variable statements. DB2 11 and later.
ALTER TABLE
ALTER TABLE statements issued to change table attributes.

ALTER INDEX
ALTER INDEX statements issued to change index attributes.

ALTER TABLESPACE
Alter Tablespace statements issued to change tablespace attributes.

ALTER STOGROUP
ALTER STOGROUP statements issued to add devices to and delete devices from storage groups.

ALTER VIEW
Number of Alter View statements.

ALTER DATABASE
ALTER DATABASE statements issued to change database attributes.

ALTER FUNCTION
ALTER FUNCTION statements issued to change the description of an external scalar or external table function at the current server.

ALTER PROCEDURE
ALTER PROCEDURE statements issued to change the description of a stored procedure at the current server.

ALTER SEQUENCE
The number of Alter Sequence statements.

ALTER TRUSTED CTX
The number of Alter Trusted CTX statements.

ALTER JAR
The number of Alter Jar statements.

ALTER MASK/PERM
The number of Alter Mask or Alter Permission statements.

RENAME TABLE
RENAME TABLE statements issued to rename an existing table.

RENAME INDEX
The number of Rename Index statements.

TRUNCATED TABLE
The number of Truncated Table statements issued to rename an existing table.

COMMENT ON
COMMENT ON statements issued to add or replace comments for user-defined objects (tables, views, columns, and sets of columns) in the DB2 catalog.

LABEL ON
LABEL ON statements issued to add or replace labels in DB2 catalog descriptions of tables, views, columns, and sets of columns.

Total DDL
All Data Definition Language statements.

RID List Processing: For each field described below the following statistics are provided:
• The amount of activities that occur during the interval.
• Rate per minute.
• Rate per thread.
• Rate per Commit.

For high water mark fields, N/A is displayed for rate fields. For interval quantity fields, the high water mark value is displayed at the end of the interval.

**Successful**

Number of times RID list processing was used when accessing a DB2 table.

This field is incremented once for a given table access for Index Access with list prefetch and for Multiple Index Access.

**Not Used (No Storage)**

Number of times RID list processing was terminated because of insufficient storage to hold the list of RIDs.

**Not Used (Max Limit)**

Number of times RID list processing was terminated because the number of RIDs would exceed a RID limit or threshold.

**To WF (No Storage)**

The number of times a RID list overflows to a work file because RIDPOOL storage is not available to hold the list of RIDs.

**To WF (Max Limit)**

The number of times a RID list overflows to a work file because the number of RIDs exceeds internal limits.

**Interrupted (No Stor)**

The number of times a RID list append for a Hybrid Join is interrupted because RIDPOOL storage is not available to hold the list of RIDs. This is the number of times DB2 interrupted the RID phase and switched to the Data phase.

**Interrupted (Max Lmt)**

The number of times a RID list append for a Hybrid Join is interrupted because the number of RIDs exceeds internal limits. This is the number of times DB2 interrupted the RID phase and switched to the Data phase.

**Skipped (Adaptive IX)**

The number of times a DM is not called for RID list retrieval for multiple index access or LPF because it was not necessary due to Runtime Adaptive Index processing being able to predetermine the outcome. DB2 12 and later. (Field name: QXRSDMAD)

**Skipped (Index Known)**

The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing.

**Term (No Storage)**

The number of times RID list processing exhausted virtual storage.

**Term (> RDS Limit)**

The number of times RID list processing terminated because the number of RID entries was greater than the RDS limit. The RDS limit is the maximum (25% of table size, number of RIDs that can fit into the guaranteed number of RID blocks).
Term (> DM Limit)
The number of times RID list processing terminated because the number of RID entries was greater than the DM limit. The DM limit is approximately 26 million RIDs.

Term (> PROC Limit)
The number of times the maximum RID pool storage was exceeded. The default maximum RID pool size is the minimum (install value pool size, 10GB).

HWM RID Blks Inuse
The number of RID blocks currently in use.

Curr RID Blks Inuse
The highest number of RID blocks in use at any one time since DB2 startup time.

HWM RID Blks in WF
The highest number of RID blocks overflowed (stored) to a work file at any time since DB2 startup.

Curr RID Blks in WF
The number of RID blocks currently residing in work file storage.

Query Parallelism: For each field described below the following statistics are provided:
• Total quantity, which reflects the amount of activities since DB2 was started.
• Interval quantity, which reflect activity during the last cycle.
• Rate per minute during the last cycle.
• Rate per thread during the last cycle.
• Rate per Commit during the last cycle.

HWM degree Parallism
Maximum degree of parallelism among the parallel groups to indicate the extent to which query parallelism applies.

Max Degree (Planned)
The planned maximum degree of parallelism for a parallel group. This value is the optimal degree of parallelism that can be obtained at execution time after host variables or parameter markers are resolved and before buffer pool negotiation and system negotiation are performed. DB2 11 and later.

Max Degree (Estimated)
The estimated maximum degree of parallelism for a parallel group. This value is estimated at bind time, based on the cost formula. If a parallel group contains a host variable or parameter marker, the estimate is based on assumed values. DB2 11 and later.

Max Degree (Executed)
Total number of parallel groups executed.

Ran Planned
Total number of parallel groups that have a planned degree greater than one at run time and were executed to the same degree because of sufficient storage on the buffer pool.

Ran Reduced (Storage)
Total number of parallel groups that have a planned degree greater
than one at run time but were processed to a parallel degree less than planned because of a storage shortage or contention on the buffer pool.

**Ran Reduced (Negotia)**
Number of parallel group degree to be reduced due to system negotiation result of system stress level. DB2 11 and later.

**Ran Seq (Cursor)**
Total number of parallel groups which fell back to sequential mode because the cursor might be used in UPDATE/DELETE.

**Ran Seq (No Buffer)**
Total number of parallel groups that have a planned degree greater than one at run time, but fell back to sequential mode because of storage shortage or contention on the buffer pool.

**Ran Seq (No ESA Sort)**
Total number of parallel groups which fell back to sequential mode due to lack of ESA sort support.

**Ran Seq (No ESA Enc)**
Total number of parallel groups executed in sequential mode due to the unavailable enclave. This applies only to DB2 9.

**Ran Seq (Autonomous)**
Total number of parallel groups which fell back to sequential mode due to executing under an autonomous procedure. This applies only to DB2 11 or higher.

**Ran Seq (Negotiate)**
Number of parallel groups that is degenerated to sequential mode due to system negotiation result of system stress level.
This applies only to DB2 11 or higher.

**One DB2 (Coord=No)**
Total number of parallel groups that are executed on a single DB2 because the COORDINATOR subsystem parameter is set to NO. When the statement is bound, the COORDINATOR subsystem parameter is set to YES. This situation might also occur when a plan or package is bound on a DB2 where the COORDINATOR subsystem parameter is set to YES, but is run on a DB2 where the subsystem parameter COORDINATOR is set to NO.

**One DB2 (Isolation)**
Total number of parallel groups that are executed on a single DB2 because of repeatable-read or read-stability isolation.

**One DB2 (DCL GTT)**
Total number of parallel groups that are part of a query block. The query block is using an UDF. It is executed on a single DB2 because a Declared Temporary Table exists in the application process. Neither the query block nor the parallel group is referencing a Declared Temporary Table. A parallel group might use or might not use an UDF.

**Groups Intended**
Total number of parallel groups that are intended to run across the data sharing group. This count is only incremented on the parallelism coordinator at run time.
Groups Skipped
The number of times that the parallelism coordinator must bypass a DB2 when distributing tasks because there is not enough buffer pool storage on one or more DB2 members.

This field is incremented only on the parallelism coordinator. It is only incremented once per parallel group even though it is possible that more than one DB2 systems have a buffer pool shortage for that parallel group. The purpose of this count is to indicate when there are not enough buffers on a member. Therefore, this count is incremented only when the buffer pool is defined to allow parallelism. For example, if VPXPSEQT is set to 0 on an assistant, DB2 does not send parallel work to the assistant, but this count is not incremented.

Reform (Config)
Total number of parallel groups for which DB2 reformulated the parallel portion of the access path because the sysplex configuration is different from the sysplex configuration at bind time. This counter is only incremented by the parallelism coordinator at run time.

Reform (No Buffer)
Total number of parallel groups for which DB2 reformulated the parallel portion of the access path because there was not enough buffer pool resource. This counter is only incremented by the parallelism coordinator at run time.

Miscellaneous
Incremental Bind
Occurrences of incremental bind, which take place upon execution of a DB2 plan that is bound as VALIDATE(RUN).

Max SQL Levels
The maximum level of nested SQL cascading. This includes cascading because of triggers, UDFs, and stored procedures.

Max LOB Storage (MB)
Maximum storage that is used for LOB values.

Max XML Storage
Maximum storage that is used for XML values.

Array Expansions
The number of times an array variable is expanded beyond 32K.
This applies to DB2 11 or higher.

Sparse IX (Disabled)
The number of times that sparse index is disabled because of insufficient storage.
This applies to DB2 11 or higher.

Sparse IX (Built WF)
The number of times that sparse index built a physical work file for probing.
This applies to DB2 11 or higher.

Fetched 1 Block Only (QXR1BOAD)
The number of times 1 block is fetched and there were no further fetches. DB2 12 and later.
Pipes Allocated (QXR1INPA)
The number of data manager fast insert pipes allocated since DB2 restart.
DB2 12 and later.

Pipes Disabled (QISTINPD)
The number of data manager fast insert pipes disabled since DB2 restart.
DB2 12 and later.

Stored procedures: For each field described below the following statistics are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects activity during the last cycle.
- Rate per minute during the last cycle.
- Rate per thread during the last cycle.
- Rate per Commit during the last cycle.

Abended
CALL statements executed to invoke a stored procedure that terminated abnormally.

Timed Out
CALL statements executed to invoke a stored procedure that timed out while waiting to be scheduled.

Rejected
CALL statements executed to invoke a stored procedure that was in the STOP ACTION(REJECT) state.

User Defined Functions: For each field described below the following statistics are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects activity during the last cycle.
- Rate per minute during the last cycle.
- Rate per thread during the last cycle.
- Rate per Commit during the last cycle.

Executed
The number of user-defined functions (UDFs) executed.

Abended
The number of times a UDF abended.

Timed Out
The number of times a UDF timed out when waiting to be scheduled.

Rejected
The number of times a UDF was rejected.

Triggers: For each field described below the following statistics are provided:
- Total quantity, which reflects the amount of activities since DB2 was started.
- Interval quantity, which reflects activity during the last cycle.
- Rate per minute during the last cycle.
- Rate per thread during the last cycle.
- Rate per Commit during the last cycle.

Stmt Triggers Executed
The number of times a statement trigger was activated.
Row Triggers Activated
The number of times a row trigger was activated.

SQL Error in Trigger
The number of times an SQL error occurred during execution of a triggered action.

Dynamic SQL
Prepares (Copy Found)
The number of times a PREPARE request is satisfied by making a copy from the prepared statement cache.

Prepares (Catalog Found)
The number of times a PREPARE request is satisfied by making a copy from the stabilized statement in SYSIBM.SYSDYNQRY catalog table. The stabilized statement search is done only when no matching statement is found in the prepared statement cache. DB2 12 and later. (Field name: QXSTSFND)

Prepares (Copy NFound)
The number of times a PREPARE request is received but a matching statement is not found in the prepared statement cache. Cache search is only done for DML SQL and only if cache option is active.

Prepares (Restrict IX)
The number of PREPARE requests for which the use of index/indexes are restricted because the index is in a pending state.

KeepDyn (Implicit)
The number of times the following actions occurred:
• An implicit PREPARE is performed because the KEEPDYNAMIC(YES) option is used
• An OPEN, EXECUTE, or DESCRIBE of a dynamic statement occurred after a COMMIT, however, DB2 no longer had a valid copy of the executable version of the prepared statement.

KeepDyn (Avoided)
The number of times that a PREPARE is avoided because KEEPDYNAMIC(YES) is used together with prepared statement caching, and DB2 still had the copy of the executable version of the prepared statement.

KeepDyn (Exceed Limit)
The number of times that an executable copy of a prepared statement is discarded because the MAXKEEPD system limit is exceeded.

KeepDyn (Invalidated)
The number of times that a prepared statement is purged from the cache because a DROP, ALTER, or REVOKE statement is issued on a dependent object.

Literals (Parsed)
The number of times DB2 parsed dynamic statements because CONCENTRATE STATEMENTS WITH LITERALS behavior is in effect for the prepare of the statement for the dynamic statement cache.

Literals (Replaced)
The number of times DB2 replaced at least one literal in a dynamic statement because CONCENTRATE STATEMENTS WITH LITERALS is in effect for the prepare of the statement for dynamic statement cache.
Literals (Matched)
The number of times DB2 found a matching reusable copy of a dynamic statement in statement cache during preparation of a statement that had literals replaced because of CONCENTRATE.

Literals (Duplicated)
The number of times DB2 created a duplicate statement instance in the statement cache for a dynamic statement that had literals replaced by CONCENTRATE STATEMENTS WITH LITERALS behavior and the duplicate statement instance was needed because a cache match failed because of literal reusability criteria.

Row ID

Successful
The number of times that direct row access was successful.

Revert to Index
The number of times an attempt to use direct row access reverted to using an index to locate a record.

Revert to TS Scan
The number of times an attempt to use direct row access reverted to using a table space scan to locate a record.

Rows Processing

Rows Fetched
The number of fetched rows.

Rows Inserted
The number of inserted rows.

Rows Updated
The number of updated rows.

Rows Deleted
The number of deleted rows.

Currently Committed

Insert Rows Skipped
The number of rows that are skipped by read transactions because uncommitted inserts are performed when current committed read is in effect for fetch operations.

Delete Rows Accessed
The number of rows that are skipped by read transactions because uncommitted deletes are performed when current committed read is in effect for fetch operations.

Update Rows Accessed
The number of rows that are accessed by read transactions while uncommitted updates existed because currently committed read behavior is in effect for fetch operation.

Workfile Database (WFDB)

Curr WFDB For TS (KB)
Current total storage (KB) that is configured for all table spaces in the WFDB.
This applies to DB2 11 or higher.

**DGTT WF configured (KB)**
Total preferred STORAGE (KB) that is configured for DGTTs in the WFDB.
This applies to DB2 11 or higher.

**WF Stor Configed (KB)**
Total preferred STORAGE (KB) that is configured for work files in the WFDB.
This applies to DB2 11 or higher.

**System WKDB threshold**
The value in percent (%) for the threshold of the system-level WFDB space usage alert.
Valid values: 0 - 100
This applies to DB2 11 or higher.

**Max Total Storage**
The maximum total storage (KBs) that is used in the WFDB at system level for DGTTs and work files since DB2 is started. After restart, this value starts again with 0.

**HWM DGTT WF Stor (KB)**
The highest total storage (KB) that is used for DGTTs by all agents on the system since DB2 is started.
This applies to DB2 11 or higher.

**HWM WF Storage (KB)**
The highest total storage (KB) that is used for work files by all agents on the system since DB2 is started.
This applies to DB2 11 or higher.

**Curr DGTT WF Stor (KB)**
Current total storage (KB) that is used for DGTTs by all agents on the system since DB2 is started.
This applies to DB2 11 or higher.

**Curr WF Storage (KB)**
The current total storage (KB) that is used for work files by all agents on the system since DB2 started.
This applies to DB2 11 or higher.

**Storage in 4K TS**
Current 4KB table space storage that is used (KB).

**Storage in 32K TS**
Current 32KB table space storage that is used (KB).

**32K used instead of 4K**
The number of times a 32KB page TS is used when a 4KB page TS is to be preferred but not available.

**4K used instead of 32K**
The number of times a 4KB page TS is used when a 32KB page TS is to be preferred but not available.
HWM DM WF Count
High watermark count (maximum number) of SORT-related DM in-memory work files that are active at any point in time since DB2 is started.

HWM NSort WF Count
High watermark count (maximum number) of non-SORT-related DM in-memory work files that are active at any point in time since DB2 is started.

This applies to DB2 11 or higher.

Curr DM WF Count
The number of times SORT-related DM in-memory work files are currently active.

Curr NSort WF Count
The number of times non-SORT related DM in-memory work files are currently active.

This applies to DB2 11 or higher.

HWM DM WF size (KB)
High watermark count of maximum space in KB that is used for the active DM In-Memory work files at any point in time since DB2 is started.

Curr DM WF size (KB)
Total space in KB that is used for the currently active DM In-Memory work files.

HWM Sort WF Count
High watermark count (maximum number) of Sort-Inmem work files that are active at any point in time since DB2 is started.

Curr Sort WF Count
The number of times Sort-Inmem work files are currently active.

HWM Sort WF size (KB)
High watermark count of maximum space that is used for the active Sort-Inmem work files at any point in time since DB2 is started.

Curr Sort WF size (KB)
Total Space that is used for the currently active Sort-Inmem work files.

WF Overflow to TS
The number of times the type-2 in-memory work files overflow into a physical tablespace since DB2 is started.

This applies to DB2 11 or higher.

WF Not Created(NoStor)
The number of times a work file is not created as any type of DM in-memory work file because of critical storage conditions since DB2 is started.

This applies to DB2 11 or higher.

Agent Max Storage
The limit of the maximum storage per agent (KB).

Number of Max Exceeded
The number of times the maximum storage limit is exceeded.

Agent WFDB threshold
The value for the threshold of the agent-level WFDB space usage alert.
Valid values: 0 - 100.

This applies to DB2 11 or higher.

HWM WFDB by Thread(KB)

The highest amount of WFDB storage (KB) that is used by any thread on the system since DB2 is started.

This applies to DB2 11 or higher.

Lock Manager Statistics Summary by Report Interval

This panel provides an overview of the locking activity that was recorded during a series of report intervals.

Navigation

For additional information about

- a report interval, move the cursor to the line you want and press F11 (Zoom). Each date/time displayed reflects the end of an interval.
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

Fields

Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start

The start time of the first interval in this display.
Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

**HOURLY**
Data will be reported in hourly intervals.

**NONE**
Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

Deadlocks
The total number of deadlocks detected during the interval.

Timeouts
The total number of times a suspension of a unit of work lasted longer than the Internal Resource Lock Manager (IRLM) timeout value.

Total Suspends
The total number of suspensions of a unit of work.

Total Lock Reqs
The number of requests to IRLM to obtain, change, query, and release locks, and also other IRLM requests.

Escalate to SHR
The number of times the allowable number of locks per tablespace was exceeded, causing a page (IS) lock to escalate to a shared (S) lock.

Escalate to EXC
The number of times the allowable number of locks per tablespace was exceeded, causing a page (IX) lock to escalate to an exclusive (X) lock.

Lock Manager Statistics Detail:
This panel shows detailed information about locking and claim and drain activity during a selected report interval.
Navigation

For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.
NONE
  Data will be reported in the time unit specified by the collection interval.

End  The end time of the interval currently displayed.

For each of the following fields, the following statistics are provided:

INTERVAL QUANTITY
  The amount of activities that occur during the interval.

/MINUTE
  Rate per minute. The number under /MINUTE (in parentheses) is the number of minutes in the interval.

/THREAD
  Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
  Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.

Deadlocks Detected
  The number of deadlocks detected.

Timeouts Detected
  Occasions when suspension of a unit of work lasted longer than the Internal Resource Lock Manager (IRLM) timeout value.

Susp Detected - Lock Only
  Suspensions of a unit of work because a lock could not be obtained.

Susp Detected - Latch Only
  DB2 internal latch suspensions.

Susp Detected - Other
  Suspensions caused by something other than locks and latches.

Lock Escalations - to Shared
  Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IS) lock to escalate to a shared (S) lock.

Lock Escalations - to Exclusive
  Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IX) lock to escalate to an exclusive (X) lock.

Lock Requests
  Requests to IRLM to obtain a lock on a resource.

Unlock Requests
  Requests to IRLM to unlock a resource.

Query Requests
  Requests to IRLM to query a lock.

Change Requests
  Requests to IRLM to change a lock.

Other IRLM Requests
  Requests to IRLM to perform a function other than those listed before.

Claim/Drain information:
Claim Requests
Number of claim requests.

Unsuccessful Claim Requests
Number of unsuccessful claim requests.

Drain Requests
Number of drain requests.

Unsuccessful Drain Requests
Number of unsuccessful drain requests.

Global Lock Statistics Summary by Report Interval
This panel provides an overview of the global locking activity that was recorded during a series of report intervals.

<table>
<thead>
<tr>

</table>

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

Start
The start time of the first interval in this display.

Report Interval
This field determines the report interval. It is set on the Near-Term History Report Option panel.
Combine Level
This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

**HOURLY**
Data will be reported in hourly intervals.

**NONE**
Data will be reported in the time unit specified by the collection interval.

End
The end time of the last interval in this display.

Interval
Provides the date and time that mark the end of the report interval.

Total XES Requests
The total number of lock, change, and unlock requests that were propagated to MVS either synchronously or asynchronously.

Total Suspends
The total number of XES requests that resulted in a suspension. This includes suspends for Internal Resource Lock Manager (IRLM) global contention, XES global contention, or false contention.

Total P-Locks
The total number of lock, change, and unlock requests for P-locks.

Total Negotiate
The number of times that this DB2 member was driven to negotiate a P-lock.

Incompat Retained
The number of global lock or change requests that failed because of an incompatible retained lock. Certain P-locks can be retained because of a system failure. Another DB2 member cannot access the data that the retained P-lock is protecting unless it requests a P-lock in a compatible state.

False Contention
The rate of false contentions to real contentions.

Global Lock Statistics Detail:
This panel shows detailed information about global locking activity in a data sharing environment during a selected report interval.

### Fields

#### Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

#### Start

The start time of the interval currently displayed.

#### Report Interval

This field determines the report interval. It is set on the Near-Term History Report Option panel.

#### Combine Level

This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

**HOURLY**

Data will be reported in hourly intervals.
NONE
Data will be reported in the time unit specified by the collection interval.

End
The end time of the interval currently displayed.

Total Global Contention
The percent of synchronous XES lock, change, or unlock requests that resulted in global contention.

False Contention Percentage
The rate of false contentions to real contentions. This number should be no more than 50%.

P-Lock/Notify Engines
The number of engines available for P-lock exit or notify exit requests.

For each of the following fields, the following statistics are provided:

INTERVAL QUANTITY
The amount of activities that occur during the interval.

/THREAD
Rate per thread. The number under /THREAD (in parentheses) is the number of Create Threads during the interval.

/COMMIT
Rate per Commit. The number under /COMMIT (in parentheses) is the number of Commit requests (including abort requests) during the interval.

P-lock Lock Requests
Number of lock requests for P-locks. A P-lock is a physical lock used only in a data sharing environment to provide consistency of data cached in different DB2 subsystems.

P-lock Change Requests
Number of change requests for P-locks.

P-lock Unlock Requests
Number of unlock requests for P-locks.

XES Lock Requests
The number of lock requests (both logical and physical) that were propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests. Only the most restrictive lock for a particular resource is propagated to XES and the coupling facility.

XES Unlock Requests
The number of unlock requests (both logical and physical) that are propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests.

XES Change Requests
The number of change requests (both logical and physical) that were propagated to MVS XES synchronously under the caller's execution unit. This count does not include suspended requests.

XES Asynchronous Requests
The number of L-locks and P-locks propagated to XES asynchronously. This occurs when a new inter-DB2 interest occurs on a parent resource or when a request completes after the requestor's execution unit has been suspended.
Suspends-IRLM Global Contention
The number of suspends due to Internal Resource Lock Manager (IRLM) global resource contentions. IRLM lock states were in conflict and inter-system communication is required to resolve the conflict.

Suspends-XES Global Contention
The number of suspends due to MVS XES global resource contentions that were not IRLM-level contentions. The XES lock states were in conflict, but the IRLM lock states were not.

Suspends-False Contention
The number of suspends caused by MVS XES false contentions. XES detects hash class contention when two different locks on different resources hash to the same entry in the coupling facility lock table. The requester is suspended until it is determined that no real lock contention exists.

Negotiate Pageset P-Locks
The number of times this DB2 member was driven to negotiate a pageset/partition P-lock because of changing inter-DB2 interest levels on the pageset/partition.

Negotiate Page P-Locks
The number of times this DB2 member was driven to negotiate a page P-lock because of inter-DB2 P-lock contention.

Negotiate Other P-Locks
The number of times this DB2 member was driven to negotiate a P-lock type other than pageset/partition or page.

Negotiate P-Lock Change
The number of times a P-lock change request was issued during P-lock negotiation.

Incompatible Retained Locks
The number of global lock or change requests that failed because of an incompatible retained lock. Certain P-locks can be retained because of a system failure. Another DB2 member cannot access the data that the retained P-lock is protecting unless it requests a P-lock in a compatible state.

Notify Messages Sent
The number of notify messages sent.

Notify Messages Received
The number of notify messages received.

Engine Not Available
The number of times an engine was not available for a P-lock exit or a notify exit request.

Very Conditional Rejections
The number of rejections of very conditional requests which could not get processed because of the heuristic algorithm used by XES.

DB2 Command Statistics By Report Interval
This panel provides an overview of DB2 command activity recorded during a series of report intervals.

You can view detailed statistics by zooming in on that interval.
### Navigation

For additional information about

- a report interval, move the cursor to the required line and press F11 (Zoom).
  (Each date/time displayed reflects the end of an interval.)
- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

### Fields

#### Collection Interval

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

#### Start

The start time of the first interval in the display.

#### Report Interval

This field determines the report interval. It is set on the Near-Term History Report Option panel.

#### Combine Level

This field reflects the selected combine level. If Combine Level is NONE, the report interval is the same as the collection interval. Possible values:

IBM Db2 Performance Expert on z/OS
HOURLY
Data will be reported in hourly intervals.

NONE
Data will be reported in the time unit specified by the collection interval.

For each field described below the following statistics are provided:
• The amount of activities that occur during the interval.
• Rate per minute during the interval.
• Percentage of total commands during the interval.

START/STOP DATABASE
The number of Start and Stop Database commands executed this interval to change the availability of specified databases.

START/STOP/MODIFY TRACE
The number of Start, Stop, and Modify Trace commands executed this interval to trace activity in the DB2 subsystem.

ARCHIVE LOG
The number Archive Log commands executed to initiate a DB2 active log switch.

RECOVER/RESET INDOUBT
The number of Recover and Reset Indoubt commands executed this interval to recover or purge indoubt threads.

CANCEL DDF THREAD
The number of Cancel DDF Thread commands executed this interval to cancel a distributed thread.

ALTER BUFFERPOOL
The number of ALTER BUFFERPOOL commands executed this interval to alter attributes for active or inactive buffer pools.

DB2 Command Statistics Detail:
This panel provides detailed statistics about DB2 command activity during a selected report interval.

Fields

Collection Interval
The time interval specified for the collection of near-term history data. This
unit of time was specified when the Near-Term History Data Collector was
started.

Start
The start time of the interval currently displayed.

Report Interval
This field determines the report interval. It is set on the Near-Term History
Report Option panel.

Combine Level
This field reflects the selected combine level. If Combine Level is NONE,
the report interval is the same as the collection interval. Possible values:

HOURLY
Data will be reported in hourly intervals.

NONE
Data will be reported in the time unit specified by the collection
interval.

End
The end time of the interval currently displayed.

For each field described below the following statistics are provided:
• Interval quantity, which is the activity during the interval.
• Rate per minute during the interval.
• Percentage of total commands during the interval.

ALTER BUFFERPOOL
ALTER BUFFERPOOL commands executed to alter attributes for active or
inactive buffer pools.

ALTER GROUPBUFFERPOOL
ALTER GROUPBUFFERPOOL commands executed to alter attributes for group
buffer pools.

ALTER UTILITY
ALTER UTILITY commands executed to change the values of certain
parameters of an execution of the REORG utility that uses SHRLEVEL
REFERENCE or CHANGE.

ARCHIVE LOG
ARCHIVE LOG commands executed to initiate a DB2 active log switch.

CANCEL (DDF) THREAD
CANCEL DDF THREAD commands executed to cancel a distributed thread.

DISPLAY ARCHIVE
DISPLAY ARCHIVE commands executed to display input archive log
information.
DISPLAY BUFFERPOOL
DISPLAY BUFFERPOOL commands executed to display statistics for active or inactive buffer pools.

DISPLAY DATABASE
DISPLAY DATABASE commands executed to display status information about tablespaces and indexspaces within a database.

DISPLAY GROUP
DISPLAY GROUP commands executed to display statistics about the data sharing group to which the DB2 subsystem belongs.

DISPLAY GROUPBUFFERPOOL
DISPLAY GROUPBUFFERPOOL commands executed to display attributes of group buffer pools.

DISPLAY LOCATION
DISPLAY LOCATION commands executed to display statistics of threads with distributed relationships.

DISPLAY PROCEDURE
DISPLAY PROCEDURE commands execute to display statistics about stored procedures.

DISPLAY RLIMIT
DISPLAY RLIMIT commands executed to display the current status of the resource limit facility.

DISPLAY THREAD
DISPLAY THREAD commands executed to display status information about DB2 threads.

DISPLAY TRACE
DISPLAY TRACE commands executed to display a list of active traces.

DISPLAY UTILITY
DISPLAY UTILITY commands executed to display status information about DB2 utility jobs.

DISPLAY FUNCTION
DISPLAY FUNCTION specific commands executed to display statistics about external user-defined functions accessed by DB2 applications.

DISPLAY LOG
DISPLAY LOG commands executed to display log information and the status of the offload task.

MODIFY TRACE
MODIFY TRACE commands executed to change the IFCIDs being traced for an active trace.

RECOVER BSDS
RECOVER BSDS commands executed to recover a boot strap data set that has been disabled by an error.

RECOVER INDOUBT
RECOVER INDOUBT commands executed to recover threads left in the indoubt status.

RESET GENERICLU
RESET GENERICLU commands executed to purge information stored by VTAM in the coupling facility for one or more partners of a particular DB2 subsystem.
RESET INDOUBT
commands executed to purge indoubt thread information.

SET ARCHIVE
commands executed to change the maximum tape units and the deallocation time parameters originally set in the installation parameters.

START DATABASE
commands executed to make stopped databases available for use.

START DB2
commands executed.

START DDF
commands executed to start the distributed data facility.

START PROCEDURE
commands executed to activate the definition of a stored procedure which is stopped, or which refreshes a stored procedure that is cached.

START RLIMIT
commands executed to start the resource limit facility.

START TRACE
commands executed to begin collection of DB2 trace records.

START FUNCTION
specific commands executed to activate an external function that is stopped. Built-in functions or user-defined functions that are sourced on another function cannot be started.

STOP DATABASE
commands executed to make specified databases unavailable for use.

STOP DB2
commands executed.

STOP DDF
commands executed to stop the distributed data facility.

STOP PROCEDURE
commands executed to prevent DB2 from accepting SQL CALL statements for one or more stored procedures.

STOP RLIMIT
commands executed to stop the resource limit facility.

STOP TRACE
commands executed to stop collection of DB2 trace records.

STOP FUNCTION
specific commands executed to prevent DB2 from accepting SQL statements with invocations of the specified functions. You cannot stop built-in functions or user-defined functions that are sourced on another function.

TERM UTILITY
commands executed to terminate execution of a utility job.
SET LOG
SET LOG commands executed to modify the checkpoint frequency specified during installation.

DISPLAY ACCEL
Display Accelerator commands that are executed to display details about accelerators that are connected to the current subsystem.

START ACCEL
Start Accelerator commands that are executed to activate an accelerator.

STOP ACCEL
Stop Accelerator commands that are executed to deactivate an accelerator.

SET SYSPARM
The number of DB2 SET SYSPARM commands that are issued. This includes normal and abnormal completion of the command.

DISPLAY DDF
The number of DB2 DISPLAY DDF commands that are issued. This includes normal and abnormal completion of the command.

ACCESS DATABASE
The number of DB2 ACCESS DATABASE commands that are issued. This includes normal and abnormal completion of the command.

START PROFILE
The number of DB2 START PROFILE commands that are issued. This includes normal and abnormal completion of the command.

STOP PROFILE
The number of DB2 STOP PROFILE commands that are issued. This includes normal and abnormal completion of the command.

DISPLAY PROFILE
The number of DB2 DISPLAY PROFILE commands that are issued. This includes normal and abnormal completion of the command.

MODIFY DDF
The number of DB2 MODIFY DDF commands that are issued. This includes normal and abnormal completion of the command.

This field is only displayed for DB2 10 or above.

ACTIVATE FUNCTION LEVEL (Q9STCTEN)
The number of DB2 ACTIVATE FUNCTION LEVEL commands issued. This includes normal and abnormal completion of the command. DB2 12 and later.

START DYNQUERYCAPTURE (Q9STCTSQ)
The number of DB2 START DYNQUERYCAPTURE commands issued. This includes normal and abnormal completion of the command. DB2 12 and later.

STOP DYNQUERYCAPTURE (QSTCTXQ)
The number of DB2 STOP DYNQUERYCAPTURE commands issued. This includes normal and abnormal completion of the command. DB2 12 and later.

DISPLAY DYNQUERYCAPTURE (Q9STCTDQ)
The number of DB2 DISPLAY DYNQUERYCAPTURE commands issued. This includes normal and abnormal completion of the command. This field only shown for DB2 12 and later.
**Near-Term History Report Option**

This panel shows the current data collection interval and the number of intervals that have been collected since the Near-Term History Data Collector was started. Use this panel to set the combine level for near-term history reporting.

```
> A-SUBSYSTEM SUPPORT   B-BIND   C-BUFFER POOL   D-GROUP BP
> E-DISTRIBUTED DATABASE F-EDM POOL G-LOG MANAGER H-OPEN/CLOSE
> I-SQL/RID/PARALLEL/PROC J-LOCK/CLAIM/DRAIN K-GLOBAL LOCK L-DB2 COMMANDS
> *-OPTIONS
> NEAR-TERM HISTORY REPORT OPTION
> HOPT
> + Collection Interval = 1 minute
> + Number of Intervals Collected = 18
> + Report Combine Level = NONE (NONE, HOURLY)
```

**Navigation**

For additional information about other topics, use the PF keys.

**Fields**

**Collection Interval**

The time interval specified for the collection of near-term history data. This unit of time was specified when the Near-Term History Data Collector was started.

**Number of Intervals Collected**

The number of intervals' worth of data that has been collected since the Near-Term History Data Collector was started. The interval that is currently in progress is not included in this count.

The maximum of 288 can be stored is 288, which is equivalent to the number of five-minute intervals during 24 hours).

**Report Combine Level**

Use this field to establish the report interval for near-term history reporting. Possible values:

**HOURLY**

Data will be reported in hourly intervals.

**NONE**

Data will be reported in the time unit specified by the collection interval.

**Note:** To change this setting permanently, save your user profile. Select the Save User option from the Profile Maintenance Menu.
Near-Term Thread History Filter Options
Use this panel to specify the reporting period for which you want to view near-term thread history information, the intervals into which the report is divided, and filter options that restrict the data that is displayed on subsequent thread history panels.

Using this panel, you can set the following options:

- **Time of oldest available record**: Displays the earliest time that thread data was collected to active data sets. Displays N/A if no thread data is collected.
  - This is either the time stamp of the first IFCID 3 record or, if detail is not being collected, the oldest near-term thread summary record.

- **Time of latest record**: Displays the most recent time that thread data was collected to active data sets. Displays N/A if no thread data is collected.
  - This is either the time stamp of the last IFCID 3 record or, if detail is not being collected, the last near-term thread summary record.

### Filters

- **Field filter options**: Specify filter options then press ENTER to continue.

### Fields

**Information about available data:**

**Time of oldest available record**
- Displays the earliest time that thread data was collected to active data sets.
- Displays N/A if no thread data is collected.

This is either the time stamp of the first IFCID 3 record or, if detail is not being collected, the oldest near-term thread summary record.

**Time of latest record**
- Displays the most recent time that thread data was collected to active data sets.
- Displays N/A if no thread data is collected.

This is either the time stamp of the last IFCID 3 record or, if detail is not being collected, the last near-term thread summary record.
Total number of records
Displays the number of thread records (IFCID 3) that are collected to active data sets. Displays 0 if no detail thread records are collected.

Filter options limiting the time: Specify an absolute or relative time range of at most 24 hours for the reporting period for which you want to view near-term thread history information. The specified time range should be within the range of collected data.

START-DATE/TIME
Specify an absolute start date and time. START-DATE/TIME and RELATIVE-START are mutually exclusive.
You can specify the date and time in U.S., European, or ISO format.

DATE
- mm/dd/yyyy (U.S.)
- dd.mm.yyyy (European)
- yyyy-mm-dd (ISO)

TIME
- hh:mm (U.S.)
- hh.mm (European, ISO)

END-DATE/TIME
Specify an absolute end date and time. END-DATE/TIME and RELATIVE-END are mutually exclusive.
You can specify the date and time in U.S., European, or ISO format.

DATE
- mm/dd/yyyy (U.S.)
- dd.mm.yyyy (European)
- yyyy-mm-dd (ISO)

TIME
- hh:mm (U.S.)
- hh.mm (European, ISO)

RELATIVE-START
Specify a start time relative to the current time, as the number of minutes or hours before the current time. The default value is one hour. RELATIVE-START and START-DATE/TIME are mutually exclusive.

RELATIVE-END
Specify an end time relative to the specified start time, as the number of minutes or hours after START-DATE/TIME or RELATIVE-START. RELATIVE-END and END-DATE/TIME are mutually exclusive.

REPORT-INTERVAL
Specify a report interval by which the report period is partitioned, from 5 to 60 minutes, in five minute increments. The value must be some multiple of the Near-Term History Data Collector summary record write frequency.

Filter options to be used at interval display level: You can use these options to filter near-term history data at thread summary (interval) display level.

PLAN
You can specify up to five plan names that you want to be displayed on subsequent thread history panels. You can enter multiple values including wildcards. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.
AUTHID
You can specify up to five authorization ids that you want to be displayed on subsequent thread history panels. You can enter multiple values including wildcards. You can compare values using the equal (=) or not equal (^=, <>) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

CONNID
You can specify up to five connection ids that you want to be displayed on subsequent thread history panels. You can enter multiple values including wildcards. You can compare values using the equal (=) or not equal (^=, <>) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

CONNTYPE
You can specify up to five connection types that you want to be displayed on subsequent thread history panels.
- TSO TSO foreground and background (QWHCTSO)
- CALLATCH
  - DB2 call attach (QWHDB2C)
- CICS CICS attach (QWHCCICS)
- DL/I DL/I batch (QWHCDLIB)
- IMSBPP
  - IMS attach BMP (QWHCIMSB)
- IMSMPP
  - IMS attach MPP (QWHCIMSM)
- IMSCTRL
  - IMS control region (QWHCICTL)
- IMSBMP
  - IMS transaction BMP (QWHCTBMP)
- IMS All IMS threads including DL/I batch (QWHCDLIB + QWHCIMSB + QWHCIMSM + QWHCICTL + QWHCTBMP)
- SYSDIR
  - System directed access (data base access threads) (QWHCDUW)
- APPLDIR
  - Application directed access (data base access threads) (QWHCRUW)
- DIST
  - Data base access threads (System-directed and Application-directed) (QWHCDUW + QWHCRUW)
- BATCH
  - DB2 call attach (QWHDB2C)

Filter options to be used only at thread detail display level: You can use these options to filter near-term history data at thread detail display level.

PACKAGE
You can specify up to five package ids that you want to be displayed on subsequent thread history panels. You can enter multiple values including wildcards. You can compare values using the equal (=) or not equal (^=, <>) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

CORRID
You can specify up to five correlation ids that you want to be displayed on subsequent thread history panels. You can enter multiple values including wildcards. You can compare values using the equal (=) or not equal (^=, <>) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.
GETPAGES
Specify the minimum number of Getpage requests that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

DEADLK/TIMEOUT
Specify the minimum number of deadlocks and lock timeouts that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

LOCK-ESCAL
Specify the minimum number of lock escalations that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

COMMIT
Specify the minimum number of commits that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

DB2-CPU-TIME
Specify the minimum amount of DB2 processor time that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

DB2-ELAP-TIME
Specify the minimum amount of DB2 elapsed time that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

IO-WAIT-TIME
Specify the minimum amount of I/O wait time that you want to be displayed on subsequent thread history panels. You can compare values using the equal (=) or not equal (^=, <> ) comparison operators. Use the equal operator to OR multiple values. Use the not equal operator to AND multiple values.

Near-Term Thread History Filter Options - Confirmation
This panel shows the reporting and filtering options that you have specified on the Near-Term Thread History Filter Options panel.
The following options have been specified, to view Thread History
press ENTER, to modify these options or CANCEL press PF3.

**Near-Term Thread History Filter Options - Confirmation**

- **HAFD**
  - Date and time options in effect for Thread History displays
  - Start = 1 hour ago
  - For = 1 hour or up to the Thread History display time
  - Report Interval = 15 minutes
  - Filter options in effect for Thread History displays
    - Plan Name =
    - Authorization Id =
    - Connection Id =
    - Connection Type =
    - Package =
    - Correlation Id =
    - Getpages >
    - Deadlock/timeout >
    - Lock-escal >
    - Commit >
    - DB2-CPU-TIME >
    - DB2-ELAP-TIME >
    - IO-WAIT-TIME >

To modify any option value, press F3, which returns you to the Near-Term Thread History Filter Options panel.

**Navigation**

For additional information about
- overview of thread activity, press Enter.
- other topics, use the PF keys.

**Fields**

- **Start** The start of the reporting period.
- **For** The minutes or hours of the reporting period.
- **Report Interval** The minutes by which the report period is partitioned.

- **Plan Name** The specified plan names.
- **Authorization Id** The specified authorization identifiers.
- **Connection Id** The specified connection identifiers.
- **Connection Type** The specified connection types.
- **Package** The specified package identifiers.
Correlation ID
The specified correlation identifiers.

Getpages
The specified number of Getpage requests.

Deadlock/timeout
The specified number of deadlocks and lock timeouts.

Lock-escal
The specified number of lock escalations.

Commit
The specified number of Commits.

DB2-CPU-TIME
The specified amount of DB2 processor time.

DB2-ELAP-TIME
The specified amount of DB2 elapsed time.

IO-WAIT-TIME
The specified amount of I/O wait time.

Thread History By Report Interval
This panel provides an overview of thread activity for the specified reporting period, divided into a series of report intervals.

Each time displayed in this panel reflects the start of an interval.

<table>
<thead>
<tr>
<th>Time</th>
<th>Thrd</th>
<th>Com</th>

</thead>
</table>

Navigation

For additional information about a report interval, move the cursor to the line you want, enter one of the following selection letters, and press Enter.

A Thread history by Plan. For more information, see the description of panel “Thread History By Plan” on page 1613.
Thread history by Authid. For more information, see the description of panel “Thread History By Authid” on page 1615.

Thread history by Plan, Authid. For more information, see the description of panel “Thread History By Plan, Authid” on page 1616.

Thread history by Authid, Plan. For more information, see the description of panel “Thread History By Authid, Plan” on page 1618.

Thread history summary (no grouping). For more information, see the description of panel “Thread History Summary” on page 1621.

Thread summary by subinterval (the Near-Term History Data Collector summary record write frequency). This is valid only when the report interval is set to a multiple of the innate subinterval. For more information, see the description of panel “Thread History By Subinterval” on page 1624.

Thread history summary by correlation ID. For more information, see the description of panel “Thread History By Correlation ID” on page 1626.

* other topics, use the PF keys.

**Fields**

**Report Interval**
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

**Start**
The start date and time of the first interval in the display.

**Report Filtered**
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

**End**
The end date and time of the last interval in the display.

**Time**
The time of the start of the report interval.

**Thrds**
The number of threads completed in this interval.

**Commit**
The number of successful commits performed in this interval. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

**Abort**
The number of successful rollbacks performed in this interval.

**DML**
The number of DML calls issued in this interval.

**DLk/TOut**
The number deadlocks and timeouts occurred in this interval.

**In-DB2 Elap Tm**
The elapsed time spent in DB2 for this interval. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

**In-DB2 CPU Tm**
The CPU time spent in DB2 for this interval. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.
In-DB2 Wait Tm
The time spent waiting in DB2 for this interval. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available. DB2 Accounting class 3 wait events are:
• Synchronous I/O waits
• Asynchronous Read I/O waits
• Asynchronous Write I/O waits
• Lock/latch waits
• Page latch waits
• Drain lock waits
• Drain of claims waits
• DB2 service task waits
• Archive Log Mode (QUIESCE) waits
• Archive read from tape waits

Getpage
The number of Getpage requests issued in this interval.

GetP/RIO
The ratio of Getpage requests to synchronous Read I/Os for this interval.

Thread History By Plan
This panel provides information about thread activity grouped by plan for a selected report interval or subinterval.

<table>

For additional information about
• a report interval, move the cursor to the line you want, enter one of the following selection letters, and press Enter.

B Thread history by Authid. For more information, see the description of panel “Thread History By Authid” on page 1615.

C Thread history by Plan, Authid. For more information, see the description of panel “Thread History By Plan, Authid” on page 1616.

D Thread history by Authid, Plan. For more information, see the description of panel “Thread History By Authid, Plan” on page 1618.
Thread history display options. For more information, see the description of the panel “Thread History Display Options” on page 1619.

Thread history summary by correlation ID. For more information, see the description of panel “Thread History By Correlation ID” on page 1626.

- threads associated with a plan, move the cursor to the line you want and press F11 (Zoom).
- other topics, use the PF keys.

Fields

Report Interval
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

Start
The start date and time of the first interval in the display.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end date and time of the last interval in the display.

Plan
The DB2 plan name.

Thrds
The number of threads completed in this interval.

Commit
The number of successful commits performed by threads running this plan. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

Abort
The number of successful rollbacks performed by threads running this plan.

DML
The number of DML calls issued by threads running this plan.

DLk/TOut
The number deadlocks and timeouts that occurred for threads running this plan.

In-DB2 Elap Tm
The elapsed time spent in DB2 for threads running this plan. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 CPU Tm
The CPU time spent in DB2 for threads running this plan. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 Wait Tm
The time spent waiting in DB2 for threads running this plan. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available.

Getpage
The number of Getpage requests issued by threads running this plan.

GetP/RIO
The ratio of Getpage requests to synchronous Read I/Os for this interval.
Thread History By Authid
This panel provides information about thread activity grouped by authorization ID for a selected report interval or subinterval.

Fields
Report Interval
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.
Start The start date and time of the interval currently displayed.
Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.
End The end time of the interval currently displayed.

Chapter 5. Monitoring  1615
Authid
The DB2 authorization identifier.

Thrds The number of threads completed for the authid.

Commit
The number of successful commits performed by threads run with this authid. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

Abort The number of successful rollbacks performed by threads run with this authid.

DML The number of DML calls issued by threads run with this authid.

DLk/Out
The number deadlocks and timeouts that occurred for threads run with this authid.

In-DB2 Elap Tm
The elapsed time spent in DB2 for threads run with this authid. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 CPU Tm
The CPU time spent in DB2 for threads run with this authid. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 Wait Tm
The time spent waiting in DB2 for threads run with this authid. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available.

Getpage
The number of Getpage requests issued by threads run with this authid.

GetP/RIO
The ratio of Getpage requests to synchronous Read I/Os for threads run with this authid.

Thread History By Plan, Authid
This panel provides information about thread activity grouped by plan and authid for a selected report interval or subinterval.
Navigation

For additional information about
• a report interval, move the cursor to the line you want, enter one of the following selection letters, and press Enter.

A Thread history by Plan. For more information, see the description of panel “Thread History By Plan” on page 1613.

B Thread history by Authid. For more information, see the description of panel “Thread History By Authid” on page 1615.

D Thread history by Authid, Plan. For more information, see the description of panel “Thread History By Authid, Plan” on page 1618.

O Thread history display options. For more information, see the description of the panel “Thread History Display Options” on page 1619.

G Thread history summary by correlation ID. For more information, see the description of panel “Thread History By Correlation ID” on page 1626.

• threads associated with a plan and authorization ID, move the cursor to the line you want and press F11 (Zoom).

• other topics, use the PF keys.

Fields

Report Interval
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

Start The start date and time of the interval currently displayed.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End The end time of the interval currently displayed.

Plan The DB2 plan name. The plan name is displayed only on the first line within a group. However, if you sort this panel on a field other than the Plan+Authid combination, the plan name is displayed on each line.

Authid
The DB2 authorization identifier of the threads.

Thrds The number of threads completed for the plan, authid.

Commit
The number of successful commits performed by this plan, authid. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

DML The number of DML calls issued.

In-DB2 Elap Tm
The elapsed time spent in DB2. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.
In-DB2 CPU Tm
The CPU time spent in DB2 for threads run with this authid. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 Wait Tm
The time spent waiting in DB2. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available.

Getpage
The number of Getpage requests issued.

GetP/RIO
The ratio of Getpage requests to synchronous Read I/Os.

Thread History By Authid, Plan
This panel provides information about thread activity grouped by plan and authid for a selected report interval or subinterval.

Navigation
For additional information about a report interval, move the cursor to the line you want, enter one of the following selection letters, and press Enter.

A  Thread history by Plan. For more information, see the description of panel “Thread History By Plan” on page 1613.
B  Thread history by Authid. For more information, see the description of panel “Thread History By Authid” on page 1615.
C  Thread history by Plan, Authid. For more information, see the description of panel “Thread History By Plan, Authid” on page 1616.
O  Thread history display options. For more information, see the description of the panel “Thread History Display Options” on page 1619.
G  Thread history summary by correlation ID. For more information, see the description of panel “Thread History By Correlation ID” on page 1626.

• threads associated with an authorization ID and plan, move the cursor to the line you want and press F11 (Zoom).
• other topics, use the PF keys.
**Fields**

**Report Interval**
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

**Start**
The start date and time of the interval currently displayed.

**Report Filtered**
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

**End**
The end time of the interval currently displayed.

**Authid**
The DB2 authorization ID. The authorization ID is displayed on the only first line within a group. However, if you sort this panel on a field other than the Authid+Plan combination, the authorization ID is displayed on each line.

**Plan**
The DB2 plan name.

**Thrds**
The number of threads completed for the authid,plan.

**Commit**
The number of successful commits performed by this authid,plan. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

**DML**
The number of DML calls issued.

**In-DB2 Elap Tm**
The elapsed time spent in DB2. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

**In-DB2 CPU Tm**
The CPU time spent in DB2 for threads run with this authid. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

**In-DB2 Wait Tm**
The time spent waiting in DB2. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available.

**Getpage**
The number of Getpage requests issued.

**GetP/RIO**
The ratio of Getpage requests to synchronous Read I/Os.

**Thread History Display Options**
This panel shows the thread history display options that you have specified on the Near-Term Thread History Filter Options panel.
To modify any option value, press F3, which returns you to the Near-Term Thread History Filter Options panel.

**Navigation**

For additional information about
- overview of thread activity, press Enter.
- other topics, use the PF keys.

**Fields**

**Start**  
The start of the reporting period.

**For**  
The minutes or hours of the reporting period.

**Report Interval**  
The minutes by which the report period is partitioned.

**Plan Name**  
The specified plan names.

**Authorization Id**  
The specified authorization identifiers.

**Connection Id**  
The specified connection identifiers.

**Connection Type**  
The specified connection types.

**Package**  
The specified package identifiers.

**Correlation ID**  
The specified correlation identifiers.
Getpages
The specified number of Getpage requests.

Deadlock/timeout
The specified number of deadlocks and lock timeouts.

Lock-escal
The specified number of lock escalations.

Commit
The specified number of Commits.

DB2-CPU-TIME
The specified amount of DB2 processor time.

DB2-ELAP-TIME
The specified amount of DB2 elapsed time.

IO-WAIT-TIME
The specified amount of I/O wait time.

Thread History Summary
This panel provides summary information about thread activity within a report interval.

Navigation
For additional information about

Chapter 5. Monitoring 1621
• a particular thread, move the cursor to the thread information line and press F11 (Zoom).
• related topics, choose one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Report Interval
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

Start
The start date and time of the interval currently displayed.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end time of the interval currently displayed.

End Time
The end time of the DB2 thread execution.

If this thread involves parallel processing or if it invokes autonomous procedures, one of the following identifiers is displayed after the elapsed time to provide more information about this thread:

* This thread is a parallel task initiated on behalf of another (originating) thread to process a query request in parallel.
A This thread is an autonomous procedure rollup record.
D This thread is a RRSAF/DDF rollup record due to ZPARM ACCUMACC >= 2.
O This thread is the originating thread that invokes autonomous procedures.
P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity that is performed for this (originating) thread is reflected under the parallel tasks.
R This thread is a parallel task rollup record due to ZPARM PTASKROL = YES.

Plan
The DB2 plan name.

Authid
The DB2 authorization identifier of the thread.

Elapsed Time
The total elapsed time for the thread.

CPU Time
The amount of CP time used by the thread. This value reflects MVS TCB time for non-database access threads and SRB time for database access threads and parallel tasks. This time represents CP time only and does not include SE (Specialty Engine) time.

SQL
The total number of DCL, DDL, and DML SQL calls issued by the thread. COMMIT and ROLLBACK/ABORT are not included.
Commit
   The number of Commits performed by the thread.

Abt
   The number of aborts performed by the thread.

Pkg
   The number of package and DBRM executions for the thread. Accounting classes 7 and 8 are required. Displays N/A if accounting classes 7 and 8 are not available.

Term Status
   The status that indicates the reason for the thread termination.

READS
   IFI READ request.

RESIGN
   Same user signed on with same authentication identifier.

NEWUSE
   User signon.

DDFINA
   The distributed thread went inactive.

DEALLO
   Thread termination.

COMMIT
   RRSAF thread specified accounting interval = COMMIT.

EOT/TE
   End of task, application terminated normally.

EOT/AB
   End of task, application terminated abnormally.

EOM/AB
   End of memory, application terminated abnormally.

RES/IN
   Resolve indoubt processing.

FORCE
   Stop forced, MVS canceled DB2 or MVS forced DB2.

IEOT/T
   End of task, application terminated normally and is indoubt.

IEOT/A
   End of task, application terminated abnormally and is indoubt.

IEOM/A
   End of memory, application terminated abnormally and is indoubt.

IFORCE
   Stop forced, MVS canceled DB2 or MVS forced DB2, and the thread is indoubt.

STALE
   Staleness Threshold exceeded for DDF or RRSAF thread.

LIMIT
   DDF ROLLUP threshold limit exceeded.
STORAGE

Internal DB2 storage threshold was reached for DDF or RRSAF thread.

INACTIVE

Distributed database access thread termination.

Thread History By Subinterval

This panel provides information about thread activity for a selected interval from the Thread History by Report Interval panel.

Each time displayed in this panel reflects the start of a subinterval. The subinterval is determined by the near-term history data collection options keyword NTAINTE RVAL, which is specified by means of the Configuration Tool. For more information, see "Configuration and Customization."
Thread history by Authid, Plan. For more information, see the description of panel “Thread History By Authid, Plan” on page 1618.

Thread history summary (no grouping). For more information, see the description of panel “Thread History Summary” on page 1621.

Thread history summary by correlation ID. For more information, see the description of panel “Thread History By Correlation ID” on page 1626.

• other topics, use the PF keys.

Fields

Report Interval
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

Start
The start date and time of the first interval in the display.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end time of the last subinterval in the display.

Time
The time of the start of the report subinterval.

Thrs
The number of threads completed in this subinterval.

Commit
The number of successful commits performed in this subinterval. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

Abort
The number of successful rollbacks performed in this subinterval.

DML
The number of DML calls issued in this subinterval.

DLk/TOut
The number deadlocks and timeouts occurred in this subinterval.

In-DB2 Elap Tm
The elapsed time spent in DB2 for this subinterval. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 CPU Tm
The CPU time spent in DB2 for this subinterval. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 Wait Tm
The time spent waiting in DB2 for this subinterval. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available. DB2 Accounting class 3 wait events are:
• Synchronous I/O waits
• Asynchronous Read I/O waits
• Asynchronous Write I/O waits
• Lock/latch waits
• Page latch waits
• Drain lock waits
- Drain of claims waits
- DB2 service task waits
- Archive Log Mode (QUIESCE) waits
- Archive read from tape waits

Getpage
The number of Getpage requests issued in this subinterval.

GetP/RIO
The ratio of Getpage requests to synchronous Read I/Os for this subinterval.

Thread History By Correlation ID
This panel provides information about thread activity grouped by correlation ID for a selected report interval or subinterval.

Thread History by Correlation ID

Navigation
For additional information about
- a report subinterval, move the cursor to the line you want, enter one of the following selection letters, and press Enter.

A  Thread history by Plan. For more information, see the description of panel “Thread History By Plan” on page 1613.

B  Thread history by Authid. For more information, see the description of panel “Thread History By Authid” on page 1615.

C  Thread history by Plan, Authid. For more information, see the description of panel “Thread History By Plan, Authid” on page 1616.

D  Thread history by Authid, Plan. For more information, see the description of panel “Thread History By Authid, Plan” on page 1618.

O  Thread history display options. For more information, see the description of the panel “Thread History Display Options” on page 1619.

- threads associated with a correlation ID, move the cursor to the line you want and press F11 (Zoom).
- other topics, use the PF keys.
Fields

Report Interval
The time interval by which the report period is partitioned. For more information, see the description of panel “Near-Term Thread History Filter Options” on page 1606.

Start
The start date and time of the first interval in the display.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end date and time of the last interval in the display.

Corrid
The DB2 correlation identifier.

Thrds
The number of completed threads for the correlation identifier.

Commit
The number of successful commits run with the correlation identifier. For attachments that use two-phase-commit protocol, this count represents the number of phase two commits. For others, this count represents the number of single-phase commit (sync) requests.

Abort
The number of successful rollbacks performed by threads running with the correlation identifier.

DML
The number of DML calls issued by threads running with the correlation identifier.

DLk/TOut
The number deadlocks and timeouts that occurred for threads run with the correlation identifier.

In-DB2 Elap Tm
The elapsed time spent in DB2 for threads run with the correlation identifier. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 CPU Tm
The CPU time spent in DB2 for threads run with the correlation identifier. Accounting class 2 data is required. Displays N/A if accounting class 2 data is not available.

In-DB2 Wait Tm
The time spent waiting in DB2 for threads run with the correlation identifier. Accounting class 3 data is required. Displays N/A if accounting class 3 data is not available. DB2 Accounting class 3 wait events are:
- Synchronous I/O waits
- Asynchronous Read I/O waits
- Asynchronous Write I/O waits
- Lock/latch waits
- Page latch waits
- Drain lock waits
- Drain of claims waits
- DB2 service task waits
- Archive Log Mode(QUIESCE) waits
- Archive read from tape waits
Getpage
The number of Getpage requests issued by threads run with the correlation identifier.

GetP/RIO
The ratio of Getpage requests to synchronous Read I/Os for the correlation identifier.

Thread History Buffer Pool Summary
This panel provides summary information about thread buffer pool activity within a report interval.

<table>

Navigation
For additional information about
- a particular thread, move the cursor to the thread information line and press F1 (Zoom).
- related topics, choose one of the options at the top of the panel.
- other topics, use the PF keys.

Fields
Report Interval
The time of the thread summary report displayed.

Start
The start date and time of the interval currently displayed.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end time of the interval currently displayed.

End Time
The end time of the DB2 thread execution.

If this thread involves parallel processing or if it invokes autonomous procedures, one of the following identifiers is displayed after the elapsed time to provide more information about this thread:
* This thread is a parallel task initiated on behalf of another (originating) thread to process a query request in parallel.

A This thread is an autonomous procedure rollup record.

D This thread is a RRSAF/DDF rollup record due to ZPARM ACCUMACC >= 2.

O This thread is the originating thread that invokes autonomous procedures.

P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity that is performed for this (originating) thread is reflected under the parallel tasks.

R This thread is a parallel task rollup record due to ZPARM PTASKROL = YES.

Plan The DB2 plan name.

Authid The DB2 authorization identifier of the threads.

Getpage The number of Getpage requests issued.

Read I/O The number of synchronous Read I/Os performed.

GetP/RIO The ratio of Getpage requests to synchronous Read I/Os.

Pfetch The number of Prefetch requests issued.

Update The number of buffer pool page updates performed.

Immed Write The number of immediate (synchronous) writes performed.

**Thread History DB2 Time Summary**

This panel provides a summary of thread In-DB2 times for a selected report interval.
Navigation

For additional information about
• a particular thread, move the cursor to the thread information line and press F11 (Zoom).
• related topics, choose on of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Report Interval
The time of the thread summary report displayed.

Start
The start date and time of the interval currently displayed.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end time of the interval currently displayed.

End Time
The end time of the DB2 thread execution.

If this thread involves parallel processing or if it invokes autonomous procedures, one of the following identifiers is displayed after the elapsed time to provide more information about this thread:

* This thread is a parallel task initiated on behalf of another (originating) thread to process a query request in parallel.

A This thread is an autonomous procedure rollup record.

D This thread is a RRSAF/DDF rollup record due to ZPARM ACCUMACC >= 2.

O This thread is the originating thread that invokes autonomous procedures.

P This thread is the parent or the originating thread of the parallel
tasks that are created to process a query request in parallel. Activity that is performed for this (originating) thread is reflected under the parallel tasks.

R  This thread is a parallel task rollup record due to ZPARM PTASKROL = YES.

Plan  The DB2 plan name.

Authid  The DB2 authorization identifier of the threads.

In-DB2 Elap Tm  The elapsed time spent in DB2. Accounting class 2 is required. Displays N/A if accounting class 2 data is not available.

In-DB2 CPU Tm  The CPU time spent in DB2. Accounting class 2 is required. Displays N/A if accounting class 2 data not available.

Waits  The total number of waits in DB2. Accounting class 3 is required. Displays N/A if accounting class 3 data is not available.

Wait Time  The time spent waiting in DB2. Accounting class 3 is required. Displays N/A if accounting class 3 data is not available.

I/O Waits  The total number of waits for I/O. Accounting class 3 is required. Displays N/A if accounting class 3 data is not available.

I/O Wait Tm  The time spent waiting for I/O. Accounting class 3 is required. Displays N/A if accounting class 3 data is not available.

Thread History DB2 Lock/Scan/Sort Summary  This panel provides a summary of thread lock, sort, and scan information for a selected report interval.
Navigation

For additional information about
• a particular thread, move the cursor to the thread information line and press F11 (Zoom).
• related topics, choose one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Report Interval
   The time of the thread summary report displayed.

Start   The start date and time of the interval currently displayed.

Report Filtered
   This field shows YES if thread filter values were used to create this display.
   Otherwise, NO is displayed.

End     The end time of the interval currently displayed.

End Time
   The end time of the DB2 thread execution.
   If this thread involves parallel processing or if it invokes autonomous procedures, one of the following identifiers is displayed after the elapsed time to provide more information about this thread:
   *
   This thread is a parallel task initiated on behalf of another (originating) thread to process a query request in parallel.
   A
   This thread is an autonomous procedure rollup record.
   D
   This thread is a RRSAF/DDF rollup record due to ZPARM ACCUMACC >= 2.
   O
   This thread is the originating thread that invokes autonomous procedures.
   P
   This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity that is performed for this (originating) thread is reflected under the parallel tasks.
   R
   This thread is a parallel task rollup record due to ZPARM PTASKROL = YES.

Plan     The DB2 plan name.

Authid   The DB2 authorization identifier of the threads.

Locks    The number of Internal Resource Lock Manager (IRLM) lock requests issued.

DLk/TOut The number of deadlocks and timeouts occurred.

Lock Waits
   The total number of waits because of lock or latch suspension. Accounting class 3 is required. Displays N/A if accounting class 3 data is not available.
Lock WaitTm
The time spent waiting as a result of lock or latch suspension. Accounting class 3 is required. Displays N/A if accounting class 3 data is not available.

TS Scan
The number of tablespace scans. Scan data required. Displays N/A if sort data is not available.

Sort
The number of sorts performed. Sort data required. Displays N/A if sort data is not available.

Recs Sorted
The total number of records sorted. Sort data required. Displays N/A if sort data is not available.

Thread History Times Summary
This panel provides time-based summary information of threads that completed within a report interval.

For additional information about
- a particular thread, move the cursor to the thread information line and press F11 (Zoom).
- related topics, choose one of the options at the top of the panel.
- other topics, use the PF keys.

Fields
Report Interval
The timespan (to the nearest minute) of the report.

Start
The start date and time of the interval currently displayed.

Report Filtered
This field shows YES if thread filter values were used to create this display. Otherwise, NO is displayed.

End
The end time of the interval currently displayed.
End Time
The end time of the DB2 thread execution.

If this thread involves parallel processing or if it invokes autonomous procedures, one of the following identifiers is displayed after the elapsed time to provide more information about this thread:

* This thread is a parallel task initiated on behalf of another (originating) thread to process a query request in parallel.
A This thread is an autonomous procedure rollup record.
D This thread is a RRSAF/DDF rollup record due to ZPARM ACCUMACC >= 2.
O This thread is the originating thread that invokes autonomous procedures.
P This thread is the parent or the originating thread of the parallel tasks that are created to process a query request in parallel. Activity that is performed for this (originating) thread is reflected under the parallel tasks.
R This thread is a parallel task rollup record due to ZPARM PTASKROL = YES.

Plan The DB2 plan name.

Authid The DB2 authorization identifier of the threads.

Elapsed Time The total elapsed time for the thread.

CPU Time The amount of CP time used by the thread. This value reflects MVS TCB time for non-database access threads and SRB time for database access threads and parallel tasks. This time represents CP time only and does not include SE (Specialty Engine) time.

In-DB2 Elap Tm The elapsed time spent in DB2. Accounting class 2 is required. Displays N/A if accounting class 2 data is not available.

In-DB2 CPU Tm The CPU time spent in DB2. Accounting class 2 is required. Displays N/A if accounting class 2 data not available.

SQL The total number of DCL, DDL, and DML SQL calls issued by the thread. COMMIT and ROLLBACK/ABORT are not included.

Getpag The number of Getpage requests issued.

Thread History Detail
This panel provides detail information about the activity of a completed thread or parallel task.

A parallel task is a subtask that is created from an originating thread to process a part of a query.

Chapter 5: Monitoring 1635
Navigation

For additional information about
• related topics, choose one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Attachment identifier:

Connection Type

The connection type is displayed in the first field:

APPLDIR Application directed access (data base access threads)

BATCH Other DB2 batch threads

CALLATCH DB2 call attach

CICS CICS attach

DLI DL/I batch

IMSBMP IMS attach BMP

IMSMPP IMS attach MPP

IMSCtrl IMS control region

IMSBMPB IMS transaction BMP

RRSAF Recoverable Resource Manager Services Attachment Facility

SYSDIR System directed access (data base access threads)

TSO TSO foreground and background
Utility Utility thread

**DB2** The DB2 subsystem identifier.

**MVS** The MVS system identifier.

**ORIGAUTH**
The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

**Time identifier:**

**Start** The start date and time of this thread execution.

**End** The end date and time of this thread execution.

**Distributed thread identifier:** The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

**Type** The distributed thread type.

**Distributed Allied**
A requesting thread; one that has issued an SQL call to a remote Db2 location.

**Database Access**
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

**Db2=** The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

**Luwid** This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E04B9D4=8

**System**
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

**Data fields:**

**Termination Status**
The status that indicates the reason for the thread termination:

- READS
- RESIGNON
- NEWUSER
- DDFINACT
- DEALLOC
- COMMIT
- EOT/TERM
- EOT/ABND
Commits
The number of Commits performed by the thread.

Total Elapsed Time
The total elapsed time for the thread, in the format hh:mm:ss.th.

Aborts
The number of aborts performed by the thread.

Total CP CPU Time
The total central processor CPU time accumulated for the thread. This value includes only MVS TCB time. SRB time is not included.

Parallel Tasks
The number of parallel tasks that are created on behalf of this thread. Any activity that is performed on behalf of this thread by parallel tasks is not included in this thread. For a parallel task rollup record, this value is the number of child threads that are included in this record.

OR

Accounting Intervals
For a DDF or RRSAF rollup record, this value is the number of accounting intervals that are included in the record for the corresponding end user.

OR

Autonomous Procs
For an autonomous procedure rollup record, this value is the number of autonomous procedures that are included in this record.

This applies to DB2 11 and higher.

ZIIP CPU Time
The accumulated CPU time that is consumed while running on an IBM ZIIP in all environments.

Parallel Agents
For all non-rollup records, this value is always 0.

For a parallel query rollup record, this value is the number of parallel child agents rolled into this record.

For an autonomous procedure rollup record, this value is always 0.

For a DDF/RRSAF rollup record, this value is the number of parallel query child agents that rolled into this record. These agents are not counted in QWACPCNT.
This applies to DB2 10 and higher.

**Autonomous Count**
For non-rollup records, this is the number of autonomous procedures that are completed.
For parallel query rollup records, this value is always 0.
For autonomous procedure rollup records, this value is always 0.
For DDF/RRSAF rollup records, this is the number of autonomous procedures that are completed. These procedures are not counted in QWACPCNT.
This applies to DB2 11 and higher.

**IIP CPU Time**
The total amount of zIIP in-DB2 CPU time that is accumulated for the thread.

**Total Stored Proc CPU**
The total CPU time (TCB time) spend processing SQL CALL statements in the DB2 stored procedures address space.

**WorkFile:**

**Workfile Max Blocks**
Maximum number of workfile blocks being used by this agent at any given point in time (traditional workfile use, DGTT and DGTT indexes). DB2 12 and later.

**Workfile Curr Blocks**
Current number of workfile blocks being used by this agent (traditional workfile use, DGTT and DGTT indexes). DB2 12 and later.

**In-DB2 times:** In-DB2 times require an Accounting trace class 2. If this trace is not active, N/A is displayed.

**Elapsed Time**
The elapsed time spent in DB2 for the thread, in the format hh:mm:ss.th.

**CP CPU Time**
The In-DB2 CPU time accumulated for the thread. This includes only TCB time. SRB time is not included.

**Stored Procedure CPU Time**
The CPU (TCB) time spent in DB2 processing SQL CALL statements issued from stored procedures for this thread.

**UDF CP CPU Time**
The accumulated In-DB2 central processor CPU time consumed executing user defined functions (UDFs) on the main application execution unit. This time does not include SE CPU time.
Because these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

**UDF IIP CPU Time**
The accumulated In-DB2 zIIP CPU time consumed executing user defined functions (UDFs) on the main application execution unit.
Because these UDFs run entirely within DB2, this time represents class 1 and class 2 time.
UDF Elapsed Time Main
The accumulated In-DB2 elapsed time consumed executing user-defined functions (UDFs) on the main application execution unit.

Because these UDFs run entirely within DB2, this time represents class 1 and class 2 time.

In-DB2 waits: Wait times require an Accounting trace class 2. If this DB2 trace is not active, N/A is displayed. For each of the following fields two values are provided:
• Time displays the total wait time that has elapsed
• Count displays the total number of waits.

Synchronous I/O Wait
Wait for synchronous I/O reads or writes.

Asynchronous Read I/O Wait
Wait for Read I/O performed under another thread (for example, list or Sequential Prefetch).

Asynchronous Write I/O Wait
Wait for Write I/O performed under another thread (for example, Deferred Writes).

Local Lock/Latch Wait
Wait for locks or latches.

Page Latch Wait
Wait for page latches.

Drain Lock Wait
Wait to acquire drain locks.

Drain of Claims Wait
Wait for claims to be released after acquiring drain lock.

Archive Log Mode(Quiesce) Wait
Wait for ARCHIVE LOG MODE(QUIESCE) command to complete.

Archive Read from Tape Wait
Waits for reads of archive log from tape.

Switch to Open/Close Wait
Waits for switches to the OPEN/CLOSE service.

Switch to SYSLGRNG Service Wait
Waits for switches to the SYSLGRNG recording service.

Switch to DMS Waits
Waits for switches to the database managed space (DMS).

Other Service Waits
Waits for switches to other DB2 service tasks.

Force at Commit Waits
Waits for force-at-commit DB2 service tasks.

Log Write I/O Wait
Waits due to Log write I/O

Sync EX Unit Sw-com/abort/dealloc
Waits due to synchronous execution switch for DB2 commit, abort, or deallocation processing.
LOB Materialization
Waits for TCP/IP LOB and XML materialization.

Latch Contention Wait
Waits due to page latch contention.

Autonomous PROC Wait (QWAC_AT_WAIT QWAC_AT_COUNT)
The amount of waits that are due to autonomous procedures.
This applies to DB2 11 and higher.

Parallel Query Sync Wait (QPAC_PQS_WAIT QPAC_PQS_COUNT)
The amount of waits after parallel query processing suspended waiting for parent/child to be synchronized.
This applies to DB2 11 and higher.

Asynch IXLCACHE/IXLFCOMP (QWAXIXLT)
The accumulated wait time for IXLCACHE and IXLFCOMP requests.

Fast Insert Pipe Wait
The accumulated wait time for a pipe wait. DB2 12 and later.

LOB Compression Wait
The accumulated wait time for LOB compression. DB2 12 and later.

Accelerator Wait (QWACAACW QPACAACC)
The accumulated wait time for requests to an accelerator. DB2 11 and later.

Total Class 3 Wait Time
The total class 3 wait time.

Thread History Lock Waits
This panel provides detailed information about lock waits that occurred for a thread.

Thread data must be collected by the Near-Term History Data Collector with the LOCKCONT(YES) or LOCKSUSP(YES) keywords. Otherwise, the panel displays a message that lock wait information is not available for a thread.
Navigation

For additional information about

• related topics, choose one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Attachment identifier:

Connection Type The connection type is displayed in the first field:

</tbody>
</table>
**Luwid**  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

\[ \text{luw-id}=\text{token} \]

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the *Luwid* field displays data like in the following example:

\[ \text{USCACO01.02D22A.A1FE6E04B9D4}=8 \]

**System**

The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

**Lock Contention (Timeout):** This section is displayed only when the thread execution ended due to a lock timeout and lock contention data was collected.

**Resource:**

The DB2 resource that was requested by the timed-out thread that was waiting for the resource.

The resource varies depending upon the type of lock requested. If it is possible, the DBid and the OBid of the resource are translated to the DBName and tablespace or to indexspace names.

Lock types such as DPAG, MDEL, TABL, or ROW might include a table record ID in the lock resource. The DBid and OBid of these resources cannot be translated. Therefore the values of the DBid and the OBid are displayed.

This field displays the following resources:

**Lock Type**

**Resource and Explanation**

**ALBP**  Alter buffer pool lock. BP=buffer pool ID

**BIND**  Autobind/remote bind lock.

**BMBA**  Buffer manager SCA MBA L-lock.

**BPPS**  Buffer manager pageset RR P-lock

- BP=buffer pool ID
- DB=database name
- PS=pageset name

**CCAT**  CATMAINT convert catalog lock.

**CDIR**  CATMAINT convert directory lock.

**CDRN**  Cursor Stability drain lock

- DB=database name
- PS=pageset name
- PT=partition

**CMIG**  CATMAINT migration lock.
COLL  Collection lock.
          COLL=collection ID

DBEX  Database exception LPL/GRECP lock.

DBXU  DB exception update lock.

DGTT  DGTT URID lock
          URID=unit of recovery ID

DPAG  Page lock in a tablespace
          • DB=database name
          • PS=pageset name
          • PG=page

DSET  Partitioned lock
          • DB=database name
          • PS=pageset name
          • PT=partition number

DTBS  Database lock.
          • DB=database name
          • PS=pageset name
          • PT=partition number

GRBP  Group buffer pool start/stop lock.
          BP=buffer pool ID

HASH  Hash anchor lock.
          • DB=database name
          • PS=pageset name
          • PG=page

IEOF  Index IEOF.
          • DB=database name
          • PS=pageset name
          • PT=partition

IPAG  Page lock in an indexspace
          • DB=database name
          • PS=pageset name
          • PG=page

MDEL  Mass delete lock.
          • DB=database name
          • PS=pageset name

PALK  • DB=database name
          • PS=pageset name
          • PT=partition

PBPC  Group Bp level castout P-lock.
PCDB  DDF CDB P-lock.
PDBD  PDBD P-lock.
PDSO  Pageset or dataset open lock
      • DB=database name
      • PS=pageset name
PITR  Index manager tree P-lock.
      • DB=database name
      • PS=pageset name
      • PT=partition
PPAG  Page P-lock.
PPSC  Pageset/partition level castout P-lock.
PPSP  Pageset/partition P-lock.
PRLF  RLF P-lock.
PSET  Pageset lock.
      • DB=database name
      • PS=pageset name
PSPI  Pageset piece lock.
      • DB=database name
      • PS=pageset name
RDRN  Repeatable read drain lock.
      • DB=dataset name
      • PS=pageset name
      • PT=partition
RSTR  SCA access for restart/redo lock.
      BMC-RSTP
ROW  Row lock.
SDBA  Start/stop lock on DBA table.
      • DB=dataset name
      • PS=pageset name
SKCT  Skeleton cursor table lock.
      PLAN=plan name
SKPT  Skeleton package table lock.
      TOKEN=(CONTOKEN) column from SYSIBM.SYSPACKAGE
SPRC  Sys Level PIT Recovery lock
      SYS_PITR
SREC  Log range lock.
      • DB=database name
      • TS=tablespace name
UIDA  Util I/O Damage Assessment
TABL  Table lock.
   • DBID=DBid
   • TABL=Tableid

UNDT  Resource ID (in hexadecimal).

UNKN  Lock without resource provided.
   • Resource does not exist.

UTEX  Utility exclusive execution lock
   • UTEXEC

UTID  Utility UID lock.
   • UID=utility id

UTOB  Utility Object Lock
   • DB=database name
   • PS=pageset name
   • PT=partition

UTSE  Utility serialization lock.
   • UTSERIAL

WDRN  Write drain lock.
   • DB=database name
   • PS=pageset name
   • PT=partition

Wait: This section provides information about the lock that ended due to timeout. This section includes the following information:

Lock Level
   The level or mode of the lock request. This information describes the level of resource access demanded by the lock request. Possible lock levels are:
   IS   Intent share
   IX   Intent exclusive
   NSU  Nonshared update
   S    Share
   SIX  Share intent exclusive
   U    Update
   UNS  Unprotected share
   X    Exclusive

Duration
   The duration of the requested lock. Possible duration categories are:

Allocation
   Lock is held until thread terminates or until plan is deallocated.
COMMIT
Lock is held until Commit is processed.

Commit+1
Lock is held until Commit is processed, unless Lock is needed to maintain the position of the cursor that was opened with the Hold attribute.

Free
Duration to free all locks.

Interest
Lock is held as long as DB2 has interest in the resource. This duration is used only for P-locks.

Manual
A lock of short duration that DB2 acquires to perform tasks such as authorization checking.

Manual+1
A lock of short duration that DB2 acquires to temporarily change from CS to RR during bind or DDL.

Plan
Lock is held until plan is deallocated.

Undetermined
Lock is held for undetermined duration.

IRLM Function
The type of request to the Internal Resource Lock Manager (IRLM). The possible request types are:

LOCK Lock request
UNLOCK Unlock request
CHANGE Change lock request

Request Type
The type of lock request. Possible types are:

Conditional Conditional lock request.
Unconditional Unconditional lock request.

Holder's Program Name
The plan name of the thread holding the resource. This might be an application plan name or a DB2 system plan name.

Holder's Call
Holder's package or DBRM name, which consists of the fields:
QW0172Q1
Program name
QW0172Q2
Package collection ID
QW0172Q3
Location name

Holder's Location
Holder's package or DBRM name, which consists of the fields:
Statement ID
The SQL statement identifier.

Statement Type
The SQL statement type.

Own
Lock ownership information. The following fields provide detailed information about the holders of incompatible locks on the resource that was requested by the timed-out thread.

Plan
The plan name of the lock owners.

Connid
The connection identifiers of the lock owners.

Corrid
The correlation identifier of the lock owners.

Luwid
The Logical Unit-of-Work identifier. This field is displayed only for database access threads (DBATs).

Lock Level
The level of the lock. (See possible lock levels listed for the *Wait:* section before).

Duration
The duration of the threads holding incompatible locks.

PWait
Priority waiter information. The following fields provide detailed information about any threads that were priority waiters for the resource during the lock request timeout.

Plan
The plan name of the priority waiter.

Connid
The connection identifiers of the priority waiter.

Corrid
The correlation identifier of the priority waiter.

Luwid
The logical unit-of-work identifier. This field is displayed only for database access threads (DBATs).

Lock Level
The level of the lock. For a list of lock levels, see the *Wait:* section above.

Duration
Indicates the duration of the requested lock. For a list of duration values, see the *Duration* section above.

Lock contention (deadlock): Deadlock information is displayed only when the thread ended due to a deadlock.

Time of Deadlock
The time that the locking deadlock occurred.

Deadlock Interval
The DB2 deadlock detection interval.
**Resource**
The DB2 resource that was requested by the deadlocked thread (see table above). The resource format varies depending upon the type of lock requested.

**Wait**
See Wait fields described under Timeout section above.

**Own**
See Own fields described under Timeout section above.

**DBMS Subsystem ID**
The database management subsystem identifier.

**Lock Suspension:** Lock suspension information is displayed only when lock suspension data was collected.

**Time**
The time that the lock was suspended.

**Resource**
The name of the resource for which the lock suspension occurred. The contents of this field depend on the Lock Type (see table above).

If the name of the resource is not available, N/A and the reason why the resource name is not available is displayed. One of the following reasons might be the cause:

- **Notify IRLM function**
  Anything to do with lock state, duration, etc. is invalid.

- **Query IRLM function**
  Anything to do with lock state, duration, etc. is invalid.

- **Change with non zero token**
  Change a non zero value indicates the lock to free. The values of resource and type are not valid.

- **Unlock with non zero token**
  Unlock a non zero value indicates the lock to free. The values of resource and type are not valid.

- **Lock with non zero token**
  Token should be zero on Lock.

**Reason for the suspend=XX**
Is displayed if none of the above reasons is found. See QW0044WS for possible XX values.

**Type**
The type of lock requested. This field determines the contents of the resource name (see table above).

**Lvl**
The level of the lock.

**Dur**
The duration of the requested lock. For a list of duration values, see the Wait section above.

**Elapsed**
The elapsed time (in seconds) for each suspended lock that was resumed.

**Resume**
The reason why the lock suspension was resumed. Possible reasons:

- **DEADLK**
  Deadlock

- **IDENT**
  Identify to IRLM
NORMAL
Normal resume

TIMOUT
Timeout

Thread History Lock/Claim/Drain Activity
This panel provides lock/claim/drain statistics such as the number of requests to acquire a lock and the number of pages that were locked for a thread.

<table>

Navigation
For additional information about
• related topics, choose one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Thread Identifier:

Plan  The DB2 plan name of the thread.

Connid  The DB2 connection identifier of the thread.

Corrid  The DB2 correlation identifier of the thread.

Authid  The DB2 authorization identifier of the thread.

Attachment identifier:

Connection Type  The connection type is displayed in the first field:

APPLDIR  Application directed access (data base access threads)
BATCH
  Other DB2 batch threads

CALLATCH
  DB2 call attach

CICS
  CICS attach

DLI
  DL/I batch

IMSBMP
  IMS attach BMP

IMSMPP
  IMS attach MPP

IMSCTRL
  IMS control region

IMSBMPB
  IMS transaction BMP

RRSAF
  Recoverable Resource Manager Services Attachment Facility

SYSDIR
  System directed access (data base access threads)

TSO
  TSO foreground and background

Utility
  Utility thread

DB2
  The DB2 subsystem identifier.

MVS
  The MVS system identifier.

ORIGAUTH
  The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Type
  The distributed thread type.

Distributed Allied
  A requesting thread; one that has issued an SQL call to a remote DB2 location.

Database Access
  A server thread; one that has received and is serving an SQL request from a remote DB2 location.

Luwid
  This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
  \texttt{luw-id=token}

  The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
  \texttt{USCACO01.O2D22A.A1FE8E0489D4=8}

Time identifier:
Start  The start date and time of this thread execution.

End    The end date and time of this thread execution.

Lock/Claim/Drain:

Lock Requests
Requests to Internal Resource Lock Manager (IRLM) to obtain a lock on a resource.

Deadlocks Detected
The number of deadlocks detected.

Unlock Requests
Requests to IRLM to unlock a resource.

Timeouts Detected
Occasions when suspension of a unit of work lasted longer than the IRLM timeout value.

Query Requests
Requests to IRLM to query a lock.

Change Requests
Requests to IRLM to change a lock.

Suspends - Latch Only
DB2 internal latch suspensions.

Other IRLM Requests
Requests to IRLM to perform a function other than those listed above.

Suspends - Other
Suspensions caused by something other than locks and latches.

Lock Escalations - to Shared
Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IS) lock to escalate to a shared (S) lock.

Lock Escalations - to Exclusive
Occasions when the allowable number of locks per tablespace was exceeded, causing a page (IX) lock to escalate to an exclusive (X) lock.

Maximum Page/Row Locks
The maximum number of page locks held concurrently during the thread's execution. This count cannot exceed the value of the NUMLKUS (locks per user) installation parameter.

Claim/Drain information:

Claim Requests
The number of requests for a claim on a resource.

Claims Failed
The number of unsuccessful claim requests.

Drain Requests
The number of requests for a drain of claims.

Drains Failed
The number of unsuccessful drain requests.

Thread History Global Lock Activity
This panel provides information about global locking activity for an individual thread.
Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan      The Db2 plan name of the active thread.

Connid    The Db2 connection identifier of the active thread.

Corrid    The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid    The Db2 authorization identifier of the active thread.

Attach    Depending on the type of connection, the appropriate information is displayed.

   Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Attachment identifier:

Connection Type
The connection type is displayed in the first field:

APPLDIR       Application directed access (data base access threads)

BATCH         Other DB2 batch threads

CALLATCH      DB2 call attach

CICS          CICS attach

DLI           DL/I batch
IMSBMP
IMS attach BMP

IMSMPP
IMS attach MPP

IMSCTRL
IMS control region

IMSBMPB
IMS transaction BMP

RRSAF
Recoverable Resource Manager Services Attachment Facility

SYSDIR
System directed access (data base access threads)

TSO
TSO foreground and background

Utility
Utility thread

DB2
The DB2 subsystem identifier.

MVS
The MVS system identifier.

ORIGAUTH
The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Time identifier:

Start
The start date and time of this thread execution.

End
The end date and time of this thread execution.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type
The distributed thread type.

Distributed Allied
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1F8E04B9D4=8

System
The originating Db2 job name and the resource manager that is the source
of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Global lock information:

**Thread History Dynamic SQL Calls**
This panel provides information about dynamic SQL calls that were issued by a completed thread.

You must specify the keyword **DYNAMICSQ(YES)** if thread data is collected; otherwise the panel displays a message that dynamic SQL information is not available for the thread.

For additional information about
• related topics, choose one of the options at the top of the panel.
• other topics, use the PF keys.

**Fields**

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan**  The Db2 plan name of the active thread.

**Connid**  The Db2 connection identifier of the active thread.

**Corrid**  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.
The Db2 authorization identifier of the active thread.

Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

The connection type is displayed in the first field:

- **APPLDIR**: Application directed access (data base access threads)
- **BATCH**: Other DB2 batch threads
- **CALLATCH**: DB2 call attach
- **CICS**: CICS attach
- **DLI**: DL/I batch
- **IMSBMP**: IMS attach BMP
- **IMSMPP**: IMS attach MPP
- **IMSCtrl**: IMS control region
- **IMSBMPB**: IMS transaction BMP
- **RRSAF**: Recoverable Resource Manager Services Attachment Facility
- **SYSDIR**: System directed access (data base access threads)
- **TSO**: TSO foreground and background
- **Utility**: Utility thread
- **DB2**: The DB2 subsystem identifier.
- **MVS**: The MVS system identifier.
- **ORIGAUTH**: The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

The start date and time of this thread execution.

The end date and time of this thread execution.

The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem:

- **Type**: The distributed thread type.
**Distributed Allied**
A requesting thread; one that has issued an SQL call to a remote Db2 location.

**Database Access**
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

**Db2=** The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

**Luwid** This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E04B9D4=8

**System**
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**Miniplan:**

**Select Call**
Specifies the next SQL statement that is displayed. Initially this panel displays the first SQL statement that was collected for the thread. Use these keywords to control the display:

FIRST First SQL statement encountered for the thread.

LAST Last SQL statement encountered for the thread.

NEXT Next SQL statement encountered for the thread.

PREV Previous statement encountered for the thread.

+nnnnn The nnnnn (1-99999) entry after the currently displayed SQL statement.

-nnnnn The nnnnn (1-99999) entry before the currently displayed SQL statement.

Snnnnn Statement number nnnnn.

**Plan #** The plan for a select block within the prepared SQL statement.

**Estimated Cost**
The cost factor for this SQL statement, generated by the DB2 Optimizer.

**Table** The name of the table that was accessed.

**Access Type**
The method by which the table was accessed. Possible values are:

Index Index was used to access table data.
Index (One-Fetch)
Index was used to determine which data page is needed for processing. This type of access is used for processing MIN and MAX functions.

Index (IN keyword)
Index was used to access table data for processing the IN keyword in SQL statements.

Index (Page Range)
Index was used to access table data in a particular page range.

Sequential Scan (Page Range)
All pages within a particular page range of the partitioned tablespace were accessed sequentially.

Sequential Scan
All pages in the tablespace (or table if the tablespace is segmented) were accessed sequentially.

Join Method
The type of join being performed. Possible values:
- Nested Loops
- Hybrid
- Merge Scan

Table Type
Indicates whether the table was the INNER or OUTER table for the join processing.

Prefetch Activity
The type of prefetch activity performed. If no prefetch was performed, this field is not displayed. Possible values are:
- Sequential
  Sequential Prefetch.
- List
  List Prefetch for one or more indexes.

Sort Activity
The reason for the sort. If no sort was performed, this field is not displayed. Possible values are:
- Uniq
  Sort to remove duplicate rows.
- Join
  Sort needed for join processing.
- Order
  Sort needed to satisfy Order By clause.
- Group
  Sort needed to satisfy Group By clause.
- Uniq(C)
  Sort to remove duplicate rows (composite table).
- Join(C)
  Sort needed for join processing (composite table).
- Order(C)
  Sort needed to satisfy Order By clause (composite table).
- Group(C)
  Sort needed to satisfy Group By clause (composite table).

Access Degree
The degree of parallelism used by the query. This is the number of parallel
I/O streams determined by the optimizer at PREPARE time. The actual number of I/O streams used at execution time can be different.

**Access Group ID**
The parallel group identifier used for accessing the new table. This is the identifier for a group of consecutive parallel operations. These parallel operations have the same number of I/O streams. The value is determined at PREPARE time and can be changed at execution time.

**Access Type**
The type of parallel processing to be used. Possible values are:

- **CPU**  CPU parallelism
- **I/O**  I/O parallelism

**Join Degree**
The degree of parallelism used in joining the composite table with the new table. This is the number of parallel I/O streams used for the join. The value is set at PREPARE time and can change at execution time.

**Join Group ID**
The value that is used to identify the parallel group when DB2 joins the composite table with the new table. This is determined at PREPARE time and could be different at execution time.

**Thread History SQL Counts**
This panel provides information about SQL calls that were issued by a completed thread. It also provides data definition and data manipulation statements.

With the information on this panel, you can obtain counts of the various SQL, RID pool, or Parallel activities of a completed thread. This helps you to determine the activities that use resources excessively. For example, a single SELECT command might result in many physical FETCHes.

### Navigation

For additional information about
- related topics, choose one of the options at the top of the panel.
- other topics, use the PF keys.

### Fields

**Thread identifier:**

**Plan** The DB2 plan name of the thread.

**Connid** The DB2 connection identifier of the thread.

**Corrid** The DB2 correlation identifier of the thread.

**Authid** The DB2 authorization identifier of the thread.

**Attachment identifier:**

**Connection Type** The connection type is displayed in the first field:

- **APPLDIR** Application directed access (data base access threads)
- **BATCH** Other DB2 batch threads
CALLATCH
   DB2 call attach
CICS    CICS attach
DLI     DL/I batch
IMSBMP  IMS attach BMP
IMSMPP  IMS attach MPP
IMSCtrl IMS control region
IMSBMPB IMS transaction BMP
RRSAF   Recoverable Resource Manager Services Attachment Facility
SYSDIR  System directed access (data base access threads)
TSO     TSO foreground and background
Utility Utility thread
DB2     The DB2 subsystem identifier.
MVS     The MVS system identifier.
ORIGAUTH The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Time identifier:
Start    The start date and time of this thread execution.
End      The end date and time of this thread execution.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.
Type     The distributed thread type.

Distributed Allied
   A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access
   A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=      The Db2 subsystem ID, indicating the member of the data sharing group of this thread.
Luwid     This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
   luw-id=token
The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCACO01.02D22A.A1FE8E0489D4=8

**System**

The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

**SQL counts fields:**

**Commit**

The number of times the thread successfully concluded Commit phase 2 processing.

**Abort**

A count of the number of times the thread has rolled back uncommitted data.

**Select**

The number of SELECT requests.

**Open Cursor**

The number of OPEN cursor statements issued by a thread.

**Close Cursor**

The number of CLOSE cursor statements issued by a thread.

**Fetch**

The number of FETCH requests.

**Insert**

The number of INSERT statements executed by the thread.

**Delete**

The number of DELETE statements issued by the thread.

**Update**

The number of UPDATE statements executed by the thread.

**Describe**

The number of DESCRIBE statements issued by the thread.

**Lock Table**

A count of the number of LOCK TABLE statements issued by the application (not the total number of tables locked by the thread).

**Prepare**

The number of PREPARE statements issued by a thread.

**Grant**

The total number of times SQL GRANT requests were issued from within the program.

**Revoke**

The total number of times SQL REVOKE requests were issued from within the program.

**Set Rules**

The number of SET CURRENT RULES statements executed by the thread.

**Increm Bind**

A count of the number of times the plan active in the thread was rebound. PREPARES are not included. This value should be zero in a production environment. The plan can be rebound with VALIDATE(BIND) to prevent incremental binds.

**Label/Comm On**

The number of LABEL ON and COMMENT ON statements issued by the thread.
Set SQLID
The number of SET SQLID requests issued by the thread.

Set Host Var
The number of SET host variable requests executed by the thread.

Set Connection
The number of SET CONNECTION statements executed by the thread.

Set Degree
The number of SET CURRENT DEGREE statements executed by the thread.

Connect Type 1
The number of CONNECT type 1 statements executed by the thread.

Connect Type 2
The number of CONNECT type 2 statements executed by the thread.

Set Path
The number of SET CURRENT PATH statements executed by the thread.

Rename table
The number of RENAME TABLE statements executed by the thread.

Hold Locator
The number of HOLD LOCATOR statements executed by the thread.

Free Locator
The number of FREE LOCATOR statements executed by the thread.

Release
The number of RELEASE statements executed by the thread.

Assoc Locator
The number of ASSOCIATE LOCATOR statements executed by the thread.

Alloc Cursor
The number of ALLOCATE CURSOR statements executed by the thread.

Merge
The number of MERGE statements executed by the thread.

Rename Index
The number of RENAME INDEX statements executed by the thread.

Truncate Table
The number of TRUNCATE TABLE statements executed by the thread.

Refresh Table
Number of refresh table statements. DB2 12 and later. (Field name: QXTREFTBL)

Transfer Owner
Number of transfer ownership statements. DB2 12 and later. (Field name: QXTRNOWN)

Creates, Drops, Alters:

Table The number of CREATE, DROP, or ALTER TABLE statements executed by the thread.

Index The number of CREATE, DROP, or ALTER INDEX statements executed by the thread.
Table Space
The number of CREATE, DROP, or ALTER TABLESPACE statements executed by the thread.

Data Base
The number of CREATE, DROP, or ALTER DATABASE statements executed by the thread.

Storage Group
The number of CREATE, DROP, or ALTER STOGROUP statements executed by the thread.

Synonym
The number of CREATE or DROP SYNONYM statements executed by the thread.

View
The number of CREATE or DROP VIEW statements executed by the thread.

Alias
The number of CREATE or DROP ALIAS statements executed by the thread.

Function
The number of CREATE, DROP, or ALTER FUNCTION statements executed by the thread.

Procedure
The number of CREATE, DROP, or ALTER PROCEDURE statements executed by the thread.

Sequence
The number of CREATE, DROP, or ALTER PROCEDURE statements executed by the thread.

Role
The number of CREATE, DROP, or ROLE statements executed by the thread.

Trusted CTX
The number of CREATE, DROP, or ALTER TRUSTED CONTENT statements executed by the thread.

Mask/Perm
The number of CREATE, DROP, or ALTER MASK/PERM statements executed by the thread.

Variable
The number of CREATE, or DROP Variable statements executed by the thread. DB2 11 and above.

Trigger
The number of CREATE or DROP DISTINCT TRIGGER statements executed by the thread.

Dist Type
The number of CREATE or DROP DISTINCT TYPE statements executed by the thread.

Aux Table
The number of CREATE AUXILIARY TABLE statements executed by the thread.

Package
The number of the DROP PACKAGE statements executed by the thread.
JAR  The number of ALTER JAR statements executed by the thread.

Glob Temp Tab  The number of CREATE GLOBAL TEMPORARY TABLE statements executed by the thread.

Declare GTT  The number of DECLARE GLOBAL TEMPORARY TABLE statements executed by the thread.

RID List:

Successful  The number of times RID list processing used. This field is incremented once for a given table access for Index Access with list prefetch and for Multiple Index Access.

To Workfile (No Storage)  The number of times a RID list was overflown to a work file because no RIDPOOL storage was available to hold the list of RIDs. DB2 10 and above.

Not Used (No Storage)  The number of times a RID list was not used for a given RID list process involving one index (Index Access with list prefetch) or involving multiple indexes (Multiple Index Access) because no storage was available to hold the list of RIDs.

To Workfile (Max Limit)  The number of times a RID list was overflown to a work file because the number of RIDs exceeded one or more internal limits. DB2 10 and above.

Not Used (Max Limit)  The number of times one or more RID lists were not used for a given RID list process involving one index (Index Access with list prefetch) or involving multiple indexes (Multiple Index Access) because the number of RIDs exceeded one or more internal limits.

Interrupted (No Storage)  The number of times a RID list append for a Hybrid Join was interrupted because no RIDPOOL storage was available to hold the list of RIDs (that is, number of times DB2 interrupted the RID phase and switched to the Data phase). DB2 10 and above.

Skipped (Index Known)  The number of times a RID list retrieval for multiple index access was skipped because it was not necessary due to DB2 being able to predetermine the outcome of index ANDing or ORing. DB2 10 and above.

Interrupted (Max Limit)  The number of times a RID list append for a Hybrid Join was interrupted because the number of RIDs exceeded one or more internal limits (that is, number of times DB2 interrupted the RID phase and switched to the Data phase). DB2 10 and above.

Skipped (Adaptive IX)  The number of times a DM is not called for RID list retrieval for multiple index access or LPF because it was not necessary due to Runtime Adaptive Index processing being able to predetermine the outcome. DB2 12 and later. (Field name: QXRSDMAD)
Query Parallelism fields:

**Max Degree (Planned)**
The planned maximum degree of parallelism for a parallel group. This value is the optimal degree of parallelism that can be obtained at execution time, after host variables or parameter markers are resolved, and before buffer pool negotiation and system negotiation are performed. DB2 11 and above.

**Parallel Group Degenerated**
Total number of parallel groups that changed to sequential mode during optimization, for reasons such as, the result of evaluation of a parallel group is that zero rows are returned, or a parallel group is partitioned on a single record. DB2 11 and above.

**Max Degree (Estimated)**
The estimated maximum degree of parallelism for a parallel group. This value is estimated at bind time, based on the cost formula. If a parallel group contains a host variable or parameter marker, the estimate is based on assumed values. DB2 11 and above.

**Reform Parallelism (Config Chg)**
The total number of parallel groups for which DB2 reformulated the parallel portion of the access path because the sysplex configuration was different from the sysplex configuration at bind time. This counter is only incremented by the parallelism coordinator at run time.

**Max Degree (Executed)**
Maximum degree of parallelism among the parallel groups to indicate the extent to which query parallelism applies.

**Reform Parallelism (No Buf)**
The total number of parallel groups for which DB2 reformulated the parallel portion of the access path because there was not enough buffer pool resource. This counter is only incremented by the parallelism coordinator at run time.

**Ran Planned**
The total number of parallel groups that have a planned degree greater than one at run time, and were executed to the same degree because of sufficient storage on the buffer pool.

**Total Parallel Groups**
The total number of parallel groups executed.

**Ran Reduced (Storage)**
The total number of parallel groups that have a planned degree greater than one at run time, but were processed to a parallel degree less than planned because of a storage shortage or contention on the buffer pool.

**Groups Intended**
The total number of parallel groups that were intended to run across the data sharing group. This count is only incremented on the parallelism coordinator at run time.

**Ran Reduced (Negot)**
The total number of parallel groups for which the degree of parallelism was reduced as a result of parallel system negotiation because system resources were constrained. DB2 11 and above.

**Members Skipped**
The number of times that the parallelism coordinator had to bypass a DB2 when distributing tasks because there was not enough buffer pool storage.
on one or more DB2 members. This field is incremented only on the 
parallelism coordinator, and it is only incremented once per parallel group, 
even though it is possible that more than one DB2 had a buffer pool 
shortage for that parallel group. The purpose of this count is to indicate 
when there are not enough buffers on a member. Therefore, this count is 
incremented only when the buffer pool is defined to allow parallelism. For 
example, if VPXPSEQT = 0 on an assistant, DB2 does not send parallel 
work there, but this count is not incremented.

Ran Seq (Cursor)
The total number of parallel groups which fell back to sequential mode 
because the cursor may be used in UPDATE/DELETE.

One DB2 (Coord=NO)
The total number of parallel groups executed on a single DB2 due to the 
COORDINATOR subsystem parameter being set to NO. When the 
statement was bound, the COORDINATOR subsystem parameter was set 
to YES. This situation can also occur when a plan or package is bound on 
one DB2 where COORDINATOR=YES but is run on a DB2 where 
COORDINATOR=NO.

Ran Seq (No Buffer)
The total number of parallel groups that have a planned degree greater 
than one at run time, but fell back to sequential mode because of storage 
shortage or contention on the buffer pool.

One DB2 (Isolation)
The total number of parallel groups executed on a single DB2 due to 
repeatable-read or read-stability isolation.

Ran Seq (No ESA Sort)
The total number of parallel groups that fell back to sequential operation 
because of a lack of ESA sort support.

One DB2 (DCL GTT)
The total number of parallel groups that are part of a query block using a 
UDF and executed on a single DB2 due to the existence of a Declared 
Temporary Table in the application process. Neither the query block nor 
the parallel group references a Declared Temporary Table, and a parallel 
group may or may not use a UDF.

Ran Seq (Autonomous)
The total number of parallel groups that changed to sequential mode 
because they were executing under an autonomous procedure. DB2 11 and 
above.

Ran Seq (Negotiate)
The total number of parallel groups that changed to sequential mode as a 
result of parallel system negotiation because system resources were 
constrained. DB2 11 and above.

Ran Seq (No ESA Enc)
The total number of parallel groups executed in sequential because Z/OS 
enclave services were unavailable. DB2 9 only.

Miscellaneous fields:
Maximum LOB Storage
The maximum storage used for LOB values, in Megabytes.
Maximum XML Storage
The maximum storage used for XML values.

Maximum Nested SQL
Maximum level of nested SQL cascading because of Triggers, User-Defined Functions, or Stored Procedures.

Array Expansions
The number of times an array variable was expanded to be larger than 32KB. DB2 11 and above.

Sparse IX (Disabled)
The number of times that sparse index was disabled because of insufficient storage. DB2 11 and above.

Sparse IX (Built WF)
The number of times that sparse index built a physical work file for probing. DB2 11 and above.

Fetched 1 Block Only (QXR1BOAD)
The number of times 1 block is fetched and there were no further fetches. DB2 12 and later.

Trigger fields:

Statement Trigger
Number of times a Statement Trigger is activated.

Row Trigger
Number of times a Row Trigger is activated.

SQL Errors
Number of times an SQL error occurred during execution of a triggered action.

Stored procedures:

Executed
The number of CALL statements executed by the thread.

Timed Out
The number of times an SQL CALL timed out waiting to be scheduled. No TCB was available in the stored procedures address space or the procedure was in the STOP ACTION(QUEUE) state.

Rejected
The number of times an SQL CALL was rejected because the procedure was in the STOP ACTION(REJECT) state.

Abended
The number of times a stored procedure terminated abnormally.

User-defined functions (UDF) fields:

Executed
The number of user-defined functions (UDFs) executed.

Abended
The number of times a UDF abended.

Timed Out
The number of times a UDF timed out when waiting to be scheduled.
Rejected
The number of times a UDF was rejected.

Prepare Statistics:

Prepares (Copy Found)
The number of times that DB2 satisfied a prepare request by making a copy of a statement in the Prepared Statement Cache.

Prepare (Copy Not Found)
The number of times that DB2 searched the Prepared Statement Cache but could not find a suitable prepared statement.

Prepares (Catalog Found)
The number of times a PREPARE request is satisfied by making a copy from the stabilized statement in SYSIBM.SYSDYNGRY catalog table. The stabilized statement search is done only when no matching statement is found in the prepared statement cache. DB2 12 and later. (Field name: QXSTSFND)

Prepare (Restrict IX)
The number of prepare statements for which the use of indexes was restricted because the indexes were in a pending state.

Literals (Parsed)
Number of times DB2 parsed dynamic statements because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

Literals (Replaced)
Number of times DB2 replaced at least one literal in a dynamic statement because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

Literals (Matched)
Number of times DB2 found a matching reusable copy of a dynamic statement in cache because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

Literals (Duplicated)
Number of times DB2 created a duplicate stmt instance in the statement cache because of CONCENTRATE STATEMENTS WITH LITERALS behaviour.

KeepDyn (Prepared)
The number of times that DB2 did an implicit prepare for a statement bound with KEEP_DYNAMIC(YES), because the Prepared Statement Cache did not contain a valid copy of the prepared statement.

KeepDyn (Avoided)
The number of times that DB2 did not prepare a statement bound with KEEP_DYNAMIC(YES), because the Prepared Statement Cache contained a valid copy of the prepared statement.

KeepDyn (Exceed Limit)
The number of times that DB2 discarded a prepared statement from the Prepared Statement Cache, because the number of prepared statements in the cache exceeded the value of subsystem parameter MAXKEEPD.

KeepDyn (Invalidated)
The number of times that DB2 discarded a prepared statement from the Prepared Statement Cache, because a program executed a DROP, ALTER, or REVOKE statement against a dependent object.
Direct Row Access fields:

Direct Access
The number of times that DB2 used Direct Row Access to locate a record.

Index Used
The number of times that DB2 attempted to use Direct Row Access but reverted to using an Index to locate a record.

TS Scan Used
The number of times that DB2 attempted to use Direct row Access but reverted to using a Table Space scan to locate a record.

Row Processing:

Rows Fetched
The number of rows fetched.

Rows Inserted
The number of rows inserted.

Rows Updated
The number of rows updated.

Rows Deleted
The number of rows deleted.

Thread History Buffer Pool Activity
This panel provides information about buffer pool activity for a completed thread.

| Thread identifier: This information identifies the thread to which the information in this panel applies. |
| Plan | The Db2 plan name of the active thread. |
| Connid | The Db2 connection identifier of the active thread. |
Corrid  The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid  The Db2 authorization identifier of the active thread.

Attach  Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Attachment identifier:

Connection Type
The connection type is displayed in the first field:

APPLDIR  Application directed access (data base access threads)

BATCH  Other DB2 batch threads

CALLATCH  DB2 call attach

CICS  CICS attach

DLI  DL/I batch

IMSBMP  IMS attach BMP

IMSMPP  IMS attach MPP

IMSCtrl  IMS control region

IMSBMPP  IMS transaction BMP

RRSAF  Recoverable Resource Manager Services Attachment Facility

SYSDIR  System directed access (data base access threads)

TSO  TSO foreground and background

Utility  Utility thread

DB2  The DB2 subsystem identifier.

MVS  The MVS system identifier.

ORIGAUTH  The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type  The distributed thread type.
Distributed Allied
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:
USCAC001.02022A.A1FE8E046894=8

System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Time identifier:
Start The start date and time of this thread execution.
End The end date and time of this thread execution.

Buffer pool:
Getpage Requests
The number of thread Getpage requests. This value includes conditional, unconditional, successful, and unsuccessful requests. A Getpage request might not actually result in physical I/O if the requested page is in the buffer pool.

Failed Getpage Requests
The number of times a conditional Getpage request could not be satisfied. A conditional Getpage will not wait for a page that is not currently in the buffer pool. A conditional Getpage is used with parallel I/O processing only.

Synchronous Read I/O
The number of synchronous Read I/O requests issued by the thread.

Getpage/Read I/O
The ratio of Getpage requests to the number of synchronous Read I/O requests. This value does not include Prefetch requests.

Page Updates
The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2's internal Deferred Write algorithm, not
immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Seq Prefetch Requests**
The number of Sequential Prefetch requests issued by the thread. Sequential Prefetch Read I/O is performed asynchronously to the user’s request.

**List Prefetch Requests**
The number of List Prefetch requests issued by the thread.

**Dynamic Prefetch Requests**
The number of Dynamic Prefetch requests issued by the thread.

**Prefetch Pages Read**
The number of pages read asynchronously for Prefetch.

**Immediate Writes**
The number of immediate (synchronous) Write I/O requests issued for a thread.

**BP Hit Percentage**
The percentage of Getpage requests for which the data was already in the buffer pool.

**Thread History Resource Limit Statistics**
This panel provides information about resource limits for a completed thread, such as the highest CPU time used by a thread and the number of times each thread exceeded the maximum CPU time limit.

---

**Navigation**
For additional information about

- related topics, choose one of the options at the top of the panel.
- other topics, use the PF keys.
Fields

Thread identifier:

Plan    The DB2 plan name of the thread.
Connid  The DB2 connection identifier of the thread.
Corrid  The DB2 correlation identifier of the thread.
Authid  The DB2 authorization identifier of the thread.

Attachment identifier:

Connection Type
The connection type is displayed in the first field:

- APPLDIR   Application directed access (database access threads)
- BATCH     Other DB2 batch threads
- CALLATCH  DB2 call attach
- CICS       CICS attach
- DLI        DL/I batch
- IMSBMP     IMS attach BMP
- IMSMPP     IMS attach MPP
- IMSCTRL    IMS control region
- IMSBMPB    IMS transaction BMP
- RRSAF      Recoverable Resource Manager Services Attachment Facility
- SYSDIR     System directed access (database access threads)
- TSO        TSO foreground and background
- Utility    Utility thread
- DB2        The DB2 subsystem identifier.
- MVS        The MVS system identifier.
- ORIGAUTH   The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Type    The distributed thread type.
Distributed Allied
A requesting thread; one that has issued an SQL call to a remote DB2 location.

Database Access
A server thread; one that has received and is serving an SQL request from a remote DB2 location.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
USCAC001.02022A.A1FE8E04B9D4=8

Time identifier:
Start The start date and time of this thread execution.
End The end date and time of this thread execution.

Resource limit:

Resource Limit Table Name in Use
The resource limit specification table used by the DB2 subsystem.

Resource Limit Origin
The origin of the resource limit in effect for this thread, if resource limiting was active.

Resource Limit in Effect (SUs)
The resource limit in MVS service units for the thread.

Resource Limit CPU Time Per SU
The number of CPU seconds per service unit. This is the ratio of the limit in CPU seconds to the limit in service units.

Resource Limit In Effect (CPU secs)
The resource limit in effect in CPU seconds.

Resource Limit High Water Mark (CPU)
The highest CPU time used for dynamic request since the thread was created.

Ratio of HWM to Resource Limit (CPU)
The ratio (in percent) of the high-water mark (HWM) to the CPU resource limit in effect.

Thread History Distributed Activity
This panel displays distributed SQL statistics for each remote DB2 location with which the thread has communicated either as a requestor or server.
Navigation

RRSAF Recoverable Resource Manager Services Attachment Facility

SYSDIR System directed access (data base access threads)

TSO TSO foreground and background

Utility Utility thread

DB2 The DB2 subsystem identifier.

MVS The MVS system identifier.

ORIGAUTH The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Type The distributed thread type.
**Distributed Allied**  
A requesting thread; one that has issued an SQL call to a remote DB2 location.

**Database Access**  
A server thread; one that has received and is serving an SQL request from a remote DB2 location.

**Luwid**  
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:  
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the **Luwid** field displays data such as the following:  
USCAC001.02D22A.A1FE8E04B9D4=8

**Time identifier:**

**Start**  
The start date and time of this thread execution.

**End**  
The end date and time of this thread execution.

**Distributed TCP/IP Data:** If no TCP/IP data is available, N/A is displayed.

**Workstation Name**  
The end user’s workstation name.

**Transaction Name**  
The transaction or application name that the end user is running.

**TCP/IP Userid**  
The end user’s user ID.

**Distributed SQL Statistics:**

**Remote Location Name**  
The name of the remote location with which the local DB2 communicated. The statistics in this panel pertain to the remote location.

**Remote Product ID**  
The product identifier of the DB2 remote location. The format is:  
PPPVVRRR where PPP is the product identifier, VV is the version number, RR is the release number, and M is the modification level.

**Protocol Used**  
The distributed protocol used to communicate with the remote server. Possible values are APPLICATION for application directed access or SYSTEM for system directed access.

This field is blank if you are monitoring a database access thread.

**Conversations Queued**  
The number of conversations that were queued by DDF.

**Conv Deallocated**  
The number of conversations deallocated.

**Dist Local Elapsed**  
The time spent waiting for a response to a remote SQL request (includes remote DB2 processing time, VTAM processing time, and network time). This field is displayed only for distributed allied threads.
SQL Sent/Recv
The number of SQL calls sent to the location and number of SQL calls received from the location.

Row Sent/Recv
The number of rows sent to the location and number of rows received from the location.

Message Sent/Recv
The number of VTAM messages sent to the location and number of VTAM messages received from the location.

Byte Sent/Recv
The number of bytes sent to the location and number of bytes received from the location.

Commit Sent/Recv
The number of Commits sent to the location and number of commits received from the location.

Abort Sent/Recv
The number of aborts sent to the location and number of aborts received from the location.

Conv Sent/Recv
The number of conversations initiated from this location to the remote location and the number of conversations initiated from the remote location to this location.

Blocks Sent/Recv
The number of blocks sent to the location and number of blocks received from the location if using block mode.

The following field values are displayed only for 2-PHASE COMMIT:

Prepare Sent/Recv
The number of Prepare requests sent to the participant and number of requests received from the coordinator.

Last Agent Sent/Recv
The number of last agent requests sent to the coordinator and number of requests received from the initiator.

Commit Sent/Recv
The number of committed requests sent to the participant and number of requests received from the initiator.

Backout Sent/Recv
The number of backout requests sent to the participant and number of requests received from the coordinator.

Forget Sent/Recv
The number of forget requests sent to the participant and number of requests received from the coordinator.

Commit Resp Sent/Recv
The number of commit responses sent to the participant and number of requests received from the coordinator.

Backout Resp Sent/Recv
The number of backout responses sent to the participant and number of requests received from the coordinator.
Thread History Package Summary
This panel provides a list of programs (DMRMs or packages) that were executed by a completed thread.

Accounting classes 7 or 8 are required to display package information.

Fields

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

Attachment identifier:

Connection Type
The connection type is displayed in the first field:

APPLDIR Application directed access (data base access threads)

BATCH Other DB2 batch threads

CALLATCH DB2 call attach
CICS  CICS attach
DLI   DL/I batch
IMSBMP  IMS attach BMP
IMSMPP  IMS attach MPP
IMSCtrl   IMS control region
IMSBMPB  IMS transaction BMP
RRSAF   Recoverable Resource Manager Services Attachment Facility
SYSDIR  System directed access (data base access threads)
TSO    TSO foreground and background
Utility Utility thread
DB2    The DB2 subsystem identifier.
MVS    The MVS system identifier.
ORIGAUTH  The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Time identifier:
Start   The start date and time of this thread execution.
End     The end date and time of this thread execution.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.
Type    The distributed thread type.
Distributed Allied  A requesting thread; one that has issued an SQL call to a remote Db2 location.
Database Access  A responding thread; one that is serving a remote Db2 location by responding to an SQL call.
Db2=    The Db2 subsystem ID, indicating the member of the data sharing group of this thread.
Luwid   This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:
USCAC001.02022A.A1FE8E04B9D4=8
System
The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the **Attach** line identifies the user thread, if any, being served by the system thread.

Package summary:

**Package/DBRM**
The name of the program for which data is reported. Up to 18 characters of the package name are returned. An asterisk (*) is displayed after the program name of the last executed program.

**SQL Requests**
The number of SQL statements issued in this package or DBRM.

**Total Elapsed Time**
The total DB2 time that has elapsed while executing in this package or DBRM.

**Total CPU Time**
The total DB2 CPU time used while executing in this package or DBRM.

**Waits**
The total number of times that the thread had to wait for a class 8 event to complete while executing in this package or DBRM.

**Total Wait Time**
The total time spent waiting for a class 8 event to complete while executing in this package or DBRM.

**Thread History Package Detail**
This panel provides detailed Accounting information on a program (package or DBRM) that has been executed by this thread.

It provides information collected for Accounting trace classes 7 and 8. If these traces are not active, this information is not available.

DB2 accounting trace classes 7 and 8 must be started before the plan begins execution, or package information is not displayed:

- If only class 7 was started, the In-DB2 Times fields display data, and N/A is displayed for the Waits and Count fields.
- If only class 8 was started, the Waits and Count fields display data, and N/A is displayed for In-DB2 Times fields.
### Fields

**Thread identifier:** This information identifies the thread to which the information in this panel applies.

**Plan**  
The Db2 plan name of the active thread.

**Connid**  
The Db2 connection identifier of the active thread.

**Corrid**  
The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

**Authid**  
The Db2 authorization identifier of the active thread.

**Attach**  
Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).

**Attachment identifier:**

**Connection Type**  
The connection type is displayed in the first field:

SYSDIR
System directed access (data base access threads)

TSO
TSO foreground and background

Utility
Utility thread

DB2
The DB2 subsystem identifier.

MVS
The MVS system identifier.

ORIGAUTH
The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Time identifier:
Start
The start date and time of this thread execution.

End
The end date and time of this thread execution.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

Type
The distributed thread type.

Distributed Allied
A requesting thread; one that has issued an SQL call to a remote Db2 location.

Database Access
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.

Db2=
The Db2 subsystem ID, indicating the member of the data sharing group of this thread.
Luwid  This value consists of two parts: the logical unit of work ID (luw-id) and a
token. The token can be used in place of the luw-id in any Db2 command
that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME,
and a unique identifier (separated by periods). Thus, the Luwid field
displays data like in the following example:
USCAC001.02D22A.A1FE8E04B9D4=8

System
The originating Db2 job name and the resource manager that is the source
of the thread. An additional line below the Attach line identifies the user
thread, if any, being served by the system thread.

Package information:

Program
The program name for which data is reported. Up to 18 characters of the
package name are returned.

Type
The program type can be:
• PACKAGE
• DBRM
• PACKAGE-STORPROC, which means that the program is a package that
was loaded by a stored procedure.

Location
The name of the location where the package is executed. For remote
packages, times displayed represent the time spent locally to execute the
remote package.

Token
The consistency token.

Collection
The package collection ID. This field is displayed only if the program type
is PACKAGE.

SQL Request Count
The number of SQL statements issued. All DCL, DDL, and DML SQL
statements as well as some Statistic Counters from DSNDQXST are
included. COMMIT and ROLLBACK/ABORT are not included.

In-DB2 Times: In-DB2 times require an Accounting trace class 7. If this trace is not
active, N/A is displayed.

In-DB2 elapsed time
The elapsed time while processing this package or DBRM:

Total  The total time the thread spends processing this package or DBRM.

Current  The total time spent processing the currently active SQL statement.

In-DB2 CPU time
The CPU time spent processing this package or DBRM.

Total  The total time the thread spends processing this package or DBRM.

Current  The total time spent processing the currently active SQL statement.
Waits: Wait times require an Accounting trace class 8. If this trace is not active, N/A is displayed. The following Statistics information is provided for each field described below:

Count  The total number of waits.
Total   The total wait time.

Synchronous I/O Wait
Waits for synchronous I/O reads or writes.

Asynchronous Read I/O Wait
Waits for Read I/O performed under another thread (prefetch).

Asynchronous Write I/O Wait
Waits for Write I/O performed under another thread (deferred writes).

Local Lock/Latch Wait
Waits for locks or latches.

Page Latch Wait
Waits for page latch.

Drain Lock Wait
Waits to acquire DRAIN lock.

Drain of Claims Wait
Waits for claimers to be released after acquiring DRAIN lock.

DB2 Service Task Wait
Waits for DB2 services. The following types of DB2 services are included:
- Open/close of data set
- DFHSM recall of a data set
- SYSLGRNG update
- Define/extend/delete of data set
- Commit phase 2 for read only threads.

Starting from DB2 11, waits that are associated with autonomous procedures are also included.

Archive Log Mode(Quiesce) Wait
Waits for MODE(QUIESCE) command to complete.

Archive Read from Tape Wait
Waits for read of archive log from tape.

Parallel Query Sync Wait (QPAC_PQS_WAIT QPAC_PQS_COUNT)
The amount of waits after parallel query processing suspended waiting for parent/child to be synchronized.

This applies to DB2 11 and higher.

LOB Materialization Wait (QPACALBW QPACALBC)
Waits for TCP/IP LOB and XML materialization.

Accelerator Wait (QWACAAACW QPACAACC)
The accumulated wait time for requests to an accelerator. DB2 11 and later.

Pipe Wait (QOAC_PIPE_WAIT QPAC_PIPEWAIT_COUNT)
The accumulated wait time for a pipe while this package is being executed. DB2 12 and later.

Total Class 3 Wait Time
The total class 3 wait time.
Thread History Sort and Scan Activity

This panel displays sort and scan statistics, such as the number of sorts, the sort elapsed time, and the number of pages scanned by a completed thread.

You must specify SCAN(YES) or SORT(YES) when collecting thread data.

<table>
<thead>
<tr>

</table>

**Navigation**

For additional information about

- related topics, choose one of the options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**Thread identifier:**

**Plan** The DB2 plan name of the thread.

**Connid** The DB2 connection identifier of the thread.

**Corrid** The DB2 correlation identifier of the thread.

**Authid** The DB2 authorization identifier of the thread.

**Attachment identifier:**

**Connection Type**

The connection type is displayed in the first field:
APPLDIR
Application directed access (data base access threads)

BATCH
Other DB2 batch threads

CALLATCH
DB2 call attach

CICS
CICS attach

DLI
DL/I batch

IMSBMP
IMS attach BMP

IMSMPP
IMS attach MPP

IMSCtrl
IMS control region

IMSBMPB
IMS transaction BMP

RRSAF
Recoverable Resource Manager Services Attachment Facility

SYSDIR
System directed access (data base access threads)

TSO
TSO foreground and background

Utility
Utility thread

DB2
The DB2 subsystem identifier.

MVS
The MVS system identifier.

ORIGAUTH
The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Type
The distributed thread type.

Distributed Allied
A requesting thread; one that has issued an SQL call to a remote DB2 location.

Database Access
A server thread; one that has received and is serving an SQL request from a remote DB2 location.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format: luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:

USCAC001.02D22A.A1FE8E0489D4=8
Time identifier:

Start  The start date and time of this thread execution.
End   The end date and time of this thread execution.

Sort statistics:

Number of Sorts
The total number of sorts performed for this thread.

Records Sorted
The total number of records sorted for this thread.

Sort Elapsed Time
The total time spent performing sort processing.

Sort CPU Time
The total CPU time spent performing sort processing.

Number of Work Files
The number of logical work files used during sort processing. This is a
high-water mark.

Work File Inserts
The number of records inserted into a work file during sort processing.

Work File Reads
The number of records retrieved from a work file during sort processing.

Scan statistics:

Rows Deleted - RI
The number of rows that were deleted or set to null to enforce referential
integrity constraints.

Pages Scanned - RI
The number of pages that were scanned to enforce referential integrity
constraints.

Type  The type of scan information displayed. Possible types:
INDEX
   Index scan
DATA  Data row scan
WORK
   Work file scan

Count  The number of times this thread generated a scan.

Rows Processed
The number of rows processed by the Data Manager.

Rows Updated
The number of rows updated by the Data Manager.

Rows Inserted
The number of rows inserted by the Data Manager.

Rows Deleted
The number of rows deleted by the Data Manager.

Pages Scanned
The number of pages scanned by the Data Manager.
Thread History Group Buffer Pool Activity

This panel provides a summary of group buffer pool usage for an individual thread.

Thread identifier: This information identifies the thread to which the information in this panel applies.

Plan The Db2 plan name of the active thread.

Connid The Db2 connection identifier of the active thread.

Corrid The Db2 correlation identifier of the active thread. If the correlation is not set, N/A is displayed.

Authid The Db2 authorization identifier of the active thread.

Attach Depending on the type of connection, the appropriate information is displayed.

Attach information is displayed only if the thread is a distributed allied thread (not for distributed database access threads).
Attachment identifier:

Connection Type
The connection type is displayed in the first field:

**APPLDIR**
Application directed access (data base access threads)

**BATCH**
Other DB2 batch threads

**CALLATCH**
DB2 call attach

**CICS**
CICS attach

**DLI**
DL/I batch

**IMSBMP**
IMS attach BMP

**IMSMPP**
IMS attach MPP

**IMSCtrl**
IMS control region

**IMSBMPB**
IMS transaction BMP

**RRSAF**
Recoverable Resource Manager Services Attachment Facility

**SYSDIR**
System directed access (data base access threads)

**TSO**
TSO foreground and background

**Utility**
Utility thread

**DB2**
The DB2 subsystem identifier.

**MVS**
The MVS system identifier.

**ORIGAUTH**
The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Time identifier:

**Start**
The start date and time of this thread execution.

**End**
The end date and time of this thread execution.

Distributed thread identifier: The following fields are displayed if the thread has a distributed relationship with a remote Db2 subsystem.

**Type**
The distributed thread type.

**Distributed Allied**
A requesting thread; one that has issued an SQL call to a remote Db2 location.

**Database Access**
A responding thread; one that is serving a remote Db2 location by responding to an SQL call.
Db2= The Db2 subsystem ID, indicating the member of the data sharing group of this thread.

Luwid This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any Db2 command that accepts luw-id as input. Format:

luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data like in the following example:

USCAC001.02D22A.A1FE8E0489D4=8

System The originating Db2 job name and the resource manager that is the source of the thread. An additional line below the Attach line identifies the user thread, if any, being served by the system thread.

Group buffer pool information:

Group Buffer Pool The group buffer pool ID.

Reads - Cross Invalidation: Data Returned The number of reads to the group buffer pool required because the page in the member's buffer pool was invalidated where the data was found and returned to the member.

Reads - Page Not Found: Data Returned The number of reads to the group buffer pool required because the page was not in the member's buffer pool where the data was found and returned to the member.

Reads - Cross Invalidation: Data not in GBP-R/W Int The number of reads to the group buffer pool required because the page in the member's buffer pool was invalidated, where:

- The data was not found in the group buffer pool and the member had to go to DASD to read the page
- Other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

Reads - Page Not Found: Data not in GBP-R/W Int The number of reads to the group buffer pool required because the page was not in the member’s buffer pool, where:

- The data was not found in the group buffer pool and the member had to go to DASD to read the page
- Other members had read/write interest in the pageset, so DB2 created a directory entry for this page if it did not already exist.

Reads - Cross Invalidation: Data not in GBP-No R/W Int The number of reads to the group buffer pool required because the page in the member's buffer pool was invalidated, where:

- The data was not found in the group buffer pool and the member had to go to DASD to read the page
- No other member had read/write interest in the pageset, so DB2 did not have to register the page, since another member cannot cause a cross-invalidation by updating a page.
Reads - Page Not Found: Data not in GBP-No R/W Int
The number of reads to the group buffer pool required because the page
was not in the member's buffer pool, where:

- The data was not found in the group buffer pool and the member had to
go to DASD to read the page
- No other member had read/write interest in the pageset, so DB2 did not
have to register the page, since another member cannot cause a
cross-invalidation by updating a page.

Read Hit Percentage
The percentage of all Reads to the group buffer pool for which the needed
data was found and returned to the member.

Read-to-Write Percentage
The ratio of reads to writes expressed as a percentage for the group buffer
pool.

Changed Pages Written
The number of changed pages written to the group buffer pool. Pages can
be forced out before the application commits if a buffer pool threshold is
reached, or when P-lock negotiation forces the pages on the vertical
Deferred Write queue to be written to the group buffer pool.

Clean Pages Written
The number of clean pages written to the group buffer pool. DB2 writes
clean pages for pagesets and partitions defined with GBPCACHE ALL.

Thread History Parallel Task Summary
This panel provides information about the activity of parallel tasks that executed
on behalf of a thread.

Parallel tasks are created when CPU parallelism is selected as the method for
processing an SQL query. Internally, parallel tasks are displayed as DB2 system
threads. The first line of information identifies the thread. The second line
identifies the thread's connection type and related information. The remaining lines
display summary accounting information for each parallel task.
Navigation

For more information about one of the following items, perform the corresponding task below:

• a particular parallel task, move the cursor to the task information line and press F11 (Zoom). The “Thread Detail” on page 923 panel is displayed (for that parallel task).
• exceptions that have tripped, type E.A on the top line of the panel.
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields

Thread identifier:

Plan  The DB2 plan name of the thread.

Connid  The DB2 connection identifier of the thread.

Corrid  The DB2 correlation identifier of the thread.

Authid  The DB2 authorization identifier of the thread.

Attachment identifier:

Connection Type

The connection type is displayed in the first field:

APPLDIR  Application directed access (data base access threads)

BATCH  Other DB2 batch threads

CALLATCH  DB2 call attach

CICS  CICS attach

DLI  DL/I batch

IMSBMP  IMS attach BMP

IMSMPP  IMS attach MPP

IMSCCTRL  IMS control region

IMSBMPB  IMS transaction BMP

RRSAF  Recoverable Resource Manager Services Attachment Facility

SYSDIR  System directed access (data base access threads)

TSO  TSO foreground and background

Utility  Utility thread
DB2  The DB2 subsystem identifier.
MVS  The MVS system identifier.

ORIGAUTH
The original (primary) DB2 authorization identifier of the thread. This field displays only when the original identifier is different from the Authid.

Distributed thread identifier: The following fields are displayed when the thread has a distributed relationship with a remote DB2 subsystem.

Type  The distributed thread type.

Distributed Allied
A requesting thread; one that has issued an SQL call to a remote DB2 location.

Database Access
A server thread; one that has received and is serving an SQL request from a remote DB2 location.

Luwid
This value consists of two parts: the logical unit of work ID (luw-id) and a token. The token can be used in place of the luw-id in any DB2 command that accepts luw-id as input. Format:
luw-id=token

The luw-id consists of the network name, the originating VTAM LUNAME, and a unique identifier (separated by periods). Thus, the Luwid field displays data such as the following:
USCAC001.O2D22A.A1FE8E04B9D4=8

Time Identifier task information:
Start  The start date and time of this thread execution.
End   The end date and time of this thread execution.

Parallel task information:
Start Time
The time the parallel task was created.
End Time
The time the parallel task ended.
CPU Time
The CPU time for the parallel task.

Getpage
The number of requests for pages.

Getpage requests are logical Read requests that might not actually result in physical I/O if the requested page is currently in the buffer pool. DB2 resets this count at create thread and signon.

Read I/O
The number of synchronous Read I/O operations.

Pfetch
The number of Sequential, List, and Dynamic Prefetch requests.

Waits
The number of waits in DB2. Accounting class 3 is required. N/A is displayed if the data is not available.
Wait Time
The time spent waiting in DB2. Accounting class 3 is required. N/A is displayed if the data not available.

Near-Term History Data Collection Options
This panel shows the specifications for the currently active Near-Term History Data Collector.

For example, you can see which DB2 subsystem is being monitored, which DB2 traces are turned on, and where the data is being stored. The values shown in this panel are determined by the content of the collection options data set member RKD2PAR(COPTcccc), where cccc specifies the DB2 subsystem being monitored. The values are set by means of the Configuration Tool and are applied when the Near-Term History Data Collector is started. More information about the content of the RKD2PAR(COPTcccc) member is described in Configuration and Customization.

Navigation
For additional information about
• related topics, select one of the options at the top of the panel.
• other topics, use the PF keys.

Fields
DB2sys
The identifier (1 to 4 characters) of the DB2 subsystem that is being monitored by the Near-Term History Data Collector.

Writeoption
The specified storage medium for trace data. Possible values are:
VSAM
The Near-Term History Data Collector stores the trace data in VSAM data sets.

VSAM,SEQ
The Near-Term History Data Collector stores the trace data in VSAM data sets and sequential data sets. Sequential data sets are either regular sequential data sets or Generation Data Group (GDG) data sets. This specification is made by means of the Configuration Tool.

Interval
The time interval for data collection.

ArchiveSEQ
If sequential data sets were specified as storage medium for trace data (WRITEOPTION(VSAM,SEQ) keyword in collection options member RKD2PAR(COPTcccc)), this entry displays the name of the data set member RKD2PAR(ARCScccc) that contains the JCL to archive the sequential data sets. cccc specifies the DB2 subsystem being monitored.

Tracebufsz
The size of the buffer on the START TRACE command.

Ifireadtime
The frequency of IFI reads on lightly loaded DB2s. The value is mmsshh, where mm stands for minutes, ss for seconds, and hh for 1/100s of a second.

Suspcoll
Flag indicating whether the data collection is to be suspended at times the VSAM data set is not available.

A near-term history VSAM data set is considered to be unavailable from the time all allocated file space is used until the end of a successful execution of the archive job.

Yes The Near-Term History Data Collector is requested to discard all collected data in memory until a VSAM data set becomes available gain for use.

No The Near-Term History Data Collector is requested to accumulate all collected data in memory until a VSAM data set becomes available gain for use.

PostPCT
A percentage value that determines when the Near-Term History Data Collector drains its IFI buffer on behalf of DB2.

Use this information to tune the Near-Term History Data Collector, if you often see the DB2 message DSNW133I. This value is used to compute a "high water mark" or threshold, which is a percentage of the total number of bytes in the IFI buffer. When this threshold is exceeded, DB2 posts the Near-Term History Data Collector to drain the buffer.

NTAInterval
Displays the Near-Term History sub-interval time. This value may be specified as minutes or seconds. This value is used to provide a secondary display of thread accounting data from a smaller period of time.

Sub-Interval periods may be displayed by entering F next to an interval of time on the THREAD HISTORY BY REPORT INTERVAL screen.
Statistics
Indicates whether a Statistics trace is active.

Accounting
Displays the number of each accounting trace class that is turned on.
Accounting class 11 is available from DB2 11 and later. When class 11 is on, class 1, 7, 8, and 10 are suppressed.

Sort summary
Indicates whether sort processing is active.

Lock contention
Indicates whether lock timeout and deadlock information is being collected.

Scan summary
Indicates whether scan processing is active.

Lock suspension
Indicates whether lock wait information is being collected.

Dynamic SQL
Indicates whether SQL text and access path information for dynamic SQL is being collected.

Negative SQL
Indicates whether information about SQL statements returning negative SQLCODE is being collected.

This entry is only shown if Negative SQL is specified in the Near-Term History configuration.

H2 Data Sets
The fully qualified names of the data sets that hold the trace data. The list of names varies depending on what media were specified with the Configuration Tool.

Filtering
Displays the specified filtering values. An asterisk (*) at the end of the filtering value means that all collected data begins with the characters that precede the asterisk. A question mark (?) at any position in the filtering value serves as a wildcard for a single character.

Near-Term History Data Record Information
This panel shows the type and number of records that have been collected and stored since the Near-Term History Data Collector was started. It also displays the timestamp of the first and last records of each type.
### Navigation

For additional information about

- related topics, select one of the options at the top of the panel.
- other topics, use the PF keys.

### Fields

#### Record Type

The type of record reported on this line. Possible values:

- **Accounting**
  - Accounting data.

- **DDF Section**
  - Distributed accounting data.

- **Pkg Section**
  - Package accounting data.

- **BP Section**
  - Buffer pool accounting data.

- **Acctg-Sum**
  - Summarized accounting data.

- **DDF Section**
  - Summarized distributed accounting data.

- **BP Section**
  - Summarized buffer pool accounting data.

- **Perf-Lock Cont**
  - Lock timeout and deadlock data.

- **Perf-lock Susp**
  - Lock suspension data.

</table>

---
Perf-Dyn SQL
SQL text and access path data.

Perf-Neg SQL
Data about SQL statements returning negative SQLCODE.

**Count**
The number of records of this type that have been collected and stored since the collector was started.

**Timestamp of First Record**
The date and time that the first record of this type was collected.

**Timestamp of Last Record**
The date and time that the last record of this type was collected; that is, the most recent record.

**Near-Term History Data Collector Dataset Status**
This panel displays the status and space utilization of the data sets used by the Near-Term History Data Collector.

This panel provides the following information:

- The name of the data set defined in the near-term history data collection options member.
- The status of the data set.
- The percentage of the space that is used by the data set.

<table>
<thead>

**Navigation**

For additional information about

- near-term history data collection options or record information, choose one of the menu options at the top of the panel.
- other topics, use the PF keys.

**Fields**

**H2 Dataset**
The name of the H2 (near-term history) data set defined in the near-term history data collection options member.

**Status**
The status of the H2 data set. Possible values:

- ACTIVE
- FULL
- AVAIL (available)
- UNAVAIL (unavailable)
The percentage of space used in this H2 data set.

SQL Performance Analyzer Reports

Select this main menu option to access the results from the DB2 SQL Performance Analyzer for z/OS (SQL PA).

SQL PA analyzes former and current SQL queries and report the results. Analyses can be initiated from the following panels:

- “SQL Call Being Executed” on page 948
- “EDM Snapshot Dynamic SQL Cache Statement Statistics Detail” on page 1170
- “Thread History Dynamic SQL Calls” on page 1656

The results from SQL PA are SQL Enhanced Explain reports, SQL Query Limits reports, and SQL Trace information.

The output provided by SQL PA reports is based on SQL PA configuration parameters that are applied by means of the Configuration Tool. During the customization the affected DB2 subsystems and Performance Warehouse options to be used by SQL PA are determined.

When an SQL performance analysis is requested, the OMEGAMON Collector silently submits a batch job that captures the analysis data and puts it into appropriate Performance Warehouse tables, from where it is retrieved and reassembled and presented as an SQL PA report.

SQL PA reports might be long. If you cannot page down to the end of a report, the “logical rows” session parameter value might be too low. Log on again, with the session parameter set to a higher value. You can set this parameter either on the OMEGAMON XE for DB2 PE Classic Interface panel or as a logon command parameter, for example logon applid(ipobd2c) data(lrows=9999).

SQL Performance Analysis: Available Reports

This panel lists currently available SQL PA reports. use this list to select a report, which provides access to panels that display detailed information about the selected report, or to perform maintenance actions on the listed reports.
Navigation

You can scroll through the list using F7 (Up) and F8 (Down), or select a particular list item and press F11 (Zoom) for additional information.

For additional options
• select one of the options from the menu.
• use the PF keys.

Actions

You can refresh the list of current SQL PA reports by pressing Enter.

Use F11 (Zoom) to obtain access to the different report types (Enhanced Explain, Query Limits, Trace).

You can apply the following maintenance actions on a single SQL PA report by typing the corresponding letter left to one of the listed reports. Some actions are permitted only if you are the creator of the report.

D-Delete
Creator only: Deletes a particular SQL PA report. Applicable if the report status is READY, FAILED, or CANCELED.

C-Cancel
Creator only: Cancels an active SQL PA invocation. Applicable if the report status is RUNNING. (The status changes to CANCEL. Keep hitting the Enter key until the status changes to CANCELED.)

B-Scope to Public
Creator only: Marks the report as public so that other users can see the report output. Applicable if the report status is READY, FAILED, or CANCELED.

P-Scope to Private
Creator only: Marks the report as private so that other users cannot see the report output. Applicable if the report status is READY, FAILED, or CANCELED.

Fields

Rept #  The unique report number (identical to the Performance Warehouse log identifier).

Status   The current status of the report.

SUCCESS  The report has completed successfully.

RUNNING  The report is currently running.

FAILED   The job for this reported has failed, based on the completion code from SQL PA.

CANCEL   There is a pending Cancel request for this SQL PA invocation.

CANCELED  The report request was canceled.

Plan     The plan from which the SQL was taken.
Package
The package from which the SQL was taken.

SQL St#  
The SQL statement number.

Date  
The date when the report was run.

Time  
The time when the report was run.

Creator
The creator of the report. The ID of the creator is dependent on a couple of factors:

- If the signon security interface has been enabled, the creator ID is the identification used by the user to sign on.
- If the security interface has not been enabled, but signon profiles are used, the creator ID is of the form OMUSERxx, where xx is the 2-character OMEGAMON profile name.
- If neither the signon exit nor signon profiles are used, a default ID of OMINSTAL is used.

Users can only see reports that they have created or reports that other users have marked as public.

Pub  
Indicator whether the report is currently public (Y) or private (N). Public reports are viewable by any user. Private reports are only viewable by the report's creator. Only the creator of the report can switch the status between Public and Private.

SQL Performance Analysis: Enhanced Explain
This panel shows an Enhanced Explain report of the report selected in the SQL Performance Analysis: Available Reports panel.
Navigation

You can scroll through the report using F7 (Up) and F8 (Down). F3 (Back) returns to the SQL Performance Analysis: Available Reports panel.

You can select a different report type by choosing one of the options from the menu.

SQL Performance Analysis: Query Limits

This panel shows a Query Limits report of the report selected in the SQL Performance Analysis: Available Reports panel.
Navigation

You can scroll through the report using F7 (Up) and F8 (Down). F3 (Back) returns to the SQL Performance Analysis: Available Reports panel.

You can select a different report type by choosing one of the options from the menu.

**SQL Performance Analysis: Trace**

This panel shows a Trace report of the report selected in the SQL Performance Analysis: Available Reports panel.
Navigation

You can scroll through the report using F7 (Up) and F8 (Down). F3 (Back) returns to the SQL Performance Analysis: Available Reports panel.

You can select a different report type by choosing one of the options from the menu.

SQL Performance Analysis: SYSPRINT

This panel shows a SYSPRINT report of the report selected in the SQL Performance Analysis: Available Reports panel.
Navigation

You can scroll through the report using F7 (Up) and F8 (Down). F3 (Back) returns to the SQL Performance Analysis: Available Reports panel.

You can select a different report type by choosing one of the options from the menu.

SQL Performance Analysis: ANLSQL

This panel shows the actual SQL statement that was analyzed by SQL PA for the report selected in the SQL Performance Analysis: Available Reports panel.
Navigation

You can scroll through the report using F7 (Up) and F8 (Down). F3 (Back) returns to the SQL Performance Analysis: Available Reports panel.

You can select a different report type by choosing one of the options from the menu.

SQL Performance Analysis: JOBERR

This panel shows diagnostics information, if the SQL PA job of the report selected in the SQL Performance Analysis: Available Reports panel failed.
Analyzing DB2 CPU Usage

This topic contains information about considerations for analyzing DB2 CPU usage.

DB2 CPU Usage

DB2 uses MVS cross memory services extensively in processing application requests. As a result, the majority of CPU time consumed in processing thread activity is attributed by MVS SRM to the thread-originating (user's) address space, not to one of the DB2 system address spaces (SSAS, DBAS, IRLM).

OMEGAMON XE for DB2 PE provides CPU use information for threads within DB2. In all cases in which CPU use is reported, the CPU rate is expressed in terms of 1-100%, regardless of the number of CPUs online in the processor complex.

The discussion below is designed to help you interpret and make use of the information provided by OMEGAMON XE for DB2 PE regarding CPU usage.

DB2 exploits MVS CPU timing services introduced in MVS/XA SP2.2 and MVS/ESA.

OMEGAMON XE for DB2 PE also exploits the new CPU timing services as it monitors a DB2 subsystem. To accurately interpret CPU utilization data reported by OMEGAMON XE for DB2 PE, first consider the type of DB2 attachment that is in use. That is, did the threads in question originate from a CICS attachment or from another type of attachment (IMS, TSO, and so on)?

CICS Attachments

For threads that originate from the CICS/DB2 attachment, the reported thread CPU usage is entirely attributable to the CICS/DB2 thread. In other words, it is entirely attributable to the CICS/DB2 attachment TCB servicing the thread. The CPU rate includes MVS TCB time only; SRB time is not included. Any CPU usage reported for CICS/DB2 threads is a subset of total CICS address space CPU utilization.

For example, assume that the total CICS address space CPU utilization is 50%, and two threads originate from the CICS connection. If one thread has a reported CPU rate of 5% and the other’s rate is 10%, the conclusion is that 15% of CICS address space CPU utilization is attributable to servicing DB2 requests. Also, 30% (15% / 50% = 30%) of total CICS address space utilization is attributable to servicing DB2 requests.

CPU utilization reported for CICS threads is the same, regardless of the version of the DB2 subsystem being monitored.

Non-CICS Attachments

Analysis of CPU use in non-CICS environments (IMS, TSO, CAF, batch, and utilities) must take several factors into account:

• thread status
• specific attachment environment

OMEGAMON XE for DB2 PE reports CPU use for the actual MVS TCB (subtask) that owns the active DB2 thread. SRB time is not included.

Thread Status:
Unlike the CICS attachment, non-CICS environments typically contain a single DB2 thread. Recognizing the status of that thread will help you determine whether the reported CPU use can be attributed to DB2 request activity.

For example, if thread status is In-SQL-Call, the CPU rate reported is indeed related to DB2 thread activity. However, if the thread status is Not-In-DB2, you can conclude that the CPU rate reported is attributable to application activity that is unrelated to DB2, although the application indeed still owns a DB2 thread (for example, an IMS transaction doing DL/I requests).

Attachment Environment:
The non-CICS attachment environments vary in the MVS task structure they use to service DB2 threads. Thus, your analysis must take into account the attachment type in use.

For example, an IMS attachment does not result in the creation of an MVS subtask to service a thread. In a TSO environment, however, an additional MVS TCB is created to service each thread.

The following examples explain the ways in which thread status, DB2 version, and attachment environment jointly affect your interpretation of the OMEGAMON XE for DB2 PE CPU use data.

Example 1

In a TSO attachment environment using SPUFI, program DSN is attached as an MVS daughter subtask in the TSO address space. The DSN subtask then attaches program DSNECP10, which is a daughter subtask of the DSN subtask. The DSNECP10 subtask is the actual MVS TCB that owns the DB2 thread. As a result, it is the CPU use of this MVS task that is being reported by OMEGAMON XE for DB2 PE.

If thread status indicates Not-In-DB2, OMEGAMON XE for DB2 PE will report that CPU use (MVS TCB CPU use) is 0.

Example 2

In an IMS environment, the IMS attachment does not attach a new MVS subtask to service the DB2 thread. As a result, the CPU use reported for IMS threads can reflect CPU time that is attributable to non-DB2 work. This means that you must take into account the status of the DB2 thread, as discussed above.

Example 3

Assume an application that creates multiple DB2 threads (executing concurrently), using the DB2 call attach facility (CAF).

The reported CPU use of a thread is always attributable to the MVS task that owns that thread. And you must consider the thread’s status to determine whether the reported CPU use is attributable to DB2 or to non-DB2 application activity.
Trace requirements for OMEGAMON XE for DB2 PE

This topic contains information about the trace requirements for OMEGAMON XE for DB2 PE.

Trace activation

To fully exploit OMEGAMON XE for DB2 PE’s realtime performance monitoring abilities, Accounting trace class 1 and class 2 must be active while OMEGAMON XE for DB2 PE is monitoring your DB2 system. If these traces are not active, specific data elements (listed in Table 121 on page 1714) will not be available to OMEGAMON XE for DB2 PE. Also, some data related to reusable threads becomes cumulative, instead of reflecting a single transaction (see Table 122 on page 1716).

To use the near-term history reporting facilities, you must activate some traces as well. Unlike the realtime portion of OMEGAMON XE for DB2 PE, near-term history reporting depends entirely on data supplied by traces. To determine exactly which traces you must activate to report on specific data elements, see the online data dictionary.

Realtime data fields for which data is unavailable

The following table lists the data fields that are available to OMEGAMON XE for DB2 PE’s realtime component only when certain Accounting traces are active. (When the required Accounting class is not active, OMEGAMON XE for DB2 PE displays N/A in the affected fields.) Each row in the table contains the name of an OMEGAMON XE for DB2 PE panel, the affected fields on that panel, and the Accounting trace class that makes data available to each field.

**Realtime data fields for which data is cumulative**

OMEGAMON XE for DB2 PE reports cumulative values for some fields when Accounting trace class 1 is not active. When Accounting trace class 1 is not active and the thread involved is reused, the value on OMEGAMON XE for DB2 PE displays is cumulative since thread creation. The following table contains the names of the fields that might contain cumulative data and the names of the panels on which they are displayed.

Table 122. Accounting trace class 1 - Cumulative data fields

</tr>
</tbody>
</table>

“Threads Summary Excluding Idle Threads” [on page 921](#)

<table>
<thead>
<tr>
<th>CICS Thread Summary</th>
</tr>
</thead>
</table>

When Accounting trace class 1 is active, the values in these fields will still be cumulative if all of the following conditions are met:

- The thread involved was created as a reusable thread.
• The thread is actually being reused.
• Thread Signon was not driven for the new user of the thread.

**Lock types and lock levels**

This topic contains additional information about the lock types and lock levels that OMEGAMON XE for DB2 PE reports.

If a database is deleted or a data inconsistency problem exists, OMEGAMON XE for DB2 PE cannot translate the database name. It displays the resource ID instead of the database name.

If a pageset is deleted or a data inconsistency problem exists, OMEGAMON XE for DB2 PE cannot translate the pageset name. No information is displayed instead of the pageset name.

**Lock types**

The table in this section describes the lock types that are displayed by OMEGAMON XE for DB2 PE.

*Table 123. Lock types*

Chapter 5. Monitoring 1719
<table>
<thead>
<tr>
<th>Lock type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **IPAG**  | The Index page (IPAG) lock in an index space. When application programs read or update data, they acquire a lock on the page containing the index when indexing is used.  
  - DB = database name  
  - PS = pageset name  
  - PG = page |
| **IXKY**  | The Index key (IXKY) lock. |
| **LBLK**  | The Large object (LOB) lock. |
| **LPLR**  | The Logical page list recovery (LPLR) lock. |
| **MDEL**  | The Mass delete (MDEL) lock is acquired when doing a mass delete from a table (for example, when you DELETE FROM a table) within a segmented tablespace.  
  It is used to prevent another user from reusing freed segments before a delete operation is committed.  
  - DB = database name  
  - PS = pageset name |
| **PALK**  | The Partition lock.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition |
| **PBPC**  | The Group BP level castout (PBPC) P-lock.  
  A physical lock acquired when a castout of a group buffer pool occurs. Castout is the process of writing pages in the group buffer pool out to DASD.  
  This lock is only used in a data sharing environment. |
| **PCDB**  | The DDF CDB P-lock.  
  A Distributed Data Facility communication database physical lock.  
  This lock is only used in a data sharing environment. |
| **PDBD**  | The DBD P-lock is a database descriptor physical lock.  
  This lock is only used in a data sharing environment. |
| **PDSO**  | The Pageset or partitioned pageset open lock.  
  If the data set supporting the tablespace that is referenced by the application is not opened, the program will acquire a lock to open the data set. The data set will stay open if CLOSE=NO is defined in the SQL statement creating the tablespace.  
  - DB = database name  
  - PS = pageset name |
| **PITR**  | The Index manager tree (PITR) is a physical lock (P-lock).  
  This lock is only used in a data sharing environment.  
  - DB = database name  
  - PS = pageset name  
  - PT = partition |

<td>X</td>
<td>Exclusive</td>
<td>The lock owner might read or change data in the tablespace. No other program might access the tablespace at all.</td>
</tr>
</tbody>
</table>

Internal lock types
OMEGAMON XE for DB2 PE also displays the following lock types that are used internally by DB2:

NSU  Non-shared update.
UNS  Unprotected share.

DB2 Thread Status Values
This topic contains a list of all possible values for the status of a DB2 thread. This field is displayed on thread summary and thread detail panels as Status, DB2 Status, or Thread Status.

The following list shows all possible values for the status of a DB2 thread:

NOT-AVAIL
The thread is not available

IN-ABORT
The thread is in abort processing.

IN-ACCEL
The thread is executing on IBM Db2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
The thread is processing an autonomous procedure.

IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.
IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

IN-DB2
The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT
The thread is in doubt.

IN-SIGNON
The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.

IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Fetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).
WAIT-CONVLRM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MMSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.
WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to finish.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

The Enhanced 3270 User Interface

In conjunction with the IBM Tivoli OMEGAMON XE monitoring products, you can monitor the performance of the z/OS systems, applications, and devices in your environment by using the IBM Tivoli OMEGAMON enhanced 3270 user interface. You can also identify or troubleshoot problems with these monitored resources.

Who should read this information

This information is intended for IBM data server professionals who want to analyze and tune the performance of a DB2 database management system. It provides a quick overview of the workspaces of the enhanced 3270UI, their content, and their panel IDs. With this information, you can quickly navigate the enhanced 3270UI.
Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:

- [OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)](https://www.ibm.com)
- [OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)](https://www.ibm.com)

**Introduction**

The IBM Tivoli OMEGAMON enhanced 3270 user interface (enhanced 3270UI) is the latest generation of user interfaces for the OMEGAMON monitoring products.

The Enhanced 3270 User Interface offers integration capability with certain performance monitoring products. If you have IBM Db2 Query Monitor for z/OS and/or IBM OMEGAMON for CICS on z/OS you can see metrics originating from these products embedded in IBM OMEGAMON for Db2 Performance Expert (and Monitor) on z/OS screens. These products must be installed, configured, and running in the same OMEGAMON Monitoring environment. See the program directory and related PTFs for installation considerations.

**Using the enhanced 3270UI**

This document does not provide you with instructions about how to use the enhanced 3270UI. For a detailed description of the enhanced 3270UI together with information about how to use it, see [OMEGAMON Enhanced 3270 User Interface Knowledge Center](https://www.ibm.com).

For quick reference information about PF keys and icons, which you can use to navigate the enhanced 3270UI, see “User interface icons and PF keys” on page 1761.

**Navigating to KDPSTART**

When you log on to the enhanced 3270UI, the workspace Enterprise Summary (KOBSTART) is displayed. It shows data from the products that are installed on your system.

From this workspace you can drill down to any other screen.

However, depending on the following criteria, a different workspace might be displayed after the first logon to OMEGAMON for Db2 PE if:

- More than one product that supports the enhanced 3270UI is installed on your system
- A particular workspace is designated as the first workspace in the site profile or the user profile

**Panel navigation flowcharts**

[Figure 7 on page 1729](https://www.ibm.com) shows the panel navigation hierarchy for 'active datasharing groups' from the KDPSTART panel.
Figure 8 on page 1730 shows the panel navigation hierarchy for the 'active subsystems' selection after you have navigated to KDPSTART.
All Active DB2 Data Sharing Groups

The summary panel displays the DB2 data sharing groups that are active in your enterprise system.

It displays the general state and health of the active DB2 data sharing groups. This is the starting point for troubleshooting.

Navigating to All Active DB2 Sharing Groups

From **Enterprise Summary**, select the option **P** next to any DB2 subsystem to navigate to DB2 Main Screen. DB2 Main Screen consists of **All Active DB2 Data Sharing Groups**, followed by **All Active DB2 Subsystems**.

**Options menu**

The following options exist:

1. D Group Object Analysis Database Activity ([KDPGOATS](#))
2. F System SQL Counts ([KDPPSQL1](#))
3. G DSNZPARMs ([KDPPZSYS](#))
4. L Global Lock Conflicts ([KDPGLKGN](#))
5. O Group Object Analysis ([KDPGOA](#))
6. P Group Object Analysis Thread Database ([KDPGOATD](#))
7. Q Group Object Analysis Volume ([KDPGVOL](#))
8. S Global & Group Buffer Pools ([KDPPGPLL](#))
9. T DSG Active Threads ([KDPPTHRD](#))
10. V Group Object Analysis Volume Thread ([KDPGVOLT](#))
11. X Coupling Facility Details ([KDPXCFD](#))
12. H History

**Threads**

A view of thread activity for DB2 data sharing groups.

**T DSG Active Threads (KDPPTHRD):**

KDPPTHRD provides a global view of thread activity for an entire data sharing group.

With this information, you can identify all active application threads and track thread activity over a period of time. You can use the thread data to monitor...
critical application threads and to evaluate the thread elapsed times and the wait times for critical threads. You can also observe thread activity for threads within the same system, group, and member.

Navigating to KDPPTHRD

All Active DB2 Data Sharing Groups ➔ T DSG Group Active Threads

Select the corresponding tab to navigate to:

- **Coupling (KDPXCFD)**
  Connection status information for all connections to a coupling facility structure. See “X Coupling Facility Details (KDPXCFD)” on page 1740.

- **GOA (KDPGOA)**
  A global view of object allocation data for a specific data sharing group. See “O Group Object Analysis (KDPGOA)” on page 1737.

- **SQLC (KDPPSQL1)**
  Displays the system SQL counts for a thread for each member of a data sharing group. See “F Group SQL Counts (KDPPSQL1)” on page 1738.

- **DSNZPARMs (KDPPZSY)
  Displays information about DSNZPARM parameters that are related to thread management. See “G DSNZPARMs (KDPPZSYS)” on page 1735.

- **Lock conf (KDPGLKGN)**
  The lock conflicts that exist in a data sharing group. See “L Group Lock Conflicts (KDPGLKGN)” on page 1734.

- **Buf Pool (KDPPGPLL)**
  A summary of all group buffer pools for all members of a data sharing group. See “S Global and Group Buffer Pools (KDPPGPLL)” on page 1739.

Zoom-in from KDPPTHRD

- **C Cancel Thread (KDPTCANC)**
  Provides an option to cancel a thread.

- **O Thread Locks Owned (KDPTHRDL)**
  Detailed information about the locks and the claims that are owned by an individual thread.

- **S Thread Detail Accounting (KDPTHDA2)**
  The accounting classes 1 and 2 for a selected thread.

- **T Thread Detail SQL Text (KDPPSQLT)**
  The SQL statement that a DB2 thread is currently executing.

- **W Thread Detail Class 3 (KDPTHRHD3)**
  The accounting class 3 wait times for a selected thread.

- **Q Thread Statistics (KDPPTHDS)**
  Thread statistics for a specific application thread. If the application thread is a parallel thread, the table view displays thread statistics for all the associated parallel threads.

- **X Multi-Thread Cancel No Confirmation (KDPPTKAC)**
  Cancel multiple threads without being prompted individually to confirm each thread cancellation.
V Group Object Analysis Volume Thread (KDPGVOLT):

KDPGVOLT displays an overview of the performance of volumes that contain DB2 objects. With this information, you can evaluate DASD performance by volume.

Navigating to KDPGVOLT

All Active DB2 Data Sharing Groups → V Group Object Analysis Volume Thread

Select the corresponding tab to navigate to:

**GOA DB (KDPGOATS)**
A high-level analysis of getpage and I/O activity from a DB2 database perspective. See “D Group Object Analysis Database Activity (KDPGOATS)” on page 1736.

**GOA (KDPGOA)**
A global view of object allocation data for a specific data sharing group. See “O Group Object Analysis (KDPGOA)” on page 1737.

**GOA TDB (KDPGOATD)**
Object Analysis database use by thread for a data sharing group. See “P Group Object Analysis Thread Database (KDPGOATD)”.

**GOA VOL (KDPGVOL)**
An overview of the performance of the volumes that contain DB2 objects. See “Q Group Object Analysis Volume (KDPGVOL)” on page 1737.

**GOA VTH (KDPGVOLT)**
The volume activity by thread workspace. See “V Group Object Analysis Volume Thread (KDPGVOLT)”.

Zoom-in from KDPGVOLT

S Group Object Analysis Volume Detail (KDPGVOL2)
The thread activity by volume workspace.

P Group Object Analysis Thread Database (KDPGOATD):

KDPGOATD displays the usage of the Object Analysis database by thread for a data sharing group.

Navigating to KDPGOATD

All Active DB2 Data Sharing Groups → P Group Object Analysis Thread Database

Select the corresponding tab to navigate to:

**GOA (KDPGOA)**
A global view of object allocation data for a specific data sharing group. See “O Group Object Analysis (KDPGOA)” on page 1737.

**GOA DB (KDPGOATS)**
A high-level analysis of getpage and I/O activity from a DB2 database perspective. See “D Group Object Analysis Database Activity (KDPGOATS)” on page 1736.

**GOA TDB (KDPGOATD)**
Object Analysis database use by thread for a data sharing group. See “P Group Object Analysis Thread Database (KDPGOATD)”.

Chapter 5. Monitoring 1733
GOA VOL (KDPGVOL)
An overview of the performance of the volumes that contain DB2 objects. See “Q Group Object Analysis Volume (KDPGVOL)” on page 1737.

GOA VTH (KDPGVOLT)
The volume activity by thread workspace. See “V Group Object Analysis Volume Thread (KDPGVOLT)” on page 1733.

Zoom-in from KDPGOATD

S Group Object Analysis Spacename (KDPSPAC)
Provides information about the activity of DB2 databases and DB2 tablespaces. With this information, you can do a more detailed analysis of the activities for a DB2 databases and DB2 tablespaces.

L Group Lock Conflicts (KDPGLKGN)
KDPGLKGN displays the lock conflicts that exist in a data sharing group.

Navigating to KDPGLKGN
All Active DB2 Data Sharing Groups → L Group Lock Conflicts

Select the corresponding tab to navigate to:

Threads (KDPPTHRD)
Provides a global view of thread activity for an entire data sharing group. See “T DSG Active Threads (KDPPTHRD)” on page 1731.

Coupling (KDPXCFD)
Connection status information for all connections to a coupling facility structure. See “X Coupling Facility Details (KDPXCFD)” on page 1740.

GOA (KDPGOA)
A global view of object allocation data for a specific data sharing group. See “O Group Object Analysis (KDPGOA)” on page 1737.

SQLC (KDPPSQL1)
Displays the system SQL counts for a thread for each member of a data sharing group. See “F Group SQL Counts (KDPPSQL1)” on page 1738.

DSNZP ARMS (KDPPZSYS)
Displays information about DSNZPARM parameters that are related to thread management. See “G DSNZP ARMS (KDPPZSYS)” on page 1735.

Lock Conf (KDPGLKGN)
The lock conflicts that exist in a data sharing group. See “L Group Lock Conflicts (KDPGLKGN)”.

Buf Pool (KDPPGPLL)
A summary of all group buffer pools for all members of a data sharing group. See “S Global and Group Buffer Pools (KDPPGPLL)” on page 1739.

Zoom-in from KDPGLKGN

Thread Locks Owned (KDPPLK)
The locks and claims that are owned by a thread that is linked from the data sharing group Lock Conflicts workspace.
G DSNZPARMs (KDPPZSYS)
KDPPZSYS displays information about DSNZPARM parameters that are related to thread management. These parameters are defined on the DB2 panels DSNTIPE and DSNTIPE1.

Navigation to KDPPZSYS

All Active DB2 Subsystems → G DSNZPARMs

Select the corresponding tab to navigate to:

TRC (Trace Parameters KDPPZTRC)
Parameters that are related to the trace. These parameters are defined on the DB2 panel, DSNTIPN.

LOG (Logging Parameters KDPPZLOG)
Parameters that are related to the active log. These parameters are defined on the DB2 panel, DSNTIPL.

ARCH (Archiving Parameters KDPPZARC)
Parameters that are related to log archiving. These parameters are defined on the DB2 panels DSNTIPA and DSNTIPH.

CNTL (Authorization/RCF/DDF parameters KDPPZCTL)
Parameters that are related to operator functions. These parameters are defined on the DB2 panels DSNTIPO, DSNTIPP, DSNTIPP1, DSNTIPR and DSNTIPL.

IRLM (IRLM Parameters KDPZIRLM)
Parameters that are related to IRLM. These parameters are defined on the DB2 panels DSNTIP1 and DSNTIPJ.

STG (Storage Parameters KDPPZSTG)
DSNZPARM parameters that are related to storage and sizes. These parameters are defined on the DB2 panels DSNTIPC and DSNTIPD.

DSN (Dataset and Database parameters KDPPZDSN)
Parameters that are related to datasets and databases. These parameters are defined on DB2 panels DSNTIP7, DSNTIP71, DSNTIP91, and DSNTIPS.

DDCS (Data Definition Control Parameters KDPPZDDCS)
Parameters that are related to data. These parameters are defined on the DB2 panel DSNTIPZ.

DSG (Data Sharing Parameters KDPPZDSG)
The parameters that are related to data sharing. These parameters are defined on the DB2 panel DSNTIPK.

SP (Stored Procedure Parameters KDPPZSP)
DSNZPARM parameters that are related to Stored Procedures. These parameters are defined on the DB2 panel DSNTIPX.

UTIL (Utility Parameters KDPPZUTL)
DSNZPARM parameters that are related to utilities. These parameters are defined on DB2 the panels DSNTIP6, DSNTIP61, and DSNTIP62.

APPL (Application Parameters KDPPZAPP)
Parameters that are related to applications. These parameters are defined on the DB2 panels DSNTIPF, DSNTIP4, and DSNTIP41.
DATA (Data Parameters KDPPZDAT)
Parameters that are related to data. These parameters are defined on the DB2 panels DSNTIPA2, DSNTIPO3, and DSNTIPM.

PERF (Performance Parameters KDPPZPF)
Parameters that are related to performance and optimization. These parameters are defined on the DB2 panels DSNTIP8, DSNTIP81, and DSNTIP82.

BP (Buffer Pool Parameters KDPPZBP)
Parameters that are related to the Default Buffer Pools. These parameters are defined on the DB2 panel DSNTIP1.

OTHER (Other System Parameters KDPPZOTH)
Miscellaneous parameters that are defined on the DB2 panels DSN6SYSP, DSN6LOGP, DSN6ARVP, DSN6SPRM, DSN6FAC, and DSNHDECP.

Searching for DSNZPARM Parameters (KDPPZFND)
To search for a DSNZPARM parameter:
1. At the command line, enter either:
   - F
   - FIND
   - FINDM
   - FINDMENU
   The Find DSNZPARM Parameters (KDPZZFND) workspace is displayed.
2. Search for the parameter by field name or description.

Group object analysis
A global view of object allocation data for a specific DB2 data sharing group.

D Group Object Analysis Database Activity (KDPGOATS):
KDPGOATS displays a high-level analysis of getpage and I/O activity from a DB2 database perspective.

Navigating to KDPGOATS
All Active DB2 Data Sharing Groups → D Group Object Analysis Database Activity

Select the corresponding tab to navigate to:

GOA DB (KDPGOATS)
A high-level analysis of getpage and I/O activity from a DB2 database perspective. See "D Group Object Analysis Database Activity (KDPGOATS)."

GOA (KDPGOA)
A global view of object allocation data for a specific data sharing group. See "O Group Object Analysis (KDPGOA)" on page 1737.

GOA DB (KDPGOATS)
Object Analysis database use by thread for a data sharing group. See "P Group Object Analysis Thread Database (KDPGOATD)" on page 1733.

GOA VOL (KDPGVOL)
An overview of the performance of the volumes that contain DB2 objects. See "Q Group Object Analysis Volume (KDPGVOL)" on page 1737.
GOA VTH (KDPGVOLT)

The volume activity by thread workspace. See "V Group Object Analysis Volume Thread (KDPGVOLT)" on page 1733.

Zoom-in from KDPGOA

S Object Analysis Activity by Spacename (KDPGOAT2)

Information about the activity of a group object by table space. With this information, you can do a more detailed analysis of the activities for a DB2 tablespace.

O Group Object Analysis (KDPGOA):

KDPGOA displays global view of object allocation data for a specific data sharing group.

Navigating to KDPGOA

All Active DB2 Data Sharing Groups + O Group Object Analysis

Select the corresponding tab to navigate to:

GOA (KDPGOA)

A global view of object allocation data for a specific data sharing group. See "O Group Object Analysis (KDPGOA)."

GOA DB (KDPGOATS)

A high-level analysis of getpage and I/O activity from a DB2 database perspective. See "P Group Object Analysis Database Activity (KDPGOATS)" on page 1733.

GOA TDB (KDPGOATD)

Object Analysis database use by thread for a data sharing group. See "P Group Object Analysis Thread Database (KDPGOATD)" on page 1733.

GOA VOL (KDPGVOL)

An overview of the performance of the volumes that contain DB2 objects. See "Q Group Object Analysis Volume (KDPGVOL)."

GOA VTH (KDPGVOLT)

The volume activity by thread workspace. See "V Group Object Analysis Volume Thread (KDPGVOLT)" on page 1733.

Zoom-in from KDPGOA

S Object Analysis Activity by Spacename (KDPGOAT2)

Information about the activity of a group object by table space. With this information, you can do a more detailed analysis of the activities for a DB2 tablespace.

Q Group Object Analysis Volume (KDPGVOL):

KDPGVOL displays and overview of the performance of volume that contain DB2 objects. With this information you can evaluate DASD performance by volume.

Navigating to KDPGVOL

All Active DB2 Data Sharing Groups + Q Group Object Analysis Volume Group Statistics
Select the corresponding tab to navigate to:

**GOA DB (KDPGOATS)**
A high-level analysis of getpage and I/O activity from a DB2 database perspective. See "D Group Object Analysis Database Activity (KDPGOATS)" on page 1736.

**GOA (KDPGOA)**
A global view of object allocation data for a specific data sharing group. See "O Group Object Analysis (KDPGOA)" on page 1737.

**GOA TDB (KDPGOATD)**
Object Analysis database use by thread for a data sharing group. See "P Group Object Analysis Thread Database (KDPGOATD)" on page 1733.

**GOA VOL (KDPGVOL)**
An overview of the performance of the volumes that contain DB2 objects. See "Q Group Object Analysis Volume (KDPGVOL)" on page 1737.

**GOA VTH (KDPGVOLT)**
The volume activity by thread workspace. See "V Group Object Analysis Volume Thread (KDPGVOLT)" on page 1733.

**Zoom-in from KDPGVOL**

**D Group Object Analysis Database Activity (KDPGOATS)**
A high-level analysis of getpage and I/O activity from a DB2 database perspective. See "D Group Object Analysis Database Activity (KDPGOATS)" on page 1736.

**O Group Object Analysis (KDPGOA)**
A global view of object allocation data for a specific data sharing group. See "O Group Object Analysis (KDPGOA)" on page 1737.

**P Group Object Analysis Thread Database (KDPGOATD)**
Object Analysis database use by thread for a data sharing group. See "P Group Object Analysis Thread Database (KDPGOATD)" on page 1733.

**S. Group Object Analysis Volume Database (KDPGVDB)**
Displays information you can use to analyze I/O activity for a single volume in a DB2 database. Based on the information that this workspace provides, you can recommend changes, set up situations, and verify that your recommended changes improve system performance.

**V Group Object Analysis Volume Thread (KDPGVOLT)**
The volume activity by thread workspace. See "V Group Object Analysis Volume Thread (KDPGVOLT)" on page 1733.

**H History**
Near-term History provides the capability to investigate problems that occurred in the recent past.

**F Group SQL Counts (KDPPSQL1)**
KDPPSQL1 displays the system SQL counts for Data Manipulation Language (DML) for each member of a data sharing group.

**Navigating to KDPPSQL1**
All Active DB2 Data Sharing Groups → F Group SQL Counts

Select the corresponding tab to navigate to:
DCL (Data Control Language KDPPSQL2)
The system SQL counts for the Data Control Language (DCL) for each member of a data sharing group.

DDL (Data Definition Language KDPPSQL3)
The system SQL counts for the Data Definition Language (DDL) for each member of a data sharing group.

RID (Record Identifier List Processing KDPPSQL4)
The system SQL counts for Record Identifier (RID) List Processing for each member of a data sharing group.

PARAL (Query Parallelism KDPPSQL5)
The system SQL counts for query parallelism for each member of a data sharing group.

NESTED (Stored Procedures, User Defined Functions, Triggers KDPPSQL6)
The system SQL counts for Stored Procedures, User Defined Functions, and Triggers for each member of a data sharing group.

PREP (Prepares KDPPSQL7)
The system SQL counts for Prepares for each member of a data sharing group.

ROWID (Row ID Access KDPPSQLD)
The system SQL counts for Row ID Access for each member of a data sharing group.

CON STMNT (Concentrate Literals KDPPSQL8)
The system SQL counts for Concentrate Literals for each member of a data sharing group.

USE COMMITTED (KDPPSQLA)
The system SQL counts for Use Committed for each member of a data sharing group.

WORKFILE (KDPPSQLB)
The system SQL counts for workfiles for each member of a data sharing group.

MISC (Miscellaneous KDPPSQLE)
The system miscellaneous SQL counts for each member of a data sharing group.

S Global and Group Buffer Pools (KDPPGPLL)
KDPPGPLL displays a summary of all group buffer pools for all members of a data sharing group.

Navigating to KDPPGPLL

All Active DB2 Data Sharing Groups → S Group Buffer Pools

Select the corresponding tab to navigate to:

Global Buffer Pools (KDPPGBPO)
The global buffer pools for all members of a data sharing group. See “Zoom-in from KDPPGBPO” on page 1740.

Group Buffer Pools (KDPPGPLL)
A summary of all group buffer pools for all members of a data sharing group.
**Zoom-in from KDPPGPLL**

**A Sync Read \ GBP Write (KDPPGBPS)**
Sync reads, writes and the hit ratio of a group buffer pool for all members of a data sharing group.

**B Prefetch \ Castout (KDPPGBPP)**
Prefetch information and castout information about a group buffer pool for all members of a data sharing group.

**L P-Locks (KDPPGBPL)**
The P-Lock information for a group buffer pool for all members of a data sharing group.

**S Secondary GBP (KDPPGBPC)**
The DB2 Group Buffer Pool secondary information for all members of a data sharing group.

**H History**
Near-term History provides the capability to investigate problems that occurred in the recent past.

**Zoom-in from KDPPGBPO**

**S Global Group Buffer Pool Details (KDPPGBPD)**
Group buffer pool detail for all members of a data sharing group.

**H History**
Near-term History provides the capability to investigate problems that occurred in the recent past.

**X Coupling Facility Details (KDPXCFD)**
KDPXCFD displays connection status information for all connections to a coupling facility structure.

**Navigating to KDPXCFD**

All Active DB2 Data Sharing Groups → X Coupling Facility Details

Select the corresponding tab to navigate to:

**Threads (KDPPTHRD)**
Provides a global view of thread activity for an entire data sharing group. See “T DSG Active Threads (KDPPTHRD)” on page 1731.

**Coupling (KDPXCFD)**
Connection status information for all connections to a coupling facility structure. See “X Coupling Facility Details (KDPXCFD).”

**GOA (KDPGOA)**
A global view of object allocation data for a specific data sharing group. See “O Group Object Analysis (KDPGOA)” on page 1737.

**SQLC (KDPPSQL1)**
Displays the system SQL counts for a thread for each member of a data sharing group. See “F Group SQL Counts (KDPPSQL1)” on page 1738.

**DSNZPARMS (KDPPZSYS)**
Displays information about DSNZPARM parameters that are related to thread management. See “G DSNZPARMs (KDPPZSYS)” on page 1735.
Lock Conf (KDPGLKGN)

The lock conflicts that exist in a data sharing group. See “L Group Lock Conflicts (KDPGLKGN)” on page 1734.

Buf Pool (KDPGPLL)

A summary of all group buffer pools for all members of a data sharing group. See “S Global and Group Buffer Pools (KDPGPLL)” on page 1739.

H History

Use near-term history to investigate problems that occurred in the recent past.

"H History" in the enhanced 3270UI refers to the OMEGAMON Family history based on the persistent datastore (PDS). For more information about historical workspaces, see [http://www-01.ibm.com/support/knowledgecenter/SSAUBV/com.ibm.omegamon_share.doc_6.3.0.2/e3270/near_term_history_intro.htm](http://www-01.ibm.com/support/knowledgecenter/SSAUBV/com.ibm.omegamon_share.doc_6.3.0.2/e3270/near_term_history_intro.htm)

For information about attribute groups that you need to enable historical collection for the workspaces, see “Enabling historical data collection in enhanced 3270UI” on page 1763.

All Active DB2 Subsystems

The summary panel KDPSTART displays the DB2 subsystems that are active in your enterprise system.

It displays the general state and health of the active DB2 subsystems. This is the starting point for troubleshooting.

Panel

![All Active DB2 Subsystems](image)

Figure 10. All Active DB2 Subsystems

For more information about panels and workspaces, see [http://www-01.ibm.com/support/knowledgecenter/SSAUBV/com.ibm.omegamon_share.doc_6.3.0.2/e3270/workspaces_overview_beacon.htm](http://www-01.ibm.com/support/knowledgecenter/SSAUBV/com.ibm.omegamon_share.doc_6.3.0.2/e3270/workspaces_overview_beacon.htm)

Options menu

The following options exist:

1. C CICS Threads (KDPCICTH)
2. G DSNZPARMS (KDPZSYS)
3. I IMS Connections (KDPIMS)
4. J DB2 Connect Server (KDPCONN)
5. K Key Performance Indicators Display (KDPKPII)
6. L Lock Conflicts (KDPLKC2)
7. M DB2 Messages (KDPMSGS)
8. S System Statistics (KDPSUBSM)
9. T Active Threads (KDPTHD52)
10. H History

**Threads**

View information about thread activity for DB2 subsystems.

**T Active Threads (KDPTHD52):**

KDPTHD52 displays a global view of thread activity for a specific DB2 subsystem.

It provides key performance data such as CPU rate, in-DB2 time, wait time, DB2 status, getpage, commits and updates that help you to identify any potential problem.

**Navigating to KDPTHD52**

All Active DB2 Subsystems → T Active Threads

Select the corresponding tab to navigate to:

**CICS (KDPTHCIS)**

Displays a CICS thread summary.

**Utilities (KDPUTILS)**

An overview of the active utilities. Workspace monitoring includes utilities that have not yet completed their run because of abnormal termination.

**Zoom-in from KDPTHD52 and KDPTHCIS**

**C Cancel Thread (KDPTCANC)**

Provides an option to cancel a thread.

**A Thread Detail Accelerator (KDPTHRDC)**

Information about accelerator metrics for an active thread.

**D Thread Detail Distributed (KDPTHDD2)**

Information about the VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

**E Thread Detail Enclave (KDPTHDE2)**

Detailed information about the workload manager (WLM) enclave service periods.

**L Thread Detail Locks Owned (KDPTHRLD)**

Detailed information about the locks and the claims that are owned by an individual thread.

**N Thread Detail Long Names (KDPTHRDN)**

The long names (identification fields) that are associated with a specific thread.

**Q Thread Detail SQL Counts (KDPTSQL1)**

The SQL counts for the Data Manipulation Language (DML) for a thread.

**S Thread Detail Accounting (KDPTHDA2)**

The accounting classes 1 and 2 for a selected thread. From the CICS Transaction Details subpanel, zoom in to:

• **CICS Region Summary (KCPRGNS)** : zoom into:
- Take Actions on Task (KDPTASAP)
- D CICS DB2 Connection Summary (KCPD2S or KCPD2P)
- B CICS Bottlenecks (KDPBOTS)
- F CICS File/Data Resources (CICS File/Data option menu)
- R CICS Resources (CICS Resources option menu)
- S CICS Region Overview (KCPRGN)
- T CICS Task Summary (KDPTASS)
- Transaction ID: navigate to CICS workspace Transaction Details (KCPTTRN).
- Current Program ID: navigate to CICS workspace Program Details (KDPPRGD).
- Task Number: navigate to ICS workspace Details for Transaction Task (KCPTASD).

T Thread Detail SQL Text (KDPTSQL)
The SQL statement that a DB2 thread is currently executing.

U Thread CICS Connection (KDPTHCIC)
Zoom-in from KDPTHCIS only.
Display CICS connection information for a CICS thread.

W Thread Detail Class 3 (KDPTHRD3)
The accounting class 3 wait times for a selected thread.

X Multi-thread Cancel No Confirm
Cancel multiple threads without being prompted individually to confirm each thread cancellation.

C CICS Threads (KDPCICTH):

KDPCICTH provides an overview of DB2 thread activity that originate from connected CICS regions. It provides key performance data such as CPU rate, in-DB2 time, wait time, DB2 status, getpage, commits and updates that help you to spot any potential problem.

Navigating to KDPCICTH

All Active DB2 Subsystems → C CICS Threads

Select the corresponding tabs to navigate to:

Active Threads (KDPTHD52)
A global view of thread activity for a specific DB2 subsystem. It provides key performance data such as CPU rate, in-DB2 time, wait time, DB2 status, getpage, commits and updates that help you to identify any potential problem.

CICS Connections (KDPCICS)
An overview of DB2 thread activity that is originating from connected CICS subsystems. Information about the CICS regions that are attached to DB2. See "T Active Threads (KDPTHD52)" on page 1742.

Zoom-in from KDPCICTH

C Cancel Thread (KDPTCANC)
Provides an option to cancel a thread.
A Thread Detail Accelerator (KDPTHRDC)
Information about accelerator metrics for an active thread.

D Thread Detail Distributed (KDPTHDD2)
Information about the VTAM APPC conversations and TCP/IP conversations of a distributed (DDF) thread.

E Thread Detail Enclave (KDPTHDE2)
Detailed information about the workload manager (WLM) enclave service periods.

I Thread Detail Locks Owned (KDPTHRL)
Detailed information about the locks and the claims that are owned by an individual thread.

N Thread Detail Long Names (KDPTHLDN)
The long names (identification fields) that are associated with a specific thread.

Q Thread Detail SQL Counts (KDPTSQL1)
The SQL counts for the Data Manipulation Language (DML) for a thread.

S Thread Detail Accounting (KDPTHDA2)
The accounting classes 1 and 2 for a selected thread. From the CICS Transaction Details subpanel, zoom in to:

- CICS Region Summary (KCPRGNS) : zoom into:
  - ! Take Actions on Task (KDPTASAP)
  - D CICS DB2 Connection Summary (KCPD2S or KCPD2P)
  - B CICS Bottlenecks (KDPBOTS)
  - F CICS File/Data Resources (CICS File/Data option menu)
  - R CICS Resources (CICS Resources option menu)
  - S CICS Region Overview (KCPRGNO)
  - T CICS Task Summary (KDPTASS)
- Transaction ID: navigate to CICS workspace Transaction Details (KCPTRND).
- Current Program ID: navigate to CICS workspace Program Details (KDPPRGD).
- Task Number: navigate to ICS workspace Details for Transaction Task (KCPTASD).

T Thread Detail SQL Text (KDPTSQTLT)
The SQL statement that a DB2 thread is currently executing.

W Thread Detail Class 3 (KDPTHRD3)
The accounting class 3 wait times for a selected thread.

X Multi-thread Cancel No Confirm
Cancel multiple threads without being prompted individually to confirm each thread cancellation.

Zoom-in from KDPCICS

R CICS RCT Summary for Region (KDPCICST)
The CICS/DB2 Resource Control Table. This table shows the DB2 plan that is used for each CICS transaction.

S CICS Thread Summary (KDPCICT1)
CICS threads summary for a target CICS region.
IIMS Connections (KDPIMS):

KDPIMS provides an overview of the activity of each IMS region connected to DB2.

Navigating to KDPIMS

All Active DB2 Subsystems → I IMS Connections

Zoom-in from KDPIMS

IMS Region Information (KDPIMSRG)
Detailed status information for a specific IMS dependent region.

J DB2 Connect Server (KDPCONN):

KDPCONN displays key information about the active and inactive DB2 Connect gateways.

Navigating to KDPCONN

All Active DB2 Subsystems → J DB2 Connect Server

Zoom into, or select the corresponding tab to navigate to:

K. Package statistics (KDPCPKG)
Provides information about the size of the data exchanged between the DB2 Connect gateway and the host database and about the network time required. It enables you to measure the throughput between the host database and the DB2 Connect gateway and gives you a better idea of the database activity and network traffic at the application level.

P. Performance (KDPCPERF)
Displays the information obtained by running a sample SQL statement between the DB2 Connect gateway and the host database. It enables you to detect any bottlenecks.

S. Gateway statistics (KDPCONNS)
Statistics about the selected DB2 Connect gateway including details about the number of agents and pooled agents, the connections that are waiting for the host to reply, and the connections that are waiting for the client to send a request.

T. Task list (KDPCTASK)
Statistics about the processes at the selected DB2 Connect gateway, for example, the CPU and the working set. Use the information to determine whether the DB2 Connect gateway is overloaded by DB2 Connect or any other allocation application.

H. History
Near-term History provides the capability to investigate problems that occurred in the recent past.

G DSNZPARMS (KDPZSYS)
KDPZSYS displays information about DSNZParm parameters that are related to thread management. These parameters are defined on the DB2 panels DSNTIPE and DSNTIPE1.
Navigating to KDPZSYS

All Active DB2 Subsystems → G DSNZPARMS

Select the corresponding tab to navigate to:

**TRC (Trace Parameters KDPZTRC)**
Parameters that are related to the trace. These parameters are defined on the DB2 panel, DSNTIPN.

**LOG (Logging Parameters KDPZLOG)**
Parameters that are related to the active log. These parameters are defined on the DB2 panel, DSNTIPL.

**ARCH (Archiving Parameters KDPZARC)**
Parameters that are related to log archiving. These parameters are defined on the DB2 panels DSNTIPA and DSNTIPH.

**CNTL (Authorization/RLF/DDF parameters KDPZCTL)**
Parameters that are related to operator functions. These parameters are defined on the DB2 panels DSNTIPO, DSNTIPP, DSNTIPP1, DSNTIPR and DSNTIP5.

**IRLM (IRLM Parameters KDPZIRLM)**
Parameters that are related to IRLM. These parameters are defined on the DB2 panels DSNTIP1 and DSNTIPJ.

**STG (Storage Parameters KDPZSTG)**
DSNZPARM parameters that are related to storage and sizes. These parameters are defined on the DB2 panels DSNTIPC and DSNTIPD.

**DSN (Dataset and Database parameters KDPZDSN)**
Parameters that are related to datasets and databases. These parameters are defined on DB2 panels DSNTIP7, DSNTIP71, DSNTIP91, and DSNTIPS.

**DDCS (Data Definition Control Parameters KDPZDDCS)**
Parameters that are related to data. These parameters are defined on the DB2 panel DSNTIPZ.

**DSG (Data Sharing Parameters KDPZDSG)**
The parameters that are related to data sharing. These parameters are defined on the DB2 panel DSNTIPK.

**SP (Stored Procedure Parameters KDPZSP)**
DSNZPARM parameters that are related to Stored Procedures. These parameters are defined on the DB2 panel DSNTIPX.

**UTIL (Utility Parameters (KDPZUTIL)**
DSNZPARM parameters that are related to utilities. These parameters are defined on DB2 the panels DSNTIPI6, DSNTIPI61, and DSNTIPI62.

**APP (Application Parameters KDPZAPPL)**
Parameters that are related to applications. These parameters are defined on the DB2 panels DSNTIPF, DSNTIPO4, and DSNTIPO41.

**DATA (Data Parameters KDPZDATA)**
Parameters that are related to data. These parameters are defined on the DB2 panels DSNTIPA2, DSNTIPO3, and DSNTIPO3.

**PERF (Performance Parameters KDPZPERF)**
Parameters that are related to performance and optimization. These parameters are defined on the DB2 panels DSNTIP8, DSNTIP81, and DSNTIP82.
BP (Buffer Pool Parameters KDPZBP)
Parameters that are related to the Default Buffer Pools. These parameters are defined on the DB2 panel DSNTIP1.

OTHERS (Other System Parameters KDPZOTH)
Miscellaneous parameters that are defined on the DB2 panels DSN6SYSP, DSN6LOGP, DSN6ARVP, DSN6SPRM, DSN6FAC, and DSNHDECP.

ALL (DSNZPARM KDPZPARM)
Parameters that are related to DSNZPARM.

Searching for DSNZPARM Parameters (KDPZFIN)
To search for a DSNZPARM parameter:
1. At the command line, enter either:
   • F
   • FIND
   • FINDM
   • FINDMENU
   The Find DSNZPARM Parameters (KDPZFIN) workspace is displayed.
2. Search for the parameter by field name or description.

K Key Performance Indicators Display (KDPKPI1)
KDPKPI1 displays a summary of thread related Key Performance Indicators for a DB2 subsystem. It includes connections, transactions and locking Key Performance Indicators that help you quickly identify and resolve any performance issues. (Version 5.3.0 only)

Navigating to KDPKPI1
All Active DB2 Subsystems → K Key Performance Indicators Display

Select the corresponding tabs to navigate to:

Pools & Storage KPI (KDPKPI2)
A summary of pool and storage related Key Performance Indicators for a DB2 subsystem. It includes DB2 pools, storage, buffer pools, sorting and group buffer pools Key Performance Indicators, which can help you quickly identify and resolve any performance issues. (Version 5.3.0 and higher).

Miscellaneous KPI (KDPKPI3)
Miscellaneous Key Performance Indicators for a DB2 subsystem. It includes monitoring, logging, stored procedures, user defined functions and query parallelism Key Performance Indicators, which can help you quickly identify and resolve any performance issues. (Version 5.3.0 and higher).

System States (KDPKPI4)
Key DB2 system and thread related performance data. This data includes thread, stored procedures, user defined functions, triggers, locks, and open datasets, which can help you quickly identify and resolve any performance issues.
**Zoom-in from KDPKPI1**

Zoom-in to DBM1 and MVS Storage below 2GB (KDPSTO2A) from:

- Avg Thread Footprint

Zoom in to System Resource Manager (KDFSUSBM) from:

- Transactions Per Second
- Indoubt-URs
- Resync attempted

Zoom-in to Lock Conflicts (KDPLKC2) from:

- Deadlocks
- Timeouts
- Lock Escalations

**Zoom-in from KDPKPI2**

Zoom-in to Storage Subsystems (KDPSTO2A) from:

- EDM pool full
- ECSA used by DB2
- Real storage used by DB2

Zoom-in to Buffer Pools (KDPBP52) from:

- DM critical thresh reached
- DWQT reached
- Open DS thresh reached
- Pages read from Bps
- Pages read from DASD
- Migrated DS timed out
- Sort error BP shortage
- Merge error BP shortage
- Sort degraded BP too small

Zoom-in to Group Buffer Pools (KDPGPOOL) from:

- Write failed no storage
- Pages castout
- Class castout thresh reached
- GBP castout thresh reached

**Zoom-in from KDPKPI3**

Zoom-in to Log Manager (KDPLOGS9) from:

- Tape volume contention
- Output buffer full
- Bytes written to log
- Resource unavailable
- No QP BP shortage

**Locking Conflicts (KDPLKC2)**

KDPLKC2 displays the lock conflicts that exist for a DB2 subsystem.
Navigating to KDPLKC2

All Active DB2 Subsystems \(\rightarrow\) L Locking Conflicts

Zoom-in from KDPLKC2

Thread Locks Owned (KDPTHRDL)
Detailed information about the locks and the claims that are owned by an individual thread.

M DB2 Messages (KDPMSGS)
KDPMSGS displays critical DB2 messages sorted by message identification number.

Navigating to KDPMSGS

All Active DB2 Subsystems \(\rightarrow\) M DB2 Messages

Zoom-in from KDPMSGS

S Critical DB2 Messages (KDPMSGC)
Displays messages that can help you identify problems with your DB2 system.

H History DB2 Messages (KDPMSGH)
Display historical DB2 messages that can help you diagnose performance problems in the past.

S System Statistics (KDPSUBSM)
KDPSUBSM shows an overview of workload-related information about the DB2 subsystem that you are monitoring.

Navigating to KDPSUBSM

All Active DB2 Subsystems \(\rightarrow\) S System Statistics

Select the corresponding tab to navigate to:

BP (Buffer Pools KDPBP52)
A summary of the buffer pools that are configured and are in use for a DB2 subsystem. A drill down to buffer pool details is available. See “Navigating from BP (Buffer Pools KDPBP52)” on page 1750.

Log (Log Management KDPOGS9)
An overview of the DB2 log manager active logging and archiving activity.

EDM (EDM Pool KDPEDM2A)
An overview of the Environmental Descriptor Manager (EDM) pool activity that is connected with DB2.

SQL (SQL Count DML KDPSQL1)
The SQL counts for the Data Manipulation Language (DML) for a DB2 subsystem. See “Navigating from SQL Counts DML (KDPSQL1)” on page 1750.

DSQL (DB2 Dynamic SQL Cache Filter Options KDPDSQLF)
Filter options to manage the data returned from the Dynamic SQL cache especially when many rows are returned. The default filter option settings display the first 100 statements in descending order of the accumulated CPU time. The results are displayed in DB2 Dynamic SQL Cache Statement
Statistics (KDPDSQLS), see “Zoom-in from DB2 Dynamic SQL Cache Statement Statistics (KDPDSQLS)” on page 1751.

SSQL (Thread Detail SQL Text (KDPPSQLT) KDPSSQLS)
A summary of the contents of the Static SQL cache so that you can determine their performance. See “Zoom-in from T Thread Detail SQL Text (KDPPSQLT) (KDPSSQLS)” on page 1751.

Accelerators (KDPACCN)
Accelerator statistics for all configured accelerators. See “Zoom-in from Accelerators (KDPACCN)” on page 1751.

Storage (Storage Consumption KDPSTO2A)
The DB2 subsystem storage consumption. See “Navigating from Storage (KDPSTO2A)” on page 1751.

ZOS Statistics (KDPZOS)
Overall CPU usage, paging real and virtual storage usage by DB2.

Navigating from BP (Buffer Pools KDPBP52)
Select the corresponding tab to navigate to:

Group Buffer Pools (KDPGPOOL)
A list of active group buffer pools.

Global Buffer Pool (KDPGBPOL)
A summary of active group buffer pools for this member of the data sharing group.

Zoom-in from KDPBP52 and KDPGBPOL:

S. Buffer Pool Details (KDPBPD52)
The size and the usage of an individual DB2 buffer pool.

H History
Near-term History provides the capability to investigate problems that occurred in the recent past.

Zoom in from KDPGPOOL:

A Sync Read \ GBP Write (KDPGBPSY)
Sync reads, writes and the hit ratio of a group buffer pool.

B Prefetch \ Castout (KDPGBPPF)
Prefetch information and castout information about a group buffer pool.

L P-Locks (KDPGBPPLK)
The P-Lock information for a group buffer pool.

S Secondary GBP (KDPGBPSC)
The DB2 Group Buffer Pool secondary information.

H History
Near-term History provides the capability to investigate problems that occurred in the recent past.

Navigating from SQL Counts DML (KDPSQL1)

DCL (Data Control Language KDPSQL2)
The system SQL counts for Data Control Language (DCL) for a DB2 subsystem.
DDL (Data Definition Language KDPSQL3)
The system SQL counts for Data Definition Language (DDL) for a DB2 subsystem.

RID List Processing (KDPSQL4)
The system SQL counts for Record Identifier (RID) List Processing for a DB2 subsystem.

PARAL (Query Parallelism KDPSQL5)
The system SQL counts for Query Parallelism for a DB2 subsystem.

NESTED SQL (SQL Counts - SP/UDF/Triggers KDPSQL6)
The system SQL counts for Stored Procedures, User Defined Functions, and Triggers for a DB2 subsystem.

PREP (SQL Counts - Prepares KDPSQL7)
The system SQL counts for Prepares for a DB2 subsystem.

ROWID (Row ID KDPSQLD)
The system SQL counts for Row ID access for a DB2 subsystem.

CON STMPT (Concentrate Statements KDPSQL8)
The system SQL counts for Concentrate Literals for a DB2 subsystem.

USE COMMITTED (User Currently Committed KDPSQLA)
The system SQL counts for Use Committed for a DB2 subsystem.

WORKFILE (Workfile Storage KDPSQLB)
The system SQL counts for work files for a DB2 subsystem.

MISC (Miscellaneous KDPSQLE)
The system miscellaneous SQL counts for a DB2 subsystem.

Zoom-in from DB2 Dynamic SQL Cache Statement Statistics (KDPDQLSQL)

S. Statistics (KDPDSYST)
Displays the statistics for a statement in the Dynamic SQL cache.

T. SQL Text (KDPDYNTEX)
Displays the SQL text of statements in the Dynamic SQL cache.

Zoom-in from T Thread Detail SQL Text (KMPSTQ) (KDPSTQ)

S. Statistics (KMPSTA)
Displays the statistics for a statement in the Static SQL cache.

T. SQL Text (KMPSTATX)
Displays the SQL text of a statement in the Static SQL cache.

Zoom-in from Accelerators (KDPACCN)

Accelerator Perspective (KDPACC41)
Accelerator statistics for a selected accelerator.

DB2 Perspective (KDPACC42)
Accelerator statistics for a selected DB2.

Navigating from Storage (KDPSTO2A)

MVS (Storage Above 2 GB KDPSTA2A)
The MVS Storage Above 2 GB workspace provides an overview of MVS storage above the 2 GB bar. It shows information about storage allocation within the DBM1 and DIST address space.
Subsy Shr (Subsystem Shared Storage Above 2GB KDPSTO2B)
The Subsy Shr workspace displays subsystem shared storage above 2 GB including real storage and auxiliary storage.

Common (Common Storage Below and Above KDPSTC2A)
The Common Storage workspace provides an overview of the common storage above and below the 2 GB bar.

LPAR (MVS LPAR Shared Storage Above 2GB KDPSTOLA)
The LPAR workspace provides an overview of MVS LPAR shared storage above 2 GB.

Real Aux (Real and Auxiliary Storage KDPSTU2A)
The Real Aux workspace provides an overview of real and auxiliary storage allocation within DBM1 and DIST address space.

STMT (Shared Storage above 2GB KDPSTS2A)
The STMT workspace provides an overview of DB2 subsystem shared storage and shared variable storage above 2 GB.

IRLM (IRLM Storage KDPSTOIB)
The IRLM workspace provides an overview of DB2 IRLM storage allocation including HWM and thresholds.

H History
Use near-term history to investigate problems that occurred in the recent past.

"H History" in the enhanced 3270UI refers to the OMEGAMON Family history based on the persistent datastore (PDS). For more information about historical workspaces, see http://www-01.ibm.com/support/knowledgecenter/SSAUBV/com.ibm.omegamon_share.doc_6.3.0.2/e3270/near_term_history_intro.htm

For information about attribute groups that you need to enable historical collection for the workspaces, see "Enabling historical data collection in enhanced 3270UI" on page 1763.

Using thread history
OMEGAMON for DB2 thread history in the Enhanced 3270UI is the equivalent of near-term history in the Classic Interface.

Database administrators and systems analysts use thread history to analyze thread performance for recent DB2 application, system, and utility threads. Near-term history (Classic) and thread history (Enhanced 3270UI) data are stored in VSAM data sets. Thread history in the Enhanced 3270UI is approximately equivalent to "thread-related information" in the Classic Interface's near-term history.

An additional distinction is that thread history is different from a snapshot history. Thread history refers to completed thread activities, while snapshot history includes activities currently in progress.

For information on how to set up thread history collection, see Configuring thread history.

Several configuration parameters are required in order to enable thread history in the Enhanced 3270UI. See Parameters updated for thread history for information on thread history configuration parameters. In addition, the HOLDDATA information for this PTF contains installation instructions and post-configuration steps required to enable thread history.
**Viewing thread history**
This topic describes how to verify that the thread history data collector is running.

**About this task**

This task makes the following assumptions:
- Thread history data collector is running
- Tivoli Enterprise Monitoring Agent (TEMA) is running
- Tivoli Enterprise Monitoring Server (TEMS) is running
- Tivoli OMEGAMON Manager is running

**Procedure**

1. From the KOBSEVTS panel, which appears when you log in, select DB2. The active DB2 subsystems are displayed.
2. Enter R beside the name of the DB2 subsystem you want to verify. Press ENTER. If the thread history data collector is running for the DB2 subsystem you selected, the Thread History Selection panel (KDPHFIL1) is displayed. If the collector is not running, a message indicates that thread history is not active for DB2.

   **Note:** The R option is also available from KOBSTART and KDPSTART.

**Filtering thread history by time ranges (timespan)**
You can filter your thread history by time range, to identify threads with performance problems.

**About this task**

This task assumes the thread history data collector is running.

**Procedure**

1. From the KOBSEVTS panel, which appears when you log in, select DB2. This displays the active DB2 subsystems.
2. Enter R next to the DB2 subsystem you want to verify.
3. From the **Timespan** tab, you can specify that you want to select threads from a span of time counting back from the present, such as (1) five minutes or (2) 100 hours. Or you can specify (3) a historical time range, with a start and end date and time. For example, you can select threads for a time range starting at 09:32:01 on 05/15/2017 and ending at 11:32:01 on 05/19/17. Set the Minute(s), Hour(s), or Time Range specification you want to use, then enter 1, 2, or 3 to the left, where 1 is entered in this example:

   ![Timespan Table](image)
4. Select OK. The thread history summary is displayed.

**Filtering thread history by event counts and times**

You can filter your thread history by event counts and times, to identify threads with performance problems.

**About this task**

This task assumes the thread history data collector is running.

**Procedure**

1. From the KOBSEVTS panel, which appears when you log in, select DB2. This displays the active DB2 subsystems.
2. Enter R next to the DB2 subsystem you want to verify.
3. Select the Counts/Times tab. From this tab, you can specify that you want to select threads based on a range of system usage counts and CPU and database elapsed times. The supported operators are EQ (Equal), NE (Not Equal), LT (Less Than), LE (Less Equal), GT (Greater Than), GE (Greater Equal).
4. When you have specified the counts and times you want to monitor, select OK. The thread history summary is displayed.

**Filtering thread history by thread IDs**

You can filter your thread history by thread IDs, to identify threads with performance problems.

**About this task**

This task assumes the thread history data collector is running.

**Procedure**

1. From the KOBSEVTS panel, which appears when you log in, select DB2. This displays the active DB2 subsystems.
2. Enter R next to the DB2 subsystem you want to use.
3. From the Thread ID tab, you can select threads by ID, using criteria such as Plan Name, Auth ID, Connect, Con Type, Correlation ID, CICS TX, and IMS PSB. Note that Correlation ID is case sensitive. You can use the EQ ("equal") or NE ("not equal") operators to specify that you want to see results that match, or results that do not match, the string you enter. The question mark (?) wildcard can be used to represent one character in a string. For example, you might specify TS12?4 to see threads with Auth IDs such as TS1234 or TS1244. The asterisk (*) wildcard can be used to specify that you want to see any string. For example, you might specify OMPE* to see threads with Auth IDs such as OMPEADMIN or OMPETEST. When you use the asterisk wildcard, any characters you enter after the asterisk will be ignored. For example, OMPE*TEST would be treated the same as OMPE*. You cannot use the asterisk at the beginning of a string, for example *ABC. This would be treated as just a wildcard, with the ABC being ignored.
4. When you have specified the selection criteria you want to use, select OK. The thread history summary is displayed.

**Filtering thread history by end user**

You can filter your thread history by end user, workstation, transaction, role, trusted context, or accounting string, from the End User tab.
**About this task**

This task assumes the thread history data collector is running.

**Procedure**

1. From the KOBSEVTS panel, which appears when you log in, select DB2. This displays the active DB2 subsystems.
2. From KOBSTART or KDPSTART, enter R next to the DB2 subsystem you want to use.
3. Select the End User tab. From this tab, you can specify that you want to select threads based on any of several case sensitive criteria:
   - End User ID (up to 56 bytes)
   - Workstation name (up to 56 bytes)
   - Transaction Name (up to 56 bytes)
   - Role Name (up to 56 bytes if running in a trusted context)
   - Trusted Context (up to 56 bytes if running in a trusted context)
   - Accounting String: up to 56 bytes for the agent. For DSN type, it is the first 56 bytes of QMDAACCT. For JCC/SQL types, it is the first 56 bytes of QMDASUFX. For other types, it is the first 56 bytes of AMDAASTR. You can use the EQ (“equal”) or NE (“not equal”) operators to specify that you want to see results that match, or results that do not match, the string you enter. The question mark (?) wildcard can be used to represent one character in a string. For example, you might specify John?Smith to see threads with End User IDs such as JohnBSmith or JohnQSmith.
   - The asterisk (*) wildcard can be used to specify that you want to see any string. For example, you might specify John* to see threads with End User IDs such as JohnSmith or JohnJones. When you use the asterisk wildcard, any characters you enter after the asterisk will be ignored. For example, John*Smith would be treated the same as John*.
4. When you have specified the selection criteria you want to use, select OK. The thread history summary is displayed.

**Viewing summary of all selected history threads**

You can view a list of threads that meet your selection criteria.

**About this task**

This task assumes the thread history collector is running and you have identified one or more selection criteria you want to use to identify current or recent threads that may have performance problems.

For information on how to specify the criteria, see Using thread history.

Once you have specified the criteria, the thread summary is displayed. The summary shows columns of information that identify the workstation, transaction, user, usage, and other characteristics you can use to determine which threads need attention to improve system performance.

**Viewing thread history detail accounting**

The thread history accounting detail helps you diagnose performance problems.
About this task

This task assumes the thread history collector is running and you have identified one or more selection criteria you want to use to identify current or recent threads that may have performance problems.

For information on how to specify the criteria, see [Using thread history](#).

Procedure

1. In the Thread History Summary, select the thread you want accounting detail on, by typing $ next to it and pressing ENTER. The DB2 Thread History Detail Accounting panel is displayed.
2. The Accounting (Acct) and Class3 tabs present information about the thread, which you can use to diagnose performance problems.

Viewing thread history wait times

The Class 3 Wait Times information helps you diagnose performance problems.

About this task

This task assumes the thread history collector is running and you have identified one or more selection criteria you want to use to identify current or recent threads that may have performance problems.

For information on how to specify the criteria, see [Using thread history](#).

Procedure

1. From the Thread History Summary, select the thread you want accounting detail on, by entering W next to it and pressing ENTER. The DB2 Thread History Detail Wait Times panel is displayed.
2. Examine the information in the Class 3 tab to diagnose performance problems.

Configuring thread history

Several parameters are required to configure PARMGEN.

About this task

For information about PARMGEN, see the [Implementation scenarios](#) in the IBM Knowledge Center.

Procedure

1. Log into PARMGEN.
2. Use the instructions in the "Customizing the configuration profiles" step in the implementation scenario to edit the LPAR RTE configuration profile in the RTE's %RTE_HILEV%.%RTE_NAME% dataset and enable the following thread history parameters:
   - Verify that KD2_PFnn_HIS_START is set to Y.
   - Set KD2_PFnn_HIS_STORE to the value that includes THVSAM. If other options (for example, VSAM, SEQ) are included, make sure to set the dependent parameters such as KD2_PFnn_HIS_LOGn.
3. Set the following parameters to YES:
   - KD2_PFnn_THRDHIS_LOG_NUM
   - KD2_PFnn_THRDHIS_DYN_SQL
- KD2_PFnn_THRDHIS_LOCK_CNTN
- KD2_PFnn_THRDHIS_LOCK_SUSP
- KD2_PFnn_THRDHIS_SCAN_SUMM
- KD2_PFnn_THRDHIS_SORT_SUMM

**Note:** These parameters can be configured in PARMGEN, but they are not yet implemented for use with thread history in the Enhanced 3270UI.

4. Run the PARMGEN SPARSE and SUBMIT steps. The jobs that need to run will depend on your SMP/E maintenance and upgrade scenario. For example, you might just need to run the KCIJPW2R job, or you might need to run allocation jobs such as ALLOCDS, TCRV&dbid_ and/or HCRV&dbid. Consult the IBM Knowledge Center page on [SMP/E maintenance and upgrade scenarios](URL).

5. Verify that the COPT&dbid file is generated correctly. Check that the THRDL parameters are set according to the values you set in KD2_PFnn_THRDHIS_* in PARMGEN:

   - THRDLOG(7)
   - THRDDATASET(D01OMPE.VTS5815.DBA9.RKTH*)
   - THRDSQL(YES)
   - THRDCONT(YES)
   - THRDSUSP(YES)
   - THRDSAN(YES)
   - THRDSORT(YES)

6. Verify that all data sets mentioned in COPT&dbid member have been generated.

**Thread history parameters**

New PARMGEN parameters have been added, and existing parameters have new defaults or have been updated, for use with thread history. See the Parameter Reference for further information.

**Setting new PARMGEN parameters**

**About this task**

You can change the new PARMGEN parameters, then refresh the profile so your new settings take effect. Follow these steps to make changes:

**Procedure**

1. Log into PARMGEN.
2. Create a new runtime environment.
3. Check the profile to make sure these parameters are set to their default values, as indicated:
   - KD2_PFnn_HIS_VSAM_SU = MB
   - KD2_PFnn_HIS_VSAM_MB = 900
   - KD2_PFnn_HIS_ACCTG_CLASS = 1
   - KD2_PFnn_THRDHIS_DYN_SQL = N
   - KD2_PF_HIS_LOCK_CNTN = N
4. Verify that KD2_PFnn_HIS_START is set to Y.
5. Run the PARMGEN SPARSE and SUBMIT steps. Note that the SUBMIT step may fail if there is insufficient free space. SUBMIT will try to allocate VSAM data sets of 900 MB each.
6. Verify that all VSAM data sets mentioned in the COPTxxxx member are generated and that they have the length you specified. If the SUBMIT job failed, verify that the **. WKD2SAM (ALLOCDS) member, which is used for dataset allocation, has 900 MB.

**Saving disk space if thread history is not in use**

If you don’t need thread history, there are several ways you can save disk resources by disabling collection and storage of unnecessary data.

**About this task**

You can disable near term history data collection, sequential data collection, or Enhanced 3270UI thread history collection to save disk space.

By default, the thread history parameter (KD2_PFnn_HIS_STORE) is set to N. In such a case, the WRITEOPTION parameter is set to NONE and no data sets are allocated. If you change KD2_PFnn_HIS_STORE to Y, the WRITEOPTION parameter is set to VSAM, SEQ, THVSAM, or any combination of these, based on the value of the KD2_PFnn_HIS_START parameter. Corresponding data sets will be allocated as well.

**Note:** These space-saving steps will work only for new runtime environments (RTEs), as PARMGEN does not delete any thread history data sets allocated earlier.

If you are a new PARMGEN user, see Implementation scenarios in the OMEGAMON shared publications. This will explain how to use PARMGEN to configure OMEGAMON for DB2. The steps that follow assume that you have some knowledge of PARMGEN.

**Procedure**

1. Log into PARMGEN.
2. Create a new runtime environment (RTE).
3. Set the KD2_PFnn_HIS_STORE parameter to, for example, THVSAM.
4. Set the KD2_PFnn_HIS_START parameter to Y.
5. Update dependent parameters: data set number, since you selected the THVSAM option.
6. Run the $PARSE and SUBMIT steps in PARMGEN. The jobs that need to be run will depend on your SMP/E maintenance and upgrade scenario. For example, you may just need to run the KCIJPW2R job, or you may need to run allocation jobs such as ALLOCDS, TCRV&dbid, and HCRV&dbid. Consult the IBM Knowledge Center topic SMP/E maintenance and upgrade scenarios for more information.
7. Verify that the COPT&dbid file has been generated correctly.
8. Verify that all data sets mentioned in the COPT&dbid member have been generated.

**Thread history parameters example**

This code sample shows the thread history parameters fully configured.

**Thread history parameters**

```
* *******************************************************************
* OMEGAMON for DB2 PE Thread history data collector options for
* Classic & OMEGAMON enhanced 3270 user interface (TOM) thread history
* Notes:
```
1. OMEGAMON enhanced 3270UI thread history applies to V5.3.0 and higher versions only.

Your OMEGAMON for DB2 PE/PM version installed is:
- FMID HKDB530

2. COPTDBA9 NTH collector options only apply if the NTH enablement flag is set (KD2_PFnn_HIS_START = "Y")

Your NTH enablement flag is set to:
- KD2_PF01_HIS_START = "Y"

*******************************************************************
DB2SYS(DBA9)

For both OMEGAMON enhanced 3270UI and Classic NTH options:
* Note: WRITEOPTION(VSAM,SEQ,THVSAM) options (or a variation of any of these NTH storage options) are generated based on your KD2_PF01_HIS_STORE setting. If KD2_PF01_HIS_START = "N" (NTH collection is not enabled), WRITEOPTION defaults to WRITEOPTION(NONE)

MEMBER: KD2$PCOP

Purpose:

WCONFIG(KD2$PCOP) to identify additional H2DATASET() in WKD2PAR(COPT&dbid) OMEGAMON for DB2 Classic NTH history.

Instructions:

1. Add your additional H2DATASET() VSAM entries
   - D01OMPE.VTS5815.QA530.DBA9.RKD2VSnn
     (where nn = 08..60)
   - if you need more than 7 VSAMs as specified in the PARMGEN LPAR
   - RTE WCONFIG(QA530) profile's "KD2_PF01_HIS_Logn" parameter.
   - Note: Do not modify "DBA9" as this imbed will be used for each
     DB2-specific COPT&dbid NTH collector options member.

2. To allocate the additional RKD2VSnn VSAMs, use the tailored
   HCRV&dbid standalone RKD2VSnn allocation job in the
   RTE's RKD2SM dataset.

USER SECTION: IMBED FOR MEMBER WKD2PRF(COPT&dbid)

Adding Thread History Datasets

This topic discusses thread history datasets in OMEGAMON for Db2 on z/OS Performance Expert (OMPE) and explains how you can increase the number of datasets. The key is that you must restart the OMPE collector in order for new datasets to be recognized.

When you run OMPE with system substitution variables, a KCIPARSE step will run the next time OMPE starts. If you make changes to the permanent RKD2PAR file, the changes are not picked up until the next time KCIPARSE is run, which will happen when you start the OMPE collector.

The KCIPARSE step creates temporary files that are copies of the runtime files, but with substitutions made. The RKD2PAR file located where the COPT members are is copied to a temporary dataset. OMPE then runs from that temporary file; for example:

//KAND2PU DD DISP=SHR,
//DSN=&USERD2PU
//TMPD2PU DD DISP=(,PASS),DSN=&TMPD2PU,DSNTRY=(LIBRARY,1),
//UNIT=SYSDA,SPACE=(CYL,(5,5,440)),
//DCB=(RECFM=FB,LRECL=80,BLKSIZE=8880)

These startup messages show the RKD2PAR file as a temporary file:

K02Z056I OM02 V540 01-RKANPAR VOL=WKP100 DSN=SYS18283.T192035.RA000.OMPEPK3S.TMPPARU.H04
K02Z056I OM02 V540 02-RKANPAR VOL=WKP104 DSN=SYS18283.T192035.RA000.OMPEPK3S.TMPPARU.H04

IBM Db2 Performance Expert on z/OS
If you change the permanent RKD2P AR file, the change is not recognized until the next time KCIPARSE is run, when OMPE starts.

The only way to avoid this behavior is not to perform system variable substitution for the RKD2PAR dataset. In the OMPE Startup JCL, the following DSN names would have to be changed to the original names (not the temporary names):

```
//RKANPAR DD DISP=(OLD,PASS),
//DSN=*.KCIPARSE.TMPPARU
//DD DISP=(OLD,PASS),
//DSN=*.KCIPARSE.TMPD2PU
```

**Accessing information about buffer pool performance**

You can review buffer pool information (such as getpages and buffer pool hit ratios), to evaluate how well a thread is performing and to determine if excessive I/O is being consumed for a thread.

### About this task

**Note:** You can access information about buffer pool performance from either Db2 Active Threads or Thread History.

### Procedure

1. To access information about buffer pool performance from Db2 Active Threads:
   a. From the OMEGAMON main menu, select the **DB2** tab (KOBSDB2).
   b. In the entry field next to the appropriate Db2 subsystem, type **T** to access Db2 Active Threads panel (KDPTHD52).
   c. In the entry field next to the appropriate active thread:
      - Type **8** and press enter to access the Db2 Thread Detail Buffer Pool panel (KDPTHDBP). In the **Buffer Pools** section, type **S** next to the buffer pool of interest to access the DB2 Thread Detail Buffer Pool panel (KDPTHDBD).
      - Type **6** and press enter to access the Db2 Thread Detail Group Buffer Pool panel (KDPTHGBP). In the **Group Buffer Pools** section, type **S** next to the buffer pool of interest to access the DB2 Thread Detail Group Buffer Pool panel (KDPTHGBD).

2. To access information about buffer pool performance from Thread History:
   a. From the OMEGAMON main menu, select the **DB2** tab (KOBSDB2).
   b. In the entry field next to the appropriate DB2 subsystem, type **R**.
   c. On the Thread History Timespan Selection panel (KDPHFL1), specify the appropriate selection criteria and click **OK**.
   d. On the Thread History Summary panel (KDPHISTL) panel:
      - Type **B** and press enter to access the **DB2 Thread History Detail Buffer Pools > BP** tab (KDPHBP). In the **Buffer Pools** section, type **S** next to the buffer pool of interest to access the DB2 Thread History Detail Buffer Pool panel (KDPHBPD).
      - Type **G** and press enter to access the **DB2 Thread History Detail Buffer Pools > GBP** tab (KDPHGBP). In the **Group Buffer Pools** section, type **S** next to the buffer pool of interest to access the DB2 Thread History Detail Buffer Pool panel (KDPHGBPD).

### User interface icons and PF keys

Reference of PF keys and icons.
Icons

The enhanced 3270UI displays many different “icons” that perform various functions. Icons are typically displayed in reverse video white, which indicates an action occurs when you place your cursor on the icon and press Enter (or double-click if your emulator is configured to do so).

Table 126. Subpanel manipulation icons

Associating a mouse click with the Enter key

If your emulator supports the option to associate a mouse click with the Enter key, you can use this feature to "double-click" where you normally "click and press Enter." Consult your emulator's documentation for details about how to enable this feature.

Enabling historical data collection in enhanced 3270UI

The enhanced 3270UI is designed for investigation of current problems or those that have occurred in the recent past.
Therefore, near-term history data can be displayed in the enhanced 3270UI workspaces. The Near-term history supports DB2 statistics, DSNZPARM, DB2 critical messages, DB2 connect server and object analysis.

Each workspace consists of one or multiple attribute groups. The history collection for the corresponding attribute groups must be started in order to see the history data in a workspace. Attribute groups that you need to enable historical collection for the workspaces are in Table 130 and Table 131.

Table 130. Workspace and attribute group cross reference for history collection for DB2 Subsystems.

For example, if you want to view the Group Buffer Pools history, you must start history collection for attribute group DB2 Group Coupling Facility, and DSG_GBP_Pool. Later, if you also want to see Global Buffer Pools history, then you start history collection for attribute group DSG_GBP_CF_Status.

<table>

**ISPF Online Monitor**

This information describes the ISPF Online Monitor of the following products:
- IBM OMEGAMON for Db2 Performance Expert on z/OS
- IBM OMEGAMON for Db2 Performance Monitor on z/OS

Always check the IBM DB2 and IMS Tools Library web page and the Tivoli library page for the most current version of this information:
- [OMEGAMON for Db2 Performance Expert on z/OS (PDFs and Techdocs on Db2 Tools Product Page)]
- [OMEGAMON for Db2 Performance Monitor on z/OS (PDFs and Techdocs on Db2 Tools Product Page)]

**Note:** As a result of an end-user interface-consolidation, the following ISPF Online Monitoring functions are not supported for DB2 11 or later.
- Display Thread Activity (option 3.1)
- Display Statistics (option 3.2)
- Display System Parameters (option 3.3)

Full real time monitoring support is supported by the VTAM end user interface, which is described in [Monitoring Performance from the OMEGAMON Classic Interface](#)

Until several unique ISPF Online Monitor functions become available through the OMEGAMON Classic Interface in stages, the ISPF Online Monitor functions and their descriptions are retained in here. Nevertheless, you are encouraged to familiarize yourself with the functions available through the OMEGAMON Classic Interface, which is described in [Monitoring Performance from the OMEGAMON Classic Interface](#)

The product often provides context-related online help information that can be invoked from menus, panels, and windows by using the PF key F1 or the Help button. Online help information is not necessarily repeated in this information,
especially if it is very detailed information that is of interest only when you actively work with a function. You are encouraged to use F1 or Help to see the entire available information.

**Overview of the ISPF Online Monitor**

The ISPF Online Monitor provides various functions to determine performance problems.

**Introduction to the ISPF Online Monitor**

This section describes how to invoke the ISPF Online Monitor and introduces the functions that are accessible through its main menu.

**Changed access path to the ISPF Online Monitor:**

When you start IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS from ISPF (Start EXEC FPEJINIT), the main menu is displayed.

```
FPEFMENU      IBM OMEGAMON for DB2 Performance Expert on z/OS

Select one of the following.

1. Create and execute reporting commands
2. View online DB2 activity - Classic Interface
3. View online DB2 activity - PE ISPF OLM
4. Maintain parameter data sets
5. Customize report and trace layouts
6. Exception profiling

Command ===> F1=Help  F2=Split  F3=Exit  F9=Swap  F12=Cancel
```

*Figure 11. Main menu*

This menu provides access to the OMEGAMON XE for DB2 PE functions and to the ISPF Online Monitor (option 3).

**Note:** The OMEGAMON XE for DB2 PE options shown on this menu (all, except option 3) are described in detail in *Monitoring Performance from the OMEGAMON Classic Interface*.

Nevertheless, for the time being, option 3 on the OMEGAMON XE for DB2 PE main menu invokes the ISPF Online Monitor, which was part of the predecessor products IBM DB2 Performance Expert for z/OS and IBM DB2 Performance Monitor for z/OS. The following topics introduce the options that are available for the ISPF Online Monitor.

**Performance data generation and online monitoring:**

DB2 generates trace data about its own performance and events in DB2 subsystems. However, DB2 does not provide any reporting facilities for analyzing this data. The Online Monitor provides you with the capability to view an active DB2 subsystem and identify performance problems online.

The Online Monitor displays subsystem-wide performance information, such as processor times, buffer pool usage, locking, log, and I/O activity. For an individual thread, the Online Monitor displays information such as the elapsed time, the time
spent in DB2, the time it was suspended, the read and write activity involved, the locks obtained, and the SQL statements executed.

The Online Monitor displays subsystem-wide DB2 performance information in a comprehensive form that is easy to understand and analyze. You can use the Online Monitor to:
- Determine total DB2 system performance and efficiency
- Measure an application’s performance and resource use
- Evaluate an application’s effect on other applications and the system
- Analyze and improve SQL statements
- Identify potential problems
- Determine tuning requirements for DB2.

When changes are made to an application or to the DB2 subsystem, the Online Monitor can help you determine the effects. This is very important for determining whether the changes increased or decreased performance.

When DB2 performance is not satisfactory, the Online Monitor can help you identify areas where tuning is required to optimize the performance of DB2. The Online Monitor can log DB2 activities and events and provide this information for later viewing to assist you in determining the cause of potential problems.

For a long-term view of DB2 performance, your needs are best served by the batch reporting capabilities.

**Overview of the ISPF Online Monitor functions:**

When you invoke the ISPF Online Monitor by selecting option 3 on the OMEGAMON XE for DB2 PE main menu, the Online Monitor Main Menu is displayed.

The Online Monitor Main Menu provides access to functions through sets of menus and panels.

![Online Monitor Main Menu](image)

**Figure 12. Online Monitor Main Menu**

**Display Thread Activity:**

Use this option to view detailed thread and locking information for all threads that are currently connected to a DB2 subsystem.
You can view active threads in a summary format, or examine them individually in greater detail.

When you select this option, the Thread Summary panel is displayed, listing all active threads. You can filter the list by using the QUALIFY command (see “QUALIFY command” on page 1867 for more information). You can also sort the list by using the SORT command (see “SORT command” on page 1870 for more information). You can select any active thread to display the Thread Detail panel, where you can examine the thread.

The Thread Detail panel provides an overview of key values for the selected thread. From the Thread Detail panel, you can access additional windows to view thread activity data in greater detail.

See “Displaying thread activity” on page 1824 for more information about viewing thread activity.

The headings, field labels, fields displayed, and the order they appear in the Thread Detail panel can be tailored. See “Customizing panels” on page 334 for more information.

Display Statistics:

Use this option to view important statistics and ratios of a DB2 subsystem in a summary format or in detail.

When you select this option, the DB2 Statistics Detail panel is displayed providing an overview of key statistics values for the system. From this panel, you can access additional windows to view statistics data in greater detail.

See “Viewing DB2 statistics” on page 1873 for more information.

The headings, field labels, fields displayed, and the order they appear in the DB2 Statistics Detail panel can be tailored. See “Customizing panels” on page 334 for more information.

Display System Parameters:

Use this option to view an overview of the current DSNZPARM values in effect for a DB2 subsystem including any changes to the buffer pool and group buffer pool parameters.

When you select this option, the DB2 System Parameters panel is displayed providing an overview of key system parameter values. From this panel, you can access additional windows providing system parameters information in greater depth.

See “Viewing system parameters” on page 1938 for more information.

The headings, field labels, fields displayed, and the order they appear in the DB2 System Parameters panel can be tailored. See “Customizing panels” on page 334 for more information.
Options:

You can use options to change the parameters affecting the behavior of your own Online Monitor session.

For example, you might want to specify the following options:

- Select the DB2 subsystem to be monitored.
- Display your installation-specific history parameters (only available if the data collector is installed at your site). See “OMEGamon Collector Purpose and function” on page 372 and the following sections for a description of the data collector.
- Control the writing of monitor records to an output data set.
- Set the default auto-display interval.
- Set several Interactive Report Facility (IRF) session options.
- Set the current SQLID for Explain processing.
- Allocate a larger storage area for thread summary information, if the default size is not sufficient.

See “Online Monitor options” on page 1789 for more information.

Collect Report Data - General:

Use this option to start and stop DB2 traces either manually or automatically by specified triggers. The resulting trace data can be directed to a data set for immediate input to batch reporting. The DB2 traces required are determined by the reports that you want to produce.

See the Reporting User’s Guide for more information.

Collect Report Data - For Buffer Pool Analysis:

Use this option to collect data for the buffer pool analysis function. The collected data is used to report buffer pool efficiency, and to simulate the effects buffer pool tuning actions before altering a buffer pool’s characteristics.

See the Buffer Pool Analyzer User’s Guide for more information.

Create and execute reporting commands:

This option invokes the Interactive Report Facility (IRF), which you can use to interactively create and execute batch report command streams.

See the Reporting User’s Guide for the description of the IRF and the Report Reference for reports generated by using the IRF.

Maintain parameter data sets:

Use this option to maintain the Exception Threshold data set, the correlation translation member, the timezone information member, and the MAINPACK definition member.

See the Reporting User’s Guide for more information.
**Explain:**

Use this option to examine the access path method chosen by DB2 for a given SQL statement in an easy-to-read format. The SQL statement you want to explain can be an existing entry in a specific PLAN_TABLE, an SQL statement from a previously bound plan or package, or a dynamically entered SQL statement.

You can view detailed information about packages, DBRMs, tables, indexes, and the SQL text. The SQL statement can be modified for online tuning.

You can also explain an SQL statement from within the thread activity function to explain a currently executing SQL statement, or from within an ISPF/PDF editor to explain an SQL statement imbedded in a source program or SPUFI input.

See “Monitoring the access path with Explain” on page 1921 for more information.

**Monitoring and problem determination**

This section describes how to monitor a DB2 subsystem and how to determine performance problems by using batch reports and the Online Monitor functions of OMEGAMON XE for DB2 PE.

You can use OMEGAMON XE for DB2 PE for continuous or periodic monitoring of a DB2 subsystem and for determining specific performance problems in DB2. OMEGAMON XE for DB2 PE can help you in:

- Determining how an application will perform or is performing over a period of time
- Indicating where there are tuning opportunities in your system
- Distinguishing among subsystem and application problems
- Monitoring an application in a detailed manner so you can identify problem areas
- Analyzing constraints acting on an application
- Determining the performance effects of any adjustments made within the DB2 subsystem
- Determining whether performance objectives are being met

OMEGAMON XE for DB2 PE offers different ways to monitor your subsystem depending on whether you want to see current or past activity. Use the Online Monitor to monitor an active subsystem as well as to view events that happened in the recent past. Use the Batch reports to examine performance problems in the more distant past and trends over a period of time.

The amount of data generated for monitoring a DB2 subsystem is vast, so limiting the amount of data to show only potential problem areas is essential. OMEGAMON XE for DB2 PE offers several ways of reducing the amount of data that needs to be examined, the most important is exception processing. Exception processing makes it easy for you to focus on possible performance problems by highlighting data that is outside defined thresholds. It is available in Batch reporting and the Online Monitor.

A good approach is to monitor an active DB2 subsystem using Online Monitor exception processing (you do not need to be logged on to have exception processing running) and to regularly generate Statistics and Accounting exception reports. Online Monitor exception processing alerts you to performance problems...
as soon as they occur, and the Accounting and Statistics reports give you a detailed picture of application and system performance over a period of time.

Deadlock and timeout participant details are available online through exception event processing. Consider generating deadlock and timeout traces regularly, because in this way information is available to help you investigate any locking problems in detail. There is no significant performance overhead on the DB2 side in collecting the data for these reports.

The best way to investigate performance trends is by producing Accounting and Statistics reports that are ordered by interval.

To detect problems as they occur, use the Online Monitor periodic exception processing. When you detect poor thread performance, you can examine the comprehensive performance data that is shown in Thread and Statistics panels. If you assume the problem is caused by SQL, you can analyze the access path using the online explain function.

If the problem occurred in the recent past, you can use the Online Monitor HISTORY command to view the events surrounding the problem without having to re-create it.

If the panels do not provide enough information to solve the problem, you can use the Online Monitor to collect instrumentation data for batch reports. You can specify the data collection to be triggered by exception thresholds; in this way you can minimize the time high-volume and high-cost traces are active and ensure that the data needed is collected at the right time.

OMEGAMON XE for DB2 PE provides a comprehensive set of reports with different levels of detail and for different areas of performance. This represents a top-down approach to problem determination: the most generic reports indicate the problem area and, if necessary, more details can be shown to narrow down the cause of the problem.

The DB2 operating environment:

The performance of a DB2 transaction or query is dependent not only on the performance of the DB2 subsystem, but also on the performance of the transaction manager, such as CICS or IMS, and the MVS system itself. Therefore the environment in which the DB2 subsystem is operating should be tuned before DB2 is tuned.

For example, if the MVS system is overloaded, tuning a DB2 subsystem is unlikely to improve DB2 system performance. DB2 performance can only be improved by reducing or balancing the load of the MVS system.

Specialized tools are available to monitor the different system components:
- CICSpex System Manager for CICS
- IMS/VS DC Monitor or IMSPARS for IMS
- RMF for MVS

The relationship between the different systems and performance tools is complex, however, it is not within the scope of this documentation. For more information, see [IBM Db2 for z/OS in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter). It is assumed that the environment in which the DB2 subsystem is operating is well tuned.
Performance objectives and exception processing:

Before you can start monitoring the system, define your performance objectives on the basis of the business needs, the workload for the system, and the resources available. Typically, the objectives would include acceptable response times, average throughput, and system availability.

These objectives are usually formalized in service-level agreements between the users and the data processing groups in an organization. The agreements can include expectations of query response times and transaction throughput.

You can monitor how well these objectives are being met.

The most efficient way to do this is to set limits, exception thresholds, for key fields that reflect your performance objectives using exception processing.

Exception profiling can assist you in establishing exception thresholds. This facility sets exception thresholds automatically based on your application configuration. For reports, the Accounting TOP subcommand option is also useful in determining Accounting exception thresholds.

For example, you can monitor response times by setting exception thresholds for class 1 and class 2 elapsed times to reflect the acceptable response times for your environment. Class 1 elapsed time shows the thread time (from thread creation to thread termination) and class 2 time shows the time DB2 spent processing SQL statements.

Monitoring performance:

The key to effective performance monitoring is in identifying unusual situations and thereby limiting the amount of data that needs to be examined. In addition to exception processing, OMEGAMON XE for DB2 PE offers several other ways of filtering the data and highlighting potential problems.

The following options are available in Batch reporting:
- Filtering data by date and time (FROM and TO subcommand options)
- Filtering data by identifiers such as user ID (INCLUDE and EXCLUDE subcommand options)
- Filtering data by resource usage (TOP subcommand option)
- Ordering data on reports by interval (INTERVAL subcommand option)
- Summarizing and sorting data on SQL reports
- Tailoring report layouts for your own needs. The User-Tailored Reporting feature (UTR) and its use is described in detail in the Reporting User’s Guide

The following options are available in the Online Monitor:
- Qualify and sort functions
- History data collection with qualifications

Monitoring using reports:

You can filter the data shown in reports by using the INCLUDE and EXCLUDE subcommands to show, for example, information only for certain plans, authorization IDs, or locations. You can use the FROM and TO subcommands to filter data within specified times.
Another way to limit the data that needs to be examined is to use the TOP subcommand option to obtain a high water mark type of reporting on resource usage. The TOP lists, printed at the end of an Accounting report or trace, can identify the threads or users that have required the most use of the resources specified in the TOP subcommand option. Alternatively, you can use the TOP subcommand option with the ONLY keyword to filter entries based on resource usage and produce a report that shows only entries with the highest resource usage.

You can summarize data for certain periods by ordering your Accounting and Statistics reports by interval. For example, you can summarize data for the peak periods during the day.

If you produce SQL Activity reports and traces, potential problems can be highlighted by sorting and summarizing the information within the report and trace entries by several criteria. For example, a problem cursor can be identified by summarizing SQL activity by cursor and ordering the cursors by TCB times. The sorted entries provide an easy way to identify SQL statements that might be causing performance problems.

You can tailor your own report layouts and trace layouts with the User-Tailored Reporting feature (UTR). Use UTR to control the volume, contents, and layout of your traces and reports. The User-Tailored Reporting feature (UTR) and its use is described in detail in the Reporting User’s Guide.

Monitoring using the ISPF Online Monitor:

The ISPF Online Monitor qualify and sort functions can help you limit and prioritize the threads listed in the Thread Summary panel.

Use the qualify function to filter threads by OMEGAMON XE for DB2 PE identifiers, thread status, and thread type, and to effectively reduce the amount of data that needs to be examined. For example, to view only the active threads in lock wait status, qualify the threads by selecting the 1 field on the DB2 Thread Qualification Parameters window.

Use the sort function to specify the order in which the threads are listed. For example, to view the threads that are spending the most time within DB2, you can sort the threads by class 2 time in descending order. Threads in exception status are automatically sorted to the top of the list.

Observing performance trends:

You can use reports and graphs to summarize data over periods of several days, weeks, or months to observe trends in performance. Pay special attention to peak periods of activity, for new applications and for the system as a whole. During peak periods, constraints and response-time problems are most evident.

Some trends to look for are:

- Increases in response times, number of I/Os, resource contention, and processor usage
- Changing workload patterns over a period
- Changes in the transaction distribution and frequency
- Changes in the SQL activity pattern
Determining performance problems:

When you find that there are performance problems when you are monitoring the system, you can use several panels and reports to investigate the cause of the problems.

Problems detected in periodic exception processing:

If you use periodic exception processing in the Online Monitor and you are notified about a problem, examine the information in the Thread Activity panels or Statistics panels, depending on the type of problem.

- For system related problems, examine the Statistics panel and the DB2 System Parameters panel.
- For application related problems, examine the Thread Activity panels.

To view the past events surrounding the problem online, you can use the HISTORY command. The amount of available historical data is determined by installation-defined options. Note, however, that the batch reports are more comprehensive than the Online Monitor panels. Therefore, if the panels do not provide enough information to solve a problem, the Online Monitor Collect Report Data function should be used to gather information in a data set for input to the batch reports.

Problems detected in exception event processing:

If you detect a problem using the online exception event processing and the Online Monitor panels do not provide sufficient information to determine the cause, collect the appropriate trace data to produce Locking reports, I/O Activity reports, Audit reports, or Record Trace reports. This section describes how to proceed with specific exception events.

Deadlock or Timeout
If deadlocks or timeouts occur too often, generate a Lockout report to see which applications and objects are affected. Having identified the objects and applications causing the deadlocks or timeouts, use EXPLAIN to understand the locking behavior of the SQL statements or consider reorganizing the database.

EDM Pool Full
First check online or batch statistics to obtain more information about the EDM Pool situation. More details are provided in the I/O Activity EDM Pool report.

Authorization Failure
If authorization failures occur too often, generate an Audit authorization failure report for details.

Thread Commit Indoubt
Run a Record trace on the Statistics Class 4 IFCIDs to see details of communication problems. These are likely to be either VTAM or DB2 internal problems.

Coupling Facility Rebuild
Use the COLLECT command to automatically start tracing IFCID 268 (CF rebuild end) when a coupling facility rebuild starts, and run a Record trace for this IFCID. You can get more details about coupling facility behavior from RMF reports.
Problems detected in exception reports:

If you use an Accounting exception report to monitor your system, produce this report using the TOP or the INTERVAL subcommand option so that you can immediately focus on potential problem areas.

If you use an Statistics exception report to monitor your system, produce this report using the INTERVAL subcommand option so that you can immediately focus on potential problem areas.

Sometimes, however, you require more detailed reports to determine the exact cause of a problem.

System problems:

If exception processing indicates problems in system-wide resource usage and a Statistics trace does not clarify the reason for the problem, but points to EDM pool or logging activity, consider running I/O Activity reports. Or, if the Statistics trace indicates a problem with binds, generate Utility Activity reports. If the number of deadlocks is high, run Locking reports. If none of these report sets offer adequate information to determine the cause of the problem, you can run a Record trace to format the individual instrumentation records.

Application problems:

If exception processing indicates an application-related problem, which is typically indicated as an elapsed time problem for an application or a user, use Explain reports to determine the access path of the suspected plan. In addition, if necessary, generate Accounting traces by using the TOP subcommand option.

- If the Explain reports and the Accounting traces do not identify the reason for poor SQL performance, use SQL Activity reports for detailed information about the specific statement, such as scans or I/O per page set or sort specifics.
- If the Accounting traces indicate a locking problem, run Locking reports.
- If the problem seems to be with binds or DB2 utilities, run Utility Activity reports.

As with system-related problem determination, you can run a Record trace if none of these report sets provide adequate information.

Other uses for OMEGAMON XE for DB2 PE:

You can also use OMEGAMON XE for DB2 PE in application development and capacity planning.

The Explain and the SQL Activity reports can help you anticipate how an application will perform. The Online Monitor Explain and Source Explain functions as well as some functions of thread activity can assist you in tuning your application’s SQL online.

Accounting and Statistics reports that are ordered by INTERVAL are useful in capacity planning. Use these reports to identify peak periods in system activity as well as the need to adjust system resources.
How to use the ISPF Online Monitor

The following information describes how to use the ISPF Online Monitor, its parameters, help, keys, panels, and commands. It also describes some common problems that you might encounter when you use OMEGAMON XE for DB2 PE.

Using the ISPF Online Monitor

This section outlines the privileges and traces required to use the ISPF Online Monitor, shows how to change parameters that affect the behavior of an Online Monitor session, describes the online help, the default function key settings, how to move between Online Monitor panels, how to issue DB2 commands, global commands, and how to treat some common errors.

Required authority:

The information in this section applies only if you do not use the user authorization exit.

If the user exit is active, the description about the user authorization exit provided in IBM Db2 for z/OS in the IBM Knowledge Center applies.

To use the Online Monitor, you need the following authorities:

- Access to a DB2 subsystem
- EXECUTE authority on the Online Monitor plan. The plan name is KO2PLAN.
- MONITOR1 privilege
- Display trace privilege

You also need the DB2 authority for any DB2 commands you issue.

The following authorities are recommended:

- MONITOR2 or SYSADM privilege if you need access to the currently executing SQL statement
- DB2 privilege to start or stop a DB2 trace, if you want to collect report data

Important: Granting MONITOR2 privilege enables access to potentially sensitive data, for example, the SQL statement being executed.

Input data from DB2 monitor traces:

To use the Online Monitor, ensure that the DB2 monitor trace is active. Monitor trace class 1 is required to display data. Monitor trace classes 2, 3, 7, and 8 should also be activated.

As long as the monitor trace is active, there is no need to activate DB2 Statistics and Accounting traces.

Monitor trace class 2 provides DB2 processor and elapsed times for the Thread Activity panels and class 7 provides DB2 processor and elapsed times for packages. Monitor trace class 2 is also required for class 1 TCB time.

Monitor trace class 3 provides DB2 suspension times for the Thread Activity panels and class 8 provides DB2 suspension times for packages.
Note: The version and release numbers of the DB2 load library allocated to the Online Monitor session must match the version and release numbers of the DB2 subsystems being monitored.

To change the version of DB2 you are monitoring, exit from the Online Monitor and ISPF to reallocate the DB2 load library. For information about how to reallocate the DB2 load library at your site, consult your system programmer.

Accessing the ISPF Online Monitor:

To access the ISPF Online Monitor, start your IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS session from the TSO/ISPF environment (Start EXEC FPEJINIT).

When the IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS main menu (see Figure 11 on page 1776) is displayed, select option 3 (View online DB2 activity - PE ISPF OLM). This presents the Online Monitor Main Menu (see Figure 12 on page 1777).

Moving between panels:

When you have entered a command on the command line, or have entered the information required to complete a panel, press Enter.

To go back to a previous panel or menu, press F3 (Exit).

Each time you press Enter or F3 (Exit), data entered in that panel is validated. If an error is detected, an error message is displayed and the cursor is positioned on the field in error. If no error is detected, processing continues.

To leave a panel without saving the entries and return to the previous panel, or to cancel all windows, press F12 (Cancel).

You can move between various Online Monitor options by typing = followed by the Online Monitor Main Menu option number on the command line of any Online Monitor panel:

=1 Jumps to Display Thread Activity
=2 Jumps to Display Statistics
=3 Jumps to Display System Parameters
=4 Jumps to Options
=5 Jumps to Control Exception Processing
=6a Jumps to Collect Report Data - General
=6b Jumps to Collect Report Data - For Buffer Pool Analysis
=7 Jumps to Create and execute reporting commands
=8 Jumps to Maintain parameter data sets
=9 Jumps to Explain
=X Exits the Online Monitor
Updating values:

To refresh Thread Activity, Statistics, and System Parameters panels with new data from DB2, press Enter.

Values are not updated if:

- Any OMEGAMON XE for DB2 PE or ISPF command is entered on the command line
- Windows are selected for display
- Function keys are used

Note: The values shown in the Thread Summary and Threads Holding Resource panels are refreshed automatically each time the panels are displayed.

Leaving the ISPF Online Monitor:

To exit the ISPF Online Monitor from the Online Monitor Main Menu, press F3 (Exit) or F12 (Cancel). From any other Online Monitor panel, type =X on the command line and press Enter.

If any asynchronous tasks are active when you exit the Online Monitor, you are notified by one of the Asynchronous Task Termination panels. If the data collector is not active, the tasks are terminated when you exit the Online Monitor. If the data collector is active, you have the choice of leaving the selected tasks active or not when you exit the Online Monitor. See Figure 13 for an example of an Asynchronous Task Termination panel and to “OMEGAMON Collector purpose and function” on page 372 and the following sections for a description of the data collector.

<table>
<thead>
<tr>
<th>FPMEGP01</th>
<th>Asynchronous Task Termination</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>====&gt;</td>
</tr>
</tbody>
</table>

Press Enter to exit the Online Monitor or request Exit or Cancel to return to the Online Monitor Main Menu.

Select an Exception task to keep it active. All non-selected tasks will be terminated when leaving the Online Monitor as well as all the DB2 traces started by the Collect Facility will be stopped.

<table>
<thead>

</tbody>
</table>

Figure 13. Asynchronous Task Termination panel

To exit the Online Monitor from this window, press Enter. If the data collector is active, any tasks selected in this window remain active.

To return to the Online Monitor Main Menu, press F3 (Exit) or F12 (Cancel). All active tasks remain active.
Online Monitor options:

Use the Options panels to change parameters affecting the behavior of your Online Monitor session. To display the Options menu, select option 4 (Options) from the Online Monitor Main Menu.

You can select one of the following options from this menu:

- Select option 1 (DB2 Subsystem) to display either the DB2 Subsystems List window or DB2 Subsystem window, where you can select the DB2 subsystem to be monitored.

- Select option 2 (History Defaults) to display the History Defaults window, where you can display the installation-specified history defaults. This option is available only if a data collector is active for the DB2 subsystem you are monitoring. See "OMEGAMON Collector purpose and function" on page 372 and the following sections for a description of the data collector.

- Select option 3 (Monitor Output) to display the Monitor Output window, where you can control the writing of monitor records to an output data set.

- Select option 4 (Auto Display) to display the Auto Display window, where you can set the default interval for the AUTO command.

- Select option 5 (Session Options) to display the Session Options window, where you can set several options controlling the environment of your IRF session.

- Select option 6 (Current SQLID) to display the Current SQLID window, where you can specify a different SQL authorization ID for qualifying the unqualified tables in the statements being explained.

- Select option 7 (ISPF Online Monitor Memory Usage) to increase the default size of the internal storage area for displaying thread summary information from 1 MB to up to 4 MB. This might become necessary in large environments, if the amount of active DB2 threads cannot be displayed in the Thread Summary panel (typically revealed by message FPEM103 or FPEM546).

DB2 Subsystem windows:

Use the DB2 Subsystems List window to select the DB2 subsystem to be monitored.

Only the DB2 subsystems with data collectors started within the MVS system are listed on the DB2 Subsystems List window (see "OMEGAMON Collector purpose and function" on page 372).
“and function” on page 372 and the following sections for a description of the data collector). If many DB2 subsystems are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

To display this window, select option 1 (DB2 Subsystem) from the Options menu.

```
DGOMDWSL  DB2 Subsystems List  ROW 1 TO 3 OF 3

Select the Data Collector to use or specify a DB2 subsystem ID

DB2 Subsystem  DSN1
               Data Collector  DB2 Location  DB2 Release
               DSNB        PM01DB11     V10
-              DSNC        PM01DC11     V10

******************************************************************************

Command ===  Scroll === CSR
F1=Help  F2=Split  F7=Up  F8=Down  F9=Swap  F12=Cancel
F16=Look  F17=Collect

Figure 15. DB2 Subsystems List window
```

The Data Collector column shows the data collector identifier.

The DB2 Location column shows the location as obtained from the trace records for the data collector.

The DB2 Release column shows the DB2 release level.

To monitor a DB2 subsystem that has an active data collector running, enter any character in the input field beside a data collector DB2 location and press Enter.

To monitor a DB2 subsystem that does not have an active data collector running, enter the name of the DB2 subsystem in the DB2 Subsystem field and press Enter.

If no data collectors are active on your MVS system, the window shown in Figure 16 is displayed instead.

**Note:** The version and release numbers of the DB2 load library allocated to the Online Monitor session must match the version and release numbers of the DB2 subsystems being monitored.

```
DGOMDWS1  DB2 Subsystem

Enter the subsystem ID of the DB2 subsystem to monitor and press Enter.

DB2 Subsystem ___

F1=Help  F2=Split  F9=Swap  F12=Cancel

Figure 16. DB2 Subsystem window
```
If the data collector is not installed at your site or the monitored DB2 subsystem does not have an active data collector running, the following Online Monitor functions are not available:

- Viewing past data
- Periodic exception processing while you are not logged on
- Exception event processing
- Collection of parallel tasks for query CP parallelism

Changing DB2 subsystems terminates all asynchronous tasks that were started using the Online Monitor. If you change DB2 subsystems while an asynchronous task is active, you are notified by the Asynchronous Task Termination panel. See [Figure 17](#).

If you work in split screen mode and you change the subsystem in one session, asynchronous tasks are terminated even if they were activated in the other session.

![DGOMGP03 Asynchronous Task Termination](#)

**Figure 17. Asynchronous Task Termination panel**

To change DB2 subsystems, press Enter. All asynchronous tasks are terminated.

To return to the previous panel without changing DB2 subsystems, press F3 (Exit) or F12 (Cancel). All active asynchronous tasks remain active.

**History Defaults window:**

Use the History Defaults window to view the history parameters that are currently in effect.

To display this window, select option 2 (History Defaults) from the Options menu.
By using the HISTORY command, you can view thread activity, statistics, and system parameters data previously gathered by the data collector. See "Viewing past data" on page 1807 for a complete description about how to view past performance data.

The History Collected field shows either YES or NO to indicate if any past data is available.

The History Interval field indicates how often DB2 instrumentation data is being gathered by the data collector. This field is a numeric value in seconds.

The History From field shows the date and time of the earliest history data available.

The History To field shows the date and time of the most recent history data available.

The Data for which History is stored field lists the types of data gathered by the data collector. This list includes the data types specified at data collector startup and subsequent changes made by the administrator users. Statistics history keeps subsystem-wide statistical information for a DB2 subsystem. For thread activity you can collect thread history individually in a summary format, in detail format, or in detail format with locking information, SQL statement, or both. System Parameters history keeps an overview of DSNZPARM values for a DB2 subsystem.

For more information about viewing past data, see "Viewing past data" on page 1807. For more information about data collector installation options, see IBM Db2 for z/OS in the IBM Knowledge Center.

Monitor Output window:

Use the Monitor Output window to enable or disable the writing of monitor output to a data set.

The main use of this option is to gather data for problem determination. Records in DPMOUT format that correspond to data shown in the Online Monitor panels.
are written to a data set whenever the display is updated. Output from the
Statistics and System Parameters panels can be used as input to the Batch Statistics
and System Parameter reports respectively. The output from the Thread Display
panels can only be processed by a batch Record trace.

To display this window, select option 3 (Monitor Output) from the Options menu.

```
DGOMDWMO Monitor Output
To write monitor output, enter 1 and dataset name and disposition
Write output ........ 2 1=yes 2=no
Dataset name ........ Disposition ........ 1 1=append 2=overwrite 3=new
F1=Help       F2=Split     F9=Swap     F12=Cancel
```

Figure 19. Monitor Output window

Use the Write output field to specify whether you want monitor output written to
a data set. Enter 1 in this field to enable the writing of monitor output to a data
set.

The Dataset name field requires the name of the data set to which the data is to be
written.

If you specify a disposition of 3 (new), the data set is dynamically allocated with
the following attributes:

**RECFM:**

```
VBS
```

**LRECL:**

```
32 756
```

**BLKSIZE:**

```
6 233
```

Auto Display window:

Use the Auto Display window to set the auto-display refresh interval for data
shown in the Online Monitor panels. When auto display is active, the values
displayed in the current panel are updated periodically, as specified in the Auto
Display window. If you activate auto-display mode while viewing past data, the
panel is updated with subsequent past records at every auto-display interval. The
time difference between these records is determined by the history interval when
the data was collected, and not by the current auto-display interval.

To display this window, select option 4 (Auto Display) from the Options menu.
Use the *Units* field to specify the unit of time that is to be associated with the value in the *Interval* field.

Use the *1* field to specify how frequently the panels are refreshed when the AUTO command is issued.

To start auto-display mode, type `AUTO` on any Thread Activity or Statistics panel command line and press Enter. To stop auto-display mode, press the Attention key. You cannot perform any other actions with your Online Monitor session while auto-display mode is running.

**Session options:**

Use the Session Options window to set several options controlling the environment of your Interactive Report Facility (IRF) session.

To display this window, select option 5 (*Session Options*) from the Options menu, or type `OPTIONS` on any command line and press Enter.

Use the *1* field to specify whether or not you want to be prompted each time you issue a delete, replace, or reset request.

Use the *1* field to specify the panel you want to start on. Possible values for this field are:

1. Create and execute reporting commands (DGOOMENU)
2. View online DB2 activity - Classic Interface (KO2MPSPF)
3. View online DB2 activity - PE ISPF OLM (FPEMMENU)
The 1 field applies to the execution of batch jobs.

Use the 1 field to specify the DPMPARMS data set to be used by the Online Monitor. The DPMPARMS data set contains information about exception thresholds, customized report layouts, time zone specifications, correlation ID translation, and the MAINPACK identifier. Only the correlation ID translation part is used by the Online Monitor.

Current SQLID window:

Use the Current SQLID window to specify a different SQL authorization ID for qualifying the unqualified tables in the statements being explained if they do not belong to a plan or package. The Current SQLID window is also used to qualify the plan table to be accessed.

To display this window, select option 6 (Current SQLID) from the Options menu.

If the 1 field in this window is not specified, it defaults to your user ID.

Online Monitor Memory Usage window:

Use the ISPF Online Monitor Memory Usage window to specify a different size of the internal storage area that the Online Monitor uses to display active thread information. You can specify a value of 1, 2, 3, or 4, which corresponds to 1 to 4 MB.

Typically, you only need to increase the size of this storage area if the Online Monitor complains about insufficient storage to display active thread information (message FPEM103 or FPEM546).

By default, the Online Monitor uses a 1 MB storage area. When you change the size, the change takes place when you select again option 3 (View online DB2 activity - PE ISPF OLM) from the OMEGAMON XE for DB2 PE main menu (shown in Figure 11 on page 1776). The specified value becomes the new default value and remains in effect until it is replaced by a different value.

To display this window, select option 7 (ISPF Online Monitor Memory Usage) from the Options menu.
Accessing online help:

You can access comprehensive panel help from any Online Monitor panel and field help from fields in these panels. Panel help shows general information that describes the purpose of the panel and the commands that are available from that panel, whereas field help shows a field description and system tuning information for that field if appropriate.

To view panel help, press F1 (Help). To view field help, move the cursor into the data area of the field and press F1.

To view help on the following topics, press F1 (Help) on the Online Monitor Main Menu:
- General information about the Online Monitor
- Authority required
- Online Monitor input data
- Moving between panels
- Updating values
- Online Monitor commands
- Function key default settings

Note:
1. In some panels where lists are shown, field help is not available on the list. Help on these lists is provided in the panel help instead.
2. The online help follows the standard conventions for help in the ISPF environment.

Function key default settings:

Use the function key default settings to view help, move between panels, or access certain Online Monitor and ISPF functions with a single keystroke.

Note:
- The Online Monitor is an ISPF application, and all normal ISPF behaviors apply.
- The default function key settings in help panels follow the standard conventions for help in the ISPF environment.

Table 133 on page 1797 describes the Online Monitor function keys, their default settings, their functions, and the Online Monitor panels on which they are available.
### Table 133. Function key default settings

<table>

| F17          | COLLECT         | Used to display the Collect Report Data panel, where you can collect specific DB2 instrumentation data and direct this data to a data set.  
|              |                 | All panels (except Collect Report Data panels) |
| F18          | EXPLAIN         | Used to explain the access path methods chosen by DB2 for a given SQL statement.  
|              |                 | All Thread panels that show the SQL statement |
| F19          | LEFT            | Used to scroll toward the left.  
|              |                 | Thread Summary panel |
| F20          | RIGHT           | Used to scroll toward the right.  
|              |                 | Thread Summary panel |
| F21          | EXPAND          | Used to expand a field content that is too long to fit in a panel into a separate window where the entire field content can be shown.  
|              |                 | All panels that contain information of a length that cannot be shown in the available panel space. |
| F22          | LEFT            | Used to scroll through a field content that is too long to fit in a panel, if the cursor is positioned on such a field.  
|              |                 | All panels that contain information of a length that cannot be shown in the available panel space. |
| F22          | RIGHT           | Used to scroll through a field content that is too long to fit in a panel, if the cursor is positioned on such a field.  
|              |                 | All panels that contain information of a length that cannot be shown in the available panel space. |

You can use the following ISPF commands to alter the function key settings:

**KEYLIST**
Changes the function key settings.

**FKA** Alternates between the function key long display format, short display format, and no function key display at all.

**PFSHOW**
Toggles on and off the display of function key settings.

**PFSHOW TAILOR**
Specifies how function keys are displayed.

All function keys correspond to a command entered on the command line. For example, typing the command CANCEL on the command line is the same as pressing the F12 (Cancel) key.
You can use the command line with the function keys to enter function parameters. To do this, type the parameters on the command line and press the function key to activate the command.

You can use the ISPF PANELID command to choose whether to display a panel ID on the top line of the panels. To toggle the panel ID display, type PANELID on the command line and press Enter.

**Issuing DB2 commands:**

Use the command DB2 to execute any DB2 command during your Online Monitor session. You can enter this command on the command line of any Online Monitor panel.

The command syntax is:

```plaintext
DB2 command text
```

*Figure 24. Syntax of the DB2 command*

The DB2 command accepts the following parameter:

**command text**

The DB2 command you want to execute.

For example:

```
DB2 DISPLAY THREAD(*)
```

Type DB2 and the **command text** on the command line and press Enter. The DB2 Command Output window is overlaid on the current panel, where you can view the DB2 command output. An example of the DB2 Command Output window is shown in [Figure 25 on page 1800](#).
If you issue the command DB2 without any parameters, the DB2 Command window is displayed. This window displays command lines on which you can issue DB2 commands. The window shows a list of the last ten DB2 commands that you entered.

---

Figure 25. DB2 Command Output window

If you issue the command DB2 without any parameters, the DB2 Command window is displayed.

---

Figure 26. DB2 Command window

This window displays command lines on which you can issue DB2 commands. The window shows a list of the last ten DB2 commands that you entered.
You can retrieve a command that is stored in the list by positioning the cursor under the command and pressing Enter. Then, the command is shown on the command line, where you can edit and then submit the command by pressing Enter again.

If a new or modified command is submitted, the command is added to the top of the list. If the command was not edited before submission, or the command was not submitted at all, the list is not updated.

**Note:** You cannot abbreviate the command **DB2**.

**Using the COLLECT command:**

Use the COLLECT command to display the Collect Report Data panel, where you can collect specific DB2 instrumentation data and direct this data to a data set.

The command syntax is:

```plaintext
COLLECT
```

To issue the COLLECT command, type `COLLECT` on the command line and press Enter. COLLECT can be truncated to a minimum of COL.

For more information about collecting report data, see the Reporting User’s Guide.

**Using the OPTIONS command:**

Use OPTIONS to display the Session Options window, where you can set several options controlling the environment of your Interactive Report Facility (IRF) session.

The command syntax is:

```plaintext
OPTIONS
```

Figure 27. Syntax of the OPTIONS command

To issue the OPTIONS command, type `OPTIONS` on any command line and press Enter. OPTIONS can be truncated to a minimum of OPT.

**Correlation ID translation:**

The correlation ID is a DB2 field that identifies the task executed by DB2.

The correlation ID contains:

- **Batch jobs**
  - Jobname

- **TSO applications**
  - Original authorization ID (the logon user ID)

- **Applications using the DB2 call attachment facility**
  - Original authorization ID (the logon user ID)

- **CICS transactions**
  - Connection type, thread type, thread number, and the transaction ID
IMS applications
PST number and PSBNAME of the application

RRS applications
The character string provided by the application during signon

Particularly for CICS and IMS it is useful to break the correlation ID into several parts, so that you can easily distinguish the transaction ID (for CICS threads) from the PSBNAME (for IMS threads).

The default translation:

OMEGAMON XE for DB2 PE breaks the correlation ID into parts by translating the correlation ID into two separate identifiers, the correlation name and the correlation number. Unless it was changed in your installation, this translation is based on the connection type of the thread.

Changing the default translation:

You can override this default translation by using option 8 (Maintain parameter data sets) from the Online Monitor Main Menu. The correlation translation information is kept in the member CORRDATA of the DPMPARMS data set.

Each record in the CORRDATA member specifies the translation that is to be used for a specific connection ID. The connection ID is used here, not the connection type.

The translation is expressed as:
• Offset where the correlation name starts
• Length of the correlation name
• Offset where the correlation number starts
• Length of the correlation number

If OMEGAMON XE for DB2 PE does not find the connection ID for a given thread in the CORRDATA member, the default translation is used.

To activate the tailored correlation translation, issue the OPTIONS command and specify the DPMPARMS data set in the Session Options window.
How large and missing values are displayed:

Values shown in panels are either total values or average values.

If there is insufficient space to display a value in a field, a rounded value is shown followed by one of the following letters to indicate magnitude:

- **K** thousand (kilo - $10^3$)
- **M** million (mega - $10^6$)
- **G** billion (giga - $10^9$)
- **TT** trillion (tera - $10^{12}$)

The letter is displayed directly after the number, without blank spaces. There can, however, be decimal places, as in the following examples:

- Valid conversions of 12 345 include 12K, 12.35K, and 12.3K.
- Valid conversions of 1 234 567 include 1M, 1.2346M, and 1235K.

If a counter value or specific information in reports, in windows, or in panels is not shown, the following notation is used to indicate the reason:

- **N/A** Not applicable is shown if DB2 never produces a counter value in a specific context. Examples are:
  - A counter is not available in one DB2 version.
  - Counters are mutually exclusive.

- **N/C** Not calculated is shown for a derived field where the value cannot be calculated or is useless. Examples are:
  - A divide by zero (percentages, ratios).
  - Suppression of negative elapsed time values.
  - Required counter values for calculation marked as N/A or N/P.
  - Insufficient data or small counter values to allow significant statements (meaningless or misleading averages).

- **N/P** Not present is shown for a field where DB2 can present values, but does not in this instance. Examples are:
  - When counter values are not generated because of operational conditions (a trace class is not active).
  - An application does not provide a value because it is optional.

Elapsed time formats:

This section shows the different time formats in which time values are presented.

- **dd hh:mm:ss.fffffffff**, where:
  - **dd** represents days
  - **hh** represents hours
  - **mm** represents minutes
  - **ss** represents seconds
  - **fffffffff** represents the fractions of a second up to 8 decimal places.

  For example, a time value of 1:30:25.10 represents 1 hour, 30 minutes, and 25.1 seconds.

  Some of the reports that use this format might not report days (dd) or hours (hh).

- **ssssssssss.fffffffff**, where:
  - **sssssssss** represents seconds
  - **fffffffff** represents the fractions of a second up to 8 decimal places.
The actual number of decimal places varies from one field to another.

Some time fields can be rounded. If there is insufficient space to print a time value, the time is rounded by removing decimal places as required. For elapsed times, a rounded value is printed.

**Date formats:**

The date format for the Online Monitor is taken from your ISPF environment, and is configured during ISPF installation.

**Displaying long names and values in scrollable fields:**

Certain identifiers, such as authorization IDs and program and collection names, can be up to 128 characters long. In general, if an identifier or any applicable field value is too long for the space available in a panel, the Online Monitor displays the information in a so-called scrollable field. To view the non-visible section of a scrollable field, you can place the cursor on the field and use an assigned function key to scroll through the information.

*Figure 28* shows a fictitious example of a panel with possible variations of scrollable fields. Relevant parts of the panel are in italics. The string `abcdefghijklmnopqrstuvwxyz` represents a hypothetical field value that is too long to fit into the available space (of whatever field).

- Variation 1 shows that the string is left-aligned and truncated at the right side (`uvwxyz` is not shown). A plus sign (+) follows the string, which indicates that more of the field’s content is available on the right side.
- Variation 2 shows that the string is right-aligned and truncated at the left side (`abcdef` is not shown). A minus sign (-) follows the string, which indicates that more of the field’s content is available on the left side.
- Variation 3 shows that the string is centered and truncated at the left and right sides (`abc` and `xyz` are not shown). A plus sign and a minus sign (+-) follow the string, which indicates that more of the field’s content is available on both sides.

![Figure 28](image-url) Fictitious panel with scrollable field variations

The plus and minus signs next to fields act as *scroll indicators.*
To view non-visible sections of an appropriate field, you need to position the cursor on the field and use the following function keys (the default function key settings are assumed).

- **F21 (Expand)** shows the field's content in a separate window, which is overlaid on the current panel. If the content exceeds the available width of this window, it continues on the next line. Pressing F3 (Exit) or F12 (Cancel) closes the window.

- **F22 (Left)** moves the begin of the shown field content toward the start of the actual content. The increment is the length of the available space, until the shown field content is left-aligned in the available space.

- **F23 (Right)** moves the end of the shown field content toward the end of the actual content. The increment is the length of the available space, until the shown field content is right-aligned in the available space.

These keys can be used in any meaningful order, provided the cursor is positioned on a scrollable field. Otherwise, pressing a key has no effect.

The mechanism described so far is applicable to input fields and output fields. When you type information in a field, you can use the same function keys to position the content of a field. However, a subtle distinction should be noted: In output fields potentially existing trailing space characters are treated as nonexistent. This means, you cannot accidentally scroll to a non-visible section of the field content. In input fields trailing space characters are considered valid. This means, when you scroll through an input field with a long sequence of space characters, the field might appear empty but in fact is not.

Finally, you can get help about the use of scrollable fields by positioning the cursor on the scroll indicator area (reserved for the -+ indicators) and pressing F1 (Help).

**Common errors using OMEGAMON XE for DB2 PE**

This section describes problems often encountered when you use OMEGAMON XE for DB2 PE. If you come across a problem, read this section before contacting IBM service.

**STEPLIB missing from IRF-generated JCL**

**Symptom**

The STEPLIB DD statement is missing from the Interactive Report Facility-generated JCL.

**Probable Cause**

Wrong option selected while running FPEJVARs.

**Explanation**

FPEJVARs is an EXEC provided with OMEGAMON XE for DB2 PE that displays a panel for setting up certain defaults. One of the options in this panel specifies whether the OMEGAMON XE for DB2 PE load library is in
the system LNKLIST concatenation. If this option is selected, no STEPLIB DD statement is in the IRF-generated JCL.

**Command not found**

**Symptom**
Message IKJ56500I Command xxx not found is issued during the execution of OMEGAMON XE for DB2 PE.

**Probable Cause**
The Program Control Facility (PCF) was not updated with the list of OMEGAMON XE for DB2 PE modules that are started as TSO command processors.

**Explanation**
The PCF performs a security check on all commands to examine if they are included in the PCF command list. See your system administrator to ensure that all necessary updates have been made. After the list has been updated, the commands can be used.

If you are running the ACF2 security program, the Command Limiting Table needs to be updated by adding FPEFMAIN, FPEMMAIN, and FPEF000.

**Insufficient storage to display thread activity information**

**Symptom**
Message FPEM103 Insufficient storage available for thread processing or message FPEM546 The area for handling all IFCID records is not large enough. VI IFCID records are suppressed is issued when one of the Thread Activity panels is invoked.

**Probable Cause**
Insufficient storage allocated to hold all active thread information.

**Explanation**
By default, the Online Monitor allocates at least 1 MB of storage to hold active thread information. If the amount of active threads grows, more storage might become necessary. Use the Options panel, option 7 (ISPF Online Monitor Memory Usage) and allocate a larger storage area. See “Online Monitor options” on page 1789 for more information. The new size is kept in member FPEFPROF of the ISPF profile data set (parameter IFIRALEN) and becomes active when the Online Monitor is restarted.

**STEPLIB missing from IRF-generated JCL:**

**Symptom:** The STEPLIB DD statement is missing from the Interactive Report Facility-generated JCL.

**Probable Cause:** Wrong option selected while running FPEJVARS.

**Explanation:** FPEJVARS is an EXEC provided with OMEGAMON XE for DB2 PE that displays a panel for setting up certain defaults. One of the options in this panel specifies whether the OMEGAMON XE for DB2 PE load library is in the system LNKLIST concatenation. If this option is selected, no STEPLIB DD statement is in the IRF-generated JCL.
Monitoring and tuning with the ISPF Online Monitor

The following information describes how to perform monitoring and tuning tasks with the ISPF Online Monitor, such as viewing past data and statistics, monitoring exceptions and thread activities, explaining SQL statements, and evaluating DB2 system parameters.

Viewing past data
You can recall and view statistics, thread activity, and system parameters data previously collected by the data collector. The data is gathered at installation-defined intervals.

See “OMEGAMON Collector purpose and function” on page 372 and the following sections for a description of the data collector.

You can view past data by issuing the HISTORY command or pressing F6 (History) in any panel that can display past data.

When viewing past data, the word HISTORY is displayed on the line following the heading of the current panel, as shown in Figure 29.

The date and time following the word HISTORY indicate when the data being displayed was collected.

Note: You can view past data only if the data collector is installed at your site.

Your installation can choose to collect data at the following levels:
- Thread Summary
- Thread Detail
- Thread Detail with locking information
- Thread Detail with SQL statement
- Thread Detail with locking information and SQL statement
- Statistics
- System Parameters

Historical data is kept in either a VSAM data set or data space. The data is gathered by the data collector. When the data set or data space is full, the data is written to the beginning again, writing over the earliest data gathered.

The availability of the data is limited by the collection rate, the size of the data space or data set used, the amount of historical data to be maintained, and the thread history qualification definitions (all of these are defined in the data collector startup parameters). For more information, see IBM Db2 for z/OS in the IBM Knowledge Center.

The data collector parameters can also be modified by the administrator user.

The syntax of the HISTORY command is:
The HISTORY command accepts the following parameters:

**OFF**  Returns the display to the current time.

**BACK**  Displays data for the previous interval. If no more data is available, data from the earliest available interval is displayed.

**FORWARD**  Displays information for the next available interval. If no data is available, data from the current time is displayed and processing continues as if HISTORY is OFF.

**date**  The date of the required information. If no date is specified, today’s date is assumed.

**hh:mm:ss**  The time of the required information. If no time is specified, the default is the time of the earliest available history record for the specified date. The seconds do not need to be specified.

**Note:** HISTORY can be truncated to a minimum of HIS.

If no data is available for the specified date and time, the next available record is displayed.

When a panel is refreshed while viewing past data, the panel is updated with data from the next stored record, just as if you had entered HISTORY FORWARD on the command line.

If no parameters are specified, the History window is displayed.

```
DGOMHWHY History
05/09/08 14:03
Date . . . . . . . . 03/16/08
Time . . . . . . . . 14:03:24
F1=Help  F2=Split  F9=Swap
F12=Cancel

Figure 31. History window
```

The current system date and time are the defaults for the History window.

**Note:** When monitoring with HISTORY OFF, it is possible to view data that cannot be viewed by using the HISTORY command. This occurs when the “current moment” does not coincide with the history collection interval. For example, when the history interval is 10 minutes in length and data is collected at 8:30 and 8:40, the data retrieved at 8:32 from DB2 is not subsequently retrievable using the HISTORY command.
A sample JCL is provided in library RK02SAMP(DGOMMJCL) that can be used to unload history VSAM data sets created by the data collector. After unloading, you can use the data as input to the batch Record trace function for problem determination. The sample JCL might need to be modified.

**Exception processing**

Exception processing is the most effective way of identifying performance problems. The first step in monitoring your DB2 system should always be to start thread and statistics exception processing.

Use Online Monitor exception processing to identify DB2 thread and statistics fields with values outside defined thresholds. This allows better management of service levels by identifying problems in the DB2 subsystem and threads causing performance problems.

By using display exception processing and periodic exception processing, you can monitor and identify:
- Threads that might be experiencing problems
- Subsystem-wide DB2 conditions that might be causing performance problems

By using exception event processing, you can monitor the following events:
- Deadlock
- Timeout
- EDM pool full
- Authorization failure
- Thread commit indoubt
- Coupling Facility (CF) rebuild/alter start
- CF rebuild/alter end
- Global trace started

The threshold values for thread activity and statistics fields are specified in the Exception Threshold data set. When exceptions are detected during your monitoring session, you are notified so that appropriate action can be taken. In addition, you can activate a user exit that can automatically trigger any immediate reaction, for example, issue an alert to NetView®.

You can view information about any of the exceptions using the Online Monitor **LOOK** command.

With exception processing, you can create the following two data sets for later analysis:
- The Exception Log data set (to print a list of exceptions or to load exception data into DB2)
- The Exception DPMOUT data set (records that had exceptions)

**Exception processing modes:**

This section describes the three basic types of exception processing available: display exception processing, periodic exception processing, and exception event processing.

**Display exception processing**

Use display exception processing to monitor the occurrence of a specific exception. This exception processing mode operates in the foreground of Online Monitor processing. With display exception processing you can view thread activity.
exceptions, and statistics exceptions in interval or delta processing mode. See "Statistics processing modes” on page 1874 for an explanation of delta and interval processing.

With display exception checking, fields shown in the current panel are checked whenever the display is refreshed with new or historical data. Fields with exception conditions are shown in reverse video, and the color of the field indicates the level of the exception. Warning level exceptions are highlighted in yellow, while Problem level exceptions are highlighted in red. These colors can differ if you have changed your ISPF default colors. Selection fields in the detail panels are also shown in reverse video if any of their lower level windows contain fields in exception status. The exception notifications are stored and can be examined using the LOOK command.

Periodic exception processing

Use periodic exception processing to periodically monitor thread activity fields and statistics fields for exception conditions. This processing mode runs in the background of Online Monitor processing. With periodic exception processing, data is tested for exception whenever the interval that you specified has elapsed (whether or not you are viewing the relevant data). If any Problem level exceptions are detected, the Exception Notification window is displayed. If only Warning level exceptions are detected, a message is displayed to notify that a periodic exception has occurred. This window is overlaid on the current panel and shows the number of periodic exceptions detected during the interval. The exception notifications are stored and can be examined using the LOOK command.

If the data collector is active, periodic exception processing can continue when you exit the Online Monitor. When you use the Online Monitor the next time, any periodic exceptions that were detected while you were not logged on are displayed. Periodic exception processing is not terminated until you stop it or until the data collector itself is terminated. If the data collector is not active, periodic exception processing terminates when you exit the Online Monitor.

Exception event processing

Use exception event processing to monitor the DB2 subsystem for the occurrence of particular events. This processing mode runs in the background of Online Monitor processing. The following events can be monitored:

- Deadlock
- Timeout
- EDM pool full
- Authorization failure
- Thread commit indoubt
- CF rebuild/alter start
- CF rebuild/alter end
- Global trace started
- Data set extension
- Unit of recovery problem
- Log space shortage

The events must be specified with the EXCEPTIONEVENT data collector parameter or in the Data Collector Parameters window before exception event
processing can be activated from the Exception Processor panel. For more information, see the IBM Db2 for z/OS in the IBM Knowledge Center.

When an exception event is detected, the Exception Notification window is displayed to notify you that an exception event has occurred. Exception event notifications are stored and can be examined using the LOOK command.

**Past data and exceptions**

Display exception processing operates with past data just as if the data had been retrieved directly from DB2. Exceptions are shown in reverse video and logged as normal.

Periodic exception processing and exception event processing do not report on past data. They report on current data, whether or not past data is currently being displayed.

**Exception Notification window:**

The Exception Notification window is displayed whenever periodic exception or exception event processing is active and either a problem level exception or an event exception is detected. This window is overlaid on the current panel and shows the number of periodic problem and warning level exceptions, and the number of exception events since the last exception notification or since exception processing was started.

If exception event processing is active, the Exception Notification window is shown, as in the following figure.

```
DGOMEPE1    Exception Notification
Time . . : 04/14/08  12:42:32

  Periodic Exceptions
    Problem . . . . . . . . : 0
    Warning . . . . . . . . : 0

  Exception Events
    Deadlock . . . . . . . . : 0
    Timeout . . . . . . . . : 0
    EDM Pool Full . . . . . : 0
    Authorization Failure . . : 1
    Thread Commit Indoubt . . : 0
    CF rebuild/alter start . . : 0
    CF rebuild/alter end . . . : 0
    Global trace started . . . : 0
    Data set extension . . . . : 0
    Unit of Recovery problem . . : 0
    Log space shortage . . . . : 0

F1=Help   F2=Split   F9=Swap
F12=Cancel
```

*Figure 32. Exception Notification window (exception event processing active)*

If exception event processing is not active, the Exception Notification window is shown, as in the following figure.
To exit the Exception Notification window and return to the panel you were viewing, press Enter or F12 (Cancel).

The Periodic Exceptions section of this window shows the number of Problem and Warning level periodic exceptions since the last time you were notified of an exception.

The Exception Events section of this window shows the number of exception events that occurred for various events since the last time you were notified of an exception. This field categorizes the seven different classes of exception events that can occur.

**Difference between batch and Online Monitor exception processing:**

The fundamental difference between batch and Online Monitor exception processing is that the Online Monitor shows an active view of DB2 subsystem activity (active threads), whereas batch exception processing shows activity that has been completed (threads that have ended). Therefore, the values shown by the Online Monitor and Batch are unlikely to match. For example, a thread shown to be in exception status in a Batch Accounting trace is not necessarily in exception status in the Online Monitor.

**How to define exception threshold values:**

This information shows where exception thresholds are defined.

This information has been consolidated in the Reporting User's Guide for consistency reasons.

**How to start exception processing:**

Exception processing is started from the Exception Processor panel. All exception processing functions are activated from this panel.

Figure 34 on page 1813 shows the Exception Processor panel.

Alternatively, exception processing can automatically be started when the OMEGAMON Collector is started.

**Starting exception processing when the OMEGAMON Collector is started:**

When the OMEGAMON Collector is started, its startup parameters determine whether exception events are to be processed. Dependent on which exception events are specified, the appropriate traces are started. If an Exception Threshold data set with exception criteria is already available, it can be specified in the
OMEGAMON Collector startup parameters. By this means, exception processing automatically starts with predefined exception thresholds whenever the OMEGAMON Collector is started.

For more information about the Exception Threshold data set, a sample data set provided with the product, its data set attributes, and how its content can be modified, see the Reporting User’s Guide.

For more information about OMEGAMON Collector startup parameters, see the topic about configuring OMEGAMON Collector for exception processing in Monitoring Performance from the OMEGAMON Classic Interface. The EXCEPTIONEVENT startup parameter determines the events, and the AUTODECPTHNAME startup parameter specifies the name of the Exception Threshold data set that is to be used at startup.

If this means of starting exception processing is used, and if the content of the Exception Threshold data set is modified while the OMEGAMON Collector is running, remember to refresh the environment if you want the new exception criteria to be recognized.

Refer to “How to restart exception processing (REINIT command)” on page 1816 for more details.

Starting exception processing from the Exception Processor panel:

Use the Exception Processor panel to activate and deactivate various exception processes by selecting exceptions under Activate/Deactivate Exception Processing.

To display this panel, select option 5 (Control Exception Processing) from the Online Monitor Main Menu.

![Exception Processor panel](image)

Figure 34. Exception Processor panel
Use the 1 field to specify whether the 1 field value is in seconds or minutes. This field is only required for periodic exception processing.

The 1 field specifies how often DB2 instrumentation data is gathered, examined for exceptions, and reported if an exception condition occurs. All periodic exception messages are gathered periodically as specified by this field, and reported when the display is refreshed. After the elapsed period, if any periodic exceptions have occurred, the Exception Notification window is displayed and shows the number of warning and problem exceptions. This field is only required for periodic exception processing.

You can request a Log File data set or DPMOUT data set to be written by selecting Log file data set output needed or DPMOUT data set output needed from the Exception Processor panel, respectively. When you request a log or DPMOUT file, the Exception Output Data Sets window is displayed. See "Exception Output Data Sets window" on page 1815 for details.

Previously selected fields are indicated by a greater than symbol (>).

The Exception threshold data set field contains the name of the Exception Threshold data set used as input to the exception processor. The data set is built using the Exception Threshold Field Details panel. The Online Monitor exception processor uses the information in this data set to test fields for exception conditions.

**Note:** A valid Exception Threshold data set needs to be specified in the Exception Processor panel before activating display exception, periodic exception, or exception event processing.

*Exception processing user exit:*

OMEGAMON XE for DB2 PE supports a user exit to enhance the exception processing capabilities. This exit can handle periodic exceptions and event exceptions. Therefore, you can start the exception user exit for periodic processing, event processing, or both, depending on which kind of exception processing you have activated in the Exception Processor panel.

You can activate the user exit together with periodic exception processing, event exception processing, or both. But you can also activate it when periodic exception processing, event exception processing, or both are already active.

To activate the user exit, type any character in the **User Exit** field. To deactivate the user exit, enter a blank in this field. The **User Exit** field is displayed only if the data collector is active.

Several users can invoke periodic exception processing or event exception processing simultaneously using different threshold data sets. The users can start or stop this user exit independently. The user exit routine can check for the user ID, the exception field name, the field value, or other characteristic items to select individual paths of processing.

OMEGAMON XE for DB2 PE provides a sample of the exception processing exit, called DGOMUPXT, which issues a message to the operator. The message text varies depending on whether the situation is an event exception or a periodic exception. For a description of the different formats of this message, see message number DGOV0100I in **Messages**.
You can modify DGOMUPXT according to your needs, for example, to examine the type of exception and perform any action necessary to handle the situation.

For more information, see [IBM Db2 for z/OS in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter/)

**Exception Output Data Sets window:**

The Exception Output Data Sets window is displayed whenever you have requested a Log File or DPMOUT data set in the Exception Processor panel.

```
DGOMEPO3 Exception Output Data Sets
Specify the data set(s) to be used, and press Enter

Display log file data set
Name . . . . .
Disposition . . I 1=append 2=overwrite 3=new

Display DPMOUT data set
Name . . . . .
Disposition . . I 1=append 2=overwrite 3=new

Periodic log file data set
Name . . . . .
Disposition . . I 1=append 2=overwrite 3=new

Periodic DPMOUT data set
Name . . . . .
Disposition . . I 1=append 2=overwrite 3=new
```

**Figure 35. Exception Output Data Sets window**

Use this window to enter the names of the Exception Log data set and DPMOUT data set you want the exception processor to write to. If the data collector is active for your current subsystem, make sure that it is authorized to write to these data sets. Different data sets are used for display exceptions and periodic exceptions.

For data sets selected in the Exception Processor panel, a valid name is required. Do not specify a name for those data sets that were not selected. Therefore, if a LOG data set was selected but not a DPMOUT data set, then you must enter a valid name for the Exception Log data set, but not for the DPMOUT data set.

You can enter the name of an output Log File data set where exception conditions are written. An entry is written to the data set for each exception condition detected by the exception processor. This data set can subsequently be used as input to the DB2 LOAD utility, or printed using the Exception Log print utility.

See “Printing the Exception Log File data set” on page 1822 for more information.

For the layout of the Exception Log File data set, see “Layout of the Exception Log File output record” on page 1987.

You can enter the name of an output DPMOUT data set where DPMOUT-formatted records that contain exception conditions are written. This data set can be used as input to a batch Record trace or Statistics trace for a more detailed analysis of exception conditions. See the Report Reference for information about the layout of DPMOUT-formatted records.
The Disposition fields specify how the data is to be written to the data sets. Enter 1 (append) to append the data, 2 (overwrite) to overwrite the old data, or 3 (new) to dynamically allocate a new data set.

Press Enter to initialize exception processing and to activate the selected functions. If there are any errors during this process, a panel is displayed that shows the errors.

Starting display exception processing:

Display exception processing is started from the Exception Processor panel under Activate/Deactivate Exception Processing.

The Exception Processor panel is shown in Figure 34 on page 1813.

Enter any character in the following fields to activate display exception processing for the appropriate panels:
- Display thread summary
- Display thread detail
- Display statistics detail

Starting periodic exception processing:

Periodic exception processing is started from the Exception Processor panel under Activate/Deactivate Exception Processing.

The Exception Processor panel is shown in Figure 34 on page 1813.

Enter any character in the 1 field and specify the periodic exception units and interval under the Options field to activate periodic exception processing.

Starting exception event notification:

Exception event notification is started from the Exception Processor panel under Activate/Deactivate Exception Processing.

The Exception Processor panel is shown in Figure 34 on page 1813.

Enter any character in the Exception event notification field to activate exception event notification.

The events must be specified with the EXCEPTIONEVENT data collector parameter or from the Data Collector Parameters window of the administrator user dialog before exception event processing can be activated.

How to restart exception processing (REINIT command):

If the values in the Exception Threshold data set are changed during an Online Monitor session, the exception processor needs to be restarted (reinitialized) to load and use the new values.

Exception processing initialization occurs when you start display or periodic exception processing using the options in the Exception Processor panel as shown in Figure 34 on page 1813. You can reinitialize exception processing by stopping and starting exception processing from the Exception Processor panel.
You can also reinitialize exception processing by using the REINIT command. The command syntax is:

```
REINIT
```

Figure 36. Syntax of the REINIT command

Type REINIT (or a valid abbreviation, beginning with a minimum of REI) on any command line (except on the Asynchronous Task Termination panel) as long as exception processing is active, and press Enter.

Examining exception messages (LOOK command):

This section describes how to examine exception messages issued during exception processing using the LOOK command.

Whenever an exception occurs, an exception message is written to the appropriate exception list where it can be examined using the LOOK command.

The command syntax is:

```
LOOK
```

Figure 37. Syntax of the LOOK command

The LOOK parameters 1 to 6 correspond to the options on the Look Selections menu in Figure 38.

To display the Look Selections menu, type LOOK and press Enter on any command line, or press F16 (LOOK).

Figure 38. Look Selections menu

Use the Look Selections menu to reach panels that display exception messages and the status of exception processes. The list panels display the last 500 exceptions.
and authorization failures that occurred during your Online Monitor session. When this limit is reached, the oldest entries in the list are discarded as new entries are added. When these windows are first displayed, the bottom of the list is displayed and shows the most recent exceptions that occurred.

The following topics describe the windows that can be accessed from the Look Selections menu.

**Examining the Periodic Exceptions:**

To display the Periodic Exceptions List window, select option 1 (Periodic Exceptions) from the Look Selections menu or type LOOK 1 and press Enter on any command line.

```
DGOMLAXP   Periodic Exceptions List   Row 499 to 500 of 500

```

**Figure 39. Periodic Exceptions List window**

Use this window to view the most recent periodic exceptions that have occurred. You can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

Select any of the entries listed in this window to display either the Thread Detail panel or DB2 Statistics Detail panel as appropriate, where you can examine the field causing the exception. Pressing F3 (Exit) or F12 (Cancel) returns you to the Periodic Exceptions List window. If the selected exception was caused by a thread that is no longer active, past data is automatically retrieved if available to display the thread.

For more information about history, see “Viewing past data” on page 1807.

This list is cleared if you exit the Online Monitor without an active data collector running.
Examining the Periodic Exceptions Messages:

To display the Periodic Exception Messages window, select option 2 (Periodic Exceptions Messages) from the Look Selections menu or type LOOK 2 and press Enter on any command line.

<table>

Command ===> F1=Help F2=Split F3=Exit F7=Up F8=Down F9=Swap F12=Cancel

**Figure 40. Periodic Exception Messages window**

Use this window to view messages issued by the periodic exception processor. You can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

This list is cleared when you exit the Online Monitor.

Examining the Display Exceptions:

To display the Display Exception List window, select option 3 (Display Exceptions) from the Look Selections menu or type LOOK 3 and press Enter on any command line.
Use this window to view information about the latest display exceptions that have occurred during your Online Monitor session. You can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

This list is cleared when you exit the Online Monitor.

**Examining the Authorization Failure Summary:**

To display the Authorization Failure Summary window, select option 4 (Authorization Failure Summary) from the Look Selections menu or type LOOK 4 and press Enter on any command line.

<table>
<thead>

**Figure 41. Display Exception List window**

**Figure 42. Authorization Failure Summary window**

Use this window to view a list of authorization failures. You can select any item from the list to display the Authorization Failure Detail window, where the
authorization failure can be examined in greater detail. You can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

**Examining the Exception Event Summary:** To display the Exception Event Summary window, select option 5 (Exception Event Summary) from the Look Selections menu or type LOOK 5 and press Enter on any command line.

![Exception Event Summary window](image)

**Figure 43. Exception Event Summary window**

Use this window to view the most recent exception events that occurred during your Online Monitor session. You can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

Select any event listed on the Exception Event Summary window for closer examination. When an exception event is selected, one of the following windows is displayed as determined by the type of event:

- EDM Pool Full Data window
- Deadlock Data window
- Timeout Data window
- Coupling Facility (CF) Rebuild/Alter Start Event window
- CF Rebuild End Event window
- CF Alter End Event window
- Unformatted Record panel (thread commit indoubt)
- Global trace started
- Data Set Extension Data window
- Unit of Recovery Inflight or Indoubt Data window
- Active Log Space Shortage Data window

For IFCID 337 (Lock Escalation) an IFCID 359 (Index Split) exception events no details are available because the ISPF Online Monitor runs in DB2 10 toleration mode only.

**Examining the Exception Event Messages:** To display the Exception Event Messages window, select option 6 (Exception Event Messages) from the Look Selections menu or type LOOK 6 and press Enter on any command line.
Use this window to view messages issued by the exception event processor. You can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

**Exception processor output data sets:**

Exception processing output data can be written to data sets. Use these data sets for further analysis of exception conditions.

**Note:** Always write monitor, trace, Exception Log File, and exception DPMOUT data to separate data sets.

**Exception Log File data set:**

You can specify a particular Exception Log File data set where information about exceptions is written. The contents of the Exception Log File data set can be either printed or loaded into a DB2 table for further investigation.

To retain log file data on the same data set across multiple Online Monitor sessions, specify APPEND for the disposition.

To dynamically allocate a new Exception Log File data set with the following attributes, specify NEW for the disposition:

**RECFM:**

VB

**LRECL:**

512

**BLKSIZE:**

4 096

The data set contains an entry for each field found in exception status.

**Printing the Exception Log File data set:**

You can print the contents of the Exception Log File data set using the Exception Log File print utility.

To use this utility, submit the sample member DGOMEJCL found in the RKO2SAMP library. This member is provided as an example and can be modified as required.
Performance Database:

Exception data can be loaded into OMEGAMON XE for DB2 PE’s Performance Database.

You can find CREATE TABLE DDL, LOAD, CREATE VIEW statements, and sample SQL queries in the RKO2SAMP library, in the following members:

**CREATE TABLE statement:**
- DGOECFIL

**LOAD utility control statement:**
- DGOELFIL

**Sample CREATE VIEW statement:**
- DGOEVFIL

**Sample SQL query:**
- DGOEQFIL

**Exception DPMOUT data set:**

You can specify a particular exception DPMOUT output data set. This data set holds the DB2 instrumentation records that contain at least one field in exception status, in DPMOUT format. You can use this data set as input to a batch Record trace or Statistics trace for a more detailed analysis of exception conditions.

To retain DPMOUT data on the same data set across multiple Online Monitor sessions, specify APPEND for the disposition.

To dynamically allocate a new DPMOUT data set with the following attributes, specify NEW for the disposition:

**RECFM:**
- VBS

**LRECL:**
- 32 756

**BLKSIZE:**
- 6 233

See the [Report Reference](#) for information about the layout of the DPMOUT record.

**Stopping exception processing:**

The different types of exception processing can be stopped using the Exception Processor panel by deselecting the appropriate fields under Activate/Deactivate Exception Processing.

[Figure 34 on page 1813](#) shows the Exception Processor panel.

If an exception task is active when you exit the Online Monitor, you are notified by one of the Asynchronous Task Termination panels. You can either keep selected tasks active (if the data collector is active) and exit the Online Monitor, or return to the Online Monitor Main Menu keeping all asynchronous tasks active.

See “Leaving the ISPF Online Monitor” on page 1788 for more information.
If an exception task is active when you change DB2 subsystems, you are notified by one of the Asynchronous Task Termination panels. You can either change DB2 subsystems and terminate all asynchronous tasks, or return to the previous panel keeping all asynchronous tasks active.

See “DB2 Subsystem windows” on page 1789 for more information.

If you work in split screen mode and you change the subsystem in one session, periodic exceptions are terminated even if they were turned on in the other session.

**Displaying thread activity**

Use the Thread Activity panels to examine information about the current activity of all active threads connected to a DB2 subsystem.

**Note:** This function is not supported for DB2 11.

From the Thread Summary panel you can view key values for all connected threads (qualified and sorted as you require). You can select any thread listed in the Thread Summary panel to display the Thread Detail panel for further investigation of the thread.

The Thread Detail panel provides an overview of all thread information categories and some more detailed values. If you select a category, a new window opens, with all information pertaining to this category.

The following table lists all Thread Activity panels shown in this section.

Display Thread Activity overview:

The Thread Summary panel shows a summary of all connected DB2 threads qualified and sorted as defined by the QUALIFY and SORT commands.

You can select individual threads for viewing from the Thread Summary panel, the Threads Holding Resource window, or the Periodic Exceptions List panel. Selecting a thread results in all currently displayed windows being removed and the Thread Detail panel being displayed for the newly selected thread. This thread then becomes the monitored thread for further examination using the Thread Activity panels. From the Thread Detail panel, you can view specific information about the monitored thread in greater detail. To do this, type any character in the selection field next to the corresponding headings and press Enter.

Data displayed in the current panel is refreshed whenever you press Enter without selecting a particular category to be displayed or executing a command.

Before you start displaying thread activity, ensure that the appropriate DB2 monitor trace classes are set on. At least monitor class 1 must be set on, but it is a good practice to also set on class 2 and class 3. If you also want to obtain class 5, 7, or 8 information, switch on the corresponding monitor trace class.

If display exception processing is active, any fields in exception status are shown in reverse video. If you are using a color terminal, fields in warning status are highlighted in yellow, while fields in problem status are highlighted in red. Furthermore, a pop-up window shows the number of display exceptions detected.

You can purge a thread currently processing in a DB2 subsystem from any Thread Activity panel using the PURGE command. You require the DB2 privilege to perform CANCEL THREAD. See “PURGE command” on page 1866 for more information about purging a thread.

For a DB2 thread that exploits parallelism, OMEGAMON XE for DB2 PE reports aggregated values across all parallel tasks that are created to execute SQL statements within the thread. Therefore, and because of the nature of parallel work, some counters (particularly processor and suspension fields) can show unexpected large values, which do not necessarily indicate problems. Sometimes these values are even larger than the entire wall-clock elapsed time. Besides query parallelism OMEGAMON XE for DB2 PE also reports DB2 utility parallelism. Further details are described in the following paragraph.
Accounting times:

Accounting times are usually the prime indicator of a performance problem and should be the starting point for analysis.

DB2 times are classified as follows:

- **Class 1** time shows the time the application spent since connecting to DB2, including time spent outside DB2.
- **Class 2** elapsed time shows the time spent in DB2. It is divided into CPU time and waiting time.
- **Class 3** elapsed time is divided into various waits, such as the duration of suspensions because of waits for locks and latches or waits for I/O.

Parallellism considerations:

This section applies to threads that exploit CP parallelism or utility parallelism.

If a thread exploits parallelism, several tasks (called parallel tasks) are scheduled to perform the parallel work. For each of these tasks an Accounting record is generated, which contains counters and timers for the work performed by the particular task. In addition, the Accounting record for the thread contains the details about non-parallel work within the thread and also some parallel work-related data.

OMEGAMON XE for DB2 PE summarizes all Accounting records generated for such a thread and presents them as one logical Accounting record. Table 136 on page 1827 describes which values are a combination of the originating task’s and parallel tasks’ values and which are taken from the originating task only.

To avoid incorrect time values, the data collector must be active with CCP=YES switched on if query parallelism or utility parallelism is used. In this case, the data collector can collect data of parallel tasks that have already terminated.

For Sysplex parallelism, thread activity information is only shown for the originating task and for those parallel tasks that are executing on the same member as the originating task. Parallel tasks that are executing on different members of the Sysplex group are ignored. Sysplex parallelism threads are marked by *$* next to the program name in the Thread Summary panel.

Especially interesting is the relationship between elapsed time, CPU time, and suspension times in the case of query parallelism or utility parallelism. The elapsed time is taken from the originating record while CPU and suspension times are calculated from all parallel and originating records. Consequently, both CPU time and suspension times can be larger than the elapsed time. Therefore, you can only get the full picture of the response time distribution if the times for each participating task are known. Produce a long Record trace for IFCID 3 using the Batch reporting facilities, especially if you suspect that the CPU times or suspension times for a thread where query parallelism or utility parallelism is used are large for other reasons than the times being added for several tasks. In a long Record trace, all Accounting records for parallel and originating threads are reported separately.

Thread Summary panel:

Use the Thread Summary panel to view a list of active threads connected to the DB2 subsystem.

To display the Thread Summary panel, select option 1 (Display Thread Activity) from the Online Monitor Main Menu.

When the Thread Summary panel is initially displayed, class 1 and class 2 elapsed times are shown. Additional information is available to the right of the panel. You can press F20 (Right) to view the portions of the panel that are not displayed. [Figure 45 on page 1828][Figure 46 on page 1828][Figure 47 on page 1829] and [Figure 48 on page 1829] show the Thread Summary panel with all its possible fields.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

Figure 48. Thread Summary panel (scrolled right three times)
You can filter threads from being displayed in this panel using the QUALIFY command (see “QUALIFY command” on page 1867). You can also specify the order in which the threads are listed using the SORT command (see “SORT command” on page 1870).

The 1 field displays one of the following values:

- **DB2** The thread is currently processing within DB2.
- **I/O** The thread is performing I/O activity within DB2.
- **LOCK** The thread is engaged in locking activity within DB2.
- **EOT** The thread is in end-of-task processing.
- **APPL** Processing is occurring within the application.
- **I/S** The thread is in identify or signon state.
- **QUE** The value specified for MAXUSERS in the DB2 Install panel DSNTIPE has been met and the thread creation is queued until an available slot is found.
- **SP** The thread is running a stored procedure and is currently processing within DB2.
- **SPA** The thread is running a stored procedure, and processing is occurring outside DB2 (in stored procedure application code).
- **SPW** The thread is waiting for a stored procedure to be scheduled within DB2.
- **NTCB** Recoverable Resource Manager Services Attach Facility (RRSAF) agent has no TCB.

The identifier fields Primauth, Plannname, Package or DBRM, Connection ID, and Status are highlighted in yellow when the status is DB2. Threads that are in I/O, Lock, SP, or SPW status are also highlighted in yellow because these are subsets of the DB2 status. The other fields in the Thread Summary panel are highlighted in reverse video when they are in exception status.

An asterisk (*) is shown to the left of the 1 field if the thread type is ALLIED DISTRIBUTED or DBAT.

When display exception processing is active, the exception fields displayed in the Thread Summary panel are checked for an exception condition each time the panel data is refreshed.

If you are filtering the threads listed in this panel, only the listed threads are checked for exception conditions. Threads in exception status are sorted to the top of the display, with problem level exceptions first and warning level exceptions second.

From the Thread Summary panel, you can select any thread to display the Thread Detail panel, where the thread can be examined in greater detail.

**Thread Detail panel:**

Use the Thread Detail panel to view detailed information about the thread being monitored. From the Thread Detail panel, you can reach the Category windows, which show selected information about the monitored thread in greater detail.
To display the Thread Detail panel, select any active thread listed in the Thread Summary panel, Threads Holding Resource window, or the Periodic Exceptions List panel.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

**Note:** The Thread Detail panel displayed at your site might have been tailored by your installation and consequently might not necessarily match the panel example shown in this information.

![Thread Detail panel](image)

If you have enabled display exception processing, all fields in exception status are shown in reverse video, and the color indicates the level of the exception. **Warning** level exceptions are highlighted in yellow, while **problem** level exceptions are highlighted in red. Categories that can be selected from this panel are shown in reverse video when their next level windows contain fields in exception status.

If DBRM is used, the Current Package field displayed in the Thread Detail panel is shown as Current DBRM instead.
The following list describes some of the important fields that are shown in this panel:

**Type**  The type of the thread being monitored.

- **ALLIED** The thread is not involved in any distributed activity.
- **A-DIST** The thread is initiated by a DB2 attach and requests data from one or more server locations.
- **DBAT** The thread is initiated by, and performing work on behalf of, a remote (requester) location.
- **D-DIST** Distributed database access thread, both a DDF server and requester.

It is important to know whether the thread is involved in distributed activity, because this can affect the fields that should be monitored. For example, if the thread is involved in distributed activity, the class 1 elapsed time is higher than if there was no distributed activity, because this time includes network time.

**Class 1 Times**
This field shows the elapsed time and the CPU time for the processing performed and includes the time spent not only in DB2 but also in the application.

CPU time is the sum of:
- The agent’s CPU (TCB) time
- The CPU time spent in stored procedures
- The accumulated processing time of the parallel tasks (if query parallelism or utility parallelism is used)

**Class 2 Times**
This field shows the elapsed time and the CPU time for the processing performed in DB2 only. Elapsed time includes wait times.

CPU time is the sum of:
- The agent’s CPU (TCB) time
- The CPU time spent in stored procedures
- The accumulated processing time of the parallel tasks (if query parallelism or utility parallelism is used)

For threads that exploit query parallelism or utility parallelism, class 2 CPU time can be larger than class 2 elapsed time because the CPU time includes the execution time of all parallel threads. To separate the agent’s CPU time from the sum of all parallel tasks’ CPU times, select Times, which displays the Thread Times window. See also the discussion at the beginning of “Accounting times” on page 339.

**Class 3 Times**
This field shows the total time spent waiting because of class 3 suspensions. For threads that exploit query parallelism or utility parallelism, wait times are summed for the originating task and all parallel tasks. See also the discussion at the beginning of “Accounting times” on page 339.

**Suspensions**
This field includes all types of lock suspensions.

**Getpage requests**
This field shows the number of Getpage requests. Reducing Getpage requests reduces CPU usage and improves performance. Fewer Getpage
requests also result in fewer synchronous reads, because fewer pages that are not in the buffer pool must be fetched.

**Prefetch reads**
This includes number of Prefetch reads done because of Sequential Prefetch, List Prefetch, and Dynamic Prefetch.

**Synchronous I/O**
This includes both synchronous reads and synchronous writes.

**Thread Activity windows:**
You can access several windows from the Thread Detail panel. To reach a window, type any character in the space beside the heading you want. Several windows can be accessed simultaneously. The windows are overlaid in the Thread Detail panel. To leave the current window and proceed with the next window, press F3 (Exit). To cancel all windows and return to the Thread Detail panel, press F12 (Cancel).

**Thread Identification window:**
Use the Thread Identification window to examine the identification data about the thread being monitored. To display this window, select Thread Identification from the Thread Detail panel.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

**Figure 50. Thread Identification window**

From the Thread Identification window, you can select Requester Correlation to display the Requester Correlation Data window.

The following list describes some of the important fields that are shown in this window:

**Status** The status of the thread. If Parallelism is ‘CP’, the status ‘In DB2’ means that the originating task is in DB2.
**Primauth**

The primary authorization ID from connection or signon. This is SYSOPR for MVS operator commands and DB2 system internal agents. The connection authorization exit and the signon authorization exit can change the primary authorization ID so that it is not the same as the original primary authorization ID. Distributed authorization ID translation can also change the primary authorization ID.

**Planname**

The name of the plan produced during the bind process and used by DB2 to process SQL statements encountered during statement execution. Examples of plan names are DSNUTIL for utility, DSNBIND for bind activity, DISTSERV for remote unit of work, and the application plan name for CICS and IMS.

**Correlation Name**

The correlation name for the thread.

For further details, see “Correlation ID translation” on page 1801.

**Correlation Number**

The correlation number for the thread.

For further details, see “Correlation ID translation” on page 1801.

**LUW Network ID**

The logical unit of work ID (LUWID), consisting of the network ID, LU name, instance number, and sequence number, identifies a thread within a network and is used to correlate local and remote activity for a single distributed transaction.

**LUW LU Name**

See LUW Network ID.

**LUW Instance Number**

See LUW Network ID.

**LUW Sequence Number**

See LUW Network ID.

**RRSAF Accounting token**

This field shows the Accounting token as defined during signon for a thread using the RRS attachment facility.

**Recovery token**

This field is used to correlate Online Monitor display with a CICS inquire task display.

**Requester Correlation Data window:**

Use the Requester Correlation Data window to view information about the correlation data belonging to the originator (initial requester) of the distributed transaction. One of four different Requester Correlation Data windows is displayed depending on the requester type.

The following figure shows an example of a Requester Correlation Data window.
Current Package/DBRM window:

To display this window, select Current Package or Current DBRM from the Thread Detail panel. One of two possible windows is displayed depending on whether the thread currently uses a package or a DBRM.

Some fields can have values that are longer than the space available to show them in this panel. If this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

Figure 51. Requester Correlation Data window for a DB2 Requester
Use the Current Package window to view information about the location, identification, and execution times of various functions performed by or on the current package.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.
Use the Current DBRM window to view information about the identification and execution times of various functions performed by or on the current DBRM.

See "Accounting times" on page 339 for a discussion of how to interpret the time values for threads that exploit query parallelism or utility parallelism. These considerations apply to class 7 times (for elapsed times and CPU times) and to class 8 times (for suspension times).

The following list describes some of the important fields that are shown in this window:

**Not accounted**
This is derived as Waiting time - Suspension time (Class 8) TCB. It includes CPU wait times, paging, and open/close activity.

**Suspensions (Class 8)**
If Waiting time and Suspension time (Class 8) are almost the same, examine the reasons for suspensions that caused the wait. Otherwise, examine the Not accounted field in the Thread Times window.

**Locks and latches**
This field shows the duration of suspensions resulting from a lock or latch not being available immediately on request. If the suspension time is high, examine the Locking (IRLM) Activity window.

**Synchronous I/O**
This field shows the accumulated I/O elapsed wait time for I/O performed under this thread. This field is for synchronous I/O only. It includes synchronous Read and Write I/O. If the time per I/O is high, one typical problem is an interference by Prefetch or Deferred Write I/O.

**Other read I/O**
This field includes waits caused by Read I/O performed under another thread, for example, Sequential Prefetch, List Prefetch, or Dynamic Prefetch.

If the value in this field is high, the problem could be an I/O bound query using Prefetch or an I/O contention. If it is an I/O bound query, DEGREE...
ANY could drastically improve elapsed time of such a query. The application is accessing data from a busy data set/volume/control unit and is continually being suspended. The DBA and the MVS system programmer should be consulted.

Other write I/O
This field includes waits caused by Write I/O performed under another thread, for example, asynchronous Write.

If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set/volume/control unit and is continually being suspended. The DBA and the MVS system programmer should be consulted to resolve possible data set placement problems.

Too small a buffer pool for sort and other updated data could also cause this problem.

Services task switch
Included here are waits because of OPEN/CLOSE data set, SYSLGRNX update, COMMIT PHASE II for UPDATE threads, HSM recall for data set, data space manager services, DEFINE, EXTEND, and DELETE data set, and the log I/Os for COMMIT and UPDATE processing.

Wait times in COMMIT are reported in the following fields:

**TSO/CAF/Batch single phase commit:**
SER.TASK SWTCH

**CICS/IMS phase 1 commit:**
SYNCHRON. I/O

**CICS/IMS phase 2 commit:**
SER.TASK SWTCH

This means, for example, that an IMS COMMIT used to have 2 synchronous I/O suspensions, whereas now it has 1 synchronous I/O suspension and 1 service task suspension.

Both single and dual logs result in the same count.

There is no overlap between the elapsed time reported in this field and the other class 3 elapsed times. If service task suspensions overlap other types of suspensions, the other types of suspensions are ignored.

Preformatting the data sets is probably most important in terms of service task suspension.

**Archive log (quiesce)**
Included here are waits because of processing of the ARCHIVE command (not the time for the ARCHIVE command to complete).

Avoid issuing ARCHIVE LOG QUIESCE during peak periods.

**Archive log read**
Accumulated wait time for archive reads (from tape).

**Drain lock**
The time spent waiting because of drain lock suspensions. If the value is large, it can indicate that the execution of a utility affects the SQL.

**Claim release**
The time spent waiting for claims to be released.
Page latch

The time spent waiting for page latch contentions.

Thread Times window:

Use the Thread Times window to investigate the response times of different actions performed by the thread.

See "Accounting times" on page 339 for a discussion on how to interpret the time values for threads that exploit query parallelism or utility parallelism.

To display this window, select Times from the Thread Detail panel.

Figure 54. Thread Times window

Class 1, 2, and 3 times can help guide your investigation into application performance and tuning.

Class 2 and 3 times are reported only if monitor trace classes 2 and 3 are active.

Class 2 and 3 times are not updated until the thread completes its current call to DB2. For example, during execution of a long running SQL statement, class 2 and 3 times are not updated until after the SQL process has ended. Consequently, class 2 and 3 times are estimated when the thread is in DB2.
The following list describes some of the important fields that are shown in this window:

**Suspensions (Class 3)**
Total time spent waiting because of various suspensions covered by monitor trace class 3.

**Locks and latches**
This field shows the duration of suspensions resulting from a lock or latch not being available immediately on request. If the suspension time is high, examine further the Locking block in the Accounting report.

**Synchronous I/O**
This field shows the accumulated I/O elapsed wait time for I/O performed under this thread. This field is for synchronous I/O only. It includes synchronous Read and Write I/O. If the time per I/O is high, one typical problem is an interference by Prefetch or Deferred Write I/O. The I/O scheduling enhancement in current DB2 releases should reduce this problem by assigning higher I/O priority to synchronous I/O over asynchronous I/O.

**Other read I/O**
This field includes waits caused by Read I/O performed under another thread, for example, Sequential Prefetch, List Prefetch, or Dynamic Prefetch.

If the value in this field is high, the problem could be an I/O bound query using Prefetch or an I/O contention. If it is an I/O bound query, DEGREE ANY could drastically improve elapsed time of such a query. The application is accessing data from a busy data set/volume/control unit and is continually being suspended. The DBA and the MVS system programmer should be consulted.

**Other write I/O**
This field includes waits caused by write I/O performed under another thread, for example, asynchronous write.

If the value in this field is high, the problem could be I/O contention. The application is accessing data from a busy data set/volume/control unit and is continually being suspended. The DBA and the MVS system programmer should be consulted to resolve possible data set placement problems.

Too small a buffer pool for sort and other updated data could also cause this problem.

**Archive log (quiesce)**
Included here are waits because of processing of the ARCHIVE command (not the time for the ARCHIVE command to complete).

Avoid issuing ARCHIVE LOG QUIESCE during peak periods.

**Archive log read**
Accumulated wait time for archive Reads (from tape).

**Drain lock**
The time spent waiting because of drain lock suspensions. If the value is large, it can indicate that the execution of a utility affects the SQL.

**Claim release**
The time spent waiting for claims to be released.
Deadlocks

The time spent waiting for page latch contentions.

Locking (IRLM) Activity window:

Use the Locking (IRLM) Activity window to view information about locking activity for the thread being monitored.

To display this window, select Locking Activity from the Thread Detail panel.

Figure 55. Locking (IRLM) Activity window

Deadlocks and timeouts displayed in this window can indicate the existence of locking problems. These problems can be further investigated using the Locked Resources window to examine resources that are either locked by or, if they are locked by another thread, unavailable to, the monitored thread.

The following list describes some of the important fields that are shown in this window:

**Timeouts**

Number of times lock suspension ultimately resulted in a timeout. This happens when a requester for a lock on a resource has waited longer than the installation-specified RESOURCE TIMEOUT limit in the DB2 Install panel DSNTIPI.

**Deadlocks**

Number of times lock suspension ultimately resulted in a deadlock. This happens when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. A single process accessing data through an unclustered index can sometimes experience a deadlock between a data page and an index page. If deadlocks are not very frequent, they might not affect performance.
Lock requests
Number of times a lock on a resource was requested.

Change requests
Number of times a lock change was requested, for example, to promote a shared page lock to exclusive lock.

Suspensions - lock
Number of resource conflicts. A suspension is a wait for a lock, and each of these waits can adversely affect application performance. The suspension might ultimately result in normal resumption, timeout, or deadlock. The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can occur on either lock requests or change requests.

The ratio of suspensions to lock requests is largely application dependent.

Lock escalations - shared
Count of lock escalations to shared mode. Number of times the LOCKS PER TABLE(SPACE) parameter in the DB2 Install panel DSNTIPJ was exceeded and the table space lock was promoted from a page lock (IS) to a table space lock (S) for this thread. Escalation can cause unpredictable response times. The lock escalation to shared mode should only happen on an exception basis. For example, if a REPEATABLE READ application references most pages in a table.

Lock escalations - exclusive
Count of lock escalations to exclusive mode. Number of times the LOCKS PER TABLE(SPACE) parameter in the DB2 Install panel DSNTIPJ was exceeded and the table space lock was promoted from a page lock (IX) to a table space lock (X) for this thread. Escalation can cause unpredictable response times. The lock escalation to exclusive mode should happen rarely, for example, if an application updates many pages in a table without issuing commits.

Check the exception event display for deadlocks occurring against the agent that causes the lock escalation. In a transaction processing environment, a moderate level of lockout is tolerable. If many escalations cause deadlocks and timeouts, you can change the escalation threshold value. Use of ANY is extremely desirable to prevent unnecessary and expensive page locks, for example locking all pages in a table space.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

If escalation occurs when LOCKSIZE ROW or LOCKSIZE PAGE is specified, the lock is escalated to the table level for a segmented table space and to the table space level for a nonsegmented table space.

A new clause LOCKMAX has been added to the CREATE TABLESPACE statement. This provides for control of the maximum number of locks for an individual table space in addition to the system-wide NUMLKTS parameter currently provided.

The default is LOCKMAX 0 to ensure that PAGE level locking is consistent with previous releases of DB2. If LOCKSIZE ANY is specified, DB2 chooses LOCKSIZE PAGE LOCKMAX SYSTEM.

Escalation is now possible with PAGE locking by specifying the LOCKMAX clause. This provides for initial PAGE level locking with escalation to table or table space locking for segmented and nonsegmented
table spaces respectively, based on the number of locks specified on the LOCKMAX clause. To disable escalation, specify LOCKMAX 0.

For high volume updates where contention is an issue, use type-2 indexes and specify one of the following:

- LOCKSIZE PAGE
- LOCKSIZE ROW for the high contention tables to improve concurrency. However, LOCKSIZE ROW should be considered only as an exceptional case, because of a potential for significant overhead. In fact, it is even possible that LOCKSIZE ROW causes deadlocks, which would not happen with LOCKSIZE PAGE.

Omitting LOCKMAX results in LOCKMAX 0, which disables escalation. If escalation is to be allowed, users should carefully consider the threshold at which it should take place for each individual table.

Maximum page or row locks held

Count of the maximum number of page or row locks concurrently held against all table spaces by a single thread during its execution. This count cannot exceed the value of the “LOCKS PER USER” DB2 installation parameter (panel DSNTIPJ). After the limit is reached, the next attempt to obtain a lock results in a RESOURCE UNAVAILABLE return code, and the SQL request is not processed.

Locking considerations

The following aspects should be considered if concurrency is an issue:

- Consistent data access sequence in applications
- The mix of concurrent processing types (batch and transaction)
- IRLM startup procedure options and DB2 installation options
- DDL LOCKSIZE
- DDL LOCKMAX
- BIND parameters

See [IBM Db2 for z/OS in the IBM Knowledge Center](https://www.ibm.com) for detailed information.

Locked Resources window:

Use the Locked Resources window to view the list of thread resources that are either locked by or, if they are locked by another thread, unavailable to, the monitored thread. If many resources are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

The resources are listed in the following sequence:
1. Resources that cause this thread to be suspended
2. Resources that cause other threads to be suspended
3. Resources that are held by more than one thread
4. Resources that are held only by this thread

To display this window, select Locked Resources from the Thread Detail panel.
From this window you can display all holders and requesters of any DB2 resource listed. Select any locked resource from this window to display the Threads Holding Resource window, where you can examine a list of threads competing for the resource. For more information, see "Threads Holding Resource window."

You can use the Locked Resources window and the Threads Holding Resource window to examine potential timeouts and deadlocks and to determine whether DB2 resource contention is the cause for long running threads. Whenever a long class 3 lock/latch elapsed time is indicated in the Thread Detail or Thread Times panels, you can use the Locked Resources window to check for suspensions.

The following list describes some of the important fields that are shown in this window:

**Type** This field shows the resource involved.

- **PAGESET** indicates that the object is either a table space or index. The ACQUIRE and RELEASE parameters for the plans, and the RELEASE parameter for the packages involved should be investigated if the lock is suspended.

- **DATAPAGE/ROW** indicates the object is an actual page of data. Check the ISOLATION level for the plans and packages if the lock is suspended.

- **INDEX** indicates the object is an index page or a subpage. The number of subpages per page in the index should be investigated if the lock is suspended.

- **PAGE** indicates the object is a data page. In this case the request type is always LATCH, which indicates a page latch request.

*Threads Holding Resource window:*

Use the Threads Holding Resource window to view information about the locked resource selected from the Locked Resource window. The Threads Holding Resource window displays a list of all holders and requesters of the locked resource. If many threads are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.
To display the Threads Holding Resource window, select any locked resource listed in the Locked Resources window. The Threads Holding Resource window is then displayed. To leave the window and return to the Locked Resources window, press F3 (Exit). To leave the window and return to the Thread Detail panel, press F12 (Cancel).

The appearance of the Threads Holding Resource window differs depending on the type of resource being held by the monitored thread. Figure 57 shows an example of a Threads Holding Resource window.

![Figure 57. Threads Holding Resource window](image)

You can display the Thread Detail panel for any of the threads listed in these windows by typing any character in the selection field beside the thread and pressing Enter.

Use the Threads Holding Resource window and the Locking (IRLM) Activity window to examine timeout or deadlock situations or to determine whether DB2 resource contention is the cause for long running threads.

**RID List Processing window:**

Use the RID List Processing window to view information about the number of successful and unsuccessful RID (Record ID) list processing operations performed. This information can help you determine the maximum number of RID blocks to allocate for optimum system performance.

To display this window, select RID List Processing from the Thread Detail panel.
The following list describes some of the important fields that are shown in this window:

**Successful**
A nonzero value in this field indicates that DB2 has used List Prefetch activity. If you are looking at a transaction and List Prefetch is used, you might want to look into the access path selection.

**Not used - no storage**
Number of times RID list processing was terminated because of insufficient storage.

This failure occurs when a RID list was not used for a given RID list process involving one or more indexes because no storage was available to hold the list of RIDs.

**Not used - limit exceeded**
Number of times RID list processing was terminated because of one or more internal limits exceeded.

The cause of the failure should be investigated, either from statistics record or from performance trace, before increasing the RID list storage size. Without proper investigation, merely increasing the RID list storage size might not solve the problem.

**SQL Activity window:**
Use the SQL Activity window to view the number of executions of SQL statements during the processing of a DB2 application, for the monitored thread.

To display this window, select SQL Activity, Commits, and Rollbacks from the Thread Detail panel.
The SQL executed for the thread being monitored displays the number of times specific SQL statements were executed for the thread being monitored.

The SQL Activity window consists of the following sections:

<table>
<thead>
<tr>
<th>Command</th>
<th>F1=Help</th>
<th>F2=Split</th>
<th>F3=Exit</th>

Total DML
This section shows the number of executions performed by various SQL statements concerning the manipulation of data.

Total DCL
This section shows the number of executions performed by various SQL statements concerning the controlling of various activities.

Total DDL
This section shows a table that contains the number of executions performed by various DDL SQL statements for each of the applicable object types. These SQL statements are used to create, drop, and alter objects.

If you are looking at a transaction and there are nonzero values for Describe, Describe Table, or Prepare, it is an indication that the transaction is involved in dynamic SQL activity. However, this is unlikely and you can investigate further.

If you are looking at a transaction, it is unlikely that you would see any SQL DCL or SQL DDL activity. However, if there is any SQL DDL activity, be sure to use frequent commits to minimize DB2 catalog contention.

The following list describes some of the important fields that are shown in this window:

Incremental bind
The number of incremental binds that took place.

If a plan is bound with VALIDATE(RUN), DB2 performs validity checks at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and how many times they are executed. Avoid VALIDATE(RUN) as much as possible. Ensure that all objects are created and all privileges are granted before bind, and select the VALIDATE(BIND) option.

In addition to plans bound with VALIDATE(RUN), this counter is incremented for plans using DB2 private protocol.

Reoptimization
The total number of times reoptimization of the access path for static and dynamic SQL queries occurred during execution time.

Reoptimization can be triggered by the option REOPT(VARS) for BIND and REBIND PLAN and PACKAGE. Reoptimization is intended for statements with host variables, parameter markers, and special registers with access paths that are so inappropriate that the performance improvement of the reoptimized path outweighs the overhead caused by the reoptimization.

Commit
The number of Commit phase 1, Commit phase 2, read only Commit and single phase Commits (syncs) that completed successfully.

Changes/Commit
This ratio shows the inserts, updates, and deletes per commit and rollback.

This ratio is useful in monitoring the frequency of Commits. Too many updates per commit means a long running unit of recovery, which degrades IRLM performance and can prolong recovery in case of a failure.
Too few updates per commit hampers performance, since log writes are involved. If necessary, look into the application to establish commit points appropriately.

The commit frequency can vary between online transactions and batch jobs.

**Buffer Manager Activity window:**

Use the Buffer Manager Activity window to view all buffer pools used by the thread.

To display this window, select Buffer Manager Activity from the Thread Detail panel.

```
<table>
<thead>
<tr>

```

**Figure 60. Buffer Manager Activity window**

You can select any buffer pool ID listed in this window to display the Buffer Pool Detail window, where you can view information about read and write activity both to and from that particular buffer pool, or select Total to view information about all of the listed buffer pools combined.

By examining buffer pool read and write activity, you can determine the buffer pool sizes for optimum system performance.

**Buffer Pool Detail window:**

Use the Buffer Pool Detail window to view information about the buffer pool selected from the Buffer Manager Activity window. These statistics show read and write activity both to and from that buffer pool. If Total was selected from the Buffer Manager Activity window, this window displays the combined statistics of all buffer pools used by the thread.

To display this window, select a buffer pool ID or Total from the Buffer Manager Activity window.
Note: For enhanced system performance, ensure that buffer pools are large enough to store frequently used data in virtual storage, which can reduce the number of I/O operations necessary.

The following list describes some of the important fields that are shown in this window:

**Buffer pool hit ratio (%)**
The total number of Getpage operations, minus the number of pages read from a hard disk drive (both synchronously and using Prefetch), divided by the total number of Getpage operations, multiplied by 100.

**Getpage requests**
Number of Getpage requests.

**Buffer updates**
Number of buffer updates. A nonzero value indicates either SQL INSERT, UPDATE, DELETE activity, merge scan join, and/or activity on the workfiles because of internal sort.

**Sequential prefetch requests**
Number of times Sequential Prefetch reads were requested. Table space scans and nonmatching index scans generally use Sequential Prefetch.

**List prefetch requests**
Number of times List Prefetch reads were requested. List Prefetch is always used to access data in multiple index access, and to access data from the inner table during a hybrid join. List Prefetch is usually employed with a single index when the index has a cluster ratio lower than 80%. List Prefetch is sometimes used on indexes with a high cluster ratio if the amount of data estimated to be accessed is too small to make Sequential Prefetch efficient, but large enough that more than one synchronous Read is needed.

**Dynamic prefetch requests**
Number of times Dynamic Prefetch reads were requested. Dynamic Prefetch is typically used for a SELECT or UPDATE that is run repeatedly, accessing the index for each access.

**Synchronous read I/O**
Number of synchronous Read I/O operations.

Figure 61. Buffer Pool Detail window (Thread Activity)
Synchronous writes

Total number of immediate Writes for a page. Although an immediate Write should be rare, a small nonzero value is always expected. A large value indicates that the system needs tuning.

SQL Statement and Program window:

Use the SQL Statement and Package window to view information about the current SQL statement being executed or the last SQL statement that was executed by the thread.

To display this window, select SQL Statement from the Thread Detail panel. One of two possible windows is displayed depending on whether the thread is using a package or a DBRM. Only the SQL Statement and Package window is shown here in this section.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

```
DGOMTWCS SQL Statement and Program

Command ===> F1=Help  F2=Split  F3=Exit  F5=Auto  F6=History  F7=Up
F8=Down   F9=Swap   F12=Cancel   F16=Look   F17=Collect   F18=Explain
F22=Purge
```

*Figure 63. SQL Statement Text window*

The SQL statement is displayed only if you have MONITOR2 or SYSADM privilege. If the SQL statement text is long, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the text.

**Note:** The SQL statement text can be truncated, depending on the size of the statement and the DB2 version. If the agent is processing an SQL CALL statement, the name of the stored procedure is shown in the Stored procedure field.

You can examine the access paths and processing methods chosen by DB2 for the SQL statement shown in this window. To do this, press F18 (Explain) or type EXPLAIN and press Enter on the command line. See "Monitoring the access path with Explain" on page 1921 for more information.

**Used Buffer Pools window:**

This window shows details of the buffer pools used for the execution of the SQL statement. For each buffer pool, the number of Getpage operations and the number of synchronous Read I/O operations is shown.
Distributed Data window:

Use the Distributed Data window to view a list of serving locations that are communicating with the thread. If many locations are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

To display this window, select Distributed Data from the Thread Detail panel.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.

```

**Figure 66. Distributed Location Detail window**

From this window you can select any conversation listed to display the Distributed Conversation Detail window, where the conversation can be examined in greater detail.

The following list describes some of the important fields that are shown in this window:

**Requester elapsed**

This field shows the elapsed time spent at the requester between the sending of the SQL statement and the receipt of the answer from the server. This includes the processing time in DB2, VTAM, and the network.

If this value is large, it could indicate block fetch might not have been used.

**Messages Received**

This field shows the count of the messages the requester location received from the server location.

More messages might be sent from the server location than are received by the requester location because of the manner in which distributed SQL statements are processed internally.
Remote Elapsed
This field shows the elapsed time spent at the server between the actual receipt of the SQL statement and until the answer is sent to VTAM.

This is not applicable to the Distributed Relational Database Architecture (DRDA).

Comparison of this time with elapsed time (class 2) reveals how much time is spent by the allied distributed thread in remote processing.

Remote CPU
This field shows the CPU time spent at the server from the actual receipt of the SQL statement until the answer is sent to VTAM.

This is not applicable to DRDA.

Distributed Conversation Detail window:
Use the Distributed Conversation Detail window to examine the conversation selected from the Distributed Location Detail window. This window displays information about just one of the conversations sent between the monitored thread and the serving location selected from the Distributed Data window. To display this window, select any conversation listed in the Distributed Location Detail window.

The following list describes some of the important fields that are shown in this window:

**Conversation active flag**
This field indicates either:
- DB2 has transferred control of the thread to the network on this conversation.
- The agent is suspended in DB2 and is waiting for notification from the network that the event is completed (asynchronous requests).
- None of the above.

**Connection ID**
This 64-bit string uniquely identifies the connection on which the conversation is executing.

For VTAM connections, this is the VTAM-defined session instance identifier of the session on which the conversation is executing.

**Distributed Conversation Detail window**

Figure 67. Distributed Conversation Detail window
For TPC/IP connections, this is the 32-bit IP address of the remote site, followed by DB2’s 16-bit TCP/IP port number and the remote site’s 16-bit TCP/IP port number.

Network connection type
This field indicates which type of network connection is used, TCP/IP or VTAM.

IFI (Class 5) and Data Capture window:
Use the IFI (Class 5) and Data Capture window to view the number of IFI calls made, the CPU time spent processing these calls, and to examine statistics on data capture activity for the thread.

To display this window, select IFI (Class 5) and Data Capture from the Thread Detail panel.

<table>

Figure 68. IFI (Class 5) and Data Capture window

Query Parallelism Data window:
Use the Query Parallelism Data window to view information about the number of parallel groups executed for the thread and to find out whether the type or degree of parallelism was changed at run time.

To display this window, select Query Parallelism Data from the Thread Detail panel.
The main objective of query parallelism is to improve query response times.

By examining the information displayed in this window, you can discover the number of parallel groups that have fallen back to sequential mode and determine the cause.

The following list describes some of the important fields that are shown in this window:

**Maximum Degree of Parallelism**
Maximum degree of parallelism executed among all parallel groups. This field indicates the extent to which query parallelism applies.

The degree can be set on the BIND and REBIND commands or the SET CURRENT DEGREE statement. The default is set by the CURRENT DEGREE installation parameter. If a query is I/O bound, I/O parallelism can help reduce the response time. If a query is CPU bound, query CP parallelism can reduce the response time. If both conditions apply, the benefits for the query can be very large.

**Parallel Groups Executed**
Total number of parallel groups that have been executed.

**Planned Parallel Degree**
Total number of parallel groups that executed to the planned parallel degree. This field is incremented by one for each parallel group that executed with the planned degree of parallelism (as determined by DB2).

**Reduced Parallel Degree - No buffer**
Total number of parallel groups that processed to a parallel degree less than planned because of a storage shortage or contention on the buffer pool. If this field is not zero, increase the size of the current buffer pool by using the ALTER BUFFERPOOL command, or use the ALTER TABLESPACE statement to assign table spaces accessed by this query to a different buffer pool.

---

<table>
<thead>

</tr>
<tr>
<td>Parallelism Disabled by RLF</td>
<td>NO</td>
</tr>
</tbody>
</table>

*Figure 69. Query Parallelism Data window (Thread Activity)*
One DB2 COORDINATOR Parm = NO
The total number of parallel groups scheduled for Sysplex query parallelism, but executed on a single DB2 because of the COORDINATOR subsystem value being set to NO. When the statement was bound, the COORDINATOR subsystem value was set to YES. This situation can also occur when a package or plan is bound on a DB2 subsystem with COORDINATOR=YES, but is run on a DB2 subsystem with COORDINATOR=NO.

One DB2 Isolation Level
The total number of parallel groups scheduled for Sysplex query parallelism, but executed on a single DB2 because of repeatable-read or read-stability isolation.

Cursor
Total number of parallel groups that fall back to sequential operation because of a cursor that can be used for update or delete.

No ESA
Total number of parallel groups that fall back to sequential operation because of a lack of MVS/ESA sort support.

No buffer
Total number of parallel groups which fall back to sequential mode because of storage shortage or contention on the buffer pool.

Member skipped (%)
The percentage of Sysplex parallel groups that were not distributed as planned.

This field indicates situations where a member has insufficient buffers and so the parallelism coordinator has to bypass a DB2 when distributing tasks.

Parallelism Disabled by RLF
This field indicates whether parallelism was disabled by RLF governing for dynamic SQL statements of this thread.

Query Parallelism Considerations:

Query parallelism is suited to both data-intensive and complex queries. A query is data-intensive if it has a high ratio of I/O compared to CPU and complex if it requires a high use of CPU to resolve complex predicates and functions.

In general queries are suited to query parallelism when the following apply:
- Partitioned table space
- Fast n-way processor
- Adequate buffer space to cater for multiple parallel tasks
- Dedicated environment

Query I/O parallelism works best when there is:
- High ratio of I/O time to CPU time
  - Large record size
  - Very large tables
  - Query which scans many rows but returns few
  - Table space scan rather than index scan

Query CP processing works best when there is:
- High ratio of CPU time to I/O time
- Complex or many predicates
- Complex many level subqueries
- Column and scalar functions
- Multi-way joins
- Grouping and ordering clauses
- Type 2 Index access and tablespace scans

*Data Sharing Locking Activity window*:

Use the Data Sharing Locking Activity window to view information about data sharing locking activity for the monitored thread.

To display this window, select Data Sharing Locking Activity from the Thread Detail panel. This selection is only available if the monitored DB2 subsystem is part of a data sharing group.

The following list describes some of the important fields that are shown in this window:

**Lock requests**

The number of lock requests for P-locks or locks that are acquired and owned by the DB2 subsystem. This means that P-locks are not owned by threads. A P-lock can be requested on behalf of the subsystem under a user TCB.

**Lock requests - XES**

The number of lock requests propagated to XES (L-lock or P-lock) synchronously (under the caller’s execution unit). If the request suspends for any reason, this counter is not incremented.

The following fields contain the global lock suspend counts for P-locks or L-locks:

**IRLM global contention**

The number of suspends because of IRLM global resource contention. IRLM lock states were in conflict.
XES global contention
The number of suspends because of XES global resource contention, but no IRLM global resource contention. XES lock states were in conflict, but the IRLM lock states were not.

Suspensions - False contention and conversion
Summation of false contentsions (see below) and sync-to-async heuristic conversions. Conversions are done when XES determines that it is more efficient to drive the request asynchronously to the CF.

False contention
The number of false contentions encountered on this z/OS image. A false contention occurs when different resource names hash to the same entry in the CF lock table. The CF detects contention within the hash entry, and XES uses inter-system messaging to determine that no actual resource contention exists. This counter is maintained on a per-LPAR basis. Therefore this counter will over-report false contentions in cases where multiple members from the same data sharing group run on the same z/OS image. The counter is not present (N/P) if data is unavailable because of errors from the IXLMG service.

Incompatible retained lock
The number of global lock or change requests denied or suspended because of an incompatible retained lock.

Group Buffer Pools Activity window:

Use the Group Buffer Pools Activity window to view all group buffer pools used by the thread. If many group buffer pools are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

To display this window, select Group Buffer Pools Activity from the Thread Detail panel. This selection is only available if the monitored DB2 subsystem is part of a data sharing group.

--- Figure 71. Group Buffer Pools Activity window ---

You can select any group buffer pool ID listed in this window to display the Group Buffer Pool Detail window, where you can view information about read and
write activity both to and from that particular group buffer pool, or select Total to view read and write activity on all of the listed group buffer pools combined.

**Group Buffer Pool Detail window:**

Use the Group Buffer Pool Detail window to view information about the group buffer pool selected from the Group Buffer Pools Activity window. These statistics show read and write activity both to and from that buffer pool. If Total was selected from the Group Buffer Pools Activity window, the Group Buffer Pool Detail window shows combined statistics on all group buffer pools used by the thread.

![Group Buffer Pool Detail window](image)

The following list describes some of the important fields that are shown in this panel:

**Data returned (Cross invalidation)**

The number of synchronous coupling facility Read requests caused by the page in the member’s buffer pool that is marked invalid. Data is returned from the group buffer pool.

**No data returned (Cross invalidation)**

The number of synchronous coupling facility Read requests caused by the page in the member’s buffer pool that is marked invalid. Data is not returned from the group buffer pool but from a hard disk drive.

**Data returned (Not Found)**

The number of synchronous coupling facility Read requests necessary because the requested page was not found in the buffer pool. Data was returned from the coupling facility.

**No data returned (Not Found)**

The number of synchronous coupling facility Read requests necessary because the requested page was not found in the buffer pool. Data is not returned from the group buffer pool but from a hard disk drive.
Read prefetch
The number of pages read from the group buffer pool because of Prefetch under the control of the agent.

Changed pages written
The number of changed pages synchronously written from the member’s virtual pool to the group buffer pool.

Clean pages written
The number of clean pages synchronously written from the member’s virtual pool to the group buffer pool.

Unregister page
The number of coupling facility requests to unregister a page.

Stored Procedures window:
Use the Stored Procedures window to view the stored procedures activity for the thread being monitored.

To display this window, select Stored Procedures from the Thread Detail panel.

<table>
<thead>
<tr>
<th>Command</th>
<th>Stored Procedures</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALL statements executed</td>
<td>0</td>
</tr>
<tr>
<td>Procedure abends</td>
<td>0</td>
</tr>
<tr>
<td>CALL statement timeouts</td>
<td>0</td>
</tr>
<tr>
<td>CALL statements rejected</td>
<td>0</td>
</tr>
</tbody>
</table>

Figure 73. Stored Procedures window

CALL statements executed
Total number of SQL CALL statements that were executed for the current thread.

Procedure abends
The number of times a stored procedure terminated abnormally.

CALL statement timeouts
The number of times an SQL CALL statement timed out while waiting to be scheduled.

CALL statements rejected
The number of times an SQL CALL statement was rejected because of the procedure being in the STOP ACTION(REJECT) state.

Thread Activity commands:
The commands in this section apply to Thread Activity panels. Commands are typed on a panel command line. Some commands are assigned to function keys. A list of active function keys is displayed at the bottom of each panel. You can abbreviate commands down to three characters in length. For example, the AUTO command can be abbreviated to AUT.
**AUTO command:**

Use the AUTO command to refresh values displayed in panels without having to press Enter. When you activate auto-display mode, the displayed values are updated periodically, as specified by the AUTO command. You cannot perform any other tasks with your Online Monitor session while auto-display mode is running.

The command syntax is:

```
AUTO [integer [SECONDS] [MINUTES]]
```

**Parameters of the AUTO command**

The AUTO command accepts the following parameters:

- **integer** Optional. Specifies the auto-display interval. The valid ranges are:
  - 1 to 7 200 seconds
  - 1 to 120 minutes
- **SECONDS** Optional. Specifies the auto-display unit in seconds. If no unit is specified, the default is seconds. If this parameter is specified, integer should also be specified.
- **MINUTES** Optional. Specifies the auto-display unit in minutes. If this parameter is specified, integer should also be specified.

If no parameters are specified, the values in the Auto Display window are used.

**Starting Auto Display mode**

To start Auto Display mode, type AUTO followed by any parameters on the command line and press Enter. You can abbreviate the AUTO command to AUT, the SECONDS to S, and the MINUTES to M.

To stop Auto Display, press the attention key.

**Note:** While the Online Monitor is executing a DB2 call (IFI or SQL), pressing the attention key might not stop the auto-display mode. An ‘A’ is displayed every time the key is pressed until attention processing is available again. For example, this is the case when the Online Monitor is issuing SQL statements to resolve names of locked resources.

**Examples of the AUTO command**

- AUTO 5 refreshes the panel with updated values every 5 seconds
- AUTO 1 MIN refreshes the panel with updated values every minute
- AUTO 10 refreshes the panel with updated values every 10 seconds
- AUTO uses the values specified in the Auto Display window
Examples of the AUTO command:

- AUTO 5 refreshes the panel with updated values every 5 seconds
- AUTO 1 MIN refreshes the panel with updated values every minute
- AUTO 10 refreshes the panel with updated values every 10 seconds
- AUTO uses the values specified in the Auto Display window

EXPLAIN command:

Use the EXPLAIN command to examine the access path methods that were chosen by DB2 for the currently executing SQL statement of a thread.

The EXPLAIN command can be issued from the following Thread Activity windows:

- SQL Statement and Package
- SQL Statement and DBRM

The EXPLAIN command can also be issued from the Thread Detail panel if it has been tailored to show the SQL statement text.

The command syntax is:

```
EXPLAIN
```

Figure 75. Syntax of the EXPLAIN command

Invoking Explain

To examine the access path methods chosen by DB2 for an SQL statement shown in a Thread Activity panel, type EXPLAIN on the command line and press Enter. EXPLAIN can be truncated to a minimum of EXP.

For more information about how to explain an SQL statement, see “Monitoring the access path with Explain” on page 1921.

HISTORY command:

Use the HISTORY command to view past data that was previously collected by the data collector. The data is gathered at installation-defined intervals. The date and time in the panels that support history indicate when the data being displayed was collected.

You can only view past data if the data collector is active for the subsystem you are monitoring and if it was started with the parameter HISTORY=YES. See “OMEGAMON Collector purpose and function” on page 372 for information about the data collector.

The command syntax is:
Parameters of the HISTORY command

The HISTORY command accepts the following parameters:

- **OFF**  
  Returns the display to the current time.

- **BACK**  
  Displays data for the previous interval. If no more data is available, data from the earliest available interval is displayed.

- **FORWARD**  
  Displays information for the next available interval. If no more data is available, data from the current time is displayed and processing continues as if HISTORY is OFF.

- **date**  
  The date of the required information. If no date is specified, today’s date is assumed.

- **hh:mm:ss**  
  The time of the required information. If no time is specified, the default is the time of the earliest available history record for the specified date. The seconds do not need to be specified.

If no data is available for the specified date and time, the next available record is displayed.

If you do not specify any parameters, the History window is displayed. The current system date and time are the defaults for the History window.

Viewing past data

To view past data, type HISTORY followed by any parameters on the command line and press Enter. HISTORY can be truncated to a minimum of HIS.

RESET command:

Use RESET to stop threads from being qualified and sorted in the Thread Summary panel.

The command syntax is:

```
RESET
```

Resetting thread display

To issue the RESET command, type RESET on the command line of the Thread Summary panel and press Enter. RESET can be truncated to a minimum of RES.
**PURGE command:**

Use the PURGE command to purge a thread that is currently processing in the DB2 subsystem you are monitoring. You need the DB2 privilege to perform CANCEL THREAD.

The PURGE command can be issued from any Thread Activity panel.

The command syntax is:

```
PURGE
```

*Figure 78. Syntax of the PURGE command*

**Purging a thread**

To purge a thread listed in the Thread Summary panel, type `PURGE` on the command line, select the listed thread you want to purge, and press Enter. PURGE can be truncated to a minimum of `PUR`.

To purge the thread being monitored from the Thread Detail panel or any of its lower level windows, type `PURGE` on the command line and press Enter.

After issuing the PURGE command, the Purge Thread Confirmation window is displayed.

*Figure 79. Purge Thread Confirmation*

To confirm the purge request, press Enter. To cancel the request and not purge the thread, press F12 (Cancel).

If you purge the thread currently being monitored from the Thread Detail panel or any of its lower level windows, you are returned to the Thread Summary panel.

*Purging a thread:* To purge a thread listed in the Thread Summary panel, type `PURGE` on the command line, select the listed thread you want to purge, and press Enter. PURGE can be truncated to a minimum of `PUR`.

To purge the thread being monitored from the Thread Detail panel or any of its lower level windows, type `PURGE` on the command line and press Enter.

After issuing the PURGE command, the Purge Thread Confirmation window shown in *Figure 80 on page 1867* is displayed.
To confirm the purge request, press Enter. To cancel the request and not purge the thread, press F12 (Cancel).

If you purge the thread currently being monitored from the Thread Detail panel or any of its lower level windows, you are returned to the Thread Summary panel.

**QUALIFY command:**

Use the QUALIFY command to filter the threads shown in the Thread Summary panel. If qualify is active, only threads that match the OMEGAMON XE for DB2 PE identifiers you specified in the DB2 Thread Qualification Parameters window are shown. You can use the QUALIFY command only from the Thread Summary panel.

Thread qualification remains active until deactivated either by a QUALIFY OFF command or the RESET command, even across Online Monitor sessions.

The command syntax is:

![QUALIFY Syntax](image)

**Figure 81. Syntax of the QUALIFY command**

**Parameters of the QUALIFY command:**

The QUALIFY command provides the parameters ON and OFF.

**ON** Activates the qualify function based on values previously entered in the DB2 Thread Qualification Parameters window.

**OFF** Deactivates qualify.

If no parameters are specified, the DB2 Thread Qualification Parameters window is displayed.

**Filtering threads:**

To filter the threads shown in the Thread Summary panel, type QUALIFY followed by any parameters on the Thread Summary panel command line and press Enter. QUALIFY can be truncated to a minimum of QUA.

When qualify is active, the word QUALIFY is displayed in the Thread Summary panel header as shown in the following example:
When the QUALIFY command is issued without parameters, the DB2 Thread Qualification Parameters window is displayed. The content of the window differs depending on the version of DB2 in use.

Parameters entered in the DB2 Thread Qualification Parameters window are saved for subsequent sessions. The saved values are used until they are changed.

You can qualify threads by entering any character string in one or more fields in the DB2 Thread Qualification Parameters window. Only threads that match the specified values are displayed in the Thread Summary panel.

You activate qualify from the DB2 Thread Qualification Parameters window by pressing F3 (Exit). To return to the Thread Summary panel without activating qualify, press F12 (Cancel).

**OMEGAMON XE for DB2 PE identifiers:**

The identifier values can be specified in generic form. Place an asterisk (*) in the field to indicate that any value in that character position is valid.
The following rules apply:

- An asterisk in the first character position, followed by blanks, processes all values in that field.
- An asterisk at the end of a character string processes all values beginning with that character string.
- An asterisk in the middle of a character string processes any value in that single character position.

**Note:** If you leave the value blank for the Plan Name or 1 fields, only threads with blank values for these OMEGAMON XE for DB2 PE identifiers are displayed. If you leave the value blank for any of the other OMEGAMON XE for DB2 PE identifiers, an asterisk (*) is inserted by default and all values in that field are processed.

**Thread status:**

Place any character beside each status to be included in the threads displayed.

- I/S The thread is in identify or signon state
- Queued The thread is queued
- **In Application**
  - Processing is occurring within the application
- **In Application Stored Procedure**
  - The thread is running a stored procedure application
- **In DB2**
  - The thread is currently processing within DB2
- **In Lock Wait**
  - The thread is currently suspended waiting for a lock
- **In I/O**
  - The thread is currently in input or output status
- **In DB2 Stored Procedure**
  - The thread is running a stored procedure within DB2
- **In DB2 Stored Procedure Wait**
  - The thread is waiting for a stored procedure to be scheduled within DB2
- **In EOT**
  - The thread is currently in end-of-task processing.

**Thread type:**

Place any character beside each type of thread to be included in the Thread Summary panel.

- **Allied** The thread is only doing local processing.
- **Allied-Distributed**
  - The thread is involved in distributed activity and is requesting data from a remote system.
- **Database Access Thread (DBAT)**
  - The thread is doing work locally on behalf of an allied-distributed or DBAT-distributed thread created at another site.
Example with the DB2 Thread Qualification Parameters window:

This section describes the effects of various parameters entered in the DB2 Thread Qualification Parameters window.

The DB2 Thread Qualification Parameters window is shown in Figure 83 on page 1868.

Primary Authorization ID . . . . . . . . .U**R*

This line of the window specifies that only threads with the following authorization IDs are shown:
• Beginning with U
• With any characters in positions 2 and 3
• With an R in position 4
• With any characters in positions 5 through 8

Planname . . . . . . . . . . . . . . . . .PLANX

This line of the window specifies that only threads with the DB2 plan name PLANX are shown.

Package/DBRM
Connection ID
Correlation ID
Requesting location
Connection Type

These lines specify that all threads meeting the previous specifications are displayed, regardless of connection ID, correlation ID, requesting location, connection type, or package details.

Note: The 1 field applies to the requesting location for distributed threads, and applies to the local location for allied threads.

Thread Status

The thread status field selections specify that all threads meeting the previous specifications are displayed, except those in I/S status.

Thread Type

The thread type field selections specify that only allied threads meeting the previous specifications are displayed.

SORT command:

Use the SORT command to specify the order in which threads are listed in the Thread Summary panel. The threads can be sorted by one or more OMEGAMON XE for DB2 PE identifiers. You can use this command only from the Thread Summary panel.

The command syntax is:
Parameters of the SOR T command:

The SOR T command provides the parameters ON, OFF, DESCENDING, and ASCENDING.

**ON**
Activates sort.
Values previously specified in the DB2 Thread Sort Specification window are used.

**OFF**
Deactivates sort.

**fieldid**
Identifies a field used for sorting threads and activates sort. You can specify multiple fields. The threads are sorted by the order of the specified fields.

**DESCENDING**
Specifies that the threads are to be sorted in descending sequence. This parameter can be abbreviated to D. This is the default.

**ASCENDING**
Specifies that the threads are to be sorted in ascending sequence. This parameter can be abbreviated to A.

**Note:**
1. If only one field is specified in a SOR T command, you do not need to specify the sequence. The sequence is descending by default.
2. If multiple fields are specified, the sequence (ascending or descending) needs to be specified for each field except the last one.
3. All parameters specified in the command are separated by a single space.

The following table lists all fields that you can use with the SOR T command. The field identifiers can be truncated. Uppercase letters indicate the shortest valid abbreviation for each field identifier.

**Table 137. Sort fields**

Sorting threads:

To sort the threads shown in the Thread Summary panel, type SORT (or one of its abbreviations) followed by any parameters on the command line of the Thread Summary panel and press Enter.

When sort is active, the word SORT is displayed in the Thread Summary panel header as shown in the following example:

Figure 85. Thread Summary panel showing sort active

If sort is issued without any parameters, the DB2 Thread Sort Specification window is displayed. Parameters entered in this window are saved for subsequent sessions.

Use the DB2 Thread Sort Specification window to specify a thread summary SORT profile. To activate sort from the DB2 Thread Sort Specification window, press F3 (Exit). To return to the Thread Summary panel without activating sort, press F12 (Cancel).

Example 1 of the SORT command:

In this example of the DB2 Thread Sort Specification window, the threads are sorted first by Connection type in ascending sequence, and next by Thread status in descending sequence.
Example 2 of the SOR T command:

This example shows a SOR T command that specifies to sort the threads by different items and the items in different sorting sequences.

Command ===>

This command specifies the following:
1. The threads are sorted first by primary authorization ID in ascending sequence.
2. The threads are ordered next by class 1 elapsed time in descending sequence.
3. The threads are sorted next by thread status. The sequence is descending by default.

Viewing DB2 statistics

The Online Monitor statistics panels provide an overview of DB2 system activity. Use these panels to view important ratios and DB2 statistics values.

Note: This function is not supported for DB2 11.

Most DB2 statistics field values accumulate while the DB2 subsystem is active. When DB2 is started, the accumulation process begins and continues until the DB2 subsystem is stopped. There are, however, certain fields that are not cumulative. Some are reported as “snapshot” values, and some are reported as “high water mark” values. A snapshot value is a current value, and is updated each time the statistics values are displayed. A high water mark is a maximum value since startup, and is updated each time the statistics values are displayed.
Fields that are not snapshot or high water mark values are known as delta values. They are derived differently for each of the statistics processing modes. They are calculated by the statistics display. For further details, see “Interval processing mode” on page 1875 and “Delta processing mode” on page 1876.

**List of all Statistics panels**

The following list covers all Statistics panels that are described in this section:

- DB2 Statistics Detail panel
- EDM Pool window
- Buffer Manager window
- Buffer Pool window
- Locking Activity window (Statistics)
- Open/Close Management window
- Bind Processing window
- Plan and Package Allocation window
- Log Manager window
- Subsystem Service window
- SQL Activity window (Statistics)
- Query Parallelism Data window (Statistics)
- RID List Processing window (Statistics)
- Distributed Data window (Statistics)
- Remote Location window
- Statistics CPU Times and Other Data window
- DB2 Commands window
- DB2 Instrumentation window
- DB2 IFC Destinations window
- Data Capture window
- Data Sharing Locking Activity window
- Group Buffer Pools Activity window
- Group Buffer Pool Detail window
- Global Group Buffer Pool Statistics window
- Global GBP Statistics Detail window
- Stored Procedures window

**Statistics processing modes:**

There are three different modes of display available for the statistics panels: regular mode, interval mode, and delta mode. Interval mode and delta mode determine the time over which delta values are accumulated. Deltas are not calculated in regular mode. Whenever option 2 (Display Statistics) is selected from the Online Monitor Main Menu, regular mode is activated.

To operate in either interval mode or delta mode, enter an INTERVAL or DELTA command on the command line of any statistics panel.

Statistics values are updated when:

- You press Enter in any statistics panel, with the command line blank and no windows selected.
You issue an INTERVAL, DELTA, or RESET command.

You activate auto-display mode, which updates values automatically at a time interval that you specify.

**Note:** The auto-display function needs to be disabled before an INTERVAL, DELTA, or RESET command is issued. To stop auto-display, press the Attention key. The auto-display function can be activated again after the processing mode command is issued.

### Regular processing mode

This is the default mode of operation whenever you select option 2 (Display Statistics) from the Online Monitor Main Menu. In this mode, the delta values displayed are accumulated since DB2 startup. No calculations are performed on the statistics values in this mode. You must be in interval or delta processing mode to use display exception processing. Use the RESET command to return to regular mode.

### Interval processing mode

To activate interval processing mode, type INTERVAL on the command line of any statistics panel and press Enter. In interval processing mode, the delta values displayed are accumulated since the last time the INTERVAL command was entered on the command line. When interval mode is activated while viewing past data, the values are accumulated between the history time shown when the INTERVAL command was issued and the current history time.

Use interval mode to isolate DB2 statistics activity beginning at a specified time. Interval processing can help indicate the existence of a problem when running with exception processing. When you select interval processing mode, all statistics field values (except high water mark and snapshot fields) are cleared and begin the accumulation process from the start. The first values displayed after the INTERVAL command is issued represent the values from the newly-established base point to the first statistics record pair (IFCID 1 and IFCID 2) encountered after the INTERVAL command. Thereafter, the values are updated each time you press Enter. The auto-display function can be activated with interval processing mode. Statistics values are then updated automatically at the time interval that you specified. A new base point can be established by repeating the INTERVAL command.

If interval processing mode is activated, all statistics panels operate in interval mode. The time elapsed since the base point was established is displayed on the line under the heading of each statistics panel, as shown in the following figure:

![Figure 87. DB2 Statistics Detail panel showing interval active](image)

Interval mode remains active until either it is turned off or you return to the main menu. You can deactivate interval mode using the RESET or DELTA command from any statistics panel. Use the RESET command to return to regular mode.
Delta processing mode:

To activate delta processing mode, type `DELTA` on the command line of any statistics panel and press Enter. In delta processing mode, the values are accumulated between the last two times you pressed Enter. When delta mode is activated while viewing past data, delta processing uses the currently shown history time and the next available history snapshot to accumulate the values.

Use delta processing to isolate DB2 statistics activity that occurs between two specified points in time. Delta mode operates similarly to the Batch statistics trace. When you initiate delta mode, DB2 statistics field values are reported in time slices. A new base point is established each time the displayed values are updated. With the exception of the high water mark and snapshot fields mentioned previously, all statistics field values reflect the activity since the previous display update.

After delta is activated, all statistics panels operate in delta mode. The elapsed time since the last `DELTA` command was entered or since the last time Enter was pressed is displayed on the line under the heading as shown in the following figure:

![Figure 88. DB2 Statistics Detail panel showing delta active](1876 IBM Db2 Performance Expert on z/OS)

Delta mode remains active until you deactivate it or you return to the main menu. You can turn off delta mode using the RESET or INTERVAL command from any statistics panel.

Snapshot fields:

The table in this section lists a selection of snapshot fields and their corresponding Statistics panels.

<table>

**Statistics panel overview:**

The DB2 Statistics Detail panel shows a summary of key statistics values. From this panel, you can reach windows that provide statistics data in greater detail.

Moving between statistics panels does not cause the values shown to be updated. Data displayed in the current panel is refreshed whenever you press Enter without selecting a window to be displayed or executing a command.

**DB2 Statistics Detail panel:**

Use the DB2 Statistics Detail panel to view key DB2 performance data and percentages and important DB2 thresholds. The DB2 Statistics Detail panel should be used as a regular check of the DB2 performance.

To display the DB2 Statistics Detail panel, select option 2 (Display Statistics) from the Online Monitor Main Menu.
Note: The DB2 Statistics Detail panel displayed at your site might have been tailored by your installation and consequently might not necessarily match the panel example shown in this information.

Figure 89. DB2 Statistics Detail panel

From this panel, you can display windows that show statistics about various aspects of the system. Type any character in the selection field next to the corresponding heading and press Enter. Multiple windows can be selected simultaneously.

If you have enabled display exception processing, all fields in exception status are shown in reverse video, and the color indicates the level of the exception. Warning level exceptions are highlighted in yellow, while problem level exceptions are highlighted in red. Selection fields in this panel are shown in reverse video when their next level windows contain fields in exception status.
The following list describes some of the important fields that are shown in this panel:

**EDM Pool pages in use (%)**
The percentage of pages in the EDM pool that have been used or are currently in use (snapshot value). This means, it shows the number of nonstealable pages.

During peak periods, the value in this field should be between 80 and 100 percent. Because stealable pages are not represented here, a value close to 100 percent does not necessarily indicate an EDM pool constraint. As the value approaches 100, examine the efficiency ratios to verify that acceptable levels are met. If the EDM pool is too small, it causes increased I/O activity in database DSNDB01, table spaces DBD01 and SCT02.

*Note:* The EDM pool use varies across the day. It is not only the pages that are in use, but also the pages that are not in use, waiting to avoid I/O, that are important for performance.

**Synchronous Reads**
Number of synchronous read I/O operations performed by sequential and random requests.

**Deadlocks**
Number of times lock suspensions ultimately resulted in a deadlock. This happens when two or more application processes each hold locks on resources that the others need, without which they cannot proceed. Deadlocks result principally from an application design problem. Ensure that all applications accessing the same tables access them in the same order. Deadlocks can also occur through index page splits if there is high insert activity. In this case, it is suggested to set SUBPAGES to 1 for the index.

**Timeouts**
Number of times lock suspensions ultimately resulted in a timeout. This happens when a requester for a lock on a resource has waited longer than the installation-specified RESOURCE TIMEOUT limit in the DB2 Install panel DSNTIPI.

**Reads satisfied - Archive Log**
Number of times DB2 needed to read log records, and had to go to the archive log for the records. The value for this should ideally be zero.

**System event checkpoints**
The value in this field indicates the frequency of DB2 checkpoints. For example, if the statistics interval is 30 minutes and the value of this field is 15, DB2 is taking checkpoints every 2 minutes.

**PREPARE Detail**
Select this field to display the PREPARE Detail panel.

**Prepare**
The number of prepares. It reflects the number of real PREPARE commands received by DB2. If the PREPARE is satisfied by getting a copy from the cache rather than by the traditional prepare process, the count is incremented. If the prepares are done under control of KEEP_DYNAMIC(YES), the count is not incremented.
DB2 Statistics windows:

You can access the following windows from the DB2 Statistics Detail panel. To reach a window, type any character in the space beside the heading you want. Multiple windows can be accessed simultaneously. The windows are overlaid on the DB2 Statistics Detail panel. To leave the current window and proceed with the next window, press F3 (Exit). To cancel all windows and return to the DB2 Statistics Detail panel, press F12 (Cancel).

EDM Pool window:

Use the EDM Pool window to examine statistics on the efficiency of the EDM buffer pool, and to determine the size of the EDM pool for optimum system performance.

To display this window, select EDM Pool from the DB2 Statistics Detail panel.

Figure 90. EDM Pool window

The EDM pool size should be large enough to store the cursor tables (CTs), package tables (PTs), and database descriptors (DBDs) for the most frequently used applications.

The following list describes some of the important fields that are shown in this panel:

EDM Pool pages in use (%)

The percentage of the EDM pool pages that are in use. If this percentage is
consistently less than 50%, the EDM pool size is probably too large. The size can be reduced without affecting the efficiency ratios (CT requests/CT not in EDM pool, PT requests/PT not in EDM pool, and DBD requests/DBD not in EDM pool) significantly. However, driving the EDM pool toward 100% usage can cause performance problems.

EDM pool use varies during the day. It is not only the pages that are in use, but also the pages that are not in use, waiting to avoid I/O, that are important for performance.

CT requests/CT not in EDM pool
Ratio of number of requests for CT sections and number of times CT sections were not already in the EDM pool.

PT requests/PT not in EDM pool
Ratio of number of requests for PT sections and number of times PT sections were not already in the EDM pool.

DBD requests/DBD not in EDM pool
Ratio of number of requests for DBDs and number of times DBDs were not already in the EDM pool.

Buffer Manager window:

Use the Buffer Manager window to view a list of active buffer pools and to examine synchronous reads and important threshold information.

To display this window, select Buffer Manager from the DB2 Statistics Detail panel.

--- End of Buffer Pool List ---

Figure 91. Buffer Manager window

The buffer manager is one of the major components involved in DB2 system performance. The buffer manager’s most significant role in performance is to reduce I/O activity, and to perform required I/O in an efficient manner.

Buffer pools should be large enough to store frequently used data in virtual storage to reduce physical I/Os. However, to minimize paging I/O, choose buffer pool sizes that can be backed by real or expanded storage.

Select any active buffer pool listed in the Buffer Manager window to display the Buffer Pool window, where you can view further details about an individual buffer
pool. Multiple windows can be accessed simultaneously by selecting multiple fields. The windows are overlaid on the Buffer Manager window. To leave the current window and proceed with the next window, press F3 (Exit). To cancel all windows and return to the DB2 Statistics Detail panel, press F12 (Cancel).

**Buffer Pool Management in DB2**

Use these buffer pool statistics in conjunction with the system parameters panels. The statistics panels show when various thresholds have been reached or exceeded, the system parameters panels show what the buffer pool settings currently are. You can alter buffer pool settings dynamically using the DB2 ALTER BUFFERPOOL command.

*Buffer Pool windows:*

Use the Buffer Pool window to view important statistics about an active buffer pool.

To display the Buffer Pool window, select any active buffer pool listed in the Buffer Manager window.

On the Buffer Pool window, select the required type of information. A further window then displays the requested information. Use the scrolling keys F7 (Up) and F8 (Down) to view the portions of the window not displayed.

*Figure 92. Buffer Pool window*

Depending on your selection one of the following windows is displayed. Each window is followed by a description of some of the important fields shown in this window.
Buffer pool hit ratio (%)

The total number of Getpage operations, minus the number of pages read from a hard disk drive (both synchronously and using Prefetch), divided by the total number of Getpage operations, multiplied by 100.

Current active buffers

Total number of current active (nonstealable) buffers at the moment the statistics were collected. A buffer critical condition is only shown if it occurs at that moment. The buffer pool might be too small if the number of active buffers is greater than the Deferred Write threshold (DWQT) of the buffer pool.

Figure 93. Buffer Pool – General window
Getpage requests

The number of Getpage requests issued by sequential and random requests.

**Synchronous reads - Total**

The number of synchronous read I/O operations performed by sequential and random requests.

**Sequential prefetch - Reads**

The number of times Sequential Prefetch reads were performed.

**Sequential prefetch - Pages read**

Number of pages read because of Sequential Prefetch.

The ratio of Sequential prefetch - Pages read to Sequential prefetch - Reads is between 0 and 32. Normally 32 is the maximum Prefetch quantity for table space scans, whether data or index.

**List prefetch - Reads**

Number of times List Prefetch reads were performed.

**List prefetch - Pages read**

Number of pages read because of List Prefetch.

The ratio of List prefetch - Pages read to List prefetch - Reads is between 0 and 32.

**Dynamic prefetch - Reads**

Number of times Dynamic Prefetch reads were performed.
Dynamic prefetch - Pages read
Number of pages read because of Dynamic Prefetch performed because of sequential detection.

The ratio of Dynamic prefetch - Pages read to Dynamic prefetch - Reads is between 0 and 32.

Prefetch disabled - No buffer
Number of times Sequential Prefetch was disabled because buffers were not available. This is the number of times the Sequential Prefetch threshold was reached. This fixed threshold is experienced if 90% of the pages in the buffer pool are unavailable. This has a significant effect on large and frequent scans that use Sequential Prefetch.

<table>
<thead>
<tr>

</table>

Buffer updates: 4706
Pages written: 2077
Synchronous writes: 5
Asynchronous writes: 2025
Write engine not available: 0

Thresholds reached:
Deferred write: 0
Vertical deferred write: 1742
Data Manager critical: 0

Page-ins required for write I/O: 0

Buffer Pool – Write Operations window

Buffer updates
Number of times pages were updated in the buffer pool.

Pages written
Number of pages written. This field contains the number of pages in the buffer pool written to a hard disk drive.

Synchronous writes
Total number of immediate Writes for a page.

An immediate Write can occur when:
- Data set is closed
- DB2 Checkpoint is taken
- Immediate Write threshold (97.5% pages in the buffer pool are unavailable), which is a fixed threshold
- a Write engine is not available

Asynchronous writes
Number of asynchronous Write I/O operations performed by media manager to a direct access storage device.

Thresholds reached - Deferred write
Number of times the Deferred Write threshold was reached. This threshold is a percentage of the virtual buffer pool that might be occupied by unavailable pages, including both updated pages and pages in use.

F1=Help F2=Split F3=Exit F5=Auto F6=History
F7=Up F8=Down F9=Swap F10=Delta F11=Interval
F12=Cancel F16=Look F17=Collect
Thresholds reached - Vertical deferred write
Number of times the Vertical Deferred Write threshold was reached. This
threshold is expressed as a percentage of the virtual buffer pool that might
be occupied by updated pages from a single data set.
When this threshold is reached, Writes are scheduled for that data set.

Thresholds reached - Data manager critical
Number of times the data manager critical threshold was reached. This
fixed threshold is experienced if 95% of the pages in the buffer pool are
unavailable. This has a significant effect on CPU usage.

Figure 97. Buffer Pool – Sort/ Merge Work File Operations window

Not created - no buffer
The number of times a workfile could not be created because of insufficient
buffer resources during sort processing.

Prefetch not scheduled - zero quantity
The number of workfile Prefetches rejected because of a zero Prefetch
quantity.
Degraded - low buffers
The number of times that a merge pass could not be efficiently performed because of a shortage of space in the buffer pool.

Workfile requests rejected - low buffers
The number of workfiles (runs) that were rejected during all merge passes because of shortage of space in the buffer pool.

Locking Activity window:

Use the Locking Activity window to view statistics on lock suspensions, timeouts, deadlocks, and lock escalations.

To display this window, select Locking Activity from the DB2 Statistics Detail panel.

Application deadlocks and timeouts should be avoided if possible. Unusually high values for these fields indicate the existence of a problem application. Exception events and console messages indicate deadlock participants. Use history to view details of the event surrounding the deadlock. You can use the Locked Resources window in thread activity to investigate thread resources locked or held.

Lock escalation counts greater than zero usually indicate an application process that updates more pages than expected. If this is not the case, examine fields Max page locks per table space and Max locks per user in the DB2 System Parameters panel to determine whether to increase DSNZPARM fields NUMLKTS and NUMLKUS (LOCKS PER TABLE(SPACE) and LOCKS PER USER respectively in the INSTALL DB2 - IRLM PANEL 2 panel DSNTIPJ).
The following list describes some of the important fields that are shown in this panel:

**Lock requests**
Number of times a lock on a resource was requested.

**Suspensions - lock**
Number of resource conflicts. A suspension is a wait for a lock and each of these waits can contribute adversely to DB2 performance. The suspension can ultimately result in normal resumption, or, in the case of lock contention, in a timeout or deadlock. The number of lock suspensions is a function of the lock requests. Lock suspensions (or conflicts) can occur on either lock request or change request.

**Lock escalations - shared**
Count of lock escalations to shared mode. Number of times the LOCKS PER TABLE(SPACE) parameter in the DB2 Install panel DSNTIPJ was exceeded and the table space lock was promoted from a page lock (IS) to a table space lock (S). Escalation can cause unpredictable response times. The lock escalation to shared mode should only happen on an exception basis. For example, a REPEATABLE READ application references most pages in a table.

**Lock escalations - exclusive**
Count of lock escalations to exclusive mode. Number of times the LOCKS PER TABLE(SPACE) parameter in the DB2 Install panel DSNTIPJ was exceeded and the table space lock was promoted from a page lock (IX) to a table space lock (X). Escalation can cause unpredictable response times. The lock escalation to exclusive mode should only happen on an exception basis. For example, an application updates most pages in a table.

Lock escalations, shared or exclusive, should not be expected in a transaction environment.

**Locking Considerations**

The following aspects should be considered if concurrency is an issue.
- Consistent data access sequence in applications
- The mix of concurrent processing types (batch and transaction)
- IRLM startup procedure options and DB2 installation options
- DDL LOCKSIZE
- DDL LOCKMAX
- BIND parameters

See [IBM Db2 for z/OS in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter/SSEPGG_12.1.0/com.ibm.db2.luw.admin.performance.doc/doc/pd/pd Shelf000.html) for detailed information.

**Open/Close Management window:**

The Open/Close Management window displays statistics on data set activity and drain requests. Use the Open/Close Management window to determine the number of open data sets, the number of drain requests, the number of page sets available to drain, and the number of successful and failed drains.

To display this window, select Open/Close Management from the DB2 Statistics Detail panel.
The following list describes some of the important fields that are shown in this panel:

**Open data sets - High water mark**

The maximum number of data sets open concurrently (high water mark).

Monitor this field to see whether you are reaching the maximum number of open data sets permissible for your system. The maximum number of open data sets depends on the MVS version, modifications to your system, and various other factors. See [z/OS information in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter) for the maximum number of open data sets permissible for your system.

**Bind Processing window**

Use the Bind Processing window to view statistics on plans successfully bound, attempts to REBIND a plan, automatic binds, and attempts to FREE a plan.

To display this window, select **Bind Processing** from the DB2 Statistics Detail panel.
### Bind Processing window

The Bind Processing window consists of the following sections:

**Bind**

This section shows statistics on bind events. These events occur when an explicit DB2 BIND subcommand is issued to bind a plan or package.

**Rebind**

This section shows statistics on rebind events. These events occur when an explicit DB2 REBIND subcommand is issued to rebind an existing plan or package.

**Autobind**

This section shows statistics on autobind events. These events occur if the plan becomes invalid since the last time the plan was bound. In this case, DB2 rebinds the plan before the plan is executed.

**Free**

This section shows statistics on free events. These events occur when an explicit DB2 FREE subcommand is issued to remove a DB2 plan or package from the DB2 catalog and directory.

---

#### Plan and Package Allocation window:

Use the Plan and Package Allocation window to check plan and package allocation attempts and successes, and authorization management attempts and successes.
To display this window, select Plan/Package Allocation, Authorization Management from the DB2 Statistics Detail panel.

</tr>
</tbody>
</table>

**Figure 101. Plan and Package Allocation window**

**Successful without catalog access**

The number of successful authorization checks not using the DB2 catalog, that is, using plan cache checks and public checks.

For transaction level security, ENABLE and DISABLE on BIND PACKAGE should be used to ensure adequate security. Granting execute authority on the plan to public might be quite adequate. See [IBM Db2 for z/OS in the IBM Knowledge Center](https://www.ibm.com/support/knowledgecenter) for more information.

**Log Manager window:**

Use the Log Manager window to check Read and Write activity both to and from the log.

To display this window, select Log Manager from the DB2 Statistics Detail panel.
### Figure 102. Log Manager window

If a high percentage of reads comes from the archive log, it might be necessary to increase the size of the active log. For example, a large update job with few commits could fill the active log forcing an archive. If the job fails, recovery is required to retrieve records from the archive log. Archive activity can be expensive in terms of response time, especially if the archive log is placed on slow devices such as tape or cartridge.

The following list describes some of the important fields that are shown in this panel:

#### Reads delayed - Tape volume contention
Number of read accesses delayed because of tape volume contention (that is, a tape volume was already in use by another thread).

#### Reads delayed - Unavailable resource
Number of read accesses delayed because of an unavailable resource. This can be because of an insufficient number of tape units allocated, or because the archive log read service task is not available.

#### Write output log buffers
The number of Write requests issued irrespective of single or dual logging. This field is updated once per buffer Write. The update value is either one or two I/Os, depending on which logging option is chosen (single or dual). This should have a value consistent with the known workload update rate.
Unavailable output log buffers
This field shows how many times a Write request to the active log had to wait because no buffer was available. The value should ideally be zero as these waits should not occur. If these waits do occur, the output buffer might be too small, or the size of the write threshold might be too close to the size of the output buffer.

Active log - Control intervals created
Number of active log output control intervals created. Log records are placed sequentially in output log buffers, which are formatted as VSAM control intervals. The control intervals are written to a set of predefined active log data sets, which are used sequentially and recycled.

A useful ratio is: Write output log buffers divided by Active log - Control intervals created.

Logging Considerations
- Minimize device contention on the log data sets by placing data sets correctly. If you use dual logging, do not place both logs on the same volume.
- Avoid waits that occur because no log buffer is available.
- Define enough active log data sets to prevent DB2 from waiting while a log is archived.
- Make the active logs large enough that backouts do not have to use the archive log.
- Consider the 3990 DASD FAST WRITE controller for the log. Performance measurements have shown that sequential access mode with DASD FAST WRITE provided substantially better performance than native DASD when the amount of log data written per commit was 24 KB or less. DASD FAST WRITE performance was comparable to that of native DASD when 48 KB of log data was written to DASD for each commit. When more than 48 KB was written, native DASD performed better than DASD FAST WRITE. Therefore there might be a need to determine in which environments log performance is critical to assess the value of DASD FAST WRITE.

Subsystem Service window:
Use the Subsystem Service window to view DB2 subsystem activity, such as connections to DB2, threads, commits, and units of recovery. You can examine these statistics to determine the work load of various subsystem functions, and to help you adjust DB2 system parameters for optimum system performance.

To display this window, select Subsystem Service from the DB2 Statistics Detail panel.

**Figure 103. Subsystem Service window**

The following list describes some of the important fields that are shown in this panel:

**Identify**

The number of successful connections to DB2 from an allied address space (for example TSO, BATCH, CICS, IMS, CAF, RRSAF, or UTILITY).

**Create thread**

The number of threads created. Thread creation can be a significant part of the cost in a short transaction. Thread reuse (discussed in "Thread Reuse" on page 1895) can help improve performance.

**Signon**

The number of Signons that have occurred in IMS or CICS. If the number of Signons is greater than the number of Create Thread occurrences, some threads have been reused. In the case of the TSO attachment facility and the call attachment facility (CAF), there is no sign-on, because the user is identified when the TSO address space is connected.

**Terminate**

The number of threads that have been terminated. The value of this field is usually greater than the number of Create Thread occurrences, because it also includes the termination of connections to DB2 (IDENTIFY) and other internal counts.

**Synchs (single phase commit)**

The number of Commits from TSO, CAF, and UTILITY environments.

**Queued at create thread**

The number of Create Thread requests queued. This count does not include DBATs.
Monitoring this field is useful in determining the right setting for the MAX
USERS option in the DSNITPE installation panel. This parameter controls
the number of threads (excluding DBATs) in the DB2 system.

**Rule of thumb:** About 1% thread queuing is acceptable.

**Commits - Phase 1**
The number of successful requests for COMMIT PHASE 1 of two-phase
commit (BEGIN COMMIT). IMS, CICS, and RRS applications use the
PREPARE and COMMIT sequence to commit work. This value does not
include successful single-phase commits.

**Commits - Phase 2**
The number of successful requests for COMMIT PHASE 2. IMS, CICS, and
RRS applications use the PREPARE and COMMIT sequence to commit
work. This value does not include successful single-phase commits. A
nonzero value for this field indicates that updates have occurred.

**Commits - Read only**
The number of times read operations were completed in a two-phase
commit environment.

**System event checkpoints**
A count of the number of checkpoints DB2 has taken. The checkpoint
interval is defined by the number of log records that you specify for the
checkpoint frequency (LOGLOAD in DSN6SYSP). A checkpoint is taken
when the specified number of log records have been written. A checkpoint
is also taken each time DB2 switches to a new active log data set. If the
statistics interval is 30 minutes and the value of this field is 15, then DB2 is
taking checkpoints every 2 minutes.

**Thread Reuse:**

The term *thread reuse* only applies to IMS and CICS attachments. In the case of the
TSO attachment facility and the call attachment facility (CAF), threads cannot be
reused, because the threads are allocated to the user address space.

Thread reuse should be considered in the following cases:

- **If transaction volume is high:**
  High volume transactions should achieve a high percentage of thread reuse. If
  threads are reused on low volume transactions, the number of threads needed
  increases because these threads are not automatically terminated by IMS when
  not being used. This can result in too many idle threads for the level of the DB2
  workload. Under CICS, protected threads are terminated after the purge cycle if
  no transaction eligible to reuse the thread has been received.

- **If thread creation cost is significant:**
  As a rule of thumb, more than 5% of the total CPU cost of transaction
  processing is considered significant.

The ACQUIRE and RELEASE parameters of BIND should be specified to minimize
the thread creation cost, while providing the needed concurrency:

- **If most of the application plan’s SQL statements are executed, then
  ACQUIRE(ALLOCATE) is cheaper than ACQUIRE(USE).**

- **If only a small number of the SQL statements are executed, ACQUIRE(USE)
  becomes cheaper and improves concurrency, because the required resources are
  only acquired (locked) when the plan actually references (uses) them. An
example would be a generalized plan used by many different transactions. It would contain multiple logic paths referencing different tables.

If packages are involved, ACQUIRE(USE) is always implicitly used.

- Concurrency in thread reuse is based on page locking provided by the IS and IX intent locks, whose duration is governed by ACQUIRE and RELEASE of BIND. RELEASE(DEALLOCATE) is recommended for thread-reuse transactions to reduce transaction CPU time.

When thread reuse is implemented, monitor the EDM pool. It should be sufficient in size to accommodate expanding plans where the next transaction requires additional plan sections over those already part of the EDM pool.

*SQL Activity window:*

Use the SQL Activity window to view subsystem-wide SQL activity for determining the SQL workload on the system. This information displays the number of times each SQL statement has been executed. To display this window, select SQL Activity from the DB2 Statistics Detail panel.
Figure 104. SQL Activity window (Statistics)

The SQL Activity window consists of the following sections:

**Total DML (Data Manipulation Language)**

This section shows the number of executions performed by various SQL statements concerning the manipulation of data.

**Total DCL (Data Control Language)**

This section shows the number of executions performed by various SQL statements concerning the controlling of various activities.
Total DDL (Data Definition Language)
This section shows a table that contain the number of executions performed by various DDL SQL statements for each of the applicable object types. These SQL statements are used to create, drop, and alter objects.

Incremental Binds
This field is the number of INCREMENTAL BINDs.
If a plan is bound with VALIDATE(RUN), DB2 performs validity checks (such as authorizations and existence of referenced DB2 objects) at bind time and rechecks any failures at run time. This can result in catalog contention and degraded application performance, depending on the number of statements flagged and the number of times they are executed. Therefore VALIDATE(RUN) should be avoided as much as possible. Ensure that all objects are created and all privileges are granted before binding, and select the VALIDATE(BIND) option.
In addition to plans bound with VALIDATE(RUN), this counter is incremented for plans using DB2 private protocol.

PREPARE Detail window:
Use the PREPARE Detail window to view information about the treatment of PREPARE commands and information about kept dynamic statements and dynamic cached statements.
To display this window, select PREPARE Detail from the DB2 Statistics Detail panel.

<table>
<thead>
<tr>
<th>Command</th>
<th>F1=Help</th>

<th>F11=Interval</th>
<th>F12=Cancel</th>
</tr>
</thead>
</table>

Figure 105. PREPARE Detail window (Statistics)
The following list describes some of the important fields that are shown in this panel:

Prepares satisfied
The number of times a PREPARE command was satisfied by copying a statement from the prepared statement cache.

Prepares received
The number of times a PREPARE command was received, but a matching statement was not found in the prepared statement cache. Cache search is only done for DML SQL.

Prepares implicit
The number of times an implicit prepare was performed because KEEPDYNAMIC(YES) was used and an open, execute, or describe for a dynamic SQL statement has occurred after a commit.
Prepares avoided
The number of times a prepare was avoided because the
KEEPDYNAMIC(YES) bind option was used and an open, execute, or
describe for a dynamic SQL statement has occurred after a commit.

Kept dynamic statement discarded
The number of times a kept dynamic statement was discarded because the
MAXKEEPD system limit has been reached.

Dynamic cache statement purged
The number of times a dynamic cached statement was purged from the
cache because a dependent object was dropped or altered.

Query Parallelism Data window:
Use the Query Parallelism Data window to view information about the total
number of parallel groups executed and to find out whether the type or degree of
parallelism was changed at run time.

To display this window, select Query Parallelism Data from the DB2 Statistics
Detail panel.

<table>

Figure 106. Query Parallelism Data window (Statistics)

The main objective of query parallelism is to improve query response times.

Query parallelism is suited to data-intensive and complex queries. A query is
data-intensive if it has a high ratio of I/O compared to CPU. A query is complex if it
requires a high use of CPU to resolve complex predicates and functions.

By examining the information displayed in this window, you can view the number
of parallel groups that have fallen back to sequential mode and determine the
cause.
The following list describes some of the important fields that are shown in this panel:

**Number of Parallel Groups executed with - One DB2 - COORDINATOR Parm = NO**
The total number of parallel groups scheduled for Sysplex query parallelism, but executed on a single DB2 because of the COORDINATOR subsystem parameter set to NO. When the statement was bound, the COORDINATOR subsystem parameter was set to YES. The same can happen when a package or plan is bound on a DB2 subsystem with COORDINATOR = YES, but is run on a DB2 subsystem with COORDINATOR = NO.

**Number of Parallel Groups executed with - One DB2 - Isolation level**
The total number of parallel groups scheduled for Sysplex query parallelism, but executed on a single DB2 because of repeatable-read or read-stability isolation.

**Member skipped (%)**
The percentage of parallel groups that were not distributed as planned. The purpose of this count is to indicate situations with insufficient buffers on a member so that the parallelism coordinator has to bypass a DB2 when distributing tasks.

**RID List Processing window:**

Use the RID List Processing window to view the number of blocks concurrently allocated for RID entries (maximum and current), and the number of times RID list processing has been terminated.

To display this window, select RID List Processing from the DB2 Statistics Detail panel.

```

**Figure 107. RID List Processing window (Statistics)**

RID list processing can terminate because the number of RID entries exceeds the RDS limit, the number of RID entries exceeds the data manager limit, or because the maximum RID list storage is exceeded.

The following list describes some of the important fields that are shown in this panel:
**Terminated - No storage**

Number of times RID list processing was terminated because of insufficient storage.

This failure occurs when the 2 GB limit is reached. You cannot increase virtual storage beyond 2 GB.

**Terminated - RDS limit exceeded**

The number of times RID list processing was terminated because either the number of RID entries was greater than the maximum limit of 25% of the table size, or because the number of RID entries that can fit into the guaranteed number of RID blocks was exceeded. The latter can only happen when RID blocks allocated - Maximum approaches the RID list storage size. There is one guaranteed RID block.

**Terminated - DM limit exceeded**

Number of times RID list processing was terminated because the number of RID entries exceeded the Data Manager limit of 16 million.

**Terminated - Process limit exceeded**

Number of times RID list processing was terminated because of the maximum RID list storage used.

The size is determined by the installation parameter RID POOL SIZE (DB2 Install panel DSNTIPC). It can be 0, or between 16 KB and 1 GB.

The general formula for calculating the RID pool size is:

\[
\text{Number of concurrent RID processing activities} \times \\
\text{average number of RIDs} \times 2 \times 5 \text{ bytes per RID}
\]

**Distributed Data window:**

Use the Distributed Data window to view subsystem-wide Distributed Data Facility (DDF) activity, and to examine a list of remote locations involved in this activity. If many remote locations are involved in distributed activity, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

To display this window, select Distributed Data from the DB2 Statistics Detail panel.
From this window, you can select any remote location listed to display the Remote Location window, where the remote location can be examined in greater detail.

**DBATs queued - maximum active**

Monitoring this field is useful in developing the right setting for the DSNTIPE parameter MAX REMOTE ACTIVE. This parameter controls the number of DBATs that can be concurrently active in the DB2 system.

**Rule of thumb:** About 1% DBAT queuing is acceptable.

**Note:** The Distributed Data window is not accessible if there is no distributed activity.

**Notes® on MAX REMOTE ACTIVE:**

The MAX REMOTE ACTIVE option in the Install panel DSNTIPE specifies the number of database access threads that can be active at the same time as opposed to MAX USERS in the same panel which specifies the maximum number of allied threads. The combined maximum allowed for MAX USERS and MAX REMOTE ACTIVE cannot exceed 2 000.

MAX REMOTE CONNECTED in the DB2 Install panel DSNTIPE represents the number of database access threads that can concurrently exist. This number cannot exceed 25 000.

The total number of inactive database access threads is the difference between MAX REMOTE CONNECTED and MAX REMOTE ACTIVE.

An installation might choose, by means of DDF THREADS in the DB2 Install panel DSNTIPR, to have database access threads considered inactive when the last operation of the thread was a commit or rollback, all packages used by the database access thread had the RELEASE (COMMIT) option, and the thread holds
no database locks (including not having any cursors open with the HOLD option). When this is the case, the thread is removed from active thread lists and moved to inactive thread lists.

If the limit set by MAX REMOTE ACTIVE parameter is reached, remote SQL requests are queued until a DBAT can be created. The number of times queuing occurred is shown by the field DBATs queued - maximum active. If necessary, the value of MAX REMOTE ACTIVE should be increased.

Remote Location window:

Use the Remote Location window to view statistics regarding the distribution of data by the remote location selected from the Distributed Data window. These statistics show the number of distributed data events performed at this remote location.

To display this window, select any remote location listed in the Distributed Data window.

```
DGOMSWRL  Remote Location

INTERVAL  6:35,240

```

Figure 109. Remote Location window

To leave the Remote Location window and return to the Distributed Data window, press F3 (Exit). To leave the Remote Location window and return to the DB2 Statistics Detail panel, press F12 (Cancel).
The following list describes some of the important fields that are shown in this panel:

**Remote Location**
Location name of the remote location with which DDF data is associated, or, for DRDA protocol, this field contains the string DRDA REMOTE LOCS. Statistics for all remote locations accessed by DRDA protocol are grouped under the location name DRDA REMOTE LOCS. For DB2 private protocol, statistics are gathered independently for each remote location.

**Conversations queued**
The number of conversation requests that are queued by the Distributed Data Facility and are waiting for allocation.
If this number is high, consider tuning VTAM.

**Limited block fetch**
The number of times a switch was made from continuous to limited block fetch mode. This value applies only to DB2 private protocol.
If this number is high, consider tuning VTAM.

**CPU Times and Other Data window:**
Use the CPU Times and Other Data window to view statistics on the work that various address spaces have accumulated.

To display this window, select CPU Times and Other Data from the DB2 Statistics Detail panel.
The 1 fields display statistics on the accumulated CPU processing time spent in various address spaces, and on various tasks. Use these statistics to examine system usage, and to determine if there are any problem areas consuming more CPU time than expected. If the Distributed Data Facility (DDF) is not installed, N/P is displayed in the DDF address space time fields.

The 1 fields show the number of calls made to the instrumentation facility interface (IFI) by various functions, and the number of IFI abnormal terminations.

From the CPU Times and Other Data window, you can reach windows that display information about DB2 commands, instrumentation record counts, IFC destination data, and data capture.

**DB2 Commands window:**

Use the DB2 Commands window to view the total number of executions of various DB2 commands, whether or not they completed successfully.

To display this window, select DB2 Commands from the CPU Times and Other Data window.

---

### Figure 110. Statistics CPU Times and Other Data window

The 1 fields display statistics on the accumulated CPU processing time spent in various address spaces, and on various tasks. Use these statistics to examine system usage, and to determine if there are any problem areas consuming more CPU time than expected. If the Distributed Data Facility (DDF) is not installed, N/P is displayed in the DDF address space time fields.

The 1 fields show the number of calls made to the instrumentation facility interface (IFI) by various functions, and the number of IFI abnormal terminations.

From the CPU Times and Other Data window, you can reach windows that display information about DB2 commands, instrumentation record counts, IFC destination data, and data capture.

**DB2 Commands window:**

Use the DB2 Commands window to view the total number of executions of various DB2 commands, whether or not they completed successfully.

To display this window, select DB2 Commands from the CPU Times and Other Data window.

Figure 112. DB2 Instrumentation window

The IFC destinations in this window are:

- **SMF**  System management facility
- **GTF**  Generalized trace facility
- **OP1 to OP8**  Output buffer destinations
- **RES**  Resident trace table.
Use this window to examine instrumentation record Write activity, and identify possible problems. A nonzero value in the Not Written column can indicate a problem. In this case, check for nonzero values in the Buffer Overrun, Not Accepted, and Write Failure columns to determine the possible cause.

**Data Capture window:**

Use the Data Capture window to view statistics on data capture activity.

To display this window, select Data Capture from the CPU Times and Other Data window.

<table>

</tbody>
</table>

Figure 114. Data Capture window

The following list describes some of the important fields that are shown in this panel:

- **Log reads performed**
  The total number of data capture log reads for processing IFI READS requests for IFCID 185.

- **Log records captured**
  The number of log records retrieved for which data capture processing was invoked.

- **Log records returned**
  The total number of data capture log records returned.

- **Data rows returned**
  The total number of data capture data rows returned.

- **Data descriptions returned**
  The total number of data capture data descriptions returned.

- **Describes performed**
  The total number of data capture describes performed.

  A data capture describe is the process of getting descriptive information about a DB2 table from the catalog.

- **Tables returned**
  The total number of data capture tables returned to the caller of an IFI READS call for IFCID 185.
**Data Sharing Locking Activity window:**

Use the Data Sharing Locking Activity window to view statistical information about data sharing locking activity for the DB2 subsystem.

To display this window, select Data Sharing Locking Activity from the DB2 Statistics Detail panel. This selection is only available if the monitored DB2 subsystem is part of a data sharing group.

![Data Sharing Locking Activity window](image)

**Figure 115. Data Sharing Locking Activity window**

A logical lock (L-lock) is a lock used by transactions to control intra-DB2 and inter-DB2 data concurrency between transactions. A physical lock (P-lock) is a lock used only by data sharing and is acquired by DB2 to provide consistency on data cached in different DB2 subsystems. P-locks are owned by the subsystem, not by the transaction. XES is the Cross System Extended Services component of MVS. For more information about locking in a data sharing environment, see *DB2 Data Sharing: Planning and Administration*.

The following list describes the fields shown in this window:
Global contention rate (%)
The total number of suspends because of contention, divided by the total number of requests that went to XES (excluding asynchronous requests), multiplied by 100.

P-locks -- Lock requests
The number of lock requests for P-locks.

P-locks - Unlock requests
The number of unlock requests for P-locks.

P-locks - Change requests
The number of change requests for P-locks.

Synchronous XES - Lock requests
The number of lock requests propagated to MVS XES synchronously.

Synchronous XES - Unlock requests
The number of resources synchronously propagated to MVS XES by unlock requests.

Synchronous XES - Change requests
The number of change requests propagated to MVS XES synchronously.

Asynchronous XES - Resources
The number of resources propagated to MVS XES asynchronously by IRLM.

Suspensions - IRLM global contention
The number of suspensions because of IRLM global contention. IRLM lock states were in conflict.

Suspensions - XES global contention
The number of suspensions because of MVS XES global contention. MVS XES lock states were in conflict, but IRLM was not.

Suspensions - False contention and conversion
Summation of false contentions (see below) and sync-to-async heuristic conversions. Conversions are done when XES determines that it is more efficient to drive the request asynchronously to the CF.

False contention
The number of false contentions encountered on this z/OS image. A false contention occurs when different resource names hash to the same entry in the CF lock table. The CF detects contention within the hash entry, and XES uses inter-system messaging to determine that no actual resource contention exists. This counter is maintained on a per-LPAR basis. Therefore this counter over-reports false contentions in cases where multiple members from the same data sharing group run on the same z/OS image. The counter is not present (N/P) if data is unavailable because of errors from the IXLMG service.

Incompatible retained lock
The number of global lock or change requests rejected or suspended because of an incompatible retained lock.

Notify messages sent
The number of notify messages sent.

Notify messages received
The number of notify messages received.
P-lock/notify exits - Maximum engines
The maximum number of engines available for P-lock exit or notify exit requests.

P-lock/notify exits - Engines unavailable
The number of times an engine is not available for P-lock exit or notify exit requests.

P-lock negotiation - Pageset/partition
The number of times this DB2 was driven to negotiate a page set or partition P-lock because of changing inter-DB2 interest levels on the page set or partition.

P-lock negotiation - Page
The number of times this DB2 was driven to negotiate a page P-lock because of inter-DB2 P-lock contention.

P-lock negotiation - Other
The number of times this DB2 was driven to negotiate another P-lock type (other than pageset/partition or page).

P-lock negotiation - Change
The number of times a P-lock change request was issued during P-lock negotiation.

Group Buffer Pools Activity window:
Use the Group Buffer Pools Activity window to view all group buffer pools used by the DB2 subsystem. If there are many group buffer pools listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

Figure 116. Group Buffer Pools Activity window
You can select any group buffer pool ID listed in this window to display the Group Buffer Pool Detail window, where you can view Read and Write activity both to and from that particular group buffer pool, or select Total to view Read and Write activity on all of the listed group buffer pools combined.
Use the Group Buffer Pool Detail window to view statistics on the group buffer pool selected from the Group Buffer Pools Activity window. These statistics show Read and Write activity both to and from that buffer pool. If Total was selected from the Group Buffer Pools Activity window, the Group Buffer Pool Detail window shows combined statistics on all group buffer pools used by the thread.

**Figure 117. Group Buffer Pool Detail window**

The following list describes some of the important fields that are shown in this panel:

**Synchronous read (Cross invalidation) - Data returned**

The number of synchronous coupling facility read requests caused by the page in the member’s buffer pool that is marked invalid. Data is returned from the group buffer pool.
Synchronous read (Cross invalidation) - No data returned
The number of synchronous coupling facility read requests caused by the page in the member’s buffer pool that is marked invalid. Data is not returned from the group buffer pool but from a hard disk drive.

Synchronous read (not found) - Data returned
The number of synchronous coupling facility read requests necessary because the requested page was not found in the buffer pool. Data was returned from the coupling facility.

Synchronous read (not found) - No data returned
The number of synchronous coupling facility read requests necessary because the requested page was not found in the buffer pool. Data is not returned from the group buffer pool but from a hard disk drive.

Unregister page
The number of times DB2 unregistered interest to the group buffer pool for a single page. This is generally done by DB2 when it steals pages from the local buffer pool that belong to group buffer pool dependent page sets or partitions.

Clean pages - Written asynchronously
The number of clean pages asynchronously written from the member’s virtual pool to the group buffer pool. If a buffer pool threshold is reached, pages can be forced out before the application commits. This can also happen when P-lock negotiation forces the pages on the Vertical Deferred Write queue to be written to the group buffer pool.

Asynchronous read - Data returned
The number of coupling facility reads for Prefetch, in which data was returned from the coupling facility.

Asynchronous read - No data returned
The number of coupling facility reads for Prefetch, in which data was not returned from the coupling facility, and a coupling facility directory entry was created, if it did not already exist.

Pages Castout
The number of pages cast out from the group buffer pool to a hard disk drive.

Unlock castout
The number of times DB2 issued an unlock request to the coupling facility for castout I/Os that have completed. When pages are in the process of being cast out to a hard disk drive, they are locked for castout in the coupling facility. The castout lock is not an IRLM lock. Its purpose is to enforce that only one system can cast out a given page at a time.

Read castout class
The number of requests made to the group buffer pool to determine which pages belonging to a given page set or partition are cached in the group buffer pool as changed pages and therefore need not be cast out.

The read castout class request is issued by the page set or partition castout owner and by the group buffer pool structure owner when the GBPOOLT threshold has been reached.

Read castout statistics
The number of requests issued by the group buffer pool structure owner when the GBPOOLT threshold has been reached. These requests are to
determine which castout classes have changed pages. Read castout statistics requests are usually issued only once or twice for each occurrence of the GBPOOL T threshold.

**Read directory info**
The number of requests (issued by the group buffer pool structure owner) for group buffer pool checkpoints to read the directory entries of all changed pages in the group buffer pool, so that the oldest recovery LRSN (Log Record Sequence Number, displayed in message DSNB798I) can be recorded and used for recovery purposes in case the group buffer pool fails. Read directory information requests might have to be issued several times for each group buffer pool checkpoint to read the directory entries for all changed pages.

**Read storage statistics**
The number of times DB2 requested statistics information from the group buffer pool. Usually this number should be relatively low. Requests for statistics information are issued once per group buffer pool checkpoint by the group buffer pool structure owner. They are also issued for DISPLAY GROUPBUFFERPOOL GDETAIL requests and to record IFCID 254.

**Register page**
The number of times DB2 registered interest to the group buffer pool for a single page. These are register-only requests, which means that DB2 does not request that data is returned for the page. DB2 knows that there is no data cached in the group buffer pool for this page. The only purpose of the register page request is to create a directory entry for the page for cross-invalidation when downgrading the P-lock on a page set or partition from S mode to IS mode, or from SIX mode to IX mode.

**Delete name**
The number of times DB2 issued a request to the group buffer pool to delete directory and data entries associated with a given page set or partition. DB2 issues this request when it converts a page set or partition from group buffer pool dependent to not group buffer pool dependent, and also for GBPCACHE ALL objects when the first DB2 member opens the object.

**Read failed - no storage**
The number of coupling facility read requests that could not complete because of a lack of coupling facility storage resources. If the value of this counter is constantly high, consider increasing the group buffer pool size.

**Write failed - no storage**
The number of coupling facility Write requests that could not complete because of a lack of coupling facility storage resources. If the value of this counter is constantly high, consider increasing the group buffer pool size.

**Global Group Buffer Pool Statistics window:**
Use the Global Group Buffer Pool Statistics window to view various information about the number of coupling facility read requests for the group buffer pools.

While the Group Buffer Pools Activity window and the Group Buffer Pool Detail window display statistics on the group buffer pool usage of the currently monitored subsystem, the Global Group Buffer Pool Statistics window below and the associated Global GBP Statistics Detail window provide information about the group buffer pool usage across the entire data sharing group.
If there are many group buffer pools listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

To display this window, select Global Group Buffer Pool Statistics from the DB2 Statistics Detail panel. This selection is only available if the monitored DB2 subsystem is part of a data sharing group.

You can select any group buffer pool listed in this window to display the Global GBP Statistics Detail window, where you can view more information about the buffer pool in greater detail.

**Global GBP Statistics Detail window:**

Use the Global GBP Statistics Detail window to view statistics on coupling facility activity for the group buffer pool selected from the Global Group Buffer Pool Statistics window.
The following list describes some of the important fields that are shown in this panel:

**Read miss assignment suppressed**

The number of coupling facility read requests for a page, in which data was not returned, where the page name was not assigned in the coupling facility directory, and where directory name assignment is suppressed.

DB2 requests suppression of the directory entry assignment in cases where it does not have to register the page to coupling facility for cross-invalidation (XI). This is the case when DB2 is the only one in the group with Read/write interest in the page set or partition.

**Read miss name assigned**

The number of coupling facility read requests for a page, in which data was not returned, where the page name was not assigned in the coupling facility directory, but a directory entry was successfully assigned to the new name.

**Read miss cache full**

The number of coupling facility read requests for a page, in which the page name was not assigned to a coupling facility directory entry and where name assignment could not complete because of a lack of coupling facility storage resources.

**Stor ed Procedures window:**

Use the Stored Procedures window to view activity on calls made to stored procedures.
The following list describes the fields shown in this window:

**CALL statements executed**
The number of SQL CALL statements executed.

**Procedure abends**
The number of times a called stored procedure terminated abnormally.

**CALL statement timeouts**
The number of times an SQL CALL statement timed out while waiting to be scheduled.

**CALL statements rejected**
The number of times an SQL CALL statement was rejected because of the procedure being in the STOP ACTION (REJECT) state.

**Statistics commands:**
You can type statistics commands on any statistics panel command line, or invoke them using the function keys. A list of active function keys is displayed at the bottom of each panel. You can abbreviate commands down to three characters in length. For example, the AUTO command can be abbreviated to AUT.

**AUTO command:**
Use the AUTO command to refresh values displayed in panels without having to press Enter. When you activate auto-display mode, the displayed values are updated periodically, as specified by the AUTO command. You cannot perform any other tasks with your Online Monitor session while auto-display mode is running.

The command syntax is:

```
AUTO [integer SECONDS | MINUTES]
```

**Parameters of the AUTO command**
The AUTO command accepts the following parameters:

- `integer` Optional. Specifies the auto-display interval. The valid ranges are:
• 1 to 7 200 seconds
• 1 to 120 minutes

SECONDS
Optional. Specifies the auto-display unit in seconds. If no unit is specified, the default is seconds. If this parameter is specified, integer should also be specified.

MINUTES
Optional. Specifies the auto-display unit in minutes. If this parameter is specified, integer should also be specified.

If no parameters are specified, the values in the Auto Display window are used.

Starting Auto Display mode

To start Auto Display mode, type AUTO, followed by any parameters, on the command line and press Enter. The AUTO command can be abbreviated to AUT, the SECONDS to S, and the MINUTES to M.

To stop Auto Display, press the attention key.

**Note:** While the Online Monitor is executing a DB2 call (IFI or SQL), pressing the attention key might not stop the auto-display mode. An ‘A’ is displayed every time the key is pressed until attention processing is available again. For example, this is the case when the Online Monitor is issuing SQL statements to resolve names of locked resources.

Examples of the AUTO command
• AUTO 5 refreshes the panel with updated values every 5 seconds
• AUTO 1 MIN refreshes the panel with updated values every minute
• AUTO 10 refreshes the panel with updated values every 10 seconds
• AUTO uses the values specified in the Auto Display window

**DELTA command:**

Use the DELTA command to view subsystem-wide DB2 statistics activity between the times that you press Enter.

The command syntax is:

```
DELTA
```

*Figure 122. Syntax of the DELTA command*

Selecting delta processing

To select delta processing mode, type DELTA on the command line and press Enter. DELTA can be truncated to a minimum of DEL.

Each time you press Enter, the displayed values are updated to reflect the system activity since the previous display update. If auto-display mode is active, the values are updated on each auto-display interval.

When DELTA is active, the DELTA time is displayed on the message line.
To return to regular mode, issue the \text{RESET} command.

\textit{INTERVAL command:}

Use the \texttt{INTERVAL} command to view an accumulation of statistics data from a specified point in time.

The command syntax is:

\begin{verbatim}
  INTERVAL
\end{verbatim}

\textit{Figure 123. Syntax of the \texttt{INTERVAL} command}

\textbf{Selecting interval processing}

To select interval processing mode, type \texttt{INTERVAL} on the command line and press Enter. \texttt{INTERVAL} can be truncated to a minimum of \texttt{INT}.

When you invoke interval mode, the time of the current display is used as a base point for further displays. Each time you press Enter to update the display in interval mode, the statistics data is accumulated from that base point. If the auto-display function is active, the values are updated automatically from the base point with each auto-display cycle.

When \texttt{INTERVAL} is active, the interval elapsed time is displayed on the message line.

To return to regular mode, issue the \texttt{RESET} command.

\textit{RESET command:}

Use \texttt{RESET} to deactivate delta or interval processing mode and revert back to regular display mode.

The command syntax is:

\begin{verbatim}
  RESET
\end{verbatim}

\textit{Figure 124. Syntax of the \texttt{RESET} command}

\textbf{Resetting the processing mode}

To deactivate delta or interval processing mode and revert back to regular display mode, type \texttt{RESET} on the command line and press Enter. \texttt{RESET} can be truncated to a minimum of \texttt{RES}.

\textit{HISTORY command:}

Use the \texttt{HISTORY} command to view past data that was previously collected by the data collector. The data is gathered at installation-defined intervals. The date and time in the panels that support history indicate when the data being displayed was collected.
You can only view past data if the data collector is active for the subsystem you are monitoring and if it was started with the parameter HISTORY=YES. See “OMEGAMON Collector purpose and function” on page 372 for information about the data collector.

The command syntax is:

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Returns the display to the current time.</td>
</tr>
<tr>
<td>BACK</td>
<td>Displays data for the previous interval. If no more data is available, data from the earliest available interval is displayed.</td>
</tr>
<tr>
<td>FORWARD</td>
<td>Displays information for the next available interval. If no more data is available, data from the current time is displayed and processing continues as if HISTORY is OFF.</td>
</tr>
<tr>
<td>date</td>
<td>The date of the required information. If no date is specified, today’s date is assumed.</td>
</tr>
<tr>
<td>hh:mm:ss</td>
<td>The time of the required information. If no time is specified, the default is the time of the earliest available history record for the specified date. The seconds do not need to be specified.</td>
</tr>
</tbody>
</table>
```

If no data is available for the specified date and time, the next available record is displayed.

If you do not specify any parameters, the History window is displayed. The current system date and time are the defaults for the History window.

**Viewing past data**

To view past data, type HISTORY followed by any parameters on the command line and press Enter. HISTORY can be truncated to a minimum of HIS.

**History and statistics processing modes:**

History can be active simultaneously with either interval or delta processing mode.

Delta processing helps isolate DB2 statistics activity that occurs between user-specified points in time. When History is invoked, the delta is the time between the currently displayed statistical data and the data requested by the HISTORY command. The two sets of statistics records are checked to determine the oldest to avoid the calculation of negative DELTA values.
Interval processing helps isolate DB2 statistics activity beginning at a certain point in time. When History is invoked, the interval is the time between the first statistics data encountered after the INTERVAL command and the statistics data requested by the HISTORY command. The two sets of statistics records are checked to determine the oldest to avoid the calculation of negative INTERVAL values.

**Monitoring the access path with Explain**

Online Monitor Explain provides a real-time analysis of the access path methods that are chosen by DB2 for a given SQL statement. You can also modify the SQL statement text and reexplain it. This provides you with the ability to tune a DB2 subsystem while you are online.

This topic describes how to select the SQL statement you want to explain from within the Online Monitor or from within an ISPF/PDF editor, the authorization required to use Explain, performance considerations, tuning advice, and the DB2 Explain Output panel.

Online Monitor Explain is based on DB2’s SQL Explain function. However, it translates the more important PLAN_TABLE codes into full English sentences, so you do not need to know the values and columns of the PLAN_TABLE. In addition, Online Monitor Explain provides direct access to related catalog information (the catalog statistics of the tables and indexes that are used in the SQL statement).

**Authorizations required to use Explain:**

To explain an SQL statement, you need DB2 EXECUTE privilege on the OMEGAMON XE for DB2 PE Explain plan defined at installation. The name of this plan is KO2EXPL.

The following DB2 PLAN_TABLE privileges might also be required:

- Explain an entry in a plan table.
  You require DB2 SELECT privilege on the PLAN_TABLE.
- Explain an SQL statement from a previously bound plan or package.
  You require DB2 SELECT privilege on the plan or package owner’s PLAN_TABLE. If you do not have the privilege, a dynamic Explain of the statement is performed if you have UPDATE privilege on your own PLAN_TABLE.
- Explain an SQL statement entered in the panel.
  You require DB2 UPDATE privilege on your own PLAN_TABLE.
- Explain an SQL statement from a Thread Activity window.
  You require DB2 SELECT privilege on the plan or package owner’s PLAN_TABLE. If you do not have the privilege, a dynamic Explain of the statement is performed if you have UPDATE privilege on your own PLAN_TABLE.
- CREATE or ALTER a plan table.
  You require a minimum of CREATETAB authority on the database that the PLAN_TABLE is created in, or ALTER authority to modify the PLAN_TABLE.

**Performance considerations:**

The execution time to explain a plan or package depends on the number of rows in the accessed PLAN_TABLE. If the table has many rows, you can improve
performance by creating an index on PROGNAME, QUERYNO. Alternatively, delete unnecessary rows from your PLAN_TABLE.

**What to look for in Explain information:**

When an SQL statement is explained, it is important that the explaining takes place on the production DB2 subsystem, or at least on a DB2 subsystem where the catalog statistics have been updated to reflect the real production system in terms of table size, available indexes, and other key values. You can specify the “current server” on which Explain is to be executed. This option makes it possible that you are connected to a DB2 test subsystem while you execute the Explain on the remote production system.

The following Explain information can be useful in determining why an application does not perform as expected:

- **Access path chosen**
  Table space scans and nonmatching index scans should be avoided, unless you intend to access all rows in a given table or the table is very small. If the table has one or more indexes, try to reconstruct the SQL statement in such a way that DB2 chooses a better access path. If there is no index, consider creating one.

- **Index-Only-Access**
  When you only select a few column values, consider the possibility of including these few columns in the column list of one of the indexes. In this way, all requested data can be found in the index. The access path message informs you if you succeed in doing so. Likewise, if you select a maximum value, consider building a descending index on that column (or an ascending index, if you select a minimum value). In this way, you can even avoid the scanning of leaf pages in the index structure.

- **Clustering versus clustered**
  If a clustering index has been chosen by DB2, ensure that the actual index is clustered. In the Index Information window, if the clustered value is NO, or if the cluster ratio is less than 95%, the table space might need a reorganization to bring the data rows into clustering sequence.

- **Number of matching columns**
  On the Plan Table Data panel, if DB2 has selected a matching index scan, you should verify in the Index Information window that the number of columns used in the index is what you expect.

- **Active pages versus pages with rows**
  Verify that the number of pages with rows is approximately the same as active pages, especially if you are performing table space scans. The value shown in the 1 field in the Table Information window should be as close as possible to 100 percent.

- **Number of tables per table space**
  On the Table Space Information window, you should monitor the Tables field. This field shows the number of tables located in the table space. If the access path is Tablespace scan and the table space is not segmented, there should be only one table in the table space. In a nonsegmented table space, all tables are scanned, not only the selected table.

- **Host variable definitions versus column definitions**
  An inconsistent definition of host variables shown in the Host Variable Definition window, compared to the corresponding column definitions shown in the Key Column Selection window, can indicate an inefficient access path selection, resulting from a possible disqualification of index usage. If, for
example, an index column is defined as 3 characters, and that column is being compared in a WHERE-clause with a host variable defined as 4 characters, then DB2 does not base its access path selection on the mentioned index. You should verify that a column and a host variable being compared in a WHERE-clause have compatible definitions.

Plan table considerations:

Whenever an SQL statement is explained, the result is written as an entry into a plan table. When the Explain function performs a dynamic Explain, the result is written to the PLAN_TABLE of the current SQLID. The current SQLID is either the same ID as the one used for your Online Monitor session or the ID that you specify in the Explain Menu. You can then examine the explained SQL statement residing in the plan table by using the DB2 Explain Output panel and its associated windows.

If you request a dynamic Explain of an SQL statement, and if you do not have an up-to-date plan table, one of these windows is displayed:
- If a plan table currently does not exist, the "Create Plan Table window" prompts you to create a plan table.
- If a plan table exists, but does not match your current version of DB2, the "Upgrade Plan Table window" prompts you to upgrade the plan table.

Create Plan Table window

If a plan table does not exist when a dynamic Explain is required, the Create Plan Table window is displayed.

Use the Create Plan Table window to specify the database name (optional), and table space name of the table to be created (optional). If neither are entered, a plan table is created in the default database DSNDB04. If this database does not exist or you do not have sufficient authority, an error message is displayed.

Upgrade Plan Table window

If a plan table exists but does not match your current version of DB2, the Upgrade Plan Table window is displayed. Use this window to confirm that the table definition be upgraded to match your current version of DB2.
You can explain an SQL statement by various actions.

- Entering the EXPLAIN command or pressing F18 (Explain) in any Thread Activity panel in either the SQL Statement and Package window or SQL Statement and DBRM window.
  The current SQL statement is then explained.
- Selecting option 9 (Explain) from the Online Monitor Main Menu.
  The Explain Menu is displayed, where you can select one of four options for explaining an SQL statement.
- Marking a range of lines to be explained from within an ISPF/PDF editor and issuing the EXPLAIN command from the editor command line.
  See "ISPF Online Monitor Source Explain" on page 1934 for more information.

The SQL statement is then explained and the result displayed in the DB2 Explain Output panel.

Figure 128 shows the flow of the Explain process.
Selecting Explain from the Online Monitor Main Menu

You can access Explain by selecting option 9 (Explain) from the Online Monitor Main Menu. See Figure 12 on page 1777 for an example of the Online Monitor Main Menu.

The Explain Menu is displayed, where you can select one of four methods for specifying the SQL statement you want explained.

Explaining an SQL statement from an ISPF/PDF editor

You can explain an SQL statement that is imbedded in a source program or SPUFI input from an ISPF/PDF editor. To do this, specify a range of source lines to explain using the E line prefix command, then type EXPLAIN on the command line and press Enter. Any valid SQL statements within the specified range can then be selected from a list for Explain processing. For more information about source Explain, see “ISPF Online Monitor Source Explain” on page 1934.

If Explain executed successfully, the DB2 Explain Output panel is displayed. For more information about the DB2 Explain Output panel, see “Explain output (DB2 Explain Output panel)” on page 1932.

Explain Menu:

Use the Explain Menu to specify the DB2 subsystem where the Explain request is to be performed (optional), a different SQL authorization ID for qualifying the unqualified tables in the statements being explained, and to select an option for explaining an SQL statement. To display the Explain Menu, select option 9 (Explain) from the Online Monitor Main Menu.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

Figure 129. Explain Menu

Use the Current server field to specify the DB2 subsystem where you want the Explain request to be performed. This field makes it possible that you are connected to a DB2 test subsystem while you execute the Explain on the remote production system. The default value is the local location.
Use the Current SQL ID field to specify a different SQL authorization ID for qualifying the unqualified tables in the SQL statements to be explained. The Current SQL ID field can also be used to qualify the plan table to be accessed. The default value is your user ID.

Whenever package or DBRM SQL statements are explained, the package or plan owner is used to qualify unqualified SQL statements. The package or plan owner is used to qualify the plan table.

From this window, you can select one of the following options:

- Select option 1 (Explain an existing entry in the plan table) to display the Plan Table Entry window, where you can interpret an existing entry in your plan table, or in another user's plan table if you have the required DB2 authority.
- Select option 2 (Explain a package's SQL statement) to display the Package SQL Statement window, where you can explain an SQL statement for a previously bound package.
- Select option 3 (Explain a DBRM's SQL statement) to display the DBRM SQL Statement window, where you can explain an SQL statement for a previously bound plan.
- Select option 4 (Enter an SQL statement to be explained) to display the SQL Text Entry window, where you can explain a dynamic SQL statement. After you specified the query number, the SQL Text Edit panel is displayed, where you can enter and explain a dynamic SQL statement.

Use these options, and related windows, to select the SQL statement you want to explain. The SQL statement is then explained, and the result displayed in the DB2 Explain Output panel.

**Explain existing entry in Plan Table:**

Use the Plan Table Entry window to explain an entry in your plan table or, if you have the required DB2 authority, an entry in another user's plan table. Regardless of the user specified, a DB2 plan table needs to exist for that user.

To display this window, select option 1 from the Explain Menu.

---

**Figure 130. Plan Table Entry window**

<table>
<thead>
<tr>
<th>Local location</th>
<th>Owner of plan table</th>
<th>Query number</th>
<th>Plan name</th>
<th>Program name</th>
<th>Version</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMODB2A SDA2 V10</td>
<td>PMDEV51</td>
<td></td>
<td>DGO@TPG1</td>
<td>DGO@TPG1</td>
<td></td>
<td>F1=Help F2=Split F3=Exit F9=Swap F12=Cancel F21=Expand</td>
</tr>
</tbody>
</table>
Enter a user ID in the Owner of plan table field, or leave this field blank to specify your own plan table. Then specify the Query number of the plan table entry you want to explain.

If the 1 field is left blank, all entries are listed that match the plan name, program name, and version that you specified. Leaving any of these criteria fields blank is equivalent to specifying an asterisk (*), which matches all entries. The Plan Table Entry List panel is then displayed, which lists all matching entries in the plan table.

After selecting an entry in a plan table, the entry is processed and the result is shown in the DB2 Explain Output panel.

**Plan Table Entry List panel:**

Use the Plan Table Entry List panel to select an entry from the list of entries belonging to the plan table. If many table entries are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

![Plan Table Entry List panel](image)

**Figure 131. Plan Table Entry List panel**

After making a selection, the entry is processed and the result is shown in the DB2 Explain Output panel.

**Explain an SQL statement of a package:**

Use the Package SQL Statement window to explain an SQL statement of a previously bound package.

To display this window, select option 2 from the Explain Menu.
To explain an SQL statement from this window, type the collection identifier, package name, and version into the appropriate fields and press Enter. Wildcards are accepted in these fields. Empty fields are equivalent to asterisks (*), which is the default. The Package Version List panel is then displayed, where you can select a package from a list of all matching packages.

**Package Version List panel:**

The Package Version List panel shows a list of packages that match the fields specified in the Package SQL Statement window. If many packages are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

**Figure 133. Package Version List panel**

From this window, you can select a package to display the SQL Statement List panel, where you can examine a list of SQL statements belonging to the package.

**SQL Statement List panel (Packages):**

The SQL Statement List panel shows a list of SQL statements for the selected package. For each item listed, the statement number and the first 60 characters of the SQL statement text are shown. If many SQL statements are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list. Use the key F21 (Expand) to browse the SQL statement.
From this window, you can select the SQL statement to be explained. The SQL statement is then processed and the result is shown in the DB2 Explain Output panel.

**Explain an SQL statement of a DBRM:**

Use the DBRM SQL Statement window to explain an SQL statement of a previously bound plan.

To display this window, select option 3 from the Explain Menu.

![Figure 134. SQL Statement List panel](image)

![Figure 135. DBRM SQL Statement window](image)

To explain an SQL statement from this window, type the DBRM name and plan name into the appropriate fields and press Enter. Wildcards are accepted in these fields. Empty fields are equivalent to asterisks (*), which is the default. The DBRM and Plan List panel is then displayed, where you can select a DBRM from a list of all matching DBRMs and plans.

**DBRM and Plan List panel:**

The DBRM and Plan List panel shows a list of DBRMs and plans matching the fields specified in the DBRM SQL Statement window. If many items are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.
From this window, you can select any DBRM listed to display the SQL Statement List panel, where you can examine a list of SQL statements belonging to the DBRM.

**SQL Statement List panel (DBRMs):**

The SQL Statement List panel shows a list of SQL statements for the selected DBRM. This window shows the statement number and the first 60 characters of the SQL statement text for each item listed. If many SQL statements are listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list. Use the key F21 (Expand) to browse the SQL statement.

**Figure 136. DBRM and Plan List panel**

From this window, you can select an SQL statement to be explained. The SQL statement is then processed and the result is shown in the DB2 Explain Output panel.

**Explain dynamic SQL statement:**

Use the SQL Text Entry window and its associated SQL Text Edit panel to enter an SQL statement to be explained.
To display this window, select option 4 from the Explain Menu.

![Figure 138. SQL Text Entry window](image)

In this window, enter the query number you want to assign to the SQL statement. The query number identifies in the plan table the SQL statement that you are entering. If no query number is specified, the default is 999 735 912.

The 1 field specifies whether the SQL statement is eligible for query parallelism. If you enter a forward slash (/) in this field, the current degree of parallelism is set to ANY. Otherwise, the current degree of parallelism is set to 1.

After you press Enter, the Edit SQL Text panel is displayed, where you can enter the SQL statement text you want to explain.

**SQL Text Edit panel:**

Use this panel to view or modify the full text of an SQL statement for purposes of online tuning, or to create an SQL statement to be explained.

This panel is displayed by pressing Enter in the SQL Text Entry window, or by selecting the 1 field from the DB2 Explain Output panel.

![Figure 139. SQL Text Edit panel](image)

From this panel, you can enter a new (or modify an existing) SQL statement to assess the effect on access path selection. The statement can be adjusted and then explained again to dynamically assess the effect.

You can enter SQL text that exceeds the display depth by using the scrolling keys F7 (Up) and F8 (Down).

To process and explain the entered SQL text, press F3 (Exit). The DB2 Explain Output panel is displayed with a confirmation message.
To ignore the changes and return to the previous panel, press F12 (Cancel).

**Explain output (DB2 Explain Output panel):**

Use the DB2 Explain Output panel and Catalog Table windows to investigate the access path methods of an explained SQL statement. Information regarding packages, DBRMs, table spaces, tables, indexes, and column attributes can also be viewed.

Use the DB2 Explain Output panel to examine the results of an explain request.

When an SQL statement has been chosen for explanation, the following processing depends on the origin of the statement:

**Explain existing entry in the plan table**

The specified PLAN_TABLE entry is shown as a result of the explain request.

**Explain a package's SQL statement**

The plan table of the package owner is searched to check whether the SQL statement has been explained during BIND. If the search is successful, this PLAN_TABLE entry is taken. If the search is not successful, a dynamic explain is performed, that is, SQL EXPLAIN is invoked for the statement. Then the result of this explain is displayed.

The plan table is searched by using the bind time of the package. There might be multiple occurrences of the package with different bind times. For example, the Db2 system catalog might contain the latest package that is created by the Db2 command BIND or REBIND. It might also contain a former package version that is activated by the Db2 command REBIND SWITCH.

**Explain a DBRM's SQL statement**

The plan table of the DBRM owner is searched to check whether the SQL statement has been explained during BIND. If the search is successful, this PLAN_TABLE entry is taken. If the search is not successful, a dynamic explain is performed, that is, SQL EXPLAIN is invoked for the statement. Then the result of this explain is displayed.

**SQL statement to be explained has been entered**

A dynamic explain is performed, that is, SQL EXPLAIN is invoked for the statement, and the result is displayed.

**SQL statement is modified in DB2 Explain Output panel**

A dynamic explain is performed, that is, SQL EXPLAIN is invoked for the modified statement and the new result is displayed.

Only the DB2 Explain Output panel for packages (DGOMYPKM) is shown in this section.
The DB2 Explain Output panel is divided into three sections:

- The first section of the panel shows the plan name, and information about the package or DBRM that contains the SQL statement. You can select this section for further investigation of the package, DBRM, or plan name associated with the SQL statement.

- The second section of the panel, titled SQL Text, shows the first 150 characters of the SQL statement text. You can view or modify the full SQL statement text by selecting the input field shown beside the SQL text. The SQL Text Edit panel is then displayed. For more information about the SQL Text Edit panel, see “SQL Text Edit panel” on page 1931. After the SQL text is modified, the SQL statement is reexplained, and the new result is shown in the DB2 Explain Output panel. From this section you can also reach windows that provide information about the host variable definitions.

- The third section of the panel, titled Access path summary, shows information about the access path methods chosen by DB2 for each of the individual query blocks and steps required to execute the SQL statement. Each step also shows a list of the tables and indexes accessed for that step. You can select any table or index listed in a step for further investigation. You can also display the raw PLAN_TABLE data for a step. This also provides online access to help information for PLAN_TABLE columns, similar to the information in DB2 SQL Reference for the EXPLAIN statement.

If the execution of the SQL statement contains many steps, you can use the scrolling keys F7 (Up) and F8 (Down) to browse through the steps.
Online Monitor EXPLAIN command:

Use the EXPLAIN command to explain the currently executing SQL statement in the Thread Activity panels.
- SQL Statement and Package
- SQL Statement and DBRM

Note: If the Thread Detail panel has been modified to show the SQL statement text, you can use the EXPLAIN command from the Thread Detail panel as well.

If the explain request was successful, the DB2 Explain Output panel is displayed.

The command syntax is:

```
EXPLAIN
```

Figure 141. Syntax of the EXPLAIN command

Note: EXPLAIN can be truncated to a minimum of EXP.

For a description of the DB2 Explain Output panel, see “Explain output (DB2 Explain Output panel)” on page 1932.

ISPF Online Monitor Source Explain:

Use Source Explain to explain SQL statements that are embedded in a source program or SPUFI input. Source explain is performed from within the ISPF/PDF editor.

The following languages are supported:
- Assembler
- C
- COBOL
- FORTRAN
- PL/I
- SPUFI

Note: Ensure that Source Explain is installed at your site. Before you activate Source Explain, make sure that the DB2 load library is allocated to your TSO ISPF session.

To explain an SQL statement while editing a source program (or SPUFI input), specify the lines you want to have explained by using the ISPF/PDF editor line prefix command E, type EXPLAIN on the command line, and press Enter.

You can use the line prefix command E like this:

- E To explain a single line, type E in the prefix area of the line to be scanned for SQL statements.
- EE To explain a range of lines, type EE in the prefix area of the first line and the last line of the range of lines to be scanned for SQL statements.
- E[n] To explain a specific number of lines, type E[n] on the first line of the area to be scanned, where n is the number of lines to be scanned for SQL statements.
When you enter the EXPLAIN command, Source Explain scans the specified range for valid SQL statements. If a range is not specified, the entire source is scanned. The valid SQL statements are then listed on the SQL Statement Selection panel.

The following figure shows how to explain an SQL statement while editing COBOL source code.

To explain the SQL statements in the source code from line 3040 to 3160:
1. In the line prefix area of lines 3040 and 3160, type EE.
2. On the command line, type explain and press Enter.

```plaintext
EDIT ---- SYS1.DSN610.SDSNSAMP(DSNBBC3) - 01.00 ----------------- COLUMNS 001 072

Figure 142. Source Explain example

If you previously selected the **Always display this window** field in the Source Explain Options window as shown in the Source Explain Options window, the Source Explain Options window is displayed. If you did not select this field, the SQL Statement Selection panel is displayed.

**Source Explain Options window:**

You can display the Source Explain Options window by specifying a command in the ISPF/PDF editor or on the SQL Statement Selection panel.

- In the command line of the ISPF/PDF editor, type EXPLAIN OPTIONS and press Enter.

  If you have previously selected the **Always display this window** field in the Source Explain Options window, you can type EXPLAIN in the command line of the ISPF/PDF editor and press Enter.

- In the command line of the SQL Statement Selection panel, type OPTIONS and press Enter.
You can use the Source Explain Options window to specify the Source Explain processing options, for example, the language of the source code you are editing, the subsystem ID of the explaining DB2, the SQLID to be used, or the degree of parallelism.

On the Source Explain Options window, you can specify the following options:

**Local DB2 Subsystem**
The local DB2 subsystem to which you want to connect.

**Current Server Location**
The DB2 subsystem where you want the source SQL statements to be explained.

In this field, you can specify the DB2 test subsystem you want to connect to while you are executing the explain on the remote production system. If you do not specify a subsystem, the local DB2 subsystem is used.

**Current SQLID**
A different SQL authorization ID for qualifying the unqualified tables in the SQL statements being explained.

A different SQL authorization ID is also used to qualify the plan table to be accessed. If you do not specify an SQL authorization ID, your user ID is used.

**Query number**
A number that identifies the Explain statement.

If you do not specify a number, the value 999 735 912 is assigned to this field.

**Set current degree to ANY**
To specify whether the SQL statement is eligible for query parallelism.

By default, the current degree of parallelism is set to 1. To set the current degree of parallelism to ANY, type a slash (/) in this field.

**Always display this window**
To control the display of the Source Explain Options window.
By default, the Source Explain Options window is not displayed on each Source Explain request. To display the Source Explain Options window on each Source Explain request, type a slash (/) in this field.

**Define source language**

In this field, you must specify the language of the source that contains the SQL statements. This field cannot be left blank.

After you have specified the Source Explain options to be used, press Enter to proceed to the SQL Statement Selection panel.

**SQL Statement Selection panel:** Use the SQL Statement Selection panel to view a summarized list of the valid SQL statements within the specified source area. If there are many SQL statements listed, you can use the scrolling keys F7 (Up) and F8 (Down) to browse the list.

![SQL Statement Selection Panel](image)

You can select any SQL statement that is listed on the SQL Statement Selection panel for Explain processing by typing a slash (/) next to the line to be explained as shown in the figure above. The SQL statement is then processed even if the SQL statement text exceeds the specified range. Then the Online Monitor is accessed. With the Online Monitor, you can view the Explain output on the DB2 Explain Output panel. For more information, see “Explain output (DB2 Explain Output panel)” on page 1932.

From the SQL Statement Selection panel, you can access the Source Explain Options window by using the OPTIONS command. In the Source Explain Options window, you can change the Source Explain processing options.

**Source EXPLAIN command:**

Use the EXPLAIN command to explain an SQL statement from within an ISPF/PDF editor, or to specify Source EXPLAIN options.

The command syntax looks like this:

```
EXPLAIN OPTIONS
```

*Figure 145. Syntax of the Source EXPLAIN command*
Viewing system parameters

Use the System Parameters panels to view current DSNZPARM and buffer pool values for the DB2 subsystem to which you are currently connected. The system parameters values specified at subsystem startup time and current buffer pool values are shown. The information displayed in these panels is similar to that presented by the Batch System Parameters report set.

Note: This function is not supported for DB2 11.

All system parameter fields are supported. You can also use Query Workload Tuner.

DB2 System Parameters panel:

Use the DB2 System Parameters panel to view a summary of important DSNZPARM values, maximum concurrent users, and IRLM thresholds. Use the scrolling keys F7 (Up) and F8 (Down) to view all information in the DB2 System Parameters panel.

To display the DB2 System Parameters panel, select option 3 (Display System Parameters) from the Online Monitor Main Menu.

The following figure shows the DB2 System Parameters panel.

![DB2 System Parameters panel](image_url)

Figure 146. DB2 System Parameters panel

1938 IBM Db2 Performance Expert on z/OS
**Note:** The DB2 System Parameters panel you see might have been tailored by your installation and consequently might not necessarily match the panel examples shown in this information.

From the DB2 System Parameters panel, you can reach a set of windows that provide system parameters information in greater detail. To reach a window, type any character in the space provided beside the heading.

Several windows can be accessed simultaneously by selecting multiple fields in the DB2 System Parameters panel. To leave the current window and proceed with the next window, press F3 (Exit). To cancel all windows and return to the DB2 System Parameters panel, press F12 (Cancel).

**System Parameters commands:**

The following command applies to System Parameters panels. You can type the command on any System Parameters panel command line, or invoke it using the appropriate function key. A list of active function keys is displayed at the bottom of each panel. You can abbreviate commands down to three characters in length. For example, the HISTORY command can be abbreviated to HIS.

**HISTORY command:**

Use the HISTORY command to view past data that was previously collected by the data collector. The data is gathered at installation-defined intervals. The date and time in the panels that support history indicate when the data being displayed was collected.

You can only view past data if the data collector is active for the subsystem you are monitoring and if it was started with the parameter HISTORY=YES. See “OMEGAMON Collector purpose and function” on page 372 for information about the data collector.

The command syntax is:

```
HISTORY
```

Figure 147. Syntax of the HISTORY command

**Parameters of the HISTORY command**

The HISTORY command accepts the following parameters:

- **OFF** Returns the display to the current time.
- **BACK** Displays data for the previous interval. If no more data is available, data from the earliest available interval is displayed.
- **FORWARD** Displays information for the next available interval. If no more data is available, data from the current time is displayed and processing continues as if HISTORY is OFF.
date  The date of the required information. If no date is specified, today’s date is assumed.

hh:mm:ss  The time of the required information. If no time is specified, the default is the time of the earliest available history record for the specified date. The seconds do not need to be specified.

If no data is available for the specified date and time, the next available record is displayed.

If you do not specify any parameters, the [History window] is displayed. The current system date and time are the defaults for the History window.

Viewing past data

To view past data, type HISTORY followed by any parameters on the command line and press Enter. HISTORY can be truncated to a minimum of HIS.

Problem identification examples

This section provides examples of how to discover and identify various system problems by using exception processing, viewing past data, analyzing the access paths chosen by DB2 to process an SQL statement, and viewing thread activity and statistics panels.

Example of exception processing:

This example demonstrates how you can use exception processing to discover a possible class 2 CPU (processing) time problem, and identify the cause by viewing past data and analyzing the access paths chosen by DB2 to process an SQL statement. The data collector needs to be installed at your site to view past data.

First, set the exception threshold for class 2 CPU time to a value applicable to your environment. To do this, select option 8 (Maintain parameter data sets) from the Online Monitor Main Menu. This displays the Data Set Maintenance Menu.
Ensure that you have specified an Exception Threshold data set name in the 1 field. Select option 1 (Maintain exception thresholds) to display the Exception Threshold Category Selection panel.

The Exception Threshold Category Selection panel is displayed.

Select the category that contains the exception field you want. For this example, select the Elapsed, CPU and Waiting Times per Plan Execution field.

The Exception Threshold Field Selection panel is displayed.
This panel shows all available fields within the specified category. Select the ADDBCPUT field and press Enter.

Field category: Elapsed, CPU, and Waiting Times per Plan Execution

- ADRECETT: Elapsed time in application (Class 1)
- ADCPUT: CPU time in application (Class 1)
- ADDB2ETT: Elapsed time in DB2 (Class 2)
- ADDBCPUT: CPU time in DB2 (Class 2)
- ADTWDB: Total wait time in DB2 (Class 2)
- ADTWTAP: Total wait time in application (Class 1)
- ADTSUST: Total Class 3 suspensions time
- ADTSUSC: Total Class 3 suspensions
- QWACAWTL: Lock/latch suspensions time (Class 3)
- ADLLSUSC: Lock/latch suspensions (Class 3)
- QWACAWTI: Synchronous I/O susp. time (Class 3)
- ADIOSUSC: Synchronous I/O suspensions (Class 3)
- QWACAWTR: Other read I/O susp. time (Class 3)

The Exception Threshold Field Details panel is displayed.

Field ID: ADDBCPUT
Description: CPU time in DB2 (Class 2)

Active: 1 = Yes, 2 = No
By: 1 = Total, 2 = Minute, 3 = Second, 4 = Commit, 5 = Thread

Compare operator: > = Less than, >= Greater than
Warning threshold: 0.09
Problem threshold: 0.1

Local location, Group name, Member name, Subsystem ID, Requester location, Connect, Planame, Corrname, Corrmbr, Primauth

Figure 150. Exception Threshold Field Selection panel

Figure 151. Exception Threshold Field Details panel
Use the Exception Threshold Field Details panel to specify the threshold criteria for the exception field selected from the Exception Threshold Field Selection panel. For this example, enter a 1 in the Active field, set the By field to Total (1), the Compare operator field to a greater than symbol (>), and the Problem threshold field to a value of 0.1 seconds.

**Note:** Choose a threshold value that is applicable to your environment. For information about defining exception threshold values, see "How to define exception threshold values" on page 1812.

Now that the exception threshold has been defined, select option 5 (Control Exception Processing) from the Online Monitor Main Menu to display the Exception Processor panel.

```
DGOMEPO2                   Exception Processor  PMO1DLOC DSN1 V10
For any field enter any character to activate

Activate/Deactivate Exception Processing
  - Display thread summary
  - Display thread detail
  - Display statistics detail
  / Periodic
  _ Exception event notification

Options
Periodic units .................. 1   1=Seconds
  2=Minutes
Periodic interval ............... 10   1-7200 Seconds
  1-120 Minutes
> Disable auto-display for problem exceptions
> Sound alarm for exception warnings
  - Log file data set output needed
  - DPMOUT data set output needed

Exception threshold data set
Name .................. SAMPLE.EXCEPT.DATASET

Command ===>
F1=Help    F2=Split    F3=Exit    F7=Up    F8=Down    F9=Swap
F12=Cancel F16=Look    F17=Collect

Figure 152. Exception Processor panel
```

Use the Exception Processor panel to activate periodic exception processing. Enter the Exception Threshold data set name you specified on the Data Set Maintenance Menu and type a forward slash (/) in the Periodic field to activate periodic exception processing. In this example, the exception processor has been set to check for periodic exceptions every 10 seconds.

For more information about activating exception processing, see "How to start exception processing" on page 1812.

When a periodic exception occurs, the Online Monitor notifies you by displaying the Exception Notification window. This window is overlaid on the current panel.
Figure 153. Exception Notification window (overlaid on Thread Detail panel)

The Exception Notification window indicates that a periodic exception has occurred. You can examine the exception in greater detail using the LOOK command. Type L00K 1 on any command line and press Enter to display the Periodic Exceptions List window.
From this window you can examine a list that contains the last 500 periodic exceptions that have occurred. The most recent exceptions are displayed at the bottom of the list.

In this example the thread causing the exception has ended. However, you can still select the exception to be examined from the list displayed in the Periodic Exceptions List window. If history and data collector are available, the Online Monitor retrieves past data and displays the Thread Detail panel where you can examine the thread causing the exception.

Some fields can have values that are longer than the space available to show them in this panel. When this happens, the last character in the field is replaced with an asterisk (*) to indicate that the reported value is truncated.
Because class 2 time is the time spent within DB2, the excessive class 2 time occurred even though you are examining what has happened on the thread.

This is where you can use past data to examine the data on a thread that has ended. In this way, you can examine the thread before and after the exception occurred by moving backward and forward through time. See "Viewing past data" on page 1807 for more information about viewing past data.

Because class 2 time is the time spent within DB2, the excessive class 2 time causing the exception could be caused by a possible SQL statement problem.

From the Thread Detail panel, select SQL Statement and Package to display the SQL Statement and Package window.
This window displays the SQL statement executing at the time the exception occurred. To obtain details about the access paths chosen by DB2 to process the SQL statement, press F18 (Explain) to explain the SQL statement and display the DB2 Explain Output panel.

Figure 156. SQL Statement and Package window
The access path summary in the DB2 Explain Output panel shows that a table space scan is being used to access the table. This could indicate the reason for the excessive class 2 time.

Select the table from the DB2 Explain Output panel to display the Table Information window, where you can see if any indexes have been defined for the table.
Figure 158. Table Information window

From this window you can see that an index has been defined for the table. Select Indexes to display the Index Selection window where you can select the index to be examined. In this example, the index selected is DSNB710.XEMP1. This displays the Index Information window.
Index Information

Local location . . . . . : PMOIDLOC  DSN1 V10
Current server . . . . . : PMOIDLOC  DSN1 V10

- Index name . . . . . . . : DSNB710.XEMP1
- Index space name . . . . : XEMP1
- Table name . . . . . . . : DSNB710.EMP
- Database name . . . . . : DSNBD31A
- Buffer pool . . . . . . . : BP

/ Key columns . . . . . . . : 1

Figure 159. Index Information window

From the Index Information window, you can select Key columns to display the Key Column Information window.

Key Column Information

Local location . . . . . : PMOIDLOC  DSN1 V10
Current server . . . . . : PMOIDLOC  DSN1 V10

- Column name . . . . . . . : EMPNO
- Table name . . . . . . . : DSNB710.EMP
- Index name . . . . . . . : DSNB710.XEMP1
- Position . . . . . . . : 6
- Sequence . . . . . . . : Ascending
- Type . . . . . . . : CHAR
- Length . . . . . . . : 6
- Scale . . . . . . . : 0
- Key cardinality . . . . . : 123
- Null value . . . . . . . : No
- Second highest value . . . : 200330
- Second lowest value . . . : 000020

Figure 160. Key Column Information window

Use this window to examine the characteristics of the key column on which the index has been defined.
One of the possible reasons for an index not being used is that the host variable defined in the program does not match the characteristics of the column as defined in the table. To determine whether this is the reason for the index not being used, you can return to the DB2 Explain Output panel where the Host Variable Definition window can be selected.

![Figure 161. Host Variable Definition window](image)

In this particular example, the Host Variable Definition window shows that the definitions do not match, thereby disqualifying use of the index.

The host variable defined in the source program should be changed to match the table definition so that DB2 can use the index and thereby reduce the class 2 time.

**Example of thread monitoring:**

This example demonstrates how to identify a possible lock suspension problem using the Online Monitor thread activity function.

Display the Thread Summary panel by selecting option 1 (Display Thread Activity) from the Online Monitor Main Menu.

![Figure 162. Thread Summary panel](image)
**Note:** To view Class 3 times in the Thread Summary panel, you need to scroll the display to the right (F20).

Type SORT on the command line and press Enter to display the DB2 Thread Sort Specification window, where you can sort threads by class 3 lock/latch times in descending sequence so that threads with the most time spent waiting because of lock and latch suspensions are sorted to the top.

![DB2 Thread Sort Specification window](image)

**Figure 163. DB2 Thread Sort Specification window**

You can also sort threads by class 3 lock/latch times in descending sequence by typing the command SORT C3E and pressing Enter on the command line.

For information about the SORT command see “SORT command” on page 1870.

Press F3 (Exit) to exit the DB2 Thread Sort Specification window and return to the Thread Summary panel.
At this point, all threads have been sorted in descending sequence by class 3 lock/latch time, although this field is not displayed. You can press the F20 (Right) key to view class 3 times. The word SORT is displayed in the header of the Thread Summary panel.

For example, to view detailed information about the class 3 lock and latch times of a particular thread, type any character next to that thread and press Enter. The Thread Detail panel is displayed.

**Note:** The Thread Detail panel that you see might have been tailored by your installation and consequently might not necessarily match the panel examples shown in this information.

---

**Figure 164. Thread Summary panel**

At this point, all threads have been sorted in descending sequence by class 3 lock/latch time, although this field is not displayed. You can press the F20 (Right) key to view class 3 times. The word SORT is displayed in the header of the Thread Summary panel.

For example, to view detailed information about the class 3 lock and latch times of a particular thread, type any character next to that thread and press Enter. The Thread Detail panel is displayed.

**Note:** The Thread Detail panel that you see might have been tailored by your installation and consequently might not necessarily match the panel examples shown in this information.
As you can see, most of the total class 3 suspension time is because of locks and latches. The Thread Detail panel shows that the thread is in LOCK status. Select the 1 field to display the Thread Times window, where you can examine the suspension time shown in the Locks and latches field.
To view the locked resources associated with this thread, press F3 (Exit) to return to the Thread Detail panel and select the Locked Resources field.

The Locked Resources window is displayed.

</tr>
</tbody>
</table>

Figure 168. Threads Holding Resource window (Planname)

All threads involved in the locking of this resource are displayed. From this window, it can be seen that USERT001 is causing USERT003 to be suspended. This problem can be resolved if USERT001 uses the SPUFI cursor stability plan (DSNESPCS), as does USERT003, instead of the SPUFI repeatable read plan (DSNESPRR). You should decide whether it is necessary for USERT001 to use DSNESPRR, or if DSNESPCS can be used instead.
Using the ISPF Online Monitor in deadlock resolution:

A deadlock is an error condition where processing cannot continue because of an unresolved contention for a particular resource. A deadlock is signaled when the deadlock detection cycle time has been reached. Ensure that the resource timeout limit is at least twice that of the deadlock detection cycle so that deadlocks are detected before a timeout occurs.

Deadlock detection

Start the data collector to collect deadlock events.

Start exception event processing from the Exception Processor panel to be notified when an exception event occurs. See “How to start exception processing” on page 1812.

Deadlock resolution

On detection of a deadlock, use LOOK to display the participants in the deadlock.

</table>

Figure 169. Deadlock Data window

If the 1 field is Datapage, ensure that all applications (Holder and Waiter) access the resource in the same order.
If the deadlock concerns an index with high insert activity (the Locked resource Type field is Index Page), set the SUBPAGES parameter for the index to 1 or consider converting the index to type 2. If the problem is not related to SUBPAGES, it could be that the commit frequency for an update application is too low. The ratio of updates per commit can be viewed in the Thread Detail panel.

Additional Information

These topics provide additional information that can be helpful when you work with OMEGAMON XE for DB2 PE or OMEGAMON XE for DB2 PE.

Online Monitor field table

The tables in this section provide a list of the Online Monitor thread activity fields, statistics fields, and system parameters fields.

You can use these tables to cross-reference exception field names for display exception processing and for periodic exception processing, or to look up a field help panel name when customizing Online Monitor panels, as described in “Customizing panels” on page 334.

The following is a description of the table columns:

Field name
The name of the field.

Field description
The field title, as the field is shown in the panel. The field titles vary slightly from panel to panel depending on the context in which the fields are used.

Help panel name
The member name of the associated help panel.

Exception
Indicates if the field is an Online Monitor exception field.

Layout of the Exception Log File output record

The table in this section outlines the format of the Exception Log File data set output record. Use these terms to interpret the table.

Offset  Length from the beginning of the record to the start of the field.

Length  Length of the field, in bytes.

DB2 Data Type

The format of the value in the field:

• SMALLINT
• INTEGER
• CHAR
• TIMESTAMP
• DOUBLE PRECISION

| 274              | 54             | CHAR          | Actual field name qualifier:
|                  |                |   - Buffer pool ID for buffer pool records |
|                  |                |   - Remote location for DDF records |
|                  |                |   - Package location, connection ID, and program name for package records |
|                  |                |   - Blank for all other records |
| 328              | 2              | CHAR          | Reserved |
| 330              | 1              | CHAR          | Reserved |
| 331              | 1              | CHAR          | Field description (without qualifier) |
### Table 196. Layout of the Exception Log File output record (continued)

<table>
<thead>
<tr>
<th>Offset (decimal)</th>
<th>Length (bytes)</th>
<th>DB2 Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| 371              | 40             | CHAR          | Compare basis:  
|                  |                |               | • V = Total value  
|                  |                |               | • M = By minute    
|                  |                |               | • S = By second    
|                  |                |               | • C = By commit    
|                  |                |               | • T = By thread    |
| 372              | 1              | CHAR          | Operator (> or <) |
| 373              | 12             | CHAR          | Exception value (character) |
| 385              | 12             | CHAR          | Threshold value (character) |
| 397              | 1              | CHAR          | Exception level:  
|                  |                |               | • P = Problem      
|                  |                |               | • W = Warning      |
| 398              | 8              | DOUBLE PRECISION | Exception value (floating point) |
| 406              | 8              | DOUBLE PRECISION | Threshold value (floating point) |
| 414              | 8              | CHAR          | Group name |
| 422              | 8              | CHAR          | Member name |

**Note:** The exception and threshold values in floating-point form (offsets 398 and 406 respectively) can contain time or counts fields. For time fields, the value is stored in terms of microseconds. For example, if you entered 0.3 seconds for the threshold value, it is stored as 300,000 microseconds in the Exception Log File data set. For counts fields, the value is stored as the actual value.

---

**Tivoli Enterprise Portal (TEP)**

Tivoli Enterprise Portal is a Java-based browser user interface for viewing and monitoring your enterprise.

The Tivoli Enterprise Portal is a user interface on the workstation that offers a single point of view for online monitoring and analysis. You can view information about all the resources in your IT environment. For example, you can view information about your operating systems, hardware such as routers, applications such as WebSphere, IMS, and CICS, and custom applications. It can run as a browser applet or as a Java application. OMEGAMON XE for DB2 PE gathers data from remote agents residing on the managed systems of your DB2 network and stores this data in system elements called *attributes*.

The monitoring data is received via the Tivoli Enterprise Portal Server (TEPS) and the Tivoli Enterprise Monitoring Server from the Tivoli Enterprise Monitoring Agents (TEMA). Information is then displayed in named *workspaces*.

The Tivoli Enterprise Portal is a customizable interface. For example, you can:

- Configure the workspaces and attributes according to your requirements. The Tivoli Enterprise Portal comes with a set of predefined workspaces for each item in the navigation tree, but you can edit any of them to suit your needs.
- Filter the information presented in a workspace by moving from the top-level workspace to lower-level workspaces.

**Note:** A workspace is not refreshed automatically, however, you can choose to automate the refresh of a workspace at specified intervals.
The Tivoli Enterprise Portal allows you to view a wealth of information, including the following:

- Detailed thread activity information about your DB2 threads, including Workload Manager information
- The interaction of a DB2 system with MVS, CICS, IMS, z/OS, and other systems, databases and applications within a single interface from any location
- Database lock activities and detailed lock conflict information about your database locks
- Information about DB2 resources such as buffer pools, EDM pools, group buffer pools, and dynamic statement caches
- Enhanced information for database access threads (DBATs) at DB2 Connect gateways
- DB2 log manager active logging and archiving activities
- Distributed Database Facility statistics, including send and receive counts
- Detailed information about threads and thread exceptions connected to DB2
- Information about the performance of volumes that contain DB2 objects so that you can monitor the DASD performance by volume (Group Object Analysis (GOA) Volume workspace group)
- Information about a data sharing group and its coupling facility structures
- Active utility jobs
- DB2 Connect gateway activities

You can use the Tivoli Enterprise Portal to perform the following analysis activities:

- Detecting I/O related bottlenecks such as heavily used volumes
- Analyzing system-wide or application-specific resource usage to tune DB2 resources or to identify applications that are performing poorly
- Using historical information in the short-term history to detect and analyze problems in the past
- Using situations to automatically inform you about problems. You can use predefined situations or you can create your own situations
- Automating problem resolution by taking automatic action when certain events are detected. For example, you can run an MVS job, send a message to a system automation tool, or cancel a thread
- Managing problems detected by your team by using a built-in trouble ticket system or by forwarding the alert to an external event console

For installation and configuration instructions, see “Installing and configuring Tivoli Enterprise Portal” on page 851.

OMEGAMON XE for DB2 PE Attributes

OMEGAMON XE for DB2 PE attributes are grouped into attribute groups. These attributes correspond to the column names contained in the associated OMEGAMON XE table views. Various attributes are used in the product-provided situations shipped with DB2.

To find out general information about an attribute group, select it from the Help Table of Contents. By expanding the Table of Contents entry for a given attribute group, you will see the names of the attributes comprising the group. For information about a specific DB2 workspace or the table view it contains, see the related workspace topic.
**Accelerator Statistics Attributes**

Use these attributes to view accelerator statistics information.

**Accelerator name** The accelerator server identifier (Field name: Q8STNAME).

**Act Worker Nodes** The number of active worker nodes (Field name: Q8STWNOD).

**Avail Disk (MB)** The disk storage (MB) available at the accelerator (Field name: Q8STDSSK).

**Avg Coord CPU Util** Average CPU utilization on accelerator coordinator nodes (Field name: Q8STCCPU).

**Avg Queue Wait Time (MS)** The average wait time at the accelerator query queue (Field name: Q8STQUEW).

**Avg Worker CPU Util** The current CPU utilization on the accelerator worker nodes. This is a snapshot, which is the average CPU utilization across all worker nodes (Field name: Q8STWCPU).

**Avg queue len, last 24 h** The average query queue length during the last 24 hours at the accelerator (Field name: Q8SQA24).

**Avg queue len, last 3 h** The average query queue length during the last 3 hours at the accelerator (Field name: Q8SQA03).

**CPU cost for all DB2** The total CPU cost spent in the accelerator for data maintenance operations from all DB2 systems. Replication-related operations are not included (Field name: Q8STTCMA).

**CPU cost for this DB2** The total CPU cost spent in the accelerator for data maintenance operations from this DB2 system. Replication-related operations are not included. (Field name: Q8STTCMS).

**CPU time executing this DB2** The total CPU cost associated with executing queries in the accelerator on behalf of this DB2 system (Field name: Q8STTCQS).

**CPU time executing all DB2** The total CPU cost associated with executing queries in the accelerator on behalf of all DB2 systems (Field name: Q8STTCQA).

**Curr Active Requests** The number of currently (actively) executing queries in the accelerator on behalf of all DB2 systems (Field name: Q8STACTV).

**Curr executing queries** The number of currently executing queries in the accelerator on behalf of this DB2 system (Field name: Q8STNCQS).

**Current queue len** The current query queue length at the accelerator (Field name: Q8STCQL).

**DB2 Subsystem** The DB2 subsystem ID.

**DB2 Version** The DB2 version.

**DSG Member Name** The Data Sharing Group (DSG) member name.

**Data Sharing Group** The Data Sharing Group name.
Data Skew Data skew (Field name:Q8STSKEW)

Data slices The number of data slices at the accelerator. This equals the degree of parallel I/O channels (Field name: Q8STNMDS).

Elapsed time in accel The accumulated elapsed time spent in the accelerator when executing requests from the DB2 subsystem (Field name: Q8STAELA).

Failed reqs since start The number of queries (sent by this DB2 system since accelerator start) that failed to be successfully executed for any reason (Field name: Q8STFREQ).

Filler Filler for padding.

Filler2 Filler for padding.

Filler3 Filler for padding.

Filler4 Filler for padding.

IP address of accel IP address of accelerator (Field name: Q8STIPAD).

In-use disk all DB2 % The disk storage (MB) in-use for accelerator databases for all DB2 systems (Field name: Q8STDSA).

In-use disk this DB2 % The disk storage in-use for accelerator databases for this DB2 system. (Field name: Q8STDSKB).

Interval Start The start time of this interval.

Log rec bytes all DB2 The number of log record bytes processed by the replication capture agents for all DB2 systems (DB2 field name: Q8STNBA).

Log rec bytes this DB2 The number of log record bytes processed by the replication capture agent for this DB2 system (DB2 field name: Q8STNBS).

Log recs read all DB2 The number of log records read by the replication capture agents for all DB2 systems (Field name: Q8STNLRA).

Log recs read this DB2 The number of log records read by the replication capture agent for this DB2 system (Field name: Q8STNLRS).

Log recs tbls all DB2 The number of log records read by the replication capture agents for all DB2 systems that are applicable to tables in this accelerator (DB2 field name: Q8STNLTA).

Log recs tbls this DB2 The number of log records (read by the replication capture agent for this DB2 system) that are applicable to tables in this accelerator (Field name: Q8STNLTS).

MVS System ID The MVS identifier.

Max Query Queue Len The high watermark of the query queue length at the accelerator (Field name: Q8STMAXQ).
Max Queue Wait Time (MS) The maximum wait time at the accelerator query queue (Field name: Q8STQUEM).

Maximum Active Request for this DB2 Shows the maximum number of queries executing in the accelerator at any time since accelerator start on behalf of this DB2 system (Field name: Q8STMNQS).

Maximum Active Request for all DB2 The maximum number of queries actively executing in the accelerator concurrently at any time since accelerator start on behalf of all DB2 systems (Field name: Q8STMAXA).

Num blocks received The total number of blocks received from the accelerator (Field name: Q8STBLKR).

Num blocks sent The total number of blocks sent to the accelerator. (Field name: Q8STBLKS).

Num bytes received The total number of bytes received from the accelerator (Field name: Q8STBYTR).

Num bytes sent The total number of bytes sent to the accelerator (Field name: Q8STBYTS).

Num msgs received The total number of messages received from the accelerator (Field name: Q8STMSGR).

Num msgs sent The total number of messages sent to the accelerator (Field name: Q8STMSGS).

Num rows received The total number of rows received from the accelerator (Field name: Q8STROWR).

Num rows sent The total number of rows sent to the accelerator (Field name: Q8STROWS).

Originating System The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Product ID The accelerator product identifier (Field name: Q8STPRID).

Query Successfully executed Requests that were successfully executed.

Queries failed to execute Shows the number of queries (sent by all DB2 systems since accelerator start) that were not successfully executed for any reason (Field name: Q8STNQFA).

Replication cost all DB2 The total CPU cost associated with the replication apply process for all DB2 systems (Field name: Q8STTCCA).

Replication cost this DB2 The total CPU cost associated with the replication apply process for this DB2 system. (Field name: Q8STTCCS).

Replication Status The current replication state of the accelerator for this DB2 system (Field name: Q8STCSS).

0 Started
1  Stopped
2  Error
3  Starting
4  Stopping

**Replication latency** The current replication latency for this DB2 system. Latency the time difference between the timestamp, when the applied to the target, compared to the current time (Field name: Q8STCRL).

**Replication status change** The timestamp when the last change of the accelerator replication state occurred for this DB2 system (Field name: Q8STTTLSC).

**Rows Deleted Accel Tables for this DB2** The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system (Field name: Q8STNDS).

**Rows Deleted Accel Tables for all DB2** The number of DELETE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems (Field name: Q8STNDA).

**Rows Inserted Accel Tables for this DB2** The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system. (Field name: Q8STNIS).

**Rows Inserted Accel Tables for all DB2** The number of INSERT rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems. (Field name: Q8STNIA).

**Rows Updated Accel Tables for this DB2** The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agent for this DB2 system (Field name: Q8STNUS).

**Rows Updated Accel Tables for all DB2** The number of UPDATE rows applicable to accelerator tables that were processed by the replication capture agents for all DB2 systems (Field name: Q8STNUA).

**Server start time** The timestamp when the accelerator server process started last time (DB2 field name: Q8STTART).

**State** Shows the current accelerator state (Field name: Q8STTATE).

**Status change time** The timestamp when the last change of the accelerator occurred (Field name: Q8STTATC).

**Success reqs since start** The number of queries (sent by all DB2 systems since accelerator start) that successfully executed in the accelerator (Field name: Q8STNQSA).

**Successful Queries** The total number of successful query requests since the accelerator started (Field name: Q8STSREQ).

**TCP/IP serv elapsed time** The accumulated accelerator services TCP/IP elapsed time measured in DB2. It starts when sending the requests to the accelerator and ends when receiving the results from the accelerator (Field name: Q8STTELA).
Timed out requests since start: The number of connections that were timed out when this DB2 system sent requests to the accelerator (Field name: Q8STTOUT).

Total failed requests: The number of connections that failed when this DB2 system sent requests to the accelerator (Field name: Q8STFAIL).

Total num accel connects: The number of connects to the accelerator from this DB2 system (Field name: Q8STCONN).

Total num accel requests: The number of Distributed Relational Database Architecture (DRDA) requests sent by this DB2 system to the accelerator (Field name: Q8STREQ).

Total num processors: The number of CPU cores available on all worker nodes (Field name: Q8STCORS).

Wait time in accelerator: The wait time spent in the accelerator when executing requests from the DB2 subsystem (Field name: Q8STAWAT).

Worker Nodes Disk util: The current disk utilization of the accelerator worker nodes, expressed as percentage of the used I/O channels/resources (Field name: Q8STDSKU).

All Threads Attributes

Use the All Threads attributes to create situations to monitor thread activity including DB2 thread activity that originates from connected IMS or CICS subsystems.

Ace Address: The DB2 thread ACE address for internal use.

Agent Address: The address of the agent in DB2 associates all processes that are involved in a DB2 unit of work.

AGNT ASID: The address space ID (ASID) of the agent.

Agent TCB Address: The z/OS Task Control Block that is associated with this DB2 thread.

Authorization ID: The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Authorization ID (Unicode): The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

Begin Time: Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and IMS wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

Bytes Sent: The number of bytes of data sent to the requester location.
Cancel Command The command string needed to cancel a thread. You can use Take Action with this attribute to cancel a thread: The format is "src CANCEL THREAD(nnnnnn)", where src is the subsystem recognition character and nnnnnn is the thread token.

CICS MVS ID The CICS MVS ID.

Collection ID This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters.

Collection ID (Unicode) The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

Commits The number of successful phase 2 or single-phase commit (sync) requests. Valid value is an integer in the range 0-999 commits.

All Thread Attributes Identifies the connection of an application to a DB2 system. It is an alphanumeric text string, with a maximum length of eight characters.

All Thread Attributes The type of connection associated with the thread. Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment facility</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Conversations The number of conversations that were initiated from the requester location.

Correlation ID The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters. For example: DLKEX212.

CP CPU Rate The central processor CPU rate.

Current Period The service class period number in goal mode.
**Database Access CPU** The database access agent CPU time. This value is calculated by accumulating the amount of CPU time spent by the database access thread at the DB2 server each time a request message is processed.

**Database Access Time** The timestamp of last send or receive in distributed database access.

**DB2 ID** The DB2 subsystem ID.

**DB2 Status** The current DB2 status of the thread. It is an alphanumeric text string, with a maximum length of 12 characters.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be determined.</td>
</tr>
<tr>
<td>INDOUBT</td>
<td>The thread is in doubt.</td>
</tr>
<tr>
<td>IN-SIGNON</td>
<td>The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.</td>
</tr>
</tbody>
</table>
IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.
WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.
WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Distributed Allied Elapsed Time The elapsed time for this thread executing on distributed host.

Elapsed Time The total amount of elapsed time since thread creation or DB2 sign-on. Valid value is an integer in the range 0-99999999 seconds.

Elapsed Per Commit The average amount of elapsed time for each database commit performed.

Enclave CP CPU Time The central processor CPU time used by each thread that is associated with an enclave token.

Enclave CPU Time The enclave CPU time.

Enclave Token The ID assigned by the z/OS workload manager for this enclave. A z/OS enclave lets each thread have its own performance objective. Using z/OS workload management (WLM) support, you can establish z/OS performance objectives for individual DDF server threads.

Enclave Token Unused This field is unused.

End User ID The user ID of the workstation end user. This user ID can be different from the authorization ID used to connect to DB2. This field contains blanks if the client does not supply this information (Field name: QWHCEUID).

Get Page The number of getpage requests. This field counts successful requests for pages for queries that are processed in parallel and both successful and unsuccessful requests for pages for queries that are not processed in parallel. Valid value is an integer in the range 0-99999999 pages.

Get Page 64 The number of getpage requests. This field counts successful requests for pages for queries that are processed in parallel and both successful and
unsuccessful requests for pages for queries that are not processed in parallel. Valid value is an integer in the range 0-999999999 pages.

**Get Page Per Read** The ratio of requested pages that resulted in actual I/O versus being found in a buffer. The read I/O count divided by Get Page count.

**Get Page Per Read 64** The ratio of requested pages that resulted in actual I/O versus being found in a buffer. The read I/O count divided by Get Page count.

**IIP CPU** The accumulated CPU time consumed while executing on an IBM zIIP in all environments.

**IIP In-DB2 CPU** The amount of time that the In DB2 CPU has been running on a zIIP processor.

**In DB2 IIP CPU** The total amount of CPU time that DB2 has accumulated for a thread in the zIIP processor. Valid value is an integer in the range 0-999999999 seconds.

**In DB2 CP CPU Time** The CP CPU time accumulated in DB2 when the SQL statement exit from DB2.

**In DB2 Per Commit** The average amount of in-DB2 CPU time used between each commit.

**In DB2 Time** The elapsed time accumulated in DB2 when the SQL statement exit from DB2.

**Interval Start** The start time of the interval.

**Job Name** The job name that is associated with a thread.

**Local Elapsed Time** The elapsed time, in tenths of a second, for local thread (in units that represent tenths of seconds).

**Location** The requesting location.

**Location (Unicode)** The requesting location.

**Logical Unit Name** The LUNAME of the connection to the remote DB2 system.

**Messages Sent** The number of messages sent to remote location.

**MVSID** The MVS system identifier.

**Original Authorization ID** The DB2 original Authorization ID of the thread. It is an alphanumeric text string, with a maximum length of 8 characters.

**Original Authorization ID (Unicode)** The DB2 original Authorization ID of the thread. It is an alphanumeric text string, with a maximum length of 8 characters.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.
**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Package Name (Unicode)** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Parallel Indicator** The thread parallelism indicator.

Valid values are:

* Indicates that this thread is a parallel task initiated for another (originating) thread to process a query request in parallel.

O Indicates that this thread is the originating thread that invoked autonomous procedures.

P Indicates that this thread is the parent, or originating thread, of the parallel tasks created to process a query request in parallel. The activity performed for this (originating) thread is reflected under the parallel tasks.

X Indicates that this thread is a parallel task initiated for another (originating) thread on another DB2 for SYSPLEX parallelism.

**Parent Ace** The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.

**Performance Index** This field is related to the z/OS Workload manager. A Performance Index less than one is an indication that the goal for this service class period is being exceeded. The service class period may be considered as a "donor", giving up CPU or pageable storage for other more important service class periods on the system. A Performance Index greater than one is an indication that the goal for this service class period is not being met. Depending on the importance, this Service class period may be considered for additional services to meet the defined goal.

**Plan** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Prefetch Requests** The number of prefetch requests issued per second over the last interval.

**Remote CPU** The database access agent CPU time at the remote location.

**Remote Elapsed** The elapsed database access agent time at the remote location.

**Request Type** The request type for a ALL THREAD related workspaces. Internal use only.

**Rows Sent** The number of rows of data sent to the requester location.

**Service Class** The service class name associated with this address space.
SQL Calls Sent The number of SQL statement sent to the server.

SQL Received The number of SQL statements received from the requester.

Sync Reads The number of synchronous reads per second for the database or space name. Valid value is a decimal number, with one decimal place allowed, in the range 0.0 - 9999.9; for example, 2.2.

Synchronous Read I/O Rate The thread synchronous read I/O rate.

Thread Status The current status of a thread.

Valid values are:

Status Description

NOT-AVAIL The thread is not available.

IN-ABORT The thread is in abort processing.

IN-ACCEL The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC The thread is processing an autonomous procedure.

IN-BIND-DYNM The thread is in dynamic bind processing.

IN-BIND-STAT The thread is in static bind processing.

IN-COMMAND Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1 The thread is in Commit phase 1 processing.

IN-COMT-PHS2 The thread is in Commit phase 2 processing.

IN-CRTE-THRD The thread is in Create Thread processing.

IN-DB2 The thread is executing in DB2. A more descriptive status could not be determined.

INDOUBT The thread is in doubt.

IN-SIGNON The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.
IN-SQL-CALL
The thread is processing an SQL call.

IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call's request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
- Inter-system communication within the data sharing group to determine if there is lock contention.
- A lock held by another subsystem in the data sharing group.
WAIT-LOCK
The thread is waiting for a lock.

WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLSGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.
WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Status Description

NOT-AVAIL
The thread is not available.

IN-ABORT
The thread is in abort processing.

IN-ACCEL
The thread is executing on IBM DB2 Analytics Accelerator for z/OS.

IN-AUTO-PROC
The thread is processing an autonomous procedure.

IN-BIND-DYNM
The thread is in dynamic bind processing.

IN-BIND-STAT
The thread is in static bind processing.

IN-COMMAND
Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)

IN-COMMIT
The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).

IN-COMT-PHS1
The thread is in Commit phase 1 processing.

IN-COMT-PHS2
The thread is in Commit phase 2 processing.

IN-CRTE-THRD
The thread is in Create Thread processing.

</table>
WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the
CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD
status.

WAIT-GLBBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine
  if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.

WAIT-MGSSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a
response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a
response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status
applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of
DB2 services include: open/close of a dataset, DFHSN recall of a dataset,
SYSLGRNG update or define/extend/delete of a dataset, rollback, and
Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of
allied task termination. This status corresponds to DB2 DISPLAY
THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal
termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring
drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring
drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the
IRLM.
WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.

WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Token The thread token uniquely identifies a specific thread.

Thread Type The thread type. It can be:

A = IMS
B = BATCH
C = CICS
0 = Unknown
1 = DB_Access
3 = SYSTEM
5 = UTILITY
6 = RRSAF
7 = TSO
9 = Allied
10 = WAIT_LOCKLAT
**Transaction ID** The transaction ID at the workstation.

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (Field name: QWHSLUUv).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.

**Updates** The number of DB2 page updates made by the thread since thread creation. This value is incremented each time a row in a page is updated, not just once for each page that is updated. DB2 might update pages when it creates intermediate result tables because of a qualified SELECT statement, even though SELECT statements are generally thought of as read only operations. Pages that have been updated are written asynchronously by DB2, according to DB2 internal Deferred Write algorithm, not immediately after update or commit. DB2 resets the page update count at Create Thread and Signon. If Signon is not driven, the page update count is cumulative.

**Wait Time** Total class 3 wait time for a thread.

**Workstation ID** The end user’s workstation name. This field contains blanks if this information was not supplied by the client.

**zIIP Different Speed** The setting if the zIIP processor is at a different speed. Valid values are:

- **Yes** The zIIP processor is set to a different speed.
- **No** The zIIP processor is set to the same speed.

**zIIP Processor** The setting to confirm that the enclave is using a zIIP processor.

- **Yes** The enclave is using a zIIP processor.
- **No** The enclave is not using a zIIP processor. If No then the other zIIP related fields will be N/A.

**Data Sharing Filter Attributes**
Use the Data Sharing Filter attributes to create situations that monitor a specific DB2 system or data sharing group.

**DB2 ID** The name of a DB2 subsystem.

**Group Object Analysis Status** The status of the Event Manager for Object Analysis.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIX</td>
<td>Some Event Managers are active</td>
</tr>
<tr>
<td>NO</td>
<td>Event Manager is not active</td>
</tr>
<tr>
<td>YES</td>
<td>Event Manager is active</td>
</tr>
</tbody>
</table>

**Group or Subsystem Name** The DB2ID or data sharing group name. It is an alphanumeric text string with a maximum of 8 characters; for example, TDDDB241G.
**Group or Subsystem Type** Indicates whether a group or subsystem is a DB2 or a data sharing group.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>DB2 subsystem</td>
</tr>
<tr>
<td>DSGRP</td>
<td>Data sharing group</td>
</tr>
</tbody>
</table>

**Lock Conflict Count** The total number of owners and waiters that are in lock conflict. Valid value is an integer in the range 0 - 99999999.

**MVS System** The MVS System Management Facility (SMF) ID. It is alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of GBP Connections** The total number of Group Buffer Pool (GBP) Connections.

**Number of Threads** The total number of currently monitored threads. Valid value is an integer in the range 0 - 99999999.

**Object Analysis DB Count** The total number of monitored databases in a specific data sharing group that are participating in object analysis. Valid value is an integer in the range 0 - 4999.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Status** Indicates whether a DB2 subsystem or data sharing group for a monitored entity is operational. Valid values are OFFLINE or ONLINE.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:
- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Data Sharing Status Attributes**
Use the Data Sharing Status attributes to create situations that monitor the status of a specific DB2 system or data sharing group.

**DB2 ID** The name of a DB2 subsystem.
**Group Object Analysis Status** The status of the Event Manager for Object Analysis.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIX</td>
<td>Some Event Managers are active</td>
</tr>
<tr>
<td>NO</td>
<td>Event Manager is not active</td>
</tr>
<tr>
<td>YES</td>
<td>Event Manager is active</td>
</tr>
</tbody>
</table>

**Group or Subsystem Name** An internal attribute used for navigation. It is an alphanumeric text string with a maximum of 8 characters; for example TDDB242G.

**Group or Subsystem Type** Indicates whether a group or subsystem is a DB2 or a data sharing group.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>DB2 subsystem</td>
</tr>
<tr>
<td>DSGRP</td>
<td>Data sharing group</td>
</tr>
</tbody>
</table>

**Lock Conflict Count** The total number of owners and waiters that are in lock conflict. Valid value is an integer in the range 0 - 99999999.

**MVS Subsystem** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of DB2 systems** The total number of monitored DB2 systems. Valid value is an integer in the range 1 - 64.

**Number of GBP Connections** The total number of Group Buffer Pool (GBP) Connections.

**Number of Threads** The total number of currently monitored threads. Valid value is an integer in the range 0 - 99999999.

**Object Analysis DB Count** The total number of monitored databases in a specific data sharing group that are participating in object analysis. Valid value is an integer in the range 0 - 4999.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Status** Indicates whether a DB2 subsystem or data sharing group for a monitored entity is operational. Valid values are OFFLINE or ONLINE.

**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

**Data Sharing Thread Detail Attributes**

Use Data Sharing Thread Detail attributes to create situations that monitor thread activity for an entire data sharing group.

**Ace Address** The DB2 thread ACE address for internal use.

**Authorization ID** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

**Authorization ID (Unicode)** The primary authorization ID from connection or sign-on that identifies the execution privileges an application has to a DB2 object or service. It is an alphanumeric text string with a maximum of 8 characters.

**Begin Time** Beginning store clock value (STCK) for the period covered by this accounting record. You can determine the elapsed time of the application by subtracting this field from QWACESC (ending store clock value). Threads that do not terminate (such as CICS primed threads and ims wait-for-input message regions) can have an ending clock value that includes the time the thread was inactive and waiting to perform work.

**Cancel Command** The command string needed to cancel a thread. You can use Take Action with this attribute to cancel a thread: The format is "src CANCEL THREAD(nnnnnn)", where src is the subsystem recognition character and nnnnnnn is the thread token.

**Collection ID** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 18 characters

**Collection ID (Unicode)** The collection ID. This field is blank for DBRM. It is an alphanumeric text string, with a maximum of 128 characters.

**Data Sharing Thread Detail Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**Thread Detail Attributes (Data Sharing)** The type of DB2 connection.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job.</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>

<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 utility</td>
</tr>
</tbody>
</table>

Correlation ID The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 12 characters; for example DLKEX212.

CP CPU Time The central processor CPU time.

DB2 ID The name of a DB2 subsystem.

Display CPU Time The total amount of CPU time that DB2 has accumulated for a thread.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

Display Elapsed Time The total amount of elapsed time since thread creation or DB2 sign-on.

Valid format is DD-HH:MM:SS, where:
- D = Day
- H = Hour
- M = Minute
- S = Second
For example, 00-20:16:18 indicates that the display elapsed time is 20 hours, 16 minutes, and 18 seconds.

**Display Wait Time** The total amount of thread wait time. The collection of thread wait time requires activation of Accounting Class 2 in the monitored DB2 subsystem.

Valid format is HH:MM:SS:mmm, where:
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

If the time goes over 24 hours, the format is DD-HH:MM where:
- D = Day
- H = Hour
- M = Minute

For example, 00:14:59 indicates that the display CPU time is 14 minutes and 59 seconds.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**In DB2 Elapsed Time** The elapsed time accumulated in DB2.

**LUWID** The logical unit name (LUNAME) of the connection to the remote DB2 system.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP1.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Package DBRM (Unicode)** The package DBRM name.

**Package Name** Identifies the package name with which a thread is associated. It is an alphanumeric text string, with a maximum of 8 characters.

**Parent Ace** The token used to correlate parallel task or utility subtask records with the records of the originating task or main utility task. For a record that is issues from a parallel task or utility subtask this field contains a token that is equal to the agent control element (ACE) of the originating task or main utility task. Otherwise, the value in this field is zero.

**Plan Name** The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. Valid format is alphanumeric, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

**Thread Elapsed Time** The total amount of elapsed time since thread creation or DB2 sign-on. Valid value is an integer in the range 0 - 999999999 seconds.
**Thread Group Member Name**  The name of the member within a data sharing group for a thread.

**Thread Group Name**  The name of a data sharing group for a thread. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**Thread Status**  The current status of a thread.

Valid values are:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT-AVAIL</td>
<td>The thread is not available.</td>
</tr>
<tr>
<td>IN-ABORT</td>
<td>The thread is in abort processing.</td>
</tr>
<tr>
<td>IN-ACCEL</td>
<td>The thread is executing on IBM DB2 Analytics Accelerator for z/OS.</td>
</tr>
<tr>
<td>IN-AUTO-PROC</td>
<td>The thread is processing an autonomous procedure.</td>
</tr>
<tr>
<td>IN-BIND-DYNM</td>
<td>The thread is in dynamic bind processing.</td>
</tr>
<tr>
<td>IN-BIND-STAT</td>
<td>The thread is in static bind processing.</td>
</tr>
<tr>
<td>IN-COMMAND</td>
<td>Command threads display this status when they are active in DB2 and executing within the DB2 command processor. (This type of thread always has a blank plan name.)</td>
</tr>
<tr>
<td>IN-COMMIT</td>
<td>The thread is in Commit processing (applies only to threads that originate from an attachment that does not use two-phase-commit protocol).</td>
</tr>
<tr>
<td>IN-COMT-PHS1</td>
<td>The thread is in Commit phase 1 processing.</td>
</tr>
<tr>
<td>IN-COMT-PHS2</td>
<td>The thread is in Commit phase 2 processing.</td>
</tr>
<tr>
<td>IN-CRTE-THRD</td>
<td>The thread is in Create Thread processing.</td>
</tr>
<tr>
<td>IN-DB2</td>
<td>The thread is executing in DB2. A more descriptive status could not be determined.</td>
</tr>
<tr>
<td>INDOUBT</td>
<td>The thread is in doubt.</td>
</tr>
<tr>
<td>IN-SIGNON</td>
<td>The thread is in signon processing. This status applies only to threads originating from CICS or IMS attachments.</td>
</tr>
<tr>
<td>IN-SQL-CALL</td>
<td>The thread is processing an SQL call.</td>
</tr>
</tbody>
</table>
IN-SQL-SORT
The thread is executing an SQL call and is doing the sort processing required to satisfy the call’s request.

IN-STOR-PROC
The thread is currently running in a stored procedure.

IN-TERM-THRD
The thread is in termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=D status.

IN-TRIGGER
The thread is currently running in a trigger.

IN-USER-FUNC
The thread is currently running a user-defined function.

NOT-IN-DB2
The thread is not currently executing in DB2.

SP/UDF-INACT
The thread is trying but not able to run in a stored procedure or user-defined function.

SWAPPED-OUT
The thread is not currently executing in DB2. The thread originating address space is swapped out.

WAIT-ARCHIVE
The thread is waiting for an archive log tape mount necessary during thread abort processing.

WAIT-ARCREAD
The thread is currently waiting for read of archive log from tape.

WAIT-ASYNCRD
The thread is currently waiting for completion of a read I/O that is being done under a thread other than this one (for example, sequential or List Prefetch).

WAIT-ASYNCWR
The thread is currently waiting for completion of Write I/O that is being done under a thread other than this one (for example, Deferred Writes).

WAIT-CONVLIM
The distributed thread is in a synchronous wait because the conversation limit has been reached for its designated logmode.

WAIT-CTHREAD
The thread is queued in Create Thread processing because DB2 reached the CTHREAD value. This status corresponds to DB2 DISPLAY THREAD=QD status.

WAIT-GLBLOCK
The thread is currently waiting for either:
• Inter-system communication within the data sharing group to determine if there is lock contention.
• A lock held by another subsystem in the data sharing group.

WAIT-LOCK
The thread is waiting for a lock.
WAIT-MSGSEND
The thread is waiting because of inter-system message sending contention.

WAIT-REMREQ
The database access thread is in a synchronous wait (waiting for a response or a request from the originating DB2 subsystem).

WAIT-REMSQL
The distributed allied thread is in a synchronous wait (waiting for a response from the remote DB2 subsystem being accessed).

WAIT-REUSE
The thread is not currently in use and is waiting to be reused. This status applies only to CICS and IMS threads.

WAIT-SERVICE
The thread is currently waiting for completion of a DB2 service. Types of DB2 services include: open/close of a dataset, DFHSM recall of a dataset, SYSLGRNG update or define/extend/delete of a dataset, rollback, and Commit phase 2 for read only threads.

WAIT-SP-STOP
The thread is queued waiting for a stopped stored procedure.

WAIT-TERM-TH
The thread is queued and waiting for thread termination as a result of allied task termination. This status corresponds to DB2 DISPLAY THREAD=QD status.

UTIL-STOP
The DB2 utility was started but not completed because of abnormal termination.

The following status are only available when class 2/3 traces are on:

WAIT-ACCEL
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CLAIMER
The thread is currently waiting for claimers to be released after acquiring drain lock.

WAIT-CL3LOCK
The thread is currently waiting for the completion of an identify call to the IRLM.

WAIT-COMMIT
The thread is waiting for the FORCE-AT-COMMIT event to complete.

WAIT-DRNLOCK
The thread is currently waiting to acquire drain lock.

WAIT LOB
The thread is currently waiting for TCP/IP to materialize a LOB.

WAIT-LOCKLAT
The thread is waiting for a LOCK-I/O-LATCH.

WAIT-LOCKPIP
The thread is currently waiting for a PIPE suspend.

WAIT-LOCKPQS
The thread is currently suspended for parallel task synchronization.
WAIT-LOGQSCE
The thread is currently suspended because of an ARCHIVE LOG MODE(QUIESCE) command.

WAIT-PGLATCH
The thread is currently waiting for page latch.

WAIT-SP-SCHD
The thread is waiting for a TCB to become available in the stored procedures address space to schedule a stored procedure.

WAIT-SWITCH
The thread is currently waiting for the completion of a synchronous execution switch.

WAIT-SYNC-IO
The thread is currently waiting for completion of a synchronous Read I/O or Write I/O.

Note: This status can indicate that a DB2 resource is not large enough. You can use the OMEGAMON XE for DB2 PE resource manager or object analysis displays to further isolate the problem.

Thread Stored Procedure Name The name of the stored procedure that a thread invokes. It is an alphanumeric text string, with a maximum of 18 characters; for example, SPCALC_TAX.

Thread Token The thread token uniquely identifies a specific thread.

Data Sharing Thread Detail Attributes The type of thread.

It can be:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BATCH</td>
<td>Batch job</td>
</tr>
<tr>
<td>CICS</td>
<td>CICS attach</td>
</tr>
<tr>
<td>DLIBATCH</td>
<td>DL/I batch</td>
</tr>
<tr>
<td>Distributed</td>
<td>Distributed Database Access thread</td>
</tr>
<tr>
<td>IMS_BMP</td>
<td>IMS attach BMP</td>
</tr>
<tr>
<td>IMS_CTL</td>
<td>IMS control region</td>
</tr>
<tr>
<td>IMS_MPP</td>
<td>IMS attach MPP</td>
</tr>
<tr>
<td>IMS_TBMP</td>
<td>IMS transaction BMP</td>
</tr>
<tr>
<td>DistAllied</td>
<td>Distributed Allied thread</td>
</tr>
<tr>
<td>RRSAF</td>
<td>DB2 Resource Recovery Services attachment</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>System directed access</td>
</tr>
<tr>
<td>TSO</td>
<td>TSO foreground and background</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>Unrecognizable connection type</td>
</tr>
<tr>
<td>UTILITY</td>
<td>DB2 Utility</td>
</tr>
</tbody>
</table>

Thread Wait Time The total amount of thread wait time. Valid format is an integer in the range 09 - 999999999 seconds. Note: collection of thread time requires activation of Accounting Class 2 in the Monitored DB2 subsystem.
**Time Stamp** Represents the end of data collection or the end of an interval, and is the local time where the system is running.

The timestamp format for SCAN and STR functions is CYYMMDDHHMMSSmmm (as in 1180315064501000 for 03/15/18 06:45:01) where:

- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Data Sharing Thread Statistics Attributes**

Use Data Sharing Thread Statistics attributes to create situations that determine the usage of parallel threads.

**Asynchronous Page Reads** The number of asynchronous page reads for prefetch. Valid value is an integer in the range 0 - 2147483647.

**Correlation ID** The correlation between an application and the connection to a DB2 system. It is an alphanumeric text string, with a maximum of 4 characters; for example D412.

**Data Sharing Group** The name of a data sharing group. It is an alphanumeric text string, with a maximum of 8 characters; for example, TDDB241G.

**DB2 ID** The name of a DB2 subsystem.

**Dynamic Prefetch** The number of dynamic prefetch requests. Valid value is an integer in the range 0 - 2147483647.

**Get Page Requests** The number of thread getpage requests. This includes conditional, unconditional, successful, and unsuccessful requests. Valid value is an integer in the range 0 - 2147483647.

**IDNAME** An internal attribute used for navigation, it contains either the Data Sharing Group Name or the DB2ID.

**Immediate Write I/O** The number of synchronous write I/O requests that DB2 issues on behalf of a thread. Valid value is an integer in the range 0 - 2147483647.

**List Prefetch** The number of list prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

**MVS System** The MVS System Management Facility (SMF) ID. It is an alphanumeric text string with a maximum of 4 characters; for example SP11.

**Number of SETW** The number of set write requests to write a page out to DASD. Valid value is an integer in the range 0 - 2147483647.
Originating System ID The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Plan Name The name of an application plan that DB2 produces during the bind process and uses for processing SQL statements during execution. It is an alphanumeric text string, with a maximum of 8 characters. For example, PLANLCK2 is the name of an application plan. *SYSTEM* indicates DB2 subsystem-generated threads that own or are waiting on a lock.

Sequential Prefetch The number of sequential prefetch requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Synchronous Read I/O The number of synchronous read I/O requests that a thread issues. Valid value is an integer in the range 0 - 2147483647.

Time Stamp Represents the end of data collection or the end of an interval, and is the local time where the system is running.

Valid format is MM-DD-YY HH:MM:SS, where:

- M = Month
- D = Day
- Y = Year
- H = Hour
- M = Minute
- S = Second

For example, 07-16-18 14:58:29 indicates that data collection ended on July 16th, 2018, at 14:58:29 PM.

DB2 Thread Exceptions Indicates the type of parallel thread.

Valid values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Not a parallel thread</td>
</tr>
<tr>
<td>Parent</td>
<td>Parallel thread is a parent</td>
</tr>
<tr>
<td>Child</td>
<td>Parallel thread is a child</td>
</tr>
<tr>
<td>Autonomous SP</td>
<td>Originating thread who invoked autonomous stored procedures</td>
</tr>
</tbody>
</table>

Unsuccessful Get Page Operation The number of conditional getpage requests that failed. Valid value is an integer in the range 0 - 2147483647.

DB2 Buffer Pool Attributes

Use these attributes to get information about DB2 buffer pools.

Assisting Parallel Seq The assisting parallel sequential threshold. Valid values are 1 to 100 (Field name: QDBPXSQT).

Buffer Pool ID Buffer Pool Name (Field name: QDPNM).

Data Sharing Group The data sharing group name (Field name: GROUP).
**DB2 Subsystem** The DB2 subsystem ID (Field name: DB2ID).

**DB2 Version** The DB2 version (Field name: DB2VER).

**Vert Deferred Write Thresh** The vert deferred write threshold of the buffer pool (Field name: QDBPVDQT). The value is between X’00’ and X’5A’.

**Deferred Write Thresh** The deferred write threshold of the buffer pool (Field name: QDBPVDQT). The value is between X’00’ and X’5A’.

**DSG Member Name** The Data Sharing Group (DSG) member name (Field name: MEMBER).

**Frame Size** The framesize attribute: ‘4K’, ‘1M’, or ‘2G’ (Field name: QDBPFRAM).

**Interval Start** The start time of this interval (Field name: TIMESTAMP).

**MVS System ID** The MVS identifier (Field name: MVSID).

**Originating System** The managed system name of the agent (Field name: ORIGINNODE). It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**PGSTEAL Attribute** PGSTEAL attribute (Field name: QDBPPGST).
- ’I’ means the buffers are managed using the least recently used (lru) algorithm.
- ’F’ means the buffers are managed using the first in first out (FIFO) algorithm.
- ’N’ means that no page stealing occurs. Data that is brought in stays resident.

**Simulated BP size** Simulated buffer pool size (Field name: QDBPSPSZ) A sequential prefetch request does not result in read I/O if the requested pages are found in the buffer pool.

**SimPool Seq threshold** The simulated buffer pool sequential threshold (Field name: QDBPSPST).

**Virtual Buffer Pool Size** The size of the virtual buffer pool (Field name: QDBPVPSZ).

**VP Sequential Thresh** The virtual pool sequential steal threshold of the buffer pool (Field name: QDBPVPSH). This value is between X’00’ and X’64’.

**VP Parallel Sequential Thresh** The parallel sequential threshold. Valid values are 1 to 100 (Field name: QDBPPSQT). This value is between X’00’ and X’64’.

**VP Write Threshold** The pool vertical write threshold, in number of buffers. Valid values are 0 to 9999 (Field name: QDBPVDQB). This field is used to determine the threshold only if VBVDPVDQT is zero and QDBPVDQB is non-zero.

**VPSIZEMIN Attribute** VPSIZEMIN attribute (Field name: QBDPVPMI).

**VPSIZEMAX Attribute** VPSIZEMAX attribute (Field name: QBDPVPMA).

**DB2 Buffer Pool Statistics Attributes**

Use these attributes to create situations that determine the usage of DB2 buffer pools.
Async Page Dyn Prefetch The number of asynchronous page reads because of dynamic prefetch (Field name: QBSTDPP).

Async Page Read List Prefetch The number of asynchronous page reads because of list prefetch (Field name: QBSTLPP).

Async Page Read Dyn Prefetch The number of asynchronous page read I/O operations because of dynamic prefetch (Field name: QBSTDIO).

Async Read List Prefetch The number of asynchronous read I/O operations because of list prefetch (Field name: QBSTLIO).

Sync Read NonSeq Overflow The number of synchronous read I/O operations for non-sequential getpage requests that used buffers in the overflow area. (Field name: QBSTASYN).

Sync Read Seq Overflow The number of synchronous read I/O operations for sequential getpage requests that used buffers in the overflow area. (Field name: QBSTASSE).

Async Reads Seq Prefetch The number of asynchronous read I/Os caused by the normal sequential prefetch (both applications and utilities) (Field name: QBSTPIO). This number represents the number of I/O operations, not the number of pages read. See QBSTSPP for the number of pages read. This counter applies to only to work file prefetch.

Async Write I/O The number of asynchronous write I/O operations to disk (Field name: QBSTWIO).

Buffer Pool ID This field identifies which buffer pool the information in this section refers to (Field name: QBSTPID).

- '0' through '49' are identifiers for 4kb buffer pools
- '100' through '109' are identifiers for 8kb buffer pools
- '120' through '129' are identifiers for 16kb buffer pools
- '80' through '89' are identifiers for 32kb buffer pools

Buffers Allocated The number of buffers allocated for a virtual buffer pool (Field name: QBSTVPL).

Castout Operations The number of castout I/O operations (Field name: QBSTCIO).

Current Active Buffers The number of current active (nonstealable) buffers. (Field name: QBSTCBA). Instantaneous sample of the number of buffers in the buffer pool that were active (in the nonstealable status) at the time of the request to transfer the buffer manager statistical data to the SMF record being produced. This field provides a snapshot value at statistics collection time, which means it only shows a problem if it happens at this time. The buffer pool might be too small if this is greater than 50% of the buffer pool. This field is not accumulated.

Currently Alloc Workfiles Exceeded The number of times the currently allocated work files exceeded the maximum buffer pool resources allocated to sequential processing (Field name: QBSTMAX). Usually, no more work files are created after this field is implemented. This field indicates that a sort is being done, and that the sort is limited in how many work files it can use. In general, sorts are more efficient with additional work files, but there are DB2 limits on the number of...
work files a transaction can have. Sometimes a transaction finds at run time that it cannot use as many work files as it had planned. You can try increasing the size of the buffer pool or altering the transaction so it requires fewer concurrent work files.

**Datasets Opened** The number of datasets physically opened (Field name: QBSTDSO). This value is cumulative since the start of this statistics interval. See the "Performance, monitoring and tuning" section of Administration Guide for information about physical and logical open and close.

**Data Sharing Group** The data sharing group name (Field name: GROUP).

**DB2 Subsystem** The DB2 subsystem ID (Field name: DB2ID).

**DB2 Version** The DB2 version (Field name: DB2VER).

**Defer Write Thresh Reached** The number of times the deferred write threshold was reached (Field name: QBSTDWT). When the deferred write threshold is reached, the data sets with the oldest updated pages are written asynchronously. DB2 continues writing pages until the ratio is under the threshold. Before this threshold is reached, pages are written only if the number of pages queued per data set reaches a certain percent of the buffer pool size. For details, see "Buffer pool thresholds" in the "Performance, monitoring and tuning" section in Administration Guide.

**Defer Write Thresh Reached** The number of times the vertical deferred write threshold was reached (Field name: QBSTDWT). When the number of updated pages for a given data set exceeds the vertical deferred write threshold, deferred writes are initiated for that data set.

**DM Buffer Crit Thresh Reached** The number of times the data manager buffer critical threshold (DMTH) was reached (Field name: QBSTDMC). When the data manager threshold is reached, getpage requests and releases apply to rows instead of to pages. That is, when more than one row is retrieved or updated in a page, more than one getpage request and release is performed on that page. Avoid reaching this threshold, because it has a significant effect on CPU usage. This field should be zero. For details, see "Buffer pool thresholds" in the "Performance, monitoring, and tuning" section of Administration Guide.

**DSG Member Name** The Data Sharing Group (DSG) member name (Field name: MEMBER).

**Dynamic Prefetch Requests** The number of dynamic prefetch requests (Field name: QBSTDPF). This is the process that is triggered because of sequential detection. This field also counts prefetches for segmented table spaces. For information about when sequential detection is used, see the "Performance, monitoring and tuning" section of Administration Guide.

**Expand Fail SOS** The number of virtual buffer pool expansion failures caused by a shortage of virtual storage (Field name: QBSTXFV). Ideally, this value should be zero. If it is not, check the virtual storage allocation of the database address space (DS1DBM1 for areas that can be reduced). For example, you can reduce the size of other buffer pools.
Expansions Contract Alter The number of successful virtual buffer pool expansions or contractions because of the alter buffer pool command (Field name: QBSTVP).

Get Page The number of GETPAGE requests (both successful and unsuccessful) and conditional requests that are successful (Field name: QBSTGET).

Getpage Fail VPOOL Full The number of times that a usable buffer could not be located in the virtual buffer pool because the virtual buffer pool was full. ideally, this value should be zero (Field name: QBSTXFL). If it is not, use the -alter buffer pool command to increase the virtual buffer pool size (vpsize).

Getpage Per Sync Read Random The number of random Getpage requests per random synchronous read I/O request (Field name: SBRGPRIO). Background and tuning information. This ration is a good indicator of read efficiency in a transaction environment. The higher the number, the better.

Getpage Sequential Access The accumulated wait time for a synchronous execution unit switch (Field name: QBSTSGT).

Hit Ratio The buffer hit ratio (Field name: BUHITRA).

HWM Buffers on SLRU The maximum number of buffers on the sequential LRU chain. (Field name: QBSTSMAX). This value is the highest value in the statistics interval.

Immediate Writes The number of immediate writes for a data set (Field name: QBSTIMW). Immediate writes occur when:
- Any synchronous write is triggered
- An immediate write threshold is reached

List Prefetch Reads The number of list prefetch requests (Field name: QBSTLPF). List prefetch allows DB2 to access data pages efficiently even when the needed data pages are not contiguous. List prefetch can be used with single index access and is always used with multiple index access. It is always used to access data from the inner table during a hybrid join. Data pages are read in quantities equal to the sequential prefetch quantity (see QBSTSEQ), which depends on buffer pool size and is usually 32 pages. During bind, DB2 does not use list prefetch if the estimated number of RIDs to be processed would take more than 50% of the RID pool. During execution time, list prefetch processing terminates if DB2 detects that more than 25% of the rows in the table must be accessed. If list prefetch is terminated, IFCID 125 indicates this.

LPL inserts The number of times that one or more pages were added to the logical page list (LPL) (Field name: QBSTLPL).

LWM Buffers on SLRU The minimum number of buffers on the sequential LRU chain. (Field name: QBSTSMIN). This value is the lowest value in the statistics interval.

Max Workfiles Used Merge The maximum number of work files that were concurrently used during merge processing within this statistics period. (Field name: QBSTWFM). Ideally, each work file needs 16 buffers to allow DB2 to perform sequential prefetch for work files.
Migrated Datasets  The number of times migrated data sets were encountered (Field name: QBSTMIG).

MVS System ID  The MVS identifier (Field name: MVSID).

Name  The buffer pool ID (Field name: QBSTPIDC).

No Sort Merge Buffer Space  The number of times that a sort/merge was not performed efficiently because of a shortage of buffer space (Field name: QBSTWFF). This counter is incremented for each sort/merge when the maximum number of work files allowed is less than the number of work files requested. The maximum number of work files allowed is computed as:

\[
\text{buffers consumed} = 2 \times (\text{work files already allocated}) \\
\text{buffers available} = (\text{sequential steal threshold} \times \text{buffer pool size} - \text{buffers consumed}) \\
\text{max work files allowed} = \frac{\text{buffers available}}{(2 \times 8)}
\]

Originating System  The managed system name of the agent (Field name: ORIGINNODE). It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Overflow Random Getpages  The number of non-sequential getpage requests that used buffers in the overflow area (Field name: QBSTAGET).

Overflow Seq Getpages  The number of sequential getpage requests that used buffers in the overflow area (Field name: QBSTASGE).

Page-Ins Read I/O  The number of Page-Ins required for read I/O (Field name: QBSTRPI).

Page-Ins Write I/O  The number of Page-Ins required for write I/O (Field name: QBSTWPI).

Pages Destruct Read Required  The number of pages for which a destructive read was requested (Field name: QBSTWDRP).

Pages Removed DS deferred Write Destruct Read  The number of pages removed from the data set deferred write queue for destructive read requests (Field name: QBSTWBVQ).

Pages Read Seq Prefetch  The number of pages read because of normal sequential prefetch (Field name: QBSTFPP). A sequential prefetch request does not result in read I/O if the requested pages are found in the buffer pool.

Pages In-Use  Buffer pool virtual buffer pool pages in use percent (Field name: SBRBUTP).

Pages Written for Castout I/O  The number of pages written for castout I/O operations (Field name: QBSTPCO).

Pages Written System  The number of pages written for system pages (Field name: QBSTPWS). This field contains the number of pages in the buffer pool written to disk. If the ratio of this field to the number of page updates (QBSTSWUS) is close to zero, efficiency is high. For example, if there are 10 page updates, all against the same page, then the ratio is 1:10 or 0.1. If all 10 updates are against 10 distinct pages, then the ratio is 10:10 or 1.0. Some factors that affect this ratio are:

- Buffer pool size
• Concurrent buffer pool usage by multiple transactions
• Real (and expanded) storage availability
• Database page updates of the same page by transactions.

**Parallel Query Requests** The total number of requests made for processing queries in parallel in this buffer pool. (Field name: QBSTPQO). This counter is applicable only for non-work file page sets and when queries are processing in parallel in DB2.

**Parallel Getpage Unavailable** The number of times a page requested for a query processed in parallel was unavailable because the page was not found in the buffer pool. (Field name: QBSTNGT). The agent does not wait. Instead, control returns to the agent and asynchronous prefetch I/O is triggered. If the value is close to zero, most pages are already prefetched into the buffer pool and wait time for synchronous I/O is small. This counter can be high if, for example, there is a cluster index scan and the data is not truly clustered by the index key, so the data pages are not accessed in their true order. Hence, the cluster ratio is not valid. Use the runstats utility to update it. This number is also used to determine how many sequential prefetches of one page were scheduled.

**Prefetch I/O Concurr HWM** The highest number of concurrent prefetch I/O streams that were allocated for supporting queries processed in parallel in this buffer pool. (Field name: QBSTNIX). This counter reflects prefetch activities for non-work file page sets. This counter is applicable only when queries are processing in parallel in DB2.

**Prefetch I/O Reduced Shortage** The total number of requested prefetch I/O streams that were denied because of a storage shortage in the buffer pool (Field name: QBSTJIS). For example, if 100 prefetch I/O streams are requested and only 80 are granted, then 20 is added to this counter. If this value is nonzero, you might want to consider increasing the size of the buffer pool. The ratio of QBSTJIS and QBSTPDF gives the average degree of parallel query processing that was reduced because of insufficient buffer pool space. QBSTXIS gives the highest degree of parallel query processing that was reduced for one or more queries processed in parallel. This counter is applicable only for non-work file page sets and when queries are processing in parallel in DB2.

**Prefetch Quantity 1/2** The total number of occurrences when the prefetch quantity is reduced from normal to one-half of normal. (Field name: QBSTPL1). The normal size is dependent on the size of the buffer pool. This counter indicates when DB2 had to reduce sequential prefetch quantity to continue to execute concurrently with parallel query processing in the system. If this field contains a small number, it might be tolerable. This counter is applicable only when queries are processing in parallel in DB2.

**Prefetch Quantity 1/4** The total number of occurrences when the prefetch quantity is reduced from one-half to one-quarter of normal. (Field name: QBSTPL2). The normal size is dependent on the size of the buffer pool. When this field contains a nonzero value, it is a more serious situation than when QBSTPL1 is nonzero. The query response for queries processed in parallel can be significantly worse when this field is nonzero. This field is applicable only when queries are processing in parallel in DB2.
**Random Getpage Hit SLRU** The number of times that a non-sequential getpage operation touched a buffer that is on the sequential LRU chain (Field name: QBSTSRHS).

**Random Hit Ratio** The percentage of random Getpage operations that were satisfied by a page already in a buffer pool (Field name: SBUFFRDM). If this value is low, it indicates that page residency in the buffer pool is too low, therefore the buffer pool may be too small.

**Random Failed Cond Request** Getpage requests - Random access - Failed cond. request (Field name: SBSTNRG).

**Random Getpages** The number of random Getpage requests (Field name: SDGETRAN).

**Read I/O Sequential Access** The number of synchronous buffer reads performed for statement (Field name: QW0316NB).

**Reduced Parallel Queries** The total number of times during this statistics interval that DB2 could not allocate the requested number of buffer pages to allow a parallel group to run to the planned degree (Field name: QBSTPQF). This is caused by a storage shortage in the buffer pool. If this value is significant, increase the size of the buffer pool. This counter is applicable only for non-work file page sets and when queries are processing in parallel in DB2.

**Recall Timeouts** The number of recall timeouts (Field name: QBSTRTO).

**Seq Failed Cond Request** The number of conditional sequential getpage requests that failed because the page was not in the buffer pool. (Field name: QBSTNSG).

**Seq Hit Ratio** The percentage of sequential Getpage operations that were satisfied by a page already in a buffer pool (Field name: SBUFFSEQ).

**Seq Prefetch Disabled Buffers** The number of times sequential prefetch was disabled because buffers were not available (Field name: QBSTSPD). In other words, this is the number of times the sequential prefetch threshold is reached. See the "Performance, monitoring and tuning" section of Administration Guide for more information on buffer pool thresholds. Ideally, this value should be zero. If this value is high, the buffer pool size or a sequential threshold might be too small.

**Seq Prefetch Disabled Read Engine** The number of times sequential prefetch was disabled because of an unavailable read engine (Field name: QBSTTREE). The value in this field should be close to zero.

**Seq Prefetch Not Scheduled Quantity** The number of times sequential prefetch was not scheduled because the prefetch quantity was zero. (Field name: QBSTWKPD). Prefetch checks the prefetch quantity. Normally the quantity should be one to eight pages. When the quantity is zero, the value in this field is incremented. A high number in this field implies that the buffer pool is too small.

**Sequential Prefetch** The number of sequential prefetch requests (Field name: QBSTSEQ). This counter is incremented for each prefetch request. Each request might result in an I/O read. If it results in an I/O read, up to 32 pages can be read for SQL and up to 64 pages for utilities. A request does not result in an i/o if all pages to be prefetched are already in the buffer pool. Sequential detection is not included in QBSTSEQ and is separately recorded in QBSTDPP.
Sort Merges  The total number of sort/merges for DB2 sort activities (Field name: QBSTWFR). This counter reflects how many sort/merges were requested for db2 to determine the number of work files permitted to support each sort/merge.

Sync reads Random access  The number of random synchronous read I/O requests (Field name: SDSTRAN).

Sync Read I/O  Number of synchronous read I/O operations performed for both applications and utilities (Field name: QBSTRIO).

Times SLRU EQ VPSEQT  The number of times that the length of the sequential LRU chain reached the sequential steal threshold (VPSEQT) (Field name: QBSTHST). This value is the highest value in the statistics interval.

Update Intents  The number of times update intents were requested against pages in the buffer pool (Field name: QBSTSWS).

Workfiles Sort Merge  The total number of work files that were requested for all sort/merge processing (Field name: QBSTWFT). This counter and QBSTWFR can be used to determine the average number of work files (runs) requested on a single sort/merge. For DB2 to perform efficient prefetch for work files, each work file should have at least 16 dedicated buffers. Work files used during sort phase processing or other non-sort-related processing are not included in this statistics counter.

Workfile Reject Sort Merge  The total number of work files that were rejected during sort/merge because of insufficient buffer resources (Field name: QBSTWFD). This counter and QBSTWFF can be used to determine the average number of work files that cannot be honored at each sort/merge because of insufficient buffer pool space. To improve sort performance, increase the buffer pool size.

DB2 CICS Exceptions Attributes
Use the DB2 CICS Exceptions attributes to create situations to monitor thread activity originating from connected CICS subsystems.

CICS ID  The job name of the CICS region connected to this DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

CICS Release  The enumerated value for the CICS release of the CICS region connected to this DB2 system.

Originating System ID  The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

Pool Thread Maximum  The maximum number of pool threads that are allowed.

Pool Thread Utilization  The utilization of pool threads based on the current pool thread in use count divided by the maximum allowed pool threads.

Pool Thread Waits  The count of pool threads that are waiting because the maximum has been reached.

Pool Threads In Use  The count of pool threads that are currently active.
**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is `CYMMDDHHMMSSmmm` (as in `1180315064501000` for 03/15/18 06:45:01) where:

- C = Century (0 for 20th, 1 for 21st)
- Y = Year
- M = Month
- D = Day
- H = Hour
- M = Minute
- S = Second
- m = Millisecond

**Total Thread Utilization** The utilization of threads based on the current total threads in use divided by the maximum allowed threads.

**Total Threads In Use** The count of active threads for this CICS connection (including both entry and pool threads).

**Total Threads Maximum** The maximum number of threads that can be used concurrently for this CICS connection (entry plus pool threads).

**DB2 CICS Threads Attributes**

Use the DB2 CICS Threads attributes to create situations to monitor DB2 thread activity originating from connected CICS subsystems.

**CICS ID** The job name of the CICS region connected to this DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**CICS Release** The enumerated value for the CICS release of the CICS region connected to this DB2 system.

**Entry Thread Waiting** The count of threads waiting because the maximum entry thread limit has been reached.

**Entry Threads In Use** The count of active entry threads for this plan and transaction within the CICS region.

**Entry Threads Utilization** The percentage of total entry threads allowed for this plan.

**Maximum Entries** The cap on the number of entry threads allowed for this plan.

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, `DB91:SYS1:DB2`.

**Plan Name** The name of the DB2 plan being executed by this CICS region. It is an alphanumeric text string, with a maximum length of eight characters.

**Pool Thread Overflow** The number of threads for this plan and transaction that is being executed on a thread from the global pool.
**Time** The date and time, as set on the monitored system, indicating the instance when the agent collects information.

The timestamp format for SCAN and STR functions is `CYYMMDDHHMSSmmm` (as in `118031506451000` for `03/15/18 06:45:01`) where:
- **C** = Century (0 for 20th, 1 for 21st)
- **Y** = Year
- **M** = Month
- **D** = Day
- **H** = Hour
- **M** = Minute
- **S** = Second
- **m** = Millisecond

**Transaction ID** The ID for the transaction currently being executed for the plan. It is an alphanumeric text string, with a maximum length of four characters.

**DB2 Connect Server Attributes**
Use DB2 Connect Server attributes to create situations that monitor all active and inactive gateways.

**Agents Assigned from Pool** The number of agents assigned by an agent pool.

**Agents Created because of Empty Pool** The number of agents created because the agent pool was empty.

**Agents Registered** The number of agents registered in the database manager instance that is being monitored.

You can use this counter in conjunction with the **Agents - Agents waiting for token** counter to determine the percentage of agents waiting for a token so they can perform a transaction in the database manager. If the percentage is high, you can improve the concurrency in the database manager by increasing the MAXCAGENTS (maximum number of concurrent agents) database manager configuration parameter. This number is always greater than, or equal to, the number of local databases with current connects.

**Agents Waiting for Token** The number of agents waiting for a token so they can perform a transaction in the database manager.

You can use this counter in conjunction with the **Agents - Agents registered** counter to determine the percentage of "sleeping" agents. If the percentage is high, you can improve the concurrency in the database manager by increasing the MAXCAGENTS (maximum number of concurrent agents) database manager configuration parameter.

**Attempted Connections for DB2 Connect** The total number of current connections initiated from remote clients to the instance of the database manager that is being monitored. It also shows the level of activity between this instance and other instances of the database manager.

**Committed Private Memory** The amount of private memory that the instance of the database manager has committed at the time of the snapshot.
You can use this counter to set the MIN_PRIV_MEM (minimum committed private memory) database manager configuration parameter to ensure you have enough private memory available. This counter is only applicable to platforms containing an agent pool, such as OS/2.

**Connection Switches** The number of the times that an agent from the agent pool was primed with a connection and was stolen for use with a different DRDA database.

**Connection Waiting for Client to Send Request** The current number of connections to the host databases that are handled by the DB2 Connect gateway and are waiting for the client to send a request.

**Connection Waiting for Host Reply** The current number of connections to the host databases that are handled by the DB2 Connect gateway and are waiting for a reply from the host.

**Current Connections** The number of applications that are currently connected to the database.

You can use this counter to understand the level of activity within a database and the amount of system resource being used. It can help you adjust the setting of the MAXAPPLS (maximum number of applications) database configuration parameter and the MAXAGENTS (maximum number of agents) database manager configuration parameter. If its value is always the same as MAXAPPLS, you may want to increase the value of MAXAPPLS. If it is always less than MAXAPPLS, you may want to increase the value of MAXAGENTS.

**DB2 ID** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**Idle Agents** The number of agents in the agent pool that are currently unassigned to an application and are, therefore, idle.

**IP Address** The current IP address.

**Maximum Agent Overflows** The number of times a request to create a new agent was received when the MAXAGENTS (maximum number of agents) database manager configuration parameter had already been reached.

**Maximum Agents Registered** The maximum number of agents that the database manager has registered at the same time since it was started.

You can use this counter to evaluate your setting of the MAXAGENTS (maximum number of agents) database manager configuration parameter. The number of agents registered at the time the snapshot was taken is recorded in the **Agents - Agents Registered** counter.

**Maximum Agents Waiting** The maximum number of agents that have been waiting for a token at the same time since the database manager was started.

You can use this counter to evaluate your setting of the MAXCAGENTS (maximum number of concurrent agents) database manager configuration parameter.
parameter. If MAXCAGENTS is set to its default value, which is -1, no agents should wait for a token and the value for this counter should be zero.

The number of agents waiting for a token at the time the snapshot was taken is recorded in the Agents Waiting for Token counter.

**Maximum Coordinating Agents** The maximum number of coordinating agents working at one time.

**MVS ID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.

This information can be useful if you are saving your monitor output in a file or database for later analysis and you need to differentiate the data from different database server nodes. This node name is determined based on the NNAME configuration parameter.

**Node Number** The number assigned to the node in the file with filename db2nodes and file type cfg. (db2nodes.cfg).

**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Remote Connections** The current number of connections initiated from remote clients to the instance of the database manager that is being monitored.

**Remote Connections Executing in the DBM** The number of remote applications that are currently connected to a database and are currently processing a unit of work within the database manager instance being monitored.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken. If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Server Product Version ID** The product and version that is running on the server in the form pppvvrrrm.

It provides the following information:

- **ppp** stands for SQL
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level
**Server Status** Shows whether the server is active or inactive.

**Server Version** The version of the server returning the information.

**Sort Heap Allocated** The total number of allocated pages of sort heap space for all sorts at the level chosen and at the time the snapshot was taken.

The amount of memory allocated for each sort can be part of or the entire sort heap size available. Sort heap size is the amount of memory available for each sort as defined in the SORTHEAP database configuration parameter. It is possible for a single application to have concurrent sorts active. For example, in some cases a SELECT statement with a subquery can cause concurrent sorts. Information can be collected at two levels:

- At the database manager level, it represents the sum of sort heap space allocated for all sorts in all active databases in the database manager.
- At the database level, it represents the sum of the sort heap space allocated for all sorts in a database.

**Stolen Agents** The number of times that agents are stolen from an application. Agents are stolen when an idle agent associated with an application is reassigned to work on a different application.

**Time in DB2 Connect** For a DCS statement, this counter shows the elapsed time for processing an SQL request at a host database server. This value is reported by this server. In contrast to the Times for sample SQL statement - Total statement time counter, this counter does not include the network elapsed time between DB2 Connect and the host database server.

**Time in Network Connection** The total time, in seconds and microseconds, at the DB2 Connect gateway to process an application request (since the connection was established), or to process a single statement.

**Time on DB2 Host** The total time, in seconds and microseconds, that was spent executing a particular statement in the SQL cache.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced from Greenwich Mean Time (GMT).

**Total Inactive DRDA agents** The number of connections made by a subagent to the database at the node.

**Total Statement Time** For a DCS statement, this counter shows the elapsed time between the time the statement was sent from the DB2 Connect gateway to the host for processing and the time at which the result was received from the host.

For a DCS database or application, this counter shows the sum of the elapsed times for all the statements that were executed for a particular application or database.

This counter shows the sum of the values for the Times for sample SQL statement - Time in DB2 Connect and Times for sample SQL statement - Time in network connection counters.
DB2 Connect Server Package Attributes

Use DB2 Connect Server Package attributes to create situations that will alert you when the package network time is too high.

**Average Network Time** The result of the value for the Network time counter divided by the number of SQL chains being transferred.

**Average Request Size Outbound** The number of bytes sent by the DB2 Connect gateway to the host database, excluding communication protocol overhead, divided by the number of SQL chains being transferred.

**Average Response Size Outbound** The number of bytes received by the DB2 Connect gateway from the host database, excluding communication protocol overhead, divided by the number of SQL chains being transferred.

**DB2 Subsystem Identifier** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**IP Address** The current IP address.

**MVSID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.

This information can be useful if you are saving your monitor output in a file or database for later analysis and you need to differentiate the data from different database server nodes. This node name is determined based on the NNAME configuration parameter.

**Node Number** The number assigned to the node in the file with filename db2nodes and file type cfg. (db2nodes.cfg).

**Network Time** The difference between the value for the Times for sample SQL statement - Total statement time counter and the value of the Times for sample SQL statement - Time on DB2 host counter. Both counters are on the Performance page.

**Originating System ID** The managed system name of the agent. It is alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Parent Database Name** The name of the remote database to which the remote application is connected.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken.

If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information...
can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Server Product Version ID** The product and version that is running on the server in the form pppvvrrrm.

In this case, pppvvrrrm represents:
- **ppp** stands for SQL
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level

**Server Status** Shows whether the server is active or inactive.

**Server Version** The version of the server returning the information.

**Statement Group** The number of statements with outbound bytes.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced from Greenwich Mean Time (GMT).

**DB2 Connect Server Tasklist Attributes**
Use DB2 Connect Server Tasklist attributes to create situations that identify any process using too much CPU time or memory.

**CPU Usage Per Process** The percentage of time that a process used the CPU since the last update.

**DB2 ID** The DB2 subsystem ID.

**Gateway Process ID** The numerical ID that uniquely distinguishes a process while it runs.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**IP Address** The current IP address.

**Memory Usage by Process** The current working set of a process, in kilobytes. The current working set is the number of pages currently resident in memory.

**MVSID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.
This information can be useful if you are saving your monitor output in a file or
database for later analysis and you need to differentiate the data from different
database server nodes. This node name is determined based on the NNAME
configuration parameter.

**Node Number** The number assigned to the node in the file with filename
db2nodes and file type cfg. (db2nodes.cfg).

**Originating System ID** The managed system name of the agent. It is an
alphanumeric text string, with a maximum of 32 characters; for example,
DB91:SYS1:DB2.

**Overall Process Time** The sum of the times contained in the System Process Time
and User Process Time columns.

**Process Name** The name of the process.

**Process Owner Name** The session ID that owns the process.

**Server Instance Name** The name of the database manager instance for which the
snapshot was taken.

If a system contains more than one instance of the database manager, this name is
used to uniquely identify the instance for which the snapshot call was issued.
Along with configuration NNAME at monitoring (server) node, this information
can be useful if you are saving your monitor output in a file or database for later
analysis, and you need to differentiate the data from different instances of the
database manager.

**Server Product Version ID** The product and version that is running on the server
in the form pppvvrrrm.

In this case pppvvrrrm represents:
- *ppp* stands for SQL
- *vv* identifies a 2-digit version number (with high-order 0 in the case of a 1-digit
  version)
- *rr* identifies a 2-digit release number (with high-order 0 in the case of a 1-digit
  release)
- *m* identifies a 1-digit modification level

**Server Status** Shows whether the server is active or inactive.

**Server Version** The version of the server returning the information.

**System Process Time** The total system CPU time, in seconds and microseconds,
used by the database manager agent process, the unit of work, or the statement.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced
from Greenwich Mean Time (GMT).

**User Process Time** The total user CPU time, in seconds and microseconds, used by
the database manager agent process, the unit of work, or the statement.
**DB2 Connect Server at Thread Level Attributes**

Use the DB2 Connect Server at Thread Level attributes to create situations to monitor all connected gateways of a DB2 subsystem.

**Ace Address** The DB2 thread ACE address for internal use.

**Application ID** The ID that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database.

**Application Name** The name of the application running at the client as known to the database manager or DB2 Connect. Together with the Application ID counter, it can be used to relate data items with your application.

**Authorization ID** The authorization ID.

**Authid (Unicode)** The authorization ID.

**Corrid** The correlation ID.

**DB2 Connect Server at Thread Level Attributes** Identifies the connection of an application to a DB2 system.

It is an alphanumeric text string, with a maximum length of eight characters.

**DB2 ID** The DB2 subsystem ID.

**Gateway Snapshot Time** The date and time at which the database system monitor information was collected.

**Inbound Number of Bytes Received** The number of bytes received by the DB2 Connect gateway from the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

**Inbound Number of Bytes Sent** The number of bytes sent by the DB2 Connect gateway to the client, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

**IP Address** The current IP address.

**Most Recent Unit of Work Elapsed Time** The elapsed execution time of the most recently completed unit of work. It indicates time that it takes for units of work to complete.

**MVSID** The MVS system identifier.

**Name** The name in the database manager configuration file at the client node. It identifies the client node that is running the application.

**Node Name** The name of the node being monitored by the database system monitor. It identifies the database server node you are monitoring.

**Node Number** The number assigned to the node in the file with filename db2nodes and file type cfg (db2nodes.cfg).
**Originating System ID** The managed system name of the agent. It is an alphanumeric text string, with a maximum of 32 characters; for example, DB91:SYS1:DB2.

**Outbound Application ID** Is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway.

**Outbound Application ID (Internal)** Is generated when the application connects to the DRDA host database. It is used to connect the DB2 Connect gateway to the host, while the application ID is used to connect a client to the DB2 Connect gateway.

**Outbound Number of Bytes Received** The number of bytes received by the DB2 Connect gateway from the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

**Outbound Number of Bytes Sent** The number of bytes sent by the DB2 Connect gateway to the host, excluding communication protocol overhead, for example, TCP/IP or SNA headers.

**Plan** The plan name.

**Server Instance Name** The name of the database manager instance for which the snapshot was taken. If a system contains more than one instance of the database manager, this name is used to uniquely identify the instance for which the snapshot call was issued. Along with configuration NNAME at monitoring (server) node, this information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

**Server Product Version ID** The product and version that is running on the server in the form pppvrrm.

In this case, pppvrrm represents
- **ppp** stands for SQL
- **vv** identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)
- **rr** identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)
- **m** identifies a 1-digit modification level

**Server Version** The version of the server that is returning the information.

**Time Stamp** The start time of this interval.

**Time Zone Displacement** The number of hours that the local time zone is displaced from Greenwich Mean Time (GMT).

**Uniqueness Value** The instance number: When concatenated with the fully qualified network name, it uniquely identifies a distributed thread (DB2 field name: QWHSLUUU).

**Uniqueness Value 2** The DB2 thread uniqueness value. For internal use.
DB2 Connect Server at Thread Level Overview Attributes

Use the DB2 Connect Server at Thread Level attributes to create situations to monitor connected gateways of a DB2 subsystem.

Ace Address The DB2 thread ACE address for internal use.

Application Agent ID The system-wide unique ID for the application. On a single-partitioned database, this ID consists of a 16-bit counter. On a multi-partitioned database, it consists of the coordinating partition number concatenated with a 16-bit counter. In addition, it is the same on every partition where the application might make a secondary connection.

Application ID The ID that is generated when the application connects to the database at the database manager or when Distributed Database Connection Services (DDCS) receives a request to connect to a DRDA database.

It is known at both the client and the server, so you can use it to correlate the client and server parts of the application. For DDCS applications, you will also need to use the Outbound Application ID to correlate the client and server parts of the application. This ID is unique across the network. There are different formats for the application ID, which are dependent on the communication protocol between the client and the server machine on which the database manager, the DDCS, or both, are running. Each of the formats consists of three parts separated by periods.

</table>

**Application Idle Time** The number of seconds since an application issued any requests to the server. This includes applications that have not terminated a transaction, for example, not issued a commit or rollback. You can use this information to implement applications that force users that have been idle for a specified number of seconds.
