

IBM Workload Automation

Messages and Codes

Version 9 Release 3

IBM Workload Automation

Messages and Codes

Version 9 Release 3

Note

Before using this information and the product it supports, read the information in "Notices" on page 1869.

This edition applies to version 9, release 3, modification level 0 of IBM Workload Scheduler (program number 5698-WSH) and to all subsequent releases and modifications until otherwise indicated in new editions.

Part 1. IBM Workload Scheduler messages	1
--	----------

Chapter 1. IBM Workload Scheduler message format	3
Message number	3
Message text	4
Message help	4

Chapter 2. AWKALR - Allocation repository messages	7
---	----------

Chapter 3. AWKAUD - Audit service messages	9
---	----------

Chapter 4. AWKBIE - BigInsights plug-in messages	11
---	-----------

Chapter 5. AWKREA - Engine REST API messages	13
---	-----------

Chapter 6. AWKBIG - Job plug-in for IBM BigInsights messages	15
---	-----------

Chapter 7. AWKCAU - Centralized Agent Update messages	17
--	-----------

Chapter 8. AWKCDM - Change and configuration management database messages	19
--	-----------

Chapter 9. AWKCGE - Cognos Plug-in messages	21
--	-----------

Chapter 10. AWKCLI - Command line messages	27
---	-----------

Chapter 11. AWKDBE - Database Job Executor messages	35
--	-----------

Chapter 12. AWKDSE - InfoSphere DataStage Plug-in messages	39
---	-----------

Chapter 13. AWKDSJ - Distributed shadow job validation messages	43
--	-----------

Chapter 14. AWKEWL - Enterprise workload manager messages	45
--	-----------

Chapter 15. AWKEXE - Executable Job Executor messages	47
--	-----------

Chapter 16. AWKFTE - File transfer Job Executor messages	49
---	-----------

Chapter 17. AWKHFS - Job plug-in for Hadoop Distributed File System messages	53
---	-----------

Chapter 18. AWKHMR - Job plug-in for Hadoop Map Reduce messages	55
--	-----------

Chapter 19. AWKICA - Calendar messages	57
---	-----------

Chapter 20. AWKIIE - IBM iconic Job Executor messages	59
--	-----------

Chapter 21. AWKIPC - Informatica PowerCenter Plug-in messages	61
--	-----------

Chapter 22. AWKITM - ITM scanner messages	65
--	-----------

Chapter 23. AWKJBJ - JBJ JSR 352 Java Batch plug-in	67
--	-----------

Chapter 24. AWKJBN - Job definition base notify service messages	69
---	-----------

Chapter 25. AWKJCL - Command line messages	71
---	-----------

Chapter 26. AWKJDB - Common objects messages	73
---	-----------

Chapter 27. AWKJDD - Job definition service messages	79
---	-----------

Chapter 28. AWKJDE - Job dispatcher messages	81	Chapter 45. AWKRSE - Resource advisor agent cache messages.	157
Chapter 29. AWKJEJ - WebSphere Java 2 Enterprise Edition job executor for CAS messages	103	Chapter 46. AWKRST - RESTful Web Services messages	159
Chapter 30. AWKJJE - Java job executor messages	107	Chapter 47. AWKSA - Tivoli Workload Scheduler Bridge messages	163
Chapter 31. AWKJMQ - Job plug-in for IBM WebSphere MQ messages	109	Chapter 48. AWKSAF - Job plug-in for Salesforce messages	165
Chapter 32. AWKJNT - Job definition notify service messages.	113	Chapter 49. AWKSBO - Job plug-in for SAP BusinessObjects BI messages.	167
Chapter 33. AWKJSV - Job definition service messages	115	Chapter 50. AWKSED - Job repository data access object messages	171
Chapter 34. AWKMSQ - MsSQL plug-in messages	117	Chapter 51. AWKSPS - SPSS statistics subset messages.	173
Chapter 35. AWKNDE - Netezza database messages.	119	Chapter 52. AWKSRI - Job brokering definition console installation messages	175
Chapter 36. AWKOEB - Job plug-in for Oracle messages.	121	Chapter 53. AWKSTE - Job plug-in for IBM Sterling Connect:Direct messages	191
Chapter 37. AWKOOZ - Job plug-in for Apache Oozie	125	Chapter 54. AWKSUL - Utility messages	195
Chapter 38. AWKPIC - SAP Process Integrator messages	129	Chapter 55. AWKTPM - Tivoli Provisioning Manager messages	199
Chapter 39. AWKPRE - Provisioning plug-in messages	131	Chapter 56. AWK TSA - Tivoli Workload Scheduler Bridge messages	201
Chapter 40. AWKQTE - Job plug-in for MQTT messages	135	Chapter 57. AWKTSM - Tivoli Storage Manager messages	205
Chapter 41. AWKRAA - Resource advisor agent	137	Chapter 58. AWKWSE - Web services job executor messages	207
Chapter 42. AWKRAE - Resource Advisor EJB messages	139	Chapter 59. AWKWUJ messages	209
Chapter 43. AWKRCE - Remote command plug-in messages	147	Chapter 60. AWKWUR messages	215
Chapter 44. AWKRRP - Resource repository messages	149	Chapter 61. AWKXAJ - Extended agent job executor messages	221
		Chapter 62. AWKZSJ - z/OS shadow job validation messages.	223

Chapter 63. AWSAEM - Event management messages	225	Chapter 82. AWSBDH - Java native interface messages	293
Chapter 64. AWSAHL - Action helper messages	227	Chapter 83. AWSBDJ - Appserverman messages	295
Chapter 65. AWSAUT - OSLC Automation Job Executor messages	229	Chapter 84. AWSBDW - Jobman messages	299
Chapter 66. AWSBAT - Event counter messages	235	Chapter 85. AWSBDX - Jobtable access messages	309
Chapter 67. AWSBCS - Check health status messages	239	Chapter 86. AWSBDY - Mailbox messages	311
Chapter 68. AWSBCT - Utility program messages	241	Chapter 87. AWSBDZ - Fileaid messages	313
Chapter 69. AWSBCU - SSL messages (symaccs)	247	Chapter 88. AWSBEA - Report1 messages	315
Chapter 70. AWSBCV - Mailman messages	249	Chapter 89. AWSBEC - Report headers and subheaders messages.	317
Chapter 71. AWSBCW - Writer messages	261	Chapter 90. AWSBEE - Parmes messages	319
Chapter 72. AWSBCX - Monman messages	267	Chapter 91. AWSBEF - Symphony archiving messages	321
Chapter 73. AWSBCY messages	271	Chapter 92. AWSBEG - Ftbox messages	323
Chapter 74. AWSBCZ - Dload messages	273	Chapter 93. AWSBEH - Web library messages	325
Chapter 75. AWSBDA messages	277	Chapter 94. AWSBEI - Users program messages	333
Chapter 76. AWSBDB - Scribner messages	279	Chapter 95. AWSBEJ - Symphony check messages	335
Chapter 77. AWSBDC - NetView/OpenView messages	281	Chapter 96. AWSBHS - MVS method messages	337
Chapter 78. AWSBDD - Bmevents messages	283	Chapter 97. AWSBHT - Batchman messages	339
Chapter 79. AWSBDE - Chkstat messages	285	Chapter 98. AWSBHU - Conman messages	351
Chapter 80. AWSBDF messages	287	Chapter 99. AWSBHV - Stageman messages	387
Chapter 81. AWSBDG - Downloader messages	289		

Chapter 100. AWSBHW - Object parsing messages	395	Chapter 118. AWSBIS - Customize messages	485
Chapter 101. AWSBHX - Logman messages	399	Chapter 119. AWSBIT - Customize messages	495
Chapter 102. AWSBHZ - Scheduler messages	401	Chapter 120. AWSBIU - Netview messages	497
Chapter 103. AWSBIA - Composer messages	405	Chapter 121. AWSBIV messages	499
Chapter 104. AWSBIB - Scheduling language parser messages	423	Chapter 122. AWSBIX - Netman messages	501
Chapter 105. AWSBIC - Scheduling language messages	437	Chapter 123. AWSBIY - Demo scripts messages	503
Chapter 106. AWSBID - Compiler messages	439	Chapter 124. AWSBIZ - Batchup messages	505
Chapter 107. AWSBIE - BigInsights plug-in messages	445	Chapter 125. AWSBJB messages	507
Chapter 108. AWSBIF messages	447	Chapter 126. AWSBJG - Router messages	509
Chapter 109. AWSBIG messages	449	Chapter 127. AWSBJH - Migration messages	511
Chapter 110. AWSBII - General and miscellaneous messages	451	Chapter 128. AWSBSM messages.	515
Chapter 111. AWSBIJ - Jobmon specific error messages.	453	Chapter 129. AWSBWX - Dataextract messages	517
Chapter 112. AWSBIK - Jobmon messages	467	Chapter 130. AWSCCM - CCMDB integration messages	519
Chapter 113. AWSBIM - Common library messages.	469	Chapter 131. AWSCDW - Clustering messages	521
Chapter 114. AWSBIN - Plan libraries messages	471	Chapter 132. AWSDAE - File system messages	529
Chapter 115. AWSBIO - Comm_api messages	477	Chapter 133. AWSDAG messages.	531
Chapter 116. AWSBIP - Connector messages	481	Chapter 134. AWSDAH - Checking messages	533
Chapter 117. AWSBIR - Libraries messages	483	Chapter 135. AWSDAL - Audit messages	535
		Chapter 136. AWSDBY messages	537
		Chapter 137. AWSDCI messages	539

Chapter 138. AWSDCJ messages . . .	541	Chapter 157. AWSDES - User parser messages	609
Chapter 139. AWSDDW - Std utility messages	543	Chapter 158. AWSDET - User parser messages	611
Chapter 140. AWSDEA - Standard functions messages	545	Chapter 159. AWSDEU - Utilities library list messages	613
Chapter 141. AWSDEB - SSL messages	547	Chapter 160. AWSDEV - TIS library messages	615
Chapter 142. AWSDEC - Events file messages	553	Chapter 161. AWSDEW messages . . .	617
Chapter 143. AWSDED - Date calculation messages	557	Chapter 162. AWSDEZ - Logging error messages	619
Chapter 144. AWSDEF messages . . .	559	Chapter 163. AWSDFC messages . . .	621
Chapter 145. AWSDEG messages . . .	561	Chapter 164. AWSDFD - Oslayer messages	623
Chapter 146. AWSDEH messages . . .	565	Chapter 165. AWSDFE messages . . .	625
Chapter 147. AWSDEI messages . . .	567	Chapter 166. AWSDFF messages . . .	627
Chapter 148. AWSDEJ - Security messages	569	Chapter 167. AWSDFG - Starter messages	629
Chapter 149. AWSDEK - Miscellaneous command messages. .	581	Chapter 168. AWSDFH - Condition expression parsing messages	631
Chapter 150. AWSDEL - CPU access messages	585	Chapter 169. AWSECM - Event Configuration messages	633
Chapter 151. AWSDEM - Workstation parsing messages	587	Chapter 170. AWSEDW - Netman messages	635
Chapter 152. AWSDEN - Workstation parsing messages	599	Chapter 171. AWSERB - Event rule builder messages	643
Chapter 153. AWSDEO - SNMP messages	601	Chapter 172. AWSERP - Event rule parser messages	645
Chapter 154. AWSDEP - FIFO error messages	603	Chapter 173. AWSETO - Object monitor plug-in messages	647
Chapter 155. AWSDEQ - FIFO messages	605	Chapter 174. AWSEVP - Event processing messages.	649
Chapter 156. AWSDER - Generic memory allocation messages	607	Chapter 175. AWSFAB - Installation messages (twinst).	651

Chapter 176. AWSFAF - Installation messages (fix pack)	677	Chapter 194. AWSMSCD messages	887
Chapter 177. AWSFMP - File monitor plug-in messages	683	Chapter 195. AWSMSL - Message logger plug-in messages	889
Chapter 178. AWSFWD - event forwarder plug-in messages	685	Chapter 196. AWSMSP - Mail sender plug-in messages	891
Chapter 179. AWSGAP - Generic action messages	687	Chapter 197. AWSPMG - Plug-in manager messages	893
Chapter 180. AWSGEP - Generic event plug-in messages	689	Chapter 198. AWSPRO - OSLC provisioning plug-in messages	895
Chapter 181. AWSGTW - Gentwsevn messages	691	Chapter 199. AWSREP - Plan extractor messages	901
Chapter 182. AWSITA - Job management messages	693	Chapter 200. AWSRES - Common REST messages	903
Chapter 183. AWSJCL - Command line messages	719	Chapter 201. AWSRJM - Remote job manager messages	905
Chapter 184. AWSJCO - Connectors messages	739	Chapter 202. AWSRST - Distributed REST messages	907
Chapter 185. AWSJCS - Common services messages	763	Chapter 203. AWSSAM - IBM System Automation for Multi Platform - Installation messages	909
Chapter 186. AWSJDB - Common objects messages	769	Chapter 204. AWSSMS - SAP Solution Manager messages	911
Chapter 187. AWSJIS messages	781	Chapter 205. AWSTAP - Action plug-in messages	913
Chapter 188. AWSJMC - Job manager REST client messages	837	Chapter 206. AWSTEL - EIF event management messages	915
Chapter 189. AWSJMR - Job management for REST services messages	839	Chapter 207. AWSTSI - SAP Solution Manager messages	917
Chapter 190. AWSJOM - Object management messages	841	Chapter 208. AWSTMB - Mailbox messages	919
Chapter 191. AWSJPL - Planner messages	859	Chapter 209. AWSTOE - Object exporter messages	921
Chapter 192. AWSJPU - Plan replication on database messages	879	Chapter 210. AWSTPL - Time planner messages	923
Chapter 193. AWSJSY - Symphony file processing messages	881	Chapter 211. AWSTWT messages	925

Chapter 212. AWSVAL - Plug-in validator messages 927

Chapter 213. AWSWUI - Dynamic Workload Console messages 931

Chapter 214. AWSZAP - Action plug-in for z/OS messages 933

Preface

Messages and Codes provides help for error and warning messages issued by the IBM Workload Automation products.

The IBM Workload Automation products include IBM Workload Scheduler (often called the *engine*), IBM Workload Scheduler for z/OS, the Dynamic Workload Console, and IBM Workload Scheduler.

What is new in this release

Learn what is new in this release.

For information about the new or changed functions in this release, see *IBM Workload Automation: Overview*, section *Summary of enhancements*.

For information about the APARs that this release addresses, see the IBM Workload Scheduler Release Notes at <http://www-01.ibm.com/support/docview.wss?rs=672&uid=swg27045180> and the Dynamic Workload Console Release Notes at <http://www-01.ibm.com/support/docview.wss?rs=672&uid=swg27045183>.

Who should read this publication

You can get more details about IBM Workload Automation error messages.

This publication is designed to help users understand any error or warning messages they encounter while working with IBM Workload Scheduler, IBM Workload Scheduler for z/OS, the Dynamic Workload Console, and IBM Workload Scheduler.

The help consists of an explanation of what has happened (where the message itself requires further explanation), the action that the system has taken, and the response that the user must provide. These details do not appear online with the message texts, and are documented only in this publication.

Accessibility

Accessibility features help users with a physical disability, such as restricted mobility or limited vision, to use software products successfully.

With this product, you can use assistive technologies to hear and navigate the interface. You can also use the keyboard instead of the mouse to operate all features of the graphical user interface.

For full information, see the Accessibility Appendix in the *IBM Workload Scheduler User's Guide and Reference*.

Technical training

Cloud & Smarter Infrastructure provides technical training.

For Cloud & Smarter Infrastructure technical training information, see:
<http://www.ibm.com/software/tivoli/education>

Support information

IBM provides several ways for you to obtain support when you encounter a problem.

If you have a problem with your IBM software, you want to resolve it quickly. IBM provides the following ways for you to obtain the support you need:

- Searching knowledge bases: You can search across a large collection of known problems and workarounds, Technotes, and other information.
- Obtaining fixes: You can locate the latest fixes that are already available for your product.
- Contacting IBM Software Support: If you still cannot solve your problem, and you need to work with someone from IBM, you can use a variety of ways to contact IBM Software Support.

For more information about these three ways of resolving problems, see the appendix about support information in *IBM Workload Scheduler: Troubleshooting Guide*.

Part 1. IBM Workload Scheduler messages

This part contains message help for many of the messages issued by the IBM Workload Scheduler engine and command line. The messages are organized in alphabetical order of message within alphabetical order of subcomponent (message set). Each subcomponent is in a separate section.

If the information does not sufficiently explain the situation you have encountered, see *IBM Workload Scheduler: Troubleshooting Guide*, which has extended error scenarios for many situations, as well as information about diagnostic tools and how to obtain support.

Chapter 1. IBM Workload Scheduler message format

IBM Workload Scheduler messages follow a standard message format.

This section explains the format of the message that is displayed on your screen or written in a log file. All messages have a message number and a message text. Many of the error and warning messages also have help. Only messages with message help are documented in this part of the guide. The help consists of an explanation of the message, a description of what the system does, and information about what you must do to resolve the problem.

Message number

IBM Workload Scheduler message numbers have a standard format.

IBM Workload Scheduler message numbers (codes) have the following format: AWS<component code><numeric identifier><severity>, where the parts of the message are as follows:

AWK or AWS

The product prefix. This value is used for all IBM Workload Scheduler messages, except those of the z/OS[®] Connector, which use EQQ (the product code for IBM Workload Scheduler for z/OS).

<component code>

The three-digit (occasionally two-digit) alphabetic code for the IBM Workload Scheduler component, for example "BAT".

<numeric identifier>

A three-digit (occasionally four-digit) numeric identifier that is unique within any combination of prefix and component code.

<severity>

The severity indicator, as follows:

- I Informational:** Informational messages provide users with information or feedback about normal events that have occurred or are occurring, or request information from users in cases where the outcome is not negative, regardless of the response.

Examples:

- The status request is processing.
- The files were successfully transferred.
- Do you want to save your output in file a or in file b?

Note: Informational messages issued by IBM Workload Scheduler are not documented in this guide because they are complete in themselves and require no further information or explanation. This also applies to informational messages giving the usage of the product's commands. If you require more information than is given on the screen, see *User's Guide and Reference*.

- W Warning:** Warning messages indicate that potentially undesirable

conditions have occurred or could occur, but the program can continue. Warning messages often ask users to make decisions before processing continues.

Examples:

- The replay table could not be sent. The link to Agent_name proceeds with a reduced replay protocol.
- A file already exists with the same name. Do you want to overwrite this file?

E Error: Error messages indicate problems that require intervention or correction before the program can continue.

Examples:

- The specified file could not be found.
- You are out of space on the x drive. The file cannot be saved to this drive.

An example of an error message number is: AWSBAT003E.

Message text

IBM Workload Scheduler message text helps you to identify the cause of the error.

Every attempt has been made to represent the message text exactly as it appears to the user in the displayed or written message. Any differences that occur are usually occasioned by the different layout of the book (in two columns) with respect to the message display panel or log.

Where the system has included variable information in the message text, this variable information is represented in this guide by an italicized label, describing the type of information referred to by the variable.

For example, if the message text that appears on your screen is as follows:

The replay table could not be sent.
The link to TRC8470 proceeds with a reduced replay protocol.

the message text shown in the guide would be as follows:

The replay table could not be sent.
The link to Agent_name proceeds with a reduced replay protocol.

In this case the label **Agent_name** tells you that the information that is inserted by the system is the name of the agent that could not receive the replay table.

Message help

IBM Workload Scheduler message help give you information about how to solve the problem.

In IBM Workload Scheduler messages you can find help for many of the more important error and warning messages. This help provides the following:

Explanation

An explanation, where necessary, of the message text.

System action

A description of what the system or process does as a result of the condition that caused the message.

Operator response

What you must do in response to the condition that caused the message.

See also

A reference to any IBM Workload Scheduler publication that might help you understand or resolve the problem.

Chapter 2. AWKALR - Allocation repository messages

This section lists error and warning allocation repository messages that might be issued.

The message component code is ALR.

AWKALR001E Unable to create the JSDL string from the SDO.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The error message points the user to the root cause of the problem.

AWKALR002E Unable to create the EPR string from the SDO.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The error message points the user to the root cause of the problem.

AWKALR003E No resources are available for deletion for allocation ID:"allocationID".

Explanation: See message text.

System action: The operation is not performed.

Operator response: The error message points the user to the root cause of the problem.

AWKALR004E No allocation is available for deletion for allocation ID:"allocationID".

Explanation: See message text.

System action: The operation is not performed.

Operator response: The error message points the user to the root cause of the problem.

AWKALR005E Unable to find any resources for allocation ID:"allocationID".

Explanation: See message text.

System action: None

Operator response: Check the allocation ID and try again

AWKALR006E Unable to create the JSDL from the string.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The error message points the user to the root cause of the problem.

AWKALR007E Unable to create the EPR from the string.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The error message points the user to the root cause of the problem.

AWKALR081E Unable to create an allocation record in the allocation repository database.

Explanation: See message text.

System action: None

Operator response: Check the error log for information about cause of the database access failure.

Chapter 3. AWKAUD - Audit service messages

This section lists error and warning audit service messages that might be issued.

The message component code is AUD.

AWKAUD050W The audit property setting "property_name" is not specified or is blank in the auditing configuration file. Using the default value: "default_value".

Explanation: See message text.

System action: The operation is performed using the default value.

Operator response: None.

AWKAUD051W The directory name specified in the audit property "property_name" is not valid. Using default value: "default_value".

Explanation: See message text.

System action: The operation is performed using the default value.

Operator response: None.

AWKAUD052W The audit file prefix "prefix_value" is not valid or the auditing file path is too long. Using the default value "default_value".

Explanation: See message text.

System action: The operation is performed using the default value.

Operator response: None.

AWKAUD053W The audit file prefix is not specified or is blank. Using the default value "default_value".

Explanation: See message text.

System action: The operation is performed using the default value.

Operator response: None.

AWKAUD054W The audit property "property_name" is not valid, is negative, or exceeds the maximum supported value. Using the maximum value as default "default_value".

Explanation: See message text.

System action: The operation is performed using the default value.

Operator response: None.

AWKAUD100E Unable to find the audit configuration file "audit_file_path". Using the default configuration settings.

Explanation: The auditing configuration file does not exist or is not readable. Default configuration settings are used.

System action: The operation is performed using the default settings.

Operator response: Check that the audit configuration file exists and that is readable. Create a new audit configuration file if it is missing.

AWKAUD101E Unable to instantiate the "audit_type" event type.

Explanation: The audit service is unable to instantiate the specified event type. The class path might be corrupted.

System action: The operation is not performed.

Operator response: Verify the installation and check whether the jar files have been deleted.

AWKAUD102E Unable to instantiate the "provider_name" Auditing Event Provider.

Explanation: The audit service is trying to instantiate an unknown or unsupported Auditing Event Provider.

System action: The operation is not performed.

Operator response: Check whether an unsupported Auditing Event Provider is specified in the audit configuration file.

AWKAUD103E Unable to log the "event_type" audit event type.

Explanation: The audit service is unable to process events of the specified type.

System action: The operation is not performed.

Operator response: Check whether an unsupported

AWKAUD104E • AWKAUD105E

auditing event consumer is specified in the audit configuration file.

AWKAUD104E Unable to process the "event_type" audit event type.

Explanation: The audit service is unable to process events of the specified type.

System action: The operation is not performed.

Operator response: The file system might be full or the audit log file is not write-protected.

AWKAUD105E Unable to use the directory specified for audit logs. The specified path and the filename might exceed the maximum length for files in the current operating system. Using: "new_file_location".

Explanation: The audit service is unable to process events of the specified type.

System action: The operation is performed using the file name and path specified in the message.

Operator response: The file system might be full or the auditing log file is write-protected.

Chapter 4. AWKBIE - BigInsights plug-in messages

This section lists error and warning messages that might be issued by the BigInsights plug-in.

The message component code is BIE.

AWKBIE001E The selected jar do not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Select a valid jar.

AWKBIE002E The field Jar is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Select a valid jar.

AWKBIE003E The properties file is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKBIE004E The property is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKBIE005E The jar repository does not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKBIE006E The Hadoop command does not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKBIE007E The Hadoop command failed.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

Chapter 5. AWKREA - Engine REST API messages

This section lists error and warning messages that might be issued by the Engine REST API messages.

The message component code is REA.

AWKREA001E Object of type *type* identified by *id* cannot be found.

Explanation: *type* is the internal type name of the object identified by *id* that cannot be found.

System action: The operation is not performed.

Operator response: Specify a valid object.

AWKREA002E Unknown action *action*.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid action.

Chapter 6. AWKBIG - Job plug-in for IBM BigInsights messages

This section lists error and warning messages that might be issued by the job plug-in for IBM BigInsights.

The message component code is BIG.

AWKBIG002E Test connection failed. The error was
""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKBIG003E The application failed to run.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKBIG004E The application cannot start. The error
is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKBIG005E No elements available for the
specified filter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether there are any available data, change the filter settings or contact your system administrator.

AWKBIG006E An error occurred parsing the
response. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the response received

AWKBIG007E The selected application is not a
Workflow.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Select a Workflow application

AWKBIG008E The execution of the workbook
""workbook"" failed.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG009E The execution of the workbook
""workbook"" is stopped.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG010E The execution of the workbook
""workbook"" cannot start. The error is
""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG011W The job was canceled by the user.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG012E The status of the workbook
""workbook"" cannot be retrieved. The
error is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG013E The status of the workbook cannot run, the following error was returned: `""error""`. Additional details: `""error details""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKBIG014E The status of the workbook `""workbook""` is unknown. The error is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG015E The status of the workbook `""workbook""` is unknown.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log and the job properties for additional details.

AWKBIG016E The required workbook parameter is missing.

Explanation: The workbook name is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKBIG017E The required application id parameter is missing.

Explanation: The application id is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKBIG018E The required execution name parameter is missing.

Explanation: The execution name is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKBIG019E Incorrect application value. The application must be an identifier or ends with (aid:identifier)

Explanation: The syntax specified for the application is incorrect.

System action: The operation is not performed.

Operator response: Specify a valid application and retry the operation.

AWKBIG020E Incorrect value `""name""` in the application parameter list. The application parameter value must ends with (isRequired:boolean, paramtype:string, name:string)

Explanation: The syntax specified for the application parameter list is incorrect.

System action: The operation is not performed.

Operator response: Specify a valid application parameter list and retry the operation.

Chapter 7. AWKCAU - Centralized Agent Update messages

This section lists error and warning messages that might be issued by the Centralized Agent Update feature.

The message component code is CAU.

Chapter 8. AWKCDM - Change and configuration management database messages

This section lists error and warning change and configuration management database messages that might be issued.

The message component code is CDM.

AWKCDM001W An error occurred while loading the user configuration file "config_file". The following error was returned: "error". The default values will be used.

Explanation: The configuration file cannot be read from the Tivoli Dynamic Workload Broker configuration directory.

System action: See message text.

Operator response: Check whether the configuration file located in the Tivoli Dynamic Workload Broker configuration directory is corrupted, locked, or missing.

AWKCDM002E An error occurred while getting the configuration file "config_file". The following error was returned: "error".

Explanation: The configuration file cannot be found in the Tivoli Dynamic Workload Broker jar files.

System action:

Operator response: Check whether the jar files in the Tivoli Dynamic Workload Broker installation directory are corrupted or missing. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKCDM003E Unable to find the configuration file "config_file".

Explanation: See message text.

System action: None

Operator response: Check whether the jar files in the Tivoli Dynamic Workload Broker installation directory are corrupted or missing. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKCDM005E An exception occurred on the CCMDB server. The following error was returned: "error".

Explanation: See message text.

System action:

Operator response: Check that the Tivoli Change and Configuration Management Database server is up and running and that it can be contacted.

AWKCDM006E The operation failed because the required parameter "parameter" is missing. Include it in the command or in the configuration file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the required parameter.

AWKCDM007E The command failed because it included an unsupported parameter "parameter".

Explanation: See message text.

System action:

Operator response: Check the command syntax and retry the operation.

AWKCDM008E The operation failed because the URL specified for the Tivoli Dynamic Workload Broker server "URL" is not correct.

Explanation: See message text.

System action: See message text.

Operator response: Correct the URL.

AWKCDM009E A problem occurred while contacting the Tivoli Dynamic Workload Broker server. The Tivoli Dynamic Workload Broker service is not available.

Explanation: See message text.

System action: See message text.

Operator response: Check that the Tivoli Dynamic Workload Broker server is up and running and that it can be contacted.

AWKCDM010E • AWKCDM014E

AWKCDM010E Unable to invoke Tivoli Dynamic Workload Broker Web Services because an incorrect parameter was specified.

Explanation: See message text.

System action: The operation was not performed.

Operator response: Check the parameters and try again.

AWKCDM011E Unable to invoke Tivoli Dynamic Workload Broker Web Services.

Explanation: See message text.

System action: The operation was not performed.

Operator response:

AWKCDM012E Unable to connect to the Tivoli Dynamic Workload Broker server. The user credentials might be incorrect.

Explanation: See message text.

System action: The operation was not performed.

Operator response: Check the user name and password and retry the operation.

AWKCDM013E The operation failed because the user is not authorized to perform it.

Explanation: See message text.

System action: The operation was not performed.

Operator response: Log on with the required level of authorization and retry the operation.

AWKCDM014E An unexpected error occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the trace file for more information about the error.

Chapter 9. AWKCGE - Cognos Plug-in messages

This section lists error and warning messages that might be issued by the Cognos Plug-in component.

The message component code is CGE.

AWKCGE001E You did not specify the report path.

Explanation: The report path is a required parameter.

System action: The operation is not performed.

Operator response: Provide the report path and retry the operation.

AWKCGE002E You did not specify the namespace.

Explanation: The namespace is a required parameter to view the list of reports.

System action: The operation is not performed.

Operator response: Provide the namespace either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE003E You did not specify the username.

Explanation: The username is a required parameter to view the list of reports.

System action: The operation is not performed.

Operator response: Provide the username either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE004E You did not specify the password.

Explanation: The password is a required parameter to view the list of reports.

System action: The operation is not performed.

Operator response: Provide the password either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE005E You did not specify the namespace and the username.

Explanation: The namespace and the username are required parameters if you specified the password.

System action: The operation is not performed.

Operator response: Provide the namespace and the username either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE006E You did not specify the namespace and the password.

Explanation: The namespace and password are required parameters if you specified the username.

System action: The operation is not performed.

Operator response: Provide the namespace and password either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE007E You did not specify the username and the password.

Explanation: The username and password are required parameters if you specified the namespace.

System action: The operation is not performed.

Operator response: Provide username and password either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE008E An error occurred while attempting to retrieve the namespaces.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE009E An error occurred while attempting to retrieve the reports.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE010E No report was found on the Cognos server.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the report filter you

AWKCGE011E • AWKCGE021E

specified is correct and that there are reports for the specified namespace.

AWKCGE011E No namespace was found on the Cognos server.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the namespace you specified is correct and that the connection to the server is active.

AWKCGE012E An error occurred while attempting to connect to the IBM Cognos server. The IBM Cognos server connection parameters are incorrect: "error_msg".

Explanation: Error connecting to the IBM Cognos server.

error_msg identifies the cause of the failure.

System action: The operation is not performed.

Operator response: Verify that the server connection parameters are correct and analyze the error message in the Java IBM Cognos plug-in log file for more information.

AWKCGE013E An error occurred retrieving the IBM Cognos report service.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE014E An Apache exception occurred communicating with the IBM Cognos server. The Apache error message is: "error_msg".

Explanation: An error occurred running the IBM Cognos report.

error_msg identifies the Apache error message.

System action: The operation is not performed.

Operator response: Correct the error and retry the operation.

AWKCGE015E An error occurred running the IBM Cognos report.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE016E The directory "file_path" you specified to save the report file does not exist.

Explanation: *file_path* identifies the name of the directory that cannot be found.

The directory where you want to save the file must exist when the job runs.

System action: The operation is not performed.

Operator response: Provide an existing directory in the Cognos job definition or create the missing directory and retry the operation.

AWKCGE017E The server port is not valid. Specify a value in the 1 - 65535 interval.

Explanation: A valid server port is required.

System action: The operation is not performed.

Operator response: Specify a valid server port.

AWKCGE018E You did not specify either the output file or the email addresses to which you want to send the report.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide either the output file or the email addresses here and retry the operation.

AWKCGE019E You did not specify the report format.

Explanation: The report format is required.

System action: The operation is not performed.

Operator response: Provide the report format and retry the operation.

AWKCGE020E The value "report_format" specified for the formatTypes is not valid. Specify a valid value.

Explanation: *report_format* identifies the value of the unsupported report format.

A valid report format is required.

System action: The operation is not performed.

Operator response: Provide a valid value for the report format. Valid values are: HTML, HTMLFRAG, HTMLWA, XML, PDF, CSV, XLS, XLSWA.

AWKCGE021E You did not specify the directory name for the output file. The output file must contain the fully qualified path.

Explanation: The output file does not contain the directory name.

System action: The operation is not performed.

Operator response: Provide the the directory name for the output file here and retry the operation.

AWKCGE022E You did not specify the server address.

Explanation: The server address is a required parameter.

System action: The operation is not performed.

Operator response: Provide the server address either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE023E You did not specify the port.

Explanation: The port is a required parameter.

System action: The operation is not performed.

Operator response: Provide the port either here or in the CognosJobExecutor.properties file and retry the operation.

AWKCGE024E An error occurred while attempting to retrieve the parameters.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE026E An error occurred during connection to the IBM Cognos report service. Verify your credentials.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the credentials you specified are correct and retry the operation.

AWKCGE027E An error occurred during the connection to the IBM Cognos report service. The error is: "error_msg".

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE028E The IBM Tivoli Workload Scheduler agent cannot monitor the IBM Cognos report.

Explanation: The IBM Tivoli Workload Scheduler agent stops monitoring the IBM Cognos report.

The IBM Cognos report status cannot be retrieved and the agent sets the status of the IBM Tivoli Workload Scheduler job to ""unknown"".

System action: The product stops monitoring the IBM Cognos report.

Operator response: Verify the IBM Cognos report status in the IBM Cognos product. If the IBM Cognos report completed successfully, release the IBM Tivoli Workload Scheduler job dependencies manually.

AWKCGE029E An error occurred while retrieving the list of available IBM Cognos reports.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE030E You did not specify the file name for the output file. The output file must contain the fully qualified path.

Explanation: The output file does not contain the file name.

System action: The operation is not performed.

Operator response: Provide the the file name and retry the operation.

AWKCGE031E An error occurred while retrieving the report output.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE032E An error occurred when sending the report output by email.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE033E An error occurred when saving the report to the file "report_file".

Explanation: *report_file* identifies the fully qualified path of the file that cannot be created.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE034E An error occurred when deleting the report.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE035E An error occurred when saving the report to the file "report_file". The error is: "error_msg".

Explanation: *report_file* identifies the fully qualified path of the file that cannot be created.

error_msg identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE036E An error occurred when deleting the report. The error is: "error_msg".

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE037E An error occurred when sending the report output by email. The error is: "error_msg".

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE038E An error occurred when retrieving the report output. The error is: "error_msg".

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE039E An error occurred while running the IBM Cognos report. The error is: "error_msg".

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java IBM Cognos plug-in log file.

AWKCGE040E The report with path "report_path" was not found on the Cognos server.

Explanation: *report_path* identifies the path of the report.

See message text.

System action: The operation is not performed.

Operator response: Verify that the report path you specified is correct.

AWKCGE041E The user "user_name" does not have the "report_permission" permission on the report with path "report_path".

Explanation: *user_name* identifies the name of the user running the report.

report_permission identifies the required permission.

report_path identifies the path of the report.

See message text.

System action: The operation is not performed.

Operator response: Verify that the user has the necessary permission to manage the report you specified. Ask the Cognos administrator to assign the necessary permission to the user.

AWKCGE042E You specified an invalid format "report_format" for the interactive report "report_path". Specify the HTML format.

Explanation: *report_format* identifies the format specified for the report.

report_path identifies the path of the report.

System action: The operation is not performed.

Operator response: Specify the HTML format for interactive reports.

AWKCGE056E The IBM Cognos report completed with errors.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Ask the IBM Cognos administrator to analyze the report error messages on the IBM Cognos server and solve the problem. After the IBM Cognos report is ready to start, retry the Cognos job submission.

AWKCGE057E The IBM Cognos report cannot be submitted.

Explanation: The IBM Cognos report cannot start because its status is suspended or inactive.

System action: The operation is not performed.

Operator response: Ask the IBM Cognos administrator to analyze the report status. After the IBM Cognos report is ready to start, retry the Cognos job submission.

Chapter 10. AWKCLI - Command line messages

This section lists error and warning messages that might be generated by the dynamic workload broker Command Line Interface.

The message component code is CLI.

AWKCLI001E An error occurred while getting the configuration file "config_file". The following error was returned: "error".

Explanation: See message text.

System action: The application will use the default values.

Operator response: Check the configuration file path.

AWKCLI013E The required variable "variable" is missing from the configuration file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Define the variable in configuration file.

AWKCLI031E The command failed because of a missing mandatory parameter "parameter".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Insert the missing parameter.

AWKCLI032E The command failed because of a missing value for a parameter: "parameter"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Insert the missing parameter value.

AWKCLI033W Unable to read the configuration file "file_name" . The default configuration file will be used.

Explanation: The configuration file might be corrupted or missing.

System action: The operation continues using values from the default file.

Operator response: Check that the configuration file is correct.

AWKCLI034E Unable to read the default configuration file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that the default configuration file is correct.

AWKCLI035E Unable to read configuration files.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that the configuration file is correct.

AWKCLI036E The command failed because the variable "variable" is not present in the configuration file.

Explanation: A required variable cannot be found in the configuration file.

System action: The operation is not performed.

Operator response: Set the variable in configuration file and try again.

AWKCLI040E The command failed because the parameter "VALUE_0" is not specified as a command parameter and the property "VALUE_1" is not present in the configuration file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the required parameter.

AWKCLI041E The command failed because of a missing parameter. One of the following parameters is required: "parameter_1" , "parameter_2" .

Explanation: See message text.

System action: The operation is not performed.

Operator response: Define the missing parameter.

AWKCLI042E The command failed because the following mutually exclusive parameters were both included. "parameter_1", "parameter_2".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Reissue the command specifying only one of the parameters.

AWKCLI043E The command failed because a variable has an incorrect format: "VALUE_0".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the JSDL variable format.

AWKCLI044E The command failed because neither of the following affinity parameters was specified: "parameter_1", "parameter_2" . . . One of the parameters must be specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify one of the affinity parameters.

AWKCLI045E The command failed because only one of the following affinity parameters can be specified: "parameter_1", "parameter_2".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the affinity parameters specification.

AWKCLI046E The command failed because of an incorrect affinity format: "VALUE_0".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the affinity parameter format.

AWKCLI047E The command failed because parameter "parameter" is not applicable.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the command and try again.

AWKCLI049E Unable to find the address of a Tivoli Dynamic Workload Broker server in the configuration file.

Explanation: No Job Dispatcher is specified.

System action:

Operator response: A valid Tivoli Dynamic Workload Broker server address must be specified in the configuration file.

AWKCLI050E The Tivoli Dynamic Workload Broker server address "address" is not in a correct format.

Explanation: The Tivoli Dynamic Workload Broker server address found in the configuration file is not a valid address.

System action:

Operator response: Check the Tivoli Dynamic Workload Broker server address format.

AWKCLI051E An unexpected error occurred while submitting the job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the log file for information about the cause of the error.

AWKCLI052E Unable to find the JSDL file "file_name".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that the JSDL file is present in the specified directory.

AWKCLI053E The JSDL file format is not correct: "VALUE_0" --- "VALUE_1".

Explanation: The JSDL file is not well formed according to the JSDL specification.

System action: The operation is not performed.

Operator response: Check the JSDL file format

AWKCLI054E Tivoli Dynamic Workload Broker server service is not available

Explanation: Possible causes are:

- The server cannot be contacted, is not responding, or is switched off.
- The service is already active or has been disabled.

System action:

Operator response: Check the status and the

accessibility of the Tivoli Dynamic Workload Broker server.

AWKCLI055E The operation failed because the input parameter is incorrect. "parameter"

Explanation: One of the parameters cannot be processed by the Tivoli Dynamic Workload Broker server

System action: The operation is not performed.

Operator response: None.

AWKCLI056E Tivoli Dynamic Workload Broker server - operation failed. "VALUE_0"

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKCLI057E An unexpected error occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the log file for more information about the error.

AWKCLI059E Unable to find job ID "jobID".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the specified job ID exists.

AWKCLI060E The operation failed because the specified state is not a valid job state.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the specified state is correct.

AWKCLI061E The operation failed because job ID "jobID" is not correct.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the specified job ID is correct.

AWKCLI063E The operation failed because of an incorrect parameter and value: "parameter", "value". This parameter does not support wildcards.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the command and try again.

AWKCLI065E The job definition file "file_name" contains errors.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check for errors in the job definition file.

AWKCLI066E The job definition name "job_def" is not correct.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job name.

AWKCLI067E Unable to find the job definition "job_def".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the specified job exists.

AWKCLI068E The command failed because of an incorrect query parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a supported parameter.

AWKCLI069E The specified job state "state" is not valid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the specified job state.

AWKCLI070E One of the selection criteria must be specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Relaunch command specifying

AWKCLI072E • AWKCLI101E

one of the selection criteria as described in command usage.

AWKCLI072E Unable to find job status "status".

Explanation: You have specified an incorrect job status.

System action: The operation is not performed.

Operator response: Correct the job status and try again.

AWKCLI073E The command failed because the date "date" is in an incorrect format. The valid format is "date_format"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the date and try again.

AWKCLI074E You have specified an incorrect date: "date"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the date and try again.

AWKCLI075E The date from "date_1"to "date_2" is not valid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the dates and try again.

AWKCLI087E Unable to find JSDL file "file_name" .

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the JSDL file path.

AWKCLI088E Unable to connect to the Tivoli Dynamic Workload Broker server.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the Tivoli Dynamic Workload Broker server is running and can be reached.

AWKCLI089E Unexpected exception received while submitting the job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the log file for more information about the error.

AWKCLI090E An unexpected error occurred. Unable to contact the Tivoli Dynamic Workload Broker server.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the Tivoli Dynamic Workload Broker server is running and can be reached.

AWKCLI098E The command failed because of a missing value for parameter "parameter"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Retry the command specifying the missing value.

AWKCLI099E The command failed because a mandatory parameter "parameter" is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Retry the command specifying the missing parameter.

AWKCLI100E The command failed because the value specified for the offset parameter "offset" is out of range. Specify a number between 0 and "Long_MAXVALUE".

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKCLI101E The command failed because the value specified for the sizePage parameter "page_size" is out of range. Enter a valid number between 0 and "Integer_MAXVALUE".

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKCLI102E A database error occurred. The internal error returned by the database manager is: "db_error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the database status and availability.

AWKCLI105E The command failed because the format of the Resource Definition file is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the resource definition file.

AWKCLI109E Incorrect JSDL file format "VALUE_0" --- "VALUE_1".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the JSDL file.

AWKCLI110E The job ID "JobID" is not correct.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the job ID.

AWKCLI120E The command failed because of incorrect input parameters "parameters".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the input parameters.

AWKCLI121E Resource Advisor - Operation failed..

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the log files and retry the operation.

AWKCLI122E Job Dispatcher - Operation failed."VALUE_0".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the log files and retry the operation.

AWKCLI129E The specified date "date" is in an incorrect format. The valid format is "date_format".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the date format.

AWKCLI130E You have specified an incorrect date: "date".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the date.

AWKCLI132E The Job Dispatcher service is unavailable.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether the Job Dispatcher is running and can be reached.

AWKCLI134E The job ID "jobID" is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job ID and retry the operation.

AWKCLI135E The specified job state "state" is not correct.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the state value and the allowed values.

AWKCLI150E The job definition "JOB_NAME" cannot be updated. It is not present in the Job Repository.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that the specified job definition name is correct.

AWKCLI151E The "all_option" option cannot be used with other query filter options.

Explanation: You can use this option on its own or define a query using a combination of other options.

System action: The operation is not performed.

AWKCLI154E • AWKCLI186E

Operator response: Check the command usage.

AWKCLI154E The specified quantity "RESOURCE_QUANTITY" is not an integer. You can specify an integer within the 0 and 99999999 range.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify an integer.

AWKCLI155E The specified quantity "RESOURCE_QUANTITY_RANGE" is outside the valid range. You can specify an integer within the 0 and 99999999 range.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify an integer within the 0 and 99999999 range.

AWKCLI156E The specified resource name "RESOURCE_NAME" is not supported.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Insert a valid resource name.

AWKCLI157E The specified resource type "RESOURCE_TYPE" is not supported.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Insert a valid resource type.

AWKCLI170E Rollback failed with database error: "error".

Explanation: An error occurred when trying to rollback a transaction.

Operator response: See message text.

AWKCLI176E The specified value "port" for the connection port is not a number. Specify a valid number in the command line configuration file.

Explanation: The specified value is not a number.

System action: The operation is not performed.

Operator response: Insert a number for the connection port in the configuration file.

AWKCLI177E The required server connection parameters are missing. Specify the hostname or the communication ports of the server in the command line configuration file.

Explanation: You did not provide the hostname or the communication ports of the server.

System action: The operation is not performed.

Operator response: Specify the hostname or the communication ports of the server in the configuration file. Enter the command again.

AWKCLI179W The broker server "server" is not responding.

Explanation: The system is not reachable or the broker application server is not running.

System action: The operation continues using other broker servers, if defined.

Operator response: Check that the broker server data in the configuration file are correct and that the broker application is running on the server.

AWKCLI183W It is not possible to perform the requested operation. The connection failed with all the defined broker servers.

Explanation: It has not been possible to contact any of the defined broker servers.

System action: The operation is not performed.

Operator response: Check that the broker server data in the configuration file are correct and that the broker application is running on the server.

AWKCLI184W Some required properties for the broker server "server" (backup server number "index") have not been correctly defined. The broker server "server" will be not added to the backup server list.

Explanation: One or more required properties of the broker server configuration are missing or wrongly defined.

System action: The operation is not performed.

Operator response: Please check into the configuration file that all the required properties for the broker server configuration are present and correctly defined.

AWKCLI186E An error occurred performing the requested operation.

Explanation: The connection with the server succeeded but the operation has not been performed.

System action: The operation is not performed.

Operator response: Check the broker server logs for more details.

Chapter 11. AWKDBE - Database Job Executor messages

This section lists error and warning messages that might be generated by the routines that handle the Database Job Executor.

The message component code is DBE.

AWKDBE001E The server address is missing.

Explanation: The server address is required.

System action: The operation is not performed.

Operator response: Specify a server address.

AWKDBE002E The server port is either missing or not valid. Specify a value in the 1..65535 interval.

Explanation: A valid server port is required.

System action: The operation is not performed.

Operator response: Specify a valid server port.

AWKDBE003E The database name is missing.

Explanation: The database name is required.

System action: The operation is not performed.

Operator response: Specify a database name.

AWKDBE004E The credentials are missing.

Explanation: The credentials are required.

System action: The operation is not performed.

Operator response: Specify the credentials.

AWKDBE005E The user name or the password is missing.

Explanation: The user name and the password are required.

System action: The operation is not performed.

Operator response: Specify both user name and password

AWKDBE006E Missing statements.

Explanation: No statement was specified. At least one statement is required.

System action: The operation is not performed.

Operator response: Specify one or more statements.

AWKDBE007E Runtime Error "exception_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE008E Unable to create the output file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE009E Unable to create the connection "exception_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE010E MSSQL Job Execution Error "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE0110E The access token secret is missing.

Explanation: The access token secret is required.

System action: The operation is not performed.

Operator response: Specify a access token secret.

AWKDBE011E SQL Job Execution Error "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE012E Rollback error "error_message".

Explanation: See message text.

AWKDBE013E • AWKDBE027E

System action: The operation is not performed.

Operator response: None.

AWKDBE013E Connection close error
"error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE014E Output file close error
"error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKDBE015E The DBMS value is either empty or
not valid.

Explanation: The value specified for DBMS is either empty or not valid.

System action: The operation is not performed.

Operator response: Specify a valid DBMS or do not use the DBMS tag.

AWKDBE016E Empty statement.

Explanation: The statement is empty.

System action: The operation is not performed.

Operator response: Provide a value for the statement and retry the operation.

AWKDBE017E The JDBC Driver path is missing.

Explanation: The JDBC Driver path in the configuration file is required.

System action: The operation is not performed.

Operator response: Specify the JDBC Driver path.

AWKDBE018E Cannot access required JDBC Driver
folder

Explanation: The job was not able to access a JDBC Driver folder, you might not have enough permissions.

System action: The operation is not performed.

Operator response: Verify that you have enough permissions.

AWKDBE019E The job type is not valid; it must be
job or sql

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a correct job type.

AWKDBE020E The driver class name is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a driver class name.

AWKDBE021E The connection URL is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a connection URL.

AWKDBE023E An error occurred while attempting to
connect to the database. See the attached
database message for more information:
"exception_message".

Explanation: The database address, name, or port might be incorrect.

System action: The operation is not performed.

Operator response: None.

AWKDBE025E The job type is not valid; it must be
sql.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct job type.

AWKDBE026E The number of arguments is invalid;
they must be 4 (Procedure Variable
Type, Variable Name, SQL Variable
Type, Variable Position Index).

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct arguments.

AWKDBE027E IN or INOUT variable was not
specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the variable value.

AWKDBE028E The SQL type "sql_type" is not supported.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The specific stored procedure is not supported.

AWKDBE029E The type "procedure_type" is not valid as stored procedure parameter type.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The type of stored procedure is invalid.

AWKDBE030E The string "sql_string" doesn't match a supported SQL type.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The string doesn't match a supported SQL type.

AWKDBE031E The string "procedure_string" doesn't match a valid stored procedure parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The string doesn't match a supported SQL type.

AWKDBE032E The stored procedure name provided doesn't match any stored procedure definition in the database.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the stored procedure name.

AWKDBE033E The stored procedure name provided matches more than one stored procedure definition in the database, to disambiguate specify also the schema.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Disambiguate specifying also the schema.

Chapter 12. AWKDSE - InfoSphere DataStage Plug-in messages

This section lists error and warning messages that might be issued by the InfoSphere DataStage Plug-in component.

The message component code is DSE.

AWKDSE001E You did not specify the project name.

Explanation: The project name is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information either here or in the DataStageJobExecutor.properties file and retry the operation.

AWKDSE002E You did not specify the job name or job alias. The job name or the job alias is a mandatory parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information either here or in the DataStageJobExecutor.properties file and retry the operation.

AWKDSE003E You did not specify the user name or the password. The user name and the password are required parameters.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information either here or in the DataStageJobExecutor.properties file and retry the operation.

AWKDSE004E You did not specify the remote file path. The remote file path is a mandatory parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKDSE005E An error occurred while attempting to retrieve the list of jobs.

Explanation: An error occurred when running the DataStage dsjob ljobs command.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java DataStage plug-in log file.

AWKDSE006E An error occurred while attempting to retrieve the list of parameters for the job.

Explanation: An error occurred when running the DataStage dsjob lparams command.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java DataStage plug-in log file.

AWKDSE007E An error occurred while attempting to retrieve the list of projects.

Explanation: An error occurred when running the DataStage dsjob lprojects command.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java DataStage plug-in log file.

AWKDSE009E An error occurred while attempting to retrieve the list of projects. The return code is: "return_code".

Explanation: Error running the DataStage dsjob lprojects command.

return_code identifies the return code of the DataStage command.

System action: The operation is not performed.

Operator response: Analyze the return code and the related error message in the java DataStage plug-in log file.

AWKDSE010E An error occurred while attempting to retrieve the list of jobs. The return code is: "return_code".

Explanation: Error running the DataStage dsjob ljobs command.

AWKDSE011E • AWKDSE018E

return_code identifies the return code of the DataStage command.

System action: The operation is not performed.

Operator response: Analyze the return code and the related error message in the Java DataStage plug-in log file.

AWKDSE011E An error occurred while attempting to retrieve the list of parameters for the job. The return code is: "return_code".

Explanation: An error occurred when running the DataStage dsjob lparams command.

return_code identifies the return code of the DataStage command.

System action: The operation is not performed.

Operator response: Analyze the return code and the related error message in the java DataStage plug-in log file.

AWKDSE012E You did not specify the domain name. The domain name is a mandatory parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKDSE013E You did not specify the server name. The server name is a mandatory parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKDSE014E You did not specified the DataStage installation directory in the DataStage.properties configuration file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the DataStage server installation path in the DataStageJobExecutor.properties file and try the operation again.

AWKDSE015E An error occurred while running the job.

Explanation: The job running failed.

System action: The operation is not performed.

Operator response: Analyze the DataStage error

message in the job output to solve the problem.

AWKDSE016E The file "fileName" was not found in the directory "dirName".

Explanation: See message text.

fileName identifies the name of the file not found.

dirName identifies the path where the file was not found.

System action: The operation is not performed.

Operator response: Verify that you have correctly specified the path in the DataStageJobExecutor.properties file.

AWKDSE017E The row limit value "value" you specified is not valid for the DataStage job "job" in the project "project".

Explanation: The value you specified in the row limit field is not valid. It must be an integer value from 1 through 9999999

value identifies the value you specified as row limit.

job identifies the DataStage job name for which the row limit is invalid.

project identifies the DataStage project name where the DataStage job is defined.

System action: The operation is not performed.

Operator response: Specify a valid row limit value in the DataStage job definition and retry the operation.

AWKDSE018E The warning limit value "value" is not valid for the DataStage job "job" in the project "project".

Explanation: The value you specified for the warning limit field is not valid. It must be an integer value from 1 through 9999999.

value identifies the value you specified as the warning limit.

job identifies the DataStage job name where the warning limit is invalid.

project identifies the DataStage project name where the DataStage job is defined.

System action: The operation is not performed.

Operator response: Verify that you specified a valid value for the warning limit value in the DataStage job definition. It must be an integer value from 1 through 9999999.

AWKDSE019E The command "fileName" cannot be run. Verify that you have the correct permissions to run the command.

Explanation: The specified command cannot be run.

fileName identifies the name of the file that cannot be run.

System action: The operation is not performed.

Operator response: Verify that you have the required permissions to run the command.

AWKDSE020E No object found with the filter "filter" you specified.

Explanation: The filter you specified did not return any values.

The *filter* identifies the filter you specified for the object list.

System action: The operation is not performed.

Operator response: Verify that you specified a correct filter.

AWKDSE021E The IBM Tivoli Workload Scheduler agent cannot monitor the DataStage job.

Explanation: The IBM Tivoli Workload Scheduler agent stops monitoring the DataStage job because of internal problems.

The DataStage job status cannot be retrieved and the agent sets the status of the IBM Tivoli Workload Scheduler job to ""unknown"".

System action: The product stops monitoring the DataStage job.

Operator response: Verify the DataStage job status in the DataStage product. If the DataStage job completed successfully, manually release the IBM Tivoli Workload Scheduler job dependencies.

AWKDSE022E No parameter was found for the selected job.

Explanation: No parameter was found on the DataStage for the selected job.

System action: The operation is not performed.

Operator response: Verify that the job you specified is correct and that the connection to the server works correctly.

Chapter 13. AWKDSJ - Distributed shadow job validation messages

This section lists error and warning messages that could be generated by the distributed shadow job validation.

The message component code is DSJ.

AWKDSJ001E The value assigned to the application name is not coherent with the XML definition.

Explanation: You used a wrong value for the application name. The correct value for a distributed shadow job is distributedShadowJob.

System action: The operation is not performed.

Operator response: Specify distributedShadowJob as application name and then retry.

AWKDSJ002E The XML namespace definition is unknown.

Explanation: The XML namespace definition must match the application name.

System action: The operation is not performed.

Operator response: Enter an existing XML namespace definition.

AWKDSJ003E The range assigned to the matching criteria is not valid.

Explanation: The value specified in the `""To""` attribute precedes the value specified in the `""From""` attribute.

System action: The operation is not performed.

Operator response: Specify a valid range for the matching criteria.

AWKDSJ004E The value assigned to JobStream is not valid.

Explanation: The JobStream value can contain the characters 0-9,a-z,_, it must not exceed 16 characters, and it must start with a letter.

System action: The operation is not performed.

Operator response: Enter a valid JobStream value and then retry.

AWKDSJ005E The value assigned to Workstation is not valid.

Explanation: The Workstation value can contain the

characters 0-9,a-z,_, it must not exceed 16 characters, and it must start with a letter.

System action: The operation is not performed.

Operator response: Enter a valid Workstation value and then retry.

AWKDSJ006E The value assigned to Job is not valid.

Explanation: The Job value can contain the characters 0-9,a-z,_, it must not exceed 16 characters, and it must start with a letter.

System action: The operation is not performed.

Operator response: Enter a valid Job value and then retry.

AWKDSJ007E The value assigned to From or To attributes is not valid.

Explanation: The correct syntax for `""From""` and `""To""` attributes for absolute interval matching criteria is: HHMM [+|-][1-6]. Make sure you add a space between HHMM and [+|-][1-6].

System action: The operation is not performed.

Operator response: Enter valid values for absolute interval matching criteria.

AWKDSJ008E The value assigned to From or To attributes is not valid.

Explanation: The correct syntax for `""From""` and `""To""` attributes for relative interval matching criteria is: [+|-][hh]hmm. The maximum value for [hh]hmm is 16759.

System action: The operation is not performed.

Operator response: Enter valid values for relative interval matching criteria.

Chapter 14. AWKEWL - Enterprise workload manager messages

This section lists error and warning enterprise workload manager messages that might be issued.

The message component code is EWL.

AWKEWL002E The Enterprise Workload Manager plug-in configuration failed because of a problem accessing the configuration file.

Explanation: Possible reasons are:

1. The IBM Tivoli Dynamic Workload Broker configuration directory is not defined.
2. The Enterprise Workload Manager plug-in configuration file is not present in the IBM Tivoli Dynamic Workload Broker configuration directory.

System action: The IBM Tivoli Dynamic Workload Broker is started without the Enterprise Workload Manager plug-in.

Operator response: See the trace file for more details.

AWKEWL004E The Enterprise Workload Manager plug-in failed to start.

Explanation: A error occurred while starting the Enterprise Workload Manager plug-in. Possible reasons are:

1. The Enterprise Workload Manager plug-in configuration file was not found.
2. There is a connection problem with Enterprise Workload Manager server.
3. An internal error occurred while initializing the Enterprise Workload Manager plug-in.

System action: The IBM Tivoli Dynamic Workload Broker is started without the Enterprise Workload Manager plug-in.

Operator response: Check that the Enterprise Workload Manager plug-in configuration file is present in the IBM Tivoli Dynamic Workload Broker configuration directory.

See the trace file for more details.

AWKEWL005W The Enterprise Workload Manager plug-in is not configured and cannot be started.

Explanation: The Enterprise Workload Manager plug-in configuration file was not found.

System action: The IBM Tivoli Dynamic Workload

Broker is started without the Enterprise Workload Manager plug-in.

Operator response: Check that the Enterprise Workload Manager plug-in configuration file is present in the IBM Tivoli Dynamic Workload Broker configuration directory.

See the trace file for more details.

AWKEWL007E An internal error occurred while stopping the Enterprise Workload Manager plug-in

Explanation: See message text.

System action: The IBM Tivoli Dynamic Workload Broker is stopped anyway.

Operator response: See the trace file for more details.

AWKEWL008W No Enterprise Workload Manager Server configuration has been defined.

Explanation: The Enterprise Workload Manager plug-in cannot establish a connection with any Enterprise Workload Manager Server.

System action: The program continues.

Operator response: See the trace file for more details.

AWKEWL010E The Enterprise Workload Manager plug-in failed to connect to the Enterprise Workload Manager Domain Manager "domain_manager_name".

Explanation: An error occurred while establishing a connection with the Enterprise Workload Manager Domain Manager. Possible reasons are:

1. The Enterprise Workload Manager Domain Manager server was not found.
2. A network error occurred connecting to the Enterprise Workload Manager Domain Manager.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL012E The Enterprise Workload Manager plug-in failed to initialize the internal cache for the Enterprise Workload Manager Domain Manager "domain_manager_name".

Explanation: An error occurred while initializing the internal cache. Possible reasons are:

1. The Enterprise Workload Manager plug-in was unable to contact the Tivoli Dynamic Workload Broker Resource Advisor component.
2. An error occurred while registering a new Tivoli Dynamic Workload Broker resource to the Enterprise Workload Manager Domain Manager.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL014E The Enterprise Workload Manager plug-in failed to update the internal cache for the Enterprise Workload Manager Domain Manager "domain_manager_name".

Explanation: An error occurred while updating the internal cache. Possible reasons are:

1. The Enterprise Workload Manager plug-in is not able to contact the Tivoli Dynamic Workload Broker Resource Advisor component.
2. An error occurred while registering a new Tivoli Dynamic Workload Broker resource to the Enterprise Workload Manager Domain Manager.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL017W An error occurred while creating the new resource "resource_name" belonging to the group "resource_group_name".

Explanation: An internal error occurred retrieving the network address of the new resource.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL020E Unable to set the Load Balancer state for the Enterprise Workload Manager Domain Manager "domain_manager_name". The following error was returned: "error".

Explanation: An internal error occurred while running the command.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL022E The Enterprise Workload Manager plug-in failed to register the following members "members" belonging to the group "resource_group_name" to the Enterprise Workload Manager Domain Manager "domain_manager_name". The following error was returned: "error".

Explanation: An internal error occurred while running the command.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL024E The Enterprise Workload Manager plug-in failed to deregister from the Enterprise Workload Manager Domain Manager "domain_manager_name" the following members "members" belonging to the group "resource_group_name". The following error was returned: "error".

Explanation: An internal error occurred while running the command.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKEWL028W The connection with the EWLM Domain Manager "domain_manager_name" has been lost. The weights of all members will be reset until the connection is reestablished.

Explanation: The EWLM Domain Manager service could be down or a network error occurred.

System action: The program continues, but the operation is not performed.

Operator response: Check that the EWLM Domain Manager service is running and listening on the correct port.

See the trace file for more details.

Chapter 15. AWKEXE - Executable Job Executor messages

This section lists error and warning messages that might be generated by the routines that handle the Executable Job Executor.

The message component code is EXE.

AWKEXE001E The script parameter is empty.

Explanation: The script parameter is required. Specify either the script or the path parameter. You cannot specify both.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE002E The path parameter is empty.

Explanation: The path parameter is required. Specify either the script or the path parameter. You cannot specify both.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE003E The error parameter is empty.

Explanation: The error parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE004E The input parameter is empty.

Explanation: The input parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE005E The output parameter is empty.

Explanation: The output parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE006E The workingDirectory parameter is empty.

Explanation: The workingDirectory parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE007E The groupName parameter is empty.

Explanation: The groupName parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE008E The password parameter is empty.

Explanation: The password parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE009E The path or the script parameters is empty.

Explanation: A path or a script is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE010E You cannot specify both path and script parameters.

Explanation: See message text.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE011E The password parameter is empty.

Explanation: The password parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE012E The user name parameter is empty.

AWKEXE013E • AWKEXE017E

Explanation: The user name parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE013E The arguments parameter is empty.

Explanation: The arguments parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE014E The environment parameter is empty.

Explanation: The environment parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE015E There are one or more empty names in the environment parameter.

Explanation: See message text.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE016E The jsdle:executable element is missing in the job definition.

Explanation: The jsdle:executable element is required in the job definition.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKEXE017E Spaces are not allowed in the script extension

Explanation: Spaces are not allowed in the script extension.

System action: The program stops.

Operator response: Remove any space from the script extension

Chapter 16. AWKFTE - File transfer Job Executor messages

This section lists error and warning messages that might be generated by the routines that handle the file transfer job executor.

The message component code is FTE.

AWKFTE001E The server address is missing.

Explanation: The server address is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKFTE002E The path to the local file is missing.

Explanation: The path to the local file is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKFTE003E The path to the remote file is missing.

Explanation: The path to the remote file is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKFTE004E The credentials are missing.

Explanation: The credentials are mandatory parameters.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKFTE005E The user name or the password is missing.

Explanation: The user name and the password are required parameters.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKFTE006E The specified protocol is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid protocol and retry the operation.

AWKFTE007E An unexpected error has occurred. The following error message was returned:"exception_message"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the agent log file in /opt/IBM/TWA/TWS/JavaExt/logs/.

AWKFTE008E The specified transfer mode is incorrect.

Explanation: The specified transfer mod is not supported. Supported transfer modes are ASCII or binary.

System action: The operation is not performed.

Operator response: Specify a valid transfer mode. Retry the operation.

AWKFTE009E One or more mandatory parameters are missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKFTE010E The user name or the password is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct user name and password and retry the operation.

AWKFTE011E Cannot reach the specified server.

Explanation: See message text.

System action: The operation is not performed.

AWKFTE012E • AWKFTE025E

Operator response: Verify if the server is running and the network connection is available. Retry the operation.

AWKFTE012E Cannot find the specified protocol.

Explanation: The specified protocol is not available on the target workstation.

System action: The operation is not performed.

Operator response: Verify if the protocol is installed and enabled. Retry the operation.

AWKFTE015E Remote file not found or permission denied

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the file is existing and that you have enough permissions.

AWKFTE016E One or more codepages are empty.

Explanation: Codepages cannot be empty.

System action: The operation is not performed.

Operator response: Check that the specified codepages have content.

AWKFTE017E The port number specified in the server address is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the server address.

AWKFTE018E The specified codepage "codepage" is not correct or is not supported.

Explanation: See message text.

System action: The operation is not performed.

codepage is the codepage name.

Operator response: Check that the codepage is valid.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKFTE019E The operation is missing.

Explanation: The upload or download parameters must be defined.

System action: The operation is not performed.

Operator response: Specify the upload or download parameters and retry the operation.

AWKFTE020E Unable to perform the codepage conversion.

Explanation: When you use the SSH or Windows protocol, the codepage is automatically detected and converted. In this case, there is an error in codepage of the file that you are trying to transfer, which is not compliant with the codepage of the local system.

System action: The operation is not performed.

Operator response: If you are trying to upload a file, verify the local file codepage.

If you are trying to download a file verify, the remote file codepage.

If the file has the correct codepage, use the codepage conversion feature.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKFTE022E An error occurred while transferring a file to or from the remote workstation.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the file is existing and that you have enough permissions, and that the necessary disk space is available.

AWKFTE023E Connection refused.

Explanation: The FTP Server refused connection.

System action: The operation is not performed.

Operator response: Check if the FTP server service is running.

AWKFTE024E No conversion available between specified codepages.

Explanation: No supported code set converter for the specified code page. The provided codepages are ignored..

System action: The file transfer is performed using default codepages.

Operator response: Check the correctness of the codepage.

AWKFTE025E One or more port numbers of the ports range are empty or invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the specified min and max port numbers.

AWKFTE026E The specified value for the timeout is invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the provided timeout.

AWKFTE027E The specified value for the passive option is invalid. Only the values yes and no can be used.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the provided value for the passive option.

AWKFTE028E Connection not established due a timeout problem.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check if the FTP server is reachable.

AWKFTE029E The specified value for the certificates validity check option is invalid. Only the values yes and no can be used.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the provided value for the certificates validity check option in the file transfer configuration file.

AWKFTE030E The specified value for the cacerts certificates key store authentication option is invalid. Only the values yes and no can be used.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the provided value for the cacerts certificates key store authentication option in the file transfer configuration file.

AWKFTE031E The specified user and password are invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the provided value for the user and the password.

Chapter 17. AWKHFS - Job plug-in for Hadoop Distributed File System messages

This section lists error and warning messages that might be issued by the job plug-in for Hadoop Distributed File System.

Chapter 18. AWKHMR - Job plug-in for Hadoop Map Reduce messages

This section lists error and warning messages that might be issued by the job plug-in for Hadoop Map Reduce.

AWKHMR001E The required Hadoop installation directory parameter is missing. Provide the required information in the Hadoop Map Reduce job definition or in the `""HadoopMapReduceJobExecutor.properties""` file.

Explanation: The Hadoop installation directory is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information in the Hadoop Map Reduce job definition or in the `""HadoopMapReduceJobExecutor.properties""` file, and retry the operation.

AWKHMR002E The required jar file parameter is missing.

Explanation: The jar file is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKHMR003E The Hadoop installation directory `""installdir""` you specified is not valid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct Hadoop installation directory.

AWKHMR004E The jar file `""jarfile""` you specified does not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify an existing jar file.

AWKHMR005E The jar file `""jarfile""` you specified is not valid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a correct jar file.

AWKHMR006E An unexpected error has occurred. The following error message was returned: `""error""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the job log for more information.

AWKHMR007E Permission denied to execute the Hadoop command `""command""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Assign execute permission to the Hadoop command.

AWKHMR009E The test of the Hadoop installation directory failed. The error message is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct Hadoop installation directory.

AWKHMR010E An unexpected error has occurred. Check the job log for further details.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKHMR011E No element is available for the specified `""filter""` filter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check whether there are any available data, change the filter settings or contact your system administrator.

Chapter 19. AWKICA - Calendar messages

This section lists error and warning messages that might be issued by the Calendar.

The message component code is ICA.

AWKICA001E Only one of the following values "var0" and "var1" is allowed for frequency "var2".

Explanation: The ICalendar rule contains two frequency values; ICalendar syntax allow only one possible value for the frequency token.

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar rule is well formed and adhere to the ICalendar specifications.

AWKICA002E Rule "var0" is incompatible with frequency "var1".

Explanation: The ICalendar contains a rule (e.g. BYDAY) that is not compatible with the specified frequency (e.g. WEEKLY).

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar rule is well formed and adhere to the ICalendar specifications.

AWKICA003E Cannot add the day of week to the recurrence rule. The name for the day of week ("var0") is incorrect.

Explanation: The ICalendar contains an invalid weekday value; weekday value can be one of ""SU"", ""MO"", ""TU"", ""WE"", ""TH"", ""FR"", ""SA"".

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar rule is well formed and adhere to the ICalendar specifications.

AWKICA004E Cannot add the element to the recurrence list. The element cannot be less than the minimal value for the list ("var0"). The element value is "var1".

Explanation: The ICalendar contains an interval whose minimum value is less than the minimum allowed value for an interval.

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar

rule is well formed and adhere to the ICalendar specifications.

AWKICA005E Cannot add element to the recurrence list. The element cannot be greater than the maximum value for the list ("var0"). The element value is "var1".

Explanation: The ICalendar contains an interval whose maximum value is greater than the maximum allowed value for an interval.

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar rule is well formed and adhere to the ICalendar specifications.

AWKICA006E Cannot add element to the recurrence list because the element value is zero.

Explanation: The ICalendar contains a list element whose value is zero, whereas zero is not a valid value for this calendar.

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar rule is well formed and adhere to the ICalendar specifications.

AWKICA007E Cannot set the interval because the value "var0" is less than 0.

Explanation: The ICalendar contains an interval whose minimum value is less than zero.

System action: The ICalendar rule is not created.

Operator response: Check that the specified ICalendar rule is well formed and adhere to the ICalendar specifications.

Chapter 20. AWKIIE - IBM iconic Job Executor messages

This section lists error and warning messages that might be generated by the routines that handle the IBM iconic job executor.

The message component code is IIE.

AWKIIE001E The command parameter is either missing or empty.

Explanation: The command is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKIIE002E The length of the command exceeds the maximum size of "max_size" characters.

Explanation: See message text.

max_size is the maximum length allowed for the command parameter.

System action: The operation is not performed.

Operator response: Specify a valid command and retry the operation.

Chapter 21. AWKIPC - Informatica PowerCenter Plug-in messages

This section lists error and warning messages that might be issued by the Informatica PowerCenter Plug-in component.

The message component code is IPC.

AWKIPC001E Missing required value for Repository Name.

Explanation: The job validation failed.

System action: The operation is not performed.

Operator response: Provide missing parameter.

AWKIPC002E Missing required value for Service Name.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide missing parameter.

AWKIPC003E Missing required value for Folder Name.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide missing parameter.

AWKIPC004E Missing required value for Workflow Name.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide missing parameter.

AWKIPC005E Failed to run workflow.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the PowerCenter plug-in log file.

AWKIPC006E Failed to cancel workflow.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the PowerCenter plug-in log file.

AWKIPC007E Failed to retrieve logon parameters.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check all login parameter are available; depending the parameter it can be provided by the PowerCenterJobExecutor.properties or in the job definition.

AWKIPC008E Missing configuration information related to the PowerCenter: "property".

Explanation: Required information is not available in the PowerCenterJobExecutor.properties.

System action: The operation is not performed.

Operator response: Provide required information using the PowerCenterJobExecutor.properties.

AWKIPC009E Missing both input and configuration information related to the PowerCenter: "property".

Explanation: Required information is not available neither in the PowerCenterJobExecutor.properties neither in the job definition.

System action: The operation is not performed.

Operator response: Provide required information using the PowerCenterJobExecutor.properties or in the job definition.

AWKIPC010E Required parameter non provided.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Depending the parameter be sure to provide required information using the PowerCenterJobExecutor.properties or by the job definition.

AWKIPC011E An error occurred retrieving repository list

Explanation: See message text.

AWKIPC012E • AWKIPC023E

System action: The operation is not performed.

Operator response: Analyze the error message in the Java PowerCenter plug-in log file.

AWKIPC012E An error occurred retrieving service list

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java PowerCenter plug-in log file.

AWKIPC013E An error occurred retrieving folder list

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java PowerCenter plug-in log file.

AWKIPC014E An error occurred retrieving workflow list

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java PowerCenter plug-in log file.

AWKIPC015E You do not specify the Repository Name. It is required to retrieve the Folder list.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide required parameter before.

AWKIPC016E You do not specify the Folder Name. It is required to retrieve the Workflow list.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide required parameter before.

AWKIPC017E The IBM Tivoli Workload Scheduler agent cannot monitor the PowerCenter job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the PowerCenter job status and log.

AWKIPC018E An error occurred retrieving the workflow parameter file list.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the directory indicated in the PowerCenterJobExecutor.properties is a directory, is readable, have valid contents.

AWKIPC019E The repository list is empty.

Explanation: See message text.

System action: The system returns an empty repository list

Operator response: If a not empty list is expected, check the PowerCenter log file for errors.

AWKIPC020E The service list is empty.

Explanation: See message text.

System action: The system returns an empty service list

Operator response: If a not empty list is expected, check the PowerCenter log file for errors.

AWKIPC021E The folder list is empty.

Explanation: See message text.

System action: The system returns an empty folder list

Operator response: If a not empty list is expected, check the PowerCenter log file for errors.

AWKIPC022E The workflow list is empty.

Explanation: See message text.

System action: The system returns an empty workflow list

Operator response: If a not empty list is expected, check the PowerCenter log file for errors.

AWKIPC023E The directory "dir", that should contain files with workflow parameter, appears to be empty.

Explanation: See message text.

System action: The system returns an empty list of files in the directory *dir*

Operator response: Check the indicated directory is valid, readable and contains expected files.

AWKIPC024E No files with the proposed filter in the directory "dir".

Explanation: See message text.

System action: No files with the proposed filter

Operator response: Check the applied filter is correct.

AWKIPC025E The directory that should contain files with workflow parameter was not indicated in the configuration file or is not a valid directory.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check a valid directory has been indicated in the PowerCenterJobExecutor.properties using the key WorkflowParameterFileDir.

AWKIPC026E An error occurred during reconnect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the PowerCenter is up and running and is reachable from the TWS agent

AWKIPC027E Cannot indicate both a workflow parameter file and in-line parameters.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Remove the workflow parameter file or the in-line parameters

AWKIPC028E Unable to contact the PowerCenter server.

Explanation: The login to the PowerCenter server fail, due to invalid parameters in input or in the PowerCenterJobExecutor.properties file

System action: The operation is not performed.

Operator response: Check login parameters as server host and port, user, password are available and correct.

Chapter 22. AWKITM - ITM scanner messages

This section lists error and warning messages that might be generated by the routines that handle the ITM scanner.

The message component code is ITM.

AWKITM001W An error occurred while loading the user configuration file "config_file". The following error was returned: "error". The default values will be used.

Explanation: The configuration file cannot be read from the Tivoli Dynamic Workload Broker configuration directory.

System action: See message text.

Operator response: Check whether the configuration file located in the Tivoli Dynamic Workload Broker configuration directory is corrupted, locked, or missing.

AWKITM002E An error occurred while getting the configuration file "config_file". The following error was returned: "error".

Explanation: The configuration file cannot be found in the Tivoli Dynamic Workload Broker jar files.

System action:

Operator response: Check whether the jar files in the Tivoli Dynamic Workload Broker installation directory are corrupted or missing. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKITM003E Unable to find the configuration file "config_file" .

Explanation: See message text.

System action: None

Operator response: Check whether the jar files in the Tivoli Dynamic Workload Broker installation directory are corrupted or missing. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKITM005E An exception occurred on the ITM server. The following error was returned: "error".

Explanation: See message text.

System action:

Operator response: Check that the IBM Tivoli Monitoring scanner is up and running and that it can be contacted.

AWKITM006E The operation failed because the required parameter "parameter" is missing. Include it in the command or in the configuration file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the required parameter.

AWKITM007E The command failed because it included an unsupported parameter "parameter".

Explanation: See message text.

System action:

Operator response: Check the command syntax and retry the operation.

AWKITM008E The operation failed because the URL specified for the Tivoli Dynamic Workload Broker server "URL" is not correct.

Explanation: See message text.

System action: See message text.

Operator response: Correct the URL.

AWKITM009E A problem occurred while contacting the Tivoli Dynamic Workload Broker server. The Tivoli Dynamic Workload Broker service is not available.

Explanation: See message text.

System action: See message text.

Operator response: Check that the Tivoli Dynamic Workload Broker server is up and running and that it can be contacted.

AWKITM010E Unable to invoke Tivoli Dynamic Workload Broker Web Services because an incorrect parameter was specified.

AWKITM011E • AWKITM014E

Explanation: See message text.

System action: The operation was not performed.

Operator response: Check the parameters and try again.

AWKITM011E Unable to invoke Tivoli Dynamic Workload Broker Web Services.

Explanation: See message text.

System action: The operation was not performed.

Operator response:

AWKITM012E Unable to connect to the Tivoli Dynamic Workload Broker server. The user credentials might be incorrect.

Explanation: See message text.

System action: The operation was not performed.

Operator response: Check the user name and password and retry the operation.

AWKITM013E The operation failed because the user is not authorized to perform it.

Explanation: See message text.

System action: The operation was not performed.

Operator response: Log on with the required level of authorization and retry the operation.

AWKITM014E An unexpected error occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the trace file for more information about the error.

Chapter 23. AWKJBJ - JBJ JSR 352 Java Batch plug-in

This section lists error and warning messages that might be generated by JSR 352 Java Batch plug-in.

The message component code is JBJ.

AWKJBJ002E Test connection failed. The error was `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the error message and retry the operation.

AWKJBJ004E JSR 352 Java Batch job submit operation failed. The error was `""error""`

Explanation: An error was received while submitting the job.

System action: The operation is not performed.

Operator response: Verify that you have the proper authorization to submit the job and that your credentials or job parameters are correct. Try the operation again

AWKJBJ005E JSR 352 Java Batch job execution failed

Explanation: An error occurred executing the job.

System action: The operation is not performed.

Operator response: Verify that the job parameters are correct. Try the operation again

AWKJBJ006E The UTF-8 encoding is not supported. The error message is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKJBJ007E An error occurred establishing a connection to the remote service. The error message is `""error""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the error message and retry the operation.

AWKJBJ008E The job was cancelled by the user.

AWKJBJ009E An error occurred retrieving JSON result from response. The error message is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the JSON result query

AWKJBJ010E An error code was returned invoking a RESTful method. The error message is `""error""`

AWKJBJ011E Missing Application Name.

Explanation: No Application Name was specified.

System action: The operation is not performed.

Operator response: Specify the Application Name.

AWKJBJ013E Invalid authorization. Missing or wrong credentials.

System action: The operation is not performed.

System action: The operation is not performed.

Operator response: Verify that your credentials are correct. Try the operation again

AWKJBJ014E The Job XML is malformed. The error message is `""error""`

System action: The operation is not performed.

System action: The operation is not performed.

Operator response: Insert a correct Job XML

AWKJBJ015E Error loading the file containing the XML job. The error message is `""error""`

Explanation: The file cannot be opened.

System action: The operation is not performed.

Operator response: Specify a correct xml file path.

AWKJBJ017E Error loading the file containing the XML job. File `""file""` not found.

AWKJBJ018E • AWKJBJ021E

Explanation: The path specified is wrong.

System action: The operation is not performed.

Operator response: Specify a correct xml file path.

AWKJBJ018E The port parameter is invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a correct port.

AWKJBJ019E The protocol parameter is invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a correct protocol.

**AWKJBJ021E The server switch mode parameter is invalid. Valid values are
""switchModes"".**

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a correct server switch mode.

Chapter 24. AWKJBN - Job definition base notify service messages

This section lists error and warning job definition base notify service messages that might be issued.

The message component code is JBN.

AWKJBN081E A notification was received with incorrect Topic: "topic" or Message: "message".

Explanation: See message text.

System action: The system continues processing other messages.

Operator response: None.

Chapter 25. AWKJCL - Command line messages

This section lists error and warning messages that might be generated when using the command line.

The message component code is JCL.

AWKJCL001E The job stream name value "invalid_job_stream_name_value" specified as jsdljcl:jobStreamName in the jsdl job definition is incorrect. It must be "valid_job_stream_value"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Set the job stream name value to *valid_job_stream_name_value* and retry the operation.

AWKJCL002E The input arrival time value "invalid_input_arrival_time_value" specified as jsdljcl:inputArrival in the jsdl job definition is incorrect. It must be "valid_input_arrival_time_value"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Set the input arrival time value to *valid_input_arrival_time_value* and retry the operation.

AWKJCL009E The MEMBER value is empty or not valid.

Explanation: The value specified for MEMBER name is empty or not valid.

System action: The operation is not performed.

Operator response: Specify a valid MEMBER name.

AWKJCL010E The DATASET value is not valid.

Explanation: The value specified for DATASET name is not valid.

System action: The operation is not performed.

Operator response: Specify a valid DATASET name.

AWKJCL011E The MEMBER value exceeds the length of 8 bytes.

Explanation: The value specified for MEMBER name is longer than 8 bytes.

System action: The operation is not performed.

Operator response: Specify a valid MEMBER name.

Chapter 26. AWKJDB - Common objects messages

This section lists error and warning messages that might be generated by the routines that handle common objects.

The message component code is JDB.

AWKJDB101E The specified object was not found.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: Check that you have correctly specified the object. If you have, check that the object has not been deleted from the database. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB102E The specified global option was not found.

Explanation: The global option is not found in the database. You might have wrongly specified the name or the option might have been deleted from the database.

System action: The operation cannot be performed. The program continues.

Operator response: Ensure that the global option name you specified is correct and that the option has not been deleted from the database. You can request a list of the global options using the command **optman ls**. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See *The Installation and Configuration Guide* for a full description of the options.

AWKJDB201E The specified object cannot be locked, updated, or deleted because it is locked by user "user_name".

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: Retry the operation and if the object is still locked, contact the user indicated in the message. Retry the operation when the object is unlocked.

AWKJDB202E The object cannot be unlocked or updated because it is not locked.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: Ensure that you have specified the correct object. Check the status of the object in the database. If the object is not locked, lock it before retrying the operation.

AWKJDB203E The object cannot be unlocked or updated because it was not locked by you. you are logged on as user "user1_name". The object is locked by user "user2_name".

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: Ensure that you have specified the correct object and that you are the identified user. Make any required corrections and retry the operation. If this is the correct object and it is locked by another user, contact the user to unlock it and then retry the operation.

AWKJDB204E The object cannot be unlocked or updated because it is locked by you, logged on as "user_name" in another session.

Explanation: If you lock an object in one session, you can only update or unlock it in that same session. A session is an instance of any of the following:

- The Tivoli Dynamic Workload Console
- The command line
- A GUI or command line developed by your own organization

Each time you open one of these instances, whether on the same or a different computer, it is treated as a separate session.

System action: The operation cannot be performed. The program continues.

Operator response: Check that you have specified the correct object and that you are the identified user and if so do the following:

AWKJDB205E • AWKJDB207E

- If you have used a second session by accident, return to the first session to continue
- If you have been forced to use a new session for some reason, use the force option to unlock the object and then restart the operation you intended to perform.

If you use the force option in a second session when the first session is still open, trying to edit the object in the first session will cause this message to be displayed again.

This message could appear in many circumstances. Here are two example scenarios:

A second session is opened by accident

1. You open a command line session on your computer and lock an object for editing.
2. Something distracts you and when you return to the work you were doing you forget that you had already started and open another command line session.
3. When you try to lock the object for editing this message is given.
4. Check to see if you have any other sessions open. When you find the original session, close the second session.
5. Continue working in the first session, editing and then unlocking the object.

A session fails

1. You open a Tivoli Dynamic Workload Console session on your computer and lock an object for editing.
2. Your computer crashes (for some reason unconnected with Tivoli Workload Scheduler), and needs to be rebooted.
3. After restarting, you open a new Tivoli Dynamic Workload Console session and try to continue editing the object. This message is displayed.
4. Unlock the object using the force option.
5. Lock the object, edit it, and then unlock it.

AWKJDB205E An error occurred when trying to lock multiple objects because at least one of the selected objects is already locked.

Explanation: You might attempt to lock multiple objects when they have been selected as the result of a wildcard search.

System action: All objects that could be locked have been locked. Objects that were already locked are not modified. The program continues.

Operator response: Complete the following steps:

1. View the details of the objects you want to lock.

2. Check their status and find out which ones are already locked.
3. Contact the user who has locked them to have them unlocked.
4. Retry the operation.

AWKJDB206E An error occurred when trying to unlock multiple objects because at least one of the selected objects was not locked by you ("user_name").

Explanation: You might attempt to unlock multiple objects when they have been selected as the result of a wildcard search.

System action: All objects that could be unlocked have been unlocked. Objects that were locked by a different user are not modified. The program continues.

Operator response: Complete the following steps:

1. View the details of the objects you want to unlock.
2. Check their status and find out which ones are locked by another user.
3. Contact the user that has locked them to have them unlocked.

AWKJDB207E An error occurred when trying to unlock multiple objects because at least one of the selected objects was locked by you ("user_name"), in another session.

Explanation: If you lock an object in one session, you can only update or unlock it in that same session. A session is an instance of any of the following:

- The Tivoli Dynamic Workload Console
- The command line
- A GUI or command line developed by your own organization

Each time you open one of these instances, whether on the same or a different computer, it is treated as a separate session.

System action: All objects that could be unlocked have been unlocked. Objects that were locked in a different session are not modified. The program continues.

Operator response: Check that you have specified the correct object and that you are the identified user and if so do the following:

- If you have used a second session by accident, return to the first session to continue
- If you have been forced to use a new session for some reason, use the force option to unlock the object and then restart the operation you intended to perform.

If you use the force option in a second session when the first session is still open, trying to edit the object in the first session will cause this message to be displayed again.

This message could appear in many circumstances. Here are two example scenarios:

A second session is opened by accident

1. You open a command line session on your computer and lock an object for editing.
2. Something distracts you and when you return to the work you were doing you forget that you had already started and open another command line session.
3. When you try to lock the object for editing this message is given.
4. Check to see if you have any other sessions open. When you find the original session, close the second session.
5. Continue working in the first session, editing and then unlocking the object.

A session fails

1. You open a Tivoli Dynamic Workload Console session on your computer and lock an object for editing.
2. Your computer crashes (for some reason unconnected with Tivoli Workload Scheduler), and needs to be rebooted.
3. After restarting, you open a new Tivoli Dynamic Workload Console session and try to continue editing the object. This message is displayed.
4. Unlock the object using the force option.
5. Lock the object, edit it, and then unlock it.

If you use the force option in a second session when the first session is still open, if you return to the first session and try to edit the object you will receive this message again.

AWKJDB301E Unused message.

AWKJDB401E Unused message.

AWKJDB402E An internal error occurred while reading or writing a UUID in the database, or while generating a UUID for a new object.

Explanation: There is a problem in the algorithm that creates unique identifiers.

System action: The identifier cannot be created. A database transaction might be rolled back. The program continues.

Operator response: If you cannot resolve the problem,

search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB403E An internal error occurred. The operation "operation_name" cannot be performed because the Data Access Object (DAO) context state "context_state" is not correct.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB404E An internal error has occurred while parsing the Identifier. The internal error message is: "error".

Explanation: See message text.

System action: The identifier cannot be created. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB501E Unused message.

AWKJDB601E An internal error occurred. A database integrity constraint has been violated. The internal error message is: "error".

Explanation: The database write operation cannot be started because it violates an integrity constraint.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB602E An internal error occurred. A database not null constraint has been violated. The internal error message is: "error".

Explanation: The database write operation cannot be started because it violates a not null constraint.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem,

search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB603E An internal error occurred. A database check constraint has been violated. The internal error message is: "error".

Explanation: The database write operation cannot be started because it violates a check constraint.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB604E An internal error occurred. A database unique constraint has been violated, the object already exists.

Explanation: The database write operation cannot be started because it violates a unique constraint.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB605E An internal error occurred. A database foreign key constraint has been violated. The internal error message is: "error".

Explanation: The database write operation cannot be started because it violates a foreign key constraint.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB606E An internal error occurred. A foreign key constraint prevents the remove operation. The internal error message is: "error".

Explanation: The database remove operation cannot be started because it is restricted by a foreign key constraint.

error explains more about the error.

System action: The remove operation was not started.

The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB607E An internal error occurred. The value defined for a database field exceeds its column bounds. The internal error message is: "error".

Explanation: The database write operation cannot be started because a value exceeds its column bounds.

System action: The operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB801E An internal error has been found while accessing the database. The internal error message is: "error".

Explanation: See message text.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB802E An internal error has occurred in the database connection. The internal error message is: "error".

Explanation: See message text.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB803E An internal deadlock or timeout error has occurred while processing a database transaction. The internal error message is: "error".

Explanation: See message text.

System action: The system attempts to roll back the current transaction. The program continues.

Operator response: On DB2 a message with code SQLERRMC: 68 identifies a time-out error. This can happen if an overhead occurred or the database server does not have sufficient resources. Check that the number of database connections is not too high with respect to the server capabilities. 16 MB of RAM are required for every 5 connections. You can lower the number of threads in the JobDispatcherConfig.properties file.

If the database is located on a server with insufficient memory, the required buffer pools might not have started correctly. This can cause unexpected behavior. To check the buffer pool status, enter the following command from the DB2 command line:

```
get snapshot for tablespaces on nulltdwb-
database_name>
```

where nulltdwb-database_name> is the database name.

If the value of the Buffer pool ID currently in use is different from the value of Buffer pool ID next startup, the buffer pool has not started

In a DB2 8.2 installation, 512 MB are required for the Tivoli Dynamic Workload Broker buffer pool.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB804E The operation cannot be completed because a concurrent update has been detected. Completing the operation would lead to a database inconsistency.

Explanation: See message text.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDB805E The requested operation cannot be performed because the database is locked by the planner process.

Explanation: Write operations are not allowed because the plan is being generated and the database is temporarily locked.

System action: The write operation was not started. The database transaction is rolled back. The program continues.

Operator response: Wait until the end of the plan generation process and retry the operation.

Chapter 27. AWKJDD - Job definition service messages

This section lists error and warning job definition service messages that might be issued.

The message component code is JDD.

AWKJDD101E The submission of the job definition failed because the submit parameters are null.

Explanation: An attempt to create or update a new job definition failed because the supplied parameters are null.

System action: The operation cannot be performed.

Operator response: Check the job definition parameters and try to submit the job again.

AWKJDD102E The submission of the job definition failed because the job definition document is null.

Explanation: An attempt to create or update a new job definition failed because the job definition document is null.

System action: The operation cannot be performed.

Operator response: Check the job definition document. It cannot be empty.

AWKJDD103E The job definition creation has failed because of the database error: "error"

Explanation: An attempt to create a new job definition failed because of a database error.

System action: The program continues, but the operation is not performed.

Operator response: See message text.

AWKJDD104E The Job Definition update failed because of the database error: "error"

Explanation: An attempt to update a new job definition failed because of a database error.

System action: The program continues, but the operation is not performed.

Operator response: See message text.

AWKJDD105E An error occurred when parsing JSDL.

Explanation: An error occurred during the conversion of the JSDL.

System action: The operation cannot be performed.

Operator response: Check the job definition syntax.

AWKJDD106E The request to remove a job definition failed because the job definition document is null.

Explanation: An attempt to delete a new job definition failed because the job definition document is null.

System action: The operation cannot be performed.

Operator response: See message text.

AWKJDD107E The job definition deletion failed because of the database error: "error"

Explanation: An attempt to delete a new job definition failed because of a database error.

System action: The program continues, but the operation is not performed.

Operator response: See message text.

AWKJDD108E The get of a job definition has failed because of the database error: "error"

Explanation: An attempt to get a job definition failed because of a database error.

System action: The program continues, but the operation is not performed.

Operator response: See message text.

AWKJDD109E The job definitions query failed because of the database error: "error"

Explanation: An attempt to get a number of job definitions failed because of a database error.

System action: The program continues, but the operation is not performed.

Operator response: See message text.

AWKJDD110E The request for the job definition failed because the Qname is null.

Explanation: An attempt to get a job definition failed because the Qname (name + namespace) is null.

System action: The program continues, but the operation is not performed.

Operator response: See message text.

Chapter 28. AWKJDE - Job dispatcher messages

This section lists error and warning Job dispatcher messages that might be issued.

The message component code is JDE.

AWKJDE005E An error occurred accessing the job repository database while performing the "operation" operation. The internal error is: "error".

Explanation: It was not possible to run the specified action on the job repository database. Possible reasons are:

- The service is unavailable.
- The Tivoli Dynamic Workload Broker server is down or not responding.

Operator response: See the trace file for more details.

AWKJDE007W An error occurred sending a client notification. The URL might not be accepting connections. The internal error is: "error".

Explanation: The Job Dispatcher is unable to notify the change of status of a job. This might be because of a network problem or because a recipient is not listening.

Operator response: Check whether the network is available.

AWKJDE008E An error occurred connecting to the job manager session bean. The internal error is: "error".

Explanation: The Job Dispatcher is unable to communicate with Job Manager because of an internal error.

Operator response: Restart IBM WebSphere Application Server and try again.

AWKJDE011E An error occurred accessing the job repository database. See the exception log for details.

Explanation: It was not possible to access the job repository database. Possible reasons are:

1. The database server is down or not responding.
2. There are no available connections in the connection pool.

Operator response: Check whether DB2 is running. See the exception log for details.

AWKJDE012W A job repository operation failed. See the exception log for details. Restart the database and try again.

Explanation: See message text.

Operator response: See message text.

AWKJDE013W An error occurred sending a Job Notification. See the exception log for details.

Explanation: See message text.

Operator response: See message text.

AWKJDE014E An error occurred creating failure or move history data alarm service. The following error was received: : "error". The Job Dispatcher cannot be started.

Explanation: There was a problem starting the Job Dispatcher because of an internal error.

Operator response: Restart IBM WebSphere Application Server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE017E An error occurred creating web service proxy. The following error was received: : "error". The Job Dispatcher cannot be started.

Explanation: There was a problem starting the Job Dispatcher because of an internal error.

Operator response: Restart IBM WebSphere Application Server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE018E An error occurred starting Job Dispatcher Queue Manager thread. The following error was received: "error".

Explanation: There was a problem while processing requests posted to Job Dispatcher.

Operator response: Restart IBM WebSphere

AWKJDE019E • AWKJDE031E

Application Server. If the problem persists, see the trace file for more details.

AWKJDE019E The Resource Advisor URL is not configured. The Job Dispatcher cannot be started.

Explanation: There was a problem starting the Job Dispatcher because the key RAEndpointAddress is missing from the configuration file.

Operator response: Verify the correctness of the key RAEndpointAddress in the configuration file JobDispatcherConfig.properties.""

AWKJDE020W An error occurred sending a client notification. The URL might not be accepting connections. See the exception log for details.

Explanation: See message text.

Operator response: See message text.

AWKJDE021E Incorrect input argument. Verify the input parameters JSDL and clientNotifyEPR.

Explanation: A null value for Job definition name was passed to the submitJob method.

Operator response: If you are using the Tivoli Dynamic Workload Broker Command Line Interface or Web UI, this is an internal error. If you are using an API, verify that your code is passing the correct job definition name.

AWKJDE022E The input message header contains an inexistent job endpoint reference.

Explanation: During a request for the job execution log, the Job Dispatcher is unable to determine on which machine the job ran.

Operator response: None.

AWKJDE023W A resource allocation request failed. Resource Advisor URL might be down or could not accept connections. See exception log for details.

Explanation: See message text.

Operator response: See message text.

AWKJDE024E An error occurred submitting job ID "jobID" with name "name" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE025E An error occurred sending a cancel resource allocation for job ID "jobID". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE027W A job is in the wrong state for the specified operation. See exception description for job ID and incorrect state descriptor.

Explanation: See message text.

Operator response: See message text.

AWKJDE028E A job interface is called with security authentication enabled but the job instance was created unauthenticated.

Explanation: Job Dispatcher is serving a request with IBM WebSphere Application Server security enabled. The operation failed because the job within which the operation is being run was submitted by an unauthenticated user. This might happen if IBM WebSphere Application Server security was previously disabled.

Operator response: Run the failed operation again using the credentials for a user with the appropriate access privileges.

AWKJDE029E A job interface is called with security authentication enabled but the calling user is not the job instance submitter or a member of the Job Administrator group.

Explanation: See message text.

Operator response: Ensure that the user has the required authorization by either granting the required role to the user specified in the server connection, or by specifying a different user to connect to the server.

AWKJDE030E An error occurred while retrieving target job End Point Reference (EPR) after submitting job "jobID" with name "name" to the Tivoli Common Agent endpoint with URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE031E The Job Dispatcher cannot be registered to the Agent Manager. The jobs cannot be submitted to Tivoli Common Agents. The following error occurred: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE032W A job repository operation failed with an unexpected exception.

Explanation: See message text.

Operator response: Retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE034E An error occurred during job recovery. The following error was received: "error".

Explanation: An error occurred while restoring the state of jobs that were in a non-final state when Tivoli Dynamic Workload Broker was stopped. The program continues, but pending jobs might not be run.

Operator response: After Tivoli Dynamic Workload Broker restarts cancel all pending jobs and submit them again.

AWKJDE035E An unknown job state was found: "state".

Explanation: See message text.

Operator response:

AWKJDE036E An error occurred while processing the job actions queue. The error message is: "error".

Explanation: Job Dispatcher received an internal error while processing job actions. The error might prevent jobs from running.

Operator response: Restart IBM WebSphere Application Server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE038E The Job Dispatcher could not save the last notified job state for the job "jobID" because of problems with the Job Repository. The following error was received: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE039E An error occurred during job status notification recovery. The following error was received: "error".

Explanation: An error occurred while restoring the state of jobs that were in a non-final state when Tivoli Dynamic Workload Broker was stopped. The program continues, but pending jobs might not be run.

Operator response: After Tivoli Dynamic Workload Broker restarts cancel all pending jobs and submit them again.

AWKJDE042E The resource allocation request for job "jobID" cannot be processed because of the following internal error: the Notify Service End Point Reference (EPR) cannot be found.

Explanation: An internal error occurred while processing the resource allocation request. The Notify Service address for the job being processed is missing.

Operator response: Cancel the job and submit it again.

AWKJDE043E Unable to retry the allocation request for job "jobID". Internal Error: Unsupported operation

Explanation: See message text.

Operator response: None.

AWKJDE044E The Job Dispatcher failed the check on job status for job "jobID" because of the following internal error: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE045E Error requesting resource allocation for job "jobID". The following error was received: "error".

Explanation: An internal error occurred while processing the resource allocation request. This might be caused by a communication problem with DB2.

Operator response: Check that DB2 is up and responding and that there are database connections available in the IBM WebSphere Application Server connection pool.

AWKJDE048E An error occurred canceling job ID "jobID" to the endpoint URL "URL" The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE055E The Work Manager needed to schedule jobs is not configured. The Job Dispatcher cannot be started.

Explanation: See message text.

Operator response: Restart IBM WebSphere Application Server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE056E An error occurred accessing the job repository database. The following error was received: : "error". The Job Dispatcher cannot be started.

Explanation: See message text.

Operator response: See message text.

AWKJDE057E An error occurred during Job Dispatcher initialization. The following error was received: "error". The Job Dispatcher cannot be started.

Explanation: The Job Dispatcher could not be started because of an internal error.

Operator response: Restart IBM WebSphere Application Server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE058E The affine job is in the wrong state for the specified operation. See the exception description for job ID and incorrect state descriptor.

Explanation: You have submitted a job specifying an affinity to another job, but the job is in a state that is not compatible with your request.

Operator response: Submit a job specifying affinity to jobs that are in the allowed state.

AWKJDE059E The affine job for job ID "jobID" is incorrect or cannot be found in the Job Repository.

Explanation: See message text.

Operator response: Check that you have specified the correct affine job.

AWKJDE060E The affine job with alias "alias" is incorrect or cannot be found in the Job Repository.

Explanation: See message text.

Operator response: Check that you have specified the correct affine job.

AWKJDE061W Error connecting to Resource Advisor. The cancel allocation for job "jobID" cannot be processed. The Job Dispatcher will retry the connection after "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to cancel the allocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE062W The Resource Advisor is unavailable, therefore the cancel allocation for job "jobID" cannot be processed. The Job Dispatcher will retry the connection in "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to cancel the allocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE063W The cancel allocation request to the Resource Advisor for job "jobID" failed because the specified allocation was not found. The following error was received: "error".

Explanation: Job Dispatcher cannot cancel the allocation of a job because the Resource Advisor has no allocation data for it.

This might happen at startup in the following circumstances: when the Job Dispatcher tries to cancel the allocation for jobs for which:

- Resource Advisor has not created an allocation.
- Resource Advisor has created an allocation by it was not delivered to Job Dispatcher because either IBM WebSphere Application Server or Tivoli Dynamic Workload Broker stopped in an abrupt manner.

System action: Job Dispatcher continues to process the job.

Operator response: None.

AWKJDE064E The cancel allocation request to the Resource Advisor for job "jobID" failed because incorrect parameters were specified. The following error was received: "error".

Explanation: Job Dispatcher received an error while contacting the Resource Advisor to cancel the allocation of a job.

Operator response: Restart IBM WebSphere Application Server to clear all allocations.

AWKJDE065E The cancel allocation request to the Resource Advisor for job "jobID" failed because of the following Resource Advisor error: "error". Check the Resource Advisor errors for further details.

Explanation: Job Dispatcher received an error from Resource Advisor while canceling the allocation of a job.

Operator response: Restart IBM WebSphere Application Server to clear all allocations.

AWKJDE068E Unable to retry the cancel allocation request for job "jobID". The following error was received: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE069E The allocation request for job "jobID" cannot be processed because of an error connecting to Resource Advisor. The Job Dispatcher will retry the connection in "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to process the allocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE070W The allocation request for job "jobID" cannot be processed because the Resource Advisor is unavailable. The Job Dispatcher will retry the operation in "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to process the allocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE071E The allocation request for job "jobID" to the Resource Advisor failed because incorrect parameters have been specified. The following error was received: "error".

Explanation: Job Dispatcher got an error while contacting the Resource Advisor to process the allocation of a job.

Operator response: Job Dispatcher failed to process the allocation request for the job. Check if the job definition is correct.

AWKJDE072E The allocation request for job "jobID" failed because of the following Resource Advisor error: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to process the allocation of a job.

Operator response: Check that the job definition is correct.

AWKJDE075W The reallocation of an allocation for job "jobID" cannot be processed because of an error connecting to the Resource Advisor. The Job Dispatcher will retry the connection in "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to process the resource reallocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE076W The reallocation of an allocation for job "jobID" cannot be processed because the Resource Advisor is unavailable. The Job Dispatcher will retry to contact Resource Advisor in "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to process the resource reallocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE077E The request to Resource Advisor for the reallocation of an allocation for job"jobID" failed because an incorrect allocation was requested. The following error was received: "error".

Explanation: Job Dispatcher received an error while contacting the Resource Advisor to process the resource reallocation of a job.

System action: The job does not run.

Operator response: Check the allocation for the job.

AWKJDE078E The request to Resource Advisor for the reallocation of an allocation for job"jobID" failed because incorrect parameters were specified. The following error was received: "error".

Explanation: Job Dispatcher received an error while contacting the Resource Advisor to process the resource reallocation of a job.

System action: The job does not run.

Operator response: Check the parameters for the job.

AWKJDE079E The request to Resource Advisor for the reallocation of an allocation for job"jobID" failed because of the following Resource Advisor error: "error". Check the Resource Advisor error log for further details.

Explanation: Job Dispatcher received an error while contacting the Resource Advisor to process the resource reallocation of a job.

System action: The job does not run.

Operator response: See message text.

AWKJDE082E Unable to retry the reallocate allocation request for job "jobID". The following error was received: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE083E Unable to submit the job because the following variables have not been resolved: "variable_name".

Explanation: The definition of the job contains one or more variables, but not all variables can be resolved to a value.

Operator response: Correct the variables in the job definition.

AWKJDE084E Unable to submit the job because the following numeric variable value has an incorrect format "variable_name" for the expected number type "number_type". Specify the correct variable value in the appropriate format.

Explanation: The job definition contains one or more variables, but the value of a variable is not compatible with the expected type for that variable.

Operator response: Correct the value that was passed to the Job Dispatcher during the job submission.

AWKJDE085E Unable to submit the job because the following variable has incorrect syntax: "variable_name". Specify the variable values or define their values in the Job Definition.

Explanation: The job definition contains one or more variables, but the value of a variable has incorrect syntax.

Operator response: Correct the value that was passed to the Job Dispatcher during the job submission.

AWKJDE086E The Job Dispatcher cannot instantiate the Job Status Change Listener plug-in "plug-in". The following internal error occurred when loading the implementation "error": "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE087E An error occurred. The Alarm Manager is null.

Explanation: Unable to get an alarm manager from IBM WebSphere Application Server.

Operator response:

AWKJDE100E Rollback failed with database error: "error".

Explanation: An error occurred when trying to rollback a transaction.

Operator response: See message text.

AWKJDE101E The notification address is not valid.

Explanation: A parser error occurred when the job was submitted to the Job Dispatcher because the notification address is not valid.

Operator response: Verify the correctness of the notification address when submitting the job to the Job Dispatcher.

AWKJDE102E The job submission from JSDL for job"jobID" failed because of the following error: "error".

Explanation: An attempt to create a new job has failed because of the reported error.

Operator response: Verify that the JSDL is correct then try to submit the job again. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE103E Unable to parse an XML file. Check the JSDL, endpoint reference address, and other details for the job "jobID".

Explanation: An error occurred during the conversion of an XML file.

Operator response: See message text.

AWKJDE104E Incorrect input argument. Verify the input parameters JSDL and clientNotifyEPR.

Explanation: See message text.

Operator response:

AWKJDE105E A database error occurred when notifying a status change for job "jobID". The following error was received: "error"..

Explanation: A job operation failed because of a database error.

Operator response: Check that DB2 is running. See the trace file for more details.

AWKJDE107E The job query failed because of the database error: "error".

Explanation: An attempt to get a number of jobs failed because a database error.

Operator response: Check that DB2 is running. See the trace file for more details.

AWKJDE108E Job "jobID" was not found.

Explanation: The query failed because no jobs were found in the database with the specified ID.

Operator response: Check the job ID and try again.

AWKJDE109E A database error occurred when processing job "jobID". The following error was received: "error".

Explanation: A job operation failed because of a database error.

Operator response: Check if DB2 is running. See the trace file for more details.

AWKJDE110E A database error occurred when processing the notification states of job "jobID". The following error was received: "error".

Explanation: A job operation failed because of a database error.

Operator response: Check that DB2 is running. See the trace file for more details.

AWKJDE111E Cannot cancel job"jobID" because the cancel operation is not supported.

Explanation: The job executor does not support the cancel operation.

Operator response: None.

AWKJDE120E An internal service error occurred submitting job "jobID" with End Point Reference (EPR)"EPR" . The following error was received: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE121E An internal invocation error occurred submitting job "jobID" with End Point Reference (EPR)"EPR" . The following error was received: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE122E An error occurred while updating the job state of job "jobID" . The following error was received: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE123E The Job execution request for job "jobID" failed because a null value was returned for the task End Point Reference (EPR).

Explanation: A submit Job operation failed because a null EPR was returned when the job was submitted to the target resource.

Operator response: Try to submit the job again. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE124E Unsupported error while processing ExecuteJobWork action for JobID: "jobID". The following error was received: "error".

Explanation: An internal error occurred when Job Dispatcher submitted the job to the endpoint. The error might be caused by unavailability of the database.

System action: If the problem is caused by a database unavailability, Job Dispatcher will submit the job again later.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE125E Error submitting execution request for job "jobID". The following error was received: "error".

Explanation: An internal error occurred when Job Dispatcher submitted the job. The error might be caused by unavailability of the database.

Operator response: Check that DB2 is available from within IBM WebSphere Application Server, then try again.

AWKJDE127E The configuration parameter "parameter" has the following incorrect number format "wrong_parameter_value". The default value "parameter_value" will be used.

Explanation: An incorrect number format was specified for the given parameter in the Job Dispatcher configuration file. The Job Dispatcher will continue to work with the default value specified in the message.

Operator response: To use a custom value, correct the value specified in the Job Dispatcher configuration file and restart the server.

AWKJDE128E An internal error occurred while creating job history data. The following error was received: "error" .

Explanation: An unexpected error occurred while moving job data from the online tables to the archive tables.

Operator response: Check the trace log for further details.

AWKJDE129E Cancel request denied. It is not compatible with the current state of job "jobname". The job might have already completed or have been previously cancelled.

Explanation: The job is in a state that is not

compatible with the cancel operation. For example, the job is in the completed state.

Operator response: None.

AWKJDE130E The job identifier returned from the endpoint is incorrect. The job cannot be processed.

Explanation: An internal error occurred on the target endpoint and the job identifier returned to the server is not valid.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE131E The job cannot be run because it has at least one incorrect parameter in the application section. Check the logs on the endpoint for further details.

Explanation: An application parameter parsing error occurred on the target endpoint. This job cannot be processed.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE132E The target resource at address "address_url" cannot be reached. The following error occurred: "error" The system will try to submit to another available endpoint.

Explanation: The server cannot contact the target resource at the specified address. The system will try to find other available resources matching the job requirements and resubmit the job to another suitable resource.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE133E The job cannot be submitted to "address_url". The following error occurred: "error"

Explanation: The server received an error while submitting the job to the specified address.

Operator response: Check the error log on the server for more details.

AWKJDE135E The job cannot be canceled on the target resource at address "address_url". The following error occurred: "message"

Explanation: The server received an error while canceling the job at the specified address.

Operator response: Check the error log on the server for more details.

AWKJDE138E The cancel request could not be sent to the address "address_url". The following error occurred: "error". The system will try to cancel the job later.

Explanation: See message text.

Operator response: Try to restore the connection to the unreachable endpoint and wait until Job Dispatcher retries the operation.

AWKJDE139E The job allocation could not be canceled at the moment. The system will try to cancel the job later.

Explanation: See message text.

Operator response: Wait until Job Dispatcher retries the operation.

AWKJDE140E The job allocation could not be canceled. The following error occurred: "error"

Explanation: Job Dispatcher has canceled the job, but an internal error prevented the release of resources allocated for the job.

Operator response: Restart Tivoli Dynamic Workload Broker to release the resources.

AWKJDE141E The get execution log could not be requested from the address "address_url". The following error occurred: "error". Try again later.

Explanation: Job Dispatcher cannot contact the endpoint on which the job has ran to get the execution log. It is possible that there is a network problem or that the agent on the endpoint is not running.

Operator response: Identify the reason why endpoint cannot be contacted then try again.

AWKJDE142E The get execution log could not be requested from the address "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE143E The job submission with job definition failed because the submit parameters are null.

Explanation: You have submitted a job whose job definition includes undefined parameters.

Operator response: Check the of submitted JSDL, then submit the job again.

AWKJDE144E The job submission with job definition failed because the job definition document is null.

Explanation: You have submitted a job whose job definition has not been completed.

Operator response: Check the of submitted JSDL, then submit the job again.

AWKJDE145E The job submission with job definition "job_def_name" failed because it has an incorrect notify End Point Reference (EPR).

Explanation: A job was submitted to Job Dispatcher but the reference to the entity that is the recipient for notifications is not valid.

Operator response: Correct the EPR, then submit the job again.

AWKJDE146E The job submission with name definition failed because the submit parameters are null.

Explanation: You have submitted a job by name, but the submission request includes parameters that have not been defined.

Operator response: Define the parameters within the request, then submit the job again.

AWKJDE147E The job submission with name failed because the job definition name is null.

Explanation: See message text.

Operator response: Define the job name, then submit the job again.

AWKJDE148E The job submission with name "job_def_name" failed because it has an incorrect notify End Point Reference (EPR).

Explanation: A job was submitted to Job Dispatcher but the reference to the entity that is the recipient for notifications is invalid.

Operator response: Check that the parameters passed to Job Dispatcher are valid, then submit the job again.

AWKJDE149E The job query failed because the query parameters are null.

Explanation: The query parameters have not been assigned valid values.

Operator response: Redefine the query and try again.

AWKJDE150E Unable to cancel job "jobID". The following error was received: "error".

Explanation: Job Dispatcher received an internal error while canceling the specified job. This might be caused by unavailability of DB2.

Operator response: Check that DB2 is available from within IBM WebSphere Application Server, then try again.

AWKJDE151E The status notification for job "jobID" cannot be completed. The client URL "URL" is malformed.

Explanation: Job Dispatcher received an unrecoverable error while notifying the changes about the job state.

System action: No further notifications about job status changes will be made to the notification recipient.

Operator response: None.

AWKJDE152E The status notification for job "jobID" cannot be completed. Unable to contact the notification service at URL "URL". The following error was received: "error".

Explanation: Job Dispatcher received an unrecoverable error while notifying the changes about the job state.

System action: No further notifications about job status changes will be made to the notification recipient.

Operator response: None.

AWKJDE153W Unable to connect to client URL "URL". The status notification for job "jobID" cannot be completed. The Job Dispatcher will retry the connection in "retry_interval" seconds. The following error was received: "error".

Explanation: Job Dispatcher failed to notify the change of the job state.

System action: The notification will be tried again later.

Operator response: None.

AWKJDE154E The status notification to the client URL "URL" for job "jobID" failed because of the following error: "error".

Explanation: Job Dispatcher failed to notify the change of the job state.

System action: The notification will be tried again later.

Operator response: None.

AWKJDE155E The job submission contains an incorrect input argument. Verify the input parameters JSDL and clientNotifyEPR.

Explanation: Job Dispatcher is serving a job submission operation, but the JSDL containing the job definition is not valid.

Operator response: Check the JSDL passed to the submit operation.

AWKJDE156W Unable to process status notification to client. The Job Dispatcher will retry to process the notification in "retry_interval" seconds. The following error was received: "error".

Explanation: Job Dispatcher failed to notify the change of the job state.

System action: The notification will be tried again later.

Operator response: None.

AWKJDE157W Unable to process status notification to client. The following error was received: "message".

Explanation: See message text.

Operator response: See message text.

AWKJDE162W Maximum number of status notification retry "max_retry" reached for job "jobID".

Explanation: Job Dispatcher has retried several times to notify the changes about the job state, but the notification recipients have not been able to process the notification. No further notifications about this job will be made.

Operator response: None.

AWKJDE163E Unable to cancel allocation for job "jobID". The following error was received: "error".

Explanation: The job was completed but it was not possible to release the resources allocated for that job because of an internal error.

System action: The operation will be retried later.

Operator response: Check that DB2 is available.

AWKJDE164E Unable to reallocate resources for job "jobID". The following error was received: "error".

Explanation: An internal error prevented reallocation of resources for the job.

System action: The operation will be retried later.

Operator response: Check that DB2 is available and the monitor the job status until it is submitted to a candidate endpoint. If the job enters the resource allocation failed state, resubmit it.

AWKJDE165E Unable to cancel allocation on recovery for job "jobID". The following error was received: "error".

Explanation: Job Dispatcher has canceled the job, but an internal error prevented the release of resources allocated for the job.

Operator response: Restart Tivoli Dynamic Workload Broker to release the resources.

AWKJDE166E Unable to process a job because the job identifier is not correct.

Explanation: Job Dispatcher failed when performing one of the following operations: cancel job, get execution log, get job properties. The job identifier is not correct.

Operator response: Correct the parameters passed to Job Dispatcher and retry the operation.

AWKJDE167E The job "jobID" cannot be updated with the new status "job_status" The following error occurred: "error" The Job Dispatcher will try to update the database with the new status later.

Explanation: A database error occurred when updating the status of the job. The database could be down.

System action: The Job Dispatcher will retry the update later.

Operator response: Check the server error log for more details about the failure.

AWKJDE168E The job "jobID" cannot be updated with the new status "job_status" The following error occurred: "error" A serious outage might have affected the data integrity. Check the server error log for details about the failure.

Explanation: A database error occurred when updating the status of the job. . This could be caused by an unrecoverable outage.

Operator response: Check the server error log for more details about the failure.

AWKJDE169E Get execution log request denied. It is not compatible with the current state of the job "jobID".

Explanation: Get execution log is only supported for jobs that have already started.

Operator response: Wait until the job reaches the executing state before requesting the execution log.

AWKJDE170E The system received a resource allocation for a job with ID "jobID" , but the job was not found.

Explanation: The system received a resource allocation for a job ID that was not found in the database.

This situation might happen after the system restarts and there are resource allocations related to jobs that have been archived or have been manually removed from the job repository.

System action: The system will clean up the allocation.

Operator response: None.

AWKJDE171E The affine job with ID "jobID" does not have a target resource.

Explanation: You have submitted a job specifying an affinity with another job. This job has a valid state but no associated target resources. This can happen when a job was canceled before it has allocated resources.

Operator response: Submit a job specifying affinity with jobs that are in the allowed state and that have a target resource.

AWKJDE172E The queue number "queue_number" for property "property_name" if is not in the range "min_value" - "max_value".

Explanation: The queue number is out of range.

Operator response: Check the Job Dispatcher configuration file and set a value in the permitted range.

AWKJDE173E The queue number "queue_number" for property "property_name" has an invalid number format.

Explanation: The queue number format is not valid.

Operator response: Check the Job Dispatcher configuration file and set a value in the correct format.

AWKJDE174E The action "action" for property "property_name" in not valid.

Explanation: The action specified for the queue is not valid or unknown.

Operator response: Check the Job Dispatcher configuration file and set a valid value.

AWKJDE175E The submission of the job definition failed because the submit parameters are null.

Explanation: An attempt to create or update a new job definition failed because the specified parameters are null.

Operator response: Check the job definition parameters provided and resubmit the job.

AWKJDE176E The submission of the job definition failed because the job definition document is null.

Explanation: An attempt to create or update a new job definition failed because the job definition document is null.

Operator response: Check the job definition document. It cannot be empty.

AWKJDE177E The job definition creation failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to create a new job definition failed because of a database error.

Operator response: See message text.

AWKJDE178E The Job Definition update failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to update a new job definition failed because of a database error.

Operator response: See message text.

AWKJDE179E The job definition deletion failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to delete a new job definition failed because of a database error.

Operator response: See message text.

AWKJDE180E The get job definition operation failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to get a job definition failed because of a database error.

Operator response: See message text.

AWKJDE181E The job definition query failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to get a number of job definitions failed because of a database error.

Operator response: See message text.

AWKJDE182E The affine jobs are in wrong state for the specified operation.

Explanation: You have submitted a job specifying the affinity with another job using a job alias, but all the jobs matching the specified alias are in a state that is not compatible with your request.

Operator response: Submit a job specifying affinity with jobs that are in an allowed state.

AWKJDE184E A network error occurred while trying to contact the target resource at address "address_url". The system will try to submit to another available endpoint.

Explanation: The server cannot contact the target resource at the specified address. The system will try to find other available resources matching the job requirements and resubmit the job to another suitable resource.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE185E An unexpected error occurred while trying to decode the fault returned by the target resource at address "address_url". The original error occurred: "error". The following error occurred while decoding: "error" The system will try to submit to another available endpoint.

Explanation: The server failed to decode the failure from the target resource at the specified address. The system will try to find other available resources matching the job requirements and resubmit the job to another suitable resource.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE186E An error occurred while submitting the job to the target resource at address "address_url". The following error occurred while submitting the job: "error" The system will try to submit to another available endpoint.

Explanation: The target resource refused the job submission. The system will try to find other available resources matching the job requirements and resubmit the job to another suitable resource.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE187E An error occurred while submitting the job to the target resource at address "address_url". The following error occurred while submitting the job: "error" The system will not try to submit to any other endpoint.

Explanation: The target resource refused the job submission with an unrecoverable error. The system will stop processing of this job.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE188E An error occurred while submitting the job to the target resource at address "address_url". The system will try to submit to another available endpoint.

Explanation: The target resource refused the job submission. The system will try to find other available resources matching the job requirements and resubmit the job to another suitable resource.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE189E An error occurred while submitting the job to the target resource at address "address_url". The system will not try to submit to any other endpoint.

Explanation: The target resource refused the job submission with an unrecoverable error. The system will stop the processing of this job.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE190E An unexpected error occurred while submitting the job to the target resource at address "address_url". The following error occurred while submitting the job: "error" The system will try to submit to another available endpoint.

Explanation: The target resource refused the job submission for an unexpected reason. The system will try to find other available resources matching the job requirements and resubmit the job to another suitable resource.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE191E A recoverable error occurred submitting job ID "jobID" with name "name" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE192E An unrecoverable error occurred submitting job ID "jobID" with name "name" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE193E An unrecoverable error occurred submitting job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE194E A recoverable unexpected error occurred submitting job ID "jobID" with name "name" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE195E The target resource could not be contacted while submitting job ID "jobID" with name "name" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE196E The target resource could not be contacted while submitting job ID "jobID" with name "name" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE197E An unrecoverable error occurred canceling job ID "jobID" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE198E An unrecoverable error occurred canceling job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE199E A recoverable unexpected error occurred canceling job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE200E The target resource could not be contacted while canceling job ID "jobID" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE201E A recoverable error occurred canceling job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE202E The target resource could not be contacted while submitting job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE203E A network error occurred while trying to contact the target resource at address "address_url". The system will retry to cancel the job later.

Explanation: The server cannot contact the target resource at the specified address. The system will retry to cancel the job at a later time.

Operator response: Check the network connection between the server and the agent.

AWKJDE204E An unexpected error occurred while trying to decode the fault returned by the target resource at address "address_url". The original error occurred: "error". The following error occurred while decoding: "error" The system will retry to cancel the job at a later time.

Explanation: The server failed to decode the failure

from the target resource at the specified address. The system will retry to cancel the job at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE205E An error occurred while canceling the job to the target resource at address "address_url". The following error occurred while canceling the job: "error" The system will retry to cancel the job at a later time.

Explanation: The target resource refused the job cancel. The system will retry to cancel the job at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE206E An error occurred while canceling the job to the target resource at address "address_url". The following error occurred while trying to cancel: "error" The system will not retry to cancel the job.

Explanation: The target resource refused the job submission with an unrecoverable error. The system will stop processing of this job.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE207E An error occurred while canceling the job to the target resource at address "address_url". The system will retry to cancel the job at a later time.

Explanation: The target resource refused the job cancel. The system will retry to cancel the job at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE208E An error occurred while canceling the job to the target resource at address "address_url". The system will not retry to cancel the job.

Explanation: The target resource refused the job cancel with an unrecoverable error. The system will stop the processing of this job cancel.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE209E An unexpected error occurred while canceling the job on the target resource at address "address_url". The following error occurred while canceling the job: "error" The system will retry to cancel the job.

Explanation: The target resource refused the job cancel for an unexpected reason. The system will try to cancel the job at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE210E An unrecoverable error occurred requesting a job execution log page for job ID "jobID" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE211E An unrecoverable error occurred requesting a job execution log page for job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE212E A recoverable unexpected error occurred requesting a job execution log page for job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE213E The target resource could not be contacted while requesting a job execution log page for job ID "jobID" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE214E A recoverable error occurred requesting a job execution log page for job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE215E The target resource could not be contacted while requesting a job execution log page for job ID "jobID" to the endpoint URL "URL".

Explanation: See message text.

Operator response: See message text.

AWKJDE216E A network error occurred while trying to contact the target resource at address "address_url". Please try again later.

Explanation: The server cannot contact the target resource at the specified address. Retry the operation at a later time.

Operator response: Check the network connection between the server and the agent and try again the operation.

AWKJDE217E An unexpected error occurred while trying to decode the fault returned by the target resource at address "address_url". The original error occurred: "error". The following error occurred while decoding: "error" Please try again later.

Explanation: The server failed to decode the failure from the target resource at the specified address. Retry the operation at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE218E An error occurred while requesting a job execution log page to the target resource at address "address_url". The following error occurred while requesting a job execution log page: "error" Please try again later.

Explanation: The target resource refused the job execution log page request. Retry the operation at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE219E An error occurred while requesting a job execution log page to the target resource at address "address_url". The following error occurred while trying to request the execution log page: "error" You can try again later, but likely fail.

Explanation: The target resource refused the job execution log page request with an unrecoverable error. Future requests for this job will likely fail.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE220E An error occurred while requesting a job execution log page to the target resource at address "address_url". Please try again later.

Explanation: The target resource refused the job execution log page request. Retry the operation at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE221E An error occurred while requesting a job execution log page to the target resource at address "address_url". You can try again later, but likely fail.

Explanation: The target resource refused the job execution log page request with an unrecoverable error. Future requests for this job will likely fail.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE222E An unexpected error occurred while requesting a job execution log page to the target resource at address "address_url". The following error occurred while requesting the job execution log page: "error" Try again later.

Explanation: The target resource refused the job execution log page request for an unexpected reason. Retry the operation at a later time.

Operator response: Check the error log on the target endpoint for more details.

AWKJDE223E The execution log page is not present for the job that has been canceled before it was executed.

Explanation: The behaviour can happen when the application server is restarted twice with a job in initial state cancel allocation.

Operator response: None.

AWKJDE224E The submission of the resource requirement failed because the resource requirement document is null.

Explanation: An attempt to create or update a new resource requirement failed because the resource requirement document is null.

Operator response: Check the resource requirement document. It cannot be empty.

AWKJDE225E The resource requirement creation failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to create a new resource requirement failed because of a database error.

Operator response: See message text.

AWKJDE226E The resource requirement deletion failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to delete a resource requirement failed because of a database error.

Operator response: See message text.

AWKJDE227E The get resource requirement operation failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to get a resource requirement failed because of a database error.

Operator response: See message text.

AWKJDE228E The resource requirement update failed because of the database error: "DB_ERROR_MSG"

Explanation: An attempt to update a resource requirement failed because of a database error.

Operator response: See message text.

AWKJDE229E The quantity of the logical resource "logical_resource" is incorrect

Explanation: See message text, where *logical_resource* is the name of the logical resource.

The quantity must be a positive integer value or a variable.

System action: The operation is not performed.

Operator response: The quantity must be a positive integer value or a variable.

AWKJDE230E An error occurred notifying the status of the job id "job_id" to the address "address"

Explanation: This is an internal error. The component that is .

The quantity must be a positive integer value or a variable.

System action: The operation is not performed.

Operator response: The quantity must be a positive integer value or a variable.

AWKJDE231E An unexpected error occurred: "error"

Explanation: An unexpected error occurred while dispatching the job in the workload broker server.

Operator response: Attempt to rerun the job.

AWKJDE232E Cannot complete the required command for job type "jobtype". The specified workstation might be unavailable or not compatible.

Explanation: The specified workstation might be unavailable or might not be at the required product level. Tivoli Workload Scheduler, version 8.6 or later is required for running the specified command.

jobtype is the ID of the job type.

Operator response: Verify that the workstation is available.

If the workstation is a pool or a dynamic pool, verify that it contains at least one compatible agent.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE233E The handler for the event "eventName" and scope "scope" was not found.

Explanation: This is an internal error that usually occurs when stopping or starting the broker server.

System action: The operation is not performed.

Operator response: None.

AWKJDE234W The allocation request for job "jobID" cannot be processed because the Resource Advisor is unavailable. The Job Dispatcher will retry the operation in "retry_time" seconds. The following error was received: "error".

Explanation: Job Dispatcher received a communication error while contacting the Resource Advisor to process the allocation of a job.

System action: Job Dispatcher will try to contact Resource Advisor later.

Operator response: None.

AWKJDE235W A connection problem occurred submitting job ID "jobID" with name "name" to the endpoint URL "URL". The error message is: "error".

Explanation: See message text.

Operator response: See message text.

AWKJDE236E An internal error occurred retrieving a job with alias "alias". The following error message is returned: "error_message".

Explanation: See message text.

Operator response: Check that you have specified the correct affine job.

AWKJDE237E You have reached the maximum number of attempts to cancel "jobID" job.

Explanation: The Job Dispatcher tried to cancel the job, but the recipients could not process the cancel requests. No further attempt to cancel this job will be made.

Operator response: None.

AWKJDE238E Get log header request denied. It is not compatible with the current state of the job "jobID".

Explanation: Get log header is only supported for jobs that have already started.

Operator response: Wait until the job reaches the executing state before requesting the log header.

AWKJDE239E The log header is not present for the job that has been canceled before it was executed.

Explanation: The behaviour can happen when the application server is restarted twice with a job in initial state cancel allocation.

Operator response: None.

AWKJDE240E Cannot complete the required command. The workstation might be unavailable or not compatible.

Explanation: The specified workstation might be unavailable or might not be at the required product level.

Operator response: Verify that the workstation is available.

If the workstation is a pool or a dynamic pool, verify that it contains at least one compatible agent.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJDE241E A database error occurred when processing job "jobID". The following error was received: "error".

Explanation: A job operation failed because of a database error.

Operator response: Check if DB2 is running. See the trace file for more details.

AWKJDE242E The action cannot be performed because the job was not submitted to the agent.

Explanation: The operation was not performed..

Operator response: Check the job status and wait for the job to be sent to the agent.

AWKJDE243E Cannot replace the variables in the job with alias "alias" because the syntax of a variable is not valid. The following error was received: "error".

Explanation: The variables are not replaced but the job is submitted.

Operator response: Verify that the variables are expressed correctly.

AWKJDE244E An unsupported value has been specified for one or more variables in the job with alias "alias". Expected value is numeric. The following error was received: "error".

Explanation: An unsupported value has been assigned to a variable that requires a numeric value. The value cannot be assigned to the variable, but the job is submitted.

Operator response: Verify that the correct value is assigned to the variables in the job.

AWKJDE245E Cannot replace the variables in the job with alias "alias" because the syntax of a variable is not valid. The following error was received: "error".

Explanation: The variables are not replaced but the job is submitted.

Operator response: Verify that the variables are expressed correctly.

AWKJDE246E An unsupported value has been specified for one or more variables in the job with alias "alias". Expected value is numeric. The following error was received: "error".

Explanation: An unsupported value has been assigned to a variable that requires a numeric value. The value

cannot be assigned to the variable, but the job is submitted.

Operator response: Verify that the correct value is assigned to the variables in the job.

AWKJDE247E Cannot replace the variables in the job with alias "alias" because of a failure accessing the database. The following error was received: "error".

Explanation: There was a problem accessing the database.

System action: The system will retry the operation.

Operator response: See message text.

AWKJDE248E The master at the address "address" cannot be contacted to get the variables for the job. The following error was received: "error".

Explanation: There was a problem contacting the master.

System action: The system will retry the operation.

Operator response: See message text.

AWKJDE249E The master at the address cannot be contacted to get the variables for the job. The following error was received: "error".

Explanation: There was a problem contacting the master.

System action: The system will retry the operation.

Operator response: See message text.

AWKJDE250E Unable to resolve the stduri variable "var_name". The following error was received: "error".

Explanation: *var_name* is the name of the variable that cannot be resolved.

error is the error received requesting the job EPR.

There was a problem getting the job EPR.

System action: The system will return the name variable.

Operator response: See message text.

AWKJDE251E Unable to resolve the stdlist variable "var_name". The following error was received: "error".

Explanation: *var_name* is the name of the variable that cannot be resolved.

error is the error received requesting the job log.

There was a problem getting the job log.

System action: The system will return the name variable.

Operator response: See message text.

AWKJDE252E Unable to resolve the property variable "var_name". The following error was received: "error".

Explanation: *var_name* is the name of the property variable that cannot be resolved.

error is the error received requesting the job properties.

There was a problem getting the job properties.

System action: The system will return the name variable.

Operator response: See message text.

AWKJDE253E Unable to retrieve the job with alias "job_alias". The following error was received: "error".

Explanation: *job_alias* is the name of the job that cannot be retrieved.

error is the error received querying the job.

There was a problem getting the job.

System action: The system will not return the job.

Operator response: See message text.

AWKJDE254E The job with alias "job_alias" used to resolve variables was not found.

Explanation: *job_alias* is the name of the job that was not found.

The job to resolve the variables was not found.

System action: The system will not return the job.

Operator response: See message text.

AWKJDE255E The database rollback failed. The following error was received: "error"

Explanation: *error* is the error received from rollback action.

Unable to rollback the database transaction.

System action: The system will not rollback the transaction.

Operator response: See message text.

AWKJDE256E Unable to retrieve the context of the job "job_id". The following error was received: "error".

Explanation: *job_id* is the identifier of the job from which the context must be retrieved.

error is the error received querying the job.

Unable to retrieve the context of the job.

System action: The system will not return the job context.

Operator response: See message text.

AWKJDE500E The job cannot be submitted to "address_url". The following error occurred: "error"

Explanation: The server received an error while submitting the job to the specified address.

System action: The job is routed to other agents.

Operator response: No operator response is required. The job is routed to other agents.

AWKJDE501E The job cannot be submitted to "address_url". The following error occurred: "error"

Explanation: The server received an exception from the agent showing an unrecoverable problem.

System action: The job will never start.

Operator response: See message text.

AWKJDE502E The job cannot be submitted to "address_url". The following error occurred: "error"

Explanation: The server received an exception from the agent showing a recoverable problem.

System action: The job is routed to other agents.

Operator response: No operator response is required. The job is routed to other agents.

AWKJDE503E The command cannot be executed by "address_url"

Explanation: The server received an exception from the agent showing an unrecoverable problem.

System action: The command cannot be executed.

Operator response: See message text.

AWKJDE504E The log header could not be requested from the address "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE505E The command cannot be executed on the agent at the address "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE506E The command cannot be executed on the agent at the address "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE507E An unexpected response was sent by the agent at the following address. "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE508E An unexpected response was sent by the agent at the following address. "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE509E An invalid response was sent by the agent at the following address. "address_url" The following error occurred: "message"

Explanation: See message text.

Operator response: See message text.

AWKJDE510E The action result cannot be retrieved from action: "action_id". The job was submitted to: "address_url"

Explanation: *action_id* is the submit action identifier.

address_url is the address where the job was submitted.

The server cannot receive the submit action result for an error occurred on the agent gateway or for timeout.

Operator response: Check the error log on the agent gateway for more details.

AWKJDE511E The action result cannot be retrieved from action: "action_id". The execution log was requested to: "address_url"

Explanation: *action_id* is the execution log action identifier.

address_url is the address where the execution log was requested.

The server cannot receive the execution log for an error occurred on the agent gateway or for timeout.

Operator response: Check the error log on the agent gateway for more details.

AWKJDE512E The get execution log could not be requested from the address "address_url" on gateway "gw_id". The following error occurred: "message"

Explanation: *address_url* is the address where the execution log was requested.

gw_id is the gateway identifier.

message is the received error message requesting the execution log.

The server cannot request the execution log for an error occurred.

System action: The action fails and will not be executed again.

Operator response: Check the error log on broker server for more details.

AWKJDE513E The action result cannot be retrieved from action: "action_id". The run executor command action was submitted to: "address_url"

Explanation: *action_id* is the run executor command action identifier.

address_url is the address where the run executor command action was submitted.

The server cannot receive the run executor command action result for an error occurred on the agent gateway or for timeout.

Operator response: Check the error log on the agent gateway for more details.

AWKJDE514E The get execution log could not be requested from the address "address_url" on gateway "gw_id". The following error occurred: "message"

Explanation: *address_url* is the address where the execution log was requested.

gw_id is the gateway identifier.

message is the received error message requesting the execution log.

The server cannot request the execution log for an error occurred.

System action: The action fails but will not be executed again.

Operator response: Check the error log on broker server for more details.

AWKJDE515E The get execution log could not be requested from the address "*address_url*" on gateway "*gw_id*". The following error occurred: "*message*"

Explanation: *address_url* is the address where the execution log was requested.

gw_id is the gateway identifier.

message is the received error message requesting the execution log.

The server cannot request the execution log for an error occurred.

System action: The action fails but will not be executed again.

Operator response: Check the error log on broker server for more details.

AWKJDE516E The action result cannot be retrieved from action: "*action_id*". The job command action was submitted to: "*address_url*"

Explanation: *action_id* is the job command action identifier.

address_url is the address where the job command action was submitted.

The server cannot receive the job command action result for an error occurred on the agent gateway or for timeout.

Operator response: Check the error log on the agent gateway for more details.

AWKJDE517E The action result cannot be retrieved from action: "*action_id*". The component command action was submitted to: "*address_url*"

Explanation: *action_id* is the component command action identifier.

address_url is the address where the component command action was submitted.

The server cannot receive the component command action result for an error occurred on the agent gateway or for timeout.

Operator response: Check the error log on the agent gateway for more details.

AWKJDE518E The action with id "*action_id*" on the gateway "*gw_id*" was not performed because the remote agent with this address "*address_url*" is down. The following error occurred: "*message*"

Explanation: The remote JobManager process is down while the remote agent process is running.

Operator response: Check the error log on the remote agent and restart the agent.

AWKJDE519E The agent did not contact the server to manage this request.

Explanation: The remote gateway did not contact the broker server to get this action.

Operator response: Check the error log on the remote agent.

Chapter 29. AWKJEJ - WebSphere Java 2 Enterprise Edition job executor for CAS messages

This section lists error and warning messages that might be issued by the WebSphere Java 2 Enterprise Edition job executor for CAS.

The message component code is JEJ.

AWKJEJ001E The J2EEJobExecutorConfig.properties property file is missing.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ002E The property file is incorrect.

Explanation: The connector.direct property is incorrect.

System action: The program stops.

Operator response: Specify an existing property file.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ003E The JMS action definition is either missing or empty

Explanation: The JMS action definition in the JSDL is either missing or empty.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ004E The JMS connection factory is either missing or empty.

Explanation: The JMS connection factory in the JSDL is either missing or empty.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ005E The JMS destination queue is either missing or empty.

Explanation: The JMS destination queue in the JSDL is either missing or empty.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ006E The JMS message is either missing or empty.

Explanation: The JMS message is either missing or empty in the JSDL.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ007E Cannot retrieve the following connection factory: "cf_name".

Explanation: See message text.

cf_name is the connection factory JNDI name.

System action: The program stops.

Operator response: Check that the connection factory is available.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ008E Cannot retrieve the following queue: "queue".

Explanation: See message text.

queue is the queue JNDI name.

System action: The program stops.

Operator response: Check that the queue is available.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ009E Cannot connect to WebSphere Application Server with address: "address".

Explanation: See message text.

address is the WebSphere Application Server address.

System action: The program stops.

Operator response: Check that the WebSphere Application Server is available.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ010E Cannot send the message to "queue".

Explanation: See message text.

queue is the queue JNDI name.

System action: The program stops.

Operator response: Check that the queue is available.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ012E The user name or password is missing.

Explanation: The user name and the password are required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKJEJ013E A generic error has occurred: "exception".

Explanation: See message text.

exception is the error message.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ014E The operation is incorrect.

Explanation: See message text.

Supported operations are SEND and RECEIVE.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ015E The connection URL value is empty.

Explanation: See message text.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ016E The timeout is incorrect.

Explanation: See message text.

The timeout value is an integer higher than or equal to 0.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ017E The job definition contains a double set of credentials.

Explanation: The JMS job definition supports two credential formats but you can use only one format in a job definition.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ018W The timeout has expired: no message was received from the specified queue.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: None.

AWKJEJ019E One or more mandatory parameters are missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required parameters. Retry the operation.

AWKJEJ022E The credentials are not valid.

Explanation: The credentials entered are not valid.

System action: The operation is not performed.

Operator response: Specify valid credentials.

AWKJEJ024E The timeout is not supported for the SEND operation.

Explanation: See message text.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJEJ025E The message is not supported for the RECEIVE operation.

Explanation: See message text.

System action: The program stops.

Operator response: Check the syntax of the JSDL.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 30. AWKJJE - Java job executor messages

This section lists error and warning messages that might be generated by the routines that handle the Java job executor.

The message component code is JJE.

AWKJJE001E The jar path is not valid.

Explanation: The jar path that was specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid jar path in the JSDL or in the property file.

AWKJJE002E The jar path is missing.

Explanation: A jar path is required.

System action: The operation is not performed.

Operator response: Specify a jar path in the JSDL or in the property file.

AWKJJE003E The classname is missing.

Explanation: A classname is required.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJJE004E Runtime Error "exception_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKJJE005E Cannot access required folders.

Explanation: The job was not able to access a jar folder, you might not have enough permissions.

System action: The operation is not performed.

Operator response: Verify that you have enough permissions.

AWKJJE006E The key attribute in the parameter tag is not valid.

Explanation: The key attribute is required in the parameter tag - the value attribute is optional.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJJE007E The jar path tag is empty

Explanation: If you specify the jar path tag, a value is required.

System action: The operation is not performed.

Operator response: Specify a value for the jar path tag or delete the tag.

AWKJJE008E The parameters tag is empty.

Explanation: If you specify the parameters tag, a value is required.

System action: The operation is not performed.

Operator response: Specify a value for the parameters tag or delete the tag.

AWKJJE010E No available information

Explanation: See message text.

System action: None.

Operator response: None.

AWKJJE011E Unable to find class "exception_message".

Explanation: See message text.

System action: None.

Operator response: None.

Chapter 31. AWKJMQ - Job plug-in for IBM WebSphere MQ messages

This section lists error and warning messages that might be generated when using the Job plug-in for IBM WebSphere MQ.

The message component code is JMQ.

AWKJMQ001E The target machine `""server""` is not reachable. The error message is `""error""`

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJMQ002E The job execution failed. The error is `""error""`

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJMQ004E The response was present in the queue. The error is `""error""`

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKJMQ005E The server address is missing.

Explanation: The server address is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ006E The queue manager is missing.

Explanation: The queue manager is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ007E The channel is missing.

Explanation: The channel is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ008E The message is missing.

Explanation: The message is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ009E The request queue is missing.

Explanation: The request queue is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ010E The response queue is missing.

Explanation: The response queue is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ011E The publish topic is missing.

Explanation: The publish topic is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ012E The publish queue is missing.

Explanation: The publish queue is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ013E The server port is either missing or not valid. Specify a value in the 1 - 65535 interval.

Explanation: A valid server port is required.

System action: The operation is not performed.

Operator response: Specify a valid server port.

AWKJMQ014E The user name or the password is missing.

Explanation: The user name and the password are required.

System action: The operation is not performed.

Operator response: Specify both user name and password.

AWKJMQ015E The specified value for the timeout is invalid.

Explanation: A valid timeout is required.

System action: The operation is not performed.

Operator response: Check the provided timeout.

AWKJMQ016E The specified value for the QueueOrTopicCombo is either empty or not valid.

Explanation: A valid value for the QueueOrTopicCombo is required.

System action: The operation is not performed.

Operator response: Specify a valid value for QueueOrTopicCombo.

AWKJMQ018E The topic `""topic""` was not found

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the value of the topic in the job definition.

AWKJMQ019E An error occurred getting the list of the topics. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the value of the topic in the job definition.

AWKJMQ020E An error occurred getting the list of the topics. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the value of the topic in the job definition.

AWKJMQ021E An error occurred contacting the MQ manager. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the MQ manager information in the job definition.

AWKJMQ022E An error occurred contacting the request queue `""requestQueue""`. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the request queue information in the job definition.

AWKJMQ023E An error occurred contacting the response queue `""requestQueue""`. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the request queue information in the job definition.

AWKJMQ024E An error occurred getting the list of the topics. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the value of the topic in the job definition.

AWKJMQ025E An error occurred contacting the queue `""queue""`. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Change the request queue information in the job definition.

AWKJMQ026E An error occurred getting the list of the queues. The error message is `""error""`.

Explanation: Error getting the list of the queues.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ027E An error occurred getting the list of the queues. The error message is `""error""`.

Explanation: An error occurred getting the queue list.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ028W There are no queue on this queue manager.

AWKJMQ029E An error occurred getting the list of the queue managers. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ030W There are no queue managers.

AWKJMQ031E An error occurred getting the list of the queue managers. The error message is `""error""`.

Explanation: The topic was not found

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ032E An error occurred getting the list of the channels. The error message is `""error""`.

Explanation: Error getting the list of the channels.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ033E An error occurred getting the list of the topics. The error message is `""error""`.

Explanation: Error getting the list of the topics.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ034W There are no topics.

AWKJMQ035E An error occurred contacting the MQ manager. The error message is `""error""`.

Explanation: The MQ manager was not found

System action: The operation is not performed.

Operator response: Change the MQ manager information in the job definition.

AWKJMQ036E An error occurred getting the list of the channels. The error message is `""error""`.

Explanation: An error occurred getting the channel list.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ037W There are no channels.

AWKJMQ038E An unexpected error occurred. The error message is `""error""`.

Explanation: An unexpected error occurred.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ039E An error occurred contacting the MQ server. The error message is `""error""`.

Explanation: An error occurred.

System action: The operation is not performed.

AWKJMQ040E • AWKJMQ042E

Operator response: Check the error message and try again.

AWKJMQ040E An error occurred contacting the MQ server. The error message is ""error"".

Explanation: An error occurred.

System action: The operation is not performed.

Operator response: Check the error message and try again.

AWKJMQ041E The subscribe topic is missing.

Explanation: The subscribe topic is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKJMQ042E The subscribe queue is missing.

Explanation: The subscribe queue is a mandatory parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

Chapter 32. AWKJNT - Job definition notify service messages

This section lists error and warning job definition notify service messages that might be issued.

The message component code is JNT.

AWKJNT081E A notification was received with an incorrect topic: "topic" or message: "message".

Explanation: See message.

System action: The system continues processing other messages.

Operator response: None.

AWKJNT082E A notification was received with an incorrect message type: "messageType".

Explanation: See message.

System action: The system continues processing other messages.

Operator response: None.

Chapter 33. AWKJSV - Job definition service messages

This section lists error and warning job definition service messages that might be issued.

The message component code is JSV.

AWKJSV081E The job submission failed because the job definition is null.

Explanation: You submitted a job containing a null definition.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

Chapter 34. AWKMSQ - MsSQL plug-in messages

This section lists error and warning messages that might be generated by the MsSQL plug-in.

The message component code is MSQ.

AWKMSQ001E The server address is missing.

Explanation: The server address is required.

System action: The operation is not performed.

Operator response: Specify a server address.

AWKMSQ002E The server port is either missing or not valid. Specify a value in the 1..65535 interval.

Explanation: The server port was either not specified or not correct.

System action: The operation is not performed.

Operator response: Specify a value in the 1..65535 interval.

AWKMSQ003E The database name is missing.

Explanation: The database name was not specified.

System action: The operation is not performed.

Operator response: Specify a database name.

AWKMSQ004E The credentials are missing.

Explanation: The credentials are required.

System action: The operation is not performed.

Operator response: Specify the credentials.

AWKMSQ005E The user name or the password is missing.

Explanation: The user name or the password are both required.

System action: The operation is not performed.

Operator response: Specify both user name and password.

AWKMSQ006E Missing statements

Explanation: No statements was specified. At least one statement is required.

System action: The operation is not performed.

Operator response: Specify one or more statements.

AWKMSQ007E Runtime Error "exception_message"

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ008E Unable to create the output file

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ009E Unable to create the connection "exception_message"

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ010E MSSQL job run error "error_message"

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ011E SQL job run error "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ012E Rollback error "error_message"

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ013E Connection close error "error_message"

Explanation: See message text.

AWKMSQ014E • AWKMSQ026E

System action: The operation is not performed.

Operator response: None.

AWKMSQ014E Output file close error "error_message"

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKMSQ015E Empty DBMS

Explanation: An empty DBMS was specified.

System action: The operation is not performed.

Operator response: Do not specify an empty DBMS or do not use the DBMS tag.

AWKMSQ016E Empty statement

Explanation: An empty statement was specified.

System action: The operation is not performed.

Operator response: Do not specify empty statements.

AWKMSQ017E The JDBC Driver path is missing.

Explanation: The JDBC Driver path is required in the configuration file.

System action: The operation is not performed.

Operator response: Specify the JDBC Driver path.

AWKMSQ018E Cannot access required folders

Explanation: The executor was not able to access a JDBC driver folder, you may not have enough permissions.

System action: The operation is not performed.

Operator response: Verify that you have enough permissions.

AWKMSQ019E The job type is not valid; it must be job

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid job type.

AWKMSQ020E The driver class name is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a driver class name.

AWKMSQ021E The connection URL value is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a connection URL.

AWKMSQ022E The DBMS value is missing, only MSSQL is supported.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify MSSQL as DBMS.

AWKMSQ023E The polling interval format is not valid, the polling interval must be a positive integer.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid polling interval.

AWKMSQ024E The job type is not valid; it must be job

Explanation: You specified an invalid job type.

Job type must be ""job"".

System action: The operation is not performed.

Operator response: Specify a valid job type.

AWKMSQ025E The type attribute for dbStatement element is missing.

Explanation: The type for the dbStatement element is required.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKMSQ026E More than one dbStatement element was specified. Only one dbStatement element of type job is allowed.

Explanation: More than one dbStatement was specified. Only one dbStatement of type job is allowed.

System action: The operation is not performed.

Operator response: Specify only one dbStatement.

Chapter 35. AWKNDE - Netezza database messages

This section lists error and warning messages that might be issued by the Netezza database.

The message component code is NDE.

AWKNDE001E The hostame cannot be empty.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE002E The user cannot be empty.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE003E The password cannot be empty.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE004E The table cannot be empty.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE005E The database name cannot be empty.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE006E Null value should not exceed 4 characters.

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE007E Decimal delimiter should not exceed 1 character

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE008E Time delimiter should not exceed 1 character

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE009E An error occurred loading the data. The error message is "error"

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE010E The directory "directory" does not exist.

Explanation: See message text.

System action: The program stops.

AWKNDE011E

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKNDE011E An error occurred getting the list of files. The error message is "error"

Explanation: See message text.

System action: The program stops.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 36. AWKOE - Job plug-in for Oracle messages

This section lists error and warning messages that might be generated by the job plug-in for Oracle.

The message component code is OEB.

AWKOE001E The server address is missing.

Explanation: The server address is required.

System action: The operation is not performed.

Operator response: Specify a server address.

AWKOE002E The server port is either missing or not valid. Specify a value in the 1..65535 interval.

Explanation: A valid server port is required.

System action: The operation is not performed.

Operator response: Specify a valid server port.

AWKOE003E The database name is missing.

Explanation: The database name is required.

System action: The operation is not performed.

Operator response: Specify a database name.

AWKOE004E The credentials are missing.

Explanation: The credentials are required.

System action: The operation is not performed.

Operator response: Specify the credentials.

AWKOE005E The user name or the password is missing.

Explanation: The user name and the password are required.

System action: The operation is not performed.

Operator response: Specify both user name and password

AWKOE006E Missing Application User.

Explanation: No application user was specified. Specify an application user or pick-up it from the list .

System action: The operation is not performed.

Operator response: Specify the application user.

AWKOE007E Runtime Error "exception_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKOE008E Unable to create the output file.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKOE009E Unable to create the connection "exception_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKOE010E Missing Application Identifier.

Explanation: No application identifier was specified. Specify an application identifier or pick-up it from the list .

System action: The operation is not performed.

Operator response: Specify the application identifier.

AWKOE011E Missing Responsibility Identifier.

Explanation: No Responsibility Identifier was specified. Specify an Responsibility Identifier or pick-up it from the list .

System action: The operation is not performed.

Operator response: Specify the Responsibility Identifier.

AWKOE012E Job XML name, Job XML or Job XML file are missing.

Explanation: No job XML name or job XML or job XML file were specified.

System action: The operation is not performed.

AWKOE013E • AWKOE028E

Operator response: Specify one of job XML name or job XML or job XML file.

AWKOE013E The JDBC Driver was not found.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKOE014E Output file close error "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKOE015E Missing Application Name.

Explanation: No Application Name was specified. Specify an Application Name or pick-up it from the list .

System action: The operation is not performed.

Operator response: Specify the Application Name.

AWKOE016E Empty statement.

Explanation: The statement is empty.

System action: The operation is not performed.

Operator response: Provide a value for the statement and retry the operation.

AWKOE017E The JDBC Driver path is missing.

Explanation: The JDBC Driver path in the configuration file is required.

System action: The operation is not performed.

Operator response: Specify the JDBC Driver path.

AWKOE018E Cannot access required JDBC Driver folder

Explanation: The job was not able to access a JDBC Driver folder, you might not have enough permissions.

System action: The operation is not performed.

Operator response: Verify that you have enough permissions.

AWKOE019E The job type is not valid; it must be job or sql

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a correct job type.

AWKOE020E The driver class name is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a driver class name.

AWKOE021E The connection URL is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a connection URL.

AWKOE023E An error occurred while attempting to connect to the database. See the attached database message for more information: "exception_message".

Explanation: The database address, name, or port might be incorrect.

System action: The operation is not performed.

Operator response: None.

AWKOE025E The job type is not valid; it must be sql.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct job type.

AWKOE026E The number of arguments is invalid; they must be 4 (Procedure Variable Type, Variable Name, SQL Variable Type, Variable Position Index).

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct arguments.

AWKOE027E IN or INOUT variable was not specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the variable value.

AWKOE028E Error during the objects lookup: " " is not working.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The specific look up is not supported.

AWKOEB029E The type "procedure_type" is not valid as stored procedure parameter type.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The type of stored procedure is invalid.

AWKOEB030E The string "sql_string" doesn't match a supported SQL type.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The string doesn't match a supported SQL type.

AWKOEB031E The string "procedure_string" doesn't match a valid stored procedure parameter.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The string doesn't match a supported SQL type.

AWKOEB032E The stored procedure name provided doesn't match any stored procedure definition in the database.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the stored procedure name.

AWKOEB033E The stored procedure name provided matches more than one stored procedure definition in the database, to disambiguate specify also the schema.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Disambiguate specifying also the schema.

AWKOEB034E All fields are mandatory.

Explanation: All fields are required.

System action: The operation is not performed.

Operator response: Specify all fields.

AWKOEB035E Validation failed. " " not found.

Explanation: See message text.

System action: The operation is not performed.

Operator response: The operation is not performed.

AWKOEB036E An error occurred while monitoring the job. The error message is " "

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify an existing file.

AWKOEB037E An error occurred while scheduling the OracleEBusiness resource " "

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify an existing file.

AWKOEB038E Number of print copies is not valid

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a number.

AWKOEB039W Printer values have not been set.

Explanation: The printer name is not valid.

System action: The operation is not performed.

Operator response: Specify a valid printer.

AWKOEB040E Missing number of print copies

Explanation: The printer name is set but the number of copies is not.

System action: The operation is not performed.

Operator response: Specify a valid number of copies.

AWKOEB041E Number of parameters is not valid.

Explanation: Maximum 100 parameters are allowed.

System action: The operation is not performed.

Operator response: Specify a valid number of parameters.

AWKOEB042W Notification not set for the following users: " "

Explanation: Notification not added for one or more users.

System action: The operation is not performed.

AWKOE043W • AWKOE045E

Operator response: Modify the list of users to be notified.

AWKOE043W Layout not set for the following template: " "

Explanation: Layout not added for one or more template.

System action: The operation is not performed.

Operator response: Modify the layout.

AWKOE044E The syntax for the layout " " is not valid. Valid syntax is Template application name, Template code,

Language, Territory, Format.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid syntax.

AWKOE045E Missing Organization name.

Explanation: No organization name was specified. Specify an organization name or pick-up it from the list .

System action: The operation is not performed.

Operator response: Specify the organization name.

Chapter 37. AWKOOZ - Job plug-in for Apache Oozie

This section lists error and warning messages that might be generated by the job plug-in for Apache Oozie.

The message component code is OOOZ.

AWKOOZ002E Test connection failed. The error was "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify the error message and retry the operation.

AWKOOZ004E Oozie job submit operation failed. The error was "error"

Explanation: An error was received while submitting the job.

System action: The operation is not performed.

Operator response: Verify that you have the proper authorization to submit the job and that your credentials or job parameters are correct. Try the operation again.

AWKOOZ005E The Oozie job execution failed. The error message is "error"

Explanation: An error occurred while running the job.

System action: The operation is not performed.

Operator response: Verify that the job parameters are correct. Try the operation again.

AWKOOZ006E The UTF-8 encoding is not supported. The error message is "error"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKOOZ007E An error occurred while establishing a connection to the remote service. The error message is "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify the error message and retry the operation.

AWKOOZ008W The job was canceled by the user.

AWKOOZ010E Invalid authorization. Missing or wrong credentials.

System action: The operation is not performed.

System action: The operation is not performed.

Operator response: Verify that your credentials are correct. Try the operation again.

AWKOOZ011E Parameter validation error. The error message is "error"

System action: The operation is not performed.

System action: The operation is not performed.

Operator response: Modify the invalid parameter and retry the operation.

AWKOOZ012E An error occurred while retrieving the JSON result from the response. The error message is "error"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the JSON result

AWKOOZ015E An error occurred while monitoring the Oozie job or timeout reached. The Oozie job could be in suspended status. Check the Oozie job logs.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the log file.

AWKOOZ016E The required node name parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ017E The required job tracker parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ018E The required user name parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ019E The required lib path parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ020E The required job script or command parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ021E The required job workflow path parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ022E The required job mapper class parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ023E The required job reducer class parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ024E The required job mapper input directory parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ025E The required job reducer output directory parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ026E The required job type parameter is missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ027E The Oozie job execution was killed. The error message is "error"

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ028E The Oozie job execution was killed. Check Oozie job logs.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKOOZ029E Unable to reconnect to Oozie job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the log file.

AWKOOZ030E The Oozie job execution failed.
Check the Oozie job logs.

Explanation: An error occurred while running the job.

System action: The operation is not performed.

Operator response: Verify that the job parameters are correct. Try the operation again.

Chapter 38. AWKPIC - SAP Process Integrator messages

This section lists error and warning messages that might be issued by the SAP Process Integrator component.

The message component code is PIC.

AWKPIC001E You did not specify any value for the host name. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC002E You did not specify any value for the port. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC003E You specified a wrong value for the port. Specify a value in the 1..65535 interval.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value in the range and try again.

AWKPIC004E You did not specify any value for the service name. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC005E You did not specify any value for the party. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC006E You did not specify any value for the channel. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC007E You did not specify any value for the user. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC008E You did not specify any value for the password. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC009E You did not specify any value for the protocol. This is required parameter. Specify a value.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify a value and try again.

AWKPIC010E You specified a wrong value for the protocol. Specify http or https.

Explanation: See message text.

System action: The job is not saved.

Operator response: You must specify http or https and try again.

AWKPIC011E • AWKPIC019E

AWKPIC011E An internal error occurred while writing to output file. The error message is: "error_message".

Explanation: See message text.

System action: The job output will not be available.

Operator response: None.

AWKPIC012E An internal error occurred while parsing the response from the channel. The error message is: "error_message".

Explanation: See message text.

System action: The job output will not be available.

Operator response: None.

AWKPIC013E An attempt to stop one or more channels has failed.

Explanation: See message text.

System action: The job failed.

Operator response: None.

AWKPIC014E An attempt to start one or more channels has failed.

Explanation: See message text.

System action: The job failed.

Operator response: None.

AWKPIC015E An error occurred while connecting to {0} . HTTP error code {1}.

Explanation: See message text.

System action: The job failed.

Operator response: None.

AWKPIC016E An error occurred while connecting to {0} on port {1}.

Explanation: See message text.

System action: The job failed.

Operator response: None.

AWKPIC017E An error occurred while connecting to {0} . User name or password incorrect.

Explanation: See message text.

System action: The job failed.

Operator response: None.

AWKPIC018E An error occurred while connecting to {0} . Is the ChannelAdmin servlet running?.

Explanation: See message text.

System action: The job failed.

Operator response: None.

AWKPIC019E An error occurred while connecting to {0} . Does channel {1} exist?.

Explanation: See message text.

System action: The job failed.

Operator response: None.

Chapter 39. AWKPRE - Provisioning plug-in messages

This section lists error and warning messages that might be generated by the Provisioning plug-in.

The message component code is PRE.

AWKPRE001E The user name is a required parameter.

Explanation: A value for the required parameter, user name, was not specified. You must specify a user name.

System action: The operation is not performed.

Operator response: Specify a user name and retry the operation.

AWKPRE002E The password is a required parameter.

Explanation: A value for the required parameter, password, was not specified. You must specify a password.

System action: The operation is not performed.

Operator response: Specify a password and retry the operation.

AWKPRE003E The host name is a required parameter.

Explanation: A value for the required parameter, host name, was not specified. You must specify a host name.

System action: The operation is not performed.

Operator response: Specify a host name and retry the operation.

AWKPRE004E The port is a required parameter.

Explanation: A value for the required parameter, port, was not specified. You must specify a port number.

System action: The operation is not performed.

Operator response: Specify a port number and retry the operation.

AWKPRE005E The server port is not valid. Specify a value ranging from 1 - 65535.

Explanation: The server port specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid server port and retry the operation.

AWKPRE006E Managing an instance requires that you select an action to be performed on the instance.

Explanation: You must specify to either start, stop, or delete the specified instance.

System action: The operation is not performed.

Operator response: Define how to manage the instance by defining the action to be performed on the instance and then retry the operation.

AWKPRE007E The action specified to be performed on the instance you want to manage is not a valid action.

Explanation: An invalid action to be performed on the instance you want to manage has been specified.

System action: The operation is not performed.

Operator response: Specify one of the following valid actions to be performed on the instance you want to manage: actionStart, actionStop, actionDelete.

AWKPRE008E The instance ID is not valid.

Explanation: The instance ID specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid instance ID for the instance you want to manage and retry the operation.

AWKPRE009E The cloud group ID is not valid.

Explanation: The cloud group ID specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid cloud group ID for the instance you want to manage and retry the operation.

AWKPRE010E The virtual image ID is not valid.

Explanation: The virtual image ID specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid virtual machine ID

AWKPRE011E • AWKPRE022E

for the instance you want to manage and retry the operation.

AWKPRE011E The instance name is a required parameter.

Explanation: You must specify the instance name for the instance you want to deploy.

System action: The operation is not performed.

Operator response: Specify the instance name for the instance you want to deploy and retry the operation.

AWKPRE012E The size specified is not valid.

Explanation: An unacceptable value was specified for the size.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the size: xsmall, small, medium, large, xlarge.

AWKPRE013E The size of the instance is required.

Explanation: You must specify the size of the instance.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the size of the instance: xsmall, small, medium, large, xlarge.

AWKPRE014E One or more mandatory parameters are missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKPRE015E There is no cloud group with the specified ID.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide an existing cloud group ID and retry the operation.

AWKPRE016E There is no virtual image with the specified ID.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide an existing virtual image ID and retry the operation.

AWKPRE017E There is no instance with the specified ID.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide an existing instance ID and retry the operation.

AWKPRE018E The virtual machines number is not valid. Specify a number greater than zero.

Explanation: The virtual machines number specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid virtual machines number and retry the operation.

AWKPRE019E There was an error retrieving the data.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please try again later or contact your system administrator.

AWKPRE020E There is no virtual machine with the specified ID.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide an existing virtual machine ID and retry the operation.

AWKPRE021E The virtual machine ID is not valid.

Explanation: The virtual machine ID specified is not valid.

System action: The operation is not performed.

Operator response: Specify a valid virtual machine ID and retry the operation.

AWKPRE022E The username or password is not valid.

Explanation: The supplied username or password value is wrong.

System action: The operation is not performed.

Operator response: Specify a valid username and password and retry the operation.

AWKPRE023E The server or port is not valid.

Explanation: The supplied server or port value is wrong.

System action: The operation is not performed.

Operator response: Specify a valid server and port and retry the operation.

AWKPRE024E There is no cloud group available.

Explanation: There is no cloud group available.

System action: The operation is not performed.

Operator response: Add one or more cloud groups and retry the operation.

AWKPRE025E There is no cloud group with the specified ID.

Explanation: There is no cloud group with the specified ID.

System action: The operation is not performed.

Operator response: Specify a valid cloud group and retry the operation.

AWKPRE026E There is no virtual image available.

Explanation: There is no virtual image available.

System action: The operation is not performed.

Operator response: Add one or more virtual images and retry the operation.

AWKPRE027E There is no template with the specified ID.

Explanation: There is no template with the specified ID.

System action: The operation is not performed.

Operator response: Specify a valid template and retry the operation.

AWKPRE028E There is no instance available.

Explanation: There is no instance available.

System action: The operation is not performed.

Operator response: Add one or more instances and retry the operation.

AWKPRE029E There is no instance with the specified ID.

Explanation: There is no instance with the specified ID.

System action: The operation is not performed.

Operator response: Specify a valid instance and retry the operation.

AWKPRE030E There is no virtual machine available.

Explanation: There is no virtual machine available.

System action: The operation is not performed.

Operator response: Add one or more virtual machines and retry the operation.

AWKPRE031E There is no virtual machine with the specified ID.

Explanation: There is no virtual machine with the specified ID.

System action: The operation is not performed.

Operator response: Specify a valid virtual machine and retry the operation.

AWKPRE032E The IBM Tivoli Workload Scheduler agent cannot monitor the Provisioning Job

Explanation: The IBM Tivoli Workload Scheduler agent stops monitoring the IBM Provisioning.

The IBM Provisioning status cannot be retrieved and the agent sets the status of the IBM Tivoli Workload Scheduler job to ""unknown"".

System action: The product stops monitoring the IBM Provisioning.

Operator response: Verify the Provisioning Job status in the IBM Provisioning product. If the IBM Provisioning completed successfully, release the IBM Tivoli Workload Scheduler job dependencies manually.

Chapter 40. AWKQTE - Job plug-in for MQTT messages

This section lists error and warning messages that might be issued by the job plug-in for MQTT.

The message component code is QTE.

AWKQTE001E An account name must be specified.
Enter a valid account name.

Explanation: The account name is required.

System action: The operation is not performed.

Operator response: Specify a valid account name.

AWKQTE002E A password must be specified. Enter a valid password.

Explanation: The password is required.

System action: The operation is not performed.

Operator response: Specify a valid password.

AWKQTE003E A database name must be specified.
Enter a valid database name.

Explanation: The database name is required.

System action: The operation is not performed.

Operator response: Specify a valid database name.

AWKQTE004E A user name must be specified. Enter a valid user name.

Explanation: The user name is required.

System action: The operation is not performed.

Operator response: Specify a valid user name.

AWKQTE005E Parameter validation error. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Modify the invalid parameter and retry the operation.

AWKQTE006E An action must be specified. Enter a valid action

Explanation: The action is required.

System action: The operation is not performed.

Operator response: Specify the valid action

AWKQTE007E A document id must be specified.
Enter a valid document id

Explanation: The document id is required.

System action: The operation is not performed.

Operator response: Specify a valid document id

AWKQTE008E A document revision must be specified. Enter a valid revision

Explanation: The document revision is required.

System action: The operation is not performed.

Operator response: Specify the valid document revision

AWKQTE009E A document must be specified. Enter a valid document file or content

Explanation: The document is required.

System action: The operation is not performed.

Operator response: Specify a valid document file or content

AWKQTE010E An error occurred updating the database ""database"".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE011E An error occurred updating the document ""document"".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE012E A document attachment revision must be specified. Enter a valid revision.

Explanation: The document attachment revision is required.

System action: The operation is not performed.

AWKQTE014E • AWKQTE051E

Operator response: Specify the valid document attachment revision

AWKQTE014E An error occurred while attempting to connect to the Cloudant server. The error is: `""exception_message""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE015E An attachment input file must be specified. Enter a valid input file.

Explanation: The attachment input file is required.

System action: The operation is not performed.

Operator response: Specify a valid attachment input file

AWKQTE016E A content type must be specified. Enter a valid content type.

Explanation: The content type is required.

System action: The operation is not performed.

Operator response: Specify a valid content type

AWKQTE017E An attach name must be specified. Enter a valid attach name.

Explanation: The attach name is required.

System action: The operation is not performed.

Operator response: Specify a valid attach name

AWKQTE018E The user is not authorized to perform the action. Enter an authorized user.

Explanation: The user is not authorized to perform the action, or the password is wrong.

System action: The operation is not performed.

Operator response: Enter an authorized user or specify the correct password.

AWKQTE019E `""document""`: document does not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE020E `""Document document""` update conflict: wrong revision.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE021E Target database `database""` does not exist.

Explanation: Target database does not exist.

System action: The operation is not performed.

Operator response: Specify a valid database name.

AWKQTE044E Error updating document `""document""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE046E Error reading document `""document""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE048E Error reading database `""database""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE050E Error replicationg database `""database""`.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKQTE051E Error performing a GET database request.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

Chapter 41. AWKRAA - Resource advisor agent

This section lists error and warning messages that might be issued by the Resource advisor agent.

The message component code is RAA.

AWKRAA207E The EMF framework is not initialized properly while starting Java Job.

Explanation: An error occurred during the initialization of Java Job.

System action: The operation is not performed.

Operator response: Restart the Common Agent Services agent. If the problem persists, contact the Tivoli Workload Broker administrator.

AWKRAA208E The application type "application_type" of job "jobId" is not valid.

Explanation: The application type of job is not valid.

System action: The operation is not performed.

Operator response: Verify that the Job type is available on the agent.

AWKRAA209E The job with advanced options with ID "application_type" was not found.

Explanation: The job with advanced options cannot be found.

System action: The operation is not performed.

Operator response: Verify that the job with advanced options is available on the agent.

AWKRAA210E Incorrect user name or password

Explanation: User name or password provided is not correct.

System action: The operation is not performed.

Operator response: Enter valid credentials.

Chapter 42. AWKRAE - Resource Advisor EJB messages

This section lists error and warning resource advisor EJB messages that might be issued.

The message component code is RAE.

AWKRAE009W The optimization object is incorrect. Minimize and Maximize only apply to numeric property values.

Explanation: See message text.

System action: The system uses the optimization object by evaluating whether the object exists and ignores the specified numeric value.

Operator response: Correct the optimization object.

AWKRAE010W The priority value "priority_value" is not a valid value.

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE011E A null value for argument "argument" was passed to method "method" .

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE012E The argument "argument" passed to method "method" is not valid.

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE013E Unable to perform operation "operation" . The following error was returned:"error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE014E Unable to connect to resource management service. Internal exception message is "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: Unable to connect to the resource management service. See the message for details and possible actions.

AWKRAE015E A requested resource is unknown. The following error was returned:"error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: Change the name of the resource to a known one.

AWKRAE016E A resource repository exception has been returned. The following error was returned:"error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE017E The requested operation failed. The following error was returned:"error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised

AWKRAE018E • AWKRAE027E

and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE018E Unable to find a requested resource. The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: Check the connection to the database and see the error message.

AWKRAE019E A null parameter was passed to allocation resources.

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE020E Unable to process a parameter passed to allocation resources. The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE021E Unable to convert back to SDO. The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE022E The resource allocation failed. The following resource repository error was received: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: None.

AWKRAE023E An allocation creation exception was caught. The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: None.

AWKRAE024E The resource allocation failed. The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: None.

AWKRAE025E The resource allocation failed. The following resource repository error was received: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: None.

AWKRAE026E Unable to allocate any resources. The following error was returned: "error_message".

Explanation: An internal error occurred while the system was processing the allocation for the job.

System action: A fault exception was received. The operation was not performed.

Operator response: Check the error and see if the error relates to the job requirements specified in the job definition.

AWKRAE027E No resources matching the job requirements were found after waiting for "wait_time" seconds.

Explanation: The system tried to find resources matching the job requirements, but at the end of the specified wait time, no matching resources were found.

System action: A fault exception was received. The operation was not performed.

Operator response: Check whether the required resources are up and running or whether they are suspended. Check whether you can resume any suspended resource that would match the requirements and resubmit the job.

AWKRAE029W Unable to find any resource matching the job requirements. The system will try to find appropriate resources for at least "wait_time" seconds.

Explanation: See message text.

System action: See message text.

Operator response: Check whether you can resume any suspended resource that would match the requirements. Otherwise provide other resources that match the requirement.

AWKRAE030W No currently available resources match the job requirements. The following resources that match the requirements cannot be contacted: "resource_list" The system will try to find appropriate resources for at least "wait_time" seconds.

Explanation: See message text.

System action: See message text.

Operator response: Check whether you can resume any suspended resource that would match the requirements. Otherwise provide other resources that match the requirement.

AWKRAE031W Waiting for currently allocated resource attributes.

Explanation: No matching resources are currently available with the required attribute quantity. Because the job needs to allocate a specified attribute quantity it will wait until that quantity is released by another job using the same attribute.

System action: The system waits for resources for the specified waiting time.

Operator response: None.

AWKRAE032E No currently available resources matching the job requirements have been found after waiting for "wait_time" seconds. The following resources matching the requirements cannot be contacted: "resource_list" .

Explanation: See message text.

System action: The system notifies the client.

Operator response: Check whether the required resources are up and running or whether they are suspended. Check whether you can resume any suspended resource that would match the requirements and resubmit the job.

AWKRAE090E Unable to cancel allocation "allocation_id" . The following error was returned: "error_message".

Explanation: See message text.

System action: The system processes the next operation.

Operator response: None.

AWKRAE091E Unable to process the reallocation of allocation "allocation_id" . The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: An exception is raised and sent to the Web Service invoker.

AWKRAE092E Unable to find allocation "allocation_id" .

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE093E The query allocation failed. The following resource repository error has been received: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE094E The resource allocation failed. The following error was returned: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE095E The Resource Advisor cannot be started because an error occurred during Resource Advisor initialization. The following error was returned:"error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed. An exception is raised and sent to the Web Service invoker.

Operator response: The error message points the user to the root cause of the problem.

AWKRAE099E An error occurred during resources heartbeat check. The following error was returned: "error_message".

Explanation: See message text.

System action: The system continues processing.

Operator response: See the message and check the connection to the resource.

AWKRAE100E The resource "resource_name" missed "missed_heartbeats" heartbeat counts. Setting the resource as inactive.

Explanation: See message text.

System action: The system continues processing the other resources.

Operator response: Check the message and check the connection with the specified resource.

AWKRAE101E An error occurred during allocation retry processing. The following error was returned:"error_message".

Explanation: See message text.

System action: The system continues to process other allocation retries.

Operator response: None.

AWKRAE102E An error occurred during notification processing. The following error was returned:"error_message".

Explanation: See message text.

System action: The system continues notification processing.

Operator response: None.

AWKRAE103E An error occurred during reallocation cancellation processing. The following error was returned:"error_message".

Explanation: See message text.

System action: The system continues to process reallocation cancellations.

Operator response: None.

AWKRAE104E An error occurred during allocation processing. The following error was returned:"error_message".

Explanation: See message text.

System action: The system continues to process allocations.

Operator response: None.

AWKRAE105W The allocation request for job "job_name" cannot currently be satisfied because maximum number of allocations allowed: "max_allowed" has already been reached.

Explanation: See message text.

System action: The system will retry this allocation.

Operator response: The system cannot satisfy all allocations coming at this rate. You can either change the MaxAllocsInCache parameter to accept more allocations if your system capacity is adequate or you can or slow down the job submission rate to allow the system to free allocations before more are requested.

AWKRAE106E An error occurred. Rollback failed with database error:"error_message".

Explanation: An error occurred when trying to rollback a transaction.

System action: See message text.

Operator response: See message text.

AWKRAE107E The database returned the following error: "error_message".

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: Check the message returned by the database to find the cause of the error.

AWKRAE108E An error occurred while the Tivoli Dynamic Workload Broker was trying to restore the allocation for job "job_name". The following error was returned:"error_message".

Explanation: An unrecoverable error occurred while restoring the job allocation during Tivoli Dynamic Workload Broker restart. The allocation for this job cannot be recreated.

System action: The job continues to run but the consumable attribute allocations defined before the error occurred are lost. As a consequence, other jobs requiring the same consumable attributes can now consume the same quantity.

Operator response: Submit the job again so that Tivoli Dynamic Workload Broker can calculate the allocation again.

AWKRAE109E Cancel allocation was requested for allocation "allocation_id" during Resource Advisor start-up. The System will retry the operation later.

Explanation: See message text.

System action: A fault exception was received. The operation was not performed.

Operator response: None.

AWKRAE110E The Resource Advisor failed to process the rebuilding of allocation "allocation_id" for job "job_name". The allocation will be canceled.

Explanation: The Resource Advisor encountered an internal problem at startup when rebuilding the resource allocations for the job. All allocated resource quantities will be removed and will be available to other jobs.

System action: A fault exception was received. The operation was not performed.

Operator response: Monitor the job for which allocations have been cancelled. If it is still running, check that it is not affected by a possible over-allocation, since other jobs could now be allocated the resources being used by this job.

AWKRAE112E An error occurred while connecting to the Job Dispatcher. The internal error is:"error".

Explanation: The Resource Advisor cannot communicate with the Job Dispatcher NotificationConsumerEJB because of an internal error.

System action: A fault exception was received. The operation was not performed.

Operator response: Restart IBM WebSphere Application Server and try again.

AWKRAE113E The Tivoli Dynamic Workload Broker server cannot contact the Tivoli Dynamic Workload Broker agent with url "url" while forcing the agent to send all the collected resources.

Explanation: The server cannot create the agent proxy object.

System action: The agent does not send all the data.

Operator response: The server could not create the proxy object. A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE114E The Tivoli Dynamic Workload Broker server got an unexpected remote exception while contacting the Tivoli Dynamic Workload Broker agent with url "url" to force a send of all the collected resources. The internal error is: "error".

Explanation: The server got an unexpected remote exception.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE115E An unexpected error occurred while trying to decode the fault returned by the target resource at address "url". The original error is"error". The following error is returned while decoding "error".

Explanation: The server could not parse the error returned by the agent.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE116E A recoverable error was returned by the agent with address "url" while forcing a send of all the collected resources. The internal error is:"error".

Explanation: See message text.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE117E A recoverable error was returned by the agent with address "url" while forcing a send of all the collected resources. No additional information is returned by the agent.

Explanation: See message text.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE118E An unrecoverable error was returned by the agent with address "url" while forcing a send of all the collected resources. The internal error is: "error".

Explanation: See message text.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE119E An unrecoverable error was returned by the agent with address "url" while forcing a send of all the collected resources. No additional information is returned by the agent.

Explanation: See message text.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE120E The Tivoli Dynamic Workload Broker server could not contact the Tivoli Dynamic Workload Broker agent with url "url" to force a send of all the collected resources. The internal error is: "error".

Explanation: See message text.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE121E An unexpected error occurred while forcing the agent at address address "url" to send a all the collected resources. The internal error is "error". No additional information are sent to the server.

Explanation: The linked cause is missing in the

exception sent by the agent. This should never happen and looks like an issue in the web services infrastructure.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE122E The Tivoli Dynamic Workload Broker server got an unexpected local exception while contacting the Tivoli Dynamic Workload Broker agent with url "url" to force a send of all the collected resources. The internal error is: "error".

Explanation: The server got an unexpected local exception.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE123E Unexpected exception while forcing the send of all the collected resources.

Explanation: The server got an unexpected.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE124E The Tivoli Dynamic Workload Broker server cannot register to the Agent Manager. The error is: "error".

Explanation: The server got an unexpected.

System action: The agent does not send all the data.

Operator response: A restart the Tivoli Dynamic Workload Broker agent will let it send all the collected resources.

AWKRAE125W A notification was received from the agent with URI "agent uri" and id "agent_id". This notification is for updating the agent properties but while the server was expecting a full notification.

Explanation: The status of the agent in the Tivoli Dynamic Workload Broker database is ""unavailable"" but the agent is sending an update for the agent properties. This should not happen.

System action: The Tivoli Dynamic Workload Broker is contacting the agent to have a full notification of the agent properties

Operator response: None.

AWKRAE126E The Tivoli Dynamic Workload Broker attempted to contact the agent at the URI "agent uri" and the following error occurred: "error_message".

Explanation: The Tivoli Dynamic Workload Broker was attempting to recover from an unexpected situation but there was an error while contacting the agent

System action: None.

Operator response: None.

Chapter 43. AWKRCE - Remote command plug-in messages

This section lists error and warning messages that might be issued by the Remote command plug-in.

The message component code is RCE.

AWKRCE001E The server name is a required parameter.

Explanation: A value for the required parameter, server name, was not specified. You must specify a server name.

System action: The operation is not performed.

Operator response: Specify a server name and retry the operation.

AWKRCE002E The user name is a required parameter.

Explanation: A value for the required parameter, user name, was not specified. You must specify a user name.

System action: The operation is not performed.

Operator response: Specify a user name and retry the operation.

AWKRCE003E A command must be specified.

Explanation: A command is required and must be specified.

System action: The operation is not performed.

Operator response: Specify a command and retry the operation.

AWKRCE004E The password is a required parameter.

Explanation: You must specify a password.

System action: The operation is not performed.

Operator response: Specify the password and retry the operation.

AWKRCE005E One or more mandatory parameters are missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the missing parameters and retry the operation.

AWKRCE006E Unable to contact the specified server.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the server is running and that the network connection is available.

AWKRCE0070E Cannot find the specified protocol. The supported protocols are: REXEC, WINDOWS, RSH, SSH, AUTO.

Explanation: The specified protocol is not available on the target workstation.

System action: The operation is not performed.

Operator response: Verify that the protocol is installed and enabled. Retry the operation.

AWKRCE0080E An error occurred while executing the command.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify the specified command and retry the operation.

AWKRCE0090E Cannot find the specified protocol or the server is unreachable.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify if the command is right;

AWKRCE0100E The port range is invalid. Specify a value in the 1 - 65535 interval.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify the port range.

AWKRCE011E The IBM Tivoli Workload Scheduler agent cannot monitor the remote command job.

Explanation: The IBM Tivoli Workload Scheduler agent stops monitoring the remote command job because of internal problems.

AWKRCE012E • AWKRCE014E

The remote command job status cannot be retrieved and the agent sets the status of the IBM Tivoli Workload Scheduler job to ""unknown"".

System action: The product stops monitoring the remote command job.

Operator response: Verify the remote command job status in the remote machine. If the remote command job completed successfully, manually release the IBM Tivoli Workload Scheduler job dependencies.

AWKRCE012E Could not establish a connection to "server" target machine.

Explanation: The specified protocol is not available on the target workstation or the target workstation is running.

System action: The operation is not performed.

Operator response: Verify that the protocol is installed and enabled or that the server is running and that the network connection is available. Retry the operation.

AWKRCE013E Could not establish a connection to the target machine with the authorization credentials that were provided.

Explanation: The specified user name or password is not valid.

System action: The operation is not performed.

Operator response: Verify that the user name or password is valid. Retry the operation.

AWKRCE014E Permissions denied to write the standard output or the standard error files.

Explanation: The IBM Tivoli Workload Scheduler agent stops monitoring the remote command.

System action: The product stops monitoring the remote command job.

Operator response: Verify the remote command job status in the remote machine. If the remote command job completed successfully, manually release the IBM Tivoli Workload Scheduler job dependencies.

Chapter 44. AWKRRP - Resource repository messages

This section lists error and warning resource repository messages that might be issued.

The message component code is RRP.

AWKRRP001E Unable to close the connection to the Resource Repository (RESREP) database.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP002E Unable to create connection to the Resource Repository (RESREP) database.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP003E Unable to perform query resources.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP004E The attribute name "attribute_name" for a computer system resource is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP005E The attribute name "attribute_name" for an operating system resource is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP006E The attribute name "attribute_name" for a file system resource is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP007E The attribute name "attribute_name" for a network system resource is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP008E The attribute name "attribute_name" for a software system resource is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP009E The attribute value "attribute_value" for attribute name "attribute_name" for the "resource" resource is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP010E A communication error occurred while connecting to the Resource Repository (RESREP) database table "table". The target database cannot be contacted.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP011E A communication error occurred while connecting to the Resource Repository (RESREP) database. The target database cannot be contacted.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP012E • AWKRRP024E

AWKRRP012E Unable to remove a record from table "table".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP013E Unable to initialize the Resource Repository. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP014E Unable to initialize the JNDI context. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP015E Unable to process an internal query for resources. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP016E An unexpected null argument was found while deleting resources.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP017E An unexpected exception occurred while deleting resources. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP018E Unable to find source or target resources for the creation or update of a relationship.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP019E Unable to create the relationship record. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP020E A generic exception occurred while creating a relationship. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP021E An unknown resource type "resource_type" was found while creating or updating a resource.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP022E A notification containing no data was received from the resource advisor agent "agentID".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP023E An error occurred during agent notification because the resource with name "resource_name" and resource type "resource_type" is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP024E An error occurred during the processing of a relationship because the source or target does not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP025E An error occurred during the processing of an agent notification. It was not possible to create a relationship. The following error was received:"error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP026E An error occurred during the processing of an agent notification. The relationship specified for deletion does not exist.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP027E An error occurred during the processing of an agent notification. It was not possible to search for a source or target resource. The following error was received:"error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP028E An error occurred during the processing of an agent notification. Unable to remove the relationship. The following internal error has been generated: "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP029E An error occurred during the processing of an agent notification. The resource with name"resource_name" and type "resource_type" could not be removed.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP030E An error occurred during the processing of an agent notification. The resource with name"resource_name" and type "resource_type"could not be found.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP031E Unable to create an resource advisor agent information record. The following error was received: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP032E Unable to find the resource advisor agent with ID "agentID". The following internal error has been generated: "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP033E Unable to generate an internal identifier for the resource advisor agent with ID "agentID". The following error was received:"error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP034E The JSDL mapper file "jsdlmapper"was not found.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP035E Unable to load the JSDL Mapper file"jsdlmapper". The following error was received:"error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP036E Unable to create the resource advisor agent information entity with URI"URI". The following error was received:"error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP037E The notification contains no data.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP038E Unable to create or remove a record for table "table_name". The following error was received:"error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP039E Unable to query resources because the matching criteria set is empty.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP040E Unable to process SDO objects.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP041E Unable to find the resource with name"resource_name" and type"resource_type".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP042E A resource already exists with name "resource_name"and type"resource_type".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRRP043E Unable to find the target resource "resource_display_name" with ID "resource_id" and type "resource_type" for job "job_name".

Explanation: The resource specified as the target for the job cannot be found because it does not exist in the Tivoli Dynamic Workload Broker repository.

System action: The operation is not performed.

Operator response: None.

AWKRRP045E The job "job_name" cannot be processed because the resource table mapping file has not been loaded.

Explanation: This is an internal error. The JSDLMapper.xml file has not been correctly loaded.

System action: The operation is not performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKRRP047E No target resource has been specified for the job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a target resource for the job.

AWKRRP048E The relationship for the resource ID: "resource_id" cannot be processed because no target or source is specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the relationships defined in your JSDL.

AWKRRP049E The relationship for the resource ID: "resource_id" cannot be processed because the resource has not been defined in the JSDL.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the resource defined in your JSDL.

AWKRRP051E There must be at least one attribute defined in OperatingSystem element.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Ensure that at least one attribute is defined in OperatingSystem element into the JSDL file.

AWKRRP052E The maximum CPU speed specified for the resource "target_type" is not a Double. Please check the value of maximum CPU speed and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP053E The exact CPU speed specified for the resource "target_type" is not a Double. Please check the value of exact CPU speed and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP054E The minimum CPU speed specified for the resource "target_type" is not a Double. Check the value for minimum CPU speed and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP055E The element CPURequirement cannot be null.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a value for the CPURequirement element.

AWKRRP056E At least one attribute must be defined for the cpu element.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that at least one attribute is defined for cpu element into the JSDL file.

AWKRRP057E The exact physical memory specified for the resource "target_type" is not a Double. Check the value of exact Physical Memory and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP058E The maximum Physical Memory specified for the resource "target_type" is not a Double. Check the value of maximum Physical Memory and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP059E The minimum Physical Memory specified for the resource "target_type" is not a Double. Check the value of minimum Physical Memory and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP060E At least one attribute must be defined in PhysicalMemory element

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that at least one attribute is defined in the PhysicalMemory element of the JSDL file.

AWKRRP061E The exact Virtual Memory specified for the resource "target_type" is not a Double. Please check the value of exact Virtual Memory and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP062E The maximum Virtual Memory specified for the resource "target_type" is not a Double. Check the value of maximum Virtual Memory and if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP063E The minimum Virtual Memory specified for the resource "target_type" is not a Double. Check the value of minimum Virtual Memory and if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP064E At least one attribute must be defined in the VirtualMemory element

Explanation: See message text.

System action: The operation is not performed.

Operator response: Ensure that at least one attribute is defined in the VirtualMemory element of the JSDL file.

AWKRRP065E The exact Disk Space specified for the resource "target_type" is not a Double. Check the value of exact Disk Space and if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP066E The maximum Disk Space specified for the resource "target_type" is not a Double. Check the value of maximum Disk Space and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP067E The minimum Disk Space specified for the resource "target_type" is not a Double. Check the value of minimum Disk Space and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP068E At least one attribute must be defined in the FileSystem element

Explanation: See message text.

System action: The operation is not performed.

Operator response: Ensure that at least one attribute is defined in the FileSystem element of the JSDL file.

AWKRRP069E The quantity of the Logical Resource is not a Long. Check the value of the quantity of Logical Resources and, if the value is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP070E At least one attribute must be defined in the LogicalResource element.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that at least one attribute is defined in the LogicalResource element of the JSDL file.

AWKRRP071E The TDWB Server cannot find a table that is associated with the resource "resource_type".

Explanation: An internal error has occurred.

System action: The operation is not performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKRRP072E The Tivoli Dynamic Workload Broker Server cannot find an attribute definition associated with the property "property_name" for the resource "resource_type".

Explanation: An internal error has occurred.

System action: The operation is not performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKRRP073E The specified unit "default_unit" is not valid.

Explanation: An internal error has occurred.

System action: The operation is not performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKRRP074E The HostName element cannot be null.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP075E At least one attribute must be defined in the Host element.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Ensure that at least one attribute is defined in the Host element of the JSDL file.

AWKRRP076E The value assigned to the attribute "property_name" includes the characters "temp_value". Values for this attribute can include only integer values for the resource "target_type".

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP078E The value assigned to the attribute "property_name" includes the characters "temp_value". Only Float values can be defined for attribute for the resource "target_type".

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP079E The relationship for resource "resource_id" references source or target resources that do not exist or that are not defined in the JSDL.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP081E The property "property_name" specified for the resource "target_type" is not a Double. Check the value and, if it is a variable, check that values have been set for all variables.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP082E The resource type "resource_type" specified in the objective element has not been defined in the JSDL for the job "job_name".

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKRRP083E No database information have been provided for the resource type "resource_type".

Explanation: An internal error occurred. The JSDLMapper.xml file could not be correctly loaded.

System action: The operation is not performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKRRP084E A resource already exists with display name "resource_name" and type "resource_type".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a resource with different parameters.

AWKRRP085E The property "property_name" specified for resource "resource_type" in the Optimization element is not optimizable.

Explanation: The property specified in the Optimization element is not a number, or it is optimizable. For a list of optimizable properties, see the IBM Tivoli Dynamic Workload Broker User's Guide.

System action: The operation is not performed.

Operator response: Specify an optimizable property for the specified resource.

AWKRRP086E • AWKRRP087E

AWKRRP086E The agent "agent_name" could not be created because the domain "domain_name" is not present.

Explanation: The dynamic domain manager is attempting to create a workstation in a domain that does not exist. This can be a temporary problem just after the dynamic domain manager installation. The product can automatically recover from this error condition.

System action: The operation is not performed.

Operator response: None.

AWKRRP087E This resource group cannot be modified or deleted from the Tivoli Dynamic Workload Broker web interface because it is linked to a workstation of type pool.

Explanation: You are attempting to modify a resource group associated to a workstation of type pool from the Tivoli Dynamic Workload Broker web interface.

System action: The operation is not performed.

Operator response: Modify or delete the workstation of type pool from the Tivoli Workload Console.

Chapter 45. AWKRSE - Resource advisor agent cache messages

This section lists error and warning resource advisor agent cache messages that might be issued.

The message component code is RSE.

AWKRSE081E Unable to initialize the Resource Advisor allocation cache. The following error was returned: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the log files for more information.

Chapter 46. AWKRST - RESTful Web Services messages

This section lists error and warning messages that might be generated by the routines that handle the RESTful Web Services.

The message component code is RST.

AWKRST001E Send direct message failed. The error was `""error""`

Explanation: An error was received while sending a direct message

System action: The operation is not performed.

Operator response: Verify that you are allowed to send a direct message to the specified follower and that your credentials are correct and try the operation again

AWKRST002E The message was successfully sent to the specified follower

Explanation: The message was successfully sent

System action: The operation is performed;

Operator response: None.

AWKRST003E The status was successfully updated

Explanation: The status was successfully updated

System action: The operation is performed;

Operator response: None.

AWKRST004E Update message failed. The error was `""error""`

Explanation: An error was received while updating the status

System action: The operation is not performed.

Operator response: Verify that you are allowed to update the status and that your credentials are correct and try the operation again

AWKRST005E A message was received from `""message""`. Message id: `""message_id""`; message text: `""message_text""`.

Explanation: The message `message_id` - `message_text` was received from status was successfully updated

System action: The operation is performed;

Operator response: None.

AWKRST006E An error occurred while getting a message from `""sender""`. The error was `""error""`

Explanation: An error was received getting a message from the specified sender while updating the status

System action: The operation is not performed.

Operator response: Verify that you are allowed to receive messages from the specified sender that your credentials are correct and try the operation again

AWKRST008E An error occurred running the RESTful Web Services job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the Java RESTful Web Services plug-in log file.

AWKRST009E The required server address parameter is missing.

Explanation: The server address is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKRST010E The specified method is incorrect. Supported values are: GET, POST, PUT, DELETE, HEAD

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKRST011E Invalid server URL syntax

Explanation: The syntax specified for the server URL is not correct.

System action: The operation is not performed.

Operator response: Specify a valid HTTP/HTTPS URL and retry the operation.

AWKRST012E An error occurred submitting the RESTful Web Services job. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST013E Keystore authentication failed. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST014E The job cannot be saved because no input file for the post has been specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST016E Error opening file ""filename"". The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST017E Error writing to file ""filename"". The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST018E Error opening file ""filename"". The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST019E Error reading file ""filename"". The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST020E An error occurred retrieving JSON result from response. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the JSON result query

AWKRST021E Unable to get valid response for server. The error message is ""error"" : ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the JSON result query

AWKRST022E Cannot add parameters to query string already defined in the URL

Explanation: See message text.

System action: The operation is not performed.

Operator response: Remove query string or remove parameters

AWKRST023E One of the header keys is empty.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKRST024E One of the query parameter keys is empty.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKRST025E The IBM Workload Scheduler agent cannot monitor the RESTful Web Services job.

Explanation: The IBM Workload Scheduler agent cannot reconnect to the RESTful Web Services job because of it is not supported.

System action: The RESTful Web Services job status cannot be retrieved and the agent sets the status of the IBM Workload Scheduler job to "unknown".

Operator response: Manually verify the RESTful Web Services job status in the RESTful Web Services server. If the RESTful Web Services job completed successfully, manually release the IBM Workload Scheduler job dependencies.

AWKRST026E The job cannot be saved because the number of retries is invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST027E The job cannot be saved because retry period is invalid.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST028E The service URI is wrong. The error message is "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST029E The UTF-8 encoding is not supported. The error message is "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKRST030E An error occurred establishing a connection to the remote service. The error message is "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None

AWKRST031E Error opening file "file_name". The error message is "error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST032E An error occurred while attempting to create the database "database".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST033E An error occurred while attempting to delete the database "database".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST038E "database": Invalid database name.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid database name.

AWKRST039E "database": Database name already exists.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a unique database name.

AWKRST040E Error creating document "document".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST041E Error creating document: Document already exists.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a document that does not already exist.

AWKRST042E Error creating document: Invalid document name

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify a valid document name.

AWKRST043E • AWKRST062E

AWKRST043E Error deleting document
""document"".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST052E Error creating/updating attachment
""attachment"".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST055E Error reading attachment
""attachment"".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST057E Error deleting attachment
""attachment"".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST058E Unexpected json structure.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST059E Unable to reconnect to Cloudant job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKRST060E Write output file error.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

**AWKRST062E An error occurred while monitoring
the job. The error message is ""error""**

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

Chapter 47. AWKSA - Tivoli Workload Scheduler Bridge messages

This section lists error and warning Tivoli Workload Scheduler Bridge messages that might be issued.

The message component code is SA.

AWKSA002E Unable to start the Tivoli Dynamic Workload Bridge.

Explanation: Possible reasons are:

- The configuration file was not found.
- The Tivoli Dynamic Workload Bridge cannot start the Netman listening thread on the TWSAgent port.

System action: The operation is not performed.

Operator response: Check that the configuration file is present in the Tivoli Dynamic Workload Broker configuration directory.

Check that the TWSAgent port was correctly specified.

Chapter 48. AWKSAF - Job plug-in for Salesforce messages

This section lists error and warning messages that might be issued by the job plug-in for Salesforce.

The message component code is SAF.

AWKSAF001E An error occurred while connecting to the Salesforce site. The error message is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Try again later or contact your system administrator.

AWKSAF002E An error occurred while canceling the Salesforce job with the `""identifier` identifier. The error message is `""error"" ""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: The job identifier is incorrect. Check the job ID and retry the operation.

AWKSAF003E A connection error has occurred. The server identified by host name or URL is not reachable.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct server host name or URL and retry the operation.

AWKSAF004E A connection error has occurred. The user name or the password is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct user name or password.

AWKSAF005E An error occurred while submitting the Salesforce job `""apexClass""`. The error message is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSAF006E An error occurred while monitoring the job. The error message is `""error""`

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSAF007E The Salesforce job with `""identifier""` identifier failed.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSAF008E An error occurred while running the Salesforce job with `""identifier""` identifier.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSAF009E The required server address parameter is missing.

Explanation: The server address is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSAF010E The required user name parameter is missing.

Explanation: The user name and the password are required parameters.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSAF011E • AWKSAF014E

AWKSAF011E The required password parameter is missing.

Explanation: The password is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSAF012E The required APEX batch class parameter is missing.

Explanation: The APEX batch class is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSAF013E The APEX batch classes were not found in Salesforce

Explanation: The APEX batch class list retrieved from Salesforce is empty.

System action: The operation is not performed.

Operator response: Check whether there are any available data, change the filter settings or contact your system administrator.

AWKSAF014E An error occurred while parsing the Salesforce response

Explanation: The Salesforce response does not have the required format

System action: The operation is not performed.

Operator response: Contact your system administrator.

Chapter 49. AWKSBO - Job plug-in for SAP BusinessObjects BI messages

This section lists error and warning messages that might be issued by the job plug-in for SAP BusinessObjects BI.

The message component code is SBO.

AWKSBO001E An error occurred while connecting to the SAP BusinessObjects site. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Try again later or contact your system administrator.

AWKSBO002E An error occurred while canceling the SAP BusinessObjects job with the ""identifier identifier. The error message is ""error"" ""

Explanation: See message text.

System action: The operation is not performed.

Operator response: The job identifier is incorrect. Check the job ID and retry the operation.

AWKSBO003E A connection error has occurred. The server identified by host name or URL is not reachable.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct server host name or URL and retry the operation.

AWKSBO004E A connection error has occurred. The user name or the password is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct user name or password.

AWKSBO005E An error occurred while submitting the SAP BusinessObjects job ""BOResource"". The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSBO006E An error occurred while monitoring the job. The error message is ""error""

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSBO007E The SAP BusinessObjects resource creation with ""identifier"" identifier failed.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSBO008E An error occurred while scheduling the SAP BusinessObjects resource ""resource"". Check error details on the SAP BusinessObjects console.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message on the SAP BusinessObjects console.

AWKSBO009E The required server address parameter is missing.

Explanation: The server address is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO010E The required user name parameter is missing.

Explanation: The user name and the password are required parameters.

AWKSBO011E • AWKSBO023E

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO011E The required password parameter is missing.

Explanation: The password is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO012E The required SAP BusinessObjects resource parameter is missing.

Explanation: The SAP BusinessObjects resource object is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO013E SAP BusinessObjects resource not found in SAP BusinessObjects

Explanation: The SAP BusinessObjects resource list retrieved from SAP BusinessObjects is empty.

System action: The operation is not performed.

Operator response: Check whether there are any available data, change the filter settings or contact your system administrator.

AWKSBO014E An error occurred while parsing the SAP BusinessObjects response

Explanation: The SAP BusinessObjects response does not have the required format

System action: The operation is not performed.

Operator response: Contact your system administrator.

AWKSBO016E The required authorization type parameter is missing in the properties file.

Explanation: The authorization type is a required parameter in the properties file when you specify the default value.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO018E Incorrect server URL syntax

Explanation: The syntax specified for the server URL is incorrect.

System action: The operation is not performed.

Operator response: Specify a valid HTTP/HTTPS URL and retry the operation.

AWKSBO019E Incorrect SAP BusinessObjects resource object parameter. The parameter must end with (rid:number)

Explanation: The syntax specified for the SAP BusinessObjects resource object is incorrect.

System action: The operation is not performed.

Operator response: Specify a valid SAP BusinessObjects resource object and retry the operation.

AWKSBO020E Incorrect authorization type parameter. Valid values are: secEnterprise, secLDAP, secWinAD and secSAPR3.

Explanation: The authorization type is incorrect.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO021W Prompts not available for this report

Explanation: The report prompt list retrieved from SAP BusinessObjects is empty.

System action: The operation is not performed.

Operator response: None.

AWKSBO022E Incorrect SAP BusinessObjects webi report prompt name ""name"". The prompt name must end with (dpId:string, type:string)

Explanation: The syntax specified for the SAP BusinessObjects webi report prompt name is incorrect.

System action: The operation is not performed.

Operator response: Specify a valid SAP BusinessObjects webi report prompt name and retry the operation.

AWKSBO023E The required SAP BusinessObjects resource object format type is missing.

Explanation: The SAP BusinessObjects resource object format type is a required parameter.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO024E Incorrect format type parameter. Valid values are: webi, pdf, xls, csv.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSBO025E Incorrect group ID. The ID must be a number.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

Chapter 50. AWKSED - Job repository data access object messages

This section lists error and warning job repository data access object messages that might be issued.

The message component code is SED.

AWKSED101E Unable to find Job with "id_type"
"jobID" in the database.

Explanation: See message text.

The job might have been archived.

System action: The operation cannot be performed.
The program continues.

Operator response: Check the Job ID.

Check whether the job has been stored consulting the properties SuccessfulJobsMaxAge and UnsuccessfulJobsMaxAge in the configuration file JobDispatcherConfig.properties.

AWKSED102E Unable to find a Job definition with
name "jobName" in the database.

Explanation: See message text.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED103E Unable to create a resource related to
the job with ID "jobID" because the
resource list is empty.

Explanation: The specified list of resources related to a job is empty. They cannot be inserted in the database.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED104E Unable to update the job definition
with name "jobName" and namespace
"namespace" because it was not found
in the database.

Explanation: See message text.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED105E An error occurred when parsing JSDL
while writing to the database. The
following error was returned:
"operation_output".

Explanation: The conversion from JSDL (xml) to string failed. The conversion is performed before storing the JSDL in the database.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED106E An error occurred when parsing JSDL
while reading from the database. The
following error was returned:
"operation_output".

Explanation: The conversion from string to JSDL (xml) has failed. The conversion happens after reading the JSDL from the database.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED107E Unable to create the job definition
because a job definition with name
"jobName" already exists.

Explanation: See message text.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED108E An error occurred when parsing the
EPR string while writing to the
database. The following error was
returned: "error".

Explanation: The conversion from EPR (xml) to string failed. The conversion is performed before storing the EPR in the database.

System action: The operation cannot be performed.
The program continues.

Operator response: See message text.

AWKSED109E • AWKSED113E

AWKSED109E An error occurred when parsing the EPR string while reading from the database. The following error was returned: "error".

Explanation: The conversion from string to EPR (xml) has failed. The conversion is performed after reading the EPR from the database.

System action: The operation cannot be performed. The program continues.

Operator response: See message text.

AWKSED110E Unable to create the requirement because a requirement with name "reqName" already exists.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: See message text.

AWKSED111E Unable to find a requirement with name "reqName" and namespace "namespace" in the database.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: See message text.

AWKSED112E Unable to update the requirement with name "reqName" and namespace "namespace" because it was not found in the database.

Explanation: See message text.

System action: The operation cannot be performed. The program continues.

Operator response: See message text.

AWKSED113E An error occurred when parsing the requirement while reading from the database. The following error was returned: "operation_output".

Explanation: The conversion from string to requirement (xml) has failed. The conversion happens after reading the requirement from the database.

System action: The operation cannot be performed. The program continues.

Operator response: See message text.

Chapter 51. AWKSPS - SPSS statistics subset messages

This section lists error and warning messages that might be generated by the routines that handle the SPSS statistics subset.

The message component code is SPS.

Chapter 52. AWKSRI - Job brokering definition console installation messages

This section lists error and warning messages that could be generated by the job brokering definition console installation process

The message component code is SRI.

AWKSRI001E An error occurred while connecting to the DB2 instance.

Explanation: There was a problem connecting to the DB2 instance. Common problems are:

- The DB2 server address is wrong
- The DB2 server port is wrong
- The DB2 server is down
- The user name or password are wrong
- There is no network connectivity to the DB2 server and port

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the information provided in the troubleshooting panel and try to resolve the connection problem.

AWKSRI002E There is a database with the same name in the directory.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Contact the DB2 Administrator.

AWKSRI003E Unable to create the database.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Contact the DB2 Administrator.

AWKSRI004E An error occurred while processing the ddl file.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the trace_installation.log file.

AWKSRI005E The database is already present and cannot be created.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Contact the DB2 Administrator.

AWKSRI006E An error occurred while connecting to the database.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Contact the DB2 Administrator.

AWKSRI007E Unexpected error returned by the dbsetup script.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Ensure that the DB2 user is authorized to run the dbsetup script.

AWKSRI008E An error is returned by InstallShield MultiPlatform while unloading files.

Explanation: There was an installation problem in the InstallShield MultiPlatform Product Tree.

System action: The installation is rolled back.

Operator response: Check the trace_installation.log file and attempt a new installation.

AWKSRI009E An error occurred, see log files for details.

Explanation: See message text.

System action: See message text.

Operator response: See message text.

AWKSRI010W The installation of "component" was cancelled.

Explanation: See message text.

System action: The installation was rolled back.

Operator response: See message text.

AWKSRI011E The installation of "component" failed.

Explanation: See message text.

System action: The installation completed with an error.

Operator response: See message text.

AWKSRI014W Unable to determine the installation status.

AWKSRI015E You must have administrator privileges to run this installation.

Explanation: The user is not an administrator.

System action: The operation is not performed.

Operator response: Log on with administrator privileges and restart the installation.

AWKSRI016W The "value" value must be specified.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required value and retry the operation.

AWKSRI017E The deployment of WebSphere Application Server failed. Check the WebSphere Application Server trace and log files for details.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI018E "value" does not match the repeat password field.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI019E The specified path "path" is too long.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI020E The silent installation failed. Check the "log_file" file for details.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI021E The silent installation failed because an unsupported value "value" was specified for the installation type. Supported installation types are typical and custom.

Explanation: See message text.

System action: The installation does not start.

Operator response: Correct the response file and run the installation again.

AWKSRI023E The database administrator does not have privileges to access the installation directory.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI024E The path name "path" is not valid because it contains incorrect characters.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the directory name.

AWKSRI025E A value must be assigned to the installLocation attribute.

Explanation: No value has been assigned to the installLocation in the response file or the command line.

System action: The installation fails.

Operator response: Assign a value to -P installLocation attribute.

AWKSRI026E You specified a read only directory "directory_name" for the installLocation attribute.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the -P installLocation attribute or change the permissions of the directory.

AWKSRI027E An unexpected error occurred, check the trace files for details.

Explanation: See message text.

System action: The operation is not performed.

Operator response: See message text.

AWKSRI028E The specified options file "filename" was not found.

Explanation: See message text.

System action: The installation does not start.

Operator response: Ensure that you specify the correct file name for the -options parameter.

AWKSRI029E An internal error occurred. The options file type "type" is not supported.

Explanation: See message text.

System action: The installation does not start.

Operator response: None.

AWKSRI030E The mandatory parameter "parameter" is not present in the options file or in the command line arguments.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Include the missing parameter in the options file or on the command line.

AWKSRI031E No value is assigned to the mandatory parameter "parameter" in the options file or in the command line arguments.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Add the value for this parameter in the options file or on the command line.

AWKSRI032E The specified value "value " is not valid for "parameter" Valid values are: "values".

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the value for this parameter to one of the valid values in the options file or on the command line.

AWKSRI033E The specified installation path "path" is not a valid directory name.

Explanation: The value of the -P installLocation parameter is wrong.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the value for the -P installLocation parameter to a valid value in the options file or on the command line.

AWKSRI034E The version of the DB2 server installed on "DB2_location" is "DB2 version"{1}. This version is not supported by Tivoli Dynamic Workload Broker.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Upgrade your DB2 installation to a supported version.

AWKSRI035E The specified value "value " is not valid for "parameter".

Explanation: No DB2 driver is available in the specified directory.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify the directory where the DB2 driver is located.

AWKSRI036E Unable to connect to the DB2 database.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Check the trace file.

AWKSRI037E The specified value "value " is not valid for the port number parameter"parameter".

Explanation: The port number must be in the range 0 - 65535.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the port number to a value in the range 0 - 65535.

AWKSRI038E Unable to connect to the DB2 server. Error details: "error".

Explanation: There was a problem connecting to the DB2 instance. Common problems are:

- The DB2 server address is wrong
- The DB2 server port is wrong
- The DB2 server is down
- The user name or password are wrong
- There is no network connectivity to the DB2 server and port

System action: If you are installing in silent mode, the installation fails.

Operator response: Check the user name, password, DB2 server address, DB2 instance or port, DB2 server status, and network connectivity.

AWKSRI040E The enterprise application deployment failed with an unexpected error. Check the WebSphere Application Server trace and log files section for details.

Explanation: See message text..

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI041E The version of the WebSphere Application Server installed on "WAS_location" is not supported by Tivoli Dynamic Workload Broker.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Upgrade your WebSphere Application Server installation to a supported version.

AWKSRI042E The specified value "value " is not valid for the WebSphere Application Server location parameter"parameter"

Explanation: There is no WebSphere Application Server in the specified location.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the WebSphere Application Server install location.

AWKSRI046E The post installation test failed. See below for details.

Explanation: None.

System action: None.

Operator response: None.

AWKSRI048E The DB2 server is not listening on port "port"specified as the "parameter".

Explanation: The port specified is wrong or the DB2 server is down.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the port number.

AWKSRI049E The License Agreement was not accepted.

Explanation: The value of the variable licenseAccepted in the options file is not ""true""

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the licenseAccepted variable in the options file to ""true""

AWKSRI050E The command failed. Check the error log section for details.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI052E The port "port" specified for the "portlabel_tovalidate" is not free.

Explanation: Another process is using this port.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the port number.

AWKSRI053E The specified value is too long. The "name" cannot be longer than 16 characters.

Explanation: The Tivoli Workload Scheduler master domain manager name cannot be longer than 16 characters.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify the correct name of the Tivoli Workload Scheduler master domain manager.

AWKSRI054E The specified value is not correct. The first character of the "name" must be a letter.

Explanation: The first character of the Tivoli Workload Scheduler master domain manager name must be a letter.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify the correct name of the Tivoli Workload Scheduler master domain manager.

AWKSRI055E The Table Space name cannot exceed the 18 characters length.

Explanation: The Table Space name is longer than 18 characters.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a Table Space name not longer than 18 characters.

AWKSRI056E The Table Space name cannot start with a number.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a Table Space name that does not start with a number.

AWKSRI057E The specified name is too long. The names of the database instance and the database cannot exceed 8 characters in length.

Explanation: The database instance name or the database name is longer than eight characters.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a database instance name or a database name not longer than eight characters.

AWKSRI058E The database name cannot contain the following characters: @, \$, and #.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a Database name that does not contain the characters @, \$, or #.

AWKSRI062E The silent uninstallation failed. Check the log file "logfile" for details.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI064E The uninstallation of "product" failed. See the log file for more details.

Explanation: See message text.

System action: See message text.

Operator response: See message text.

AWKSRI065E See DB2 error message.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI066E The profile "profile_name" specified for the "profilelabel_tovalidate" is not present on the WebSphere Application Server installed on "installation_path". The discovered profiles are: "profile_list".

Explanation: The profile does not exist.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the profile name.

AWKSRI067W An error occurred while collecting information from the WebSphere Application Server profile. The return code is "return_code" and the error is "return_code"

Explanation: An error occurred while running the list.py command

System action: If you are installing in silent mode, the installation fails.

Operator response: Check the error log.

AWKSRI068E The server "server_name" specified for the "serverlabel" is not present on the WebSphere Application Server installed in "installation_path". The discovered servers are: "server_list".

Explanation: The server does not exist.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the server name to that of an existing server.

AWKSRI069E The cell "cell_name" for the "celllabel" is not present on the WebSphere Application Server installed in "installation_path". Existing cells are: "cell_list".

Explanation: The cell does not exist.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the cell name to that of an existing cell.

AWKSRI070E The node "node_name" specified for the "nodelabel" is not present on the WebSphere Application Server installed in "installation_path". Existing nodes are: "node_list".

Explanation: The node does not exist.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the node name to that of an existing node.

AWKSRI071E The installation of the Tivoli Agent Manager failed. If it is partially installed, uninstall it before re-running this step. The Tivoli Agent Manager installation reported the following:

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: The error message reported by the Tivoli Agent Manager identifies the reason for the failure or the appropriate log file. If you cannot understand what happened, run the LogCollector command in the toolkit directory to collect the trace files for support. If the Tivoli Agent Manager is partially installed, run the uninstallation and re-run this step.

AWKSRI072E The installation of the Tivoli Agent Manager failed. No error is returned running the {0} command.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check that the user can run the Tivoli Agent Manager installation. Attempt to manually install the Tivoli Agent Manager. Remove the -silent option to run the installation with the GUI.

AWKSRI073W No feature is selected. Click Back and select a feature to install or Cancel to quit the installation.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI074W No feature to be installed is specified in the response file.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Edit the response file to enable installation of at least one feature.

AWKSRI077E The uninstallation of the Tivoli Agent Manager failed.

Explanation: The uninstallation of the Tivoli Agent Manager failed.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: The error message reported by the Tivoli Agent Manager indicates the reason for the failure or the appropriate log file. If you cannot understand what happened, run the LogCollector command to collect the trace files for support.

AWKSRI078E The uninstallation of the Tivoli Agent Manager failed. No error is returned running the "command" command.

Explanation: The uninstallation of the Tivoli Agent Manager failed.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check that the user can run the Tivoli Agent Manager uninstall command. Try to manually uninstall the Tivoli Agent Manager. Remove

the -silent option to run the uninstallation with the GUI.

AWKSRI080E Unable to connect to the DB2 server running on host "hostname" and listening on port "portnumber".

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: None.

AWKSRI081E Unable to connect to Connection to host "hostname" on port "portnumber" to check for the "value".

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: None.

AWKSRI082E The specified user ID "user_id" cannot be authenticated on the server "server_name" of the profile "profile_name" on the Web Application Server installed in "installation_path" with the supplied credentials .

Explanation: An error occurred while attempting to check the status of the server.

System action: If you are installing in silent mode, the installation fails.

Operator response: Check the log file for details. Check the user and password. Try to run the serverStatus command with the provided credentials.

AWKSRI083E The command "command" with arguments "arguments" failed with error code: "error". Command output: "output" Error Message: "error_message"

Explanation: There is an error attempting to check the status of the server.

System action: If you are installing in silent mode, the installation fails.

Operator response: Check the error message. Check the user and password. Try to run the serverStatus command with the provided credentials

AWKSRI084E The value "value" is not a valid boolean value for the parameter "parameter".

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the value for this parameter in the options file or in the command line.

AWKSRI085E The value "value" is not a valid value for the parameter "parameter".

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the value for this parameter in the options file or in the command line.

AWKSRI086E The value "value" specified for the path parameter "path" is not a directory.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the value for this parameter in the options file or in the command line.

AWKSRI087E The value "value" specified for the profile location parameter "location" is not a valid profile location

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Change the value for this parameter in the options file or on the command line.

AWKSRI088W The installation wizard cannot check the DB2 installation. Check that the DB2 is installed correctly.

Explanation: An unexpected condition occurred.

System action: The installer proceeds with the installation or the uninstallation.

Operator response: Check that DB2 is installed correctly and that the machine was rebooted after it was installed.

AWKSRI089E Feature "feature" is already installed at patch level "installed_level". You are trying to install it at a previous level: "prev_level"-

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: None.

AWKSRI089W The installation wizard cannot check the WebSphere Application Server installation. Check that the WebSphere Application Server is installed correctly.

Explanation: An unexpected condition occurred.

System action: The installer proceeds with the installation or the uninstallation.

Operator response: See message text.

AWKSRI091E An error occurred during the installation. See the log file "file" for details.

Explanation: See message text.

System action: See message text.

Operator response: See log file to check the cause of the error.

AWKSRI092E An error occurred during the installation. See the trace file "file" for details.

Explanation: See message text.

System action: See message text.

Operator response: See the trace file to check the cause of the error.

AWKSRI093W No feature is selected. Click Back and select a feature to uninstall or Cancel to quit.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: See message text.

AWKSRI094E This patch has been superseded. The installation exits.

Explanation: A patch superseding the one being installed is already installed. The installation cannot proceed.

System action: If you are installing in silent mode, the installation fails.

Operator response: None.

AWKSRI095W The Tivoli Agent Manager was not correctly installed or it is already uninstalled.

Explanation: The Tivoli Agent Manager uninstall file is not present. This happens if the Tivoli Agent Manager was not correctly installed, was uninstalled, or if the uninstallation files were removed.

System action: The installer proceeds with the installation or the uninstallation.

Operator response: None.

AWKSRI096W The uninstaller cannot find file "file".

Explanation: The Tivoli Agent Manager uninstall file is not present. This happens if the Tivoli Agent Manager was not correctly installed, was uninstalled, or if the uninstallation files were removed.

System action: The installer proceeds with the installation or the uninstallation.

Operator response: None.

AWKSRI097E The installation of the Common Agent Services failed.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: None.

AWKSRI099E The installation of the Common Agent Services failed. No error is returned running the "command" command.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: None

AWKSRI101E The uninstallation of the Common Agent Services failed.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Use the troubleshooting panel to identify the problem.

AWKSRI102E The uninstallation of the Common Agent Services failed. No error is returned running the "command" command.

Explanation: The uninstallation of the Common Agent Services failed.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Use the troubleshooting panel to identify the problem.

AWKSRI103E The installation of the Tivoli Common Agent failed. The trace file "file" might contain additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the Tivoli Common Agent log files and re-run this step.

AWKSRI104W A later version of the Tivoli Common Agent is already installed.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: None

AWKSRI105W The user did not allow the installation to upgrade the Tivoli Common Agent. The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI106E You provided a wrong password on Services. The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI107E An incorrect JRE was used to invoke the installer. The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI108E A file operation failed. Possible failures are: Cannot copy JRE Cannot change file directory permissions Cannot copy cert files The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI109E Unable to create, start, or stop a service. The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI110E One of the following utility failures occurred: Cannot encrypt or decrypt a password Cannot reset GUID Cannot update script files Cannot scrub file, e.g. of password values Cannot run system commands The trace file "file" might have additional information on the cause of this failure.

Explanation: A utility failure has occurred

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: None.

AWKSRI111E A property failure occurred. Unable to update one or more of the following files: nonstop.properties endpoint.properties smfnonstop.properties The trace file "file" might have additional information on the root cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI112E The validation of the Tivoli Common Agent response file failed. The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the

AWKSRI113E • AWKSRI124E

troubleshooting panel is displayed.

Operator response: Check the property values and re-run this step.

AWKSRI113E The Tivoli Common Agent installer returned an unexpected return code "return_code" The trace file "file" might have additional information on the cause of this failure.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the property values and re-run this step.

AWKSRI114E The deployment of the "bundle" bundle failed because the installer could not find the "file" file bundle.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the file name being reported as missing.

AWKSRI115W The bundle file for the bundle "bundle" is already present as "file".

Explanation: The bundle file is already present. This happens only when re-running a failed installation step.

System action: The bundle is reinstalled.

Operator response: None

AWKSRI116E An error occurred while opening file "file" while deploying bundle "bundle".

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check whether there is anything unusual in the file and check the trace file for additional information.

AWKSRI117E An error occurred while copying file "file" to "location".

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check whether there is anything unusual in the file and check the trace file for additional information.

AWKSRI118E The deployment of the bundle "bundle" failed. Check the error message for additional information.

Explanation: An error occurred while deploying the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI119E The deployment of the bundle "bundle" failed. The following error is returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI121E Bundle "bundle" failed to start. Check the error message for additional information.

Explanation: An error occurred while starting the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI122E Bundle "bundle" failed to start. The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: An error occurred while starting the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI124E Bundle "bundle" failed to stop. Check the error message for additional information.

Explanation: An error occurred while stopping the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI125E Bundle "bundle" failed to stop. The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: An error occurred while stopping the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI127E The "variable" variable could not be set. Check the error message for additional information.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI128E The "variable" variable could not be set. The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI130E The Tivoli Common Agent did not register to the Tivoli Agent Manager.

Explanation: The Tivoli Common Agent did not register to the Tivoli Agent Manager in the expected time frame.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready, and run it again.

AWKSRI131E The Tivoli Common Agent is not ready to accept requests on port "portnumber".

Explanation: The Tivoli Common Agent registered to the Tivoli Agent Manager but the connector subagent did not open the port to accept incoming requests.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Wait a little longer to see if the port specified in the message is open. If it is not, check whether there is a clock difference between Agent Manager and Tivoli Common Agent, for example using shell commands such as 'date -u' to see the current date in UTC. If the clocks are different, align them and restart the endpoint.

Check the Tivoli Common Agent trace file and make the required changes, then set the status of the step to ready and run it again.

AWKSRI132E The Tivoli Common Agent failed to stop. Check the error message for additional information.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: See message text.

AWKSRI133E The Tivoli Common Agent failed to stop. The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI135E An error occurred while copying file {0} to {1}.

Explanation: An exception occurred while copying the file.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check whether there is anything unusual in the file and check the trace file for additional information.

AWKSRI136E The installer cannot find the template property file that was expected to be on "file_path".

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the file name being reported as missing. .

AWKSRI137E An error occurred while opening the file "file_path" for writing.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check if there is anything unusual in the file and check the trace file for additional information.

AWKSRI138E Unable to create directory "directory".

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check if there is anything unusual in the directory and check the trace file for additional information.

AWKSRI139E The user "userID" cannot access the directory "directory" of the installation image.

Explanation: The DB2 user must access the CDROM to run some scripts to verify the DB2 connection and create the DB2 database and schema.

System action: If you are installing in silent mode, the installation fails.

Operator response: Grant the required permissions to the DB2 user on the CDROM image directory.

AWKSRI140E Unable to uninstall bundle"bundle". Check the error message for additional information.

Explanation: An error occurred while uninstalling the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI141E Unable to uninstall bundle"bundle". The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: An error occurred while uninstalling the subagent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI143E The Tivoli Common Agent failed to start. Check the error message for additional information.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI144E The Tivoli Common Agent failed to start. The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message, make the required changes, set the status of the step to ready and run it again.

AWKSRI146E Unable to connect to Oracle Net Service. Error details: "error"

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check that Oracle is up and running, the service name is correct and the credentials provided are correct.

AWKSRI148E The installation of each of the Extension features requires the installation of the Server feature. Select the Server for installation to install the Extension.

Explanation: The Server Feature is a prerequisite for any Extension installation.

Operator response: Check the error message.

AWKSRI149E The value "user_or_password"you specified is not compliant with the rules for "field_label".

Explanation: Oracle user and password must be compliant with Oracle rules.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different Oracle user or password.

AWKSRI150E No Oracle instance is present in "path".

Explanation: The specified path does not contain an Oracle instance.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different Oracle installation path.

AWKSRI151E Oracle server version "version" is installed in "path" This version is not supported by Tivoli Dynamic Workload Broker.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different Oracle instance or upgrade the selected instance.

AWKSRI154E The database "database" does not exist on the DB2 server or is not at the right level. The following error was returned: "error" Specify another database name or install the Tivoli Dynamic Workload Broker Database feature.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Check that the database you specified already exists on the DB2 server and that it is at the expected level. If you want to create a new database select the Tivoli Dynamic Workload Broker Database feature for installation.

AWKSRI155E User "userID" does not exist or the specified password is wrong. Specify another user, check the password or install the Tivoli Dynamic Workload Broker Database feature.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify an existing Oracle user with the CONNECT role.

AWKSRI156E The Tivoli Common Agent failed to start before the timeout expired. Check the error message for additional information.

Explanation: See message text.

System action: The installation stops and the

troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI157E The Tivoli Common Agent failed to start before the timeout expired. The following error was returned: "error" The following is reported on the Standard Error: "std_err"

Explanation: The Tivoli Common Agent network service failed to start.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error message.

AWKSRI159E The Agent Name contains an unsupported character. Valid characters are all alphanumeric characters and the following characters: -, /, _.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Correct the name using only supported characters.

AWKSRI160E Values specified for the isDB2 and isOracle parameters in the response file are inconsistent. You must set one of the parameters to true and the other parameter to false.

Explanation: Either both parameters are set to true or both are set to false.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify the correct values in the response file.

AWKSRI161E The specified table space "table_space" does not exist on the Oracle server.

Explanation: See message text.

System action: The program waits for input from the user.

Operator response: Specify the name of a table space that exists on the Oracle server.

AWKSRI162E Unable to resolve the fully qualified host name "hostname".

Explanation: See message text.

System action: The program waits for input from the user.

Operator response: Specify a fully qualified host name or use an IP address.

AWKSRI165E The feature installation failed. Error message is "error"

Explanation: An error occurred while trying to install or upgrade all the features on the agent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the error log section for details and try again the operation.

AWKSRI166E The feature uninstallation failed. Error message is "error"

Explanation: An error occurred while trying to uninstall all the features from the agent.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check the Error Log section for details and try again the operation.

AWKSRI167E The Table Space name cannot start with the underscore character.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a table space name that does not start with the underscore character.

AWKSRI169E An error occurred while updating the database "database".

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check troubleshooting information for the failed step and try to resolve the problem.

AWKSRI170E The database "database" does not exist.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Check troubleshooting information for the failed step and try to resolve the problem.

AWKSRI171E The Tivoli Dynamic Workload Broker schema is not present in the "database" database.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Connect to a different database or choose a custom install to create the Tivoli Dynamic Workload Broker database

AWKSRI172E The Tivoli Dynamic Workload Broker schema present in the "database" database is not at the current level.

Explanation: See message text.

System action: The installation stops and the troubleshooting panel is displayed.

Operator response: Connect to a different database or choose a custom installation to update the Tivoli Dynamic Workload Broker database

AWKSRI173E An instance of Tivoli Dynamic Workload Broker Agent has been discovered in the selected installation path. It is at the same or a higher version than the one you are trying to install. Change the installation path if you want to install a new instance of version 8.5.1.

Explanation: The specified installation path already contains a v8.5.1 instance of the agent so it can not be installed or updated on top of it.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different installation path or click Cancel to exit the wizard.

AWKSRI175E User "userID" does not own an Oracle Tivoli Dynamic Workload Broker schema or its version is not valid.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify an existing Oracle user with the CONNECT role.

AWKSRI176E The upgrade of the Tivoli Dynamic Workload Broker Agent can not be performed in diconnected mode. Specify false for the DisconnectedMode property in the response file.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify false for the DisconnectedMode property in the response file.

AWKSRI177E The version of the Agent Manager you are trying to connect to is "amversion". The version required by Tivoli Dynamic Workload Broker server is "amsupportedversion" or higher.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different Agent Manager, or upgrade the current Agent Manager to the required version.

AWKSRI178E You are attempting to install the Tivoli Dynamic Workload Broker on an unsupported WebSphere Application Server flavour. The supported flavour is Embedded Express.

Explanation: See message text.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different WebSphere Application Server instance.

AWKSRI179E No instance of Tivoli Dynamic Workload Broker Agent to apply the fix to has not been discovered in the selected installation path.

Explanation: The specified installation path does not contain an instance of the agent so no update can be performed.

System action: If you are installing in silent mode, the installation fails.

Operator response: Specify a different installation path or click Cancel to exit the wizard.

Chapter 53. AWKSTE - Job plug-in for IBM Sterling Connect:Direct messages

This section lists error and warning messages that might be issued by the job plug-in for IBM Sterling Connect:Direct.

The message component code is STE.

AWKSTE001E One or more required parameters are missing.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKSTE002E A connection error has occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please try again later or contact your system administrator.

AWKSTE003E For the specified Primary node, you cannot reach a Secondary Nodes.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please check the Primary node definition or verify that the second node are reachable.

AWKSTE004E The Primary Node Address is a required parameter.

Explanation: A value for the required parameter, Primary Node Address, was not specified. You must specify a Primary Node Address.

System action: The operation is not performed.

Operator response: Specify a Primary Node Address and retry the operation.

AWKSTE005E A connection error has occurred. The Server Address or Port value is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct Server host name or port value and retry the operation.

AWKSTE006E A connection error has occurred. The user name or the password is incorrect.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Specify the correct User Name or Password value.

AWKSTE007E A Sterling KQV Error has occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please check the Sterling Connect:Direct documentation to correct the error.

AWKSTE008E An error occurred submitting the job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please try again later or contact your system administrator.

AWKSTE009E An error occurred monitoring the job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please try again later or contact your system administrator.

AWKSTE010E An unknown error occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Please try again later or contact your system administrator.

AWKSTE011E For the Primary Node, the User ID is a required parameter.

Explanation: You do not specify the Primary Node User ID.

System action: The operation is not performed.

AWKSTE012E • AWKSTE023E

Operator response: Specify a Primary Node User ID and retry the operation.

AWKSTE012E For the Primary Node, the Password is a required parameter.

Explanation: You do not specify the password for the Primary Node User ID.

System action: The operation is not performed.

Operator response: Specify a Password for the Primary Node User ID and retry the operation.

AWKSTE013E For the Secondary Node, the User ID is a required parameter.

Explanation: You do not specify the Secondary Node User ID.

System action: The operation is not performed.

Operator response: Specify a Secondary Node User ID and retry the operation.

AWKSTE014E For the Secondary Node, the Password is a required parameter.

Explanation: You do not specify the password for the Secondary Node User ID.

System action: The operation is not performed.

Operator response: Specify a Password for the Primary Node User ID and retry the operation.

AWKSTE015E For the Primary Node, the Port is a required parameter.

Explanation: You do not specify the Primary Node Port number.

System action: The operation is not performed.

Operator response: Specify a Primary Node Port number and retry the operation.

AWKSTE016E The Primary Node Port is not valid value. Specify a value ranging from 1 - 65535.

Explanation: The Primary Node Port specified is not a valid value.

System action: The operation is not performed.

Operator response: Specify a valid port value and retry the operation.

AWKSTE017E The Secondary Node Name is a required parameter.

Explanation: You do not specify the Secondary Node Name value.

System action: The operation is not performed.

Operator response: Specify a Secondary Node Name value and retry the operation.

AWKSTE018E The Sterling Connect:Direct Process is a required parameter.

Explanation: You do not specify the Sterling Connect:Direct Process Name.

System action: The operation is not performed.

Operator response: Specify a Sterling Connect:Direct Process Name and retry the operation.

AWKSTE019E The Local File Path for the Send action is a required parameter.

Explanation: You do not specify the Local File Path value for the Send action.

System action: The operation is not performed.

Operator response: Specify a Local File Path for the Send action and retry the operation.

AWKSTE020E The Remote File Path for the Send action is a required parameter.

Explanation: You do not specify the Remote File Path value for the Send action.

System action: The operation is not performed.

Operator response: Specify a Remote File Path value for the Send action and retry the operation.

AWKSTE021E The Local File Path for the Receive action is a required parameter.

Explanation: You do not specify the Local File Path value for the Receive action.

System action: The operation is not performed.

Operator response: Specify a Local File Path value for the Receive action and retry the operation.

AWKSTE022E The Remote File Path for the Receive action is a required parameter.

Explanation: You do not specify the Remote File Path value for the Receive action.

System action: The operation is not performed.

Operator response: Specify a Remote File Path value for the Receive action and retry the operation.

AWKSTE023E The Check Point Restart value is a required parameter if you select ""Check"" type.

Explanation: You do not specify the Check Point Restart value.

System action: The operation is not performed.

Operator response: Specify a Check Point Restart value and retry the operation.

AWKSTE025E An error occurred running the IBM Sterling job.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSTE026E The IBM Sterling process ended with errors. The IBM Sterling internal error is: error

Explanation: *error* the error message returned by IBM Sterling.

System action: The operation is not performed.

Operator response: Please verify that the source file exists and the destination path already exists. After you solve the problem, retry the operation.

AWKSTE027E An error occurred deleting the IBM Sterling process. The error is: *""error_msg""*.

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSTE029E An error occurred when submitting the IBM Sterling process. The error is: *""error_msg""*.

Explanation: *error_msg* identifies the cause of the failure.

See message text.

System action: The operation is not performed.

Operator response: Analyze the error message in the log file.

AWKSTE030E The file name that identifies the process is a required parameter.

Explanation: You do not specify the Process File Name value.

System action: The operation is not performed.

Operator response: Specify a Process File Name and retry the operation.

AWKSTE031E The Check Point Restart value is invalid. It must be a positive integer.

Explanation: You do not specify the Check Point Restart valid value. You must specify a positive number value.

System action: The operation is not performed.

Operator response: Specify a positive integer value for Check Point Restart and retry the operation.

AWKSTE032E The platform value is invalid. Specify one of the following valid values: Unknown, Windows, OpenVMS, OS400 or Unix

Explanation: You do not specify the Platform valid value.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the platform: Unknown, Windows, OpenVMS, OS400, Unix.

AWKSTE033E The destination disposition value is invalid. Specify one of the following valid values: RPL, MOD or NEW

Explanation: You do not specify a destination disposition valid value.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the destination disposition: RPL, MOD, NEW.

AWKSTE034E The compression type value is invalid. Specify one of the following valid values: NONE or EXTENDED

Explanation: You do not specify a Compression Type valid value.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the compression type: NONE, EXTENDED.

AWKSTE035E The check point restart value is not valid. Specify one of the following valid values: Default, None or Check

Explanation: You do not specify a Check Point Restart valid value.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the check point restart: Default, None or Check.

AWKSTE036E

AWKSTE036E The action type value is not valid.
Specify one of the following valid
values: Send or Receive

Explanation: You do not specify an Action Type valid value.

System action: The operation is not performed.

Operator response: Specify one of the following valid values for the action type: Send or Receive.

Chapter 54. AWKSUL - Utility messages

This section lists error and warning utility messages that might be issued.

The message component code is SUL.

AWKSUL001E Unable to find the Tivoli Dynamic Workload Broker path "path_label".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKSUL002E An internal error occurred while finding the Tivoli Dynamic Workload Broker "path_label" path. The following error was returned: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the returned error message.

AWKSUL003E Unable to parse the job definition document. The following error was returned: "parsing_error_message".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the returned error message.

AWKSUL004E Unable to parsing the job definition document. The XML is not correct or an I/O error occurred.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the structure of the job definition document.

AWKSUL005E The application name "application_name" is not one of the following permitted values: "allowed_values_list".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Select an application from the list of permitted applications.

AWKSUL006E The optimization name "optimization_name" is not one of the following permitted values: "allowed_values_list".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Select an optimization name from the list of permitted values.

AWKSUL007E The recovery action name "recovery_action_name" is not one of the following permitted values: "allowed_values_list".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Select a recovery action from the list of permitted values.

AWKSUL008E Unable to convert the job definition to an XML document.

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKSUL009E An internal error occurred getting the configuration file "config_file". The following error was returned: "error".

Explanation: There was a problem starting the Tivoli Dynamic Workload Broker server. The configuration file cannot be read.

System action: The Tivoli Dynamic Workload Broker server was not started.

Operator response: Check if the configuration file is present in the Tivoli Dynamic Workload Broker configuration directory, if it is readable and if it is syntactically correct.

AWKSUL010E Unable to find the configuration file "config_file".

Explanation: See message text.

System action: The Tivoli Dynamic Workload Broker server was not started.

Operator response: Check that the configuration file is present in the Tivoli Dynamic Workload Broker configuration directory.

AWKSUL011W An error occurred while loading the user configuration file "config_file". The following error was returned: "error". The default values will be used.

Explanation: See message text.

System action: The application will run with default configuration values.

Operator response: Check that the configuration file is present in the Tivoli Dynamic Workload Broker configuration directory, that it is readable and that it is syntactically correct.

AWKSUL012W Unable to find the user configuration file "config_file". The default values will be used.

Explanation: See message text.

System action: The application will run with default configuration values.

Operator response: Check that the configuration file is present in the Tivoli Dynamic Workload Broker configuration directory.

AWKSUL013E An error occurred while storing the user configuration file "config_file". The following error was returned: "error".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check that there is enough space on the file system where Tivoli Dynamic Workload Broker is installed and that the file system has write permissions.

AWKSUL014E The value "wrong_parameter_value" specified for configuration parameter "parameter" is too low. Specify a value in the range "minimum" to "maximum". The default value "default_parameter_value" will be used.

Explanation: See message text.

System action: The application will run with default configuration values.

Operator response: Correct the value specified in the configuration file and restart the server to use the new value.

AWKSUL015E The value "wrong_parameter_value" specified for configuration parameter "parameter" is too high. Please specify a value in the range "minimum" to "maximum". The default value "default_parameter_value" will be used.

Explanation: See message text.

System action: The application will run with default configuration values.

Operator response: Correct the value specified in the configuration file and restart the server to use the new value.

AWKSUL017E The configuration parameter "parameter" has the following incorrect number format "wrong_parameter_value". The default value "parameter_value" will be used.

Explanation: See message text.

System action: The application will run with default configuration values.

Operator response: Correct the value specified in the configuration file and restart the server to use the new value.

AWKSUL018E The configuration parameter "parameter" has a wrong format "wrong_parameter_value". The default value "parameter_value" will be used.

Explanation: See message text.

System action: The application will run with default configuration values.

Operator response: Correct the value specified in the configuration file and restart the server to use the new value.

AWKSUL019E Unsupported attribute or element: "element" with value: "value".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the JSDL

AWKSUL020E Unsupported element: "element".

Explanation: See message text.

System action: The operation is not performed.

Operator response: Fix the JSDL

AWKSUL021E The value "uservariable" is not allowed in the password field "passwordfield". The use of a variable as user is not allowed in password fields.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Correct the JSDL

AWKSUL022E The value "tag_value" contains an invalid keyword. The keyword "password_syntax" is allowed only in password fields.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Fix the JSDL

AWKSUL081W An incorrect duration has been specified: "duration".

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

Chapter 55. AWKTPM - Tivoli Provisioning Manager messages

This section lists error and warning Tivoli Provisioning Manager messages that might be issued.

The message component code is TPM.

AWKTPM001W An error occurred while loading the user configuration file "config_file". The following error was returned: "error". The default values will be used.

Explanation: The configuration file cannot be read from the Tivoli Dynamic Workload Broker configuration directory.

System action: The application runs with default configuration values.

Operator response: Check whether the configuration file in the Tivoli Dynamic Workload Broker configuration directory is corrupted, locked or missing.

AWKTPM002E An error occurred while getting the configuration file "config_file". The following error was returned: "error".

Explanation: The configuration file cannot be read from the Tivoli Dynamic Workload Broker jar files.

System action: The application cannot load configuration values.

Operator response: Check whether the jar files in the ITDWB.ear installation directory are corrupted or missing. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWKTPM003E Unable to file the configuration file "config_file" .

Explanation: See message text.

System action: The application cannot load configuration values.

Operator response: Check whether the jar files in the ITDWB.ear installation directory are corrupted or missing. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 56. AWK TSA - Tivoli Workload Scheduler Bridge messages

This section lists error and warning Tivoli Workload Scheduler Bridge messages that might be issued.

The message component code is TSA.

AWK TSA004E Unable to stop the Tivoli Dynamic Workload Bridge.

Explanation: An error occurred stopping the Tivoli Dynamic Workload Bridge Enterprise Application.

System action: The operation is not performed.

Operator response: An internal error occurred.

See the trace file for more details.

AWK TSA006E Unable to configure the Tivoli Dynamic Workload Bridge configuration.

Explanation: There was a problem accessing the configuration file. Possible reasons are:

- The Tivoli Dynamic Workload Broker configuration directory is not defined.
- The configuration file is not present in the Tivoli Dynamic Workload Broker configuration directory.

System action: Tivoli Dynamic Workload Bridge enterprise application is not started.

Operator response: See the trace file for more details.

AWK TSA008E Unable to start Netman.

Explanation: There was a problem starting Netman. Possible reasons are:

- Unable to create the server socket connection.
- Unable to create the workmanager.

System action: The Tivoli Dynamic Workload Bridge enterprise application is not started.

Operator response: See the trace file for more details.

AWK TSA011W The WRITER service is already started.

Explanation: The Tivoli Dynamic Workload Bridge WRITER service is already running.

System action: The program continues.

Operator response: See the trace file for more details.

AWK TSA013W The MAILMAN service is already started.

Explanation: The Tivoli Dynamic Workload Bridge MAILMAN service is already running.

System action: The program continues.

Operator response: See the trace file for more details.

AWK TSA016W The SCRIBNER service is already started.

Explanation: The Tivoli Dynamic Workload Bridge SCRIBNER service is already running.

System action: The program continues.

Operator response: See the trace file for more details.

AWK TSA018E Unable to start the TWSAgent WRITER service.

Explanation: See message text.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWK TSA020E Unable to stop the TWSAgent WRITER service.

Explanation: See message text.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWK TSA022E Unable to start Mailman. There could be a problem with the uplink connection to Domain Manager.

Explanation: See message text.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA023W Unable to start Mailman. The TWSAgent CPU is not initialized.

Explanation: The Tivoli Dynamic Workload Bridge CPU is not yet initialized. It has not yet received a Symphony file.

System action: The program continues, but the operation is not performed.

Operator response: Initialize the Tivoli Dynamic Workload Bridge before starting it.

AWKTSA025E Unable to stop Mailman.

Explanation: An internal error occurred while stopping Mailman.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA027E Unable to start Jobman. The uplink connection might not be available.

Explanation: A problem occurred sending the JOBMAN_UP message.

System action: TWSAgent will retry to send it as soon as the uplink connection is available.

Operator response: See the trace file for more details.

AWKTSA029E Unable to stop Jobman.

Explanation: An internal error occurred while stopping Jobman.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA031E Scribner failed to retrieve the job output for job"JobID" (alias"Job_alias").

Explanation: A problem occurred contacting the Tivoli Dynamic Workload Broker Web service. Possible reasons are:

- The service is unavailable.
- Incorrect parameters have been used submitting the job.
- The job submission Web service returned an operation fault.
- A generic Web service fault occurred.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA033E The Tivoli Dynamic Workload Bridge CPU could not link to its parent.

Explanation: A problem occurred while establishing the uplink connection.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA035E The Tivoli Dynamic Workload Bridge CPU was not correctly initialized.

Explanation: A problem occurred initializing the Tivoli Dynamic Workload Bridge CPU. Possible reasons are:

- A problem occurred sending a MyJobRec message.
- A problem occurred sending the MyInit message.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA043E The Tivoli Dynamic Workload Bridge could not forward the new job status "Job_status" for the job "Job_name" and job ID"JobID" to Tivoli Dynamic Workload Broker.

Explanation: A problem occurred while forwarding the job status change notification to Tivoli Dynamic Workload Broker. Possible reasons are:

1. The uplink is not available.
2. Mailman encountered a problem sending the related message.

System action: The Tivoli Dynamic Workload Bridge will resend the job status change notification as soon as possible.

Operator response: See the trace file for more details.

AWKTSA047W Unable to find the job with alias"Job_alias" .

Explanation: It was not possible to retrieve the job ID for the specified job alias. Possible reasons are:

1. A job with the specified alias has not been found into the Tivoli Dynamic Workload Broker database.
2. The service is unavailable. Tivoli Dynamic Workload Broker server might be down.
3. The job submission web service returned an operation fault.
4. A generic Web service fault occurred.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA048E An internal error occurred. Scriber could not retrieve job output for the job with job ID "JobID" and job alias "Job_alias").

Explanation: A problem occurred retrieving the Tivoli Dynamic Workload Broker Web service.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA049E The Tivoli Dynamic Workload Bridge could not submit the job "JobID" and job alias "Job_alias" to the Tivoli Dynamic Workload Broker server.

Explanation: A problem occurred while contacting the Tivoli Dynamic Workload Broker server.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA050E A problem with the JCL content, prevent Tivoli Dynamic Workload Bridge from submitting the job "Job_Name" (alias "Job_alias"). The following error was returned: "error".

Explanation: A problem occurred while parsing the job JCL string.

System action: The program continues, but the operation is not performed.

Operator response: Check the error reported by the message and correct it.

AWKTSA051E The Tivoli Dynamic Workload Bridge Notification Service cannot contact Tivoli Dynamic Workload Bridge.

Explanation: See message text..

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA052E The Tivoli Dynamic Workload Bridge Notification Service received a notification with an unknown format: "format".

Explanation: A problem occurred while receiving a notification from the Tivoli Dynamic Workload Broker server.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA053E An authentication problem occurred contacting the Tivoli Dynamic Workload Broker server. The UserId "userId" does not exist or the password is wrong.

Explanation: A security problem occurred.

System action: The program continues, but the operation is not performed.

Operator response: Insert the correct user and password into the Tivoli Dynamic Workload Bridge properties file and restart the Tivoli Dynamic Workload Broker server.

AWKTSA054E The Tivoli Dynamic Workload Bridge was not started because it has been disabled.

AWKTSA055E An error occurred sending the job output for job "JobID" (alias "Job_alias"). The error message is "Error_Message"

Explanation: A problem occurred sending the job output

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA056E An internal error occurred while getting the job output for job "JobID" (alias "Job_alias"). The error message is "Error_Message"

Explanation: A problem occurred getting the internal EJB interface to retrieve the job output

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA057E An internal error occurred while getting the job output for job "JobID" (alias "Job_alias"). The error message is "Error_Message"

Explanation: A problem occurred getting the getting the UTF-8 character encoding

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA058E The agent returned a wrong interval while getting the job output for job "JobID" (alias "Job_alias").

Explanation: There was an error in the response of the job output sent by the agent.

AWKTSA059E • AWKTSA065E

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA059E The following error was returned retrieving the job output of the job with alias "Job_alias": "Error_Message"

Explanation: There was an error retrieving the job output.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA060E The following error was returned was returned sending the job output of the job with alias "Job_alias": "Error_Message"

Explanation: There was a connection exception sending the job output to TWS.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA061E An event for the workstation "workstation" was received but this workstation is no longer in the plan. The event is discarded.

Explanation: See message text.

System action: The program continues, but the operation is not performed.

Operator response: The program continues, but the operation is not performed.

AWKTSA062E An error occurred saving the Launch Job message into the DB.

Explanation: A error occurred adding the new job to launch into the job table.

System action: No acknowledge will be sent back to

the parent. The workstation will be set to unlinked from the parent and the message will be sent again by the parent as soon as the workstation will be linked again.

Operator response: See the trace file for more details.

AWKTSA063E An error occurred removing the Launch Job message from the DB.

Explanation: A error occurred removing from the job table the just received job to launch.

System action: The program continues, but the operation is not performed.

Operator response: See the trace file for more details.

AWKTSA064E An error occurred opening the port "port_number". The error is "Error_Message".

Explanation: A error occurred opening the broker workstation port.

System action: The program continues, but the operation is not performed.

Operator response: Check if a different process opened that port. If this is the case, reconfigure the broker port or the process that opened the port.

An automatic recovery procedure is periodically attempting to open this port..

AWKTSA065E An error occurred creating the work manager of the broker workstation. The error is "Error_Message".

Explanation: A error occurred opening the broker workstation port.

System action: The program continues, but the operation is not performed.

Operator response: Check the error message and take the appropriate action.

An automatic recovery procedure is periodically attempting create the work manager.

Chapter 57. AWKTSM - Tivoli Storage Manager messages

This section lists error and warning Tivoli Storage Manager messages that might be issued.

The message component code is TSM.

Chapter 58. AWKWSE - Web services job executor messages

This section lists error and warning messages that might be generated by the routines that handle the web services job executor process.

The message component code is WSE.

AWKWSE001E The Wsdl URL is missing.

operation.

Explanation: A valid Wsdl URL is required in the JSDL.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKWSE002E Missing operation

Explanation: A valid operation is required in the JSDL.

System action: The operation is not performed.

Operator response: Provide the required information and retry the operation.

AWKWSE003E The user name or the password is missing.

Explanation: Valid user name and password are required.

System action: The operation is not performed.

Operator response: Specify a valid user name and password.

AWKWSE004E Empty argument

Explanation: Empty arguments are not valid.

System action: The operation is not performed.

Operator response: Do not specify empty arguments.

**AWKWSE005E WebService invocation failed:
"exception_message"**

Explanation: See message text.

System action: The operation is not performed.

Operator response: None.

AWKWSE009E The host "hostname" is unknown.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Check the hostname and retry the

Chapter 59. AWKWUJ messages

This section lists error and warning messages that could be issued.

The message component code is WUJ.

AWKWUJ000W You must select at least one row for this operation.

Explanation: The operation cannot be performed because no rows were selected.

Operator response: See message text.

AWKWUJ001E The following jobs have not been canceled because of a problem with the IBM Tivoli Dynamic Workload Broker server: "job names". More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ003E The operation could not be performed because of a problem with the IBM Tivoli Dynamic Workload Broker server.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running.

AWKWUJ004E The operation failed because of an internal error. Check the log file for details.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ005E The operation failed because of an internal error. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ007E The following jobs have not been canceled because they are not in a state that supports cancellation: "job names"

Explanation: See message text.

Operator response: None.

AWKWUJ008E An incorrect date range was specified. Specify a range where the first date is before the second date.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUJ009E The value for the Last n hours field must be a positive integer.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Correct the value of the field.

AWKWUJ010E The value for the Last n minutes field must be a positive integer.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Correct the value of the field.

AWKWUJ011E The value specified in the highlighted field is too long. The value cannot be longer than "max length in chars" characters.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUJ012E The following jobs have not been submitted because of a problem with the IBM Tivoli Dynamic Workload Broker server: "job names". More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed on the listed jobs.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ014E The following job definitions have not been deleted because of a problem with the IBM Tivoli Dynamic Workload Broker server: "job names". More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed on the listed jobs.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ015E The following jobs were not submitted because their JSDL definitions are incorrect: "job names"

Explanation: See message text.

System action: The operation cannot be performed on the listed jobs.

Operator response: Check the format of the JSDL file. Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ016E An error occurred while retrieving the job definitions from the IBM Tivoli Dynamic Workload Broker server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ017E The format of the string "string" is incorrect.

Explanation: The syntax is incorrect for a NCName data type.

System action: The operation cannot be performed.

Operator response: Check the syntax of the NCName data type.

AWKWUJ018E An error occurred while retrieving the job definition. More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ019E The job definition is not structurally correct. Some details follow: "error details".

Explanation: The job definition contains at least one syntax error.

System action: The operation cannot be performed.

Operator response: Check the JSDL format. Check the Integrated Solutions Console configuration and make that sure the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ020E An error occurred while saving the job definition. More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ021E You must select at least one job for this operation.

Explanation: The operation cannot be performed because no job has been selected.

System action: The operation cannot be performed.

Operator response: Select at least one job.

AWKWUJ022E Only one job can be selected for this operation.

Explanation: The operation cannot be performed because more than one job has been selected.

System action: The operation cannot be performed.

Operator response: Select one job.

AWKWUJ024E An error occurred retrieving the job instances from the IBM Tivoli Dynamic Workload Broker server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ026E The name of an existing job definition can only be changed using the Job Brokering Definition Console. Replace the new name "new name" with the previous name "old name".

Explanation: It is not possible to change the name of an existing job definition in this task.

Operator response: To change the name, edit the JSDL. If you want to create a new job definition, use the appropriate task.

AWKWUJ027E The value "value" is not valid for this field. A numeric value is required.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Provide a numeric value.

AWKWUJ028E The value "value" is not valid for this field. A positive integer numeric value is required.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Provide a positive integer numeric value.

AWKWUJ029E A value for this field is required.

Explanation: The field cannot be left empty.

System action: The operation cannot be performed.

Operator response: Provide a value for the field.

AWKWUJ030E A variable with the same name "variable name" is already present. Provide a unique variable name.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Provide a name for the variable that is unique for this job submission.

AWKWUJ035W The configuration file "configuration file name" cannot be found or is not readable. The default configuration will be used.

Explanation: See message text.

System action: The program proceeds using the default configuration.

Operator response: None.

AWKWUJ036E The Web service connections could not be initialized. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUJ037E The value "value" is not valid for this field.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Refer to the documentation and provide a valid value.

AWKWUJ038W No target resource for the job has been specified. The system will allocate the best available resource to the job.

Explanation: See message text.

System action: See message text.

Operator response: Return to the previous panel if you want to specify a target resource.

AWKWUJ039E An error occurred retrieving the list of computers matching the job requirements. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the

database are running. Check the log file for errors.

AWKWUJ040E An error occurred retrieving the output of the "job name" job instance. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ041W This operation may take a long time. Are you sure you want to continue?

Explanation: See message text.

System action: The program waits for the user to provide an answer.

Operator response: Specify whether the operation should be performed by choosing the appropriate option.

AWKWUJ042W No previous job has been specified. The system will allocate the best available resource to this job.

Explanation: See message text.

System action: See message text.

Operator response: Return to the previous panel if you want to specify a previous job.

AWKWUJ044E The operation failed because of a security problem. The user specified in the server connection does not have the required level of authorization on the IBM Tivoli Dynamic Workload Broker server.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Ensure that the user has the required authorization by either granting the required role to the user specified in the server connection, or by specifying a different user to connect to the server.

AWKWUJ045E You cannot define an affinity relationship with the selected job instance because the instance has not been successfully allocated to a computer.

Explanation: The affinity relationship applies only to jobs which have been correctly submitted to a computer. When two jobs have an affinity relationship, the second job runs on the same computer as the first.

System action: The operation cannot be performed.

Operator response: Select a job instance with one of the following statuses: Run failed, Unable to start, Unknown, Cancel pending, Cancel allocation, Canceled, Running, Completed successfully.

AWKWUJ046E The operation "operation name" failed because of an internal error. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ047E The Web service "web service name" cannot be found.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUJ048E The operation failed because of a security problem: the user or the password specified in the server connection are incorrect.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check that the user specified in the server connection exists on the IBM Tivoli Dynamic Workload Broker server and that the password is correct.

AWKWUJ050E The operation failed because of a syntax error in a variable expression in the JSDL. The following expression "variable expression" is incorrect.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the syntax of the variable specification.

AWKWUJ051E The operation failed because of a syntax error in a variable expression in the JSDL. The following expression "variable expression" is incorrect. The expected type is "variable expression".

Explanation:

System action: The operation cannot be performed.

Operator response: Check the syntax of the variable specification.

AWKWUJ052W The following variables could not be replaced in the JSDL: "variable names". This might have limited the list of available resources for the job. If you cannot find the resource you were looking for, go back, provide values for any of these variables and try again.

Explanation:

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUJ053E There has been a communication failure with the server: either the host is not available, or the address or the port (or both) are not correct.

Explanation: See message text.

System action: null

Operator response: Check that the server is available (try pinging it). Check the server connection credentials. null

AWKWUJ054E An error occurred retrieving the output of the job instance. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

Chapter 60. AWKWUR messages

This section lists error and warning messages that could be issued.

The message component code is WUR.

AWKWUR001E The format of the string "string" is incorrect.

Explanation: The syntax is incorrect for a NCName data type.

System action: The operation cannot be performed.

Operator response: Specify a value meeting the following rules:

- The first character must be alphabetical.
- Underscore (_), minus (-), and period (.) can be included.
- Space, special characters, and accented characters cannot be included.

AWKWUR002W You must select at least one object for this operation.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR003E The resources have not been suspended because of a communication problem with the scheduling server. Check the console server configuration and make sure that the scheduling server and the database are running.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR005E The resources have not been resumed because of a communication problem with the scheduling server. Check the console server configuration and make sure that the scheduling server and the database are running.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR007E The operation could not be performed because of a problem with the scheduling server. Check the console server configuration and make sure that the scheduling server and the database are running.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR008E The operation failed because of internal error. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR009E The following resources were not suspended because they are already in the suspended state: "resource names"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: None.

AWKWUR010E The following resources were not resumed because they are not in the suspended state: "resource names"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: None.

AWKWUR011E The following resources "resource names" have not been suspended because of a problem on the scheduling server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR012E The following resources "resource names" have not been resumed because of a problem on the scheduling server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR013E The following resources "resource names" have not been deleted because of a problem on the scheduling server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR015E An error occurred retrieving the computers from the scheduling server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Change the search criteria and retry the operation.

AWKWUR016E An error occurred retrieving the resources from the scheduling server. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Change the search criteria and retry the operation.

AWKWUR019E You must select at least one computer for this operation.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR020E You can select only one computer for this operation.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR021E A problem on the scheduling server occurred while saving the "resource name" logical resource. More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR022E A problem on the scheduling server occurred while saving the "resource name" logical resource. The "resource name" logical resource has been created in the database, but the following computers were not associated to it: "computers list". More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR023E A problem on the scheduling server occurred while saving the "group name" group. More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR024E A problem on the scheduling server occurred while saving the "group name" group. The "group name" group has been created in the database, but the following computers were not associated to it: "computers". More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR025E A problem on the scheduling server occurred while saving the "group name" group. The "group name" group has been created in the database, but the following computers "computers" and logical resources "logical resources" were not associated to it. More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR026E A problem on the scheduling server occurred while saving the "group name" group. The "group name" group has been created in the database, but the following logical resources were not associated to it: "logical resources". More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR027E An error occurred retrieving computer details. More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR028E An error occurred saving the user preferences.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR029E An error occurred saving the server connection.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR032E A password was specified without a user name.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: A password needs a user name. Specify a user name.

AWKWUR033E You must select an object for this operation.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR034E You can select only one object for this operation.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR035E A problem on the scheduling server occurred while updating the "resource name" logical resource. The "resource name" logical resource has been updated in the database, but the following computers were not removed from it: "computers list". More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR036E A problem on the scheduling server occurred while updating the "group name" group. The "group name" group has been updated in the database, but the following computers were not removed from it: "computers list". More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR037E A problem on the scheduling server occurred while updating the "group name" group. The "group name" group has been updated in the database, but the following logical resources were not removed from it: "logical resources list". More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR038E A problem on the scheduling server occurred while updating the "group name" group. The "group name" group has been updated in the database, but the following computers: "computers" and logical resources: "logical resources" were not removed from it. More details follow: "error"

Explanation: See message text.

System action: The operation cannot be performed.

AWKWUR041E • AWKWUR053E

Operator response: Manually remove the computers from the group.

AWKWUR041E A problem on the scheduling server occurred while searching for resource groups. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR042E A problem on the scheduling server occurred while searching for logical resources. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR043E An error occurred retrieving group details. More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the console server configuration and make sure that the scheduling server and the database are running. In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR044E The installation failed on the following agents: "list of agents". More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the status of the failing agents. Check the console server configuration and make sure the scheduling server and the database are running. Check the log file for errors.

AWKWUR046E The uninstallation failed on the following agents: "list of agents". More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the status of the failing agents. Check the console server configuration and make sure that the scheduling server and the database are running. Check the log file for errors.

AWKWUR048E A problem on the scheduling server occurred while searching for agents. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the console server configuration and make sure that the scheduling server and the database are running. In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR049E A problem on the scheduling server occurred while retrieving the agents details. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the console server configuration and make sure that the scheduling server and the database are running. In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR051W The following agents cannot be installed because they are unavailable: "agents"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Select agents that are available. Try refreshing the agents list to update their status.

AWKWUR052W The following agents cannot be uninstalled because they are unavailable: "agents"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Select agents that are available. Try refreshing the agents list to update their status.

AWKWUR053E The operation failed because of a security problem: the user specified in the server connection does not have the required level of authorization on the IBM Tivoli Dynamic Workload Broker server.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Either grant on the IBM Tivoli Dynamic Workload Broker server the required role to the user specified in the server connection, or specify a

different user to connect to the server.

AWKWUR054E An error occurred retrieving logical resource details. More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the console server configuration and make sure that the scheduling server and the database are running. In the log file, check the messages that preceded this one to determine what caused the error.

AWKWUR055E The operation failed because of a security problem: the user or the password specified in the server connection are incorrect.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check that the user specified in the server connection exists on the IBM Tivoli Dynamic Workload Broker server and that the password is correct.

AWKWUR056E The operation "operation name" failed because of an internal error. More details follow: "error details"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUR058E An error occurred retrieving information about the IBM Tivoli Dynamic Workload Broker server. More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the Integrated Solutions Console configuration and make sure that the IBM Tivoli Dynamic Workload Broker server and the database are running. Check the log file for errors.

AWKWUR059E The following agents cannot be configured because they are unavailable: "agents"

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Select agents that are available. Try refreshing the agents list to update their status.

AWKWUR060E The configuration failed on the following agents: "list of agents". More details follow: "error details".

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Check the status of the failing agents. Check the console server configuration and make sure the scheduling server and the database are running. Check the log file for errors.

AWKWUR063E The type " " specified for logical resource " " is incorrect because it is a reserved word.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: Specify a different type for the logical resource you want to create.

AWKWUR064E The host name or address is not valid.

Explanation: See message text.

System action: The operation cannot be performed.

Operator response: See message text.

AWKWUR065E There has been a communication failure with the server: either the host is not available, or the address or the port (or both) are not correct.

Explanation: See message text.

System action: null

Operator response: Check that the server is available (try pinging it). Check the server connection credentials. null

Chapter 61. AWKXAJ - Extended agent job executor messages

This section lists error and warning messages that might be generated by the routines that handle the extended agent job executor process.

The message component code is XAJ.

AWKXAJ001E The method parameter is empty.

Explanation: The method parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ002E The taskType parameter is empty.

Explanation: The taskType parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ003E The step parameter is empty.

Explanation: The step parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ004E The error parameter is empty.

Explanation: The error parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ005E The output parameter is empty.

Explanation: The output parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ006E The target parameter is empty.

Explanation: The target parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ007E The user name parameter is empty.

Explanation: The user name parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ008E The taskString parameter is empty.

Explanation: The taskString parameter is required.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

AWKXAJ009E The jsdlxa:xajob element is missing in the job definition.

Explanation: The jsdlxa:xajob element is required in the job definition.

System action: The program stops.

Operator response: Provide the required information and retry the operation.

Chapter 62. AWKZSJ - z/OS shadow job validation messages

This section lists error and warning messages that might be generated by the z/OS shadow job validation.

The message component code is ZSJ.

AWKZSJ001E The value assigned to the application name is not coherent with the XML definition.

Explanation: A wrong value for the application name was entered. The correct value for a z/OS shadow job is zShadowJob.

System action: The operation is not performed.

Operator response: Specify zShadowJob as application name and then retry.

AWKZSJ002E The XML namespace definition is unknown.

Explanation: The XML namespace definition must match the application name.

System action: The operation is not performed.

Operator response: Check that the XML namespace definition is correct and then retry.

AWKZSJ003E The value entered for JobStream is not valid.

Explanation: See message text. The maximum length for the JobStream string is 16 characters.

System action: The operation is not performed.

Operator response: Specify a correct value for JobStream and then retry the operation.

AWKZSJ004E The value entered for JobNumber is not valid.

Explanation: See message text. The Job number string must be an integer and its maximum value is 255.

System action: The operation is not performed.

Operator response: Specify a correct value for JobNumber and then retry the operation.

Chapter 63. AWSAEM - Event management messages

This section lists error and warning event management messages that might be issued.

The message component code is AEM.

AWSAEM001E An internal error has occurred. The property `com.ibm.tws.event.configuration.manager` is not found in the `TWSConfig.properties` file.

Explanation: The class that manages the event processor must be defined in the `TWSConfig.properties` file. You should use the `com.ibm.tws.event.configuration.manager` key to define it.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSAEM002E An internal error has occurred while loading or initializing the DAO factory class "`factory_class`".

Explanation: See message.

factory_class identifies the name of a DAO factory class as defined in the `TWSConfig.properties` file.

System action: The operation cannot be performed.

Operator response: Contact the Tivoli Workload Scheduler administrator to verify the Tivoli Workload Scheduler installation.

AWSAEM003E Unable to execute the operation because this workstation is not the Event Processor Manager.

Explanation: If the workstation is not the Event Processor Manager, it is not possible to run the event manager operations: `starteventprocessor` and `stopeventprocessor`.

System action: The operation cannot be performed.

Operator response: Contact the Tivoli Workload Scheduler administrator to verify the Tivoli Workload Scheduler installation.

AWSAEM005W This workstation "`workstation`" is not the Event Processor Manager.

Explanation: See message.

workstation identifies the active workstation.

System action: The operation cannot be performed.

Operator response: Contact the Tivoli Workload Scheduler administrator to verify the Tivoli Workload Scheduler installation.

Chapter 64. AWSAHL - Action helper messages

This section lists error and warning action helper messages that might be issued.

The message component code is AHL.

AWSAHL001E The action plug-in "*plug-in_name*" is not valid.

Explanation: The loaded plug-in "*plug-in_name*" is not valid: either no plug-in has been loaded or it is not the action plug-in.

System action: The operation cannot be performed.

Operator response: Redefine the trigger rule to invoke the correct action plug-in.

AWSAHL007E The action "*action_type*" of event rule instance "*rule_name*" ("*time_stamp*") has completed with errors: "*msg*"

Explanation: The action "*action_type*" of the event rule instance "*rule_name*" with time stamp *time_stamp* has completed with errors.

System action: The operation cannot be performed.

Operator response: Check the "*msg*" for specific reason for the failure.

AWSAHL008W The event rule instance "*rule_name*" ("*time_stamp*") has completed with warnings.

Explanation: At least one of the actions of the event rule instance "*rule_name*" with time stamp *time_stamp* has completed with warnings, no action has ended in error.

Operator response: Verify the warning message reported by the action.

AWSAHL009E The event rule instance "*rule_name*" ("*time_stamp*") has completed with errors.

Explanation: At least one of the actions of the event rule instance "*rule_name*" with time stamp *time_stamp* has reported an error.

Operator response: Verify the error message reported by the action.

Chapter 65. AWSAUT - OSLC Automation Job Executor messages

This section lists error and warning messages that might be issued by the BigInsights plug-in.

The message component code is AUT.

AWSAUT001E The Registry Services URI was not specified.

Explanation: The Registry Services URI is a required value.

System action: The operation is not performed.

Operator response: Specify a value for the Registry Services URI and try the operation again.

AWSAUT002E A password was provided without specifying the Registry Services user. Specify a user name or delete the password.

Explanation: A password for the Registry Services user was provided without specifying the user name.

System action: The operation is not performed.

Operator response: Specify the name of the Registry Services user or delete the password, and try the operation again.

AWSAUT003E The password associated with the specified Registry Services user was not provided.

Explanation: A name for the Registry Services user was provided without specifying the associated password.

System action: The operation is not performed.

Operator response: Provide the password for the Registry Services user and try the operation again.

AWSAUT004E The Service Provider URI was not specified.

Explanation: The Service Provider URI is a required value.

System action: The operation is not performed.

Operator response: Specify a value for the Service Provider URI and try the operation again.

AWSAUT005E A password was provided without specifying the Service Provider user. Specify a user name or delete the password.

Explanation: A password for the Service Provider user was provided without specifying a user name.

System action: The operation is not performed.

Operator response: Specify the name of the Service Provider user or delete the password, and try the operation again.

AWSAUT006E The password associated with the specified Service Provider user was not provided.

Explanation: The name of the Service Provider user was provided without specifying the associated password.

System action: The operation is not performed.

Operator response: Provide the password for the Service Provider user and try the operation again.

AWSAUT007E The Template URI was not specified.

Explanation: The Template URI is required to define an instance.

System action: The operation is not performed.

Operator response: Specify the Template URI and try the operation again.

AWSAUT008E An error occurred while attempting to go to the IBM OSLC server. The IBM OSLC server connection parameters are not correct: "error_msg".

Explanation: An error occurred while connecting to the IBM OSLC server.

error_msg identifies the cause of the error.

System action: The operation is not performed.

Operator response: Verify that the server connection parameters are correct. For more details about the error, see the error message in the Java IBM OSLC log file.

AWSAUT010E The syntax used for the Registry Services URI is not correct. Verify that you specified a valid string.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the URI provided is correct.

AWSAUT011E The syntax used for the Registry Services URI is not correct. Verify that you specified a valid string.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the URI provided is correct.

AWSAUT012E An error occurred while connecting to the IBM OSLC service. The error is "error message"

Explanation: An error occurred while contacting the service provider to submit the automation request.

System action: The job fails.

Operator response: Check the error message.

AWSAUT013E The syntax used for the Automation Service Provider URI is not correct. Verify that you specified a valid string.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the URI provided is correct.

AWSAUT014E The syntax used for the Automation Service Provider URI is not correct. Verify that you specified a valid string.

Explanation: See message text.

System action: The operation is not performed.

Operator response: Verify that the URI provided is correct.

AWSAUT015E The syntax of the Service Provider URI "provider URI" is not correct. The error is: "error message"

Explanation: The syntax of the automation Service Provider address is not correct.

System action: The job fails.

Operator response: Edit the job definition and correct the Service Provider URI.

AWSAUT016E The Service Provider at the address "provider URI" does not exist.

Explanation: The automation Service Provider specified does not exist.

System action: The job fails.

Operator response: Edit the job definition and correct the Service Provider URI.

AWSAUT017E The property file "plug-in property file" for the OSLC Automation job was not found.

Explanation: The specified property file was not found.

System action: The operation is not performed.

Operator response: Check that the specified property file exists and that the user that installed the Tivoli Workload Scheduler can read it. If the file does not exist, create it. For details about how to create the property file, see the Tivoli Workload Scheduler documentation.

AWSAUT018E An error occurred while loading the property file "plug-in property file" for the OSLC Automation job.

Explanation: The property file cannot be read or its content is not valid.

System action: The operation is not performed.

Operator response: Check that the specified property file exists and that the user that installed the Tivoli Workload Scheduler can read it. Verify that the file content is correct; for detailed information about the property file, see the Tivoli Workload Scheduler documentation.

AWSAUT019E The following error occurred when retrieving the description of the Service Provider: "error message".

Explanation: The Registry Services replied with an error.

System action: The operation is not performed.

Operator response: Refer to the error message to correct the problem and try the operation again.

AWSAUT020E The following error occurred when retrieving the list of the Service Providers: "error message".

Explanation: The Registry Services replied with an error.

System action: The operation is not performed.

Operator response: Check that the credentials

specified for the Registry Service are correct and try the operation again.

AWSAUT021E The property file "provider URI" for the OSLC Automation job is empty.

Explanation: The specified property file is empty.

System action: The operation is not performed.

Operator response: Check that the content of the property file is valid. For information about how to create a property file, see the Tivoli Workload Scheduler documentation.

AWSAUT023E The job did not complete successfully. For detailed information, go to the following address: "instance uri".

Explanation: The job completed with errors.

System action: The job did not complete successfully.

Operator response: For detailed information about the reason for the failure, go to the address shown in the error message.

AWSAUT024E The job did not complete successfully. For detailed information, go to the following address: "instance uri".

Explanation: The job completed with errors.

System action: The job did not complete successfully.

Operator response: For detailed information about the reason for the failure, go to the address shown in the error message.

AWSAUT025E The job did not complete successfully. For detailed information, go to the following address: "instance uri".

Explanation: The job completed with errors.

System action: The job did not complete successfully.

Operator response: For detailed information about the reason for the failure, go to the address shown in the error message.

AWSAUT026E The job did not complete successfully. For detailed information, go to the following address: "instance uri".

Explanation: The job completed with errors.

System action: The job did not complete successfully.

Operator response: For detailed information about the reason for the failure, go to the address shown in the error message.

AWSAUT027E The job did not complete successfully. For detailed information, go to the following address: "instance uri".

Explanation: The job completed with errors.

System action: The job did not complete successfully.

Operator response: For detailed information about the reason for the failure, go to the address shown in the error message.

AWSAUT028E The job did not complete successfully. For detailed information, go to the following address: "instance uri".

Explanation: The job completed with errors.

System action: The job did not complete successfully.

Operator response: For detailed information about the reason for the failure, go to the address shown in the error message.

AWSAUT029E The URI of the remote instance "instance uri" is not valid.

Explanation: The address of the instance returned by the remote system is not valid.

System action: The job did not complete successfully.

Operator response: For further troubleshooting, contact the administrator of the remote system.

AWSAUT033E The following error: "error message" was returned by the remote system.

Explanation: The remote system returned an error when submitting the action.

System action: The job did not complete successfully.

Operator response: To take the appropriate action, check the error message returned by the remote system.

AWSAUT034E An internal error occurred. The location header is not present in the response sent by the remote system.

Explanation: There was an error in the protocol with the remote system. The location header is not present.

System action: The job did not complete successfully.

Operator response: Check if the address of the service provider is correct and run the job again.

AWSAUT035E The status of the job cannot be monitored. The status is set to unknown.

Explanation: There is an error in an internal property file; the status of the job could not be retrieved after the agent restarted.

System action: The job status is set to unknown.

Operator response: Manually change the status of the job.

AWSAUT036E The status of the job cannot be monitored after the agent restarted. The status is set to unknown.

Explanation: There is an error in an internal property file; the status of the job could not be retrieved after the agent restarted.

System action: The job status is set to unknown.

Operator response: Manually change the status of the job.

AWSAUT038E The syntax used for the Registry Services URI "registry services URI" is not correct. The error is: "error message".

Explanation: There is an error in the syntax of the Registry Services URI.

System action: The user interface from which you can choose the Service Provider is not shown.

Operator response: Verify that the URI specified is correct.

AWSAUT039E An error occurred while retrieving the list of service providers from the Registry Services with URI "Registry services URI". The error is: "error message".

Explanation: An error occurred when you tried to retrieve the list of service providers.

System action: The list of service providers is not shown.

Operator response: Verify that the URI of the Registry Services is correct.

AWSAUT040E An error occurred while retrieving the list of service providers from the Registry Services with URI "Registry services URI".

Explanation: An error occurred when you tried to retrieve the list of service providers.

System action: The list of service providers is not shown.

Operator response: Verify that the URI of the Registry Services is correct.

AWSAUT041E The syntax used for the Service Provider URI "provider URI" is not correct. Ensure that you specified a valid string.

Explanation: There is an error in the syntax of the Service Provider URI.

System action: The user interface to configure the instance is not shown.

Operator response: Verify that the URI specified is correct.

AWSAUT042E An error occurred while loading the user interface to configure the instance. The error is: "error message".

Explanation: An error occurred while loading the user interface to configure the instance.

System action: The user interface to configure the instance is not shown.

Operator response: Verify that the URI of the Service Provider is correct and that the Registry Services are specified correctly.

AWSAUT043E The following error occurred when retrieving the creation dialog: "error message".

Explanation: The Registry Services replied to the request with an error.

System action: The action is not performed.

Operator response: For further details, see the error message. If the error message is ""Unauthorized """, check the user and password of the Registry Services.

AWSAUT044E The syntax used for the Service Provider URI "provider URI" is not correct. Ensure that you specify a valid string.

Explanation: There is an error in the syntax of the Service Provider URI.

System action: The description of the Service Provider is not shown.

Operator response: Verify that the URI specified is correct.

AWSAUT045E An error occurred while retrieving the details of the Service Provider with URI "provider URI". The error is: "error message".

Explanation: An error occurred when you tried to retrieve the details of the Service Provider.

System action: The details of the Service Provider are not shown.

Operator response: Verify that the URI of the Service Provider is correct and that the Registry Services are specified correctly.

AWSAUT046E The address discovered for the panel "creation dialog URI" is not correct. The error is: "error message".

Explanation: There is an error in the syntax of the URI for the creation dialog; the URI is retrieved by making a query to the Registry Services.

System action: The user interface to configure the instance is not shown.

Operator response: Check the service provider registration on the Registry Services.

AWSAUT047E The address discovered for the panel "creation dialog URI" is not correct. The error is: "error message".

Explanation: There is an error in the syntax of the URI of the creation dialog; the URI is retrieved by making a query to the Registry Services.

System action: The user interface to configure the instance is not shown.

Operator response: Check the service provider registration on the Registry Services.

AWSAUT048E The automation request was not defined.

Explanation: The automation request must be defined.

System action: The job definition is not saved.

Operator response: Define the automation request before saving the job definition.

AWSAUT049E An error occurred while connecting to the IBM OSLC service. The error is "error message"

Explanation: An error occurred while contacting the service provider to submit the automation request.

System action: The job fails.

Operator response: Check the error message.

AWSAUT050E An error occurred while connecting to the IBM OSLC service. The error is "error message"

Explanation: An error occurred while contacting the service provider to get the automation result.

System action: The job fails.

Operator response: Check the error message.

AWSAUT051E An error occurred while connecting to the IBM OSLC service. The error is "error message"

Explanation: An error occurred while contacting the service provider to get the automation result.

System action: The job fails.

Operator response: Check the error message.

Chapter 66. AWSBAT - Event counter messages

This section lists error and warning messages that might be issued by the event counter used by the fault-tolerant switch manager feature.

The message component code is BAT.

AWSBAT003E The event counter failed to initialize for the following reason:
"error_message"

Explanation: The event counter failed to initialize for the reason detailed in the *error_message*.

System action: The *Enable switch fault tolerance* feature is no longer functioning. The process continues.

Operator response: Correct the reported problem and restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT004E The event counter has failed after encountering the following problem:
"error_message"

Explanation: The event counter failed for the reason detailed in the *error_message*.

System action: The event counter and the *Enable switch fault tolerance* feature both stop. The process continues.

Operator response: Correct the reported problem and restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT005E The event counter failed to initialize while attempting to load its table with workstation names from the Symphony file. The following gives more details of the error: "system_error".

Explanation: This is an internal error. The event counter initialization failed for the indicated *system_error*.

System action: The event counter and the *Enable switch fault tolerance* feature both stop. The process continues.

Operator response: Restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT008E The process could not retrieve a value from the event counter.

Explanation: This is an internal error. Either the event counter is corrupted or the workstation identified by the event counter does not exist.

System action: The event counter and the *Enable switch fault tolerance* feature both stop. The process continues.

Operator response: Restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT011W The event counter received a message with a lower ID-number ("ID_number") than a message previously received from the same workstation.

Explanation: The message might be displayed while switch manager is running or after an error has occurred with Tivoli Workload Scheduler.

System action: The event counter is updated to use the new value. The process continues.

Operator response: None.

AWSBAT012E The process could not write the received ID-number to the event counter.

Explanation: This is an internal error.

System action: The process continues. Events routed through this workstation from the moment this message is displayed until the moment the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: Restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT015E The event counter could not be saved because the following error occurred:
"error_message"

Explanation: The event counter table could not be saved for the reason detailed in the *error_message*.

System action: The *Enable switch fault tolerance* feature stops. The process continues.

Operator response: Correct the problem reported, and restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT053E The run-number in the Symphony file is higher than the current Symphony run-number.

Explanation: Either **writer** or **mailman** found that the Symphony file on the hard disk drive referred to a higher Symphony run number than that stored in the process. There are two possibilities:

1. An occurrence of **JnextPlan** took place while the process was running, without the process being restarted
2. The Symphony file or the EventCounter file has been changed manually or by a process outside Tivoli Workload Scheduler.

System action: The process continues. Events routed through this workstation since the last **JnextPlan** up to when the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: The operator response depends on the cause of the error:

- If the cause of the error was 1), an internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.
- If the cause of the error was 2), either reinstate the original version of the Symphony file or delete the EventCounter file (`nullInstallDirnull\ftbox\EventCounter`) before restarting the process.

See *The event counter troubleshooting section* for more information.

AWSBAT054E The saved event counter file could not be opened.

Explanation: A saved version of the event counter exists, but the process was not able to open the file.

System action: The process continues. Events routed through this workstation since the last **JnextPlan** up to when the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: Delete the event counter file and restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT055E A new event counter file could not be created, and there is no saved file.

Explanation: There is no saved version of the event counter file, but when the process attempted to create a file, it failed.

System action: The process continues. Events routed through this workstation since the last **JnextPlan** up to when the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: Check the following:

- Does an event counter file exist? If it does, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.
- Is there enough free disk space available in the product's installation directory to create the file? If not, free up more space.
- Are the security permissions on the installation directory correct? If not, correct the permissions.

Restart the process.

AWSBAT056E The following operating system error has affected the functionality of the process: "error_code".

Explanation: The operating system error indicated by *error_code* has occurred, and the process cannot continue with full functionality.

System action: The *Enable switch fault tolerance* feature stops. The process continues.

Operator response: Fix the operating system error. Restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT057E The event counter file is corrupt.

Explanation: The process is trying to use the saved version of the event counter file, but it is corrupted.

System action: The process continues. Events routed through this workstation since the last **JnextPlan** up to when the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: Delete the event counter file and restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT058E The event counter failed to initialize.

Explanation: Some fields hold incorrect values.

System action: The process continues. Events routed through this workstation since the last **JnextPlan** up to

when the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: Restart the process.

See *The event counter troubleshooting section* for more information.

AWSBAT059E The event counter failed to initialize.

Explanation: Some fields are empty.

System action: The process continues. Events routed through this workstation since the last **JnextPlan** up to when the process is restarted are ignored by the *Enable switch fault tolerance* feature.

Operator response: Restart the process.

See *The event counter troubleshooting section* for more information.

Chapter 67. AWSBCS - Check health status messages

This section lists error and warning check health status messages that could be issued.

The message component code is BCS.

AWSBCS002E The timeout value !1 is not valid.

Explanation: You have supplied a timeout value that is not in the correct format. It must be the numeric value of the number of seconds required for the timeout to be used by `chkhltst`. For example, the value for 30 seconds must be `""30""`, not `""30s""` or `""30 secs""`.

System action: The `chkhltst` process cannot start.

Operator response: Rerun the `chkhltst` command, supplying a correctly formatted timeout value.

AWSBCS003E There is a syntax error. Too few parameters have been supplied.

Explanation: The `chkhltst` process requires the link parameters to be passed to it. These parameters have not been supplied correctly.

System action: The `chkhltst` process cannot start.

Operator response: Rerun the `chkhltst` command, supplying the correct linking parameters.

AWSBCS026W Node "node" is running with an old Symphony file.

AWSBCS027E An internal error occurred while calculating the path between firewalls and prevents node "from_node" from connecting with node "to_node".

AWSBCS028E An error occurred while communicating with node "node": "err_msg"

AWSBCS029W The node "node" is not able to ping its Domain Manager.

AWSBCS030W Message file "filename" on node "node" has reached "percentage"% of its maximum size.

AWSBCS031E Message file "filename" on node "node" has reached its maximum size.

AWSBCS032W The filesystem where Tivoli Workload Scheduler is installed on node "node" is almost full. Only "available" MBytes are available.

AWSBCS033E The filesystem where Tivoli Workload Scheduler is installed on node "node" is full.

AWSBCS034E The Symphony file on node "node" is corrupted. More details are available in the local Tivoli Workload Scheduler trace files.

AWSBCS040W Workstation "ws_name" was not found in the Symphony file on node "node".

AWSBCS041W Domain "dom_name" was not found in the Symphony file on node "node".

AWSBCS042W Node "node" is not running.

AWSBCS043W Nodes "node1" and "node2" are not linked.

Chapter 68. AWSBCT - Utility program messages

This section lists utility program error and warning messages that might be issued.

The message component code is BCT.

AWSBCT002E A jcl file is required.

AWSBCT003E The jcl file path must be no more than !1 characters

AWSBCT004E The -u option is available only for root users.

AWSBCT005W The jcl is submitted as root, you must use -u nullusernull.

AWSBCT006E No password entry for the user. Error: !1

AWSBCT007E The user name must not be more than 8 bytes.

AWSBCT008E This user needs read and execute access for nulljclfilenull !1. Error: !2

AWSBCT009E No group entry for this user. Error: !1

AWSBCT010W Created !1 as a job stream from the group name.

AWSBCT011W Only 8 byte schedule names supported, using: !1

AWSBCT012W Only 8 byte job names supported, using: !1

AWSBCT013W Used !1 as job name, from filename.

AWSBCT014E An error occurred accessing the current work directory: !1

AWSBCT015E An error has occurred writing to !1, Error: !2

AWSBCT016E An error has occurred opening !1, Error: !2

AWSBCT017E An error has occurred reading stdin, Error: !2

AWSBCT018E Could not acquire a temporary file.

AWSBCT019E An error has occurred closing !1, Error: !2

AWSBCT021E Could not assign a schedule name, use -s option.

AWSBCT022E Could not assign a job name, use -j option.

AWSBCT023E Must assign date/time in the format YYMMDDHHmm.

AWSBCT024E Date/time must have 10 digits in the format YYMMDDHHmm.

AWSBCT025E Priority must be a numeric value from 0 to 101, hi (= 100), or go (= 101).

AWSBCT026E null!1null must be specified with a leading alphabetic character.

AWSBCT031E You must start Netman manually on this system.

AWSBCT033E An error occurred starting the local system, Type: !1, Error: !2

be specified.

AWSBCT877E Remove option requires only the
service name.

AWSBCT878W Extraneous arguments ignored.

AWSBCT879W Username not given. Installing as
System account service.

AWSBCT880W Display name not given. Will use
service name itself.

AWSBCT881E No dependency given.

AWSBCT882E Error creating service (%d).

AWSBCT884E Error opening service %d.

AWSBCT885E Service !1 is not stopped. Cannot
remove.

AWSBCT886E Unable to delete service (%d).

AWSBCT888E Cpuinfo cannot show information
about workstation "workstation"
because is not included in the current
Symphony file.

Explanation: See message.

workstation identifies the workstation which is the subject of the *cpuinfo* utility, but which is not in the Symphony file.

System action: *Cpuinfo* stops without producing any output.

Operator response: Check that you have typed the

workstation name correctly. If you find an error, correct it and retry the utility.

If you have typed the name correctly, and were expecting the workstation to be in the plan, check the job or job stream in the plan that you thought was using the workstation.

Chapter 69. AWSBCU - SSL messages (symaccs)

This section lists symaccs error and warning messages that might be issued when using SSL.

The message component code is BCU.

AWSBCU001E Opening "Variable", error: "Error"

AWSBCU002E Locking "Variable", error: "Error"

AWSBCU003E Unable to allocate comarea "Comarea"

AWSBCU004E Could not set file options on
"Variable", error "Error"

AWSBCU005E Closing "Variable", error: "Error"

AWSBCU006E Purging "Variable", error: "Error"

AWSBCU007E An error has occurred in the common
area used to access the Symphony file.

Explanation: The error is probably due to a memory
corruption. It is a symaccs error.

System action: The program might stop.

Operator response: If Tivoli Workload Scheduler has
not yet stopped, stop and restart it. If the problem
persists, search the IBM Support database for a solution
at [http://www.ibm.com/software/sysmgmt/products/
support](http://www.ibm.com/software/sysmgmt/products/support).

See The chapter on 'Symphony file corruption' in the
Troubleshooting guide.

AWSBCU008E Seeking "Variable", record "Record"
("Record2"), error: "Error"

AWSBCU009E Reading "Variable", record "Record"
("Record2"), error: "Error"

AWSBCU010E Writing "Variable", record "Record"
("Record2"), error: "Error"

AWSBCU011E Trying to read a nonexistent record
from "Variable", Record "Record"
("Record2").

AWSBCU012E Write called without update access on
"Variable"

AWSBCU013E Obtaining statistics on "Variable",
error: "Error"

AWSBCU014E End of file on "Variable", record
"Record" ("Record2").

AWSBCU015E Error comarea isn't a symaccs comarea

AWSBCU016E No write access to "Variable", record
"Record" ("Record2").

AWSBCU017E Attempting to write NIL ("Variable")
record to "Record".

AWSBCU018E Write recnum disagreement on
"Variable", recnum "RecNum"
("RecNum2").

AWSBCU021E Attempting to write past absolute
limit on "Variable", record "Record"
("Record2").

AWSBCU022E No statistics available for record type,
for "Variable2", on "Variable".

AWSBCU023W Stats only kept on production
transactions, not for "Variable"

AWSBCU024E Procedure not implemented.

AWSBCU025E Lock called and "Object" already
locked, record "Record" ("Record2"),
error: "Error"

AWSBCU026E Unknown lock flag for lock on
"Object", record "Record" ("Record2"),
error: "Error"

AWSBCU027W Unlock called for "Object", record
"Record" ("Record2"), file not locked.

AWSBCU028E • AWSBCU150W

AWSBCU028E Call to LOCK failed for "Object", record "Record" ("Record2"), error: "Error"

AWSBCU029E Call to GETLOCK failed for "Object", record "Record" ("Record2"), error: "Error"

AWSBCU030E Call to RENAME failed on "Object", error: "Error"

AWSBCU031E Exclusive access needed to install "Object" as Symphony.

AWSBCU032E File "File" already locked by another process, error: "Error"

AWSBCU035E Opening "Object", error: "Error"

AWSBCU036E Seeking "File", record type "RecordType", error: Record not found

AWSBCU037W Filename "FileName" exceeds "Limit" byte limit, Warning: Filename truncated.

AWSBCU038E Filepath "FilePath" exceeds "Limit" byte limit. Filepath unusable.

AWSBCU040E %s:%d sym_e_2_i() unexpected Symphony record type: 0%o

AWSBCU041E %s:%d sym_i_2_e() unexpected Symphony record type: 0%o

AWSBCU042W OPENS dependency resolution could fail at runtime because of the syntax used. Action must be taken.

AWSBCU150W SSL authorization is required to connect to the following workstation "workstation_name"

Explanation: See message. The most common reason for this error is an inconsistent Security Level. For example, the workstation where **mailman** is running could be enabled for SSL but the target workstation is not. *workstation_name* is the name of the workstation you cannot connect to.

System action: The program proceeds to process other workstations.

Operator response: Use **composer** or the Tivoli Dynamic Workload Console to verify the security level of the Workstation that cannot communicate. Enable or

disable SSL as appropriate and where appropriate, to ensure that both this workstation and the target workstation have compatible SSL settings.

See See the chapter on setting security in the *Planning and Installation Guide* for more information about SSL.

Chapter 70. AWSBCV - Mailman messages

This section lists error and warning messages that might be issued by the mailman component.

The message component code is BCV.

AWSBCV001E Batchman has failed with an internal error, producing the following status code: "status".

Explanation: Mailman issues this message when batchman terminates unexpectedly. *status* contains an operating system exit status message relating to batchman.

System action: Batchman stops. Mailman continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV002E Error building !1, Error !2

AWSBCV003E Mailman was unable to start one of the internal components ("program") of batchman. The system error message is "system_error"

Explanation: Mailman was unable to start the batchman process.

program is the fully qualified name for the batchman internal component that could not start. *system_error* is the operating system error message.

System action: Batchman did not start. Mailman continues.

Operator response: Use the *program* and attempt to locate the executable. Make sure that it has the correct file access permission. If you locate the program successfully and it has the correct permissions, stop all Tivoli Workload Scheduler processes and restart them. If you cannot find the program, or you find it and restart Tivoli Workload Scheduler but the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV004E Mailman was unable to start one of its internal components ("program") due to an internal error. The operating system error message is "system_error".

Explanation: Mailman was unable to start a mailman server process.

program is the fully qualified name for the batchman internal component that could not start. *system_error* is the operating system error message.

System action: Mailman did not start.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV005E Mailman encountered an internal error opening the following file: "file_name". The operating system error message is "error_message".

Explanation: Mailman was unable to open either the Courier.msg or the Intercom.msg files for writing. Courier.msg is opened when mailman is running on a standard agent or broker workstation.

file_name is the fully qualified name for the message file. *error_message* is a message that describes the error and includes the operating system error message.

System action: Mailman did not start.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV006E Workstation "workstation_name" cannot be added to the mailman table because there are more workstations than the maximum allowed.

Explanation: *workstation_name* is the name of the workstation that mailman has failed to add to its table.

System action: The operation is not performed. This message is produced for all workstations that mailman is trying to add to the table in excess of the maximum allowed. Mailman proceeds, ignoring this workstation.

Operator response: Try to limit the number of workstations (should not be greater than 100000). If you succeed, retry the operation.

AWSBCV007E The workstation "workstation_name" cannot be accessed.

Explanation: There are two possibilities:

1. The program cannot find the *workstation_name* in its table. An internal error has occurred.
2. The program finds the workstation in its table, but the workstation is not in the current domain and thus the program cannot link to it.

System action: If the program can link to the workstation's domain manager, it will pass all messages for the workstation to that domain manager. Otherwise, such messages are discarded. the program proceeds.

Operator response: Verify that the *workstation_name* correctly describes a workstation. If it is correct, verify that the workstation cannot be linked to. If it cannot be linked to you should investigate why, and correct the problem. If it can be linked to, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV008E A message file cannot be opened; the operating system gives the following error: "error_message"

Explanation: This can be one of two possibilities:

1. **Mailman** is unable to open its message file: Mailbox.msg
2. A **mailman** server process is unable to open its message file pobox/[server].msg.

error_message is a message that contains information about the error and includes the operating system error message.

A possible reason is that either your Tivoli Workload Scheduler user or your system has too many files open (a typical user is limited to 64 files).

System action: **Mailman** stops.

Operator response: Attempt to resolve the operating system error. Use the **limit** command to see the user's file limits (the file limit is the 'descriptor' line for csh users).

If the problem is with the number of files open, take one of the following actions, according to whether the problem is with the operating system limits or a user's limits:

- Add the following lines to your system parameters file (/etc/system) and reboot the system:

```
set rlim_fd_max = 4096
set rlim_fd_cur = 1024
```

 This may consume slightly more available memory, but it speeds up the system.
- Modify your Tivoli Workload Scheduler user environment (the following is correct for a csh user):

```
limit descriptors nnn
```

 where nnn is a value greater than the value revealed by the **limit** command.

Restart **mailman**.

AWSBCV009E Mailman could not open the workstation message file: "file_name" in the PO box. The following gives more details of the error: "error_message".

Explanation: **Mailman** is not able to open a workstation message file in the Tivoli Workload Scheduler pobox directory.

file_name specifies the name of the message file.

error_message describes the error and includes the operating system error message.

System action: **Mailman** may stop. If it continues, it will not perform any message processing for this workstation.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV010E Error opening Symphony on !1

AWSBCV011E Error reading cpu records, Error !1

AWSBCV012E Mailman cannot read a message in a message file. The following gives more details of the error: "error_message".

Explanation: **Mailman** was unable to read a message from its local mailbox: Mailbox.msg, or [Server].msg for a server **mailman**.

error_message describes the error and includes the operating system error message.

System action: **Mailman** continues.

Operator response: Attempt to resolve the operating system error. Check the file system of "" nullTWS_home>Mailbox.msg "" to ensure that there is sufficient space, and that the user has write permissions.

AWSBCV013E Error server jcw bad for !1

AWSBCV014E Mailman could not start the following mailman server: "server_name". The following gives more details of the error: "error_message".

Explanation: **Mailman** encountered an error trying to start the desired **mailman** server.

server_name is the name of the **mailman** server which **mailman** is trying to start. *error_message* is a message which explains why the server could not be started.

System action: **Mailman** proceeds.

Operator response: Taking into consideration what is written in the *error_message*, check if the network and

the operating system are working correctly. If this check does not reveal any reason why the server could not be started, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV015E Mailman was unable to write a message to the PO box message file for workstation: "workstation_name". The following gives more details of the error: "error_message".

Explanation: *workstation_name* is the name of the workstation for which the message file could not be written.

error_message describes the error and includes the operating system error message.

System action: Mailman proceeds.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV024W Mailman has lost communication with the following workstation: "workstation_name".

Explanation: The **writer** of the workstation, identified by *workstation_name*, is either busy, or is not responding due to communication problems.

System action: No further messages are processed for this workstation. Mailman proceeds.

Operator response: Use the **ping** command to verify that the workstation is accessible in the network. If you are able to access the workstation, unlink and re-link the workstation, using the **conman** commands **unlink nullworkstation_namenu** and **link nullworkstation_namenu**.

AWSBCV025W Mailman has unlinked from workstation: "workstation_name".

Explanation: Mailman has not received a communication from the workstation identified by *workstation_name* for a period longer than its configured time-out period, so it unlinks from the workstation.

System action: No further messages are processed for this workstation. Mailman proceeds.

Operator response: Verify that the workstation is available and working, using the **ping** command. If it is, take no action; if it is not, take whatever network action or action at the workstation that is necessary to allow the connection to be remade. If you want to remake the connection manually, use the **conman** command **link nullworkstation_namenu**.

AWSBCV034W Impossible branch taken: file: !1, line: !2

AWSBCV035W Mailman was unable to link to workstation: "workstation_name"; the messages are written to the PO box.

Explanation: Mailman was unable to link to the workstation *workstation_name*, for an unknown reason.

System action: All messages for this workstation are written to the message file in the PO box directory (pobox). Mailman attempts, at a configurable interval, to re-establish the link to the workstation. As soon it succeeds, the messages in the PO box are sent to the workstation. Mailman proceeds.

Operator response: If you are not expecting the workstation to be unavailable, do the following:

1. Use the **ping** command to check the workstation's availability. If it is now available, you can link to it manually, or leave **mailman** to relink to it automatically.
2. Verify that **netman** on the workstation is working, running **StartUp** on the workstation if it is not.
3. Verify that **netman** on the workstation is listening on the specified **netman** port, by checking that the **netman** port specified in the database definition is the same as the port specified in the `localopts` file on the workstation.

If you want to change the frequency with which **mailman** attempts to relink to the workstation, modify the appropriate parameter in the `localopts` file.

If you want to attempt to relink manually to the workstation launch the **conman** command **link nullworkstation_name>**.

AWSBCV036W Mailman cannot link to the following workstation: "workstation_name" because it has an incompatible Symphony file.

Explanation: Mailman encountered a problem while trying to link to its parent workstation: *workstation_name* because the workstation has an incompatible Symphony file and needs to be initialized first. Probably the run number of the Symphony file on the workstation is less than the run number of the child Symphony file.

A new Symphony file cannot be sent, because the workstation **mailman** is trying to link to is not its domain manager.

System action: Mailman proceeds.

Operator response: Verify that *workstation_name* can connect to this workstation and if it can, remove its Symphony file.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBCV037E Mailman encountered an internal error while it was reading the Sinfonia file. The following gives more details of the error: "error_message".

Explanation: Mailman sends the Sinfonia file to each workstation when it links to the workstation.

error_message contains the fully qualified name of the Sinfonia file and includes the operating system error message.

System action: Mailman stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV038E Mailman encountered a memory problem while downloading the Symphony file to workstation. Mailman failed to allocate the memory necessary to store the information that it needs to read from the Sinfonia file: "workstation_name"

Explanation: Mailman failed to allocate the memory necessary to store the information that it needs to read from the Sinfonia file.

System action: Mailman proceeds.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to mailman. Rerun mailman.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun mailman.
3. If the problem persists, reboot the workstation, and then rerun mailman.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBCV040W Mailman cannot link to the following workstation: "workstation_name".

Explanation: Mailman is trying to link to the

workstation: *workstation_name* and either the **writer** service on the workstation is unavailable or the version of the Tivoli Workload Scheduler at the workstation is not compatible with the version of **mailman**.

System action: The operation on the workstation is not performed. Mailman proceeds.

Operator response: Verify that the workstation is working correctly. Verify that the version of Tivoli Workload Scheduler on the workstation is correct, by issuing the **conman** command **v**, or by using the Tivoli Dynamic Workload Console options to determine the version. Look at the *stdlist* file on the workstation for more information about the possible causes. The file can be found in the directory `nullInstallDirnull\stdlist\logs`.

AWSBCV045E Error adding cpu !1 to Symphony, Error: !2

AWSBCV047E Error getting info on Sinfonia

AWSBCV048E Error renaming Sinfonia on !1

AWSBCV050E Error writing Sinfonia on !1

AWSBCV051E Error purging Sinfonia on !1

AWSBCV052E Error closing Sinfonia on !1

AWSBCV053E Error closing Symphony on !1

AWSBCV054E Error closing mailbox on !1

AWSBCV057E Error writing to remote Mailbox on !1

AWSBCV058E Error opening remote Mailbox on !1

AWSBCV059E Error building remote Mailbox on !1

AWSBCV060E Error opening DSline to !1, Type !2, Error !3

AWSBCV062E Mailman encountered the following error when attempting to open the Symphony file: "error_message".

Explanation: *error_message* contains the operating system error message.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV063E Link to !1 failed

AWSBCV064E Error attempting to lock Links, Error: !1

AWSBCV065E Error creating Start program !1, Error: !2

AWSBCV066E Mailman was not able to remove a record from the following message file: "message_file". The following gives more details of the error: "error_message".

Explanation: Mailman encountered an error while rereading a record from the message file before deleting it. Mailman processes message records in the following way:

1. It reads a record.
2. It processes the record.
3. It rereads the record and removes it from the message file.

message_file is the name of the file that mailman is processing. *error_message* contains the operating system error message.

System action: Mailman stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV067E Mailman was not able to read a message from the following message file in the pobox directory: "message_file". The following gives more details of the error: "error_message"

Explanation: *message_file* is the name of the file that mailman is processing. *error_message* contains the operating system error message.

System action: Mailman stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV068E Mailman found a discrepancy when trying to delete a message from the Mailbox.msg message file. The following gives more details of the error: "error_message"

Explanation: Mailman processes record messages in the following way:

1. It reads a record.
2. It processes the record.
3. It rereads the record and removes it from the message file.

Mailman issues this error when the length of the reread record does not match the length of the record when it was first read.

System action: Mailman stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV069E Mailman cannot find the workstation: "workstation_name" in the Symphony file.

Explanation: Mailman cannot find the *workstation_name* of either the workstation where it is running, or of the master domain manager, in the Symphony file.

System action: Mailman stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV076E Mailman could not add information about the following workstation: "workstation_name" to the Symphony file. The following gives more details of the error: "system_error"

Explanation: Mailman could not write a workstation record in the Symphony file.

workstation_name is the name of the workstation mailman is trying to write a message for. *system_error* contains the operating system error message.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV078E Error locking Straus

AWSBCV079E Error unlocking Straus

AWSBCV080W Warning link to !1 not found in Straus

AWSBCV081E Error updating Straus

AWSBCV084E Mailman could not link to the following workstation "workstation_name" because it encountered a non valid link type: "link_type_ID".

Explanation: Mailman has encountered an unknown link type (it is neither TCP nor DS).

workstation_name is the name of the workstation mailman is trying to link to.

link_type_ID is the actual link type encountered.

System action: Mailman stops.

Operator response: An internal error has occurred. Try to restart mailman. If the error persists, and you are on a fault-tolerant agent or a domain manager, try removing the Symphony file and then relinking to the workstation, using the **conman** command **link nullworkstation_namenu11**.

See The chapter in this guide on 'Symphony file corruption'.

AWSBCV088E Mailman could not write a mailbox record to the Intercom.msg file. The following gives more details of the error: "error_message".

Explanation: Mailman encountered an error when it tried to write a mailbox record to the Intercom.msg message file.

error_message contains the operating system error message.

System action: Mailman stops. The message it was trying to write could not be sent to batchman.

Batchman might not be able to process the Intercom.msg message file.

Operator response: If the operating system error message is not ""End of file"", search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

If the operating system error message is ""End of file"", the internal size limit of the file has been reached. In this case, expand the Intercom.msg file using the **evtsize** utility. To permanently increase the file size, insert an **EVSIZ**E variable set to the desired size in the StartUp command file (before the line that runs **netman**) in the Tivoli Workload Scheduler user home directory.

AWSBCV089E Error writing to remote !1, Error: !2

AWSBCV095E Mailman was unable to pass a message to the following mailman server: "server_name" because of the following internal error: "error_message".

Explanation: Messages are passed to a mailman server process by writing mailbox records to its `pobox/nullservernull.msg` file. See the *server* keyword in the workstation definition for an explanation of mailman server processes.

server_name is the name of the mailman server to which the message is sent. *error_message* describes the error and includes the operating system error message.

System action: Mailman stops.

Operator response: If the operating system error message is not ""End of file"", search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

If the operating system error message is ""End of file"", the internal size limit of the has been reached. In this case, expand the `pobox/nullservernull.msg` file using the **evtsize** utility. To permanently increase the file size, insert an **EVSIZ**E variable set to the desired size in the StartUp command file (before the line that runs **netman**) in the Tivoli Workload Scheduler user's home directory.

AWSBCV097E Mailman cannot access the batchman program file.

Explanation: Mailman cannot access the batchman program file.

System action: Mailman stops. Batchman does not start.

Operator response: Verify in the product's installation directory that an executable called "" batchman "" exists, and that it has correct file access permission. If the workstation on which the error occurred is a standard agent or broker workstation, you should look for the executable on its host workstation. If the workstation on which the error occurred is a fault-tolerant agent workstation, or a Master domain manager workstation, you should look for the executable on that same workstation.

If you cannot find the executable, or you find it but the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV098W Mailman has not received an acknowledgement for a message sent to workstation: "workstation_name".

Explanation: There are two possible reasons:

- The version of the Tivoli Workload Scheduler Agent running on *workstation_name* is incompatible with the version of **mailman**.
- A corruption of the event occurred during the transmission.

System action: Mailman proceeds. No information is lost.

Operator response: To determine the reason and correct the problem, take the following steps:

1. Verify the version of the agent on the workstation by issuing the **conman** command **v** on the workstation, or by checking in the Tivoli Dynamic Workload Console.
2. If the version is not compatible with the version of **mailman**, upgrade the agent or Tivoli Workload Scheduler running on the computer where **mailman** is running (whichever is back-level). See the *Tivoli Workload Scheduler Planning and Installation Guide* for instructions on upgrading the components.
3. If the agent and **mailman** are at compatible versions, unlink and relink the workstation using the **conman** commands **unlink nullworkstation_namenu** and **link nullworkstation_namenu**.
4. If the **link** command gives an error, investigate and correct the reason for the error and then repeat this step.
5. Then retry the operation.

AWSBCV099E Mailman has lost communication with workstation: "workstation_name".

Explanation: The **writer** of the workstation is not running or is not responding due to communication problems.

workstation_name is the name of the workstation that is not responding to **mailman**.

System action: Mailman stops.

Operator response: Take the following steps:

1. Verify that the workstation is available by using the **ping** command to check both if it is available and if its answer time is acceptable.
2. If the workstation is available, unlink and relink the workstation using the **conman** commands **unlink nullworkstation_namenu** and **link nullworkstation_namenu**.
3. If the **link** command gives an error, investigate and correct the reason for the error and then repeat this step.
4. Then retry the operation.

AWSBCV100W Warn: DS remotes are invalid, assuming slave for !1.

AWSBCV101E Error: TCP slaves are invalid, can not initialize !1.

AWSBCV107E Mailman has encountered an internal error as it could not find a record for the following workstation in the Symphony file: "workstation_name".

Explanation: See message.

workstation_name is the name of the workstation for which **mailman** could not find a record.

System action: **Mailman** might stop, depending on the nature of the error.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV110E Mailman has verified that jobman has terminated unexpectedly. The exit status of jobman is: "exit_status".

Explanation: This message is issued when a **mailman** process running on a standard agent or broker workstation determines that **jobman** on the same workstation has failed.

exit_status contains the **jobman** exit status.

System action: **Mailman** may stop, depending on the nature of the error.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV111E Error setting pgid: !1

AWSBCV112E Mailman encountered an error trying to start or restart a workstation. The following gives more details of the error: "error_message".

Explanation: See message.

error_message is a message that contains more information about the error and includes the operating system error message, if any.

It is possible that the remote node is not reachable, it is not responding, switched off, or the service is already active or has been disabled. The name of the workstation involved can be determined from associated messages.

System action: **Mailman** proceeds.

Operator response: Read the error message for more information, then perform the following:

1. Use the **ping** command to check the workstation's availability. If it is now available, you can link to it manually, or leave **mailman** to relink to it automatically.
2. Verify that **netman** on the workstation is working, running StartUp on the workstation if it is not.
3. Verify that **netman** on the workstation is listening on the specified **netman** port, by checking that the **netman** port specified in the database definition is the same as the port specified in the `localopts` file on the workstation.

If you want to change the frequency with which **mailman** attempts to relink to the workstation, modify the appropriate parameter in the `localopts` file.

If you want to attempt to relink manually to the workstation launch the **conman** command `link nullworkstation_name>`.

AWSBCV113E The master mailman process has terminated unexpectedly because of an internal error.

Explanation: This message is issued by a **mailman** server process when the parent **mailman** process has terminated unexpectedly.

System action: The server **mailman** stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV114E Mailman could not set the termination signal handling routines. The following gives more details of the error: "error_message".

Explanation: As message.

error_message contains the operating system error message.

System action: **Mailman** stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV115E Mailman is unable to find the new manager workstation: "workstation_name" in the Symphony file. The following gives more details of the error: "error_message".

Explanation: **Mailman** is processing a **switchmgr** command, but is unable to find the new manager

workstation in the Symphony file.

workstation_name is the name of the new manager workstation. *error_message* is the operating system error.

System action: **Mailman** stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV117E Mailman encountered an internal error while attempting to switch domain managers in the following domain: "domain_name"

Explanation: **Mailman** is processing a **switchmgr** command, but was unable to switch domain managers.

domain_name is the name of the domain where the switch was taking place.

System action: **Mailman** stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV118E Mailman encountered an internal error while attempting to update the Symphony file record header during the initialization process.

Explanation: See message.

System action: **Mailman** stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV119E Mailman encountered an internal error while attempting to find the workstation record for the workstation on which it is running in the Symphony file.

Explanation: See message.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV120E Mailman encountered an internal error while attempting to find its own domain definition record in the Symphony file.

Explanation: See message.

System action: Mailman proceeds. The operation is not performed.

Operator response: Verify on the master domain manager that the domain entry for the workstation has been correctly defined and added to the plan (in the Symphony file).

- If it is not defined, define it.
- If it has not been added to the plan, run or release the **JnextPlan**.
- If it has been defined and added to the plan, the Symphony file could be corrupted, and you should search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter in this guide on 'Symphony file corruption'.

AWSBCV121E Mailman cannot link to the following workstation: "workstation_name", which is a domain manager but is running a version prior to 6.0.

Explanation: Mailman encountered an error trying to link to a workstation which is not running Tivoli Workload Scheduler version 6.0 or later, but is defined as a domain manager. The link is not allowed because it will cause problems in the network.

workstation_name is the name of the workstation **mailman** is trying to link to.

System action: Mailman proceeds.

Operator response: Install Tivoli Workload Scheduler version 6.0 or later on the indicated workstation.

AWSBCV122E Mailman cannot link to workstation: "workstation_name".

Explanation: There are two possible reasons:

1. The most probable reason is that the **writer** on the workstation is at a version prior to 6.0.
2. The Symphony file could be corrupt.

workstation_name is the name of the workstation **mailman** is trying to link to.

System action: Mailman proceeds.

Operator response: Verify the version of Tivoli Workload Scheduler on the indicated workstation, using the **conman v** command, or the Tivoli Dynamic Workload Console.

- If the version is prior to 6.0, install Tivoli Workload Scheduler version 6.0 or later on the workstation.
- If the version is 6.0 or later, the Symphony file might be corrupted.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBCV124E Mailman is unable to connect to workstation "workstation_name" using SSL due to an inconsistency in the Tivoli Workload Scheduler network configuration.

Explanation: See message. The most common reason for this error is an inconsistent Security Level. For example, the workstation where **mailman** is running could be enabled for SSL but the target workstation is not. *workstation_name* is the name of the workstation you cannot connect to.

System action: Mailman proceeds to process other workstations.

Operator response: Verify on the Master Domain Manager the security level of the workstation that has the problem. Enable or disable SSL as appropriate and where appropriate, to ensure that both this workstation and the target workstation have compatible SSL settings.

See See the chapter on setting security in the *Planning and Installation Guide* for more information about SSL.

AWSBCV125E Mailman could not write to the following ftbox: "ftbox_name" for "workstation_name". The following gives more details of the error: "error_message".

Explanation: This error occurs when the program encounters a problem while writing into an ftbox(*ftbox_name*) queue. The possible ftbox queues are ftup and ftdown. They are located in the ftbox directory.

ftbox_name is the name of ftbox where **mailman** is trying to write.

workstation_name is the local workstation.

error_message describes the error and includes the operating system error message.

System action: Mailman stops.

Operator response: Verify that the ftbox directory was correctly created and that it has access rights to the workstation displaying the error. Verify that no program was requesting an exclusive access to that file at the time of the error.

AWSBCV126E Mailman has stopped the event counter because it received the following error while processing it: "error_message".

Explanation: Due to problems encountered while processing the event counter table, the event counter process was stopped.

error_message describes the error and includes the operating system error message.

System action: Mailman proceeds.

Operator response: Stop and restart **mailman**.

See The *event counter troubleshooting section* in the product documentation.

AWSBCV127W Mailman encountered the following error: "error_message" because an event with id-number 0 was sent from the workstation hosting an X-agent.

Explanation: An event with id-number 0 was sent from the workstation hosting an X-agent.

error_message is the error message (often ""AWSBAT008E"").

System action: Mailman proceeds. This situation may inhibit the correct replay of events on this X-agent if a **switchmgr** command is run later.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *event counter troubleshooting section* in the product documentation.

AWSBCV128E Mailman cannot send an acknowledgement (ACK) to the writer on the following workstation: "workstation_name".

Explanation: During the replay protocol with the **writer** on the indicated workstation, **mailman** could not acknowledge the receipt of a portion of the event counter table from the remote **writer**.

workstation_name is the name of the remote workstation.

System action: The replay protocol was interrupted. Mailman proceeds.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV129E Mailman cannot send a message indicating that a communication problem had been encountered (NACK) to the writer on the following workstation: "workstation_name".

Explanation: During the replay protocol with the **writer** on the indicated workstation, **mailman** could not communicate that it had encountered a problem while transferring the event counter table from the remote **writer**.

workstation_name is the name of the remote workstation.

System action: The replay protocol was interrupted. Mailman proceeds.

Operator response: Check if there are any messages in the STDOUT that indicate that the **writer** at the workstation had a problem when loading the event counter table. If such a message or messages are found, attempt to resolve the problems. If you have resolved these problems, wait for **mailman** to reattempt to process this workstation, at which point the error should not reoccur.

Otherwise search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV132E Mailman could not create the replay file for "workstation_name".

Explanation: At the end of the replay protocol, **mailman** could not create the file (called `nullworkstation_namenu11_replayed`) in the `ftbox` directory. This file indicates that the replay protocol has been run for that workstation and prevents **mailman** from rerunning it next time the link is established.

System action: Mailman proceeds.

Operator response: Verify whether there are any problems due to incorrect access rights or disk space that prevent **mailman** from writing to the `ftbox` directory. If you find such a problem and fix it, check if the workstation has received the **mailman** messages. If it has, you can then create the `nullworkstation_namenu11_replayed` file manually.

Otherwise, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV133W Mailman could not truncate the ftbox "ftbox_name".

Explanation: During plan creation, one or both of the `ftbox` message files are truncated (the reader and **writer** pointers to the files are set to the beginning). For some reason **mailman** cannot perform this task.

System action: Mailman proceeds.

Operator response: Verify that the `ftbox` directory was correctly created and that it has the correct access rights. Verify that no program was requesting an exclusive access to that file at the time of the error. If you think the error has been resolved, wait for **mailman** to reattempt the processing of this file, at which point the error should not reoccur.

If you can find no apparent reason for the error, stop **mailman**, delete the message file that gave the error and restart **mailman**.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV134W The replay table could not be passed to the following workstation: "workstation_name" because of an internal error.

Explanation: See message.

System action: Mailman proceeds. Linking to the workstation will proceed with a reduced replay protocol.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV135W Mailman is in isolated state and cannot open any outbound connection.

Explanation: This workstation is an old domain manager that still has to perform the demotion from domain manager to full status fault-tolerant agent. During this phase, the old domain manager must not connect to other agents in the network, so it was restarted in isolated mode.

This warning explains the error that usually precedes it in the log about a failed link attempt.

System action: Mailman proceeds. This state continues until the **switchmgr** command is processed.

Operator response: Wait for the old domain manager to process the **switchmgr** command and give up its status of domain manager.

If for urgent reasons the old manager must connect with the rest of the network, stop and restart the agent. It restarts in a non-isolated state.

AWSBCV136W Event !1 from: !2 to: !3 on iteration !4 was canceled.

AWSBCV137W A possible message loss was detected at the start of the replay protocol on the following event: "record_ID", from the following workstation: "workstation_name".

Explanation: This warning indicates a potential loss of a message during the replay protocol. After exchanging the counter table, the first message drawn from the fault tolerance queue (ftbox) is passing through the filter, indicating that maybe other previous messages were lost. This warning might appear after the **switchmgr** command has been run.

If this warning occurs after **JnextPlan**, this is a normal condition. If it occurs during the day, it may indicate that one or both of the ftbox message files have reached their size limit, and it is probable that one or more messages have been lost.

record_ID is a number that identifies the event.

workstation_name is the remote workstation name.

System action: Mailman proceeds.

Operator response: If the warning did not follow **JnextPlan**, check on the state of the jobs run on the workstation displaying the warning or on other workstations under it in the hierarchy. If you think that messages have been lost, expand the ftbox message files using the **evtsize** utility. To permanently increase the file size, insert an **EVSIZE** variable set to the desired size in the StartUp command file (before the line that runs **netman**) in the Tivoli Workload Scheduler usernulls home directory.

AWSBCV139E An internal error has occurred while updating the Mailbox header. The error message is as follows: "error_message".

Explanation: See message.

error_message is a message that contains information about the error and includes the operating system error message.

System action: Mailman stops.

Operator response: Attempt to resolve the operating system error. Restart mailman.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCV140W An error has occurred while creating the Windows event object which signals the status of the Tivoli Workload Scheduler processes. The error message is as follows: "error_number".

Explanation: Mailman creates a Windows event object if the workstation instance is being used in a Microsoft Cluster Environment. The object is used to signal the status of the Tivoli Workload Scheduler processes. The creation of this object has failed. This means that mailman will not be able to signal the status of the processes. For example, it will not be able to signal that a **conman stop** command has been launched.

error_number is the operating system error number.

System action: Mailman proceeds.

If you take no corrective action, mailman might continue to work successfully. However, to maintain full control of the workstation in the cluster environment you are recommended to correct the problem.

Operator response: Attempt to resolve the operating system error. Restart mailman.

AWSBCV143E Mailman encountered an error trying to send switchmgr command to a workstation. The following gives more details of the error: "error_message".

Explanation: See message.

error_message is a message that contains more information about the error and includes the operating system error message, if any.

It is possible that the remote node is not reachable, it is not responding, switched off, or the service has been disabled. The name of the workstation involved can be determined from associated messages.

System action: Mailman proceeds.

Operator response: Read the error message for more information, then perform the following:

1. Use the **ping** command to check the workstation's availability. If it is now available, you can link to it manually, or leave **mailman** to relink to it automatically. As soon as the workstation is linked, you can rerun the switchmgr command.
2. Verify that **netman** on the remote workstation is working, running StartUp on the workstation if it is not.
3. Verify that **netman** on the workstation is listening on the specified **netman** port, by checking that the **netman** port specified in the database definition is the same as the port specified in the localopts file on the workstation.
4. Check if a firewall is present between this workstation and the remote one. Verify that port where **netman** is listening on the remote workstation is opened on the firewall.

If you want to attempt to relink manually to the workstation launch the **conman** command **link nullworkstation_name>**. As soon as the workstation is linked, you can rerun the switchmgr command.

Chapter 71. AWSBCW - Writer messages

This section lists error and warning messages that might be issued by the writer component.

The message component code is BCW.

AWSBCW001W Warning illegal option(s): !1

AWSBCW002W Writer cannot find a valid wr read value in the localopts file. The value found is as follows: "wr_read". The default value is used.

Explanation: The `""wr_read""` option in the localopts file is the number of seconds that the **writer** process waits for an incoming message before checking for a termination request from **netman**. It is either not specified, or the `wr_read` value is not a valid number, or is out of range. The default value (150 seconds) is used.

`wr_read` is the value specified in the localopts file. A value given here of `""Unknown""` means that no value was found in the localopts file.

System action: Writer proceeds using the default value.

Operator response: If the default value is not what you require, set a valid value for the `wr_read` option in the localopts file.

AWSBCW003E Writer cannot connect to the remote mailman. The following gives more details of the error: "error_text".

Explanation: One possible reason is that the socket descriptor passed to **writer** by **netman** is not valid.

`error_text` is a string indicating the reason for the problem.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW004E Error non numeric sockfd: !1

AWSBCW008E The following error has occurred while installing the Sinfonia file: "error_message".

Explanation: During the initialization of the node **writer** purges the old Symphony file and renames the new plan it is receiving (Sinfonia) as Symphony. The

operation failed because of the reason detailed in the `error_message`.

`error_message` describes the error and includes the operating system error message.

System action: Writer stops.

Operator response: Resolve the problem described in the `error_message` and re-link the node.

See The chapter in this guide on 'Symphony file corruption'.

AWSBCW010W Writer has received and ignored the following unknown Symphony record type from the remote mailman: "record_type".

Explanation: **Writer** received an unknown or unexpected Symphony file record `record_type` from the remote **mailman**. The Symphony file record is ignored and **writer** sends a message to inform the remote Mailman that the record has not been accepted.

`record_type` is the record type **writer** is receiving.

System action: Writer proceeds.

Operator response: Verify the following:

1. The Tivoli Workload Scheduler agent running on the remote workstation is compatible. If it is not, upgrade whichever is at a back level.
2. A corruption of the event occurred during the transmission.

Then try to re-establish the link.

AWSBCW011E An error occurred while converting a Symphony file record from network to host byte order. The following gives more details of the error: "error_text"

Explanation: The `error_text` normally contains the record type, the expected record type and the record number.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW012E Writer was unable to read a record from mailman. The following gives more details of the error: "error_text".

Explanation: *error_text* is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW013E Error building Mailbox.msg file: !1

AWSBCW014E Writer is unable to open the Mailbox.msg message file. The following gives more details of the error: "error_text"

Explanation: *error_text* is a string that describes the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW015E Writer is unable to write to the message file Mailbox.msg. The following gives more details of the error: "error_text"

Explanation: *error_text* is a string that describes the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW016E Writer is unable to send the initialization process LinkInit record to the remote mailman. The following gives more details of the error: "error_text".

Explanation: *error_text* is a string that describes the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

AWSBCW017E Writer is unable to send a LinkAck record to mailman to acknowledge that a packet has been received correctly. The following gives more details of the error: "error_text".

Explanation: *error_text* is a string that describes the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW018E Writer is unable to indicate to mailman with a LinkNack record that there was a communication error while receiving an initialization packet. The following gives more details of the error: "error_text".

Explanation: *error_text* is a string that describes the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW019E Writer, when exiting on error, is unable to send an unlink command record to mailman. The following gives more details of the error: "error_text".

Explanation: *error_text* is a string that describes the error. The information is retrieved from the operating system.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW020E Writer received an incorrect command during workstation initialization. Writer expected a stop Symphony command after mailman downloaded the Symphony file, but did not receive it. The following message might be given: "error_text".

Explanation: *error_text* is a string that might describe the error.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW021E Writer received a stop Symphony record when mailman was not downloading the Symphony file. The following error text might be given: "error_text".

Explanation: *error_text* is a string that might describe the error.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW023E Error Unknown Rec Type !1

AWSBCW024W Writer encountered the following internal error: "error_message"

Explanation: *error_message* describes the error and includes the operating system error message.

System action: Writer proceeds.

Operator response: If you can resolve the problem described in the *error_message*, do so, and unlink and re-link the node.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW025E Writer is started by netman with an incorrect number of arguments.

Explanation: See message.

System action: Writer stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW026E Error incorrect caller info: !1

AWSBCW027E Writer is unable to create its stdlist file.

Explanation: Writer creates its own stdlist file when the *merge stdlists* option is set to *no* in the *localopts* file.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW033E Writer could not allocate memory for internal data structures (comarea).

Explanation: See message.

System action: Writer stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **writer**. Rerun **writer**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **writer**.
3. If the problem persists, reboot the workstation, and then rerun **writer**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBCW036E Writer has stopped, giving the following operating system error: "error_number". The total cpu time is as follows: "time "

Explanation: *error_number* identifies the operating system error number.

time is the total time used by the process before stopping.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW037E Writer cannot initialize this workstation because mailman is still active.

Explanation: Writer cannot initialize this workstation (download the Symphony file) because **mailman** is still active. The parent workstation cannot send the new version of Symphony file.

System action: Writer stops.

Operator response: Force the stop of the **mailman**

process with the **conman** command **stop**.

AWSBCW038E Writer needs the exclusive access to the Symphony and Sinfonia files in order to initialize the workstation. Either batchman or mailman is using one or other of the files.

Explanation: See message.

System action: Writer proceeds.

Operator response: Shutdown all Tivoli Workload Scheduler processes on the workstation. Unlink and relink the workstation after Tivoli Workload Scheduler processes have been stopped.

AWSBCW039E Writer encountered an error opening the Mailbox.msg file. The total cpu time used is as follows: "time"

Explanation: This problem arose in one of the following circumstances:

- When processing a message coming from mailman
- Posting a message to mailman
- During the initialization of the node (new plan installation).

time is the total time used by the process.

System action: Writer stops.

Operator response: Look in the log at the messages that preceded this one to determine what caused the error.

If you can, try to correct the error and re-link the workstation. Otherwise, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW040E Writer encountered an error while processing the Symphony file. The total cpu time is as follows: "time"

Explanation: This problem arose in one of the following circumstances:

- During the initialization of the node (new plan installation)
- While opening the Symphony file
- On not finding this workstation inside the Symphony file.

time is the total time used by the process.

Operator response: Look in the log at the messages that preceded this one to determine what caused the error.

If you can, try to correct the error and re-link the workstation. Otherwise, search the IBM Support database for a solution at <http://www.ibm.com/>

[software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

AWSBCW041E Writer stops because it has not received any incoming messages during the period specified in the localopts file for the option **wr unlink**. The total cpu time is as follows: "time"

Explanation: *time* is the total time used by the process.

System action: Writer stops.

Operator response: Verify that the domain manager (or the parent if the node is a Domain Manager) is working and that there are no network problems preventing the domain manger from contacting the workstation.

When you have resolved whatever caused the timeout, if the workstation is defined to autolink you need take no further action. Otherwise, relink the workstation from the domain manager.

AWSBCW042E Writer stops because it has encountered an error while sending an Ack message to the remote mailman. The total cpu time is as follows: "time"

Explanation: *time* is the total time used by the process.

System action: Writer stops.

Operator response: Usually this message is shown after a network problem.

1. Verify that the remote workstation is reachable from the workstation that is logging the message (you can use the system command **'ping'**).
2. Verify that the **netman** on the remote workstation is up and running (run **StartUp** otherwise).
3. Verify that the **netman** on the remote workstation is listening to the specified **netman** port (verify that the **netman** port specified on the DB definition is the same as the one specified in the localopts file on the workstation that verified the error).

If you have resolved the network problems, re-link the workstation.

AWSBCW043E Writer stops because it has encountered an error while reading or waiting for a message from the remote mailman. The total cpu time is as follows: "time"

Explanation: *time* is the total time used by the process.

System action: Writer stops.

Operator response: Look in the log at the messages that preceded this one to determine what caused the error.

If you can, try to correct the error and re-link the workstation. Otherwise, search the IBM Support

database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW045E Writer is unable to write an init synchronization message to the Mailbox.msg file.

Explanation: Mailman uses this message to start its Symphony file synchronization process.

System action: Writer stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW047E Writer encountered an error while launching the following command: "command_file_name". The following error was received from the operating system: "error_number"

Explanation: Writer has launched the `wmaeutil` shell script to stop the Tivoli Workload Scheduler connector, but the script has failed. Most commonly occurring errors are those related to access rights to the `wmaeutil` shell script (`wmaeutil.cmd` on Windows, `wmaeutil.sh` on UNIX), resource availability (memory, process handles) or the Tivoli Management Framework configuration.

file_name is the command that **writer** is launching.

error_number is the system error number.

System action: Writer proceeds.

Operator response: Using the error message, identify the problem and resolve it.

Then reissue the remote command you were using to stop the connector.

AWSBCW051E Writer was unable to find this workstation in the Symphony file during its initialization phase, or when it is trying to purge the Symphony file and rename Sinfonia file to Symphony. The following gives more details of the error: "error_text"

Explanation: *error_text* describes the error and includes the operating system error message.

System action: Writer stops.

Operator response: Verify that the name that you specified for the parameter 'thiscpu' in the `localopts` file is the same as the name you specified during the definition of the workstation in the `mozart` database. If there is a mismatch, you must do one of the following:

- Correct the parameter 'thiscpu' in the `localopts` file and stop and restart **writer** (one way to do this is to unlink the workstation, wait for Writer to timeout and then relink it).
- Correct the workstation name in the `mozart` database and re-issue the job or job stream that needs to use it.

If there is a match, or you cannot find or open the Symphony file, there could have been a corruption of the Symphony file during the transfer to the fault tolerant agent.

Even if the workstation name in the Symphony file is correct, the **Symphony** file itself may still be corrupted in some way not immediately obvious.

To correct a **Symphony** file corruption, see the chapter in this guide on 'Symphony file corruption'.

See The chapter in this guide on 'Symphony file corruption'.

AWSBCW052E During the exchange of the event counter table, it was not possible to transfer the table header correctly. The following gives more details of the error: "error_code"

Explanation: *error_code* more accurately describes the problem.

System action: Writer stops.

Operator response: If this was due to a network problem, the connection will be attempted again at an interval defined in the configuration parameters.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW053E While transmitting the event counter table, it was not possible to transfer the table values correctly. The following gives more details of the error: "error_code"

Explanation: *error_code* more accurately describes the problem.

System action: Writer stops.

Operator response: If this was due to a network problem, the connection will be attempted again at an interval defined in the configuration parameters.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW054E • AWSBCW055E

AWSBCW054E During the exchange of the event counter table, writer did not receive the confirmation message it was expecting from mailman. The following gives more details of the error: "error_code"

Explanation: *error_code* more accurately describes the problem.

System action: Writer stops.

Operator response: If this was due to a network problem, the connection will be attempted again at an interval defined in the configuration parameters.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCW055E Error during replay protocol, total
cpu !1

Chapter 72. AWSBCX - Monman messages

This section lists error and warning monman messages that might be issued.

The message component code is BCX.

AWSBCX001E An internal error has occurred.
Monman cannot read a message in a message file. The following gives more details of the error: "error_message".

Explanation: Monman was unable to read a message from its local mailbox: Monbox.msg.

error_message describes the error and includes the operating system error message.

System action: Monman continues.

Operator response: Attempt to resolve the operating system error. Check the file system of ""nullTWS_home>Mailbox.msg"" to ensure that there is sufficient space, and that the user has read and write permissions.

AWSBCX002E An internal error has occurred.
Monman could not set the termination signal handling routines. The following gives more details of the error: "error_message".

Explanation: As message.

error_message contains the operating system error message.

System action: Monman stops.

Operator response: Attempt to resolve the problem indicated in the error_text.

AWSBCX005E An internal error has occurred.
Monman encountered the following error when attempting to open the Symphony file: "error_message".

Explanation: *error_message* contains the operating system error message.

Operator response: Attempt to resolve the problem indicated in the error_text. If the Symphony file exists verify that the owner is the Tivoli Workload Scheduler user and that the user has permission to access and modify it. If the program cannot read the Symphony file or the Symphony file is not present, follow the procedure described in the section on ""Symphony file corruption"" in the Troubleshooting guide.

AWSBCX007E A message file cannot be opened; the operating system gives the following error: "error_message"

Explanation: Monman is unable to open one of its message file: Monbox.msg or Moncmd.msg.

error_message is a message that contains information about the error and includes the operating system error message.

A possible reason is that either your Tivoli Workload Scheduler user or your system has too many files open (a typical user is limited to 64 files).

System action: Monman stops.

Operator response: Attempt to resolve the operating system error. Use the **limit** command to see the user's file limits (the file limit is the 'descriptor' line for csh users).

If the problem is with the number of files open, take one of the following actions, according to whether the problem is with the operating system limits or a user's limits:

- Add the following lines to your system parameters file (/etc/system) and reboot the system:
set rlim_fd_max = 4096
set rlim_fd_cur = 1024 This may consume slightly more available memory, but it speeds up the system.
- Modify your Tivoli Workload Scheduler user environment (the following is correct for a csh user):
limit descriptors nnn where nnn is a value greater than the value revealed by the **limit** command.

Restart Monman.

AWSBCX011E The Event Integration Facility configuration file ("file") cannot be written; the operating system gives the following error: "error_message"

Explanation: Monman is unable to write the configuration file for the Event Integration Facility, the component used to send the events.

file is the name of the file with the configuration that Monman is attempting to write.

error_message is a message that contains information about the error and includes the operating system error message.

AWSBCX012E • AWSBCX019E

System action: Monman stops.

Operator response: Attempt to resolve the operating system error.

Restart Monman.

AWSBCX012E An internal error has occurred. The Event Integration Facility initialization has failed.

Explanation: Monman is unable to initialize the Event Integration Facility, the component used to send the events.

System action: Monman stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCX013E An internal error has occurred. A parsing error has occurred reading the following event "event".

Explanation: Monman is unable to parse the event, it will be discarded and not sent to the event processor.

System action: Monman discards the current event and will not send it to the event processor. Monman continues.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCX015E An error has occurred opening the temporary file "file_name" for writing.

Explanation: See message.

file_name is the file that cannot be opened.

System action: The action stops.

Operator response: Check the following:

- That there is sufficient disk space to open and read a file
- That there are sufficient file descriptors available to open a file.

Correct any errors that you find, and perform the action again.

AWSBCX016E An error has occurred opening the file "file_name" for reading.

Explanation: See message.

file_name is the file that cannot be opened.

System action: The action stops.

Operator response: Check the following:

- That the file exists

- That the file is in the correct directory
- That the file has read permission
- That there is sufficient disk space to open and read a file
- That there are sufficient file descriptors available to open a file.

Correct any errors that you find, and perform the action again.

AWSBCX017E An error has occurred opening the file "file_name" for writing.

Explanation: See message.

file_name is the file that cannot be opened.

System action: Deployconfig action stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has read permission
- That there is sufficient disk space to open and read a file
- That there are sufficient file descriptors available to open a file.

Correct any errors that you find, and perform the action again.

AWSBCX018E An error has occurred writing the file "file_name".

Explanation: See message.

file_name is the file that cannot be written.

System action: The action stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has write permission
- That there is sufficient disk space to write the file

Resolve the problem and rerun the operation.

AWSBCX019E The zip file "file_name" was built incorrectly. The Unzip process is stopped with an error.

Explanation: See message.

file_name is the zip file built incorrectly.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCX020E An error has occurred extracting the file "*file_name*". The Unzip process is stopped with an error.

Explanation: See message.

file_name is the zip file that cannot be unzipped.

System action: The action stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCX021E An error has occurred before completing the unzip process.

Explanation: See message.

System action: The action stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBCX022E Monman encountered an error when attempting to open the Mailbox.msg file. The following gives more details of the error: "*error_message*"

Explanation: Monman is unable to open the Mailbox.msg file.

error_message is a message that contains information about the error and includes the operating system error message.

A possible reason is that either your Tivoli Workload Scheduler user or your system has too many files open (a typical user is limited to 64 files).

System action: Monman stops.

Operator response: Attempt to resolve the operating system error. Use the **limit** command to see the user's file limits (the file limit is the 'descriptor' line for csh users).

If the problem is with the number of files open, take one of the following actions, according to whether the problem is with the operating system limits or a user's limits:

- Add the following lines to your system parameters file (/etc/system) and reboot the system:

```
set rlim_fd_max = 4096
set rlim_fd_cur = 1024
```

 This may consume slightly more available memory, but it speeds up the system.
- Modify your Tivoli Workload Scheduler user environment (the following is correct for a csh user):

```
limit descriptors nnn
```

 where nnn is a value greater than the value revealed by the **limit** command.

Restart **Monman**.

AWSBCX023W The Event Driven Workload Automation feature is disabled, Monman stops.

Explanation: The Event Driven Workload Automation feature has been disabled by optman, which set the **enEventDrivenWorkloadAutomation** option to NO.

Monman exits, as it is not required in this configuration.

System action: Monman stops.

Operator response: None.

AWSBCX024W The Agent is not able to send the Event Driven Workload Automation events to the Event Processor.

Explanation: Monman and/or the SSM Agent are not able to connect to the Event Processor to send the events.

The events are stored locally and will be sent to the Event Processor when the Agent will be able to connect to the Event Processor.

System action: The monitoring status on the workstation status is turned off.

Operator response: If the monitoring status is not restored automatically, check that the Event Processor is running and that there is no network or firewall problem that is preventing the agent to connect to the event processor.

Chapter 73. AWSBCY messages

This section lists error and warning messages that might be issued.

The message component code is BCY.

AWSBCY001E Could not allocate dbaccs comarea.

AWSBCY002E Invalid comarea passed to dbaccs routines.

AWSBCY003E Attempt to write to unopened file.

AWSBCY004E Database not available or access not initialized.

AWSBCY005W File newer than dbaccs.

AWSBCY007E Record not found.

AWSBCY008E Cannot make the temporary file.

AWSBCY009E File system error.

AWSBCY010E You cannot access the parameter.

AWSBCY011E Bad access parameter passed to m_parm_access_allowed.

AWSBCY012E Cannot get user's ID.

AWSBCY015E Cannot open the database.

Chapter 74. AWSBCZ - Dload messages

This section lists error and warning Dload messages that might be issued.

The message component code is BCZ.

AWSBCZ001E An error while opening !1: !2

AWSBCZ003E The object ID must start with an alphabetic character.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the object ID and resubmit the operation.

AWSBCZ004E The object ID contains at least one character that is not valid. Valid characters are 0-9, a-z, dashes and underscores.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the object ID and resubmit the operation.

AWSBCZ005E A database error occurred while writing the calendar data.

AWSBCZ006E A database error occurred while writing the calendar dates.

AWSBCZ007E A database error occurred while writing a parameter.

AWSBCZ008E A database error occurred while writing a prompt.

AWSBCZ009E A database error occurred while writing a resource.

AWSBCZ010E The parameter value must be no more than !1 bytes.

AWSBCZ011E The prompt value must be no more than !1 bytes.

AWSBCZ012E A resource count was expected at this point.

AWSBCZ013E The resource count must be in the range !1 to !2.

AWSBCZ014E A valid object ID was expected at this point.

AWSBCZ015E A valid date was expected at this point.

AWSBCZ016E The date is not valid.

AWSBCZ021E A definition keyword was expected at this point.

AWSBCZ023E The command used is not supported for this definition.

AWSBCZ024W The duplicate calendar definition !1 has been ignored.

AWSBCZ025W The duplicate parameter definition !1 has been ignored.

AWSBCZ026W The duplicate prompt definition !1 has been ignored.

AWSBCZ027W The duplicate resource definition !1#!2 has been ignored.

AWSBCZ028E Workstation !1 defined in cpudata: !2 does not exist.

AWSBCZ103E The description exceeds the maximum length of "max_description" bytes.

Explanation: See message.

max_description is the maximum length for the description.

System action: The operation cannot be performed.

Operator response: Shorten the description and resubmit the operation.

AWSBCZ104E The resource name exceeds the maximum length. The maximum for the workstation is "max_workstation" bytes and the maximum for the resource is "max_resource"

Explanation: See message.

max_workstation and *max_resource* are the maximum lengths for the workstation and resource names.

System action: The operation cannot be performed.

Operator response: Shorten the resource name and resubmit the operation.

AWSBCZ105E The parameter name exceeds the maximum length of "max_parameter" bytes.

Explanation: See message.

max_parameter is the maximum length for the parameter name.

System action: The operation cannot be performed.

Operator response: Shorten the parameter name and resubmit the operation.

AWSBCZ106E The prompt name exceeds the maximum length of "max_prompt" bytes.

Explanation: See message.

max_prompt is the maximum length for the prompt name.

System action: The operation cannot be performed.

Operator response: Shorten the prompt name and resubmit the operation.

AWSBCZ107E The variable table name exceeds the maximum length of "max_vartable" bytes.

Explanation: See message.

max_vartable is the maximum length for the variable table.

System action: The operation cannot be performed.

Operator response: Shorten the variable table name and resubmit the operation.

AWSBCZ108E The variable description exceeds the maximum length of "max_desc" bytes.

Explanation: See message.

max_desc is the maximum length for the variable description.

System action: The operation cannot be performed.

Operator response: Shorten the description and resubmit the operation.

AWSBCZ109E The variable name exceeds the maximum length of "max_var" bytes.

Explanation: See message.

max_var is the maximum length for the variable name.

System action: The operation cannot be performed.

Operator response: Shorten the variable name and resubmit the operation.

AWSBCZ110E The variable value exceeds the maximum length of "max_value" bytes.

Explanation: See message.

max_value is the maximum length for the variable.

System action: The operation cannot be performed.

Operator response: Shorten the variable value and resubmit the operation.

AWSBCZ111E The syntax of the variable table is incorrect. The token "token" is expected at this point.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the syntax of the variable table and resubmit the operation.

AWSBCZ112E A syntax error was detected in the list of variables.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the syntax of the variable table list and resubmit the operation..

AWSBCZ113E The value of the variable must be a string enclosed in quotation marks.

Explanation: See message.

The value specified for a variable is not in the correct format.

System action: The operation cannot be performed.

Operator response: Correct the format of the specified value and resubmit the operation..

AWSBCZ114E The variable table "variable_table" contains syntax errors.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the syntax of the variable table and resubmit the operation..

AWSBCZ115E The maximum number of errors that can be displayed for the variable table has been reached.

Explanation: See message.

System action: No further validation of the input is performed.

Operator response: Correct the syntax of the variable table and resubmit the operation..

AWSBCZ116E The variable "variable" is already present in the variable table "variable_table"

Explanation: See message.

Duplicates are not allowed in a variable table

System action: The operation cannot be performed.

Operator response: Delete or rename the duplicated variable.

Chapter 75. AWSBDA messages

This section lists error and warning messages that might be issued.

The message component code is BDA.

AWSBDA001W A host has been specified for the master domain manager, and has been ignored.

AWSBDA002W The domain manager "domain_manager" is not defined as a fault-tolerant agent.

AWSBDA003W The domain manager "domain_manager" does not have fullstatus set to on.

AWSBDA004W The domain manager "domain_manager" is not in the same domain.

AWSBDA005W The domain manager "domain_manager" was not found.

AWSBDA006W ****WARNING**** For cpu !1 host !2 not defined YET.

AWSBDA007W No host has been specified in the definition of an extended agent.

AWSBDA008W The master domain manager "master_domain_manager" has been set as the host.

AWSBDA009W The domain manager "domain_manager" has been set as the host.

AWSBDA010W Domain "domain" was not found. The master domain manager "master_domain_manager" has been set as the host.

AWSBDA011W The agent's domain "agent_domain" was changed to be the host's domain "host_domain".

AWSBDA012W The host was not found in the Symphony file. The master domain manager was made the host.

AWSBDA013W The parent domain "domain" does not exist. The master domain "master_domain" has been set as the parent domain.

AWSBDA014W The domain "domain" was not found. The master domain "master_domain" has been set as the domain.

AWSBDA015E The workstation record could not be written to the Symphony file.

AWSBDA016W The host's domain "domain" was not found. The master domain "master_domain" has been set as the domain.

AWSBDA017W Trying to recreate the master domain !1, ignored.

AWSBDA018W The domain name "domain_name" is not valid. The master domain "master_domain" has been set as the domain.

AWSBDA019W The master domain "master_domain" conflicts with global options value "global_options_master_domain". The global options value has been used.

AWSBDA020W The manager of domain "domain" is the same as the master domain manager workstation "master_domain_manager". Ignoring domain "domain".

AWSBDA021W Access method "access_method" cannot be found on your system.

AWSBDA022W Time zones are not enabled in the global options.

AWSBDA023W Time zones are enabled in the global options but have not been specified for the workstation.

Chapter 76. AWSBDB - Scribner messages

This section lists error and warning scribner messages that might be issued.

The message component code is BDB.

AWSBDB001E Error opening connection to conman,
Error !1

AWSBDB002E Error unable to create stdlist

AWSBDB004W The timeout value !1 is not valid.
The default value has been used.

Explanation: You have supplied a timeout value that is not in the correct format. It must be the numeric value of the number of seconds required for the timeout to be used by **scribner**. For example, the value for 30 seconds must be `""30""`, not `""30s""` or `""30 secs""`.

System action: **scribner** uses its default timeout value.

Operator response: If you want to apply a timeout value different from the default, shut down the **scribner** process and rerun the **scribner** command, supplying a correctly formatted timeout value.

AWSBDB005E There is a syntax error. Too few
parameters have been supplied.

Explanation: The **scribner** process requires the link parameters to be passed to it. These parameters have not been supplied correctly.

System action: The **scribner** process cannot start.

Operator response: Rerun the **scribner** command, supplying the correct linking parameters.

AWSBDB006E Error in ntoh (Symphony rec): !1

AWSBDB007E Error sending scribner_response rec:

Chapter 77. AWSBDC - NetView/OpenView messages

This section lists error and warning NetView and OpenView messages that might be issued.

The message component code is BDC.

AWSBDC001E Error in !1, calling !2, for !3, error: !4

AWSBDC002E Error allocating space in !1, error: !2

AWSBDC003E Unknown parent for !1, id=!2

AWSBDC004E Unknown node for !1, ID=!2

AWSBDC005E Unknown network for !1, ID=!2

AWSBDC006E Unknown workstation for !1, ID=!2

AWSBDC007E Unknown owner for !1, ID=!2

AWSBDC008E Error in !1, calling !2, for !3, field !4,
error: !5

AWSBDC009E Error unknown case in !1, line=!2,
value=!3

AWSBDC010E Error in getpwuid in !1

AWSBDC011E Error in snmp call in !1, for !2, error:
!3

AWSBDC012E Unknown proc !2 in !1: !2

AWSBDC013E Unknown field !1: !2

AWSBDC101W Openview is not running on this
system: !1

AWSBDC102E Tivoli Workload Scheduler is not
correctly installed on this system:
"computer".

Explanation: The program has found an error or
inconsistency in the installation of Tivoli Workload
Scheduler.

System action: The program stops.

Operator response: The Tivoli Workload Scheduler

component installed on the indicated computer must be
reinstalled.

AWSBDC103E Initialization failed.

AWSBDC104E No object for !1.

AWSBDC105E Non-valid state packet received: !1

AWSBDC106E Non-valid info packet received: !1

AWSBDC107E Non-valid info count, doing !1: !2

AWSBDC503E need error message for work != node

Chapter 78. AWSBDD - Bmevents messages

This section lists error and warning Bmevents messages that might be issued.

The message component code is BDD.

**AWSBDD001E BmEvents error allocating space for
!1: !2**

AWSBDD002E BmEvents option !1 is not supported.

AWSBDD003E BmEvents error opening !1: !2

AWSBDD004E BmEvents error writing !1: !2

Chapter 79. AWSBDE - Chkstat messages

This section lists error and warning Chkstat messages that might be issued.

The message component code is BDE.

AWSBDE001E Unable to open a connection to client:
!1

AWSBDE002E Unable to create the stdlist

AWSBDE004E A non-valid value for the timeout !1
has been supplied.

AWSBDE005E The chkstat command has not been
supplied with the correct number of
parameters.

AWSBDE006E Unable to send a response record. The
error is: !1.

AWSBDE007E Unable to receive a request record: !1

AWSBDE008E Could not allocate storage for comarea

AWSBDE011E Unable to close the Symphony file: !1

Chapter 80. AWSBDF messages

This section lists error and warning messages that might be issued.

The message component code is BDF.

AWSBDF001E Unable to open a connection to the
chkstat service: !1

AWSBDF002E Unable to start the chkstat service: !1

AWSBDF003E Error: !1

AWSBDF004E Cannot get a reply from the chkstat
service: !1

AWSBDF005E Cannot send a request to the chkstat
service: !1

AWSBDF006E Cannot allocate storage for
communication

AWSBDF007E Missing argument for option !1

AWSBDF008E Unknown option argument: !1

AWSBDF009E Missing -t task option

AWSBDF010E Missing -c cpu,host,master option

AWSBDF011E Missing -n node option

AWSBDF012E Missing -p port option

AWSBDF013E Unsupported task: !1

AWSBDF015W The task !1 passed to netmth contains
the Schedule Time parameter that is not
supported by the version of the remote
network. It is removed.

Chapter 81. AWSBDG - Downloader messages

This section lists error and warning messages that might be issued by the downloader component.

The message component code is BDG.

AWSBDG001E Downloader cannot connect to the remote client. The socket descriptor passed to downloader by netman is not valid. The following gives more details of the error: "error_text".

Explanation: *error_text* is a string giving more details.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*. Check that the network is working correctly. Check that SSL is configured correctly. When you have resolved the problem, retry the operation. See also: See the chapter on setting security in the Planning and Installation Guide for more information about SSL.

AWSBDG002E Downloader is unable to create the stdlist file.

Explanation: Downloader creates its own *stdlist* file when the *merge stdlists* option is set to *no* in the *localopts* file.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*. If the *error_text* indicates a problem with disk space or access rights, check the *"" nullTWS_home> ""* file system to ensure that there is sufficient space, and that the user has write permission. When you have resolved the problem, retry the operation.

AWSBDG004W Incorrect timeout value: !1, using default

AWSBDG005E Downloader is started by netman with an incorrect number of arguments.

Explanation: See message.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDG006W The download for file "file_name" has been stopped by the client (the domain manager on z/OS).

Explanation: See message.

file_name is the name of the centralized script file that could not be downloaded.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: See the associated messages issued either before or after this one that indicate the detail of why the download did not complete successfully.

AWSBDG007E Downloader was unable to send a record. The following gives more details of the error by the operating system: "error_text"

Explanation: *error_text* is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*. If the *error_text* indicates a problem with the network check that the network is working correctly. When you have resolved the problem, retry the operation.

AWSBDG008E Downloader could not read a record from the centralized script. The following gives more details of the error by the operating system: "error_text"

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, is downloading a centralized script to this workstation, but *downloader* was unable to read one of the records.

error_text is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*. If the *error_text* indicates a

problem with the network, check that the network is working correctly. If the `error_text` indicates a problem with disk space or access rights, check the `"" nullTWS_home> ""` file system to ensure that there is sufficient space, and that the user has write permissions. When you have resolved the problem, retry the operation.

AWSBDG009E Downloader could not allocate memory for internal data structures (comarea).

Explanation: See message.

System action: **Downloader** stops. The centralized script is not correctly downloaded.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **downloader**. Rerun **downloader**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **downloader**.
3. If the problem persists, reboot the workstation, and then rerun **downloader**.

See The *Release Notes* for details of memory requirements.

AWSBDG011E Downloader cannot save the downloaded centralized script in the following temporary file: "file_name ". The following operating system error was received: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on **OPCMaster**, is downloading a centralized script to this workstation. **Downloader** tries to save the script in a temporary file, (`file_name`), but is unable to write the file. The download of the script fails.

`error_text` is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: **Downloader** stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the `error_text`.

If the `error_text` reveals a problem with disk space or access rights, check the `nullTWS_home>` file system to ensure that there is sufficient space, and that the user has write permission.

When you have resolved the problem, rerun **downloader**.

AWSBDG012E Downloader cannot open the following temporary file where the downloaded centralized script is saved: "file_name ". The following operating system error was received: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on **OPCMaster**, is downloading a centralized script to this workstation. **Downloader** tries to save the script in a temporary file, (`file_name`), but is unable to open the file. The download of the script fails.

`error_text` is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: **Downloader** stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the `error_text`.

If the `error_text` reveals a problem with disk space or access rights, check the `nullTWS_home>` file system to ensure that there is sufficient space, and that the user has write permission.

When you have resolved the problem, rerun **downloader**.

AWSBDG013E Downloader cannot change the access mode of the following temporary file where the downloaded centralized script is saved: "file_name ". The following operating system error was received: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on **OPCMaster** is downloading a centralized script to this workstation. **Downloader** tries to save the script in a temporary file, (`file_name`), but is unable to set the correct access mode. The download of the script fails.

`error_text` is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: **Downloader** stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the `error_text`.

If the `error_text` reveals a problem with disk space or access rights, check the `nullTWS_home>` file system to ensure that there is sufficient space, and that the user has write permission.

When you have resolved the problem, rerun **downloader**.

AWSBDG014E Downloader cannot close the following temporary file where the downloaded centralized script is saved: "file_name ". The following operating system error was received: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER is downloading a centralized script to this workstation. Downloader tries to save the script in a temporary file, (*file_name*), but is unable to close the file. The download of the script fails.

error_text is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*.

If the *error_text* reveals a problem with disk space or access rights, check the nullTWS_home> file system to ensure that there is sufficient space, and that the user has write permission.

When you have resolved the problem, rerun downloader.

AWSBDG015E Downloader cannot convert the temporary file where the downloaded centralized script is saved from UTF-8 to the local file format. The UTF-8 file is the following: "file_name1" and the local file that cannot be created is the following: "file_name2".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER is downloading a centralized script to this workstation. Downloader has saved the script in a temporary file (*file_name1*) but it is unable to convert this file from UTF-8 to the local file format (*file_name2*). The download of the script fails.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Verify that ""file_name"" exists. Check the "" nullTWS_home> "" file system to ensure that there is sufficient space. When you have resolved the problem, retry the operation.

AWSBDG016E Downloader is receiving a centralized script file, but a packet is too long for the buffer.

Explanation: See message.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: This is an internal error. Try rerunning the operation.

AWSBDG017E Downloader cannot download a centralized script. The following operating system error was received: "error_text"

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, is downloading a centralized script to a target workstation. The download of the script has failed.

error_text is a string that describes the cause of the error.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*. If the *error_text* reveals a problem with disk space or access rights, check the "" nullTWS_home> "" file system to ensure that there is sufficient space, and that the user has write permission. When you have resolved the problem, rerun downloader.

AWSBDG019E Downloader cannot obtain file status information for the following file: "file_name". The following gives more details of the error: "error_text".

Explanation: Downloader in unable to retrieve status information for file *file_name*.

error_text is a string that describes the reason for the error.

System action: Downloader stops. The centralized script is not correctly downloaded.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDG021E Downloader cannot create the following directory where the downloaded centralized script is saved: "directory_name". The following operating system error was received: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, is downloading a centralized script to a target workstation. Downloader tries to save the script in a temporary file, but is unable to create the directory for the file. The download of the script fails.

error_text is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: Downloader stops. The centralized

AWSBDG022E

script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*.

If the *error_text* reveals a problem with disk space or access rights, check the nullTWS_home> file system to ensure that there is sufficient space, and that the user has write permission.

When you have resolved the problem, rerun **downloader**.

AWSBDG022E Downloader cannot write the downloaded centralized script in a temporary file on the target workstation.

Explanation: In an end-to-end configuration the translator thread, running on **OPCMaster**, is downloading a centralized script to a target workstation, but the download has failed.

System action: **Downloader** stops. The centralized script is not correctly downloaded.

Operator response: Attempt to resolve the problem indicated in the *error_text*. If the *error_text* reveals a problem with disk space or access rights, check the "" nullTWS_home> "" file system to ensure that there is sufficient space, and that the user has write permission. When you have resolved the problem, rerun **downloader**.

Chapter 82. AWSBDH - Java native interface messages

This section lists error and warning messages that might be issued by the Java native interface.

The message component code is BDH.

AWSBDH001E The action code !1 specified in the !2 native method is invalid

AWSBDH002E The object type !1 specified in the !2 native method is invalid

Chapter 83. AWSBDJ - Appserverman messages

This section lists error and warning appserverman messages that might be issued.

The message component code is BDJ.

AWSBDJ003E The application server has stopped unexpectedly or failed.

Explanation: The application server monitor (**appservman**) has detected that the application server is no longer running, but that it has not been stopped by the user.

System action: The application server monitor checks the policies defined in the localopts file to decide whether the application server should be restarted.

Operator response: See the application server logs to diagnose the problem that is causing the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDJ005E Cannot restart the application server. See the application server log for the reason.

Explanation: See message.

System action: The application server monitor has failed to restart the application server. The application server monitor (**appservman**) stops.

Operator response: See the application server logs to diagnose the problem that has caused the start of the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

To restart the application server run a `conman startappserver` or `StartUp` command.

AWSBDJ006E Cannot stop the application server. See the application server log for the reason.

Explanation: See message.

System action: The application server monitor (**appservman**) has failed to stop the application server.

The application server monitor stops. However, the application server is probably still running.

Operator response: See the application server logs to diagnose the problem that is causing the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

To manually stop the application server run the following command:`wastools/stopWas -direct -user nullusername null -password nullpassword null`.

AWSBDJ007W The auto-restart flag (see localopts) is set to false, so the application server is not restarted by the application server monitor.

Explanation: The application server monitor (**appservman**) has detected that the application server has failed.

However, the policies in the localopts files indicate that the application server is not to be restarted.

System action: The application server monitor does not restart the application server. It stops.

Operator response: See the application server logs to diagnose the problem that is causing the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

To restart the application server run a `conman startappserver` or `StartUp` command.

To permit the application server monitor to automatically restart the application server, change the value of the `Appserver auto restart` option in the **localopts** file.

AWSBDJ008E The application server has been restarted more times than the configured maximum (see localopts), so the application server will not be restarted by the application server monitor.

Explanation: The application server monitor (**appservman**) has detected that the application server has failed.

The application server monitor has already restarted the application server one or more times, and the policies in the localopts files indicate that the application server should no longer be restarted automatically by the application server monitor (it might be failing repeatedly for the same reason).

System action: The application server monitor does not attempt to restart the application server. It stops.

Operator response: See the application server logs to diagnose the problem that is causing the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

To restart the application server run a `conman startappserver` or `StartUp` command.

To allow the application server monitor to continue restarting the application server automatically in these circumstances, change the value of the `Appserver max restarts` option in the `localopts` file. You might also want to change the value of the `Appserver count reset interval` option.

AWSBDJ009E The application server was up before failing for less time than the configured minimum (see `localopts`), so the application server will not be restarted by the application server monitor.

Explanation: The application server monitor (`appservman`) has detected that the application server has failed. The monitor restarted the application server, which failed again in a shorter time than the minimum restart time as determined by the policies in the `localopts` files.

System action: The application server monitor does not attempt to restart the application server. It stops.

Operator response: See the application server logs to diagnose the problem that is causing the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

To restart the application server run a `conman startappserver` or `StartUp` command.

To allow the application server monitor to continue restarting the application server automatically in these circumstances, change the value of the `Appserver min restart time` option in the `localopts` file.

AWSBDJ010E Cannot restart the dynamic workload broker application. For details, see the application server log.

Explanation: See message.

System action: The application server monitor has failed to restart the dynamic workload broker application.

Operator response: To diagnose the problem that has caused the start of the dynamic workload broker application to fail, see the application server logs. If you are not able to solve the problem, search the IBM

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

To restart the application server run a `conman startappserver` or `StartUp` command.

AWSBDJ011E Cannot stop the dynamic workload broker application. For details, see the application server log.

Explanation: See message.

System action: The application server monitor (`appservman`) has failed to stop the dynamic workload broker application.

The dynamic workload broker application is probably still running.

Operator response: See the application server logs to diagnose the problem that is causing the application server to fail. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

To manually stop the dynamic workload broker application, run the command `wastools/stopBrokerApplication -user nullusername null -password nullpassword null`.

AWSBDJ012E An internal error occurred while opening the Appserverbox message queue.

Explanation: The application server monitor (`appservman`) was not able to open the Appserverbox message queue.

System action: The application server monitor stops.

Operator response: Check the access permissions of the `Appserverbox.msg` file. If you have solved the problem, stop and restart the application server, which automatically restarts the application server monitor. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDJ013E An internal error occurred while opening the Mailbox message queue.

Explanation: The application server monitor (`appservman`) was not able to open the Mailbox message queue.

System action: The application server monitor stops.

Operator response: Check the access permissions of the `Mailbox.msg` file. If you have solved the problem, stop and restart the application server, which automatically restarts the application server monitor. If you are not able to solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDJ016E An internal error occurred while reading the Appservrbox message queue.

Explanation: An internal error has occurred.

System action: The application server monitor stops.

Operator response: This is an internal error. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 84. AWSBDW - Jobman messages

This section lists error and warning messages that might be issued by the jobman component.

The message component code is BDW.

AWSBDW001E Jobman cannot set the process group id to the group id of the logon user. The operating system error is: "system_message".

Explanation: Internal error: Setgid() failed with the indicated error.

system_message contains the operating system error.

System action: Jobman proceeds.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW002E The user ID used to launch this job is not valid. The operating system error is: "system_error_number".

Explanation: To launch a job, a user ID must have the following characteristics:

- It must be a valid user ID for the computer on which the job is launched
- It must be defined in the moztart database with permission to launch jobs.

Further, the user ID must be supplied correctly when the job is launched, either from the command line or from the moztart database.

system_error_number contains the operating system error message.

Internal error: Setuid() failed with the indicated error.

System action: Jobman proceeds.

Operator response: Follow this procedure:

1. Check the job properties in the plan list from the Tivoli Dynamic Workload Console, or use the **sj schedid.jobid;L** command in **conman** to obtain the user ID with which Tivoli Workload Scheduler is attempting to launch the job.
2. Verify that the user ID has been supplied correctly. If not, modify the job definition used to launch the job to identify a different user that has the rights to launch jobs on this workstation.

3. If the correct user ID has been supplied, verify that the user ID is defined in the moztart database as a user with the rights to launch jobs. If it is not, you need to either change the user in the job definition to a user that has the rights to launch jobs on this workstation, or define the original user ID to have these rights in the moztart database. Note that only a Tivoli Workload Scheduler administrator can do this.

4. If the user ID is defined in the moztart database with rights to launch jobs, verify that the user ID is defined in the operating system. If it is not, you need to define the user ID to the operating system, using the operating system's standard procedures for creating a user. Note that you might not have the rights to do this; you might have to log on as Administrator or root.

When you have corrected the problem, either rerun the job using the **from** option (specifying the same name of the job) or submit the job into the plan.

AWSBDW003E Jobman cannot change the current working directory to the home directory of the logon user. The operating system error is: "system_error".

Explanation: Internal error: ""Chdir() failed with errno = *system_error* "".

system_error is the operating system error message.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW004E Jobman could not run the job because the system call used to launch the job failed. The operating system error is: "system_error".

Explanation: This message was previously: ""Exec failed with errno = *system_error* "".

system_error is the operating system error message.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW005E Error "system_error" occurred while trying to open JCL file "file_name".

Explanation: See the attached message.*system_error* contains the operating system error message. *file_name* is the name of the JCL file Tivoli Workload Scheduler is trying to launch.

System action: The requested operation is not performed.

Operator response: Correct the error and retry the operation.

AWSBDW006E Jobman could not run a job or check an external dependency because an internal system call failed. The error number is: "error_number".

Explanation: Internal error: ""Monitor could not fork to create job process. Errno = error_number ""

error_number is the operating system error number.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW009E The following operating system error occurred retrieving the password structure for either the logon user, or the user who owns a file or external dependency: "system_error".

Explanation: This message is a warning when checking a file dependency or when getting the status of an external dependency.

It is an error when trying to launch a job. **Jobman** cannot retrieve the password structure from the system for either the logon user, the Check File user (CFuser), or the Get Status user (GSuser).

system_error is the operating system error message.

The logon must be a valid user on the system where the job is being launched or check file or get status is being requested. It has a different meaning according to the platform.

- **UNIX:** The user logon does not exist.
- **Windows:** The problem might be caused by a confusion between local or domain accounts; however the logon must be valid and must be correctly associated with the password stored in the Symphony file and the userdata database.

Operator response: If the user was documented incorrectly in the plan, update the value in the database and use the **rerun** command with the **from** option so that Tivoli Workload Scheduler can read the original definition or resubmit the job into the plan.

AWSBDW010E Jobman was unable to create the monitor process that runs and monitors a job. The operating system error is: "system_error".

Explanation: *system_error* is the operating system error message.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW011E Jobman received unexpected signal !1.

AWSBDW012E Jobman was unable to delete the following JCL file "file_name" because it cannot find it or does not have the rights to delete it. The operating system error is: "error_message".

Explanation: *file_name* is the name of the file **jobman** is attempting to delete.

error_message is a message that contains more information about the error and includes the operating system error message, if any.

Technical note for support: This is a MPE related problem only.

System action: The program proceeds.

Operator response: Remove the indicated JCL file manually.

AWSBDW013E Unable to Launch job !1.

AWSBDW014E Jobman found a mailbox record in the Courier.msg file in an unrecognizable format, and was unable to process it.

Explanation: This error happens because either a more recent version of Tivoli Workload Scheduler is working within the same network or the event has been corrupted.

System action: The program proceeds.

Operator response: In the former case, follow the advice about upgrading your installation in the *Planning and Installation Guide*.

In the latter case, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW016E Jobman was unable to end the following user job due to a system error: "job_name", # "job_number". The operating system error is: "system_error".

Explanation: *job_name* is the name of the job that has not ended. *job_number* is the number that identifies this job in the process list (PID). *system_error* contains the operating system error message.

System action: The program proceeds.

Operator response: Stop the job manually using one of the following:

- **UNIX:** use the **conman kill** command.
- **Windows:** use the Task Manager.
- **Either:** use the Tivoli Workload Scheduler utility **killproc** in the Tivoli Workload Scheduler bin directory.

AWSBDW017E Jobman cannot create a new session for the monitor daemon. The operating system error is: "system_error".

Explanation: This is an internal error: Setsid failed with *errno* = *system_error*.

Jobman creates a new session as part of the process to create a monitor daemon process. The monitor process is the parent of the process that runs a job.

system_error is the operating system error message

System action: Jobman stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW018E Timeout on Courier.

AWSBDW020E Error occurred opening stdin !1.

AWSBDW021E Error occurred opening stdout !1.

AWSBDW022E Error occurred opening stderr !1.

AWSBDW023E A monitor process encountered an error while waiting for its child process to terminate. The operating system error is: "system_error".

Explanation: Internal error: ""Jobprocess Wait error: *system_error* "".

Jobman creates a monitor process for each job that it launches. The monitor process starts the job, waits for the job to complete, and reports the job exit status. In normal circumstances the monitor process then

terminates. However, in this case it cannot terminate. A monitor process is also used by **jobman** to monitor the method that checks the status of external dependencies.

system_error is the operating system error message.

System action: Jobman continues, with the monitor process still running.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

You can attempt to terminate the process yourself, using the options of your operating system. See the job standard list to determine the outcome.

AWSBDW024W No Writers on Courier (Writers = !1).

AWSBDW026E The file that jobman is trying to delete was expected to be a JCL file, but is not.

Explanation: See message.

System action: The program proceeds.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW028E Jobman encountered the following incorrect test condition when attempting to check an opens file dependency: "qualifier". The file being checked is the following: "file_name".

Explanation: *file_name* is the name of the file specified by the *opens* dependency.

qualifier is the qualifier specified in the *opens* dependency.

Operator response: Make sure that the qualifier specified with the *opens* dependency is valid. Correct the job description and reschedule or rerun it.

See *The Reference Manual* for more details.

AWSBDW029E Jobman is trying to end the following job: "job_name", but was unable to find it in the job table.

Explanation: *job_name* is the job that cannot be stopped because it is not in the job table.

System action: The program proceeds.

Operator response: Probably the job has stopped. If it is still running, stop it manually.

Stop the job manually using one of the following:

- **UNIX:** use the **conman kill** command.

- Windows: use the Task Manager.
- **Either:** use the Tivoli Workload Scheduler utility **killproc** in the Tivoli Workload Scheduler bin directory.

AWSBDW032E Jobman is trying to perform an operation as root or Administrator which is not authorized.

Explanation: Previous message text: *""Root jobs are not authorized to be executed by TWS""*.

This error occurs when **jobman** has to launch a job as root or Administrator and the option *jm no root* in the *localopts* file is set to *yes*. This error also happens when **jobman** has to launch the command to verify the existence of a file which has been specified in a *opens* dependency. In the case of an extended agent, this error could also occur if the Cfuser has not been set.

System action: The program proceeds.

Operator response: Use a user other than root or Administrator.

If this is an extended agent, specify a user for the extended agent's jobs which is in the extended agent's configuration files.

Evaluate the possibility to change the option *jm no root* in the *localopts* file to *no*.

AWSBDW033E Jobman could not set the group access list for the user specified in the logon of the job. The operating system error is: "system_error".

Explanation: Previous message text: *""Failed to set groups system_error ""*.

system_error is the operating system error message.

System action: **Jobman** proceeds.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW034E Jobman encountered an error processing the following command: "command" on the following file: "file_name".

Explanation: Previous message text: *""Command (command) not allowed on file file_name with jm no root set.""*

The reason is one of the following:

- An *opens* file dependency includes special characters, such as *""pipe""* (*|*), or *""command in background""* (*null*).
- The option *jm no root* in the *localopts* file is set to *yes*.

file_name is the name of the file which **jobman** is working on. *command* is the command that cannot be used.

System action: **Jobman** proceeds.

Operator response: Do not use special characters in *opens* dependencies or change the option *jm no root* in the *localopts* options file to *no*.

AWSBDW036W Jobman was unable to invoke the following method file: "method_file", because it was either not executable, unreadable or missing.

Explanation: *method_file* is the name of the method file.

System action: **Jobman** proceeds.

Operator response: Check the correct name of the method file in *nullTWS_home>/methods* and verify the access rights. When you have resolved the problem, rerun or reschedule the job.

AWSBDW037E Jobman cannot get the status of an external dependency because the timeout jm look specified in the localopts file has been exceeded.

Explanation: See message.

System action: The method stops.

Operator response: Verify that the remote system is reachable. If the access is slow, increase the value of the timeout *""jm look""* in the *localopts* file. When you have located the error, rerun or reschedule the job, as appropriate.

AWSBDW038E Jobman cannot resolve an external dependency because it cannot check the status of the following external job: "external_job". This is because the workstation where the job is running is not an X-agent.

Explanation: See message.

external_job identifies the external job.

System action: **Jobman** proceeds.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW039E Jobman or jobmon could not resolve an external dependency on job "external_job". The operating system error is: "system_error".

Explanation: *external_job* is the name of the external job (*nullworkstation>#nullexternal_job>*). *system_error* is

the operating system error message.

This is a message that is embedded in other error messages.

System action: Jobman proceeds.

Operator response: Check the response associated with the error specified by *system_error*. When you have located the error, rerun or reschedule the job, as appropriate.

AWSBDW040E Jobman encountered a file descriptor problem while trying to resolve an external dependency. The operating system error is: "system_error".

Explanation: Internal error: ""fdopen failed with errno = *system_error* "".

system_error contains the operating system error message.

This is an operating system error generated by the I/O library function fdopen. It could occur if the process has opened too many file descriptors or if there is insufficient storage space available.

System action: Jobman proceeds.

Operator response: Verify that there is enough space available on the file system. If there is, increase the number of file descriptors a process can open, using the operating system facilities. Jobman will recheck the dependency after an interval (determined by the *bm check files* parameter in the *localopts* file. If the number of file descriptors increases or the number of file streams decreases, the external dependency check succeeds, otherwise the error condition will reoccur.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW041E Jobman was unable to end the following user job: "job_name", # "job_number". This may happen when user kills jobs running on extended agents.

Explanation: *job_name* is the name of the job that has not ended. *job_number* is the number that identifies this job in the process list (PID).

System action: The program proceeds.

Operator response: Stop the job manually.

AWSBDW053E Jobman was unable to open the stdlist file for either the job process or itself. The operating system error is: "system_error"

Explanation: *system_error* contains the operating system error message.

System action: The program proceeds but if it was trying to open the stdlist for a job process, that process fails.

Operator response: Check the file system of *nullTWS_home>/stdlist* to ensure that there is sufficient space, and that the user has write permission. If a job failed, when you have resolved the problem, rerun or reschedule the job.

AWSBDW054E Can not malloc environment array: !1

AWSBDW055E Can not malloc buffer for environment variables: !1

AWSBDW057E The job "job_name" was not launched for this reason: "error_message"

Explanation: *job_name* is the name of the job.

error_message contains the reason for the failure. It is another Tivoli Workload Scheduler message.

System action: Jobman proceeds.

Operator response: Check the indicated message and implement the associated operator response.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW059E Jobman cannot allocate sufficient memory to store its workstation table.

Explanation: See message.

System action: Jobman stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to jobman. Rerun jobman.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun jobman.
3. If the problem persists, reboot the workstation, and then rerun jobman.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBDW060W Jobman was unable to add the following workstation: "workstation_name" to the workstation table, because the table is full. This is workstation record # "workstation_record_number".

Explanation: Previous message text: ""CPU record #workstation_record_number for workstation_name, ignored, too many cpus.""

workstation_record_number identifies the machine.

workstation_name is the name of the workstation.

The workstation table can hold up to 255 workstations.

System action: The program proceeds, but the workstation record is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW061E Jobman encountered an error trying to read workstation information from the Symphony file.

Explanation: See message.

System action: Jobman stops.

Operator response: This may be caused by a corruption of the Symphony file. To check if it is corrupt, view it with a file viewer and ensure that its contents look to be correct. If you suspect that it is corrupt, see the chapter in this guide on ""Symphony file corruption"".

If the Symphony file does not seem to be corrupt, an internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See See the chapter in this guide on 'Symphony file corruption'.

AWSBDW062E Jobman was unable to invoke the following method file "method_file" for the extended agent. The operating system error is: "system_error".

Explanation: *system_error_number* contains the operating system error message.

method_file is the name of the method.

System action: The program stops.

Operator response: Check that a method file with the indicated name exists in the `nullTWS_home>/methods` directory and that the user running **jobman** has access rights to it. When you have resolved the access problem, resubmit the job that failed.

AWSBDW063E Jobman was unable to find the following workstation: "workstation_name" in the workstation table.

Explanation: This could occur because *workstation_name* is not in the Symphony file, or an error occurred while **jobman** was building the internal workstation table, or the Symphony file is corrupt.

workstation_name is the workstation **jobman** is searching for in the workstation table.

System action: The program proceeds.

Operator response: Verify that the indicated workstation name is a valid workstation.

- If it is correct, stop and restart the process to recreate the workstation table.
- If it is not correct, to check if the Symphony file is corrupt, view it with a file viewer and ensure that its contents look to be correct. If you suspect that it is corrupt, see the chapter in this guide on ""Symphony file corruption"".

If the error persists it maybe that it is not possible to access this workstation for some unknown reason, in which case the job that **jobman** is processing will be ignored.

See The chapter in this guide on 'Symphony file corruption'.

AWSBDW064E A job that jobman is monitoring has returned the following unrecognizable message: "incorrect_message". The job identifier, monitor PID and method file are as follows: "job_name", #J"monitor_pid" using "method_file".

Explanation: *job_name* identifies the extended agent job or the extended agent external job. *monitor_pid* is the PID of the method. *method_file* is the name of the method launched. *incorrect_message* is the message **jobman** cannot understand.

System action: The program proceeds and the message is ignored.

Operator response: Contact the owner of the extended agent method. Change the method to generate a recognizable message and re submit the job.

See The *Reference Manual* for a description of how to create your own methods.

AWSBDW066E The schedulr has asked jobman to run a task that is not supported on the targeted agent. The following method options file was used: "method_options_file". The job identifier and monitor PID are as follows: "job", #J"monitor_pid".

Explanation: *job* identifies the extended agent job or the extended agent external job. *monitor_pid* is the PID of the method. *method_options_file* is the name of the method launched.

System action: The program proceeds, but the operation is not performed.

Operator response: Check which tasks are supported by the given extended agent. Modify the method and reschedule the job, if appropriate.

See *The Reference Manual* for details of how to use methods.

AWSBDW067E The extended agent has returned an unrecognized state "invalid_state" for job "job", #J"monitor_pid".

Explanation:

- *invalid_state* is the state has been returned
- *job* identifies the extended agent job or the extended agent external job.
- *monitor_pid* is the PID of the method.

System action: The program proceeds.

Operator response: Check the Tivoli Workload Scheduler documentation for the valid states. Modify the method and reschedule the job, if appropriate.

See *The Reference Manual* for details of how to use methods.

AWSBDW068E Jobman encountered a problem (getlogin failed) with the user name for a job. The operating system error is: "system_error"

Explanation: Internal error: generated by a call to *strerror* (*errno*).

system_error is the system error message indicating why *getlogin* failed.

System action: *Jobman* proceeds, but the job in question is not run.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW069E Jobman encountered a problem with the user name of the remote user that will launch a job on an extended agent. The operating system error is: "system_error"

Explanation: Internal error: *cuserid* failed.

The system error message *system_error* is generated by a call to *strerror* (*errno*), and indicates why *cuserid* failed.

System action: *Jobman* proceeds, but the job in question is not processed.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW070E Jobman cannot start. It has tried to become a daemon, giving the following internal error: "error" and system error: "system_error".

Explanation: On UNIX only, when starting up, *jobman* tries to become a daemon. It disassociates itself from the terminal, closing all file descriptors.

error is the internal error type. *system_error* is the operating system error message.

System action: The program cannot start.

Operator response: Read carefully the system error and try to resolve it. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW071E The following script or command name: "script_name" has exceeded the maximum number of characters allowed: "maximum_number".

Explanation: See message.

- *script_name* is the name of the script or command.
- *maximum_number* is the number of characters permitted.

System action: The program proceeds, but the operation is not performed.

Operator response: Change the indicated script or command name to a valid name with fewer characters than the indicated limit.

AWSBDW072E Jobman encountered an error when removing the following centralized script file: "file_name". The operating system error is: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, has downloaded a centralized script to this workstation into the temporary file *file_name*. After the script has been run, *jobman* cannot remove the temporary file.

error_text is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: *Jobman* proceeds.

Operator response: Resolve the problem indicated by the error message and manually delete the temporary file. If the problem persists, search the IBM Support

database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW073E Jobman encountered an error when changing the owner of the following centralized script file: "file_name". The operating system error is: "error_text".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, has downloaded a centralized script to this workstation into the temporary file *file_name*. Before the script is run, **jobman** needs to change the ownership of the script, but cannot.

error_text is a string that describes the reason for the error. The information is retrieved from the operating system.

System action: **Jobman** proceeds, and runs the script without changing its ownership.

Operator response: Resolve the problem indicated by the error message and reschedule or rerun the activity. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW074E Jobman has exceeded the available memory while trying to allocate a buffer for the following centralized script file: "file_name".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, has downloaded a centralized script to this workstation into the temporary file *file_name*. **Jobman** cannot allocate a buffer to load the file.

file_name is the file name of the local copy of the centralized script.

System action: **Jobman** proceeds without running the script.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **jobman**. Rerun **jobman**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **jobman**.
3. If the problem persists, reboot the workstation, and then rerun **jobman**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBDW075E Jobman (UNIX) or jobmon (Windows) encountered an error opening the following centralized script file: "file_name".

Explanation: *file_name* is the file name of the local copy of the centralized script.

System action: **Jobman** proceeds without running the script.

Operator response: Verify that the Tivoli Workload Scheduler user has the rights to access the directory where the centralized scripts are written in the product directory structure, and the rights to open and read the scripts. Correct any problems you find and rerun or reschedule the job that used the script.

AWSBDW076E The content of the following centralized script file is too long: "file_name".

Explanation: The centralized script file cannot be more than 4096 characters in length.

file_name is the file name of the local copy of the centralized script.

System action: **Jobman** proceeds without running the script.

Operator response: Limit the size of the centralized script stored within the JOBLIB to no more than 4096 characters. Rerun or reschedule the job.

AWSBDW077E The following centralized script file is empty: "file_name".

Explanation: In an end-to-end configuration the translator thread, running on OPCMASTER, has downloaded a centralized script to this workstation into the temporary file *file_name*. The file is empty.

The most probable cause is that a problem occurred during the download of the file to the workstation. It may also be possible that the file was empty before the download.

file_name is the file name of the local copy of the centralized script.

System action: **Jobman** proceeds without running the script.

Operator response: Attempt to repeat the process so that the script is downloaded again. If the problem persists, check if the script was empty before the download.

AWSBDW078W The promotion value specified in the localopts file is greater than zero. Values that are greater than zero are not valid and are set to -1.

Explanation: Positive promotion values do not work correctly and decrease system performance.

System action: Jobmon automatically set the promotion value to -1.

Operator response: Check the values defined in the ""localopts"" file and assign the correct promotion values.

AWSBDW079E Jobman could not run the job because the system call used to launch the job failed: Jobmon was unable to retrieve user information.

Explanation: See message.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDW210W The Realtime priority value specified in the localopts file is not supported. High priority will be used.

Explanation: See message.

System action: Jobmon proceeds using the High priority setting..

Operator response: Check the values defined in the ""localopts"" file and assign the correct priority values.

AWSBDW301E Jobman was unable to successfully access a mailbox record in its Mailbox.msg file, Courier.msg, giving the following error type and number: "error_type" - "error_number". The problem was identified in the following source file: "source_file" and the function being performed is: "function_name".

Explanation: *source_file* is the name of the source file where the error occurred. *function_name* is the name of the function where the error occurred (*read_courier* or *delete_courier*). *error_type* is the internal error type for event file messages (unison.msg - set 106). *error_number* is the internal error number.

If the error number is zero, it means that **jobman** cannot delete the Mailbox.msg file.

If the error number is greater than zero, it probably indicates that **batchman** has failed, and is thus not writing to the Mailbox.msg file.

System action: Jobman stops.

Operator response: Check the **batchman** log message for the explanation. If you can see why **batchman** failed, and can recover from the situation, you should do so, and then restart **batchman** and **jobman** (in that order).

If you cannot resolve the **batchman** failure, or the problem persists, an internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 85. AWSBDX - Jobtable access messages

This section lists jobtable access error and warning messages that might be issued.

The message component code is BDX.

AWSBDX001E Jobman has found a problem with its internal job table. See the message help for details.

Explanation: This message can be provoked by two different situations:

1. **Jobman** expected to find an entry for a running job in its internal job table, but there are no more entries to be read (end-of-table encountered). This is an internal error.
2. **Jobman** tried to add a new job to the job table, but the table is full. There are too many jobs running. The maximum is determined by the *jm job table size* parameter in the localopts file.

System action: **Jobman** continues, but the job that it is trying to manage is ignored (it might be run later when the number of running jobs has reduced).

Operator response: Check how many jobs are running using the operating system tools. If you have reached the maximum indicated in the localopts file, you must either explicitly stop an existing job, or wait for jobs to finish as normal, before you can run any new jobs. If you believe that the maximum number of jobs is likely to be exceeded on other occasions, you might want to consider increasing the value of the *jm job table size* parameter (if you make any changes, you have to stop and restart **jobman** for them to take effect).

If you have not reached the maximum number of jobs, this is an internal error, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDX002E You or jobman tried to perform an action on a job that is either not running or is not within jobman's internal job table. Probably the job has terminated. If it is still running, an internal error has occurred. The action that cannot be performed is the following: "action_number".

Explanation: *action_number* is a number indicating the action that was being performed when the error occurred:

- 1 = open
- 2 = read
- 3 = add
- 4 = update

- 5 = delete
- 6 = lock
- 7 = unlock
- 8 = write

System action: **Jobman** continues, but the action that you or **jobman** were trying to perform is ignored.

Operator response: Verify if the job in question is running, using the operating system tools. If it is, try to perform your action manually, for example using a shell command.

If it is not running, and you expected it to be, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDX003E Jobtable - Attempt to add duplicate entry !1.

AWSBDX004E Jobman could not open the jobtable file. The operating system error is: "error_message".

Explanation: The following are the two most commonly occurring possibilities:

1. The maximum size of the jobtable (maximum number of entries, as defined in the option *jm job table size* in the localopts file), is set to 0.
2. **Jobman** could not find an existing jobtable file.

error_message is a system error message, giving more details about the cause of the error.

System action: **Jobman** stops.

Operator response: Verify if the option *jm job table size* in the localopts file is equal to 0. If it is 0, change the value to a positive integer value, for example 1024.

If the *jm job table size* option is already a positive integer, an existing jobtable file was not found. Use the *error_message* to determine why the file could not be opened. Also search in the log file for entries that indicate that **Jobman** failed to create the file or had some other problem with the file. When you have identified the cause of the problem, rerun **jobman** by running the **start** command for the workstation.

See See the *Planning and Installation Guide* for details

AWSBDX005E • AWSBDX010E

about the options in the localopts file and their default values.

AWSBDX005E Jobman received the following operating system error while handling the jobtable file: "error_number".

Explanation: The system calls that can fail are: lock, fcntl, open, write, lseek, and read. *error_number* is the operating system error number, which indicates what problem was encountered.

System action: Jobman stops.

Operator response: Resolve the problem indicated in the operating system error message.

Check the file system of nullTWS_home> to ensure that there is sufficient space, and that the user has write permission. If jobman has stopped, when you have resolved the problem, rerun jobman.

AWSBDX006E Jobtable - MPE system error !1.

AWSBDX007E Jobman cannot add a new entry to the job table because the job does not have a valid job number.

Explanation: This is an internal error.

System action: Jobman continues, but the job in question is not run.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDX008E Jobman tried to perform the action "action_number" but the job table is not locked. This is an internal error.

Explanation: *action_number* is a number indicating the action that was being performed when the error occurred:

- 1 = open
- 2 = read
- 3 = add
- 4 = update
- 5 = delete
- 6 = lock
- 7 = unlock
- 8 = write

System action: The action is not performed. Jobmon could not be correctly initialized. Jobman might stop.

Operator response: Verify the access rights to the job table for the TWS user. Read and write access rights are required.

AWSBDX009E Jobman attempt to lock a file already locked.

AWSBDX010E The file version is incorrect for this program version.

Chapter 86. AWSBDY - Mailbox messages

This section lists mailbox error and warning messages that might be issued.

The message component code is BDY.

AWSBDY101E Bad Mailbox record found.

AWSBDY102E An internal error has occurred. The program cannot access the mailbox or ftbox common area in memory. The pointer to the mailbox common area is NULL or the area is not initialized.

Explanation: See message.

System action: The program might stop, depending on the circumstances of the error.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDY118E Tivoli Workload Scheduler encountered a nonexistent mailbox record type. The problem was encountered in the following source code file: "file_name" at line: "line_number". The call was mb_e_2_i_HDR() and the unexpected mailbox record type is as follows: "record_type".

Explanation: This is an internal error. It might occur if one or more workstations in your network are running an old version of Tivoli Workload Scheduler.

file_name and *line_number* are source code information.

record_type is the unexpected record type.

System action: The program continues.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDY119E Tivoli Workload Scheduler received a mailbox record incompatible with the version of the product. The problem was encountered in the following source code file: "file_name" at line: "line_number". The call was mb_e_2_i() and the unexpected mailbox record type is as follows: "record_type".

Explanation: The Mailbox.msg file is not compatible with the expanded Symphony file version.

file_name and *line_number* are source code information.

record_type is the unexpected record type.

System action: The program continues.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDY122W Mailbox cache temporarily disabled.

AWSBDY124W The Mailbox.msg file in !1 is not read by Mailman.

Explanation: The Mailbox.msg file is not read by Mailman.

Mailman is not up and running.

System action: The program continues.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDY125E An error occurred reading the header of the Mailbox.msg file in !1.

Explanation: An error has occurred while reading the header of the Mailbox.msg file.

System action: The program continues.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBDY126E An error occurred opening the Mailbox.msg file in !1.

Explanation: An error has occurred while opening the Mailbox.msg file.

System action: The program continues.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 87. AWSBDZ - Fileaid messages

This section lists Fileaid error and warning messages that might be issued.

The message component code is BDZ.

AWSBDZ001E Record out of range.

AWSBDZ005E The input was not valid.

AWSBDZ006E No lists are possible for this file structure.

AWSBDZ007E There are no children for this record type.

AWSBDZ008E The file is not modifiable.

AWSBDZ011E You cannot modify the selected item.

AWSBDZ012E The value specified is not valid.

AWSBDZ019E The jobtable is not accessible under MPE.

AWSBDZ026E Unable to read the Symphony file.

AWSBDZ027E No resources could be found.

AWSBDZ028E No messages could be found.

AWSBDZ029E No files could be found.

AWSBDZ030E No string records could be found.

AWSBDZ031E No calendars could be found.

AWSBDZ032E No workstations could be found.

AWSBDZ033E No Job records could be found in the header.

AWSBDZ034E No job streams could be found.

AWSBDZ035E An incorrect option was supplied.
Valid options are a,c,f,g,j,m,r,s,'!'

AWSBDZ036E At String Record.

AWSBDZ037E At Calendar Record.

AWSBDZ038E At Purgeable Jobs Record. No list options.

AWSBDZ039E At Message Record.

AWSBDZ040E At Dependency Record.

AWSBDZ041E At File Record.

AWSBDZ042E At CPU Record.

AWSBDZ043E No list options.

AWSBDZ047E An error occurred when opening the file.

AWSBDZ048E No record could be found.

AWSBDZ049E An error occurred while opening the jobtable. error:!1 !2.

AWSBDZ050E An error occurred while creating the file. Permission denied. Specify another path and filename, run as a different user with create permissions for the file, or add create permission for the file to this user.

AWSBDZ051E Specify a valid option: J, D, or ..

AWSBDZ057E No holders could be found.

AWSBDZ058E No dependencies could be found.

AWSBDZ059E No rerun jobs could be found.

Chapter 88. AWSBEA - Report1 messages

This section lists Report1 error and warning messages that might be issued.

The message component code is BEA.

AWSBEA001E Unable to open the mozart database.

AWSBEA002E Unable to read from the mozart
database.

AWSBEA003E An error occurred while initializing
the SORT routine.

AWSBEA004E An error occurred in the SORTINPUT.

AWSBEA005E An error occurred in the
SORTOUTPUT.

Chapter 89. AWSBEC - Report headers and subheaders messages

This section lists error and warning report headers and subheaders messages that might be issued.

The message component code is BEC.

AWSBEC110E Cannot open file "file_name".

Explanation: The report generator program cannot open the indicated file.

System action: The report generator program stops.

Operator response: Verify the following:

- That the file exists.
- That the user of Tivoli Workload Scheduler can access the file in all modes.
- That the file has not been locked by another process.

Correct any errors you find and rerun the report generator.

If you cannot find any error, rerun the report generator. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEC111E An error occurred while writing file "file_name".

Explanation: The report generator program cannot write the indicated file.

System action: The report generator program stops.

Operator response: Verify the following:

- That the user of Tivoli Workload Scheduler has write access to the directory in which the file needs to be written.
- That there is sufficient space in the file system where the file is to be written.

Correct any errors you find and rerun the report generator.

If you cannot find any error, rerun the report generator. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEC112E An error occurred while reading file "file_name".

Explanation: The report generator program cannot read the indicated file.

System action: The report generator program stops.

Operator response: Verify the following:

- That the user of Tivoli Workload Scheduler has read access to the file.
- That the file has not been locked by another process.

Correct any errors you find and rerun the report generator.

If you cannot find any error, rerun the report generator. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEC821E The following database open error occurred: !1

AWSBEC870E The following database open error occurred: %s

Chapter 90. AWSBEE - Parms messages

This section lists error and warning parms messages that might be issued.

The message component code is BEE.

AWSBEE001E Parameter !1 does not exist.

AWSBEE002E The following parameter name is not valid: !1.

AWSBEE003E You cannot use the following parameter: !1.

AWSBEE007E You do not have build permission for the parms -build command that creates and maintains the parameters database.

Explanation: You have tried to build the local parameters database but your user ID does not have ""build"" permission in the Security file.

System action: The build of the parameters database cannot be performed.

Operator response: Either ask your Tivoli Workload Scheduler Administrator to give you ""build"" permission for this action and retry, or log off and log again with a user ID that has ""build"" permission for this action.

AWSBEE008E A syntax error occurred. The parameter name exceeds the maximum length of "max_varable" bytes.

Explanation: You have supplied a parameter name that is too long.

System action: The submitted command cannot be performed.

Operator response: Change the parameter name so that it is no longer than the indicated maximum length and retry the operation.

Chapter 91. AWSBEF - Symphony archiving messages

This section lists error and warning messages that might be issued by the Symphony archiving.

The message component code is BEF.

AWSBEF001E Missing last archive run date.

AWSBEF002E Archiver could not create a directory with the following path: !1.

AWSBEF004E An error occurred while opening the Symphony file from schedlog !1.

AWSBEF005E An error occurred reading workstation record !1 from the logged Symphony file !2.

AWSBEF006E An error occurred reading job stream record !1 from the logged Symphony file !2.

AWSBEF007E An error occurred reading job record !1 from the logged Symphony file !2.

AWSBEF009E An error occurred while opening one or more output files.

Chapter 92. AWSBEG - Ftbox messages

This section lists error and warning messages that might be issued by the routines that maintain the ftbox directory.

The message component code is BEG.

AWSBEG201E The following directory could not be created: "directory_name". The following error was returned from the operating system: "error_code"

Explanation: The ftbox directory could not be created.

System action: The program goes ahead. However, any program that subsequently needs to access a file in the ftbox directory fails.

Operator response: Check the file system of nullTWS_home> to ensure that there is sufficient space, and that the user has write permission. When you have resolved the problem, if the Tivoli Workload Scheduler processes are still running, stop them by issuing a **stop** command for the workstation. Then issue a **start** command for the workstation.

any program that subsequently needs to access a file in the ftbox directory fails.

Operator response: Check if the nullTWSuser> has the authority to change the ownership of the ftbox directory. Grant these rights if they are not already granted. When you have resolved the problem, if the Tivoli Workload Scheduler processes are still running, stop them by issuing a **stop** command for the workstation. Then issue a **start** command for the workstation.

AWSBEG202E Access rights to the following directory could not be set: "directory_name". The following error was returned from the operating system: "error_code"

Explanation: The access rights to the ftbox directory could not be changed.

System action: The program goes ahead. However, any program that subsequently needs to access a file in the ftbox directory fails.

Operator response: Check if the nullTWSuser> has the authority to change the access rights to the ftbox directory. Grant these rights if they are not already granted. When you have resolved the problem, if the Tivoli Workload Scheduler processes are still running, stop them by issuing a **stop** command for the workstation. Then issue a **start** command for the workstation.

AWSBEG203E A change of ownership could not be made to the following directory: "directory_name". The following error was returned from the operating system: "error_code"

Explanation: The owner of the ftbox directory cannot be changed.

System action: The program goes ahead. However,

Chapter 93. AWSBEH - Web library messages

This section lists error and warning messages that might be issued by the routines that use the Web library.

The message component code is BEH.

AWSBEH001E The connection configuration file "file_name" containing the connection properties cannot be found.

Explanation: The error occurred while trying to open the file that contains the connection properties. The files checked are the useropts and localopts files.

The command line client does not have the connection configuration data to contact the server.

file_name identifies the configuration file that cannot be found.

System action: The operation cannot be performed.

Operator response: Check whether and why this file is missing. If it has been renamed or moved to another location, rename it or move it back and retry the operation. If the file cannot be found, uninstall and reinstall Tivoli Workload Scheduler on this computer.

AWSBEH002E The target host computer is not defined in the connection configuration file or the supplied command parameters.

Explanation: "Host" is one of the required parameters for the connection to the command line server.

The command line client does not have the connection configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check the useropts and localopts files and ensure that the "host" keyword is defined and identifies a valid host.

Alternatively, supply the host as a command parameter.

See *The User's Guide and Reference* for the full syntax of the connection parameters.

AWSBEH003E The protocol is not defined in the connection configuration file or the supplied command parameters.

Explanation: "Protocol" is one of the required parameters for the connection to the command line server.

The command line client does not have the connection

configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check the useropts and localopts files and ensure that the "protocol" keyword is defined and identifies a valid protocol.

Alternatively, supply the protocol as a command parameter.

See *The User's Guide and Reference* for the full syntax of the connection parameters.

AWSBEH004E The target host port is not defined in the connection configuration file or the supplied command parameters.

Explanation: "Port" is one of the required parameters for the connection to the command line server.

The command line client does not have the connection configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check the useropts and localopts files and ensure that the "port" keyword is defined and identifies a valid port.

Alternatively, supply the port as a command parameter.

See *The User's Guide and Reference* for the full syntax of the connection parameters.

AWSBEH005E The user is not defined in the connection configuration file or the supplied command parameters.

Explanation: "User" is one of the required parameters for the connection to the command line server.

The command line client does not have the connection configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check the useropts and localopts files and ensure that the "username" keyword is defined and identifies the user making the connection.

Alternatively, supply the user as a command parameter.

See The *User's Guide and Reference* for the full syntax of the connection parameters.

AWSBEH006E The password is not defined in the connection configuration file or the supplied command parameters.

Explanation: `""Password""` is one of the required parameters for the connection to the command line server.

The command line client does not have the connection configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check the `useropts` and `localopts` files and ensure that the `""password""` keyword is defined and identifies the password of the user making the connection.

Alternatively, supply the password as a command parameter.

See The *User's Guide and Reference* for the full syntax of the connection parameters.

AWSBEH007W The supplied protocol "protocol" is not valid. It must be http or https.

Explanation: `""Protocol""` is one of the required parameters for the connection to the command line server.

protocol is the value that is not valid.

The command line client does not have the connection configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check the supplied value of the `""protocol""` keyword and change it to a valid value (`""http""` or `""https""`).

See The *User's Guide and Reference* for the full syntax of the connection parameters.

AWSBEH008E The user options properties file "file_name" could not be opened or was not found.

Explanation: The error occurred while opening the user file that contains the connection properties.

file_name identifies the user file that cannot be opened.

The command line client does not have the connection configuration data to contact the server.

System action: The operation cannot be performed.

Operator response: Check whether and why this file could not be opened. If it has been renamed or moved to another location, rename it or move it back and retry the operation. If the file cannot be found, uninstall and reinstall Tivoli Workload Scheduler on this computer.

AWSBEH009E The connection configuration file "file_name" identified in the command by the `-file` keyword could not be opened or was not found.

Explanation: The command line client does not have the connection configuration data to contact the server.

file_name identifies the connection parameters file that cannot be opened.

System action: The operation cannot be performed.

Operator response: Check that you have supplied the correct name and path for the file. Correct the error found and retry the operation.

AWSBEH010E An internal error has occurred. A function has tried to initialize the HTTP libraries more than once.

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH011E An error occurred while contacting the server "server_name" on port "port_number".

Explanation: See message.

server_name identifies the server that cannot be contacted.

port_number identifies the port being used for the communication.

System action: The operation is not performed.

Operator response: Check that the connection parameters (the keywords: host, protocol, port, username, password, proxy, and timeout in the `localopts` file or supplied with the command) are correct. Check that the server is accessible in the network by pinging it. Fix any errors found and retry the operation.

AWSBEH012E The supplied file "file_name" could not be found or opened.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check that the file has been correctly identified. If not, retry the operation, identifying the file correctly.

If it has been correctly identified, verify the following:

- That the file exists. If it does not, create it.

- That the user of Tivoli Workload Scheduler can access the file in all modes. If it does not, change the access permissions.
- That the file has not been locked by another process. If it has, close that process.

Retry the operation.

AWSBEH013E An internal error has occurred.
WebLib could not allocate memory for processing the supplied file.

Explanation: See message.

System action: The operation is not performed.

Operator response: The file might be too large. Retry the operation with a smaller file.

AWSBEH014E An error occurred while reading the supplied file "file_name".

Explanation: See message.

System action: The operation is not performed.

Operator response: Verify the following:

- That the user of Tivoli Workload Scheduler has read access to the file. If it does not, change the access permissions.
- That the file has not been locked by another process. If it has, close that process.

Retry the operation.

AWSBEH015E An internal error occurred while initializing the AXIS HTTP libraries.

Explanation: See message.

System action: The operation is not performed.

Operator response: If this is the first time you have tried using the command line client it might be that the libraries were not installed correctly, in which case uninstall and reinstall the command line client, and retry the operation.

If this is not the first time, retry the operation. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH016E An error occurred while contacting the server using the AXIS HTTP libraries.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check that the server is accessible in the network by pinging it. Fix any errors found and retry the operation. If the problem persists, search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH017E An internal error has occurred "error" while using the AXIS HTTP libraries.

Explanation: See message.

System action: The operation is not performed.

Operator response: The quoted error message might help you to identify the problem and resolve it, in which case retry the operation. If you cannot identify or solve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH018E An error occurred while setting the credentials for user ID "user".

Explanation: An error occurred when setting the credentials with the AXIS HTTP libraries.

user identifies the user whose credentials cannot be set.

System action: The operation is not performed.

Operator response: Verify the connection and the user ID and password supplied. If the details are not correct, correct them and retry the operation. If they are correct, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH019W The format of the proxy server "proxy_server" and its port "port" is not valid.

Explanation: See message.

proxy_server and *port* identify the proxy server connection information that is not valid.

System action: The operation is not performed.

Operator response: Verify the proxy server and port information supplied. The *proxy_server* must be a correctly formed server name, expressed either as a host name or an IP address. The *port* must be a number between 1 and 65535. Do not supply the colon separator (:) between server and port; it is supplied by the software. Correct the error and retry the operation.

AWSBEH021E The user "user" is not authorized to access the server on host "host" using port "port".

Explanation: There has been an authentication failure on contacting the server.

System action: The operation is not performed.

Operator response: Check the following:

- Check the supplied values for the indicated fields.

AWSBEH022E • AWSBEH027E

- Check that the user details in the Security file are correct, and that the user has permission to access the server.
- Ensure that your SSL configuration and certificates are correct.
- If you have made any changes to the SSL configuration on the server, ensure that the application server has been restarted.

Correct any errors and retry the operation.

AWSBEH022E The server on host "host" cannot be contacted.

Explanation: The indicated server cannot be contacted.

System action: The operation is not performed.

Operator response: Check that the server is running and the network is up. Ping the server from the client.

If there is no network problem between the client and the server, check the supplied values for the connection. Ensure that your SSL configuration and certificates are correct. If you have made any changes to the SSL configuration on the server, ensure that the application server has been restarted. Correct any errors and retry the operation.

AWSBEH023E Unable to establish communication with the server on host "host" using port "port".

Explanation: The indicated server can be contacted, but is not listening on the indicated port.

System action: The operation is not performed.

Operator response: Check that you are using the correct port number. Check if there is a firewall in place between the client and the server that is blocking the indicated port. Correct any errors and retry the operation.

AWSBEH024E The connection with the server on host "host" has timed out.

Explanation: The timeout is supplied as one of the connection parameters, either as part of the command, in a file of connection parameters, or by default from the `useropts` or `localopts` file.

System action: The operation is not performed.

Operator response: Increase the value of the `timeout` parameter and retry the command.

AWSBEH025E The server response cannot be understood. There is a probably a mismatch with language variables, codesets, codepages, or other configuration elements of the international communication environment.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check that the language variables, codesets, codepages, or other configuration elements of the international communication environment match on the client and server. Correct any error you find and retry the command.

AWSBEH026E It was not possible to establish an SSL communication with the server on host: "host" using port "port" because of the following error: "error".

Explanation: The server can be contacted but the SSL handshake failed.

System action: The operation is not performed.

Operator response: Check that the following parameters in the `useropts` or `localopts` file: `port`, `clisslcipher`, and `clisslservercertificate` match the required values on the server. Correct any errors and retry the operation.

AWSBEH027E The connection parameters were not specified completely in your useropts or localopts file. Correct the file, or submit the connection parameters as part of the command syntax.

Explanation: See message.

System action: The command is not performed.

Operator response: Do one of the following:

- Edit the `useropts` or `localopts` file, correct the connection parameters, save the file and resubmit the command.
- Create a file, insert the connection parameters, save the file, and resubmit the command, identifying the file of connection parameters with the `-file` attribute.
- Resubmit the command, adding the connection parameters to the command line as arguments. Run `nullcommand_name> -U` to determine the syntax, or look in the *User's Guide and Reference*.

See *User's Guide and Reference* for full details of the connection parameters and their syntax.

AWSBEH028E The SSL connection using GSKit (FIPS 140-2 mode active) with the server fails.

Explanation: See message.

System action: The command is not performed.

Operator response: Check the certificate in the localopts.

See *User's Guide and Reference* for full details of the connection parameters, certificates, and their syntax.

AWSBEH029E The SSL connection using OpenSSL Toolkit with the server fails.

Explanation: See message.

System action: The command is not performed.

Operator response: Check the certificate in the localopts.

See *User's Guide and Reference* for full details of the connection parameters, certificates, and their syntax.

AWSBEH030E The connection with the server fails.

Explanation: See message.

System action: The command is not performed.

Operator response: Check the parameters in the localopts.

See *Reference Manual* for full details of the connection parameters, certificates, and their syntax.

AWSBEH100E There is a syntax error in the connection parameters.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check the supplied connection parameters. You might have mistyped a keyword, or omitted a separator between keywords or between a keyword and its value. Correct the error and retry the operation.

AWSBEH101E An internal error occurred while initializing the WebLib HTTP libraries.

Explanation: See message.

System action: The operation is not performed.

Operator response: Ensure that the connection parameters are correct. Retry the operation. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH102E No valid command was supplied.

Explanation: You submitted a command string from the command line client but it did not contain a recognizable command.

System action: The operation is not performed.

Operator response: Verify the syntax of the command. Correct the error and retry the operation.

AWSBEH103E Too many commands have been supplied, or a command has been duplicated.

Explanation: The command line string contains too many commands, or a command has been submitted twice. Each command string must comprise one command and its associated attributes.

System action: The operation is not performed.

Operator response: Verify the syntax of the command. Correct the error and retry the operation.

AWSBEH104E The following HTTP communication failure has occurred:
"HTTP_return_code".

Explanation: See message.

System action: The operation is not performed.

Operator response: Check that the server is running and the network is up. Ping the server from the client.

If the network is working correctly, the problem might have been temporary. Retry the command.

Otherwise, solve the network connection problem and then retry the operation.

AWSBEH105E The following HTTP response failure was received from the server:
"HTTP_return_code".

Explanation: See message.

System action: The operation is not performed.

Operator response: Use the information in the *HTTP_return_code* to diagnose and resolve the problem.

Check that the server is running and the network is up. Ping the server from the client.

If the network is working correctly, the problem might have been temporary. Retry the command.

Otherwise, solve the HTTP problem and then retry the operation.

AWSBEH106E There is a syntax error. The required value for keyword "keyword" is missing.

Explanation: Each keyword must have an associated value. After the indicated keyword the corresponding value was not found.

System action: The operation is not performed.

Operator response: Verify the syntax of the command. Correct the error and retry the operation.

AWSBEH107E There is a syntax error. The supplied date is not in the format specified in the useropts or localopts files.

Explanation: See message.

System action: The operation is not performed.

Operator response: Either reissue the command using the correct date format or change the date format in the useropts or localopts file.

AWSBEH108E There is a syntax error. The format of the time in the date is incorrect.

Explanation: See message.

System action: The operation is not performed.

Operator response: Either reissue the command using the correct time format or change the time format in the useropts or localopts file.

AWSBEH109E There is a syntax error. The time zone is not valid.

Explanation: See message.

System action: The operation is not performed.

Operator response: Reissue the command using the correct time format or change the time format in the useropts or localopts file.

AWSBEH110E There is a syntax error. A start or finish time in the format hhmm is required when you specify a time zone in the -from or -to options.

Explanation: One of the following has occurred:

- The plan ""-from"" or ""-to"" time has not been explicitly defined when a time zone has been used. When you specify a time zone for the plan ""-from"" or ""-to"" date you cannot use the default time and so must define it explicitly. This is to avoid any ambiguity between the time zone of the master domain manager and the time zone defined in the command. If no time zone is specified, the default ""-from"" or ""-to"" time uses the time zone of the master domain manager.

- You have supplied a plan ""-from"" or ""-to"" time that is not in the format hhmm (note that you must enter the leading zero if the start time is less than 1000).

System action: The submitted command cannot be performed.

Operator response: Correct the ""-from"" or ""-to"" time definition and retry the command.

AWSBEH111E The following internal error occurred while opening the Symphony file: "error".

Explanation: See message.

System action: The confirm action cannot be executed

Operator response: Verify the following:

- That the Symphony file exists. Run JnextPlan to create it if not.
- That the user issuing the command has access rights to the Symphony file. Change the user permissions, if not.

Retry the command.

AWSBEH112W There is a syntax error. The -from parameter was ignored because you are trying to extend a plan.

Explanation: You are trying to extend the plan, for which action the ""-from"" parameter is not required.

System action: The command is processed, ignoring the ""-from"" parameter.

Operator response: To avoid the reproduction of this message, do not supply a ""-from"" parameter when you are extending a plan.

AWSBEH113E There is a syntax error. A keyword has been used more than once.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check the command syntax. Reissue the command, supplying only one instance of each valid keyword.

AWSBEH114E There is a syntax error. The -to keyword has been specified, but also the -for or the -days keywords, which is not allowed.

Explanation: You can extend a plan for a period of hours (-for), or a period of days (-days), or both, or until a specific date and time (-to), but you cannot use -to with the -for and -days keywords.

System action: The operation is not performed.

Operator response: Check the command syntax. Reissue the command, supplying either `""-to""`, or one or both of the `""-for""` or `""-days""` keywords.

AWSBEH115E The file "file" does not exist or you do not have read access to the file.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check that the file is identified correctly, retrying the command with the correct file path and name if it is not.

If it is identified correctly, verify the following:

- That the file exists, creating it if not.
- That the user of Tivoli Workload Scheduler has read access to the file.
- That the file has not been locked by another process.

Correct any errors you find and rerun the command.

AWSBEH116E An error occurred while converting the globalopts option "globalopts_option" to the database global option "db_global_option".

Explanation: See message.

System action: The operation is not performed.

Operator response: Check the connection to the server. If the connection is broken solve the connection problem and retry the command. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEH118E There is a syntax error. The time format for the -for value is not [h]hhmm.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the value of the `""-for""` time definition and retry the command.

AWSBEH144W Unable to execute the Resync command because the Symphony file is not found.

Explanation: See message.

System action: The operation is not performed.

Operator response: Generate the Symphony file and retry the operation.

AWSBEH145W Unable to execute the Checksync command because the Symphony file is not found.

Explanation: See message.

System action: The operation is not performed.

Operator response: Generate the Symphony file and retry the operation.

Chapter 94. AWSBEI - Users program messages

This section lists error and warning users program messages that might be issued.

The message component code is BEI.

AWSBEI001E User "user_name" does not exist.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Verify that the correct user name has been supplied. Correct the user name and retry the operation.

AWSBEI002E The file "file_name" is empty, or an error occurred during the conversion of the contents of the file to UNICODE. No user has been added to or updated in the local database.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check that the file exists in the correct location. Check that the user performing the operation has permission to open the file. Check that the file is not empty. Check the log file for any other messages that might help you to understand what has happened. Correct the problem and retry the operation.

AWSBEI003W An internal error has occurred. Cannot open the audit log file.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBEI007E You are not authorized to run this command.

Explanation: You have tried to add, display, delete or modify a user but your user ID does not have correct permission in the Security file.

System action: The submitted command cannot be performed.

Operator response: Either ask your Tivoli Workload Scheduler Administrator to give you ""correct"" permission for this action and retry, or log off and log

again with a user ID that has the permission for this action.

AWSBEI009E An error has occurred. The user "user_name" has not been updated or added.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the log file for any other messages that might help you to understand what has happened. Correct the problem and retry the operation.

AWSBEI010E Cannot open the file "file_name". Operating system error: "os_error".

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Use the operating system error message *os_error* to determine what the problem is. Correct the problem and retry the operation.

AWSBEI011E The Unicode (UTF-8) name of the workstation is too long to be stored.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Provide a shorter name.

See *Reference Guide* for rules about workstation names.

AWSBEI012E The Unicode (UTF-8) name of either the domain or the user is too long to be stored.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Provide a shorter name.

See *Reference Guide* for rules about domain and user names.

AWSBEI013E

AWSBEI013E The Unicode (UTF-8) password is too long to be stored.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Provide a shorter password.

See *Reference Guide* for rules about user passwords.

Chapter 95. AWSBEJ - Symphony check messages

This section lists error and warning messages that might be issued by Symphony check routines.

The message component code is BEJ.

AWSBEJ010E Error: Job stream record ("recnum") has incorrect dependencies.

AWSBEJ011E Error: Job record ("recnum") has incorrect dependencies.

AWSBEJ012E Error while reading record ("recnum"): "reason"

AWSBEJ014E Error: The job stream chain is corrupted.

AWSBEJ015E Error: Record ("recnum") is not a job stream record as expected.

AWSBEJ016E Error: Record ("recnum") is not a job record as expected.

Chapter 96. AWSBHS - MVS method messages

This section lists error and warning messages that might be issued by the MVS method.

The message component code is BHS.

AWSBHS001E Error: Unable to open connection to MVS gateway: !1

AWSBHS002E Error: Unable to start the MVS gateway: !1

AWSBHS003E Error: !1

AWSBHS004E Error: Cannot get reply from the MVS gateway: !1

AWSBHS005E Error: Cannot send request to MVS gateway: !1

AWSBHS006E Error: Could not allocate storage for communication

AWSBHS007E Error: Missing argument for option !1

AWSBHS008E Error: Unknown option argument: !1

AWSBHS009E Error: Missing -t task option

AWSBHS010E Error: Missing -c cpu,host,master option

AWSBHS011E Error: Missing -n node option

AWSBHS012E Error: Missing -p port option

AWSBHS013E Error: Unsupported task: !1

AWSBHS015E Error: Mismatched TWS ID. Expected !1 got !2.

AWSBHS016E Error: Missing response result code. Response: !1.

AWSBHS017E Error: MAXTIME retries limit null!1null reached.

Chapter 97. AWSBHT - Batchman messages

This section lists error and warning messages that might be issued by the batchman component.

The message component code is BHT.

AWSBHT001E The job "*job_name*" in file "*file_name*" has failed with the error: "*error_message*"

Explanation: **Batchman** encountered an error launching a job. The job has been put in the state *FAIL*. This can happen for many reasons:

- **Jobman** is not able to open the `stdlist` file where it redirects the job standard output and error, because either it cannot find the directory or it cannot create it.
- If the job is run from a file, the user might not have access to the file.
- The job must run on a hosted extended agent and the user who must launch the job does not have permission to access the extended agent method.
- **Jobman** is not able to read the entry of the job in the internal jobtable.
- **Jobman** is not able to update the record in the internal jobtable.
- **Jobman** cannot retrieve the user's password.
- The user is not authorized to run the job as root.
- **Jobman** failed to set the GID for the secondary user group.
- **Jobman** failed to set the GID for the primary user group.
- **Jobman** failed to set the UID.
- **Jobman** cannot change to the home directory of the user.
- **Jobman** failed to set the SID.
- **Jobman** is not able to launch the MONITOR for the job.
- **Jobman** is not able to fork the job process.

job_name is the name of the job (`nullworkstation>#nulljob_stream >.nulljob>`) that **batchman** is launching. *file_name* is the name of the JCL file. *error_message* describes the error and includes the operating system error message.

System action: **Batchman** proceeds. The job has not been launched.

Operator response: Use the *error_message* to solve the problem.

The most common causes are the following:

- The password you specified for the user (within the userdata moztart database) is wrong, not valid, expired or the account is locked (only for Windows jobs). In this case change the user password using **composer**
- The JCL file name you specified for the job is incorrect or the file cannot be found (both UNIX and Windows). Verify the JCL name you specified in the job definition exists in the correct directory.
- Access rights to the JCL file or the Tivoli Workload Scheduler binaries are not correct. Verify that the JCL has the right access rights.

AWSBHT002W Job logs on differently than documentation indicates.

AWSBHT003E **Batchman** is unable to allocate memory for its internal record table during initialization.

Explanation: See message.

System action: **Batchman** stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **batchman**. Rerun **batchman**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **batchman**.
3. If the problem persists, reboot the workstation, and then rerun **batchman**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBHT004E Batchman has read a record in the message file which has the following destination workstation ("to_workstation") that cannot be found. The message originated at the following workstation: "from_workstation".

Explanation: Batchman has read from its message file, Intercom.msg, a record with a destination workstation did not match that of batchman or any of the extended agents hosted by it.

to_workstation is the name of the destination workstation. *from_workstation* is the name of the origin workstation.

System action: Batchman continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT005E Batchman has read a record in the message file which identifies a job which cannot be found in the Symphony file.

Explanation: Batchman read a record from its local message file, Intercom.msg. The record is a job ID whose record batchman could not find in the Symphony file.

System action: Batchman continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT006E Batchman has read a Job Terminate record in the message file for a job that is not in the execute state.

Explanation: Batchman read from its mailbox file, Intercom.msg, a *Job Terminate* record for a job that is not in the *execute* state.

System action: Batchman continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT007W Record type mismatch reading SYMPHONY file

AWSBHT008E Batchman has read a record in the message file which has either an incorrect length, or the following unrecognized record type: "record_type".

Explanation: Batchman read a record from its local message file, Intercom.msg with an unknown type or a length which does not match the correct record type length. *record_type* is the type of the record, a two character string.

System action: Batchman continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT009E Batchman has found a non-valid dependency type in the Symphony file.

Explanation: Batchman found an invalid dependency type in the Symphony file. This message is issued also when a mailbox *add dependency* record with an unknown dependency type is processed by batchman.

System action: Batchman continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT010E Batchman has received a mailbox message that updates the state of a job, but the job cannot be found in the Symphony file.

Explanation: See message.

System action: Batchman continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT011E Batchman found corrupted job recovery information while it was attempting to determine the recovery action for a job that terminated with an ABEND state.

Explanation: See message.

System action: Batchman continues, but the recovery action for the job is not performed.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

AWSBHT012E The batchman internal job table or its extension area is full.

Explanation: The **batchman** internal Symphony file record table or its extension area is full.

Batchman has run out of entries in the jobtable or its extension area in system memory. The extension area is used to record ad hoc work, restart jobs, and manage the iterations of the jobs that use the *every* keyword.

System action: **Batchman** stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **batchman**. Rerun **batchman**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **batchman**.
3. If the problem persists, reboot the workstation, and then rerun **batchman**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBHT013E Batchman has received a mailbox message that refers to the following job stream: "job_stream_name". However, the job stream does not exist in the Symphony file.

Explanation: See message.

job_stream_name is the name of the job stream.

System action: **Batchman** continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT014E Batchman has received a mailbox message that refers to the following job: "job_name". However, the job does not exist in the Symphony file.

Explanation: See message.

job_name is the name of the job.

System action: **Batchman** continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT015W Batchman cannot release a job stream from its dependencies because the job stream is not in the holding state that is required to allow it to be updated.

Explanation: This message explains why an event has been discarded.

The situation can occur when a job stream changes its state before the event that required a release of the dependencies (generated by **conman** or the Tivoli Dynamic Workload Console) arrived at the workstation where **batchman** is running.

System action: **Batchman** continues, but the event is ignored.

Operator response: No action is required.

AWSBHT016W Batchman cannot release a job from its dependencies because the job is not in the holding state that is required to allow it to be updated.

Explanation: This message explains why an event has been discarded.

The situation can occur when a job changes its state before the event that required a release of the dependencies (generated by **conman** or the Tivoli Dynamic Workload Console) arrived at the workstation where **batchman** is running.

System action: **Batchman** continues, but the event is ignored.

Operator response: No action is required.

AWSBHT017E Batchman has received a mailbox message that refers to a job stream that cannot be found in the Symphony file.

Explanation: **Batchman** read from *Intercom.msg* a mailbox record that modified the dependencies or the state of a job stream. However, **batchman** was not able to find the job stream record in the Symphony file.

System action: **Batchman** continues, but the record in the message file is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT018E Batchman has received an event that refers to the following job that cannot be found in the Symphony file: "job_name".

Explanation: See message.

job_name is the name of the job **batchman** cannot find.

System action: **Batchman** continues, but the event is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT019E Batchman was unable to modify a job because it is not in the valid state to apply the modification.

Explanation: This message explains why an event has been discarded.

Some job actions can only be applied if the job is in the appropriate state. For example, a job cannot be stopped if it is in the ""SUCC"" state (it has already stopped).

The situation can occur when a job stream changes its state before the event (generated by **conman** or the Tivoli Dynamic Workload Console) arrived at the workstation where **batchman** is running.

System action: **Batchman** continues, but the event is ignored.

Operator response: No action is required.

AWSBHT020E Batchman has received an event for a prompt that cannot be found in the Symphony file.

Explanation: See message.

System action: **Batchman** continues, but the event is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT021E Batchman has received an event to add a new job stream to the plan, but a job stream with that name already exists in the Symphony file.

Explanation: See message.

System action: **Batchman** continues, but the event is ignored.

Operator response: Check if two job streams with the same name have been submitted in quick succession (either the same job stream twice, or 2 different job streams but with the same name). Normally, you are

not able to submit two job streams with the same name, but it is possible that a synchronization error has occurred if they were submitted in quick succession.

If you have submitted the same job stream twice, you need take no action - the second occurrence is ignored.

If you have submitted two different job streams with the same name, resubmit the second job stream using an alias name.

AWSBHT022E Batchman has received an event for a job stream or a job within a job stream, but the job stream cannot be found in the Symphony file.

Explanation: See message.

System action: **Batchman** continues, but the event is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT023E While responding to a submit schedule request, batchman has found a record in the message file which is not a job stream, job or dependency record.

Explanation: **Batchman** is processing a **conman submit sched** request, for which it expects to find a set of job stream, job, and dependency records in the message file. However, while processing this set it has found a record type that is not one of these. The message file is corrupt, or an internal error has occurred.

System action: **Batchman** proceeds. The job stream that was submitted might not be added to the Symphony file. If it is added, a job or dependency might be missing.

Operator response: Run the **stop nullworkstation>** and then the **start nullworkstation>** commands to regenerate the mailbox file.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT024W Batchman has received an end-event for a job stream, but the job stream is not in the correct status to receive an end-event.

Explanation: This message explains why an event has been discarded.

Some actions can only be applied if the job stream is in the appropriate state. In this case, an end-event cannot be processed if the job stream state is not ""ADDING"".

The situation can occur when a job stream changes its state before the event (generated by **conman** or the Tivoli Dynamic Workload Console) arrived at the workstation where **batchman** is running.

System action: **Batchman** continues, but the event is ignored.

Operator response: No action is required.

AWSBHT025W Batchman has received an end-event for a job, but the job is not in the correct status to receive an end-event.

Explanation: This message explains why an event has been discarded.

Some actions can only be applied if the job is in the appropriate state. In this case, an end-event cannot be processed if the job state is not ""**ADDING**"".

The situation can occur when a job changes its state before the event (generated by **conman** or the Tivoli Dynamic Workload Console) arrived at the workstation where **batchman** is running.

System action: **Batchman** continues, but the event is ignored.

Operator response: No action is required.

AWSBHT026E Batchman has received an event for the following resource, but the resource cannot be found in the Symphony file: "resource_name".

Explanation: See message.

resource_name is the name of a physical or logical scheduling resource that cannot be found in the Symphony file.

System action: **Batchman** proceeds.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT027W Batchman has received an event to add a new job to a job stream, but a job with that name already exists in the job stream in the Symphony file.

Explanation: See message text. Two or more jobs with the same name can only be present in the ""**USERJOBS**"" job stream.

System action: **Batchman** continues, but the event is ignored.

Operator response: Check if two jobs with the same name have been submitted in quick succession (either the same jobs twice, or 2 different jobs but with the same name). Normally, you are not able to submit two jobs with the same name, but it is possible that a

synchronization error has occurred if they were submitted in quick succession.

If you have submitted the same job twice, you need take no action - the second occurrence is ignored.

If you have submitted two different jobs with the same name, resubmit the second job using an alias name.

AWSBHT028E Batchman has received an event for a FILE dependency, but the dependency cannot be found in the Symphony file:

Explanation: See message.

System action: **Batchman** continues, but the event is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT029E Batchman was unable to allocate memory to hold the internal workstation table that contains the workstations for which batchman schedules jobs. The number of entries it wants to create is as follows: "table_entries".

Explanation: *table_entries* is the number of workstation entries for which **batchman** is trying to allocating memory.

System action: **Batchman** stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **batchman**. Rerun **batchman**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **batchman**.
3. If the problem persists, reboot the workstation, and then rerun **batchman**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBHT038W The internal workstation table used by batchman is full. Workstation record #"workstation_record_number" for "workstation_name", has been ignored.

Explanation: The internal workstation table used by

batchman is limited to 255 entries. This should be sufficient for any normal working situation. The fact that the table is full indicates that an internal error has occurred.

workstation_record_number identifies the machine.
workstation_name is the name of the workstation.

System action: **Batchman** continues, but the workstation record is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT044E Batchman could not find the entry for the following resource: "resource_name" in the dependency list for the following job stream or job: "job_stream_or_job".

Explanation: A **conman** release **sched** command has been issued to release the dependencies on the indicated job stream or job. However, the command refers to a resource that **batchman** cannot find as a dependency for job stream or job.

resource_name is the resource name that cannot be found.

job_stream_or_job is the name of the job stream or job that depends on the resource.

System action: **Batchman** proceeds.

Operator response: You need to contact the person who issued the **conman** release **sched** command, and determine the circumstances in which it was issued. These could be any of the following:

- When the command was issued, the resource name was typed incorrectly. Reissue the command, typing the resource name correctly.
- When the command was issued, the resource name was typed correctly, but the command identified the wrong job stream or job. Reissue the command, typing the job stream or job name correctly.
- The command was issued in error, attempting to release a resource from a job stream or job that had never depended on that resource. Take no action.
- Two operators separately issued the command to release the dependencies at about the same time. The first command to arrive at the workstation has been correctly processed. The second command would give this error. Take no action.

AWSBHT049E Batchman could not find a job or job stream as a holder in the list of holders in the Symphony file resource record with the following record number: "record_number".

Explanation: A holder is defined as a job stream or job that has need of a resource. In the Symphony file

record for the resources in the plan there is a resource record which lists the holders of that resource. This internal error occurs if a job stream or job refers to a resource, but the job stream or job is not listed as a holder in the corresponding resource record.

record_number is the Symphony file record number for the job stream or job that is the holder of the resource.

System action: **Batchman** proceeds.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT050E An internal error has occurred. Batchman has received an event from a master domain manager, from which this event should not have been produced.

Explanation: See message.

System action: **Batchman** proceeds. The event is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT051W The number of dependencies specified in the following resolve dependency record "resolve_dependency_record" exceeds the total dependencies defined in the Symphony file: "dependencies_in_symphony". The job is the following: "job_or_job_stream_name".

Explanation: This probably indicates a synchronization problem. For example, it may be that a dependency has been added to a job and then deleted. If the dependency deletion reaches the workstation before the add, this error could occur.

resolve_dependency_record is the number of the record that contains the dependency that cannot be processed.

dependencies_in_symphony is the total number of dependencies contained in the Symphony file.

job_or_job_stream_name identifies the job or job stream for which the dependency cannot be processed.

System action: **Batchman** proceeds. The dependency record is not processed. The job that depends on this dependency record may wait indefinitely for the resolution of this dependency, unless some remedial action is taken.

Operator response: Check the status of the job in question. If it is waiting for a dependency, you can

release or delete the dependency, using **conman**.

If the job is being processed it probably indicates that Batchman encountered a synchronization problem but then resolved it.

AWSBHT052W Requested dependency type !1 is not equal to actual type of !2.

AWSBHT056E Batchman was unable to add a dependency to a job stream or job, because the number of dependencies in the record is already equal to the maximum allowed (40).

Explanation: See message.

System action: Batchman, but the event is ignored.

Operator response: Wait until the next plan generation (**JnextPlan**) to add a dependency. Even if you delete one or more dependencies from the job stream or job, you can probably not add a new dependency until after the next **JnextPlan**.

AWSBHT057W Batchman has found a non-valid run number in the Symphony file for the following record type: "record_type" and object: "object".

Explanation: See message.

record_type is the record type of the record in the Symphony file with the non valid run number.

object is the object of the record with the non valid run number, for example, job stream, job, or resource.

System action: Batchman proceeds. The record is ignored.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT060W CS record ignored !1

AWSBHT061E Batchman has received a mailbox record indicating that the following job has stopped unexpectedly: "job_name" ("job_number").

Explanation: *job_name* is the name of the job (*nullworkstation>#nulljob_stream>.nulljob>*).

job_number is the number assigned to the job.

System action: Batchman continues. The indicated job has stopped.

Operator response: Use internal policies to determine how to handle the stopped job. All jobs depending on the stopped job wait until the job is rerun successfully

or until it is cancelled. Stopped jobs that have the *continue* recovery option do not prevent dependent jobs from running.

AWSBHT069E The following job stream is in the stuck state: "job_stream_name".

Explanation: A job stream might become ""stuck"" for any of the following reasons:

- Jobs in the job stream cannot launch because they depend on a job that has failed. This is the most common reason.
- Operator intervention is required for a reply to a prompt on one of the jobs in the job stream.
- A job on which another depends cannot launch because its priority is zero.

job_stream_name is the name of the job stream that is stuck.

System action: Batchman continues. The indicated job has stopped.

Operator response: For a failed job, use your internal policies to determine how to handle it. You can either cancel the job to satisfy the other job dependencies or rerun it again successfully.

For a prompt, reply to the active prompt to change the status and free a ""stuck"" job.

For a zero priority, altering the value to any number greater than 0 changes the status and frees a ""stuck"" job.

AWSBHT087E Batchman has determined that jobman has failed with the following exit code: "exit_code".

Explanation: *exit_code* is jobman's exit status code.

System action: Batchman continues.

Operator response: See the section about jobman in the FAQ, on the Tivoli Workload Scheduler support web page, to see if the error matches any of the errors described in the section. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT089E A resource cannot be allocated to a job or a job stream because the maximum number of resource holders (32) has been reached.

Explanation: For each resource defined in a job stream or job, batchman creates a holder for that resource and that job stream or job. Batchman can manage a maximum of 32 active holders for each resource. This means that no more than 32 job streams or jobs can use the same resource at the same time.

System action: **Batchman** continues. The resource is ignored.

Operator response: Check in the log to determine the job or job stream that wanted to use the resource. This job or job stream might need to be rerun when some of the instances of the required resource have been freed.

If the condition that has given rise to the error is one that might re-occur, modify the job streams or jobs and the resource definitions. Split the resource into two or more resources maintaining the same number of resource instances between all of them. Distribute these resources between the job streams or jobs.

For example, suppose you have a resource called `""tape""` that has a value of `""100""`. If you have 40 jobs that need to run at the same time and all need this resource, create a second resource called, for example, `""more_tape""` and allocate 50 to it, reducing the value of `""tape""` also to 50 (to maintain the same total value). Allocate these two resources equally to the 40 jobs or job streams so that if all of the jobs were running at the same time the total number of holders of either `""tape""` or `""more_tape""` would be 20, and would never exceed 32.

AWSBHT090E Batchman could not start jobman. The following gives more details of the error: "error_text".

Explanation: See message.

error_text describes at what step of the **jobman** creation process the error occurred, and the operating system error.

System action: **Batchman** continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT091E Batchman could not open the Symphony file. The following gives more details of the error: "error_text".

Explanation: See message.

error_text contains the text of the error indicating why **batchman** could not open the Symphony file.

System action: **Batchman** stops.

Operator response: Make sure that a Symphony file exists with the correct file permissions and ownership in the Tivoli Workload Scheduler directory. If one does not exist, take the following steps to recreate it:

1. Copy the Symphony file from the backup master.
2. Start and link to the agent from the master.

If the error occurs at the beginning of the production day, do the following:

1. Use the **conman shut** command to stop **netman** on the agent.
2. Issue the **StartUp** command.
3. From the master, issue the **start** command for the agent.

AWSBHT092E Batchman could not open the mailbox file Intercom.msg. The following gives more details of the error: "error_text".

Explanation: See message. **Batchman** reads and processes mailbox records from this file.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT093E Batchman could not open the mailbox file Mailbox.msg. The following gives more details of the error: "error_text".

Explanation: See message. **Batchman** writes mailbox records to this file and **mailman** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT094E Batchman could not open the mailbox file Courier.msg. The following gives more details of the error: "error_text"

Explanation: See message. **Batchman** writes mailbox records to this file and **jobman** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT095E Batchman could not access the mailbox file Symphony.msg for reading or writing. The following gives more details of the error: "error_text"

Explanation: See message.

error_text contains the reason why **batchman** could not access the Symphony file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT096E Batchman could not read from the mailbox file Intercom.msg. The following gives more details of the error: "error_text"

Explanation: See message. **Batchman** writes mailbox records to this file and **mailman** processes them.

error_text contains the reason why **batchman** could not read the file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT097E Batchman could not write to the mailbox file Intercom.msg. The following gives more details of the error: "error_text"

Explanation: See message. **Batchman** writes mailbox records to this file and **mailman** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT098E Batchman could not write to the mailbox file Courier.msg. The following gives more details of the error: "error_text"

Explanation: See message. **Batchman** writes mailbox records to this file and **jobman** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT099E AAn internal error has occurred. Batchman could not write to the mailbox file Server.msg. The following error was generated: "error_text"

Explanation: **Batchman** writes mailbox records to the Server.msg file and **PlanMonitor** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** stops.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT156E Batchman could not open the mailbox file DeadMessage.msg. The following gives more details of the error: "error_message"

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: **Batchman** stops.

Operator response: Verify that there is sufficient space in the file system of the `ftbox` directory and that the `TWSuser` has the authority to create files in that directory. If not, create more space or grant the user that authority.

If one of these is not the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT157E Batchman could not read the mailbox file DeadMessage.msg.

Explanation: See message text.

System action: **Batchman** proceeds.

Operator response: Verify if the `TWSuser` has the authority to read files in `ftbox` directory. If not, grant the user that authority.

If this is not the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT158E Batchman could not write to the mailbox file DeadMessage.msg. The message has been lost.

Explanation: See message.

System action: **Batchman** proceeds, but the message that it wanted to write to the deal message queue could not be written, and has been lost.

Operator response: To avoid problems with other

AWSBHT159E • AWSBHT217E

messages destined for this queue, verify that there is sufficient space in the file system of the `ftbox` directory and that the `TWSuser` has the authority to create files in that directory. If not, create more space or grant the user that authority.

If one of these is not the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT159E Batchman could not write to the mailbox file `DeadMessage.msg` because the file is full. The message has been lost.

Explanation: See message. Incoming messages refer to missing objects in Symphony file and they are discarded if the file is full.

System action: Batchman proceeds.

Operator response: Verify if any secondary link from another workstation to this workstation is not working, and if so, perform a link command to restore it. Remember that if a workstation does not open the primary link and all its secondary links it is not fully linked.

AWSBHT160E The `EvtLog` message file is full, events will not be logged until a new Symphony is produced. Recovery with event reapply is no more possible until that time.

AWSBHT210E Batchman encountered an error because the user name is not defined in the Symphony file.

Explanation: See message.

System action: Batchman proceeds.

Operator response: Verify that you have used the correct user name. Verify the database user definition. When the new plan is created, the user is added to the plan.

AWSBHT212W Batchman has determined a negative value for the run time for a job. The following error text contains useful information about the job: "`error_text`"

Explanation: See message.

`error_text` contains time related information about the job. Possible message are the following:

- Elapsed time: [time]
- Start date: [date]
- Start time: [time]
- End date: [date]
- End time: [time]

- Record Num: [number]
- Calculated negative elapse time for job `job_name`

System action: Batchman proceeds. The job is not run.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT214E Batchman could not create a new Sinfonia file during the network synchronization processing.

Explanation: See message.

System action: Batchman stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT215E Batchman could not open a new Sinfonia file during the network synchronization processing.

Explanation: Batchman was unable to open the Sinfonia file during the network synchronization processing.

System action: Batchman stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT216E Batchman could not access the Sinfonia file during the network synchronization processing.

Explanation: See message.

System action: Batchman stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT217E Batchman encountered an error while trying to allocate memory for its internal CPU table (`calloc` or `realloc`).

Explanation: See message.

System action: Batchman stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make

changes in memory management and paging to make more memory available to **batchman**. Rerun **batchman**.

2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **batchman**.
3. If the problem persists, reboot the workstation, and then rerun **batchman**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBHT228W The deadline for job stream "job_stream_name" has already passed.

Explanation: The processing of the job stream is running late and the deadline for completion has already passed.

System action: **Batchman** continues to process the job stream.

Operator response: None

AWSBHT230W Warning: Dependency !1 not found in Symphony;ignored.

AWSBHT231W A duplicated job termination (JT) record has been received for the following job: "job_name".

Explanation: Duplicate job termination messages have been received in respect of the same job.

The probable reason is that the job finished at about the same time as JnextPlan was run, and a brief synchronization problem occurred.

System action: **Batchman** continues.

Operator response: Compare the status of the job received on this workstation with the status of the job recorded at other workstations.

If you find different job statuses recorded in different places, and other jobs have ""FOLLOWS"" dependencies with respect to this job, you should resolve those dependencies manually.

If there are no dependencies, the presence of duplicate job termination records needs no action on your part.

AWSBHT233W An incorrect dependency has been detected for the following jobstream: "sched".Priority will be set to 0.

Explanation: The dependency record gets somehow corrupted. **Batchman** was unable to determine if the dependency was satisfied or not.

System action: **Batchman** cleaned out the dependency

and set the priority to 0 to prevent job or jobstream from run.

Operator response: Check if the jobstream can run. If yes, change its priority.

AWSBHT234W An incorrect dependency has been detected for the following job: "job".Priority will be set to 0.

Explanation: The dependency record gets somehow corrupted. **Batchman** was unable to determine if the dependency was satisfied or not.

System action: **Batchman** cleaned out the dependency and set the priority to 0 to prevent job or jobstream from run.

Operator response: Check if the job can run. If yes, change its priority.

AWSBHT235E An internal error has occurred. Batchman could not write to the mailbox file planbox.msg. The following error was generated: "error_text"

Explanation: **Batchman** writes mailbox records to the Planbox.msg file and **PlanboxMonitor** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT236E An internal error has occurred. Batchman could not write to the mailbox file mirrorbox.msg. The following error was generated: "error_text"

Explanation: **Batchman** writes mailbox records to the mirrorbox.msg file and **PlanUpdateMonitor** processes them.

error_text contains the reason why **batchman** could not open the file.

System action: **Batchman** continues.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHT237E An internal error has occurred. Batchman is unable to extend the Symphony file and then it cannot manage the mailbox message queue. A possible cause is a full file system.

Explanation: Batchman is unable to update the symphony file.

System action: Batchman exits.

Operator response: Check the file system and restart the agent.

Chapter 98. AWSBHU - Conman messages

This section lists error and warning messages that might be issued by the conman component.

The message component code is BHU.

AWSBHU001E Conman encountered an error when attempting to open the Symphony file: the file does not exist or conman could not find it. The following gives more details of the error: "error_text".

Explanation: See message.

error_text is the error message. It supplies you with more details about the error causes.

System action: The command is not processed.

Operator response: If the Symphony file exists verify that the owner is the Tivoli Workload Scheduler user and that the user has permission to access and modify it. If the program is not able to read the Symphony file or the Symphony file is not present, follow the procedure described in the section on ""Symphony file corruption"" in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU002E Conman encountered an error when attempting to open either the Mailbox.msg file or the Intercom.msg file. The following gives more details of the error: "error_text".

Explanation: The file might not exist, or conman might not have permission to access it.

error_text contains more details about the causes of this error.

System action: The command is not processed.

Operator response: Check that both of these files exist, and that conman has permission to access them. To recreate these files, follow this procedure:

1. Run the **conman stop** command with a **wait** argument
2. Run the **conman start** command.

If the problem occurred on z/OS, a memory dump has been taken to aid with problem determination. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

- A tar file of the Tivoli Workload Scheduler work directory (*nullTWS_home*>)

- The memory dump.

See *The User's Guide and Reference* for more details about start and stop commands.

AWSBHU003E Conman encountered an error while initializing because the Security file does not exist or could not be found. The following gives more details of the error: "error_text"

Explanation: See message.

error_text is an error message.

System action: Conman stops.

Operator response: Verify if this file exists. If it does not, try to recreate it, as follows:

1. Run the **wmaeutil** command to stop the connectors.
2. Run the **makesec** command to create the Security file. On Windows you must use the **wmaeutil** command before using the **makesec** command, while on UNIX they can be performed in either sequence.
3. Restart **conman**.

See The chapter on setting security in the *Administration Guide* for more details.

AWSBHU004E The job logon name you specified is not valid.

Explanation: You have issued a command that includes the job parameter logon or streamlogon. The value for this parameter includes the string ""\\", which is not valid in a user id.

System action: The command is not processed.

Operator response: Modify the value of the job parameter logon or streamlogon, and resubmit the command.

AWSBHU009E Conman encountered a problem trying to read the Symphony file. The following gives more details of the error: "error_text"

Explanation: See message.

error_text is the error message, which provides you

with more details about the error causes.

System action: Conman stops.

Operator response: Check if the Symphony file exists. If it does, verify that the owner is the Tivoli Workload Scheduler user and that the user has the rights to access and modify it. If the program is not able to read the Symphony file or the Symphony file does not exist, follow the procedure described in the chapter on ""Symphony file corruption"" in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU010E For record # "record_number", conman found an incorrect Symphony file record type: "record_type_found". It was expecting the following type: "record_type_expected".

Explanation: See message.

record_number is the record number.

record_type_expected is the record type expected.

record_type_found is the record type found.

System action: Conman stops.

Operator response: Try to recreate the Symphony file. Follow the procedure described in the chapter on ""Symphony file corruption"" in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU016E One of the values specified for a numeric argument is not numeric.

Explanation: You have specified a non-numeric value to an argument of a command that is expected to be numeric.

System action: The command is not processed.

Operator response: Check the syntax of the issued command and verify that the values supplied for all the arguments are syntactically correct. Then re-issue the command.

See The *User's Guide and Reference*.

AWSBHU017E A value specified for a range-limited numeric argument is below the minimum permitted value. The permitted range is from: "minimum" to "maximum".

Explanation: See message.

minimum is the minimum permitted value. *maximum* is the maximum permitted value.

System action: The command is not processed.

Operator response: Check the syntax of the issued command and verify that the values of any range-limited arguments are within the indicated range. Then re-issue the command.

See The *User's Guide and Reference*.

AWSBHU018E A value specified for a range-limited numeric argument is above the maximum permitted value. The permitted range is from: "minimum" to "maximum".

Explanation: See message.

minimum is the minimum permitted value. *maximum* is the maximum permitted value.

System action: The command is not processed.

Operator response: Check the syntax of the issued command and verify that the values of any range-limited arguments are within the indicated range. Then re-issue the command.

See The *User's Guide and Reference*.

AWSBHU021E The agent on workstation: "workstation_name" cannot be started because it has not got the latest Symphony file version.

Explanation: This error occurs when you use the **start** command to start an agent on a remote workstation that has not been linked for some reason.

workstation_name is the remote workstation name.

System action: The command is not processed.

Operator response: Use the **conman link** command to initialize the workstation.

See The *User's Guide and Reference* for more details about the link command.

AWSBHU022E The time value specified as an argument is incorrect. It must be numeric, between 0000 and 2359.

Explanation: See message. Tivoli Workload Scheduler uses a form of the 24-hour clock without a separator between minutes and hours, so that, for example, 9:30 a.m. is written as 0930 and 3 p.m. as 1500.

System action: The command is not processed.

Operator response: Check the syntax of the issued command and verify that the values of any time arguments are between 0000 and 2359. Then re-issue the command.

See The *User's Guide and Reference*.

AWSBH023E You have issued an opens job qualifier with incorrect syntax.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the issued command and verify that the values of **opens** job qualifiers are syntactically correct. Then re-issue the command.

See *The User's Guide and Reference* for details of the conman job qualifiers syntax.

AWSBH024E The mozart directory cannot be accessed or is missing some files.

Explanation: Usually this error happens when the mozart database on the master domain manager is not accessible to the workstation where you issued the command, and in one of the following situations:

- You have tried to add a prompt dependency to a job or job stream.
- You have tried to submit a job or job stream that has a prompt dependency.

System action: The command is not processed.

Operator response: Verify the mozart directory properties. If you want to manage a prompt dependency, the mozart directory (nullTWSHomenu1/mozart) on the master domain manager must be accessible, either mounted or shared. If the mozart directory is shared and mounted, verify that the Tivoli Workload Scheduler user has the rights to access its files.

If you have found an error, correct it and re-issue the command.

If you cannot find any error, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBH025E Conman either cannot find the job stream in the Symphony file, or the specified workstation name is not correct.

Explanation: See message.

System action: The command is not processed.

Operator response: Take the following steps:

1. Look in the Symphony file and verify if the job stream exists and if its name has been correctly specified.
2. If the job stream details are correct, verify that the workstation name identifies an existing workstation.
3. If an error is found, correct it and re-issue the command.

4. If no error is found, the Symphony file might be corrupt. In this case follow the procedure described in the chapter on "Symphony file corruption" in the Troubleshooting guide.

See *The User's Guide and Reference* for 'Selecting job stream in commands'. See also The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBH028E The recovery action is not correct. It must be one of the following: STOP, CONTINUE, RERUN.

Explanation: You have supplied a *recovery* action that is incorrectly typed, or not supported. Only the following are permitted:

- recovery=STOP
- recovery=CONTINUE
- recovery=RERUN

System action: The command is not processed.

Operator response: Reissue the command, supplying one of the permitted *recovery* actions.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBH029E Fatal: Should not be here: !1 [#!2].

AWSBH030E DCM Pak required to use this feature.

AWSBH031E The number of minutes must be an integer value between 0 and 59.

Explanation: The number of minutes must be an integer value between 0 and 59.

System action: The command is not processed.

Operator response: Specify the number of minutes as an integer number between 0 and 59 and retry the operation.

See *The User's Guide and Reference*.

AWSBH032E You have issued a rerun command that does not uniquely identify a workstation.

Explanation: **Conman** shows this error when the **rerun** command you issued does not identify a unique workstation name in the **from** argument. This command cannot be applied to more than one workstation at one time.

System action: The command is not processed.

Operator response: Specify the correct workstation name in the **from** argument, without the use of wildcards, and rerun the command.

See *The User's Guide and Reference* for 'Selecting job stream in commands' and the description of the rerun command.

AWSBHU033E You have supplied more instances of a dependency option than are permitted by the issued command.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command specifying the correct number of dependency options.

See *The User's Guide and Reference* for more details about dependencies.

AWSBHU034E You have not supplied a mandatory selection argument (job, or job stream, for example).

Explanation: You have issued a command that has a mandatory selection argument (to select a job, or job stream, for example) and you did not specify one. The selection specifies the object or set of objects the command acts on.

System action: The command is not processed.

Operator response: Rerun the command specifying a valid selection argument.

See *The User's Guide and Reference* for details of all command arguments.

AWSBHU035E You have issued a command with a dependency keyword (follows, needs, opens, prompt), but the value associated with the keyword is not valid.

Explanation: See message.

System action: The command is not processed.

Operator response: Check that the value associated with the dependency keyword is syntactically correct, and that any object it refers to exists. Correct the error and re-issue the command.

See *The User's Guide and Reference* for details of the syntax of the dependency keywords.

AWSBHU037E Conman has stopped with the following internal error: Non-valid trap action.

Explanation: See message.

System action: Conman stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU038E Conman cannot run the command because the command string has too many characters.

Explanation: See message. The number of characters accepted by the command line is operating system-dependent.

System action: The command is not processed.

Operator response: Check your operating system documentation to determine the maximum acceptable length. Change the command to conform to this restriction. You might need to divide the command into two or more commands.

See *The User's Guide and Reference* for details of the command syntax, and to find ways of reducing the number of characters in the command.

AWSBHU039E You have issued a command containing an incorrect argument keyword. The acceptable keywords for this command are as follows: "keyword_list"

Explanation: See message.

keyword_list is the list of accepted argument keywords.

System action: The command is not processed.

Operator response: Correct the argument keyword to one shown in the list, and re-issue the command.

See *The User's Guide and Reference* for details of the syntax of the command.

AWSBHU040E You have issued a command containing an incorrect delimiter. The accepted delimiters are the following: "delimiters"

Explanation: See message.

delimiters is a list of accepted delimiters or qualifiers for this command.

A delimiter or qualifier is a special character that separates two commands, selection items, parameters, or values in an argument. There are several types:

- The command delimiter: "\$" - separates one command from the next command.
- The argument delimiter: ";" - separates arguments.
- The repetition delimiter: ":", "~" - separates different values, for example range values.
- The value delimiter: "=" - separates a keyword and its value.
- The selection qualifier: - separates selection items
 - "+" - indicates additional selection criteria
 - "~" - indicates exclusion criteria.

System action: The command is not processed.

Operator response: Correct the delimiter you have used to conform to the supplied list and to correspond to the indicated usage.

See *The User's Guide and Reference*.

AWSBH041E You have entered the following command: "command ", which requires access to the Symphony file. However, either the Symphony file does not exist or conman cannot find it.

Explanation: See message.

command is the **conman** command requiring the Symphony file.

System action: The command is not processed.

Operator response: Follow this procedure:

1. Look for the Symphony file
2. If the Symphony file exists verify that the owner is the Tivoli Workload Scheduler user and that the user has the rights to access and modify it
3. If the Symphony file exists, and the access permissions are correct, it means that it is corrupted. Follow the procedure described in the chapter on ""Symphony file corruption"" in the Troubleshooting guide.
4. If the Symphony file is not present, follow the procedure described in the chapter on ""Symphony file corruption"" in the Troubleshooting guide.

When you have completed the corrective action, retry the command.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBH042E You have entered the following command: "command", which requires access to the current (latest) Symphony file. However, the Symphony file that conman has found does not contain the latest production plan.

Explanation: See message.

command is the **conman** command requiring the Symphony file.

System action: The command is not processed.

Operator response: Set the production plan (Symphony file) to the current, using the **conman setsym** command.

See *The User's Guide and Reference*.

AWSBH043E You have issued a command that specifies a dependency. However, either conman cannot find the dependency in the Symphony file, or the command has an invalid dependency argument.

Explanation: See message.

System action: The command is not processed.

Operator response: Follow this procedure:

1. Check the dependency argument that you supplied is valid and correctly formed.

Verify if the object on which the dependency relies exists in the Symphony file.

See *The User's Guide and Reference* for more details.

AWSBH044E You have issued a command with a file dependency, but the path name of the file you have supplied is not fully qualified (absolute).

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command using a fully qualified filename.

See *The User's Guide and Reference*.

AWSBH045E You have issued the following command: "command " with one or more arguments, but this command does not have any arguments.

Explanation: See message. For example, use the command **redo** to edit and re-issue the previous command, but it does not have any arguments. If you type **redo showjobs**, this message is displayed.

command is a **conman** command.

System action: The command is not processed.

Operator response: Reissue the command without arguments.

See *The User's Guide and Reference*.

AWSBH046E Conman has encountered an internal error; encountering the following incorrect selection type: "selection_type". The problem was encountered in the following source file "file_name", at line "line_number".

Explanation: See message.

selection_type is the selection type found.

file_name and *line_number* identify the line of source code where the problem was found.

System action: Conman stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBH047E A command has been supplied without its required selector.

Explanation: Conman commands have the following structure:

- The command name
- A selector that identifies the object or objects on which the command acts. The selector might or might not use a keyword. For example, the **showjobs** command has no keyword; you just enter the identifier of the job you want to look at. However, the **adddep** command uses the keywords: **job** and **sched**, to identify whether it is acting on a job or a job stream.
- One or more arguments that control the action of the command on the object or objects

You have not supplied an identifiable selector.

System action: The command is not processed.

Operator response: Re-issue the command, adding a valid selector after the command name and before the arguments.

See *The User's Guide and Reference* for full details of the syntax of the command.

AWSBH048E A command has been supplied with an ambiguous selector.

Explanation: Conman commands have the following structure:

- The command name
- A selector that identifies the object or objects on which the command acts. The selector might or might not use a keyword. For example, the **showjobs** command has no keyword; you just enter the identifier of the job you want to look at. However, the **adddep** command uses the keywords: **job** and **sched**, to identify whether it is acting on a job or a job stream.
- One or more arguments that control the action of the command on the object or objects

The selector supplied does not unambiguously identify the object on which the command must act. The command might require a selector keyword that you have not supplied.

System action: The command is not processed.

Operator response: Re-issue the command, ensuring that the selector contains a keyword, if required, and that the syntax indicated in the *User's Guide and Reference* has been followed.

See *The User's Guide and Reference* for more details.

AWSBH049E You have issued a command with a selector keyword, but the supplied selector keyword is not valid.

Explanation: Conman commands have the following structure:

- The command name
- A selector that identifies the object or objects on which the command acts. The selector might or might not use a keyword. For example, the **showjobs** command has no keyword; you just enter the identifier of the job you want to look at. However, the **adddep** command uses the keywords: **job** and **sched**, to identify whether it is acting on a job or a job stream.
- One or more arguments that control the action of the command on the object or objects

The selector supplied is not a valid selector keyword.

System action: The command is not processed.

Operator response: Re-issue the command, adding a valid selector after the command name and before the arguments.

See *The User's Guide and Reference* for full details of the syntax of the command.

AWSBH050E You have issued a command with a selector keyword, but the supplied selector keyword is not valid for this command.

Explanation: Conman commands have the following structure:

- The command name
- A selector that identifies the object or objects on which the command acts. The selector might or might not use a keyword. For example, the **showjobs** command has no keyword; you just enter the identifier of the job you want to look at. However, the **adddep** command uses the keywords: **job** and **sched**, to identify whether it is acting on a job or a job stream.
- One or more arguments that control the action of the command on the object or objects

The selector keyword supplied is not a valid selector keyword for this command.

System action: The command is not processed.

Operator response: Re-issue the command, adding a valid selector after the command name and before the arguments.

See *The User's Guide and Reference* for full details of the syntax of the command.

AWSBH051E You have issued a command with a valid selector keyword, but have omitted to identify the object.

Explanation: Conman commands have the following structure:

- The command name
- A selector that identifies the object or objects on which the command acts. The selector might or might not use a keyword. For example, the **showjobs** command has no keyword; you just enter the identifier of the job you want to look at. However, the **adddep** command uses the keywords: **job** and **sched**, to identify whether it is acting on a job or a job stream.
- One or more arguments that control the action of the command on the object or objects

You have probably issued a command with its selector keyword, but have not included the object identifier. For example, issuing **adddep job** without identifying which job.

System action: The command is not processed.

Operator response: Re-issue the command, adding a valid selector after the command name and before the arguments.

See *The User's Guide and Reference* for more details.

AWSBH052E You have issued a command with the job qualifier state, but the identified state is not appropriate for the object identified in the command.

Explanation: See message. For example, **stuck** is not a valid state for a job and **pend** is not a valid state for a job stream.

System action: The command is not processed.

Operator response: Change the value of the **state** argument to a valid state for the object of the command, and re-issue the command.

See *The User's Guide and Reference* for details of the values available when the state argument can be used.

AWSBH053E You have issued a command that identifies a file, but the path name of the file you have supplied is not fully qualified (absolute).

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command using a fully qualified file name.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBH054E You have issued a show... command other than **showjobs**, and have used the argument "argument" without its associated **;deps** argument.

Explanation: The **;info** argument is only used on its own in the **showjobs** command. In all other commands where it appears, it is one possible value of the **;deps** argument.

System action: The command is not processed.

Operator response: Correct the syntax and re-issue the command.

See *The User's Guide and Reference*.

AWSBH055E You have used one of the limit commands, but did not supply a value for the limit, or you supplied it with an incorrect syntax.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the limit command providing a value for the limit. You can enter 0 through 1024.

See *The User's Guide and Reference* for details of the specific command.

AWSBH056E You have used the fence command, but did not supply a value for the new priority level, or you supplied it with an incorrect syntax.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the fence command providing a value for the priority level. You can enter a numeric value from 0 to 101, **""hi""** (= 100), or **""go""**.

See *The User's Guide and Reference* for full details of the fence command.

AWSBH058E The command issued for workstation "workstation_name" cannot be performed, because the workstation is an extended agent, where the command is not supported.

Explanation: See message.

workstation_name is the extended agent workstation name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the extended agent workstation in error, change the command to identify a different workstation and

re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU059E You have identified a file name that has a base name greater than "maximum_length" bytes. This file name is not permitted.

Explanation: The file base name is the name of the file, including the extension and the dot separator, but excluding the directory names in the full path. For example, "" myfilenamel.txt "" is 14 bytes.

maximum_length is the longest file base name accepted.

System action: The command is not processed.

Operator response: Shorten the name of the file so that it is no greater than the value of the *maximum_length* indicated and re-issue the command.

See *The User's Guide and Reference*.

AWSBHU060E You have issued a command that has attempted to modify or delete the EXTERNAL job stream. This is not permitted.

Explanation: The EXTERNAL job stream is used to monitor the status of internetwork dependencies, and cannot be modified or deleted.

System action: The command is not processed.

Operator response: To modify an internetwork dependency for a given job you have to use the **conman adddep** and **deldep** commands on that job.

See *The User's Guide and Reference* for more details about the **adddep** and **deldep** commands.

AWSBHU061E The domain manager of this workstation cannot be found in the Symphony file.

Explanation: The circumstances are one of the following:

- You issued a **switchmgr** command specifying a domain and a new manager.
- You issued a **start** command with the **mgr** option on this workstation.

In either case, you tried to switch to a domain manager that **conman** cannot find in the Symphony file.

System action: The command is not processed.

Operator response: If Tivoli Workload Scheduler is running several **switchmgr** or **start** commands from several workstations, it is possible that it has not completed one or more of the commands, and until those commands are completed cannot successfully run this command. Wait until it has completed these activities.

AWSBHU062W The MGR option is valid only on the local workstation. Ignoring it.

Explanation: A command has been issued remotely using the MGR option, which is valid only on the local workstation.

System action: The command is processed, ignoring the MGR option.

Operator response: None.

AWSBHU063E The domain manager "current_manager" is not in the same domain as the workstation that you want to become the new domain manager: "new_manager".

Explanation: There are two possibilities:

1. You are using the **switchmgr** command to switch the domain manager of your domain to a fault-tolerant agent not belonging to your domain.
2. You issued a **start** command with the **;mgr** option on the local workstation, to make it exchange roles with its current domain manager (this method of switching domain managers is deprecated - use the **switchmgr** command).

If this error arises from this activity, an internal error has occurred.

current_manager is the name of the current domain manager. *new_manager* is the workstation that you want to become the new domain manager.

System action: The command is not processed.

Operator response: The response depends on what you were doing when the error occurred:

1. If you were using **switchmgr**, repeat the command selecting as *new_manager* a fault-tolerant agent belonging to your domain. Alternatively, if the *new_manager* workstation is in the domain of the *current_manager*, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.
2. If you were using the **start ;mgr** command, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU064E The domain manager "new_manager" is not a fault-tolerant agent.

Explanation: There are two possibilities:

1. You are using the **switchmgr** command to switch the domain manager of your domain to a workstation that is not a fault-tolerant agent.
2. You issued a **start** command with the **;mgr** option on a workstation which is not a fault-tolerant agent (this method of switching domain managers is deprecated - use the **switchmgr** command).

new_manager is the workstation that you want to become the new domain manager.

A backup domain manager has to be a fault-tolerant agent that operates in full status mode, because it has to be updated with the status of jobs and job streams running on all other workstations in its domain and in subordinate domains.

System action: The command is not processed.

Operator response: The response depends on what you were doing when the error occurred:

1. If you were using **switchmgr**, repeat the command selecting as *new_manager* a fault-tolerant agent operating in full status mode. Alternatively, if the *new_manager* workstation is operating in full status mode, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.
2. If you were using the **start ;mgr** command, you cannot run it on this workstation. You must either choose a different fault-tolerant agent, or promote this agent to be fault-tolerant (see the *Planning and Installation Guide* for details.)

AWSBH065E The specified new domain manager is not full status.

Explanation: There are two possibilities:

1. You are using the **switchmgr** command to switch the domain manager of your domain to a fault-tolerant agent that is not full status.
2. You issued a **start** command with the **;mgr** option on a fault-tolerant agent that is not full status (this method of switching domain managers is deprecated - use the **switchmgr** command).

A backup domain manager has to operate in full status mode, because it has to be updated with the status of jobs and job streams running on all other workstations in its domain and in subordinate domains.

System action: The command is not processed.

Operator response: The response depends on what you were doing when the error occurred:

1. If you were using **switchmgr**, repeat the command either selecting a fault-tolerant agent operating in full status mode or first setting the mode of the chosen workstation to full status.

To do this, run the **composer mod** command with the 'cpu=nullworkstation>' option. When the editor displays the workstation definition, set the *fullstatus* option to *on*. Then run **JnextPlan**. See the *User's Guide and Reference* for more details.

2. If you were using the **start ;mgr** command, either choose a different fault-tolerant agent operating in full status mode on which to run the command, or change the mode of this workstation, as described for the **switchmgr** command, above.

See *The User's Guide and Reference*.

AWSBH066E The domain you supplied to the switchmgr command is not in the Symphony file.

Explanation: See message.

System action: The **switchmgr** command is not processed.

Operator response: The procedure to follow is as follows:

1. Verify if the supplied domain is correct and exists. If it is not, select a valid domain and rerun the command.
2. If the supplied domain name is correct and the domain must have been found in the Symphony file, the user who issued the command might not have access rights to the Symphony file. Verify that the owner of the file is the Tivoli Workload Scheduler user and that this user has the rights to access and modify it. If any of these requirements are not true, correct the problem and rerun the command.
3. If the program is not able to read the Symphony file or the Symphony file is not present, see the chapter on "Symphony file corruption" in the Troubleshooting guide. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See *The User's Guide and Reference* for details of the **switchmgr** command, and this guide for a description of how to solve a corruption of the Symphony file.

AWSBH067E A manager workstation has not been specified for the switchmgr command.

Explanation: See message.

System action: The **switchmgr** command is not processed.

Operator response: Rerun the **switchmgr** command ensuring that you supply a domain and a manager workstation.

See *The User's Guide and Reference* for details of the **switchmgr** command.

AWSBH068E The following workstation supplied to the switchmgr command is not in the Symphony file: "workstation_name".

Explanation: See message. The workstation that you want to become the domain manager must be a fault-tolerant agent operating in full status mode.

workstation_name is the workstation not found in the Symphony file.

System action: The command is not processed.

Operator response: The procedure to follow is as follows:

1. Verify if the supplied workstation name is correct and it is a fault-tolerant agent operating in full status mode. If it is not, either select a different workstation that satisfies these criteria, or modify the selected workstation to satisfy them; then rerun the command.
2. If the supplied workstation name is correct and the workstation should have been found in the Symphony file, the user who issued the command might not have access rights to the Symphony file. Verify that the owner of the file is the Tivoli Workload Scheduler user and that this user has the rights to access and modify it. If any of these requirements are not true, correct the problem and rerun the command.
3. If the program is not able to read the Symphony file or the Symphony file is not present, see the chapter on 'Symphony file corruption' in the Troubleshooting guide. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *User's Guide and Reference* for details of the switchmgr command, and this guide for a description of how to solve a corruption of the Symphony file.

AWSBHU069E Too many parameters have been supplied to this switchmgr command.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command with the correct syntax.

See The *User's Guide and Reference* for the correct syntax of this command.

AWSBHU070E The following domain name could not be found in the Symphony file: "domain_name".

Explanation: You have issued a command referring to a domain name that is not in the Symphony file.

domain_name is the domain not found in the Symphony file.

System action: The command is not processed.

Operator response: The procedure to follow is as follows:

1. Verify if the supplied domain is correct and exists. If it is not, select a valid domain and rerun the command.
2. If the supplied domain name is correct and the domain ought to have been found in the Symphony file, the user who issued the command might not have access rights to the Symphony file. Verify that

the owner of the file is the Tivoli Workload Scheduler user and that this user has the rights to access and modify it. If any of these are not true, correct the problem and rerun the command.

3. If the program is not able to read the Symphony file or the Symphony file is not present, see the chapter on ""Symphony file corruption"" in the Troubleshooting guide. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *User's Guide and Reference* for details of the switchmgr command, and this guide for a description of how to solve a corruption of the Symphony file.

AWSBHU071E An error was encountered accessing the following file: "file_name". The following gives more details of the error: "error"

Explanation: **Conman** encountered an error during the retrieving of the selected file or file list. If you used the **setsym** command, **conman** cannot access the list of archived Symphony files or the Symphony file you selected.

error is either a Symphony file access error message or a system error, or an error number. *file_name* is the file **conman** is trying to open. If the object is a file list, this field is blank.

System action: The command is not processed.

Operator response: Verify that the owner of the files or the directory selected is the Tivoli Workload Scheduler user, and that that user has the right to access it. Change the user permissions if needed.

AWSBHU072E There are no objects that match the selection you have entered.

Explanation: See message.

If you are trying to select a job consider that it might have been archived.

System action: The command is not processed.

Operator response: Check if the object you are trying to select exists. If it exists, you might be using an incorrect selection format. For example if you use the selection format *wkstation#jobstream.job* to select jobs, the workstation has to be the workstation where the job stream exists, not the workstation where the job is run. On the other hand, if you use the format *wkstation#job*, the workstation refers to the workstation where the job is run. Verify you are using the right selection format for the object the command acts on and rerun the command.

Check whether the job has been stored consulting the properties `SuccessfulJobsMaxAge` and `UnsuccessfulJobsMaxAge` in the configuration file

JobDispatcherConfig.properties.

See *The User's Guide and Reference* for details of the syntax and descriptions and examples of how to select objects or change the archiving properties.

AWSBH073E The mozart database does not exist, or cannot be opened or accessed. The following gives more details of the error: "error_text".

Explanation: See message.

error_text is an optional error message. It provides you with more details about the cause of the error.

System action: Conman stops if it requires the mozart database to continue. If it can continue in the absence of the file it does so.

Operator response: Check that the mozart database exists, is in the correct directory, and that the user has the right to open it. Check also that there is sufficient disk space for the file to be opened.

AWSBH075E The following incorrect conman command has been used: "command".

Explanation: See message.

command is the incorrect command.

System action: The command is not processed.

Operator response: Check the correct format of the command you want to use in the User's Guide and Reference.

See *The User's Guide and Reference*.

AWSBH076E Conman cannot process the issued command. The following error occurred: "error_text"#

Explanation: *error_text* indicates the reason for the problem.

System action: The command is not processed.

Operator response: Check the *error_text* for more details about the problem.

See *The User's Guide and Reference*

AWSBH077E The issued show command does not indicate the object or objects which you want the command to show.

Explanation: See message.

System action: The command is not processed.

Operator response: Reissue the command using the correct syntax.

See *The User's Guide and Reference*.

AWSBH078E An internal error has occurred. The following command number is not correct for the show command: "command_number". The problem was encountered in the following source file "file_name", at line "line_number".

Explanation: *command_number* is an internal code identifying the command that is not valid.

file_name and *line_number* identify the line of source code where the problem was found.

System action: Conman stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBH079E An internal error has occurred. CmdLink needs more workspace; it needs: "required_space", but only: "available_space" is available.

Explanation: Conman cannot allocate enough space for a work buffer.

required_space is the required space. *available_space* is the available space.

System action: Conman stops.

Operator response: Check the "" nullTWS_home> "" file system to ensure that there is sufficient space. When you have resolved the problem, retry the operation.

AWSBH080E An internal error has occurred. The following keyword is not correct: "keyword_number". The problem was encountered in the following source file "file_name", at line "line_number".

Explanation: Conman does not recognize a keyword.

keyword_number is an internal code identifying the keyword that conman does not recognize.

file_name and *line_number* identify the line of source code where the problem occurred.

System action: Conman stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBH081E An internal error has occurred. The following record type is not a valid mailbox record type: "record_type". The problem was encountered in the following source file "file_name", at line "line_number".

Explanation: Conman does not recognize a record type in a mailbox file.

AWSBHU082E • AWSBHU091E

record_type is the internal record type that **conman** does not recognize.

file_name and *line_number* identify the line of source code where the problem occurred.

System action: **Conman** stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU082E Modification is not authorized.

AWSBHU083E The issued command cannot be applied to the USERJOBS job stream.

Explanation: The USERJOBS job stream is a special job stream that includes all the jobs that are not in the job stream CARRYFORWARD started in the previous Production Plan. In the USERJOBS job stream you cannot run commands like **cancel**, **altpri**, **limit**, or **rerun**.

System action: The command is not processed.

Operator response: Check that you have used the correct command and have not identified the USERJOBS job stream by mistake.

See *The User's Guide and Reference* for details of the commands that can be run against the USERJOBS job stream.

AWSBHU084E The issued command cannot be applied to the JOBS job stream.

Explanation: The JOBS job stream is a special job stream that includes all the Ad-Hoc jobs you submit without specifying a target job stream (argument INTO). On this job stream you cannot run commands like **cancel**.

System action: The command is not processed.

Operator response: Check that you have used the correct command and have not identified the JOBS job stream by mistake.

See *The User's Guide and Reference* for details of the commands that can be run against the JOBS job stream.

AWSBHU085E This job or job stream is not in the correct state to apply the issued command.

Explanation: See message.

System action: The command is not processed.

Operator response: Check that you have correctly identified the job or job stream. Check which states are acceptable for running commands. Wait until the job or job stream is in the correct state and reissue the command.

See *The User's Guide and Reference* for the list of states accepted by the command.

AWSBHU086E You must be on the master to execute this command.

AWSBHU087E The selected job stream has already been cancelled.

Explanation: You cannot add a dependency to, submit a job to, or kill a job in a cancelled job stream.

System action: The command is not processed.

Operator response: Check that you have correctly identified the job stream and have issued the correct command.

See *The User's Guide and Reference*.

AWSBHU088E You cannot rerun user jobs.

Explanation: See message.

System action: The command is not processed.

Operator response: Select a valid job to rerun.

AWSBHU089E This parameter is only valid when using the from parameter with the rerun command.

Explanation: You tried to rerun the job using an `""at""` or a `""pri""` dependency without specifying the `""from""` keyword.

System action: The command is not processed.

Operator response: The *at* and *pri* dependencies can only be used if you specify the *from* parameter.

See *The User's Guide and Reference* for the correct syntax for the rerun command.

AWSBHU090E The job indicated by the from parameter does not exist in the database.

Explanation: See message.

System action: The command is not processed.

Operator response: Reissue the **rerun** command, selecting a valid job name for the *from* parameter.

See *The User's Guide and Reference*.

AWSBHU091E The alias or step name supplied for the job or job stream is not valid.

Explanation: You have either specified an alias name in a **submit** command or a step name in a **rerun** command. The name supplied is not valid. It must start with an alphabetic character, and must contain only alphanumeric characters, dashes, and underscores.

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid alias.

See *The User's Guide and Reference* for a description of how to use these aliases.

AWSBH092E This job or job stream has too many dependencies.

Explanation: The maximum number of dependencies that you can add to a job or a job stream is 40.

System action: The job or job stream is not processed.

Operator response: Rerun the job or job stream, defining fewer than 40 dependencies. Note: you might find that removing some dependencies to replace them with others does not work. For example, if you want to add 2 dependencies and you have reached the limit of 40, deleting 5 dependencies to add 2 might not work. In these cases replan your job dependencies.

See *The User's Guide and Reference* for more details.

AWSBH093E The issued rerun command did not specify the step name to use after the ;step parameter.

Explanation: See message.

System action: The command is not processed.

Operator response: Reissue the **rerun** command, supplying the parameter `;step=nullstep_name>` if you want to rename the job.

See *The User's Guide and Reference* for details of the rerun command.

AWSBH094E The following dependency keyword is an unknown dependency: "dependency_keyword". The problem was encountered in the following source file "file_name", at line "line_number".

Explanation: **Conman** does not recognize the dependency keyword.

dependency_keyword is an internal code.

file_name and *line_number* identify the line in the source code where the problem was found.

System action: **Conman** stops.

Operator response: Probably the Tivoli Workload Scheduler keyword you are using is not valid for the current command. See the *User's Guide and Reference* for more details about the valid keywords that you can pass to the command.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See *The User's Guide and Reference*.

AWSBH095E The job stream or job dependency "dependent_job_stream_or_job" was not found in the Symphony file.

Explanation: *dependent_job_stream_or_job* is the dependent job stream or job name identified by the `""follows""` dependency keyword.

System action: The command is not processed.

Operator response: Select a valid job name and rerun the command. You must select a job using the complete format (`nullworkstation_of_the_job_stream> # nulljob_stream> . nulljob>` or `nulljob_stream> . nulljob>`).

You can use the 'nocheck' option. In this case, **conman** does not check for the existence of the `nulljob_stream> . nulljob>` in the Symphony file. However, **batchman** does check its existence, and shows an error message in the stdlist if the `nulljob_stream> . nulljob>` does not exist.

See *The User's Guide and Reference*.

AWSBH096E You have specified a range of values for a command qualifier that does not accept ranges.

Explanation: **Conman** gives this error when the command string includes a range (a value followed by a comma) and the command itself or the qualifier used in this command does not accept ranges of values.

System action: The command is not processed.

Operator response: Correct the command syntax and rerun the command.

See *The User's Guide and Reference* for details of the permitted syntax for this command.

AWSBH097E You have not specified a values for a command qualifier that requires one.

Explanation: See message.

System action: The command is not processed.

Operator response: Correct the command syntax and rerun the command.

See *The User's Guide and Reference* for details of the permitted syntax for this command.

AWSBH098E An internal error has occurred. The following internal command is not a valid command: "command_number". The problem was encountered in the following source file "file_name", at line "line_number".

Explanation: **Conman** has encountered an internal error.

command_number is an internal code. It represents the

command that **conman** does not recognize.

file_name and *line_number* identify the line in the source code where the problem was found.

System action: Conman stops.

Operator response: Retry the command. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU099E The supplied path name exceeds the maximum size, which is: "maximum_size".

Explanation: See message.

maximum_size is the maximum number of bytes accepted in the path name.

System action: The command is not processed.

Operator response: Verify if the file name that you inserted is correct. If it is, move it to a shorter path name or rename directories in the path to have shorter names. Rerun the command using the shorter path.

See The *User's Guide and Reference*.

AWSBHU112E The supplied job specification is not in the correct format. You can use only **nullworkstation>#nulljob>** or **nulljob>**.

Explanation: See message.

System action: The command is not processed.

Operator response: A job specification is normally one of the following:

- **nullworkstation>#nulljob_stream>.nulljob>**
- **nulljob_stream>.nulljob>**
- **nullworkstation>#nulljob>**
- **nulljob>**

However, for this command **conman** only accepts the latter two formats (highlighted).

See The *User's Guide and Reference* for full details.

AWSBHU114E The supplied **switchmgr** command did not identify the domain, the new manager, or both.

Explanation: See message.

System action: The command is not processed.

Operator response: Reissue the **switchmgr** command, ensuring to identify the domain name and the new manager name.

See The 'switchmgr' command syntax in the *User's Guide and Reference*.

AWSBHU115E The user that has issued a **start ;mgr** or a **switchmgr** command does not have stop rights to the current domain manager: "current_manager". Conman therefore cannot start the new manager: "proposed_manager".

Explanation: See message.

current_manager is current domain manager.

proposed_manager is the proposed domain manager.

System action: The command is not processed.

Operator response: Either the Security file must be modified to give the user the required access, or a different user that has this access must issue the command.

See The *Planning and Installation Guide*.

AWSBHU116E The user that has issued a **start ;mgr** or a **switchmgr** command does not have start rights to the new domain manager: "proposed_manager".

Explanation: See message.

proposed_manager is the proposed domain manager.

System action: The command is not processed.

Operator response: Either the Security file must be modified to give the user the required access, or a different user that has this access must issue the command.

See The *Planning and Installation Guide*.

AWSBHU117E The **switchmgr** command cannot be completed. The workstation proposed as the new domain manager: "proposed_manager" is not in the supplied domain: "domain_name".

Explanation: See message.

proposed_manager is the proposed domain manager identified in the command.

domain_name is the domain where you want to switch the manager.

System action: The command is not processed.

Operator response: Reissue the command, selecting as *proposed_manager* a fault-tolerant agent operating in full-status mode and belonging to the domain.

AWSBHU118W Workstation !1 is already the manager of domain !2.

AWSBHU119E Wild cards are not permitted in the domain name parameter of the switchmgr command.

Explanation: You have used one or more wildcards (such as '@' or '?') in the specification of the domain name.

System action: The command is not processed.

Operator response: Rerun the command, supplying a fully qualified domain name.

See *The User's Guide and Reference* for more details about domain selection.

AWSBHU121E Conman could not identify the parent domain of the following workstation: "workstation_name".

Explanation: See message.

workstation_name is a workstation for which the parent domain could not be found.

System action: The command is not processed.

Operator response: Verify the `JnextPlan` `stdlist` file to discover if there was a problem during the creation of the plan (Symphony file). Solve the problem and create a new plan.

Alternatively, the Symphony file might be corrupted. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU122E The supplied command includes both the options short and single, which are mutually exclusive.

Explanation: See message.

System action: The command is not processed.

Operator response: Correct the syntax to include either the *short* or the *single* option, but not both, and rerun the command.

See *The User's Guide and Reference* for details of the syntax of this command.

AWSBHU123E The supplied command includes the option single, which can only be used when a Job Number is supplied.

Explanation: See message.

System action: The command is not processed.

Operator response: Reissue the command, identifying the job by means of its job number (the number that follows the `""#j""` in the output of the `show job` command).

See *The User's Guide and Reference* for full details.

AWSBHU126E A time zone has been specified in a time dependency, but time zone use has not been enabled for workstation: "workstation_name"

Explanation: See message.

workstation_name is the name of the workstation where the time dependency is to be resolved.

System action: The command is not processed.

Operator response: Either rerun the command without specifying a time zone or enable time zone use at the indicated workstation.

See *The Planning and Installation Guide* for more details.

AWSBHU127W Submitted !1 to batchman as !2# but workstation !3 not present in the Symphony file.

AWSBHU128W Dependency !1 might not be present in the Symphony file.

AWSBHU129E The issued submit command includes more than one nocheck keyword after a follows keyword, which is not permitted.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying not more than one *nocheck* keyword after each *follows* keyword.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU130E The issued command cannot be used. It is not allowed by the centralized security option, which is enabled for this domain.

Explanation: See message.

System action: The command is not processed.

Operator response: Check that it is correct that centralized security is enabled for the domain:

- If it is not, disable the *enable centralized security* global option using `optman`. However, note that this change is not effective until next `JnextPlan`.
- If it is, check if the security options on the master domain manager permit this command to be used:
 - If the security options do not permit the command to be used, consider changing them. However, any changes that you make are not effective until the next `JnextPlan`.

- If the security options permit the command to be used, the local Symphony file might be corrupt. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU131E Conman has been unable to obtain information about the remote workstation "workstation_name" because centralized security, which is enabled for this domain, does not allow it to.

Explanation: See message.

System action: The command is not processed.

Operator response: Check that it is correct that centralized security is enabled for the domain:

- If it is not, disable the *enable centralized security* global option using **optman**. However, note that this change is not effective until next **JnextPlan**.
- If it is, check if the security options on the master domain manager permit information to be obtained from remote workstations:
 - If the security options do not permit such information to be obtained, consider changing them. However, any changes that you make are not effective until the next **JnextPlan**.
 - If the security options permit such information to be obtained, the local Symphony file might be corrupt. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU132E You have issued a show jobs command, but the information you are requesting can only be supplied if the keyword keys is specified in the command.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command using the correct syntax.

AWSBHU133E You have supplied a return code condition expression that is longer than the maximum number of bytes permitted, which is: "number".

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, supplying a return code condition expression that is within the

maximum number of bytes permitted.

AWSBHU134E You have supplied a script path name and a return code condition expression, which are together longer than the maximum number of bytes permitted, which is: "number".

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, supplying a script path name and a return code condition expression that are together within the maximum number of bytes permitted.

AWSBHU135E You have supplied a return code condition expression that is enclosed in mismatched or missing quotes.

Explanation: The return code condition expression must be enclosed (preceded and followed) by the double quotes character ("").

System action: The command is not processed.

Operator response: Re-issue the command, supplying a return code condition expression that is enclosed by the double quotes character ("").

AWSBHU136E You have supplied a return code condition expression that could not be validated by Conman. The following gives more details of the error: "error_text".

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the expression, correct it and re-issue the command.

AWSBHU137W The user is not authorized to display the selected objects.

AWSBHU138E The issued submit command includes more than one wait keyword after a follows keyword, which is not permitted.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying not more than one *wait* keyword after each *follows* keyword.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU139E The issued submit command includes a wait keyword, but you have not supplied the associated numeric wait value.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying a numeric value for the *wait* keyword in the format *wait=nullnumber*>, where *nullnumber*> is the wait period in seconds, between 0 and 1200.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU140E The issued submit command includes a wait keyword, but the associated numeric wait value (seconds) is not between 0 and 1200.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying a numeric value for the *wait* keyword in the range 0 to 1200.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU141E The issued submit command includes a non-numeric or incorrect value for a time parameter. The valid values are from: "minimum_value" to "maximum_value".

Explanation: See message.

minimum_value to *maximum_value* is the valid range of numeric values.

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid numeric value for the time parameter that is within the indicated range.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU142E The issued submit command includes a date which is not valid or is not in the correct format. The accepted format is: "date_format".

Explanation: See message.

date_format is the permitted format.

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid date in the indicated format.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU143E The action associated with the *onuntil* attribute is not correct. It must be one of the following: *suppr*, *cont*, *canc*.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid action for the *onuntil* attribute.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU144E There is a syntax error. The schedule time is not valid or is not in the correct format. The correct format is *hhmm* or *hhmm "localopts_date_format"*.

Explanation: See message.

date_format is the permitted format for the date from the *localopts* file, for example, ""yymmdd"".

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid date in the indicated format.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU145E There is a syntax error. The job stream ID can contain only alphanumeric characters.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, specifying a valid job stream ID.

See *The User's Guide and Reference* for more information about specifying job streams.

AWSBHU146E There is a syntax error. The job stream ID must be between 1 and 16 bytes long.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, specifying a valid job stream ID.

See *The User's Guide and Reference* for more information about specifying job streams.

AWSBHU147E The keywords "keyword_1" and "keyword_2" are mutually exclusive. You cannot supply both of them.

Explanation: See message.

keyword_1 and *keyword_2* are the mutually exclusive keywords.

System action: The command is not processed.

Operator response: Verify the syntax of command. Resubmit the command specifying only one of the two indicated keywords.

See *The User's Guide and Reference* for more information about the syntax of the commands.

AWSBHU148E The keyword "keyword" cannot be used because the Symphony file was created by a previous version of Tivoli Workload Scheduler.

Explanation: *keyword* is the keyword that cannot be used with a Symphony file created by a previous version of Tivoli Workload Scheduler.

System action: The command is not processed.

Operator response: Verify the syntax of command. Resubmit the command, omitting the indicated keyword, or upgrade the workstation where the Symphony file was created to the latest version.

See *The User's Guide and Reference* for more information about the syntax of the commands.

AWSBHU149E The job stream or job dependency "dependent_job_stream_or_job" with the specified schedule time was not found in the Symphony file.

Explanation: *dependent_job_stream_or_job* is the dependent job stream or job name identified by the ""follows"" dependency keyword.

System action: The command is not processed.

Operator response: Select a valid job stream or job name and rerun the command.

You can use the 'nocheck' option. In this case, **conman** does not check for the existence of the `nulljob_stream> . nulljob>` in the Symphony file. However, **batchman** does check its existence, and shows an error message in the stdlist if the `nulljob_stream> . nulljob>` does not exist.

See *The User's Guide and Reference*.

AWSBHU150W An internal error has occurred. The program is unable to initialize the GSKit libraries.

Explanation: A problem has occurred with the installation or configuration of the GSKit libraries, or

both, and they cannot be initialized.

System action: The program cannot commence a secure connection, so stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU151E The supplied date is not valid or is not in the correct format. The correct format is "localopts_date_format".

Explanation: See message.

date_format is the permitted format for the date from the localopts file, for example, ""yymmdd"".

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid date in the indicated format.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU152E There is more than one job stream instance with the given name. You must refer to a single instance by specifying either the job stream ID or the scheduled start time.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying also either the job stream ID or the scheduled start time, to uniquely identify the instance of the job stream in the plan.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU153E The keyword "keyword_1" can only be supplied if the keyword "keyword_2" is specified.

Explanation: See message.

keyword_1 must be supplied only with keyword *keyword_2*.

System action: The command is not processed.

Operator response: Verify the syntax of command. Resubmit the command specifying the indicated keywords correctly.

See *The User's Guide and Reference* for more information about the syntax of the commands.

AWSBHU154E Either the `nocheck` argument or the `schedid` argument have been supplied without the required job stream ID.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, supplying a valid job stream ID with both the `""nocheck""` and the `""schedid""` arguments when they are used.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU155E You have submitted a command to be scheduled as a job (submit docommand) but have not included the command.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun `submit docommand`, supplying a the command to be scheduled.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU156E The workstation you specified is already the event processor.

Explanation: You have tried to set a workstation as the new event processor, but it is already the event processor.

System action: The command is not processed.

Operator response: Check why the selected workstation is already the event processor. It might be because another person has performed the operation you are trying to perform, or because you typed the workstation name incorrectly. Correct the error and retry the operation.

AWSBHU157E You have issued a command containing at least one incorrect argument keyword.

Explanation: The command contains at least one unsupported keyword.

System action: The command is not processed.

Operator response: Correct the syntax and retry the command.

See *The User's Guide and Reference* for details of the syntax of the command.

AWSBHU158E The command issued for workstation "`workstation_name`" cannot be performed, because the workstation is agent, or pool, or dynamic pool, or remote engine, or broker workstation,

where the command is not supported.

Explanation: See message.

`workstation_name` is the agent, or pool, or dynamic pool, or remote engine, or broker workstation name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the agent, or pool, or dynamic pool, or remote engine, or broker workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU159E The command issued for workstation "`workstation_name`" cannot be performed, because the workstation is broker agent, where the command is not supported.

Explanation: See message.

`workstation_name` is the broker agent workstation name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the broker agent workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU160E The command issued for workstation "`workstation_name`" cannot be performed, because of the following error: "`error`".

Explanation: See message.

System action: The command is not processed.

Operator response: This command failed on the selected workstation.

AWSBHU161E The command issued for workstation "`workstation_name`" cannot be performed, because the workstation is master domain manager, or domain manager, where the command is not supported.

Explanation: See message.

`workstation_name` is the master domain manager, or domain manager name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the master domain manager, or domain manager in error, change the command to identify a different workstation

and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU162E "file_name" file cannot be moved on workstation "workstation_name" because it is being used by another process.

Explanation: See message.

file_name is the file that cannot be moved because it is being used by another process.

workstation_name is the workstation to reset.

System action: The operation is not performed.

Operator response: Stop any Tivoli Workload Scheduler process that might be using the file and re-issue the command.

AWSBHU163E An error has occurred while launching the script `moveFTATargetFiles` on workstation "workstation_name".

Explanation: See message.

workstation_name is the workstation to reset.

System action: The operation is not performed.

Operator response: If you have customized the script, check that it does not contain syntax error. If any errors are present, correct them and re-issue the command.

AWSBHU164E The script `moveFTATargetFiles` is missing on workstation "workstation_name".

Explanation: See message.

workstation_name is the workstation to reset.

System action: The operation is not performed.

Operator response: If the script was deleted, copy it in the `%HOME%/bin` directory from another agent. Customize the `%HOME%` variable in the script according to the installation directory on the agent.

AWSBHU166E A file cannot be removed from `TWSHome/pobox` directory on workstation "workstation_name" because it is being used by another process.

Explanation: See message.

workstation_name is the workstation to reset.

System action: The operation is not performed.

Operator response: Stop any Tivoli Workload Scheduler process that might be using the file and re-issue the command.

AWSBHU168E The agent on workstation "workstation_name" cannot be reset because it is still active.

Explanation: See message.

workstation_name is the workstation to reset.

System action: The operation is not performed.

Operator response: Stop any Tivoli Workload Scheduler process that might be using the files to reset and re-issue the command.

AWSBHU169E The number of hours must be an integer value between 0 and 500.

Explanation: The number of hours must be an integer value between 0 and 500.

System action: The command is not processed.

Operator response: Specify the number of hours as an integer number between 0 and 500 and retry the operation.

See *The User's Guide and Reference*.

AWSBHU170E The action to be performed when the value of the `onmaxdur` attribute is exceeded, is not a valid action. Specify one of the following: `kill`, `cont`.

Explanation: See message.

System action: The command is not processed.

Operator response: Specify a valid action to be performed when the value for the `onmaxdur` attribute is exceeded, and then retry the operation.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU171E The action to be performed when the value of the `onmindur` attribute is reached, is not a valid action. Specify one of the following: `abend`, `cont`, `confirm`.

Explanation: See message.

System action: The command is not processed.

Operator response: Specify a valid action to be performed when the value for the `onmindur` attribute is reached, and then retry the operation.

See *The User's Guide and Reference* for a description of the 'submit' command.

AWSBHU172E The command issued for workstation "workstation_name" cannot be performed, because the workstation is pool, or dynamic pool, or remote engine workstation or broker, where the command is not supported.

Explanation: See message.

workstation_name is the pool, or dynamic pool, or remote engine workstation name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the pool, or dynamic pool, or remote engine workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU173E Conman command is unable to start a new process. Your Tivoli Workload Scheduler license expired "exp_date".

Explanation: Conman cannot start a new process because the Tivoli Workload Scheduler license has expired

System action: The command can continue but it is not able to start new processes.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU174E The command issued for workstation "workstation_name" cannot be performed, because the workstation is remote engine, or broker workstation, where the command is not supported.

Explanation: See message.

workstation_name is the remote engine, or broker workstation name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the remote engine, or broker workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU410E The workstation name parameter has not been specified for the "command_name" command.

Explanation: See message.

System action: The operation is not performed.

Operator response: Rerun the command ensuring that you specify a workstation.

See *The User's Guide and Reference* for details of the command.

AWSBHU411E Wild cards are not permitted in the workstation name parameter of the "command_name" command.

Explanation: You have used one or more wildcards (such as '@' or '?') while specifying the workstation name.

System action: The operation is not performed.

Operator response: Rerun the command, specifying a fully qualified workstation name.

See *The User's Guide and Reference* for more details about workstation selection.

AWSBHU412E Too many parameters have been supplied to the "command_name" command.

Explanation: See message.

System action: The operation is not performed.

Operator response: Rerun the command with the correct syntax.

See *The User's Guide and Reference* for the correct syntax of this command.

AWSBHU503E You have included one or more keywords that are not required for this command. The point beyond which the keywords are not required is indicated.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command using the parameters and keywords only up to the indicated position.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHU504E You have issued a command with a time-related dependency, but have omitted the keyword day[s].

Explanation: You have issued a command with an *at*, *until*, or *deadline* dependency. You have also entered a

AWSBHU508E • AWSBHU516E

""+"" delimiter and a numeric value, which can only be used if accompanied by the keyword *day[s]*.

The *day[s]* qualifier is optional, but if it is present it must be preceded by the ""+"" delimiter and a numeric value. Similarly, if the delimiter and value are present, so must the qualifier.

For example, *+5 days*.

System action: The command is not processed.

Operator response: Re-issue the command, with the following correction

- If you intended to supply a *day[s]* qualifier, add the keyword to the command string.
- If you did not intend to supply a *day[s]* qualifier, remove the ""+"" delimiter and the numeric value.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBHU508E You do not have access to this file or database object.

Explanation: See message.

System action: The command is not processed.

Operator response: If you are using the **display** command, verify that the current user has the rights to access the file that the user is trying to display.

In other cases, verify that the object name selected is correct and that the current user has the Tivoli Workload Scheduler Security rights to apply the command action for the object.

When you have identified and corrected the problem re-issue the command.

See The 'Security Notes' section of the *Planning and Installation Guide* for more information about security.

AWSBHU509E The requested file cannot be found.

Explanation: See message.

System action: The command is not processed.

Operator response: Verify the name of the file you want to access. Re-issue the command, ensuring that the file is specified as fully or partially qualified, as required by the command syntax.

See *The User's Guide and Reference* for details of the syntax of commands.

AWSBHU510E The following job already exists: "workstation#"job_stream"."job". Use the rerun command or supply an alias with the submit command.

Explanation: See message.

workstation#job_stream.job is the job name that already exists.

System action: The command is not processed.

Operator response: If you intended to run a new job, select a different job name. Use the **sj** command to list the current jobs in the Symphony file.

If you intended to rerun an existing job, use the **rerun** command or the **submit** command with the *alias* option.

See *The User's Guide and Reference* for details of the indicated commands and options.

AWSBHU511E You have no access to the recovery job (!#!2).

AWSBHU512E The issued command operates on an existing job. However, conman cannot find the indicated job in the Symphony file, and it is not an external job.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, identifying an existing job by its job name or number.

Use the **sj** command to list the current jobs in the Symphony file.

See *The User's Guide and Reference* for more details about the command you issued.

AWSBHU513E The following job stream already exists: "job_stream_name". Supply an alias with the submit command.

Explanation: See message.

job_stream_name is the job stream name.

System action: The command is not processed.

Operator response: If you intended to run a new job stream, select a different job stream name. Use the **sc** command to list the current job streams in the Symphony file.

If you intended to rerun an existing job stream, use the **submit** command with the *alias* option.

See *The User's Guide and Reference* for details of the indicated commands and options.

AWSBHU516E You have not supplied a valid alias of the job you are trying to resubmit.

Explanation: You are trying to resubmit a job. A resubmitted job cannot have the same name as the original job; it must instead be supplied with an alias that has a different value from the original job name.

System action: The command is not processed.

Operator response: Resubmit the command, using the *alias* option with a valid new job name. See the *User's*

Guide and Reference for more details.

See *The User's Guide and Reference*.

AWSBHU517E The required information cannot be displayed.

Explanation: **Conman** gives this error because it cannot display a file. There are two possibilities:

- **No job file:** You are trying to display a job file, but the job was defined by a command and not in a file.
- **Remote job:** You are trying to display a job scheduled on another workstation for which the definition file is not available locally.

System action: The command is not processed.

Operator response: Use the command **sj; info** to see how the job is defined, whether as a command or in a file. This also tells you whether the job is locally or remotely defined.

See *The User's Guide and Reference*, in the section 'Selecting jobs in Commands'.

AWSBHU518E You cannot add dependencies to a job or job stream in the adding status, or to a job in an in order job stream.

Explanation: You tried to add dependencies to a job or job stream but either the job or job stream status is *adding* or this job belongs to an *in order* job stream.

An *in order* job stream is one where the definition specifies, by use of the *in order* keyword, that jobs must be run in their definition order.

System action: The command is not processed.

Operator response: If you need to add dependencies to an *in order* job stream, you need to redefine the job stream.

See *The User's Guide and Reference* for more details.

AWSBHU520W Dependency !1 was not found in the database; it has been ignored.

AWSBHU521W Dependency !1 was not found in the Symphony file ; it has been ignored.

AWSBHU522E The supplied job name is not in the database.

Explanation: See message.

System action: The command is not processed.

Operator response: Select a valid job name and rerun the command.

See *The User's Guide and Reference*.

AWSBHU523E You have issued a link or an unlink command on a standalone workstation (on which mailman is not running).

Explanation: See message.

System action: The command is not processed.

Operator response: Check that it is correct that the workstation is standalone. If so, do not use the command.

AWSBHU524E The issued command incorrectly ends with a delimiter.

Explanation: The last character in the command string ends with a delimiter (for example: `"";""` or `""=""`). This implies that a keyword or value is missing, because all delimiters must be followed by a keyword or value.

System action: The command is not processed.

Operator response: Re-issue the command, either omitting the delimiter or supplying the keyword or value that is required by the syntax to follow it.

See *The User's Guide and Reference* for full details of the syntax for commands.

AWSBHU526E The following internal error occurred when conman attempted to display a JCL file: "error_message".

Explanation: See message.

error_message is an operating system error message returned by the function pipe().

System action: The command is not processed.

Operator response: Re-issue the command.

AWSBHU527E A file-descriptor or disk-space error occurred when conman attempted to open a JCL file for display.

Explanation: **Conman** could not open a JCL file. Either the process has opened too many file descriptors or there is insufficient storage space available.

This is an operating system error given by the I/O Library function fdopen.

System action: The command is not processed.

Operator response: Increase the number of file descriptors a process can open or verify that there is enough space available on the file system.

AWSBHU528E A file-descriptor or disk-space error occurred when conman attempted to display a JCL file.

Explanation: **Conman** could not open a work file to display a JCL file. Either the process has opened too

AWSBHU529E • AWSBHU535E

many file descriptors or there is insufficient storage space available.

This is an operating system error given by the I/O library function `fdopen`.

System action: The command is not processed.

Operator response: Increase the number of file descriptors a process can open or verify that there is enough space available on the file system.

AWSBHU529E The following error occurred while `conman` was displaying a JCL file: "error_number".

Explanation: `Conman` gave this error because a system error occurred while it was reading the JCL file.

error_number is the operating system error number, returned from I/O library function `ferror`, issued by the function `fgets()`.

System action: The command is not processed.

Operator response: Verify that the file system is working properly and is not full.

AWSBHU530E The following error occurred while `conman` was writing a work file when displaying a JCL file: "error_number".

Explanation: See message.

error_number is the system error number, returned from I/O Library function `fprintf`.

System action: The command is not processed.

Operator response: Verify that the file system is working properly and is not full.

AWSBHU531E `Conman` was unable to access the `mozart` database or was unable to find a parameter within the database.

Explanation: See message.

System action: The command is not processed.

Operator response: Verify that all parameters used in the command have been defined in the `mozart` database, and that the database itself is available and viable. Re-issue the command.

See *The User's Guide and Reference* for details on how to define and use parameters.

AWSBHU532E You have either entered too many parameters, or the expansion of the parameters you have entered has exceeded the internal parameter buffer.

Explanation: You can supply a maximum of 20 parameters to this command, and when the parameters

are fully expanded they must not occupy more than 4095 bytes.

System action: The command is not processed.

Operator response: Re-issue the command, reducing the number of parameters, or re-specify the parameters to be shorter.

See *The User's Guide and Reference* for more details about the maximum length of various fields.

AWSBHU533E `Conman` has found a problem with the syntax of the issued command, but is unable to determine more precisely the nature of the problem.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command. If it is incorrect, re-issue the command with the correct syntax.

If the command syntax seems to be correct, an internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU534E The workstation selected for this job is not a workstation but a workstation class.

Explanation: The syntax `"" nullworkstation_class>#nulljob> ""` is not correct. You cannot submit a job to run on a workstation class.

System action: The command is not processed.

Operator response: Re-issue the command, defining the job to run on a workstation.

See *The User's Guide and Reference* for information on how to identify workstations.

AWSBHU535E The following workstation is not in the `Symphony` file: "workstation_name".

Explanation: See message.

workstation_name is the name of the workstation not found.

System action: The command is not processed.

Operator response: Re-issue the command, selecting a valid workstation name.

See *The User's Guide and Reference* for information on how to identify workstations.

AWSBHU536E The following domain is empty:
"domain_name".

Explanation: See message.

domain_name is the name of the empty domain.

System action: The command is not processed.

Operator response: Add workstation to the domain. You can perform this operation using either the composer command or the Tivoli Dynamic Workload Console.

AWSBHU537E You have issued the link or unlink command to the following workstation within the same domain and neither is the domain manager: "workstation_name". This is not allowed.

Explanation: The link or unlink commands can only be issued to a workstation in the same domain which is a parent or a child of the workstation where the command is issued, not to a peer workstation.

workstation_name is the local workstation that you cannot link to or unlink from.

System action: The command is not processed.

Operator response: If you intended to link to or unlink from the domain manager, re-issue the command, identifying the domain manager workstation. See the User's Guide and Reference

See *The User's Guide and Reference* for more details about using the link and unlink commands.

AWSBHU538W !1: The domain of the workstation being linked or unlinked is not subordinate to the domain of the local workstation.

AWSBHU539E An internal error has occurred while linking to or unlinking from the following workstation: "workstation_name":

Explanation: The internal message is the following: ""Unknown link case encountered"".

workstation_name is the workstation name that cannot be linked to or unlinked from.

System action: The command is not processed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU540E Conman cannot find any domains in the Symphony file.

Explanation: See message.

System action: The command is not processed.

Operator response: This normally indicates a problem with the Symphony file.

If the Symphony file exists, verify that the owner is the Tivoli Workload Scheduler user and that this user has the permissions to access and modify the Symphony file. If you find a problem, correct it and re-issue the command.

If the Symphony file is not present or is unreadable, follow the instructions in the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU541E You have tried to issue a start command to the following workstation: "remote_workstation", which is not a child of the local workstation: "local_workstation".

Explanation: You cannot start or stop a workstation which is not at a lower point in the Tivoli Workload Scheduler hierarchy than the local workstation.

local_workstation is the local workstation name.

remote_workstation is the workstation name you were trying to start.

System action: The command is not processed.

Operator response: If you need to start the *remote_workstation*, issue the start command from its domain manager, or from any other workstation which is at a higher point in the hierarchy, or from the *remote_workstation* itself.

AWSBHU542E Conman has verified that the versions of the Symphony and Database files (Masksed version) are different.

Explanation: See message.

System action: The command is not processed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU543E You have supplied the interactive qualifier keyword to the submit jobs command, which is not valid.

Explanation: See message.

System action: The command is not processed.

Operator response: The *interactive* option is only valid with **sbf** and **sbd** commands. If you want to submit a job as interactive and this job is defined in the *mozart* database, you have to run **composer** and modify the job stream containing the job.

See *The User's Guide and Reference* for details about **composer** usage.

AWSBHU544E The supplied path name is longer than the maximum allowed: "maximum_bytes".

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command using a path name shorter than the maximum indicated.

See *The User's Guide and Reference*.

AWSBHU545E You have supplied a path name that does not match the workstation type: "workstation_type".

Explanation: See message.

workstation_type is the workstation type of the workstation.

The type of path to be supplied depends on the type of workstation, as follows:

- **UNIX and IBM i:** the path must be specified as a Posix path.
- **WNT:** the path must be specified as a DOS path.

System action: The command is not processed.

Operator response: Re-issue the command, supplying the path in the correct format.

AWSBHU546E You have supplied either a tz or a timezone keyword but did not supply the time zone name.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, supplying a time zone name after the *tz* or *timezone* keyword.

See *The User's Guide and Reference* for a list of the valid time zone names.

AWSBHU547E You have supplied a time zone name that is longer than 40 bytes.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, supplying a valid time zone name, shorter than 40 bytes.

See *The User's Guide and Reference* for a list of the valid time zone names.

AWSBHU548E You have supplied a time zone name that is not valid.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, supplying a valid time zone name.

See *The User's Guide and Reference* for a list of the valid time zone names.

AWSBHU549W There is a logic error in the time-related dependencies. The until time occurs before the at time.

Explanation: See message.

System action: The job to which this warning relates is added to the plan. However, it can never run. Conman proceeds.

Operator response: The simplest way to deal with this problem is to resubmit the job with an alias, correcting the dependency logic problem so that the job can run.

See *The User's Guide and Reference* for more details about dependencies.

AWSBHU550W There is a logic error in the time-related dependencies. The dependency is circular.

Explanation: See message.

System action: The job to which this warning relates is added to the plan. However, it can never run. Conman proceeds.

Operator response: The simplest way to deal with this problem is to resubmit the job with an alias, correcting the dependency logic problem so that the job can run.

See *The User's Guide and Reference* for more details about dependencies.

AWSBHU551E You are trying to add the same dependency twice.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command, omitting the duplicated dependency.

AWSBHU553E An error has occurred while starting an internal component (clagent).

Explanation: See message.

System action: The command is not processed.

Operator response: To rebuild the masked database, run composer and issue the build masked command. Rerun Conman.

AWSBHU556E The following error occurred while opening the clbox.msg file: "error_text".

Explanation: See message.

error_text is an error message. It supplies you with more details about the error causes.

The error is probably one of the following:

- The clbox.msg file already exists but the Tivoli Workload Scheduler user does not have write access to the file.
- There is insufficient space to create the file.
- The process has exceeded the maximum number of file descriptors.

System action: The command is not processed.

Operator response:

1. Verify from the error message where the problem is.
2. Fix the problem and re-issue the command.

AWSBHU557W There is a logic error in the time-related dependencies. The deadline time occurs before the at or until time.

Explanation: See message.

System action: The job to which this warning relates is added to the plan. However, it can never run. Conman proceeds.

Operator response: The simplest way to deal with this problem is to resubmit the job with an alias, correcting the dependency logic problem so that the job can run.

See *The User's Guide and Reference* for more details about dependencies.

AWSBHU558W There is a syntax error in the time-related dependencies. The onuntil keyword was specified but the until time was not supplied.

Explanation: See message.

System action: The job to which this warning relates is added to the plan. However, it can never run. Conman proceeds.

Operator response: The simplest way to deal with this problem is to resubmit the job with an alias, correcting the syntax error so that the job can run.

See *The User's Guide and Reference* for more details about dependencies.

AWSBHU559E The following workstation "remote_workstation" cannot be stopped, because it is in a peer or parent domain of the following local workstation, which is not a domain manager: "local_workstation".

Explanation: A workstation which is not a domain manager can only stop workstations in child domains.

System action: The command is not processed.

Operator response: To stop the indicated workstation, issue the stop command from the workstation itself, its domain manager, or any workstation in a parent domain.

AWSBHU560E The command startmon cannot be performed, because the Event Driven Workload Automation feature is disabled.

Explanation: The Event Driven Workload Automation feature has been disabled by optman, which set the `enEventDrivenWorkloadAutomation` option to NO.

Monman cannot be started.

System action: The command is not processed.

Operator response: You cannot use this command when the Event Driven Workload Automation feature is disabled.

AWSBHU561W A syntax error has occurred in the specifications for the time-related dependencies. The onmaxdur keyword was specified but the maxdur time was not supplied.

Explanation: See message.

System action: The job for which the keyword is specified is added to the plan, but it cannot run. Conman proceeds.

Operator response: Specify the "maxdur" time for the "onmaxdur" keyword and then resubmit the job with an alias.

See *The User's Guide and Reference* for more details about time dependencies.

AWSBHU562W A syntax error has occurred in the specifications for the time-related dependencies. The onmindur keyword was specified but the mindur time was not supplied.

Explanation: See message.

System action: The job for which the keyword is specified is added to the plan, but it cannot run. Conman proceeds.

Operator response: Specify the `""mindur""` time for the `""onmindur""` keyword and then resubmit the job with an alias.

See *The User's Guide and Reference* for more details about time dependencies.

AWSBHU600E There is a logic error in the follows dependencies. The dependency "circular_dep" is circular.

Explanation: See message.

`circular_dep` is the dependency which refers directory or indirectly to itself.

System action: The command is not processed.

Operator response: Check the details of the supplied command. Check the indicated dependency and determine why it is circular. It might be directly circular, in that you have erroneously made the scheduled object dependent on itself, or it might be more complex with, for example, job A dependent on job B, which is dependent on job C, which is dependent on job A. Correct the error and resubmit the command.

See *The User's Guide and Reference* for more details about dependencies.

AWSBHU601E Cannot create semaphore, Error number: !1

AWSBHU602E Cannot create thread, Error number: !1

AWSBHU603E Cannot release thread, Error number: !1

AWSBHU604E Wait for semaphore failed, Error number: !1

AWSBHU605E Conman timed out - Closing Symphony.

AWSBHU606E An error occurred while saving the user options file:"file"

Explanation: See message.

System action: The operation is not performed.

Operator response: Verify that there is sufficient space in the indicated file system, and that the user of Tivoli Workload Scheduler has permission to write files in the indicated directory.

AWSBHU607E The value specified for the -protocol connection parameter is not valid. It must be http or https.

Explanation: See message.

System action: The operation is not performed.

Operator response: Correct the `""-protocol""` connection parameter and reissue the command.

AWSBHU609E The value specified for the -timeout connection parameter is not valid. It must be the number of seconds that the command line client is to wait for a connection before timing out.

Explanation: The `""-timeout""` parameter is one of the connection parameters, supplied as part of the command, in a file of connection parameters, or by default from the `useropts` or `localopts` file. It must be expressed as a number (of seconds). For example, the value for 30 seconds must be `""30""`, not `""30s""` or `""30 secs""`.

System action: The operation is not performed.

Operator response: Retry the command, changing the value of the `timeout` parameter to be a number of seconds.

AWSBHU610E The credentials to connect to the remote server have not been specified.

Explanation: When you use the command line client, it needs to connect to the remote server at the master domain manager. For this it requires connection parameters that are supplied as part of the command, in a file of connection parameters, or by default from the `useropts` or `localopts` file.

`conman` could not find a set of these parameters to establish a connection.

System action: The operation is not performed.

Operator response: Do one of the following:

- Edit the `useropts` or `localopts` file and insert the communication parameters. Save the file and rerun the command.
- Reissue the command, supplying the connection parameters as command options, or in a file.

See *The User's Guide and Reference* for details of the syntax of the connection parameters.

AWSBHU611W Conman could not initialize the HTTP or HTTPS connection.

Explanation: `Conman` is running on a fault-tolerant agent using the command line client. If the connection fails to the command line server on the master domain manager, `conman` can continue with limited

functionality, but the connection must be remade before too much time elapses.

System action: `conman` continues.

Operator response: You can continue using `conman`, especially if you think that the connection problem is temporary.

However, you must take steps before too long to re-establish the connection.

AWSBHU612E The port specified by the `-port` connection parameter is not numeric.

Explanation: See message.

System action: The operation is not performed.

Operator response: Locate where you have supplied the connection parameters, correct the port, and reissue the command.

AWSBHU613E There are insufficient units of resource "resource" available. The job requires "required_resources" units but only "available_resources" are available.

Explanation: See message.

resource identifies the resource.

required_resources is the number of requested units of the specified resource.

available_resources is the number of available units of the specified resource.

System action: `Conman` does not proceed.

Operator response: Check the job requirements. Determine why the number of available resource units is inadequate. Try and increase the number of available units or decrease the number of required units, or both. See if it is possible to modify the job so that it uses fewer resources. Perhaps you can divide into two or more separate jobs, each of which uses fewer resources. Perhaps you can schedule the job to run on a different workstation with more resources.

Make whatever modifications you think are necessary and rerun the job.

See *The User's Guide and Reference* for more details about resources.

AWSBHU614E No job stream was submitted to batchman. It is possible that the workstation where the job stream was defined is set to ignore.

Explanation: No job stream was received by the server, so no job stream could be submitted to batchman.

System action: The `conman submit sched` command cannot be processed.

Operator response: Check that there is nothing in the job stream definition that would prevent it from being scheduled. In particular, check whether the workstation is set to check `""ignore""` and that the scheduled time is within the range of the current plan. Correct any errors you find and resubmit the job stream.

See *The User's Guide and Reference* for more details about submitting job streams.

AWSBHU615E The submitted job refers to a recovery job which could not be found in the database.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the details of the job you have submitted. You might have made a mistake when identifying the recovery job. Check that the job you want to use as the recovery job is available in the database. Resubmit the job, specifying an existing recovery job.

See *The User's Guide and Reference* for more details about submitting job.

AWSBHU616E More than one job stream matches your selection. Uniquely identify the job stream by specifying its ID or schedule time.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, uniquely identifying the job stream to be submitted using the related job stream ID or schedule time.

See *The User's Guide and Reference* for more details about submitting job streams.

AWSBHU618E The `bulk_discovery` was not performed because no configuration file was found.

Explanation: The bulk discovery command was not forwarded to batchman because the integration configuration file was not found.

System action: The submitted command cannot be performed.

Operator response: Verify that the `BmEvents.conf` file is in the TWS home directory. Rerun the bulk discovery command.

AWSBHU619E The following error occurred obtaining the monitoring configuration file for workstation "workstation_name": "error_message".

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHU624W Either the application server or appservman, or both, on workstation "workstation_name" is already stopped.

Explanation: See message.

System action: The operation is not performed.

Operator response: The action to take depends on the final outcome you want:

- If you want the application server to be restarted, run the command `startWas -direct -user nulluser_name> -password nullpassword>`. This starts the application server, bypassing `appservman`. If the application server is not stopped, you receive a message: this means that it is `appservman` that is stopped. To restart it, run the command `startappserver`.
- If you want to stop the application server, but are not certain if it has already stopped, run the command `stopWas -direct -user nulluser_name> -password nullpassword>`. This stops the application server, bypassing `appservman`. If you receive a message that the application server is stopping, it means that `appservman` is stopped.
- If you want both the application server and `appservman` to be restarted, run the command `startappserver`. This starts both. If `appservman` is not stopped, you receive a message: this means that it is the application server that is stopped.
- If you want to stop the dynamic workload broker application, but are not certain if it has already stopped, run the command `stopBrokerApplication -user nulluser_name> -password nullpassword>`. This stops the dynamic workload broker application, bypassing `appservman`. If you receive a message that the dynamic workload broker application is stopping, it means that `appservman` is stopped.

AWSBHU625W The option WAIT is not supported for remote workstations. It is ignored.

Explanation: See message.

System action: The operation is not performed.

Operator response: Choose a supported option and retry the operation.

AWSBHU626W The application server is not installed on the local workstation.

Explanation: You issued a command to start or stop the application server, but the application server is not installed, probably because it is not part of the current configuration.

The application server is normally installed on the master domain manager and backup master domain manager. The application server is installed on other domain managers or fault-tolerant agents only if the Connector has been installed.

System action: The operation is not performed.

Operator response: You cannot use this command on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a valid command.

AWSBHU630E The command issued for workstation "workstation_name" cannot be performed, because the workstation is a fault tolerant agent, where the command is not supported.

Explanation: See message.

workstation_name is the fault tolerant agent workstation name.

System action: The submitted command cannot be performed.

Operator response: You cannot use this command on the selected workstation. If you have selected the fault tolerant agent workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU631E The command issued for workstation "workstation_name" cannot be performed, because the workstation is a standard agent or broker workstation, where the command is not supported.

Explanation: See message.

workstation_name is the standard agent or broker workstation name.

System action: The submitted command cannot be performed.

Operator response: You cannot use this command on the selected workstation. If you have selected the standard agent or broker workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU632E The command issued for workstation "workstation_name" cannot be performed, because the command is not supported.

Explanation: See message.

workstation_name is the workstation name.

System action: The submitted command cannot be performed.

Operator response: You cannot use this command on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBHU633W The event processor workstation is set to ignore in the production plan.

Explanation: See message.

System action: The operation is not performed.

Operator response: Change the workstation setting to a value other than ignore. You can perform this operation using either the **composer** command or the Tivoli Dynamic Workload Console.

See *The User's Guide and Reference* for full details of the parameters for the composer command line client.

AWSBHU634E The command "command_name" cannot be performed, because the event processor workstation is set to ignore in the production plan.

Explanation: See message.

command_name is the issued command.

System action: The submitted command cannot be performed.

Operator response: Change the workstation setting to a value other than ignore. You can perform this operation using either the **composer** command or the Tivoli Dynamic Workload Console.

See *The User's Guide and Reference* for full details of the parameters for the composer command line client.

AWSBHU635E A syntax error occurred. The variable table name must start with an alphabetic character and contain only alphanumeric characters. The maximum length is 80 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Change the name of the variable

table to conform to the rules indicated in the message and resubmit the command.

See *The User's Guide and Reference* for full details of the variable table.

AWSBHU636E The Workload Service Assurance feature is not enabled.

Explanation: See message.

Workload Service Assurance is a feature which can be enabled or disabled. At present it is disabled.

System action: The submitted command cannot be performed.

Operator response: Use **optman** to enable the Workload Service Assurance feature.

See *The User's Guide and Reference* for full details of the Workload Service Assurance feature.

AWSBHU638W The dynamic workload broker application on workstation "workstation_name" is already stopped.

Explanation: See message.

System action: The operation is not performed.

Operator response: If you want to stop the dynamic workload broker application, but are not certain if it has already stopped, run the command **stopBrokerApplication -user nulluser_name>-password nullpassword>**. This stops the dynamic workload broker application, bypassing **appservman**. If you receive a message that the dynamic workload broker application is stopping, it means that **appservman** is stopped.

AWSBHU639W The dynamic workload broker application is not installed on the local workstation.

Explanation: You issued a command to start or stop the dynamic workload broker application, but the dynamic workload broker application is not installed, probably because it is not part of the current configuration.

The dynamic workload broker application is normally installed on the master domain manager, backup master domain manager, dynamic domain manager and backup dynamic domain manager.

System action: The operation is not performed.

Operator response: You cannot use this command on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a valid command.

AWSBHU700E There is a syntax error. A job name, file name or keyword is missing in the submitted command.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, adding the missing item.

See The *User's Guide and Reference* for full syntax of the command.

AWSBHU701E There is a syntax error. The submitted command appears to contain extra or duplicated characters, or unmatched brackets.

Explanation: Conman has verified that additional characters appear to be attached to a valid keyword or other parameter. For example, you might have duplicated a character in a keyword, or the `""dot""` in a file name.

Alternatively, you have used a pair of brackets in the command, but the opening bracket does not match the closing bracket. For example, you have put an opening round bracket `""(""` and a closing square bracket `""]""`.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, omitting the extra character or characters.

See The *User's Guide and Reference* for full syntax of the command.

AWSBHU702E There is a syntax error. The workstation name must be between 1 - 16 bytes.

AWSBHU703E There is a syntax error. The workstation name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, supplying a correctly formatted workstation name.

See The *User's Guide and Reference* for details of how to identify a workstation.

AWSBHU704E There is a syntax error. The delimiter of a workstation name is a #.

AWSBHU705E There is a syntax error in the workstation name. The # symbol was found more than once.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, omitting the additional `""#""` character.

See The *User's Guide and Reference* for details of how to identify a workstation.

AWSBHU706E There is a syntax error. The job stream name must be between 1 - 40 bytes.

AWSBHU707E There is a syntax error. The job stream name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, supplying a correctly formatted job stream name.

See The *User's Guide and Reference* for details of how to identify a job stream.

AWSBHU708E There is a syntax error. The delimiter of the schedule name is .

AWSBHU709E There is a syntax error. The job name must be between 1 - 40 bytes.

AWSBHU710E There is a syntax error. The job name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, supplying a correctly formatted job name.

See The *User's Guide and Reference* for details of how to identify a job.

AWSBHU711E There is a syntax error. The submitted command has a job as its object but the job name has not been supplied.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the syntax of the command in the *User's Guide and Reference* and resubmit it, supplying a correctly formatted job name.

See The *User's Guide and Reference* for details of how to identify a job.

AWSBHU712E There is a syntax error. The prompt name must be between 1 and 8 bytes long.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted prompt name.

See The *User's Guide and Reference* for details of how to identify a prompt.

AWSBHU713E There is a syntax error. The prompt name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted prompt name.

See The *User's Guide and Reference* for details of how to identify a prompt.

AWSBHU714E Prompt name or message number not supplied.

AWSBHU715E There is a syntax error. The resource name must be between 1 and 8 bytes long and workstation name must be between 1 and 16 bytes

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted resource name.

See The *User's Guide and Reference* for details of how to identify a resource.

AWSBHU716E There is a syntax error. The resource name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted resource name.

See The *User's Guide and Reference* for details of how to identify a resource.

AWSBHU719E There is a syntax error. You cannot specify a priority higher than 99 (use hi (= 100), or go (= 101) instead.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted priority specification.

See The *User's Guide and Reference* for details of how to specify the priority.

AWSBHU720E User domain length incorrect

AWSBHU721E The supplied user name is too long. The name can contain up to 47 bytes. If the name contains special characters it must be enclosed in quotes ().

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted user name.

See The *User's Guide and Reference* for details of how to specify the user name.

AWSBHU722E Duplicate user name given.

AWSBHU723E There is a syntax error in the specification of a network dependency. The syntax of the command indicates that you wanted to enter a Network ID to identify a workstation in a different network, but the ID is blank.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, entering a valid Network ID before the network delimiter """:"". "

See The *User's Guide and Reference*.

AWSBHU724E The Network ID must be between 1 - 40 bytes.

AWSBHU725E There is a syntax error in the specification of a network dependency. You have submitted a Network ID enclosed in quotes, but either the quote characters that you used before and after the ID are mismatched, or one of them is missing.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, ensuring that if you need to use quotes to enclose the ID, that you use the same type of quote character both before and after the ID.

See *The User's Guide and Reference*.

AWSBHU726E There is a syntax error in the specification of a network dependency. The Network ID has not been specified.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, specifying the Network ID before the network delimiter ""::""

See *The User's Guide and Reference*.

AWSBHU727E There is a syntax error in the specification of a network dependency. You have defined a network dependency which requires the use of quotes, but either the quote characters that you used are mismatched, or one of them is missing.

Explanation: See message.

System action: The command is not processed.

Operator response: Rerun the command, ensuring that if you need to use quotes that you use the same type of quote character, and enter both of them.

See *The User's Guide and Reference*.

AWSBHU728E You have issued a command that includes an exclamation point (!), which is the delimiter for a domain name. However, the exclamation point is not preceded by a valid domain name.

Explanation: See message.

System action: The command is not processed.

Operator response: Re-issue the command ensuring that the domain name immediately precedes the

exclamation point (there must be no space between them).

See *The User's Guide and Reference* for details of the syntax of the issued command.

AWSBHU729E There is a syntax error. The domain name must be between 1 and 16 bytes long.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted domain name.

See *The User's Guide and Reference* for details of how to identify a domain.

AWSBHU730E There is a syntax error. The domain name must immediately be followed by a workstation name.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, identifying the workstation as nulldomain>!nullworkstation>, without any spaces between the exclamation point and the workstation name.

See *The User's Guide and Reference* for details of how to identify a workstation.

AWSBHU731E There is a syntax error. The domain name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted domain name.

See *The User's Guide and Reference* for details of how to identify a domain.

AWSBHU732E The delimiter of domain name is an exclamation point.

AWSBHU733E There is a syntax error in the domain name. The delimiter ! has been typed more than once.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, with just one exclamation point delimiter separating the domain from the workstation.

See *The User's Guide and Reference* for details of how to identify a domain.

AWSBHU734E The job alias name must be between 1 - 40 bytes.

AWSBHU735E The job stream alias name must be between 1 - 16 bytes.

AWSBHU736E There is a syntax error. The alias name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted alias name.

See *The User's Guide and Reference* for details of how to identify a domain.

AWSBHU737E Conman encountered a system error when attempting to retrieve either the current input mode or the current output mode of the console.

Explanation: The following internal error has occurred: ""Operating system error given on termios.h Library function tcgetattr or console function GetConsoleMode"".

System action: Conman stops.

Operator response: Type the password in interactive mode. Batch mode is not supported when typing passwords.

AWSBHU738E Conman encountered a system error when attempting to set either the console input mode or the console output mode.

Explanation: The following internal error has occurred: ""Operating system error given on termios.h Library function tcsetattr or console function SetConsoleMode"".

System action: Conman stops.

Operator response: Enter the password in interactive mode not in batch mode

AWSBHU739E The supplied user is not in the Symphony file.

Explanation: See message.

System action: The command is not processed.

Operator response: If an incorrect user name has been

used, resubmit the command, supplying a valid user name.

If the user name supplied is correct, the Symphony file might be corrupt. The chapter on 'Symphony file corruption' in the Troubleshooting guide.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHU740E The new password and the confirmation password do not match.

Explanation: You are trying to change your password, but the two versions of the new password that you supplied are not the same.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring to type the new password correctly, twice.

AWSBHU741E Conman is unable to open the audit log file.

Explanation: Conman is unable to open the audit log file because the open() system call failed for some unspecified reason.

System action: The command you entered has not been executed. Conman continues accepting commands

Operator response: Verify the following before resubmitting the command:

- Verify that the user has write access to the audit directory: (nullTWS_home>/audit).
- Ensure that there is sufficient space in the file system of the audit directory.

AWSBHU743E There is a syntax error in the name. It must be between 1 and 16 bytes.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring to specify a valid workstation name.

See *The User's Guide and Reference* for more information about specifying workstations.

AWSBHU744E There is a syntax error. The job stream name must be between 1 and 16 bytes.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring to specify a valid job stream name.

AWSBHU745E • AWSBHU753E

See *The User's Guide and Reference* for more information about specifying job streams.

AWSBHU753E Not found

AWSBHU745E There is a syntax error. The job name must be between 1 and 40 bytes.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring to specify a valid job name.

See *The User's Guide and Reference* for more information about specifying jobs.

AWSBHU746E There is a syntax error in the specification of a network dependency. Either the Network ID is missing or it is longer than 40 bytes.

Explanation: See message text.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring that the network dependency is correctly specified.

See *The User's Guide and Reference* for more details about Network selection in command line.

AWSBHU747E There is a syntax error. The job alias name must be between 1 and 40 bytes.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring to specify a valid job alias name.

See *The User's Guide and Reference* for more information about specifying job aliases.

AWSBHU748E There is a syntax error. The job stream alias name must be between 1 and 16 bytes.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, ensuring to specify a valid job stream alias name.

See *The User's Guide and Reference* for more information about specifying job stream aliases.

AWSBHU749E Alias name must start with an alpha and contain only alphanumeric characters.

Chapter 99. AWSBHV - Stageman messages

This section lists error and warning messages that might be issued by the stageman component.

The message component code is BHV.

AWSBHV001E An unspecified error was encountered building the following message file "message_file"

Explanation: Stageman was either unable to build the message file Mailbox.msg or to write an initialization or synchronization record in it.

System action: Stageman stops.

Operator response: Check the file system of nullTWS_home>/Mailbox.msg to ensure that there is sufficient space, and that the user has write permission. When you have corrected the problem, rerun JnextPlan.

AWSBHV002E Unexpected error creating new SYMPHONY

AWSBHV003E Unable to open CROSSREF help file

AWSBHV004E An internal error has occurred. Stageman has found an incorrect record in the Symphony file. Stageman expected record number "record_number" to be of type "record_type", but it was not.

Explanation: *record_number* is the record that stageman read from the Symphony file.

record_type is the record type that it was expecting.

System action: Stageman stops.

Operator response: This is an internal error. The Symphony file might be corrupt. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHV009E Fatal error copying SYMPHONY to SINFONIA.

AWSBHV011E Error occurred while switching managers in domain !1 from !2 to !3.

AWSBHV019E There is not enough memory to run stageman.

Explanation: See message text.

System action: Stageman stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to stageman. Rerun JnextPlan.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun JnextPlan.
3. If the problem persists, reboot the workstation, and then rerun JnextPlan.

See The *Release Notes* for details of memory requirements.

AWSBHV020E Stageman has exceeded the internal limit of 10 duplicate carry forward job stream instances.

Explanation: See message text.

System action: Stageman stops.

Operator response: This is an internal error. It could be the result of a Symphony file corruption. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

If you have solved the problem, rerun JnextPlan.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHV021E An internal error has occurred. Stageman has encountered an error while reading a record from the Symphony or Symnew files. The Production Plan has not been extended correctly.

Explanation: The most likely cause is that the number of the record it is trying to read exceeds the maximum value allowed or exceeds the actual number of records in the Symphony file. Other possible causes are:

- the fstat() or lseek() system calls failed.

AWSBH022E • AWSBH026E

- the read() system call failed due to a physical I/O error or to a bad Symphony file descriptor.
- the read operation was interrupted by a signal.

System action: Stageman stops.

Operator response: This is an internal error. It might be that the Symphony file is corrupt. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBH022E An internal error has occurred.
Stageman has encountered a record of an unknown type while creating the Symphony file.

Explanation: Stageman is trying to create the new Symphony file with job streams carried forward from the previous plan period's production, plus job streams from the new plan period's production. To do this it has to write the file, resource, and job records for each of these job streams to the new Symphony file. While writing them, stageman encountered a record of unknown type.

System action: Stageman stops.

Operator response: An internal error has occurred. The Symphony file might be corrupt.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBH023E The number of carryforward job streams exceeds the maximum allowed by the Symphony file.

Explanation: A Symphony file in non-expanded mode supports a maximum of 676 carryforward job streams. A Symphony file in expanded mode supports, in theory, 5.4 trillion carryforward job streams, but this number is in practice reduced by the size limitation of the file.

System action: Stageman stops.

Operator response: Reduce the number of carryforward job streams. If you are in non-expanded Symphony mode, consider moving to expanded mode if possible (only if there are no MPE systems in your network).

If a job stream is being carried forward longer than necessary, you can limit the number of days it is carried forward by specifying the UNTIL time + n days dependency on the job stream itself.

AWSBH024E An internal error has occurred.
Stageman has encountered a record from the old Symphony file that is neither a job stream nor a job record. Index: "sym_rec_array_index", type "record_type"

Explanation: While carrying forward the old Symphony file records for unfinished job streams and jobs, stageman encountered a record that was neither a job stream nor a job record.

sym_rec_array_index is an index in an array containing information about each Symphony file record.

record_type is the record type of the Symphony file record in error.

System action: Stageman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBH026E The old Symphony file cannot be renamed to the following file name: "file_name"

Explanation: Stageman is trying to archive the old Symphony file by renaming it or copying it as "" nullTWS_home>/schedlog/Mnulldate_time_stamp> "". The rename and the copy have failed.

file_name is the actual name that stageman wants to give the file.

Possible reasons for this are as follows:

- The file system is full.
- Stageman does not have write permission in the archive directory.
- Another file already exists with the same name.
- The archive directory is on a mountable file system that is not mounted.
- The file name stageman wants to use is not permitted by the operating system.

System action: Stageman proceeds, without archiving the old Symphony file. The new Symphony file is valid.

Operator response: The failure to create the archive does not impact the correct functioning of Tivoli Workload Scheduler. However, attempt to resolve the problem so that the following plan period's old Symphony file can be correctly archived. Check the possible causes above to determine what has gone wrong, and correct the error.

Check the file system of nullTWS_home>/schedlog/Mnullarchive_date> to ensure that there is sufficient space, and that the user has write permission. Delete old archived Symphony files that are no longer needed.

When you have corrected the problem, rerun JnextPlan.

AWSBH027E The old Symphony file cannot be saved as the following file name: "file_name"

Explanation: **Stageman** encountered an error attempting to close the old Symphony file. The file cannot be saved.

file_name is the new name (nullTWS_home>/schedlog/Mnulldate_time_stamp>) of the file that **stageman** was trying to save.

Possible reasons for this are as follows:

- The file system is full.
- **Stageman** does not have write permission in the archive directory.
- Another file already exists with the same name.
- The archive directory is on a mountable file system that is not mounted.
- The file name **stageman** wants to use is not permitted by the operating system.

System action: **Stageman** proceeds.

Operator response: The failure to create the archive does not impact the correct functioning of Tivoli Workload Scheduler. However, attempt to resolve the problem so that the following plan period's old Symphony file can be correctly archived. Check the possible causes above to determine what has gone wrong, and correct the error.

Check the file system of nullTWS_home>/schedlog/Mnullarchive_date> to ensure that there is sufficient space, and that the user has write permission. Delete old archived Symphony files that are no longer needed.

When you have corrected the problem, rerun **JnextPlan**.

AWSBH028E The new Symphony file cannot be renamed to the following file name: "file_name".

Explanation: **Stageman** is unable to rename the Symnew file to "" nullTWS_home>/Symphony "".

file_name is the actual name that **stageman** wants to give the file.

Possible reasons for this are as follows:

- The file system is full.
- **Stageman** does not have write permission in the directory.
- Another file already exists with the same name.

System action: **Stageman** stops, without saving the new Symphony file.

Operator response: Check the file system of nullTWS_home>/Symphony to ensure that there is sufficient space, that the user has write permission, and that there is not already a Symphony file present. You might want to delete old archived Symphony files that

are no longer needed from the nullTWS_home>/schedlog/ directory.

When you have corrected the problem, rerun **JnextPlan**.

AWSBH029E The new Symphony file cannot be saved.

Explanation: **Stageman** is unable to save the Symphony file in "" nullTWS_home>/Symphony "".

Possible reasons for this are as follows:

- The file system is full.
- **Stageman** does not have write permission in the directory.
- Another file already exists with the same name.

System action: **Stageman** stops, without saving the new Symphony file.

Operator response: Check the file system of nullTWS_home>/Symphony to ensure that there is sufficient space, that the user has write permission, and that there is not already a Symphony file present. You might want to delete old archived Symphony files that are no longer needed from the nullTWS_home>/schedlog/ directory.

When you have corrected the problem, rerun **JnextPlan**.

AWSBH031W User is not creator of !1, must logon as !1

AWSBH032E Multiple runs of Stageman, recompile new Symphony first

AWSBH034W The following job has dependencies not carried forward: "workstation_name#"job_name".

Explanation: The indicated job has dependencies in the production plan (Symphony file), but the jobs on which it is dependent are not in the Symphony file. This is because those jobs were not in a carryforward job stream. **Stageman** adds a *prompt* for every job not found.

workstation_name#job_name identifies the job with the missing dependencies.

System action: **Stageman** proceeds.

Operator response: Respond to the ""prompts"" to release the job. You might need to add those jobs in a carryforward job stream.

See *The User's Guide and Reference* for more details.

AWSBHV035W The following job stream has dependencies not carried forward: "job_stream_name".

Explanation: The indicated job stream has dependencies in the production plan (Symphony file), but the jobs on which it is dependent are not in the Symphony file. This is because those jobs were not in a carryforward job stream. **Stageman** adds a *prompt* for every job not found.

job_stream_name identifies the job stream with the missing dependencies.

System action: **Stageman** proceeds.

Operator response: Respond to the ""prompts"" to release the job stream. You might need to add those jobs in a carryforward job stream.

See *The User's Guide and Reference* for more details.

AWSBHV037W The following job stream or job is in the adding state, and has not been carried forward: "workstation#"job_stream_or_job".

Explanation: See message.

workstation#job_stream_or_job is the name of the job stream or job which is in the *adding* state.

System action: **Stageman** proceeds, but the job or job stream is not added to the plan.

Operator response: Add the *carryforward* option to the job stream's definition.

AWSBHV038E Stageman has been unable to get exclusive access to the Symphony file. You need to shutdown the Tivoli Workload Scheduler processes.

Explanation: See message.

System action: **Stageman** stops.

Operator response:

1. Unlink the workstation and shutdown the Tivoli Workload Scheduler processes.
2. Stop the connectors if present
3. Rerun **stageman**.

AWSBHV039W No carry job states are specified in the global options. The default behavior of allowing all states has been used.

Explanation: The *carry job states* setting in the global options determines the jobs, by state, that are to be included in job streams that are carried forward. If you make no specific setting, all jobs are included.

System action: **Stageman** proceeds.

Operator response: If the job state selection is not

what you require, change the *carry job states* setting in the global options using **optman**, stop all Tivoli Workload Scheduler processes and restart **stageman**.

See See the 'Optional Customization Topics (Global Options)' section in the *Planning and Guide*.

AWSBHV040W Only jobs in the following states are carried forward: "job_states", as defined in the global options (carry job states).

Explanation: See message.

job_states is the list of states of job streams that are carried forward.

System action: **Stageman** proceeds.

Operator response: If the job state selection is not what you require, change the *carry job states* setting in the global options using **optman**, stop all Tivoli Workload Scheduler processes and restart **stageman**.

If you want jobs in all states to be carried forward, set the *carry job states* setting in the global options to null, using **optman**.

See See the 'Optional Customization Topics (Global Options)' section in the *Planning and Guide*.

AWSBHV041E Error accessing mozart: !1

AWSBHV042E Error accessing Straus: !1

AWSBHV043E Stageman cannot create the new Symphony file because the settings in the global options or the localopts file indicate that this workstation is not the master domain manager.

Explanation: See message.

System action: **Stageman** stops.

Operator response: Verify that this workstation is the master domain manager by checking that the *master* variable in the global options identifies this workstation.

- If it does not, run **stageman** from the master domain manager.
- If this is the master domain manager, the probable cause is that the workstation specified by the *thiscpu* variable in the *localopts* option file and the workstation specified by the *master* variable in the global options, are not the same. Change the *localopts* file so that they are the same, save the file, stop all Tivoli Workload Scheduler processes, and rerun **stageman**.

AWSBHV044E Stageman is unable to open the mailbox file Mailbox.msg. The following operating system error message was given: "error_number".

Explanation: See message.

System action: Stageman stops.

Operator response: Verify that the file Mailbox.msg exists and that you have the correct access rights. Retry the operation.

AWSBHV045E An error occurred while opening the following file: "file_name". The following gives more details of the error: "error_text".

Explanation: See message.

file_name is either Symnew or Symphony file. *error_text* is the text of the error message indicating why the file could not be opened.

System action: Stageman stops.

Operator response: Verify that *file_name* exists and that you have the correct access rights. Retry the operation.

AWSBHV046E An error occurred while writing the Symphony file. The following gives more details of the error: "error_text".

Explanation: Stageman is unable to write to the Symphony file. One possible reason is that Sinfonia does not have read permission.

error_text is a message indicating why.

If the Sinfonia file is unreadable, *error_text* could include the symaccs error AWSBCU007E. The full text of the combined message in these circumstances would be: *Error writing the Symphony file: An error has occurred in the common area used to access the Symphony file.*

System action: Stageman stops.

Operator response: Check the file system of `nullTWS_home>/Sinfonia` to ensure that there is sufficient space and that the user has read permission. You might want to delete old archived Symphony files that are no longer needed from the `nullTWS_home>/schedlog/` directory.

When you have corrected the problem, rerun **JnextPlan**.

AWSBHV047W The following job stream: "workstation#"job_stream" was carried forward, even though its workstation is not present in the Symphony file.

Explanation: See message.

workstation#job_stream is the name of the job stream whose workstation is not present.

System action: Stageman proceeds and carries forward the job stream.

Operator response: Check if the job stream contains any jobs for an operative workstation. If not, cancel the job stream, so that at the plan generation, stageman does not carry it forward.

AWSBHV048W An invalid dependency has been detected for the following job stream: "workstation#"job_stream".The priority has been set to 0.

Explanation: See message.

workstation#job_stream is the name of the job stream whose dependency was not correct.

System action: Stageman proceeds and set the priority to 0.

Operator response: Check if the job stream can start without respecting its dependency. If yes, increase its priority.

AWSBHV049W An invalid dependency has been detected for the following job: "workstation#"job_stream"."job".The priority has been set to 0.

Explanation: See message.

workstation#job_stream.job is the name of the job whose dependency was not correct.

System action: Stageman proceeds and set the priority to 0.

Operator response: Check if the job can start without respecting its dependency. If yes, increase its priority.

AWSBHV065E In the options for stageman there is an option that has a required argument, but that argument has not been supplied. The option in question is as follows: "option".

Explanation: For example, stageman was run without either *yes*, *no*, or *all* specified as the argument to the *-carryforward* option.

System action: Stageman does not start.

Operator response: Rerun stageman, adding the missing argument.

To see the stageman syntax, issue the command **stageman -U**, or look in the *User's Guide and Reference*.

See *The User's Guide and Reference* for full details of the stageman syntax.

AWSBHV066E The following argument: "argument" is not valid for the "option" option; perhaps it has been typed incorrectly.

Explanation: See message.

System action: Stageman does not start.

Operator response: Rerun **stageman**, supplying the required argument with the correct syntax.

To view the **stageman** syntax, issue the command **stageman -U**, or look in the *User's Guide and Reference*.

See The *User's Guide and Reference* for full details of the **stageman** syntax.

AWSBHV067E The following option is not a valid option for this command: "option"; maybe it has been typed incorrectly.

Explanation: See message.

System action: Stageman does not start.

Operator response: Rerun **stageman**, supplying the required options with the correct syntax.

To view the **stageman** syntax, issue the command **stageman -U**, or look in the *User's Guide and Reference*.

See The *User's Guide and Reference* for full details of the **stageman** syntax.

AWSBHV068W Stageman has been invoked with the "option" option, but other options or arguments have also been supplied. To use this option supply it without other options or arguments.

Explanation: See message.

System action: Stageman does not start.

Operator response: Rerun **stageman**, supplying the *-parse* option on its own. If you did not intend to use the *-parse* option, omit it.

To view the **stageman** syntax, issue the command **stageman -U**, or look in the *User's Guide and Reference*.

See The *User's Guide and Reference* for full details of the **stageman** syntax.

AWSBHV069W The following logfile name begins with -: "log_file_name"

Explanation: The *log_file_name* must not begin with "'-'", but with an alphanumeric character.

log_file_name is the name of the logfile.

System action: Stageman proceeds without writing to the log file.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHV070E Stageman has been submitted with both the *-log* and *-nolog* options, which are mutually exclusive.

Explanation: See message.

System action: Stageman does not start.

Operator response: Rerun **stageman**, supplying either the *-log* or the *-nolog* option, but not both.

To view the **stageman** syntax, issue the command **stageman -U**, or look in the *User's Guide and Reference*.

See The *User's Guide and Reference* for full details of the **stageman** syntax.

AWSBHV073W Globalopts file parsed only. No carryforward done.

AWSBHV074E The previous Symphony file is expanded but the Symnew file is in non-expanded mode. They cannot be merged to form the new Symphony file.

Explanation: Stageman tried to merge an expanded old Symphony file and a non-expanded Symnew file to create the new Symphony file. One possibility is the following:

1. The databases were expanded, and a Symphony file was generated.
2. Then a non-expanded database was restored from the backup in the *mozart* directory.
3. **Compiler** was then run to generate a non-expanded Symnew file.
4. Finally **stageman** was run, generating this error.

System action: Stageman stops.

Operator response: If it was your intention to switch to non-expanded mode, then you must remove the expanded Symphony file before rerunning **stageman**.

Otherwise, correct the database problem by running **dbexpand** or by restoring the last known good database files in expanded mode. Rerun **stageman** once the expanded mode files are present.

AWSBHV076E Unable to open the audit log.

Explanation: Stageman is unable to open the audit log file because the *open()* system call failed for some reason.

System action: Stageman stops.

Operator response: Verify access permissions to make sure **stageman** has permission to write to the audit directory: *nullTWS_home>/audit*).

Verify that there is sufficient space in this fileset to open a file.

support.

When you have resolved the problem, rerun **JnextPlan**.

AWSBHV080E **Stageman is trying to access a record in the old Symphony file which has a record number higher than the final record in the file.**

Explanation: See message text.

System action: **Stageman** stops.

Operator response: This is an internal error. It might be that the Symphony file is corrupt. See the chapter on 'Symphony file corruption' in the Troubleshooting guide.

See The chapter on 'Symphony file corruption' in the Troubleshooting guide.

AWSBHV081W **The pending predecessor "workstation_name"#job_stream_name" has not been found in the new Production Plan as expected. The pending predecessor is marked as an orphan predecessor, which must be released or replaced before the job or job stream in which it was defined can be run.**

Explanation: See message text.

System action: **Stageman** marks the pending predecessor as an orphan and continues.

Operator response: Check the orphan predecessor dependencies in the Production Plan and release them to allow the dependent job or job stream to start, or replace them with dependencies on existing jobs or job streams.

AWSBHV082E **The previous Symphony file and the Symnew file have the same run number. They cannot be merged to form the new Symphony file.**

Explanation: **Stageman** tried to merge a Symphony file and a Symnew file with the same run number to create the new Symphony file. Probably **stageman** has been run twice on the same Symnew file without resetting the plan or deleting the Symphony file.

System action: **Stageman** stops.

Operator response: If it was your intention to recover the Symphony file, you must reset the plan and run **JnextPlan** or you have to replace the Symphony file with the previous one that is archived in the schedlog directory before rerunning **stageman**.

Otherwise, rerun **JnextPlan**. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/>

Chapter 100. AWSBHW - Object parsing messages

This section lists object parsing error and warning messages that might be issued.

The message component code is BHW.

AWSBHW001E A job name, file name or keyword is missing in the submitted command.

Explanation: See AWSBHU700E.

AWSBHW002E The submitted command appears to contain extra or duplicated characters.

Explanation: See AWSBHU701E.

AWSBHW003E There is a syntax error in the name. It must be between 1 and 16 bytes.

Explanation: See AWSBHU743E.

AWSBHW004E There is a syntax error in the name. It must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See AWSBHU703E.

AWSBHW005E The delimiter of cpu name is a #.

AWSBHW006E There is a syntax error in the workstation name. The # symbol was found more than once.

Explanation: See AWSBHU705E.

AWSBHW007E There is a syntax error. The job stream name must be between 1 and 16 bytes.

Explanation: See AWSBHU744E.

AWSBHW008E There is a syntax error. The job stream name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See AWSBHU707E.

AWSBHW009E The delimiter of the schedule name is a period .

AWSBHW010E The job name is either null, or longer than the maximum length of 40 bytes.

AWSBHW011E There is a syntax error. The job name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See AWSBHU710E.

AWSBHW012E There is a syntax error. The command has a job as its object but the job name has not been supplied.

Explanation: See AWSBHU711E.

AWSBHW013E There is a syntax error. The prompt name must be between 1 and 8 bytes long.

Explanation: See AWSBHU712E.

AWSBHW014E There is a syntax error. The prompt name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See AWSBHU713E.

AWSBHW015E Prompt name or message number not supplied.

AWSBHW016E There is a syntax error. The resource name must be between 1 and 8 bytes long.

Explanation: See AWSBHU715E.

AWSBHW017E There is a syntax error. The resource name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See AWSBHU716E.

AWSBHW018W Priority is either HI, GO, or 0-99.

AWSBHW019W There is a syntax error. Priority must be a numeric value from 0 to 99, hi (= 100), or go (= 101).

Explanation: See AWSBHU718E

AWSBHW020E There is a syntax error. You cannot specify a priority higher than 99 (use hi (= 100), or go (= 101) instead.

Explanation: See AWSBHU719E.

AWSBHW021E User domain length incorrect

AWSBHW022E There is a syntax error. The supplied user name is not valid. The name can contain up to 47 bytes. If the name contains special characters the full name must be enclosed in quotes ().

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted user name.

See *The User's Guide and Reference* for details of how to specify the user name.

AWSBHW023E Duplicate user name given.

AWSBHW038E There is a syntax error. The calendar name must be between 1 and 8 bytes long. It must also start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted calendar name.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW039E There is a syntax error. The parameter name must be between 1 and 8 bytes long. It must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted parameter name.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW040E There is a syntax error. The prompt name must be between 1 and 8 bytes long. It must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted prompt name.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW041E There is a syntax error. The date is not valid.

AWSBHW045E There is a syntax error. You cannot specify both dates in a valid in argument using the @ wildcard.

Explanation: The command has been supplied with a "valid in" argument, which requires two dates to define the period in which the job can be run. One or other of these dates can use the "@" wildcard to mean "any", but not both.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted "valid in" argument.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW046E There is a syntax error. The required workstation name is missing. Specify a workstation name or remove the workstation delimiter.

Explanation: The delimiter that precedes the definition of a workstation name was found in the command string, but the workstation name was not specified.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, providing a correctly formatted object definition.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW047E There is a syntax error. The event rule name must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, providing a correctly formatted object definition.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW048E A syntax error occurred. The variable table name must not exceed 80 bytes. It must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, supplying a correctly formatted object definition.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW049E A syntax error occurred. The variable name must not exceed 16 bytes. It must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, supplying a correctly formatted object definition.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW050E A syntax error occurred. The character . is duplicated in the variable.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, supplying a correctly formatted variable.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW051E A syntax error occurred. The value specified for the variable must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation: The correct command syntax is: ren vb=Current_VariableTable_name.Variable_name New_Variable_name

You can omit VariableTable_name if the variable is defined in the default variable table.

System action: The submitted command cannot be performed.

Operator response: Resubmit the command, supplying a correctly formatted variable.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW052E There is a syntax error. The run cycle group name is not valid. It must be between 1 and 40 bytes long, start with an alphabetical character, and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a valid cycle group name.

See *The User's Guide and Reference* for details of the command syntax.

AWSBHW053E There is a syntax error. The batch application name is not valid. It must be between 1 and 80 bytes long, start with an alphabetical character, and contain only alphanumeric characters, dashes, and underscores.

Explanation: See message.

System action: The command is not processed.

Operator response: Resubmit the command, supplying a valid batch application name.

See *The User's Guide and Reference* for details of the command syntax.

Chapter 101. AWSBHX - Logman messages

This section lists error and warning messages that might be issued by logman.

The message component code is BHX.

AWSBHX011W The job has negative elapsed time.
Check the time parameters.

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHX021E An error occurred opening the temporary file "file_name".

Explanation: See message.

file_name is the file that cannot be opened.

System action: Logman stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has read permission
- That there is sufficient disk space to open and read a file
- That there are sufficient file descriptors available to open a file.

Correct any errors that you find, and restart logman.

AWSBHX022E An internal error occurred while initializing the HTTP communication. The library returned this error "error_message".

Explanation: See message.

error_message is the reason for the error returned by the library.

System action: Logman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHX023E An internal error occurred while sending data to the server. The error message is "error_message".

Explanation: See message.

error_message is the reason for the error.

System action: Logman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at

AWSBHX024E An internal error has occurred. The server has returned an error code. RC="server_return_code"

Explanation: See message.

server_return_code is the return code returned by the server.

System action: Logman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHX027W The value specified for the -timeout connection parameter is not valid. It must be the number of seconds that the command line client is to wait for a connection before timing out.

Explanation: The "-timeout" parameter is one of the connection parameters. These are supplied: as part of the command, in a file of connection parameters, or by default from the `useropts` or `localopts` file. It must be expressed as a number (of seconds). For example, the value for 30 seconds must be "30", not "30s" or "30 secs".

System action: The operation is not performed.

Operator response: Retry the command, changing the value of the *timeout* parameter to be a number of seconds.

Chapter 102. AWSBHZ - Scheduler messages

This section lists error and warning messages that might be issued by the scheduler component.

The message component code is BHZ.

AWSBHZ001E **Schedulr cannot be run on this workstation, because the settings in the global options or the localopts file indicate that this workstation is not the master domain manager.**

Explanation: See message.

A common reason for this problem is that the procedure for switching to the backup master domain manager has not been followed correctly.

System action: The program stops.

Operator response: Verify that this workstation is the master domain manager by checking that the *master* variable in the global options identifies this workstation.

- If it does not, run **schedulr** from the master domain manager.
- If this is the master domain manager, the probable cause is that the workstation specified by the *thiscpu* variable in the *localopts* option file and the workstation specified by the *master* variable in the global options, are not the same. Change the *localopts* file so that they are the same, save the file, stop all Tivoli Workload Scheduler processes, and rerun **schedulr**.

AWSBHZ002E **There is not enough memory available to run schedulr.**

Explanation: See message.

System action: The program cannot start.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **schedulr**. Rerun **schedulr**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **schedulr**.
3. If the problem persists, reboot the workstation, and then rerun **schedulr**.

See The *Release Notes* for details of memory requirements.

AWSBHZ003W **The submitted job stream has not been found or the job stream name is too long.**

Explanation: See message.

System action: The program proceeds.

Operator response: Resubmit the command, ensuring that all job streams that you ask **schedulr** to use exist, and have correctly-formed valid names.

See The *User's Guide and Reference* for details about job stream names and how to invoke them for **schedulr**.

AWSBHZ008E **Schedulr was unable to open the prodsked file for the following reason: "error_message".**

Explanation: Some possible reasons are that the file has been locked, or the user running **schedulr** does not have the rights to open it.

error_message describes the error and includes the operating system error message.

System action: The program stops.

Operator response: Attempt to correct the error given in the message. In any case it is worthwhile removing the old prodsked file if it exists, and verifying that the user of Tivoli Workload Scheduler has access rights to the Tivoli Workload Scheduler home directory.

AWSBHZ009E **You have supplied a date with the -date option, but the supplied date is not in the correct format.**

Explanation: See message.

System action: **Schedulr** prompts you for a new date.

Operator response: Provide a date in the correct format: `"" nullmm>/nulldd>/null[yy]yy> ""`.

AWSBHZ010E **Schedulr has encountered the following error when trying to find a job stream in the mastsked database: "error_text"**

Explanation: See message.

error_text is the message indicating why the error occurred. The mastsked database might be corrupted.

System action: **Schedulr** stops.

Operator response: To rebuild the mastsked database, run **composer** and issue the **build mastsked** command. Rerun **schedulr**.

AWSBHZ011E **Schedulr encountered the following error while checking to see if a date is defined for a particular calendar in the calendars database: "error_text".**

Explanation: See message.

error_text is the message indicating why the error occurred. The calendars database might be corrupted.

System action: **Schedulr** stops.

Operator response: To rebuild the calendars database, run **composer** and issue the **build calendars** command. Rerun **schedulr**.

AWSBHZ012E **Schedulr encountered the following error while searching for a specific calendar in the calendars database: "error_text".**

Explanation: See message.

error_text is the message indicating why the error occurred. The calendars database might be corrupted.

System action: **Schedulr** stops.

Operator response: To rebuild the calendars database, run **composer** and issue the **build calendars** command. Rerun **schedulr**.

AWSBHZ013E **Schedulr encountered the following error while reading a job stream from the mastsked database: "error_message".**

Explanation: See message text.

error_message contains the reason for the error and includes the operating system error message. The mastsked database might be corrupted.

System action: **Schedulr** stops.

Operator response: To rebuild the mastsked database, run **composer** and issue the **build mastsked** command. Rerun **schedulr**.

AWSBHZ014E **Schedulr encountered the following error while reading dates from the calendars database: "error_message".**

Explanation: See message.

error_message contains the reason for the error and includes the operating system error message. The

calendars database might be corrupted.

System action: **Schedulr** stops.

Operator response: To rebuild the calendars database, run **composer** and issue the **build calendars** command. Rerun **schedulr**.

AWSBHZ015E **Schedulr encountered the following error while trying to lock the mastsked or job.sched databases: "error_message"**

Explanation: See message. These databases are locked before **schedulr** starts selecting the job streams that are to be included in the production period. **Schedulr** might not be able to lock the mastsked and job.sched databases because the databases might be locked by another process.

error_message contains the reason for the error and includes the operating system error message.

System action: **Schedulr** stops.

Operator response: Determine if another process has locked the databases, using the operating system tools (for example, **fuser**). Wait till that process has finished, or stop it if you are certain that you can safely do so. Rerun **schedulr**.

AWSBHZ016E **An internal error has occurred. While processing the mastsked database, schedulr was unable to add a job stream dependency to the internal table used by the resolve dependencies functions.**

Explanation: The internal error is: **""Not allowed to call resolve function""**.

System action: **Schedulr** stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHZ017E **An internal error has occurred. Schedulr was unable to add a job stream dependency to the internal table used by the resolve dependencies functions.**

Explanation: The internal error is: **""Bad dependencies passed to resolver""**.

System action: **Schedulr** stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBHZ023E **Schedulr encountered an error parsing the contents of the job streams in the mozart database.**

Explanation: A previous message has given details of the error.

System action: **Schedulr** stops.

Operator response: Solve the problem as described in the previous error message. Rerun **schedulr**.

AWSBHZ024E **Schedulr has encountered the following error while trying to initialize the Security file: "error_message".**

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: **Schedulr** stops.

Operator response: Check if the Security file exists. If it does, delete it and then recreate it.

If it does not exist, create it.

Create or recreate the Security file as follows:

1. Run the **wmaeutil** command to stop the connector.
2. Run the **makesec** command to create the Security file.

See The chapter on setting security in the *Administration Guide* for more details.

AWSBHZ025E **The user that launched schedulr does not have the correct permissions for the schedulr actions.**

Explanation: To run **schedulr**, the user must have *build* access to the *file* object in the Tivoli Workload Scheduler Security file.

System action: **Schedulr** stops.

Operator response: Do one of the following:

- Edit the Security file to give the user the correct rights, stop all Tivoli Workload Scheduler processes and rerun **schedulr**.
- Log off and log on again as a user with the rights to run **schedulr**.

See The chapter on setting security in the *Administration Guide* for more details.

AWSBHZ029E **Schedulr encountered the following error while trying to lock the calendars database: "error_message".**

Explanation: The calendars database is locked before **schedulr** starts selecting the job streams that are to be included in the production period.

error_message contains the reason for the error and

includes the operating system error message.

System action: **Schedulr** stops.

Operator response: Determine if another process has locked the calendars database. Wait till that process has finished, or stop it. Rerun **schedulr**.

AWSBHZ030E **Schedulr is unable to find the "calendar" calendar specified in the following job stream: "workstation_name"#"job_stream".**

Explanation: See message text.

workstation_name is the name of the workstation where the job stream is defined. *job_stream* is the name of the job stream. *calendar* is the name of the calendar that cannot be found.

System action: **Schedulr** stops.

Operator response: Confirm that the calendar specified in the job stream does not exist in the calendars database:

- If it does not exist, either remove the reference to the calendar from your job stream, change the reference to an existing calendar, or create the calendar with **composer**. Then rerun **schedulr**.
- If it does exist, an internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 103. AWSBIA - Composer messages

This section lists error and warning messages that might be issued by the composer component.

The message component code is BIA.

AWSBIA002E The identifier "identifier" is required at this point, but has not been supplied.

Explanation: See message.

identifier is the identifier expected at this point in the command.

System action: Composer cannot perform the update required.

Operator response: Check the syntax of the object definitions. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definitions.

AWSBIA003E A parameter or identifier has been supplied where it is not required.

Explanation: See message.

System action: Composer cannot perform the update required.

Operator response: Check the syntax of the object definitions. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definitions.

AWSBIA004E The delimiter "delimiter" is required at this point, but has not been supplied.

Explanation: See message.

delimiter is the delimiter expected at this point in the command.

System action: Composer cannot perform the update required.

Operator response: Check the syntax of the object definitions. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definitions.

AWSBIA005E Expected a !1 here.

AWSBIA006E Error on database access.

AWSBIA007E Security error.

AWSBIA008E The supplied job stream !1#!2 could not be found.

AWSBIA009E Error opening database.

AWSBIA010E Autodoc not allowed for this job.

AWSBIA014E Someone else has changed schedule !1#!2. No update done.

AWSBIA017E An internal error has occurred. Out of memory trying to allocate "internal_storage_item".

Explanation: The program has encountered an internal error trying to allocate memory for the indicated *internal_storage_item*.

System action: Composer cannot perform the update required.

Operator response: This is an internal error. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA018E Job "job_identifier" is already present in the job stream.

Explanation: You cannot add the job identified by the indicated *job_identifier* to the job stream, because it is already present, and multiple jobs cannot coexist.

System action: Composer cannot perform the update required.

Operator response: Check the job definition. Reissue the command, identifying a different job that does not exist in the job stream, or using an alias to give the job a separate identity.

AWSBIA019E For job stream !1#!2: errors !3, warnings !4.

AWSBIA020E Mastsked not updated.

AWSBIA021E Job "job_name" does not exist in job stream "workstation#"job_stream_name".

Explanation: The issued command identifies a job that is not in the job stream. *job_name* is the job that does not exist.

workstation#job_stream_name identifies the job stream which is the subject of the command.

System action: Composer cannot perform the update required.

Operator response: Check the job definition. Reissue the command, identifying an existing job.

AWSBIA022E A file system error "error_message" occurred building the temporary file "temporary_file_name".

Explanation: See message.

System action: Composer cannot perform the update required.

Operator response: Check the file system error message. This might indicate a problem that you can resolve, such as: file system full, insufficient file descriptors, or incorrect file permissions. If you can resolve the problem, do so. If not, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA023E Job !1#!2 not found in job master.

AWSBIA024E Job master changed while trying to update job !1#!2. Update aborted.

AWSBIA030E An error has occurred opening the redirected output file "file_name" identified by the MAESTROL variable.

Explanation: The ;offline keyword has been used to redirect the output. The MAESTROL variable is set to redirect the output to a file, but the file cannot be opened.

file_name is the file that is nominated as the redirected output file that cannot be opened.

System action: Composer cannot perform the update required.

Operator response: Perform the following checks:

1. Check that the file path is correct, and that if the path includes spaces it has been included between double quotes.
 2. Check that the directory has write permission for the user performing the command.
 3. Check that there is sufficient disk space in the file set for a file to be opened.
-

4. Check that the operating system has sufficient file descriptors available to open the file.

Correct any errors and retry the command.

AWSBIA031E An error has occurred writing the redirected output file "file_name" identified by the MAESTROL variable.

Explanation: The ;offline keyword has been used to redirect the output. The MAESTROL variable is set to redirect the output to a file, but an error occurred while writing to the file.

file_name is the file that is nominated as the redirected output file that cannot be opened.

System action: Composer cannot perform the update required.

Operator response: Perform the following checks:

1. Check that the file has not been deleted by another user
2. Check that there is sufficient disk space in the file set for a file to be written.

Correct any errors and retry the command.

AWSBIA032E Error reading schedule.

AWSBIA034E No job streams found in !1#!2

AWSBIA037E The only keyword allowed at this point is ;offline.

Explanation: The syntax of the object definition language determines that the only permissible keyword at this point is "";offline"", but something else is present instead of ""offline"".

System action: Composer cannot perform the update required.

Operator response: Check the object definition syntax. See the *User's Guide and Reference* for full details of the syntax. Correct the error and reissue the command.

AWSBIA038E No qualifying CPU's were found in !1.

AWSBIA043E Validation for object "object_ID": errors: "error_count"; warnings "warning_count".

Explanation: The validation of the indicated object has found errors, warnings, or both.

object_ID identifies the object that is the subject of the command.

error_count is the number of errors found.

warning_count is the number of warnings found.

System action: Composer cannot perform the update required.

Operator response: This message will have been preceded by error messages, warning messages, or both. Follow the instructions for each message to correct them, and resubmit the command.

AWSBIA044W Cpdata not updated.

AWSBIA045E Error accessing cpudata.

AWSBIA046E Error opening cpudata.

AWSBIA047E An error occurred while accessing the definition file "file_name".

Explanation: See message *file_name* identifies the file containing the object definitions that cannot be accessed.

System action: Composer cannot perform the update required.

Operator response: Check the syntax of the command. Perform the following checks:

1. Check that the file exists, that the path is correct, and that if the path includes spaces it has been included between double quotes.
2. Check that the file has read permission for the user performing the command.
3. Check that there is sufficient disk space in the file set for a file to be opened.
4. Check that the operating system has sufficient file descriptors available to open the file.

Correct any errors and retry the command.

AWSBIA057E No resources were found.

AWSBIA060E Error modifying resources.

AWSBIA065E No prompts were found.

AWSBIA068E No prompts found in the database.

AWSBIA076E No calendars found in the database.

AWSBIA081E No parms were found.

AWSBIA084E No parms found in the database.

AWSBIA085E Circular dependency for !1#!2 and !3#!4.

AWSBIA086E !1 is not a definition file.

AWSBIA087E There is a syntax error in the command.

Explanation: See message.

System action: Composer cannot perform the update required.

Operator response: Check the syntax of the issued command. Use the command **composer -u** to view the usage of the command, or look in the *User's Guide and Reference*. Correct the error and reissue the command.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA088E An internal error "error" has occurred while trying to resolve dependencies.

Explanation: See message.

error is a code that refers to a list in the program code of potential errors.

System action: Composer cannot perform the update required.

Operator response: This is an internal error. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA089E The keyword "keyword" was expected at this point.

Explanation: You have issued a **validate** command, but following the name of the file to be validated the only permitted (optional) keyword is `""keyword""`.

System action: Composer cannot perform the update required.

Operator response: Check the object definition syntax. See the *User's Guide and Reference* for full details of the syntax. Correct the error and reissue the command.

See *The User's Guide and Reference* for full details of the object definition syntax.

AWSBIA092E Resource !1#!2 doesn't exist.

AWSBIA093E Prompt !1 doesn't exist.

AWSBIA095E Schedule already exists.

AWSBIA096E Cpu definition already exists.

AWSBIA097E A file system error "error_message" occurred writing the temporary file "temporary_file_name".

Explanation: See message.

System action: Composer cannot perform the update required.

Operator response: Check the file system error message. This might indicate a problem that you can resolve, such as: file system full, insufficient file descriptors, or incorrect file permissions. If you can resolve the problem, do so. If not, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA098E A file system error "error_message" occurred closing the temporary file "temporary_file_name".

Explanation: See message.

System action: Composer cannot perform the update required.

Operator response: Check the file system error message. This might indicate a problem that you can resolve, such as: file system full, insufficient file descriptors, or incorrect file permissions. If you can resolve the problem, do so. If not, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA100E CPU !1 does not exist in cpudata: !2

AWSBIA101E Only SCHEDULE or CPU can be specified here.

AWSBIA105E A file system error "file_system_error" has occurred opening the script or jcl file "file_name".

Explanation: See message.

file_system_error is the error given by the operating system.

file_name identifies the file

System action: Composer cannot perform the update required.

Operator response: Check the operating system documentation to determine the nature of the file system error. If you can correct the error, do so and retry the operation. If you cannot correct the error, search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA106W The job stream definition has one or more warnings.

Explanation: The job stream definition has been validated and accepted, but one or more warnings were issued.

System action: You are asked whether composer is to perform the update.

Operator response: Check the preceding warning message or messages. If the situations indicated by the warning or warnings are acceptable, answer ""y"" to the question ""Do you want to update?"".

If not, answer ""n"" to the question ""Do you want to update?"" , correct the job stream definition and reissue the command.

AWSBIA107W The workstation definition has one or more warnings.

Explanation: The workstation definition has been validated, but one or more warnings were issued.

System action: You are asked whether composer is to perform the update.

Operator response: Check the preceding warning message or messages. If the situations indicated by the warning or warnings are acceptable, answer ""y"" to the question ""Do you want to update?"".

If not, answer ""n"" to the question ""Do you want to update?"" , correct the workstation definition and reissue the command.

AWSBIA109E Calendar !1 is not in the calendars database.

AWSBIA110E You are not authorized to access schedule !1#!2.

AWSBIA111E You are not authorized to access calendar !1.

AWSBIA112E You are not authorized to access parm !1 on this cpu.

AWSBIA113E You are not authorized to access resource !1#!2.

AWSBIA114E You are not authorized to access cpu !1.

AWSBIA115E You are not authorized to access prompt !1.

AWSBIA116W Recovery job !3#!4 not found for job !1#!2.

AWSBIA117W Job is hosted by cpu !4, resource !1#!2 is hosted by cpu !3.

AWSBIA118W Schedule is hosted by cpu !4, resource !1#!2 is hosted by cpu !3.

AWSBIA119E Error, schedule not updated.

AWSBIA120W The host keyword has been supplied for the definition of a workstation of type fta, but is not required. It has been ignored.

AWSBIA121W Order of interleaved dependencies will be lost when sched is written.

AWSBIA122W Autodoc for !1 will be removed when schedule is written to mastsked.

AWSBIA123W Autodoc for !1#!2 will be removed when schedule is written to mastsked.

AWSBIA124W Dependency !1 does not exist in schedule !2#!3.

AWSBIA125W The host cpu !1 is not a domain manager or the master.

AWSBIA126W The domain name !1 is already used and managed by another workstation.

AWSBIA127W The domain manager workstation !1 is not defined as an FTA.

AWSBIA128W The domain manager workstation !1 must be in the same domain.

AWSBIA129W The parent domain !1 not found.

AWSBIA130W The parent domain !1 is not defined as a DOMAIN definition.

AWSBIA131E !1 is reserved for the master domain name.

AWSBIA138E You cannot specify both the domain and the host keywords for a standard agent or broker workstation. Use only one or the other.

AWSBIA139E For a standard agent or broker workstation you must specify a domain.

AWSBIA140E For an extended agent you must specify the host and the access method.

AWSBIA141W The master domain has a parent: !1. It must have no parent domain.

AWSBIA142E Domain !1 not found.

AWSBIA143W !1 is not defined as a domain.

AWSBIA144E Error: Incompatible database files, use dbexpand to update databases.

AWSBIA145W Access method !1 does not exist on your system!

AWSBIA146W A loop was found in the domain definition.

AWSBIA147E The "first_time_zone_definition" differs from "second_time_zone_definition" for "job_or_job_stream". A time zone need be specified just once, or all instances of it must be equal.

Explanation: A time zone need only be specified once in a job or job stream definition. If you choose to specify it more than once, all instances of the time zone definition must be equal.

Note: a job can have a different time zone definition than that of its job stream.

first_time_definition is one of the time definitions.

second_time_definition is another time definition that has a different time zone specification.

job_or_job_stream identifies the job or job stream that cannot be scheduled.

System action: The job or job stream cannot be scheduled.

Operator response: Correct the job or job stream definition so that either the time zone specification

AWSBIA148W • AWSBIA265E

occurs only once, or so that each time definition has exactly the same time zone specification. Note that a job can have a different time zone definition than that of its job stream.

Use composer to reschedule the job or job stream.

AWSBIA148W The until time is earlier than the at time for !1. Check the time definitions and ensure that this is what you intended.

AWSBIA149E Time zones are not enabled on workstation !1.

AWSBIA150W Domain manager !1 is a manager of another domain

AWSBIA151W The deadline is earlier than the at time for !1.

AWSBIA152W The deadline is earlier than the until time for !1.

AWSBIA153W You must specify a domain when the host is \$MANAGER.

AWSBIA198E The domain definition already exists.

AWSBIA199E The workstation class definition already exists.

AWSBIA201E You are not authorized to access job !1#!2.

AWSBIA203E No qualifying jobs were found in !1.

AWSBIA204W For !1, errors !2, warnings !3.

AWSBIA211E Job !1#!2 already exists.

AWSBIA213W The job definition has warnings.

AWSBIA214E Error, job not updated.

AWSBIA215E Job Master not updated.

AWSBIA221E Invalid composer command: !1

AWSBIA222E Modify command is not valid in gui mode.

AWSBIA223E New command is not valid in gui mode.

AWSBIA224E Edit command is not valid in gui mode.

AWSBIA225W Workstation "workstation" is defined as a workstation class.

AWSBIA226W Workstation "workstation" is not the master domain manager. The parameters are expanded from the master domain manager.

AWSBIA227E The extended agent, standard agent or broker workstation "workstation" cannot host itself.

AWSBIA228E !1 already exists and its type does not match what is being created.

AWSBIA229E The master domain manager "workstation" is managing the domain "domain" as specified in the global options.

AWSBIA230E The domain "domain" cannot be included in a cpuclass definition.

AWSBIA231E The !1 entry type is unknown and cannot be included in a cpuclass definition

AWSBIA250E No qualifying users were found in !1.

AWSBIA256E Userdata not updated.

AWSBIA257E Error accessing Userdata.

AWSBIA258E Error opening Userdata.

AWSBIA264E User definition already exists.

AWSBIA265E User !1 does not exist in userdata: !2.

AWSBIA267W The user definition has warnings.

AWSBIA268E You are not authorized to access user !1.

AWSBIA269E Error: !1

AWSBIA270E Command line arguments too long.

AWSBIA271E Unexpected keyword before or at caret position.

AWSBIA272W The specified tcpaddr value "TCP/IP_port" is not in the range 1 to 65535. The following value of !2 is used instead, calculated as the modulus of the input value divided by 65536.

Explanation: The supplied TCP/IP port number is out of range. A default value has been calculated using the *modulus* of your input value divided by 65536 (the *modulus* is defined as the remainder left after the input value has been divided by 65536 the maximum integral number of times). For example, if you input a port value of 300001 (which is greater than 65535), the program divides it by 65536 an integral number of times (4), giving a remainder of 37857. This remainder is called the modulus, and is used as the port value.

System action: The program continues, using the indicated default value.

Operator response: Check the indicated port number used. If it is not already in use, you need take no action, other than to register the value used for future reference.

If it is already in use, retry the operation, supplying a valid port number.

AWSBIA273E The offset value !1 is not in the range -32767 to 32767.

AWSBIA274E Problems found while opening or acquiring the ShortID file

AWSBIA276W The short ID is not generated for job names shorter than !1 bytes.

AWSBIA277E Problems retrieving the ShortID Value from file

AWSBIA278E Error using cpuclass !1 on a job stream whose workstations are !2

AWSBIA279W The Job !1 is for workstation !2 with Ignore State

AWSBIA280E There is an error in the connection parameters for composer. The port specified by the -port connection parameter is not numeric.

Explanation: See message.

System action: The composer command line client cannot connect to its server. The submitted command cannot be performed.

Operator response: Check the composer connection parameters. Correct the value defined for the ""-port"" parameter so that it is the valid numeric port number of the composer command line server, and retry the command.

See *The User's Guide and Reference* for full details of the connection parameters for the composer command line client.

AWSBIA281E The composer command line client cannot connect to its server. The value specified for the -protocol connection parameter is not valid. It must be http or https.

Explanation: See message.

System action: The composer command line client cannot connect to its server. The submitted command cannot be performed.

Operator response: Check the composer connection parameters. Correct the value defined for the ""-protocol"" parameter so that it is the valid protocol to use for communication with the composer command line server, and retry the command. Valid values are ""http"" (insecure) or ""https"" (secure).

See *The User's Guide and Reference* for full details of the connection parameters for the composer command line client.

AWSBIA282E The composer command line client cannot connect to its server. The value specified for the -timeout connection parameter is not valid. It must be the number of seconds that the command line client is to wait for a connection before timing out.

Explanation: See message.

System action: The composer command line client cannot connect to its server. The submitted command cannot be performed.

Operator response: Check the composer connection parameters. Correct the value defined for the ""-timeout"" parameter so that it is the number of

seconds that the command line client is to wait for a connection with the command line server before timing out, and retry the command.

See *The User's Guide and Reference* for full details of the connection parameters for the composer command line client.

**AWSBIA283E An internal error has occurred.
Composer cannot open the temporary
file "temporary_file".**

Explanation: See message.*temporary_file* is the name and path of the temporary file that cannot be opened.

System action: The submitted command cannot be performed.

Operator response: Perform the following checks:

- Check that there is sufficient space on the file system where your temporary files are created
- Check that the user of the command line client has write permission in the temporary files directory
- Check that you have not reached the maximum number of open file descriptors allowed by the operating system

Correct any problems you find and retry the command.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

**AWSBIA284E An internal error has occurred.
Composer cannot open the temporary
file "temporary_file" for writing.**

Explanation: See message.*temporary_file* is the name and path of the temporary file that cannot be opened for writing.

System action: The submitted command cannot be performed.

Operator response: Perform the following checks:

- Check that there is sufficient space on the file system where your temporary files are created
- Check that the user of the command line client has write permission in the temporary files directory
- Check that you have not reached the maximum number of open file descriptors allowed by the operating system

Correct any problems you find and retry the command.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

**AWSBIA285E An internal error has occurred.
Composer cannot open the temporary
file "temporary_file" for reading.**

Explanation: See message.*temporary_file* is the name and path of the temporary file that cannot be opened for reading.

System action: The submitted command cannot be performed.

Operator response: Perform the following checks:

- Check that there is sufficient space on the file system where your temporary files are created
- Check that the user of the command line client has read permission in the temporary files directory
- Check that you have not reached the maximum number of open file descriptors allowed by the operating system

Correct any problems you find and retry the command.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA286E Total errors: "error_count".

Explanation: The total errors that occurred during a composer ""update"" or ""delete"" command.

System action: None.

Operator response: Check the individual messages to determine the nature of the errors. Correct them and resubmit the command.

AWSBIA287W Total warnings: "warning_count".

Explanation: The total warnings that occurred during a composer ""update"" or ""delete"" command.

System action: None.

Operator response: Check the individual messages to determine the nature of the warnings. Take any appropriate action.

**AWSBIA293E An internal error has occurred.
Composer was not able to initialize the
HTTP or HTTPS connection.**

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check that the connection parameters are valid. If you find an error, correct it and resubmit the command.

If the connection parameters are valid, resubmit the command, because the problem might have been only temporary.

See *The User's Guide and Reference* for full details of the connection parameters for the composer command line client.

AWSBIA294E An internal error has occurred. The composer command line server could not authenticate the client.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check that the connection parameters are valid. If you find an error, correct it and resubmit the command.

If the connection parameters are valid, resubmit the command, because the problem might have been only temporary.

AWSBIA297E The job stream, or the workstation on which it runs, cannot be renamed because another job stream already exists with the supplied name. Two job streams can only have the same name if one has been created, not renamed, as a version of the other (with different valid-from dates).

Explanation: A job stream is identified by the job stream name and the workstation or workstation class it is to run on. But different versions of the job stream can exist with different *valid-from* dates, but only provided they are created as such. An existing job stream cannot be renamed to become a version of another existing job stream.

job_stream identifies the job stream which already exists.

System action: The submitted command cannot be performed.

Operator response: If you want the job stream to become a version of another job stream, you must create it as such. If you selected an existing job stream name by mistake, select a different job stream name that does not exist and retry the rename operation.

AWSBIA298E If you want to rename a job, the associated workstation and job stream cannot be renamed in the same action.

Explanation: See message.

System action: The rename command cannot be performed.

Operator response: If you want to rename a job and the workstation or job stream to which it belongs (or both), you must make the changes in separate actions. For example, if you want to rename both a job stream and a job which belongs to it, first issue a rename

command for one, and then a second rename command for the other.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIA301W The scheduling language syntax check for object "object_ID" has produced the following number of warnings "warning_count".

Explanation: See message.

System action: Composer has successfully completed all of the commands, but some warnings were issued.

Operator response: Check the warning messages issued by composer. Take any appropriate action.

AWSBIA303W Total warnings in !1: !2.

AWSBIA304W An inconsistency in the workstation definition has been ignored. The secure port identified in the *secureaddr* keyword has been ignored because the *securitylevel* keyword has not been supplied.

Explanation: See message.

System action: The action relating to the workstation definition is completed successfully. The workstation does not use secure (SSL) communications.

Operator response: Check the scheduling language syntax. If you intended to define secure communication for this workstation modify the workstation parameters again to set the *securitylevel* keyword to the value you require (you need to re-supply the SSL port with the *secureaddr* keyword).

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIA309E The *validto* date must be later than the *validfrom* date in run cycle "run_cycle" defined for "job_stream".

Explanation: See message.

run_cycle identifies the run cycle with the incompatible dates.

job_stream identifies the job stream or the run cycle group within which the run cycle is defined.

System action: The operation is not performed.

Operator response: Submit the command again, ensuring that the *validto* date is later than the *validfrom* date.

AWSBIA310E The validto date must be later than the validfrom date in a run cycle defined for job stream "job_stream".

Explanation: See message.

job_stream identifies the job stream or the run cycle group within which the run cycle is defined.

System action: The operation is not performed.

Operator response: Submit the command again, ensuring that the ""validto"" date is later than the ""validfrom"" date.

AWSBIA315E There is a syntax error. The syntax of either the follows or the matching keywords is not correct.

Explanation: See message.

System action: The creation or modification of the job stream definition is not successful.

Operator response: Check the scheduling language syntax. Correct the syntax of the ""matching"" or ""follows"" keywords and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIA316E An internal error has occurred. The file "file" could not be read.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check that the file exists, and has not been renamed, moved, or deleted. Check that the user has permission to read it. If you find a problem, correct it and retry the command. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIA317E An internal error has occurred. The file "file" could not be opened due to a memory allocation error.

Explanation: See message.

System action: The operation is not performed.

Operator response: You have run out of memory. The data file is too big, or you have too many applications open.

AWSBIA320E An error occurred while trying to save the user options file "file".

Explanation: See message.

System action: The operation is not performed.

Operator response: Verify that there is sufficient space

in the indicated file system, and that the user of Tivoli Workload Scheduler has permission to write files in the indicated directory.

AWSBIA322W The local prompt text in job stream "job_stream" exceeds the maximum length allowed of "max_prompt" bytes. It has been truncated.

Explanation: See message.

job_stream identifies the job stream for which the prompt cannot be created or modified.

max_prompt indicates the maximum number of bytes that you can use for the prompt.

System action: The submitted command cannot be performed.

Operator response: Check the input command. Shorten the prompt length until it is less than the indicated maximum.

AWSBIA323W The total units for the resource "resource" in job stream "job_stream" is "resource_units" units, which exceeds the maximum number of resource units: "max_resource_units".

Explanation: See message.

resource identifies the resource that has exceed the maximum number of resource units.

job_stream identifies the job stream for which the resource cannot be created or modified.

resource units indicates the total number of resource units in the job stream.

max_resource_units indicates the maximum number of resource units you can specify.

System action: The submitted command cannot be performed.

Operator response: Check the input command. Reduce the number of resource units so that it is less than the indicated maximum.

AWSBIA324E The total units for the resource "resource" in job "job" is "resource_units" units, which exceeds the maximum number of resource units: "max_resource_units".

Explanation: See message.

resource identifies the resource that has exceed the maximum number of resource units.

job identifies the job for which the resource cannot be created or modified.

resource units indicates the total number of resource units in the job.

max_resource_units indicates the maximum number of resource units you can specify.

System action: The submitted command cannot be performed.

Operator response: Check the input command. Reduce the number of resource units so that it is less than the indicated maximum.

AWSBIA325W The local prompt text in job "job" exceeds the maximum length allowed of "max_prompt" bytes. It has been truncated.

Explanation: See message.

job identifies the job for which the prompt cannot be created or modified.

max_prompt indicates the maximum number of bytes that you can use for the prompt.

System action: The submitted command cannot be performed.

Operator response: Check the input command. Shorten the prompt length until it is less than the indicated maximum.

AWSBIA326W The server field has been supplied for extended agent "agent", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the "server" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the "server" field when defining an extended agent.

AWSBIA327W The fullstatus field has been supplied as on for extended agent "agent", for which it is not required. It has been set to off.

Explanation: See message.

System action: Processing continues, treating the "fullstatus" field as if it had been defined as "off".

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the "fullstatus" field when defining an extended agent.

AWSBIA328W The behindfirewall field has been supplied for extended agent "agent", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the "behindfirewall" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the "behindfirewall" field when defining an extended agent.

AWSBIA329W The securitylevel field and the secureaddr fields have been supplied for extended agent "agent", for which they are not required. They have been ignored.

Explanation: See message.

System action: Processing continues, ignoring the "securitylevel" field and the "secureaddr" fields.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the "securitylevel" field and the "secureaddr" fields when defining an extended agent.

AWSBIA330W The autolink field has been supplied as on for extended agent "agent", for which it is not required. It has been set to off.

Explanation: See message.

System action: Processing continues, treating the "autolink" field as if it had been defined as "off".

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the "autolink" field when defining an extended agent.

AWSBIA331W The fullstatus field has been supplied as on for standard agent or broker workstation "agent", for which it is not required. It has been set to off.

Explanation: See message.

System action: Processing continues, treating the "fullstatus" field as if it had been defined as "off".

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the "fullstatus" field when defining a standard agent or broker workstation.

AWSBIA332W The fullstatus field has been supplied as off for domain manager "domain_manager", which is not correct. It has been set to on.

Explanation: See message.

System action: Processing continues, treating the "fullstatus" field as if it had been defined as "on".

Operator response: No action is required, but to avoid

AWSBIA333W • AWSBIA340W

receiving this warning in future ensure to specify the `""fullstatus""` field as on when defining a domain manager.

AWSBIA333W The server field has been supplied for domain manager "domain_manager", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""server""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""server""` field when defining a domain manager.

AWSBIA334W The resolvedep field has been supplied for workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""resolvedep""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""resolvedep""` field when defining a workstation.

AWSBIA335W The secureaddr field has been supplied for workstation "workstation", but the securitylevel field has not. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""secureaddr""` field.

Operator response: If you had not intended to define secure communications for this workstation, no action is required, but to avoid receiving this warning in future ensure to not specify the `""secureaddr""` field when defining a workstation.

However, if you had intended to define secure communications, modify the workstation definition, setting the appropriate values for the `""securitylevel""` and `""secureaddr""` fields.

AWSBIA336W The access keyword has been supplied for workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""access""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify

the `""access""` field when defining a workstation.

AWSBIA337W The manager field has been supplied for domain "domain", for which it is not required as it is now obsolete. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""manager""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""manager""` field when defining a domain.

AWSBIA338W The domain field has been supplied for extended agent "agent", but the host field value is not \$MANAGER. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""domain""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""domain""` field when defining an extended agent.

AWSBIA339W The securitylevel field has been supplied for agent "agent", but the secureaddr field (SSL port) has not. The default value of 31113 is used for secureaddr.

Explanation: See message.

System action: Processing continues, using the value of `""31113""` for the `""secureaddr""` field.

Operator response: Verify that port 31113 on the master domain manager is the correct port for secure communications. If it is not, modify the agent description to correct the value.

If the port number is correct, no action is required, but to avoid receiving this warning in future ensure to specify the `""secureaddr""` field when defining an agent.

AWSBIA340W The host field has been supplied for standard agent or broker workstation "agent", for which it is not required. It has been replaced by the domain to which the workstation belongs.

Explanation: A standard agent or broker workstation must have its host field set to the value of the domain in which it resides.

System action: Processing continues, treating the `""host""` field as if it had been defined as the domain of the agent.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the `""host""` as the workstation's domain when defining a standard agent or broker workstation.

AWSBIA341W The host field has been supplied for workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""host""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""host""` field when defining an extended agent.

AWSBIA342E The filter keyword "incorrect_keyword" cannot be used for the supplied object.

Explanation: See message.

incorrect_keyword is the filter keyword that is not correct for the supplied object.

System action: The command is not processed.

Operator response: Check the scheduling language syntax. Resubmit the command supplying a valid keyword.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIA343E The supplied filter criteria cannot be used twice.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the filter criteria only once.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA344E The supplied filter criteria is not valid for the supplied object of the command. The filter for the object of this command requires keyword "valid_keyword".

Explanation: See message.

For example, you have issued the command `list js=@; filter workstation=abc123` but `""workstation""` is not a valid filter keyword for a job stream.

valid_keyword is the correct filter keyword to use with the object of this command.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the correct keyword in the filter criteria.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA345E The supplied filter criteria is not valid for the supplied object of the command. The filter for the object of this command requires one of the following keywords "valid_keywords_list".

Explanation: See message.

For example, you have issued the command `list js=@; filter workstation=abc123` but `""workstation""` is not a valid filter keyword for a job stream.

valid_keywords_list is the list of correct filter keywords to use with the object of this command.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying one of the correct keywords in the filter criteria.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA346E No filter criteria has been supplied after the filter keyword. Use the following criteria: "filter_criteria".

Explanation: See message.

filter_criteria is the type of filter criteria available for this command on this object.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the filter criteria or omitting the `""filter""` keyword.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA347E No filter criteria has been supplied after the filter keyword. Use the following criteria: "valid_filter_criteria_list".

Explanation: See message.

valid_filter_criteria_list is a list of the types of filter criteria available for this command on this object.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the filter criteria from the list or omitting the `""filter""` keyword.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA348E The supplied keyword is not valid for the supplied object. The command on this object requires keyword "valid_keyword".

Explanation: See message.

valid_keyword is the correct keyword to use with the object of this command.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the correct keyword.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA349E The supplied keyword is not valid for the supplied object. The command on this object requires one of the following keywords "valid_keywords_list".

Explanation: See message.

valid_keyword_list is the list of correct keywords to use with the object of this command.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying one or more keywords from the indicated list.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA350W The keywords `schedtime` and `at` can be specified only once. The last value is used.

Explanation: See message.

One or both of the keywords `"schedtime"` and `"at"` has been specified more than once for a job or job stream.

System action: The command is processed, using the last value issued.

Operator response: Check that the last value issued was the one you wanted to use. If it was, you need take no action. If it was not you need to redo the operation, setting the `"schedtime"` and `"at"` keywords to the required values.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA351E The rename command does not support the `cpu` keyword because it is ambiguous. To rename `cpu` objects use the specific keywords for `workstation` `ws`, `workstation class` `wscl`, or `domain` `dom`.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: To rename a workstation use the `"ws"` or `"workstation"` keyword.

To rename a workstation class use the `"wscl"` or `"workstationclass"` keyword.

To rename a domain use the `"dom"` or `"domain"` keyword.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA352W The IPv6 address you entered is an IPv4-mapped address and might not be supported on some platforms.

Explanation: Some operating systems do not support IPv4-mapped IPv6 addresses, either because the IPv6 and IPv4 stacks are separate, or because of security concerns.

System action: The command is processed only if the operating system accepts this type of address.

Operator response: If the operating system does not accept IPv4-mapped IPv6 addresses, replace it with a regular IPv4 or IPv6 address.

AWSBIA353W The IPv6 address you entered is an IPv4-compatible address and might not be supported on some platforms.

Explanation: Some operating systems do not support IPv4-compatible IPv6 addresses, either because the IPv6 and IPv4 stacks are separate, or because of security concerns.

System action: The command is processed only if the operating system accepts this type of address.

Operator response: If the operating system does not accept IPv4-compatible IPv6 addresses, be ready to replace the address with a regular IPv4 or IPv6 address.

AWSBIA354W The IPv6 address you entered is a Link Local address. Its scope is limited to the same data link and the interface is not portable.

Explanation: Link Local addresses work only between two nodes on the same data link and cannot be forwarded by routers. Different data links cannot establish any sort of communication. Also, the local name of the outgoing interface might not match the interface name of the remote host.

System action: The command might not be processed.

Operator response: Replace with a regular IPv6 address.

AWSBIA355E There is a syntax error in the XML file. The closing Eventrule tag has been found without a corresponding opening tag.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the syntax of the XML file and retry the operation.

See *The User's Guide and Reference* for full details of the command syntax.

AWSBIA356E There is a syntax error in the XML file. The closing comment tag has been found without a corresponding opening tag.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the syntax of the XML file and retry the operation.

AWSBIA357E There is a syntax error in the XML file. An opening tag for a comment tag has been found before the closing tag of the previously opened comment.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the syntax of the XML file and retry the operation.

AWSBIA358E There is a syntax error in the XML file. The encoding used is not that of the locale.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the syntax of the XML file and retry the operation.

AWSBIA359E There is a syntax error in the XML file. The XML version is missing from the header, so the file cannot be parsed.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the syntax of the XML file and retry the operation.

AWSBIA360E There is a syntax error. You can not change the vartable of a variable. You can change only the variable name.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the syntax and retry the command.

AWSBIA361W The domain keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""domain"" field.

Operator response: No action is required, but to avoid receiving this warning in future nsure to not specify the ""domain"" field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA362W The server keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""server"" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the ""server"" field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA363W The fullstatus keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""fullstatus"" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the ""fullstatus"" field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA364W The `behindfirewall` keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""behindfirewall""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""behindfirewall""` field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA365W The `autolink` keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""autolink""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""autolink""` field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA366W The `access` keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""access""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""access""` field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA367W The `securitylevel` keyword has been supplied for agent, or pool, or dynamic pool, or remote engine workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""securitylevel""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the `""securitylevel""` field when defining an agent, or pool, or dynamic pool, or remote engine workstation.

AWSBIA368W The `protocol` keyword has been supplied for workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""protocol""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the `""protocol""` field when defining an agent workstation.

AWSBIA369W The `protocol` value is `http` for agent workstation "workstation", for which the `secureaddr` keyword has been supplied. The `protocol` keyword has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""protocol""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the `""https""` value for `""protocol""` field when defining an agent workstation with `""secureaddr""` keyword.

AWSBIA370W The `protocol` value is `https` for agent workstation "workstation", for which the `secureaddr` keyword has not been supplied. The `protocol` keyword has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the `""protocol""` field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the `""http""` value for `""protocol""` field when defining an agent workstation without `""secureaddr""` keyword.

AWSBIA371E The `required node` keyword is missing for workstation "workstation".

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the object definition. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definition.

AWSBIA372E The required members keyword is missing for pool workstation "workstation".

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the object definition. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definition.

AWSBIA373E The required requirements keyword is missing for dynamic pool workstation "workstation".

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the object definition. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definition.

AWSBIA374E The os keyword specified for workstation "workstation" is not set to a valid operating system type. ZOS type is valid only for agents, pools, dynamic pools and remote engine workstations.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the object definition. See the *User's Guide and Reference* for full details. Correct the error and reissue the command.

See The *User's Guide and Reference* for full details of the syntax of the object definition.

AWSBIA375W One or more invalid keywords have been supplied for workstation "workstation". These invalid keywords have been ignored.

Explanation: See message.

System action: Processing continues. The invalid keywords are ignored.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the correct syntax.

AWSBIA376W The requirements keyword has been supplied for workstation "workstation", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""requirements"" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the ""requirements"" field when defining a dynamic pool workstation.

AWSBIA377W The securitylevel value for workstation "workstation" is not NONE. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""securitylevel"" value.

Operator response: No action is required, but to avoid receiving this warning in future ensure to specify the NONE value for the ""securitylevel"" field when defining a broker workstation.

AWSBIA378E The supplied set criteria cannot be used twice.

Explanation: See message.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the set criteria only once.

See The *User's Guide and Reference* for full details about the command syntax.

AWSBIA379E The "incorrect_keyword" attribute specified for the set criteria cannot be used for the supplied object.

Explanation: See message.

The *incorrect_keyword* attribute specified for the set criteria is not applicable for the supplied object.

System action: The command is not processed.

Operator response: Check the scheduling language syntax. Resubmit the command supplying a valid attribute.

See The *User's Guide and Reference* for full details about the scheduling language syntax.

AWSBIA380E No set criteria was supplied after the set keyword. Use the following syntax to specify the attribute for the set criteria: "set_criteria".

Explanation: See message.

The *set_criteria* is the only attribute that you can specify for this object in the command.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the set criteria.

See *The User's Guide and Reference* for full details about the command syntax.

AWSBIA381E No set criteria was supplied after the set keyword. Use the following criteria: "valid_set_criteria_list".

Explanation: See message.

valid_set_criteria_list is a list of the attributes that you can use for this object type in the command.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the set criteria from the list of available attributes.

See *The User's Guide and Reference* for full details about the command syntax.

AWSBIA382E The attribute specified for the set criteria is not applicable for the supplied object. The set keyword for the object requires the following attribute "valid_keyword".

Explanation: See message.

For example, if you run the command `update ws=@; set calendar=abc123`, the `calendar` attribute is not valid for a workstation object type.

The *valid_keyword* is the correct attribute that you can use for the set keyword for this type of object.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying the correct attribute in the set criteria.

See *The User's Guide and Reference* for full details about the command syntax.

AWSBIA383E The attributes specified for the set criteria are not applicable for the supplied object. The set criteria for the object requires one of the following attributes "valid_keywords_list".

Explanation: See message.

For example, you run the command `update ws=@; set calendar=abc123` but `calendar` is not a valid set keyword for a workstation.

The *valid_keywords_list* is the list of correct attributes that you can use for the set keyword for this type of object.

System action: The command is not processed.

Operator response: Check the command syntax. Resubmit the command supplying one of the correct attributes in the list for the set criteria.

See *The User's Guide and Reference* for full details about the command syntax.

Chapter 104. AWSBIB - Scheduling language parser messages

This section lists scheduling language parser error and warning messages that might be issued.

The message component code is BIB.

AWSBIB001E There is a syntax error. The time specified in the at, until, or deadline time definitions must be between 0000 and 2359 (hhmm).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB002E There is a syntax error. The job limit must be between 0 and 1024.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB003W The resource number must be between 1 and 32.

AWSBIB004W There is a syntax error. Priority must be a numeric value from 0 to 99, hi (= 100), or go (= 101).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB006E There is a syntax error. The job stream name is not syntactically valid. The name must start with a letter, and can contain alphanumeric characters, dashes, and underscores. It can contain up to 16 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB007E There is a syntax error. The job name is not syntactically valid. The name must start with a letter, and can contain alphanumeric characters, dashes and underscores. It can contain up to 40 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB008E There is a syntax error. The resource name is not syntactically valid. The name must start with a letter, and can contain alphanumeric characters, dashes and underscores. It can contain up to 8 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB009E There is a syntax error. The prompt name is not syntactically valid. The name must start with a letter, and can contain alphanumeric characters, dashes and underscores. It can contain up to 8 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB010E There is a syntax error. The calendar name is not syntactically valid. The name must start with a letter, and can contain alphanumeric characters, dashes and underscores. It can contain up to 8 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB011E There is a syntax error. The recovery job name is not syntactically valid. The name must start with a letter, and can contain alphanumeric characters, dashes and underscores. It can contain up to 40 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB012E Recovery job lockword is not syntactically valid.

AWSBIB013E Recovery job password is not syntactically valid.

AWSBIB014E There is a syntax error in the job statement in the job stream definition. The required streamlogon nullusername> argument has not been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB015E Invalid logon for MPE job

AWSBIB016E There is a syntax error in the job statement in the job stream definition. The streamlogon user name is not syntactically valid. The name must be no more than 47 bytes, and cannot contain periods or other special characters.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB017E Group name is not syntactically valid.

AWSBIB018E Account name is not syntactically valid.

AWSBIB019E User job name is not syntactically valid.

AWSBIB020E File name is not syntactically valid.

AWSBIB021E File group name is not syntactically valid.

AWSBIB022E File account name is not syntactically valid.

AWSBIB023E There is a syntax error in the job statement in the job stream definition. The user name associated with the streamlogon keyword is not syntactically valid. The name can contain up to 47 bytes. If the name contains special characters they must be enclosed in quotes ().

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB024E Group name in streamed job's logon is not syntactically valid.

AWSBIB025E Account name in streamed job's logon is not syntactically valid.

AWSBIB026E There is a syntax error. A non-valid date has been specified. The date format is determined by the value in the useropts file.

Explanation: See message. If the format cannot be found in the useropts file, it is obtained from the localopts file.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB027E There is a syntax error. The at keyword can be specified for a job or its job stream (not both).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB028E There is a syntax error. The until keyword can be specified for a job or its job stream (not both).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB029E There is a syntax error. The needs keyword can be specified for a job or its job stream (not both).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB030W Resource CPU should match either job's or schedule's cpuid

AWSBIB032E Internal Error

AWSBIB033E The file "file_name" could not be opened.

Explanation: This message can be displayed for either a user file or an internal work file. If it is a user file you might be able to correct the error. If it is an internal file it might be an internal error.

System action: The submitted command cannot be performed.

Operator response: Check the displayed file name.

- If it is a user file, make sure that the file exists, is in the correct directory, and has the correct permissions for the Tivoli Workload Scheduler.
- If it is not a user file, ensure that the indicated directory has sufficient disk space to open a file, and that the operating system has sufficient file descriptors available

If you identify an error, correct it and rerun the command. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIB034E There is a syntax error in the job statement of the job stream definition. A duplicate keyword has been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB035E There is a syntax error. The required on keyword is missing.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB036E There is a syntax error. The job stream definition does not start with the schedule keyword.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB037E Expected a Job description

AWSBIB038E There is a syntax error. An object identifier (for example, a job name) is missing.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB039E There is a syntax error. A numeric value (for example, the priority value) has not been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB040E There is a syntax error. An object identifier (for example, a job name) or the @ wildcard is missing.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB041E There is a syntax error. A date-related keyword has been supplied (for example, deadline) but it is not followed by a date or day specification, or a calendar or iCalendar name.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB042E There is a syntax error. A day, weekday, or workday keyword has been supplied, but it is not preceded by an offset value.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB043E There is a syntax error. A dependency specification or other keyword is missing, or an incorrect keyword has been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB044E There is a syntax error. A time-related keyword (for example, every) has been supplied, but its value is either missing or is not a valid time specification.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB045E There is a syntax error. An opens keyword has been supplied, but its value is either missing or is not a valid file name.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB046E Expected a day specification.

AWSBIB047E There is a syntax error. An except keyword has been supplied, but its value is either missing or is not a valid date specification, day specification, calendar or iCalendar name.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB048E Expected a calendar name.

AWSBIB049E Expected a job autodoc specification.

AWSBIB050E Expected an autodoc option.

AWSBIB051E There is a syntax error. The prompt keyword has been supplied, but is not followed by a prompt name or the prompt text enclosed in quotes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB052E There is a syntax error. The end keyword has not been found to stop the job stream definition.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB053E There is a syntax error. A file name has been supplied with an incorrect syntax.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command. Ensure that the file name is fully qualified.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB054E There is a syntax error. The supplied fully qualified path name is longer than the maximum of "maximum_path_name_length" bytes.

Explanation: See message.

maximum_path_name_length is the maximum number of bytes permitted in the path name.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB055E There is a syntax error. The supplied logon name is longer than the maximum of "maximum_logon_name_length" bytes.

Explanation: See message.

maximum_logon_name_length is the maximum number of bytes permitted in the logon name.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB056E There is a syntax error. The supplied file name is longer than the maximum of "maximum_file_name_length" bytes.

Explanation: See message.

maximum_file_name_length is the maximum number of bytes permitted in the file name (excluding the path information).

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB057E There is a syntax error. The supplied abendprompt is longer than the maximum of "abendprompt_length" bytes.

Explanation: See message.

abendprompt_length is the maximum number of bytes permitted in the abendprompt.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB058E There is a syntax error. The supplied Windows domain name is not syntactically valid. The name can contain up to 16 bytes (including the backslash), and the user name can contain up to 31 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB059E There is a syntax error. The supplied timezone keyword is not followed by valid time zone information.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB060E There is a syntax error. The supplied timezone keyword is not followed by a time zone name.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB061E There is a syntax error. The supplied time zone name is not a recognized time zone.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See The *User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB062E There is a syntax error. The supplied time zone name is longer than 40 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB063E There is a syntax error. The scheduler has determined that a job statement has commenced but it is not preceded by the `:` character.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB064E There is a syntax error. The dates specified with the `on` and `except` keywords are not compatible. For example, you might have defined the same date or dates for both.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB065E There is a syntax error. The deadline offset can be specified for a job or its job stream (not both).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB066E There is a syntax error in the job statement in the job stream definition. The `rcncondsucc` keyword defines a return code success condition expression which is longer than the maximum number of bytes allowed: `"maximum_expression_length"`.

Explanation: See message.

`maximum_expression_length` is the maximum number of bytes that can be included in the expression.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB067E There is a syntax error. The return code condition expression: `"expression"` is not syntactically valid.

Explanation: See message. `expression` is the expression which is not valid.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB068E The time in the relative from `nulltime>` to `nulltime>` clause of the matching or follows keyword is not in the valid format `[+/-][h]hhmm` (where `mm` is between 00-59).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB069E The time in the from `nulltime>` to `nulltime>` clause of the matching or follows keyword must be between 0000-2359.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle

group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB070E There is a syntax error. An **at** or a **schedtime** keyword has been specified with a time specification, but is not followed by a **timezone/tz** or **daykeyword**, or a right bracket.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB071E An error has occurred due to either a syntax error or unacceptable value when specifying the time for either the **maxdur** or **mindur** keyword, or both. The correct format and acceptable values for the time specified for the keywords are: [h]hhmm (where, hhh represents the number of hours ranging from 000-500, and mm represents the number of minutes ranging from 00-59).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB072E The percentage specified for the **maxdur** or **mindur** keyword is either not in the valid format or an unacceptable value has been specified. The correct format and acceptable values are: **percentage %** (where **percentage** is a number ranging from 0-1000000).

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB200E There is a syntax error. An object identifier (for example, a job name) is longer than the maximum number of bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB201E There is a syntax error. An object identifier (for example, a job name) must begin with an alphabetic character.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB202E There is a syntax error. An object identifier (for example, a job name) contains non valid characters.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB206E There is a syntax error. More than one parameter was specified.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB208E There is a syntax error. The number of job stream dependencies exceeds the maximum number allowed.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB209E There is a syntax error. The number of job dependencies exceeds the maximum number allowed.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB210E Missing parameter ^^ was specified.

AWSBIB211W The IN ORDER keyword must be the last keyword.

AWSBIB212E No dependencies are allowed when IN ORDER is specified

AWSBIB213E There is a syntax error. A blank name has been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB214E There is a syntax error. The onuntil keyword has a non-valid value. Valid values are `suppr`, `cont` or `canc`.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the job stream definition. Change the value of the `""onuntil""` keyword to one of the indicated valid values and retry the operation.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB215E There is a syntax error. Either the follows or matching keyword is not followed by one of the following keywords: `previous`, `sameday`, `relative from`, or `from`.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB216E There is a syntax error. Expected the keyword set: `from nulltimenull` to `nulltimenull`.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB217E There is a syntax error. Expected the keyword set: `relative from nulltimenull` to `nulltimenull` (`nulltimenull` is expressed as `HHMM`, and the permitted values are between 0000 and 2359)

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB219E There is a syntax error. More than one matching keyword has been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB220E There is a syntax error. A non-valid job alias has been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB221E There is a syntax error. A non-valid runcycle name has been supplied.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB222E Duplicated runcycle name.

Explanation: This is a parser error, please check the scheduling language

AWSBIB223E There is a syntax error. A value has been supplied for a description keyword that is longer than the maximum length of "maximum_description_length" bytes.

Explanation: See message.

maximum_description_length is the maximum length of the value of the "description" keyword.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB224E There is a syntax error. An external string dependency has been supplied that is longer than the maximum length of "maximum_description_length" bytes.

Explanation: See message.

maximum_description_length is the maximum length of the external string dependency.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB225E There is a syntax error. An iCalendar name has been supplied that is longer than the maximum length of "maximum_description_length" bytes.

Explanation: See message.

maximum_description_length is the maximum length of the iCalendar name.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB226E There is a syntax error. A day[s] offset for a relative from nulltime> to nulltime> or a from nulltime> to nulltime> clause has been supplied that is greater than the maximum of "maximum_offset" days.

Explanation: See message.

maximum_offset is the maximum number of offset days of the "relative from" or "from" clause.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB227E There is a syntax error. An day[s] offset for an at, until, or deadline clause has been supplied that is greater than the maximum of "maximum_offset" days.

Explanation: See message.

maximum_offset is the maximum number of offset days of the "at", "until", or "deadline" clause.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB228E There is a syntax error. An every keyword has been supplied with a rate not in the range 0 - "maximum_rate".

Explanation: See message.

maximum_rate is the maximum value that the "every" rate can have. The rate is in the format hhmm.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB229E An iCalendar cannot be empty.

Explanation: This is a parser error, please check the scheduling language

AWSBIB230E There is a syntax error. The keyword "keyword" is not correct at this position.

Explanation: See message.

keyword is the keyword that is out of position.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB231E There is a syntax error. A relative from nulltime> to nulltime> or a from nulltime> to nulltime> clause has been supplied where the from time is later than the to time.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB232E There is a syntax error. The value specified for the onmaxdur keyword is not valid. Valid values are kill or cont.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the job stream

definition. Specify a valid value for the "onmaxdur" keyword and retry the operation.

See *The User's Guide and Reference* for full details about the scheduling language syntax.

AWSBIB233E There is a syntax error. The value specified for the onmindur keyword is not valid. Valid values are confirm, abend or cont.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the job stream definition. Specify a valid value for the "onmindur" keyword and retry the operation.

See *The User's Guide and Reference* for full details about the scheduling language syntax.

AWSBIB315E Either a job or job stream identifier is missing, or the matching criteria is not valid.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB316E There is a syntax error. A recovery action has been supplied that is not stop, continue, or rerun.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB317E The path of a filename in the opens dependencies and its qualifier cannot exceed "dependency_file_name_max_length" bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB318E You cannot specify a time zone for the run cycle time dependencies.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB319E There is an error in the job definition. The sum of the docommand string and the rcondsucc string must not be greater than "maximum_length" bytes.

Explanation: See message.

maximum_length is the maximum length of the sum of the ""docommand"" string and the ""rcondsucc"" string.

System action: The submitted command cannot be performed.

Operator response: Correct the job definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB320W The specified keyword is not allowed in a job definition outside a job stream.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB321E A variable table name is expected at this point, but was not supplied.

Explanation: See message.

System action: The operation is not performed.

Operator response: Correct the variable table reference in the job stream definition and retry the operation.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB322E The variable table name exceeds the maximum length of "maximum_variable_table_size" bytes.

Explanation: *maximum_variable_table_size* is the maximum size in bytes of the variable table.

System action: The operation is not performed.

Operator response: Correct the variable table reference in the job stream definition and retry the operation.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB323W The tasktype keyword has been supplied for job definition "job_definition", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""tasktype"" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the ""tasktype"" field when defining a job definition.

AWSBIB324W The interactive keyword has been supplied for job definition "job_definition", for which it is not required. It has been ignored.

Explanation: See message.

System action: Processing continues, ignoring the ""interactive"" field.

Operator response: No action is required, but to avoid receiving this warning in future ensure to not specify the ""interactive"" field when defining a job definition.

AWSBIB325E The task definition supplied for job definition "job_definition" is not well formatted.

Explanation: *job_definition* is the job definition to validate.

System action: The operation is not performed.

Operator response: Correct the task definition in the job definition and retry the operation.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB326E There is a syntax error. The run cycle group name is not valid. The name must start with an alphabetical character, and can contain alphanumeric characters, dashes, and underscores. It can contain up to 40 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB327E There is a syntax error. A valid run cycle subset name was expected but was not found. The subset name must start with either an alphabetical character or number, and can contain alphanumeric characters, dashes, and underscores. It can contain a maximum of 40 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB328E There is a syntax error. The run cycle subset cannot be specified in the job stream definition.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB329E There is a syntax error. The run cycle group name is not valid. The name must start with an alphabetical character, and can contain alphanumeric characters, dashes and underscores. It can contain up to 40 bytes.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB330W The specified keyword cannot be defined in a run cycle group definition.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the run cycle group definition, specifying only supported keywords, and submit the command again.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB331E There is a syntax error. The end keyword is missing from the run cycle group definition.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB332E There is a syntax error. The run cycle type run cycle group cannot be specified inside the run cycle group definition.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB333E There is a syntax error. A value has been supplied for the subset keyword that is longer than the maximum length of "maximum_subset_length" bytes.

Explanation: See message.

maximum_subset_length is the maximum length of the value of the "subset" keyword.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB334E There is a syntax error. The **runcyclegroup** keyword is missing from the start of the run cycle group definition.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB335E There is a syntax error. The **every** keyword is not followed by the **everyendtime** keyword.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Correct the job stream or run cycle group definition and resubmit the command.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB336E There is a syntax error. The **onoverlap** keyword has a non-valid value. Valid values are **parallel**, **donotstart** or **enqueue**.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the job stream definition. Change the value of the `""onoverlap""` keyword to one of the indicated valid values and retry the operation.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

AWSBIB337E There is a syntax error. The **statistictype** keyword has a non-valid value. Valid values are **automatic** or **custom**.

Explanation: See message.

System action: The submitted command cannot be performed.

Operator response: Check the syntax of the job stream definition. Change the value of the `""statistictype""` keyword to one of the indicated valid values and retry the operation.

See *The User's Guide and Reference* for full details of the scheduling language syntax.

Chapter 105. AWSBIC - Scheduling language messages

This section lists scheduling language error and warning messages that might be issued.

The message component code is BIC.

AWSBIC001E An error occurred opening the database: !1

AWSBIC002E An error occurred opening the file !1 for reading

AWSBIC003E An error was returned from the parser.

AWSBIC004E !1 line !2, error looking for !3#!4 job in database: !5

AWSBIC005E !1 line !2, error looking for !3 prompt in database: !4

AWSBIC006E !1 line !2, error looking for !3#!4 resource in database: !5

AWSBIC007E !1 line !2, bad symphony job stream record retrieved: !3 instead of !4

AWSBIC008E !1 line !2, bad symphony job record retrieved: !3 instead of !4

AWSBIC009E !1 line !2, Security error: !3

AWSBIC010E !1 line !2, Symphony access error: !3

AWSBIC011E Error accessing run-message number file : !1

AWSBIC107W Time zones are not enabled in the global options and so are ignored on the job or job stream !1.

Chapter 106. AWSBID - Compiler messages

This section lists error and warning messages that might be issued by the compiler component.

The message component code is BID.

AWSBID001E Compiler cannot find the *thiscpu* option in the local options file (*localopts*).

Explanation: See message.

System action: Compiler stops.

Operator response: Add the *thiscpu* option to the *localopts* file.

AWSBID002E Compiler cannot find the master option in either the *localopts* file or the global options.

Explanation: See message.

System action: Compiler stops.

Operator response: Add the `"" master ""` option to the global options, using **optman**.

AWSBID003E Compiler cannot be run on this workstation, because the settings in the global options or the *localopts* file indicate that this workstation is not the master domain manager.

Explanation: See message.

A common reason for this problem is that the procedure for switching to the backup master domain manager has not been followed correctly.

System action: Compiler does not start.

Operator response: Verify that this workstation is the master domain manager by checking that the *master* variable in the global options identifies this workstation.

- If it does not, run **compiler** from the master domain manager.
- If this is the master domain manager, the probable cause is that the workstation specified by the *thiscpu* variable in the *localopts* option file and the workstation specified by the *master* variable in the global options, are not the same. Change the *localopts* file so that they are the same, save the file, stop all Tivoli Workload Scheduler processes, and rerun **compiler**.

AWSBID005E There is a syntax error in the compiler command. An incorrect date specification ("date") has been found either in the production schedule file ("file_name"), or as an argument to the **-date** option.

Explanation: The production schedule file name is either the default *prodsked* or the file specified with the **-input** option.

date is the date string that is not correct.

file_name is the name of the production schedule file.

System action: Compiler does not start.

Operator response: Locate whether the error was in the supplied **-date** option or in the indicated file.

- If the error was in the **-date** option, resubmit the command with a valid date argument in the format .
- If the error was in the file, edit it. Make sure that the date specified in the first line that contains the following string `"" Production Schedule for nulldate> ""` is correct and in the following format: `"" nullmm>/nulldd>/null[yy]yy> ""`. Then resubmit the command.

AWSBID006E Compiler was unable to open the production schedule file: "file_name". The following gives more details of the error: "system_error".

Explanation: *file_name* is the name of the production schedule file. *system_error* contains the operating system error message.

System action: Compiler stops.

Operator response: Read the error message and see if you can identify the error and correct it, resubmitting the command. If the error message is not sufficiently explanatory, make the following checks:

1. Verify that you have supplied the correct name for the production schedule file (the default name is *prodsked* when submitting the command. If you made an error, resubmit the command with the corrected file name.

2. If the file name has been correctly supplied, check that this file exists, in the correct directory. If you find an error, rename or move the file and resubmit the command.
3. If the file is present, check that the user running **compiler** has read permission for the file. If it does not, either change the permissions for the user or for the file, and resubmit the command.
Alternatively, log off and log on again as a user with the correct permissions and resubmit the command.
4. If the user is correct, check that there is sufficient space in the fileset of the file. If there is not, make more space and resubmit the command.
5. If the file space is sufficient, check that the processes running on the workstation have not exceeded the maximum number of available file descriptors (see your operating system documentation for more information). Close any applications that are holding open large numbers of files, or use the operating system tools to enable a larger number of descriptors, and resubmit the command.

AWSBID007E Compiler is unable to add the workstation records to the Symphony file. The following gives more details of the error: "error_message"

Explanation: *error_message* contains the reason for the error.

The following is a list of possible reasons why this error could occur:

- **Compiler** encounters an error when it accesses the *cpudata* database.
- **Compiler** encounters an error when it writes to the Symphony file.
- **Compiler** could not find a definition for the master workstation on the *cpudata* database.

System action: **Compiler** stops.

Operator response: When **compiler** cannot access the *cpudata* database or write to the Symphony file, the *error_message* can be used to determine the cause and the appropriate response.

When **compiler** cannot find the master workstation in the *cpudata* database, add the master workstation definition to the database. The name of the master workstation must match the names specified in the *localopts* file and the global options maintained by **optman**. Then rerun **compiler**.

AWSBID008E Compiler has found a database incompatibility (expanded/non-expanded) or is unable to allocate memory to access the databases. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: **Compiler** stops.

Operator response: Use the **dbinfo all** command to make sure that all databases are either all non-expanded (0) or all expanded (1). Use the **dbexpand** command to convert all databases to the expanded version.

If the database cannot be opened because of a failure to allocate memory, use the operating system tools to determine how much memory **compiler** is using and whether it is leaking memory. If it is leaking memory, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID009E There is a syntax error in the compiler command. The -date option has been supplied, but the date that follows the option is not valid: "date"

Explanation: *date* is the date specified with *-date* option, that is not valid.

System action: **Compiler** cannot start.

Operator response: Resubmit the command with a valid date argument in the format: `""-date nullmm>/nulldd>/null[yy]yy> ""`.

AWSBID010E Compiler was unable to read calendar information from the database. The following gives more details of the error: "error_message"

Explanation: *error_message* contains the reason for the error.

System action: **Compiler** stops.

Operator response: Check the error message and resolve the error that is described. Then rerun **compiler**.

If the error seems to be a problem with the calendar data itself, rebuild the *calendars* database. To do this run **composer** and issue the `"" build calendars ""` command. Rerun **compiler**.

AWSBID011E Compiler was unable to read date information from the following calendar in the "calendar" database. The following gives more details of the error: "error_message".

Explanation: *calendar* is the name of the calendar, the dates of which **compiler** is trying to read.

error_message contains the reason for the error.

System action: **Compiler** stops.

Operator response: Check the error message and

resolve the error that is described. Then rerun **compiler**.

If the error seems to be a problem with the calendar data itself, rebuild the calendars database. To do this run **composer** and issue the **build calendars** command. Rerun **compiler**.

AWSBID012E Compiler was unable to add the following calendar to the Symphony file: "calendar". The following gives more details of the error: "error_message"

Explanation: *calendar* is the name of the calendar you are trying to add.

error_message contains the reason for the error.

System action: **Compiler** stops.

Operator response: Check the error message and resolve the error that is described. Then rerun **compiler**. If the error seems to be a problem with the calendar data itself, rebuild the calendars database. To do this, run **composer** and issue the **build calendars** command. Rerun **compiler**.

AWSBID013E Compiler did not find the definition for the master domain manager workstation in the cpudata database.

Explanation: **Compiler** reads workstation records from the cpudata database and adds them to the Symphony file.

System action: **Compiler** stops.

Operator response: Add the master domain manager workstation definition to the database with **composer**. If the definition is already in the database, make sure that the entries for *thiscpu* in the *localopts* file and *master* in the global options match the name of the master domain manager workstation in the database.

When you have found and resolved the problem, rerun **compiler**.

AWSBID014E There is a syntax error in the compiler command. An incorrect number of options was supplied.

Explanation: See message text.

System action: **Compiler** cannot start.

Operator response: To see the correct syntax for **compiler**, run the command: **compiler -U**, or look up the command in the *User's Guide and Reference*.

See *The User's Guide and Reference* for details of the compiler syntax.

AWSBID015E Compiler was unable to lock the jobs database. The following gives more details of the error: "error_message".

Explanation: It is possible that another process has locked the database.

error_message contains the reason for the error.

System action: **Compiler** stops.

Operator response: Determine if another process has locked the jobs database using the tools of your operating system. Wait till that process has finished, or stop it, if you are sure it is safe to do so. Rerun **compiler**.

AWSBID016E Compiler was unable to lock the resources database. The following gives more details of the error: "error_message".

Explanation: It is possible that another process has locked the database.

error_message contains the reason for the error.

System action: **Compiler** stops.

Operator response: Determine if another process has locked the resources database using the tools of your operating system. Wait till that process has finished, or stop it, if you are sure it is safe to do so. Rerun **compiler**.

AWSBID017E Compiler was unable to lock the prompts database. The following gives more details of the error: "error_message".

Explanation: It is possible that another process has locked the database.

error_message contains the reason for the error.

System action: **Compiler** stops.

Operator response: Determine if another process has locked the prompts database using the tools of your operating system. Wait till that process has finished, or stop it, if you are sure it is safe to do so. Rerun **compiler**.

AWSBID018E Compiler was unable to lock the cpudata database. The following gives more details of the error: "error_message".

Explanation: It is possible that another process has locked the database.

error_message contains the reason for the error.

System action: **Compiler** stops.

Operator response: Determine if another process has

locked the cpudata database using the tools of your operating system. Wait till that process has finished, or stop it, if you are sure it is safe to do so. Rerun compiler.

AWSBID019E Compiler was unable to lock the calendars database. The following gives more details of the error: "error_message".

Explanation: It is possible that another process has locked the database.

error_message contains the reason for the error.

System action: Compiler stops.

Operator response: Determine if another process has locked the calendars database using the tools of your operating system. Wait till that process has finished, or stop it, if you are sure it is safe to do so. Rerun compiler.

AWSBID020E Compiler was unable to unlock the jobs database. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID021E Compiler was unable to unlock the resources database. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID022E Compiler was unable to unlock the prompts database. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID023E Compiler was unable to unlock the cpudata database. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID024E Compiler was unable to unlock the calendars database. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID025E Compiler was unable to lock the userdata database. The following gives more details of the error: "error_message".

Explanation: It is possible that another process has locked the database.

error_message contains the reason for the error.

System action: Compiler stops.

Operator response: Determine if another process has locked the userdata database using the tools of your operating system. Wait till that process has finished, or stop it, if you are sure it is safe to do so. Rerun compiler.

AWSBID026E Compiler was unable to unlock the userdata database. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBID027E Compiler was unable to read the user information from the database and add it to the Symphony file. The following gives more details of the error: "error_message".

Explanation: *error_message* contains the reason for the error.

System action: Compiler stops.

Operator response: Verify that the Symphony file exists and that you have the correct access rights. Retry the operation.

AWSBID029W You cannot initialize the centralized security option because your database is in non-expanded mode.

Explanation: See message text.

System action: Compiler stops.

Operator response: Use the **composer dbexpand** command to convert all databases to the expanded version, or use the normal security model (non-centralized).

AWSBID200E Line !1: The !2 name is longer than 8 bytes.

AWSBID201E Line !1: The !2 name must begin with an alphabetic character.

AWSBID202E Line !1: The !2 name contains one or more character that is not allowed.

Chapter 107. AWSBIE - BigInsights plug-in messages

This section lists error and warning messages that could be issued by the BigInsights plug-in.

The message component code is BIE.

**AWSBIE013E Error: input file !1 and output file !2
are identical**

Chapter 108. AWSBIF messages

This section lists error and warning messages that could be issued.

The message component code is BIF.

AWSBIF002E Couldn't malloc program globals.

AWSBIF003E Couldn't open output, error is: !1

AWSBIF004E Error writing output, error is: !1

AWSBIF006E Error reading masked is: !1

AWSBIF007E Error finding next job stream is: !1

Chapter 109. AWSBIG messages

This section lists error and warning messages that could be issued.

The message component code is BIG.

AWSBIG001W No msg

Chapter 110. AWSBII - General and miscellaneous messages

This section lists error and warning general and miscellaneous messages that might be issued.

The message component code is BII.

AWSBII001E Unable to write token control structure.

AWSBII002E No tokens in list.

AWSBII003E Non-valid token !1 in list (!2).

AWSBII004E No read access to parameter in !1.

AWSBII005E Undefined parameter !1 in string !2; not replaced.

AWSBII006E Parameter expansion overflow in !1.

AWSBII007E Parameter syntax error in !1.

AWSBII008E Cannot daemonize.

AWSBII009E An error has occurred.

AWSBII010W Cannot update the file "old_file". A new file "new_file" was created. You must replace the old file with the new file.

Explanation: The program was not able to update the configuration file *old_file* (useropts). Maybe the file was locked by another process. The program has saved the changes it needed to make, giving the file this name: *new_file*.

System action: The program continues.

Operator response: Manually replace the *old_file* with the *new_file*, as soon as possible.

AWSBII014E Your command line interface settings cannot be modified to allow the input of the password.

Explanation: The program needs to modify the settings of your command line interface so that you can enter the password in a secure way. It was not able to do this. You cannot use the command line interface to run this program.

System action: The operation is not performed.

Operator response: Verify with your system support if the command line interface on your computer can be modified to allow the interaction required to let you enter a password in a secure way (it needs to reset the echo input). If not, consult the Tivoli Workload Scheduler documentation and choose a different way of achieving the same objective.

AWSBII015E The new password and the confirmation password do not match.

Explanation: See message.

System action: You are asked to re-input the passwords.

Operator response: Check the values you supplied, and when requested input the correct password and confirm it.

AWSBII016E An internal error has occurred. The directory !1 cannot be created.

Explanation: See message.

System action: The operation is not performed.

Operator response: Verify the following:

- That there is sufficient space in the file system where the directory is to be created. If not, create more space.
- That the parent directory has create permission for the Tivoli Workload Scheduler user.

When you have solved the problem retry the operation.

AWSBII017E An internal error has occurred. The program is unable to initialize the GSKit libraries.

Explanation: A problem has occurred with the installation or configuration of the GSKit libraries, or both, and they cannot be initialized.

System action: The program cannot commence a secure connection, so stops.

Operator response: Verify that GSKit is correctly installed and configured.

Chapter 111. AWSBIJ - Jobmon specific error messages

This section lists error and warning messages that could be issued by the routines that handle the Jobmon process.

The message component code is BIJ.

AWSBIJ001E An internal error has occurred. Jobmon is unable to create a socket for communication with jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg, using the socket.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ002E Unable to get hostname !1:!2 error = !3 : !4.

AWSBIJ003E Unable to get host entries by name !1:!2 error = !3 : !4.

AWSBIJ004E An internal error has occurred. Jobmon is unable to bind the socket to the address used for communication with jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg, using the socket.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. nullcontibm;

AWSBIJ005E An internal error has occurred. Jobmon is unable to obtain the socket attributes for communication with jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg, using the socket.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ006E An internal error has occurred. Jobmon is unable to listen for connection requests from jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ007E An internal error has occurred. Jobmon is unable to accept a connection request from jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ008E An internal error has occurred. Jobmon is unable to allocate sufficient memory to process requests from jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: Check the following:

1. Verify if the workstation on which **jobmon** is running has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **jobmon**. Use the workstation **stop** and **start** commands to restart **jobmon**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then use the workstation **stop** and **start** commands to restart **jobmon**.
3. If the problem persists, reboot the workstation, and then run the **start** command to start **jobmon**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBIJ009E An internal error has occurred. Jobmon is unable to select a data socket for a communication request from jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ010E An internal error has occurred. Jobmon is unable to read the data received from jobman. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobman is trying to send jobmon the messages that it reads from the message file, Courier.msg.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ011E An internal error has occurred. Jobmon either cannot generate a temporary file name, or is unable to retrieve a system configuration value. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: In the case where the system configuration value could not be retrieved, the value is the number of clock intervals per second that are used to report run times by the system. The value is needed to report a job run time in seconds.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ012E Error changing directory !1:!2 error = !3 : !4.

AWSBIJ013E Error opening file !1:!2 error = !3 : !4.

AWSBIJ100E An internal error has occurred. Jobmon has received an error when using a Windows system call (API). The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart jobmon.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ101E An internal error has occurred. Jobmon was unable to create a new process and its primary thread. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart jobmon.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

AWSBIJ102E An internal error has occurred. Jobmon cannot determine the state of an opens (check file) dependency. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ103E An internal error has occurred. Jobmon cannot determine the status of the command used to determine the state of an opens (check file) dependency. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ104E Error allocating storage local to thread !1:!2 error = !3 : !4.

AWSBIJ105E An internal error has occurred. Jobmon cannot create the thread to read the output of the method that is used to resolve internetwork dependencies. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ106E Error setting local thread value !1:!2 error = !3 : !4.

AWSBIJ107E Error getting local thread value !1:!2 error = !3 : !4.

AWSBIJ108E An internal error has occurred. Jobmon was unable to retrieve time information for the specified process. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ109E An internal error has occurred. Jobmon was unable to log a user on to the local computer. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds, but the job fails.

Operator response: Read the description of the internal system error and try to correct it. Verify that the Tivoli Workload Scheduler user has correct settings to log on the target computer. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

See *The Reference Manual* for information about user rights.

AWSBIJ110E Error creating a mutex !1:!2 error = !3 : !4.

AWSBIJ111E Error acquiring a mutex !1:!2 error = !3 : !4.

AWSBIJ112E Error releasing a mutex !1:!2 error = !3 : !4.

AWSBIJ113E An internal error has occurred. Jobmon cannot terminate the command that determines the state of an opens (check file) dependency. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: Jobmon attempts to terminate the command when the command has not completed within a fixed timeout interval.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ114E An internal error has occurred. Jobmon was unable to duplicate an object handle because an API window has failed. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ115E An internal error has occurred. Jobmon was unable to create the event to communicate with the threads that monitor active jobs. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ116E An internal error has occurred. Jobmon could not create the security descriptor to change the access permissions for the stdlist file. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ117E An internal error has occurred. Jobmon was unable to create temporary files to redirect the stdin/stdout of the command that resolves opens (check file) dependencies. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ118E An internal error has occurred. Jobmon was unable to get the default process environment to launch jobs. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ119E An internal error has occurred. Jobmon encountered an error looking up a security identifier (SID) for the account and the name of the domain on which the account was found. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ120E An internal error has occurred. Jobmon was unable to obtain the name of the user associated with the current jobmon thread. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ121E An internal error has occurred. Jobmon was unable to get a user's Security Identifier (SID) to set the stream logon to that user. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** might stop.

Operator response: Read the description of the internal system error and try to correct it. In case of a domain user verify that the Tivoli Workload Scheduler user has the correct right to retrieve the *SID* from the domain controller. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ122E An internal error has occurred. Jobmon was unable to validate a security identifier (SID). The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: The problem could be caused either because the revision number is not within a known range or the number of subauthorities is greater than the maximum.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ123E An internal error has occurred. Jobmon was unable to initialize a security identifier (SID). The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ124E An internal error has occurred. Jobmon encountered an error because the Access Control List buffer size is too small for the information needed to be stored in it (the buffer size is hard-coded). The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ125E An internal error has occurred. Jobmon was unable to initialize a new Access Control List structure. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ126E An internal error has occurred. Jobmon was trying to access the stdlist file, but was unable to add an access-allowed access control entry to an access control list. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: An access control entry contains a set of access rights and a security identifier (SID).

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ127E An internal error has occurred. Jobmon was trying to access the stdlist file, but was unable to initialize a new security descriptor. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: A security descriptor is a structure and associated data that contains the security information for a securable object.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ128E An internal error has occurred. Jobmon was trying to access the system desktop or the stdlist file, but was unable to set information in a discretionary access control list. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: The discretionary access control list is an access control list that is controlled by the owner of an object and that specifies the level of access particular users or groups can have to the object.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ129E Error getting current process !1:!2 error = !3 : !4.

AWSBIJ130E An internal error has occurred. Jobmon was unable to retrieve the handle for the window station associated with the calling process. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: A window station object is a secure object that contains a set of global atoms, a clipboard, and a set of desktop objects.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ131E Error getting user object information !1:!2 error = !3 : !4.

AWSBIJ132E An internal error has occurred. Jobmon was unable to retrieve the handle for the desktop associated with a specified thread. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ133E An internal error has occurred. Jobmon was unable to create a window station object. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: A window station object is a secure object that contains a set of global atoms, a clipboard, and a set of desktop objects.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ134E An internal error has occurred. Jobmon was unable to assign a window station to the calling process. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: A window station object is a secure object that contains a set of global atoms, a clipboard, and a set of desktop objects.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ135E An internal error has occurred. Jobmon was unable to retrieve the handle to an existing desktop object. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: A desktop object is a Windows object contained within a window station object, which itself is a secure object that contains a set of global atoms, a clipboard, and a set of desktop objects.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the

internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ136E Error in validating heap !1:!2 error = !3 : !4.

AWSBIJ137E An internal error has occurred. Jobmon was unable to allocate system memory for internal data structures. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **jobmon**. Use the workstation **stop** and **start** commands to restart **jobmon**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then use the workstation **stop** and **start** commands to restart **jobmon**.
3. If the problem persists, reboot the workstation, and then use the workstation **start** command to restart **jobmon**.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSBIJ138E Error in freeing heap memory !1:!2 error = !3 : !4.

AWSBIJ139E An internal error has occurred. Jobmon was unable to create a new desktop on the window station associated with the calling process. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: A window station object is a secure object that contains a set of global atoms, a clipboard, and a set of desktop objects.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ140E An internal error has occurred. Jobmon was unable to create the Windows process environment to launch jobs. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ141E Error in getting the domain controller name !1:!2 error = !3 : !4.

AWSBIJ142E Error in getting the user information from system !1:!2 error = !3 : !4.

AWSBIJ143E An internal error has occurred. Jobmon cannot open its own process token to set its process rights. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon might stop.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ144E Error in setting user object information !1:!2 error = !3 : !4.

AWSBIJ145E Error in getting any of the domain controllers name !1:!2 error = !3 : !4.

AWSBIJ146E An internal error has occurred. Jobmon was unable to find the home directory of the user specified in the streamlogon field of the job. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds, but the job fails.

Operator response: Read the description of the internal system error and try to correct it. Verify that the user has a home directory associated and that the

home directory exists on the machine. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

AWSBIJ147E An internal error has occurred. Jobmon was unable to retrieve a pointer to the discretionary access control list in a specified security descriptor. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds, but the job fails.

Operator response: Read the description of the internal system error and try to correct it. Verify that the Tivoli Workload Scheduler user has the correct rights to launch a job on the target computer. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

See The *Reference Manual* for details about user access.

AWSBIJ148E One of the following internal errors has occurred: - Jobmon was unable to retrieve the handle of an existing window station - Jobmon was unable to retrieve the handle of the window station associated with the calling process - Jobmon was unable to assign a window station to the calling process. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ149E An internal error has occurred. Jobmon was unable to retrieve the security information for the Tivoli Workload Scheduler user object. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds, but the job fails.

Operator response: Read the description of the internal system error and try to correct it. Verify that the Tivoli Workload Scheduler user has the correct rights to launch a job on the target computer. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

See The *Reference Manual* for details about user access.

AWSBIJ150E An internal error has occurred. Jobmon encountered an error because the user specified in the streamlogon field of the job does not have the rights either to log on locally or to log on as batch. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: **Jobmon** proceeds, but the job fails.

Operator response: Read the description of the internal system error and try to correct it. Verify that the Tivoli Workload Scheduler user has both of the indicated rights. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

See *The Reference Manual* for information about user rights.

AWSBIJ151E Error granting user rights for job logon !1:!2 error = !3 : !4.

AWSBIJ152E An internal error has occurred. Jobmon encountered an error checking that the user specified in the streamlogon field of the job has access to the interactive desktop. The error occurred in the following source code file: "file_name" at line: "line_number". The error message and error number are as follows: "error_message" : "error_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_message describes the operating system error.

error_number is the operating system error number.

System action: Jobmon proceeds, but the job fails.

Operator response: Read the description of the internal system error and try to correct it. Verify the rights of the ""streamlogon"" user. If the user does not have access, add it to the discretionary access control list for the interactive Windows Station WinSta0 and its default desktop. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

AWSBIJ153E An internal error has occurred. Jobmon was unable to retrieve time information for the specified process.

Explanation: See message.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. If you have corrected it, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ154E An internal error has occurred. Jobmon was unable to get a user's Security Identifier (SID) to set the stream logon to that user.

Explanation: See message.

System action: Jobmon proceeds. The operation is not performed.

Operator response: Read the description of the internal system error and try to correct it. In case of a domain user verify that the Tivoli Workload Scheduler user has the correct right to retrieve the *SID* from the domain controller. If you have corrected the error, use the workstation **stop** and **start** commands to restart **jobmon**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ201E Incorrect usage. Correct usage is JOBMON pipehandle !1:!2

AWSBIJ203E An internal error has occurred. Jobmon encountered an error while trying to adopt a child process. The error occurred in the following source code file: "file_name" at line: "line_number".

Explanation: Jobmon is trying to monitor processes that were active when **jobmon** exited.

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

System action: Jobmon stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ204W An internal error has occurred. Jobmon has received a message from jobman that it is unable to interpret. The error occurred in the following source code file: "file_name" at line: "line_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

System action: Jobmon proceeds, but does not accept any more messages from **jobman**.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ205W An internal error has occurred. Jobmon has received a message from jobman that has a non-valid version. The error occurred in the following source code file: "file_name" at line: "line_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

System action: Jobmon stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ206W An internal error has occurred. Jobmon has received a message from jobman that contains a non-valid message type. The error occurred in the following source code file: "file_name" at line: "line_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

System action: Jobmon stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ207E An internal error has occurred. Jobmon was unable to read the user information from the Symphony file. The error occurred in the following source code file: "file_name" at line: "line_number".

Explanation: *file_name* is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

System action: Jobmon stops.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIJ208E An internal error has occurred. Jobmon was unable to retrieve user information. The error occurred in the following source code file: "user_name" at line: "file_name".

Explanation: *user_name* is the name of the user for

which jobmon was unable to retrieve the definition.

file_name contains the name of the file and the line number where the error occurred.

System action: The program proceeds.

Operator response: Verify that the user exists in the mozart directory.

Then verify the following items are correct:

- The user name in the job definition.
- The password entered in the Tivoli Workload Scheduler database.

If you have corrected the error, use the workstation **stop** and **start** commands to restart jobmon.

AWSBIJ209E Unable to initialize the GSKit libraries.

AWSBIJ211E An internal error has occurred. Jobmon could not find any existing or valid Windows sessions for user streamlogon that requires an interactive desktop.

Explanation: See message.

System action: Jobmon proceeds, but the job fails.

Operator response: Check that the selected user has existing or valid Windows sessions.

Chapter 112. AWSBIK - Jobmon messages

This section lists error and warning Jobmon messages that might be issued.

The message component code is BIK.

AWSBIK001E Error creating socket !1:!2 error = !3. : !4.

AWSBIK002E Unable to get host name !1:!2 error = !3. : !4.

AWSBIK003E Unable to get host entries by name !1:!2 error = !3. : !4.

AWSBIK004E Error binding socket to address !1:!2 error = !3. : !4.

AWSBIK005E Error connecting socket to server !1:!2 error = !3. : !4.

AWSBIK006E Error sending data !1:!2 error = !3. : !4.

AWSBIK007E Error receiving data !1:!2 error = !3. : !4.

AWSBIK008E Error allocating memory !1:!2 in = !3. : !4.

AWSBIK009E Error opening OS file handle !1:!2 error = !3. : !4.

AWSBIK010E Error reading data !1:!2 error = !3. : !4.

AWSBIK100E Error performing NT system action !1:!2 error = !3. : !4.

AWSBIK101E Error creating process !1:!2 error = !3. : !4.

AWSBIK102E Error creating anon. pipe !1:!2 error = !3. : !4.

AWSBIK103E Error setting information on handle !1:!2 error = !3. : !4.

AWSBIK104E Error getting process time information !1:!2 error = !3. : !4.

AWSBIK105E Error converting time information !1:!2 error = !3. : !4.

AWSBIK201E Unable to connect to job monitor !1:!2.

AWSBIK202E Error creating JOBMON !1:!2.

AWSBIK203E Jobmon responded with failure !1:!2

Chapter 113. AWSBIM - Common library messages

This section lists error and warning common library messages that might be issued.

The message component code is BIM.

AWSBIM001E The workstation type does not match the workstation type in the database.

AWSBIM002E The workstation !1 is not a valid host.

AWSBIM003E The domain name must be specified for this workstation definition.

AWSBIM004E An extended agent !1 cannot host itself.

AWSBIM005E The parent domain !1 is not defined as a domain definition.

AWSBIM006E The master domain cannot have a parent domain. It is the top-level in the domain hierarchy.

AWSBIM007E A loop was found in the domain definition.

AWSBIM008E The domain manager !1 is not defined as an FTA.

AWSBIM009E The master domain manager !1 cannot be the manager of this domain !2.

AWSBIM010E The domain manager !1 must be in the same domain as the workstation.

AWSBIM011E The host workstation !1 is not found in the database.

AWSBIM012E A non-valid domain !1 has been specified for the master domain manager.

AWSBIM013E The workstation !1 already exists in the database.

AWSBIM014E The workstation class !1 already exists in the database.

AWSBIM015E The domain !1 already exists in the database.

AWSBIM016E The access method !1 does not exist on your system.

AWSBIM017E An object named as master domain !1 cannot be created in the database.

AWSBIM018E The number of levels of hosting cannot be greater than two.

AWSBIM019E Error: !1

AWSBIM020E Non-valid syntax for MPE user ID: !1

AWSBIM021E Non-valid job recovery option.

AWSBIM022E Workstation !1 does not support the task type !2.

AWSBIM030E Error !1 occurred while resolving dependencies.

AWSBIM031E Job !1 does not exist in job stream !2#!3

AWSBIM032E Job stream !1#!2 has been changed. No update done.

AWSBIM033E A circular dependency has occurred for !1#!2 and !3#!4.

AWSBIM034E Job !1 already exists in the job stream.

AWSBIM035E The job is hosted by workstation !4, resource !1#!2 is hosted by workstation !3.

AWSBIM036E Resource !1#!2 has !4 available; this requires !3.

AWSBIM037E • AWSBIM060E

AWSBIM037E Job stream is hosted by workstation !4, resource !1#!2 is hosted by workstation !3.

AWSBIM041E Job master changed while trying to update job !1#!2. Update aborted.

AWSBIM042E Error !1 occurred in resolve dependencies.

AWSBIM043W Workstation !1 is not the master domain manager. The parameters are expanded from the master domain manager.

AWSBIM045E File system error opening script/jcl file !1. !2

AWSBIM046W Order of interleaved dependencies are lost when job stream is written.

AWSBIM048E Mastsked not updated.

AWSBIM049E Autodoc not allowed for this job.

AWSBIM050E Non-valid time zone !1 specified for at time of job or job stream!2.

AWSBIM051E Non-valid time zone !1 specified for until time of job or job stream !2.

AWSBIM052E A non-valid time of !1 hours, !2 minutes has been specified for the every keyword in job !3.

AWSBIM053E A job stream cannot follow itself.

AWSBIM054E A job cannot follow itself.

AWSBIM055E A job stream cannot follow one of its jobs.

AWSBIM056E A job cannot follow its job stream.

AWSBIM057E The until time occurs before the at time for job or job stream !1.

AWSBIM060E Error inserting into list.

Chapter 114. AWSBIN - Plan libraries messages

This section lists error and warning messages that might be issued by the plan libraries that are used by several components.

The message component code is BIN.

AWSBIN001E The workstation "workstation" has not been initialized yet.

Explanation: See message.

System action: The operation is not performed.

Operator response: Initialize the specified workstation and retry the operation.

AWSBIN002E The workstation "workstation" is already active.

Explanation: See message.

System action: The operation is not performed.

Operator response: None.

AWSBIN003E The workstation "workstation" identified as the target for a switch manager operation is not a fault-tolerant agent.

Explanation: The switch manager operation can only be performed if the target workstation is a fault-tolerant agent.

System action: The operation is not performed.

Operator response: Choose a target workstation that is a fault-tolerant agent.

AWSBIN004E The domain manager does not have the fullstatus field set to on.

Explanation: See message.

System action: The operation is not performed.

Operator response: Set the "fullstatus" field to "on"

AWSBIN005E The domain manager "domain_manager" is not in the same domain as the local workstation "workstation".

Explanation: See message.

System action: The operation is not performed.

Operator response: Change the domain of either the local workstation or the domain manager. You can

perform this operation using either the **composer** command or the Tivoli Dynamic Workload Console.

AWSBIN006E An internal error occurred while starting workstation "workstation".

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIN007W The manager option is valid only on the local workstation. It has been ignored.

Explanation: See message.

System action: The operation is not performed.

Operator response: Run the command locally or use a command supported on a remote workstation.

AWSBIN008E The start command cannot be issued to workstation "workstation", because it is not hosted by "host_workstation".

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify the correct host for the workstation.

AWSBIN009E An error occurred while starting workstation: "workstation".

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIN011W Workstation "workstation" has already stopped.

Explanation: See message.

System action: The operation is not performed.

Operator response: Issue a command appropriate to the workstation status.

AWSBIN014E A link or unlink command has been issued on workstation "workstation" to link to or unlink from a peer workstation within the same domain, which is not allowed.

Explanation: See message.

System action: The operation is not performed.

Operator response: You can issue the link or unlink commands on higher or subordinate domains.

See *The User's Guide and Reference* for more details about link and unlink commands.

AWSBIN015E A link or unlink command has been issued on workstation "workstation", but the domain of the workstation being linked to or unlinked from is not subordinate to the domain of the local workstation.

Explanation: See message.

System action: The operation is not performed.

Operator response: You can issue the link or unlink commands on higher or subordinate domains.

See *The User's Guide and Reference* for more details about link and unlink commands.

AWSBIN016E Monitoring is already active for workstation "workstation".

Explanation: See message.

System action: The operation is not performed.

Operator response: None.

AWSBIN017E Monitoring is already stopped for workstation "workstation".

Explanation: See message.

System action: The operation is not performed.

Operator response: None.

AWSBIN020E An error occurred while running command: "command_name"#

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIN030E The command issued for workstation "workstation_name" cannot be performed because the workstation is an extended agent, on which the command is not supported.

Explanation: See message.

workstation_name is the extended agent name.

System action: The command is not processed.

Operator response: This command is not supported on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBIN031E Workstation "workstation" is not in domain "domain". The domain manager cannot be switched.

Explanation: See message.

System action: The operation is not performed.

Operator response: Select a workstation in the same domain as the domain manager.

AWSBIN032W Workstation "workstation" is already the manager of domain "domain".

Explanation: See message.

System action: The operation is not performed.

Operator response: None.

AWSBIN033E The command issued for workstation "workstation_name" cannot be performed, because the workstation is extended agent, or agent, or pool, or dynamic pool, or remote engine workstation, where the command is not supported.

Explanation: See message.

workstation_name is the extended agent, or agent, or pool, or dynamic pool, or remote engine workstation name.

System action: The command is not processed.

Operator response: You cannot use this command on the selected workstation. If you have selected the extended agent, or agent, or pool, or dynamic pool, or remote engine workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBIN034E The command issued for workstation "workstation_name" cannot be performed because the workstation is an extended agent, workload broker, dynamic agent, pool, dynamic pool, or remote engine workstation, on which the command is not supported.

Explanation: See message.

workstation_name is the extended agent, workload broker, dynamic agent, pool, dynamic pool, or remote engine workstation name.

System action: The command is not processed.

Operator response: This command is not supported on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBIN035E The command issued for workstation "workstation_name" cannot be performed because the workstation is a dynamic agent, pool, dynamic pool, or remote engine workstation, on which the command is not supported.

Explanation: See message.

workstation_name is the dynamic agent, pool, dynamic pool, or remote engine workstation name.

System action: The command is not processed.

Operator response: This command is not supported on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBIN036E The command issued for workstation "workstation_name" cannot be performed because the workstation is an extended agent, workload broker, pool, dynamic pool, or remote engine workstation, on which the command is not supported.

Explanation: See message.

workstation_name is the extended agent, workload broker, pool, dynamic pool, or remote engine workstation name.

System action: The command is not processed.

Operator response: This command is not supported on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you

have selected the wrong command, issue a different command.

AWSBIN037E The command issued for workstation "workstation_name" cannot be performed because the workstation is a pool, dynamic pool, or remote engine workstation, on which the command is not supported.

Explanation: See message.

workstation_name is the pool, dynamic pool, or remote engine workstation name.

System action: The command is not processed.

Operator response: This command is not supported on the selected workstation. If you have selected the workstation in error, change the command to identify a different workstation and re-issue the command. If you have selected the wrong command, issue a different command.

AWSBIN040E Unable to obtain information about the remote workstation "workstation_name" because centralized security, which is enabled for this domain, does not allow it to.

Explanation: See message.

System action: The operation is not performed.

Operator response: Contact the Tivoli Workload Scheduler Administrator for more information on security settings.

AWSBIN050E An internal error has occurred. An unexpected record type has been found in the Symphony file.

Explanation: See message.

System action: The operation is not performed.

Operator response: Contact the Tivoli Workload Scheduler administrator.

AWSBIN051E This operation cannot be performed on job stream "workstation"#"job_stream".

Explanation: See message.

System action: The operation is not performed.

Operator response: See the Tivoli Workload Scheduler documentation for information on supported operations.

AWSBIN052E The job stream has already been cancelled.

Explanation: See message.

System action: The operation is not performed.

Operator response: None.

AWSBIN053E An error has been found in file "file_name" at line "line_number". The program could not obtain the workstation names in workstation class "workstation_class".

Explanation: See message.

System action: The operation is not performed.

Operator response: Contact the Tivoli Workload Scheduler administrator for information on the file.

AWSBIN054E The following internal error has occurred in the TRANS module: "error_message"

Explanation: You have submitted an ad hoc job stream. During the processing, the job stream is transformed into a Symphony file record before being processed. The module (TRANS) that performs this transformation has encountered an unexpected error.

System action: The program that called the TRANS module continues, but the ad hoc job stream is discarded.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIN055E Job stream "workstation"#"job_stream" was not found in the database. The job stream cannot be submitted.

Explanation: See message.

System action: The operation is not performed.

Operator response: Check the job stream name and the database records.

AWSBIN070E Parameter not defined.

AWSBIN071E Parameter expansion overflowed.

AWSBIN072E There is a syntax error in a parameter.

AWSBIN073E An error occurred creating a valid job name.

AWSBIN074E You cannot submit a job to a workstation class.

AWSBIN075E The job has been cancelled.

AWSBIN076E The operation cannot be performed. The job or the current instance of the job is in an incorrect state.

AWSBIN077E User jobs cannot be rerun.

AWSBIN078E The stdlist could not be accessed. The job cannot be run.

AWSBIN079E An error occurred obtaining the stdlist file status information for job: "JobKey1"."JobKey2": "JobKey3"

AWSBIN080E An internal error occurred processing scribner packets.

AWSBIN090E The following error occurred while obtaining the monitoring configuration file for workstation "workstation_name": "error_message"

Explanation: See message.

System action: The operation is not performed.

Operator response: See the error message for further details on the problem.

AWSBIN091E An error occurred obtaining the monitoring configuration file for workstation "workstation_name": The workstation does not support monitoring.

Explanation: See message.

System action: The operation is not performed.

Operator response: Select a workstation where the monitoring function is supported.

AWSBIN092E The following error occurred while getting the broker information: "error_message"

Explanation: See message.

System action: The operation is not performed.

Operator response: See the error message for further details on the problem.

AWSBIN100E An error occurred accessing the runmsg file: "file".

AWSBIN101E The opens file dependency is too long.

AWSBIN102W The specified dependencies are same as those in the Symphony file.

AWSBIN103E The supplied command is not valid for theuserjobs job stream.

AWSBIN104E Dependencies cannot be added to a job in an in order job stream.

AWSBIN105E The number of dependencies specified is more than the maximum allowed.

AWSBIN106E The dependency record is not an external job type.

AWSBIN107E The dependency "dependency" cannot be added, because it was not found in the Symphony file.

AWSBIN108E A fully qualified filename is required for an opens file dependency.

AWSBIN109E There is a logic error in the follows dependencies. The dependency is circular.

AWSBIN200E The Symphony file and the database have incompatible versions.

Chapter 115. AWSBIO - Comm_api messages

This section lists error and warning comm_api messages that might be issued.

The message component code is BIO.

AWSBIO001E The supplied parameter "parameter" is not valid.

AWSBIO002E The supplied parameter "parameter" does not have a valid length.

AWSBIO003E The supplied parameter "parameter" already exists.

AWSBIO004E The supplied parameter "parameter" has a non-alphabetic first character.

AWSBIO005E The supplied parameter "parameter" contains non-valid characters.

AWSBIO006E Field "field" has a null value.

AWSBIO007E An internal error has occurred. The MAE_CA comarea cannot be initialized.

AWSBIO008E An internal error has occurred. The SEC_CA comarea cannot be initialized. The error was: !1.

AWSBIO009E An internal error has occurred. The database could not be opened. The error was: !1.

AWSBIO010E An internal error has occurred. The database files are not at the correct version.

AWSBIO011E An internal error occurred allocating memory.

AWSBIO012E The filter type "filter_type" is not valid.

AWSBIO013E The specified Tivoli Workload Scheduler object is not valid.

AWSBIO014E An incorrect time value "time" has been specified in the filter "filter".

AWSBIO015E An incorrect time type "time_type" has been specified in the filter "filter".

AWSBIO016E An incorrect priority value "priority" has been specified in a filter.

AWSBIO017E An incorrect priority type "priority_type" has been specified in a filter.

AWSBIO018E ID filter not found in filter array.

AWSBIO019E File "file" could not be opened. The error was: "error".

AWSBIO020E File "file" could not be closed. The error was: "error".

AWSBIO021E File "file" could not be read. The error was: "error".

AWSBIO022E File "file" could not be written. The error was: "error".

AWSBIO023E TWS is not installed under group "Group"

AWSBIO024E "Server" server is not installed.

AWSBIO025E Error opening Symphony: "Symphony"

AWSBIO026E Error opening Events files: "EventFile"

AWSBIO027E The object "object" could not be found.

AWSBIO028E An incorrect limit "limit" was specified in the filter.

AWSBIO029E An incorrect limit type "limit_type" was specified in the filter.

AWSBIO030E An incorrect status "status" was specified in the filter.

AWSBIO031E An incorrect recovery option "recovery_option" was specified in the filter.

AWSBIO032E An incorrect prompt status "prompt_status" was specified in the filter.

AWSBIO033E An internal system error occurred.

AWSBIO034E An incorrect limit "limit" was specified for the job stream "job_stream".

AWSBIO035E Unable to initialize Tivoli Workload Scheduler Connector plan auditing.

AWSBIO036E Unable to initialize Tivoli Workload Scheduler Connector database auditing.

AWSBIO037E Workstation "workstation" does not support the task type "task_type".

AWSBIO038E A method options file or jobdef keyword was not found for task type "task_type" on workstation "workstation".

AWSBIO039E The variable "variable" could not be found.

Explanation: The variable could not be found in any database.

System action: The operation is not performed.

Operator response: Check that this variable is defined in the global or local database. If the variable does not exist, define it and rerun the operation that needs to use it.

AWSBIO040E The supplied job stream alias "alias" cannot be used, because another job stream has been submitted in this plan instance with the same alias.

Explanation: When a job stream is submitted with an alias, the internal ID of the submitted job stream is set to the value of the alias. This is so that follows dependencies can be created where the aliased job stream instances are predecessors. If you subsequently submit the same or a different job stream, using the same alias, the software detects the duplication and does not submit the job stream, issuing this message.

The potential for duplication only exists within the same unextended plan. Whenever you extend the plan, the original job stream and its alias are assigned new internal IDs which make them unique, making the alias available for use for the same or another job stream.

The following is an example:

1. You submit job streams ""JS-1"" and ""JS-2"". The plan now contains the following items, identified uniquely by their job stream internal IDs:
 - Job stream name=WS-1#JS-1 Job stream internal ID=058HNKHGRD8378
 - Job stream name=WS-1#JS-2 Job stream internal ID=058HNKYIJG8945
2. You then submit job stream ""JS-1"" with the alias ""myalias"". The plan now contains the following items, identified uniquely by their job stream internal IDs:
 - Job stream name=WS-1#JS-1 Job stream internal ID=058HNKHGRD8378
 - Job stream name=WS-1#JS-2 Job stream internal ID=058HNKYIJG8945
 - Job stream name=WS-1#myalias Job stream internal ID=myalias
3. You then try and submit job stream ""JS-2"" with the alias ""myalias"". The plan already has a job stream with the internal ID ""myalias"", so the job stream cannot be created and this message is issued.

System action: The submit operation is not performed.

Operator response: Choose a different alias and resubmit the job stream. If there are particular reasons why you must use this alias, wait until after a plan extension before resubmitting the job stream.

AWSBIO041E The job cannot be submitted because the job or job alias "job_name_or_alias" already exists.

Explanation: When a job is submitted, the program checks to see if a duplicate job or duplicate alias already exists in the Symphony file. The program follows these rules:

- Two jobs without aliases cannot exist with the same name, irrespective of whether they were put in the plan by planner or by a normal submission to the current plan.
- Two aliases cannot exist with the same name, irrespective of whether they were supplied explicitly, or generated by the program.
- The program only generates an alias if you are: a) performing an ad-hoc submission, b) the job name already exists, and c) an alias has not been supplied. The program uses the ""docommand"" string of the job as the alias.

This means that if the program has already created an alias for a job with a given ""docommand""

string, it cannot create an alias for any job that has the same `""docommand""` string. The job cannot be submitted because the alias is a duplicate.

The following is an example of the latter situation: The jobs `""Job-1""` and `""Job-2""` already exist in the plan in the same job stream for workstation `""WS-1""`. You submit `""Job-1""` again as an ad-hoc job without an alias and with a `""docommand "" of ""runjob27.exe""`. The program generates the alias from the docommand resulting in the following job in the plan: Job name=WS-1#0AAAAAAAAAAAAABG.RUNJOB27

You then submit `""Job-2""` again as an ad-hoc job without an alias. The program wants to generate the same job name, but cannot, because to do would create a duplicate alias. This message is issued.

System action: The submit operation is not performed.

Operator response: Choose a different specific alias and resubmit the job.

Chapter 116. AWSBIP - Connector messages

This section lists error and warning messages that might be issued by the connector component.

The message component code is BIP.

AWSBIP001E A general failure occurred in file: !1 at line: !2.

AWSBIP002E The object of type !1 is represented by a non-valid ID or handle in method !2

AWSBIP003E Either the object does not exist or its properties cannot be displayed with this Tivoli Dynamic Workload Console version.

AWSBIP004E An incorrect filter was encountered for the object type "object_type" in method "method_name"

Explanation: This message is issued by the Tivoli Workload Scheduler Connector upon encountering one of the following conditions:

- There is a product level mismatch between the Tivoli Dynamic Workload Console and the Connector.
- An incorrect field was sent by the Tivoli Dynamic Workload Console on a particular user action.

System action: The connector might stop, depending on the circumstances.

Operator response: Verify that compatible Tivoli Dynamic Workload Console, Tivoli Workload Scheduler Connector, and Tivoli Workload Scheduler versions are installed. If this is not the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIP005E An incorrect timer language expression was found for object type !1 in method !2

AWSBIP006E Could not generate the timer language expression for object type !1 in method !2

AWSBIP007E Expected a different timer language expression format type for object type !1 in method !2

AWSBIP008E An incorrect resource type !1 was encountered in method !2

AWSBIP009E A nonexistent object !1 was referenced by the object ID or handle for object type !2 in method !3

AWSBIP010E Unable to send data to object type !1 in method !2

AWSBIP011E Workstation !1 not found. Using UNKNOWN task type.

AWSBIP012E Workstation !1 not found, cannot find task type for job !2. Returning UNKNOWN as the task type.

AWSBIP013E Job !1#!2 not found. Returning empty string for task type.

AWSBIP014E Error generating audit record

AWSBIP015E Unable to switch Symphony file.

AWSBIP016E Operation not allowed while Symphony file is switched.

Chapter 117. AWSBIR - Libraries messages

This section lists error and warning libraries messages that might be issued.

The message component code is BIR.

AWSBIR001E nullunknown symphony recordnull

AWSBIR100E option requires an argument -- %c

AWSBIR101E illegal option -- %c

AWSBIR102E Cannot open file '%s'

Chapter 118. AWSBIS - Customize messages

This section lists error and warning messages that might be issued by the customize component.

The message component code is BIS.

AWSBIS002E An internal error has occurred. Customize failed to run the following UNIX command during the installation: "command" Correct the problem and rerun customize.

Explanation: The *command* can be any of the following:

- **chgrp**
- **chmod**
- **chown**
- **filepriv** (UnixWare only)
- **mkdir**
- **mv**
- **rm**

Customize issues this message in any of the following circumstances:

- It is unable to set permissions, ownership or group of the Tivoli Workload Scheduler files.
- It could not create one or more directories.
- It could not delete or rename one or more files.

System action: Customize stops. The installation is not completed.

Operator response: Determine why the system command specified in *command* failed and rerun **customize**.

Capturing the output from the **customize** command will help you to determine the error. Do the following:

1. Run this command: **script -a nullfile_name>** where *nullfile_name>* is the fully qualified path and file name of the file where you want to capture the **customize** output (for example, /tmp/custOut.txt).
2. Re-issue the **customize** command with all the arguments used before.
3. When **customize** fails, issue the **exit** command to close the output file.
4. Open the file and read the output from customize.

AWSBIS003E The following Tivoli Workload Scheduler configuration file does not exist: "file_name".

Explanation: **Customize** is attempting to customize a

Tivoli Workload Scheduler configuration file, but the file does not exist in the nullTWS_home>/config directory.

A possible reason is that the Tivoli Workload Scheduler tar file was corrupted while being copied to the workstation, or an error occurred during the unpacking of the file.

file_name can be any of the following:

- jobmanrc
- JnextPlan
- loadbal
- localopts
- NetConf
- ntmulti
- ntsingle
- Security
- Sfinal
- StartUp
- unixloc1
- unixrsh
- unixrsh.wrp

These files must all be in the nullTWS_home>/config directory before running **customize**.

System action: Customize stops. The installation is not completed.

Operator response: Check that all the configuration files listed above exist in the nullTWS_home>/config directory, and are legible. If any files are missing or corrupted, delete the nullTWS_home> directory and all its contents and restart the installation process described in the Planning and Installation Guide.

See The *Planning and Installation Guide* for details of the installation process.

AWSBIS009E Customize could not create a symbolic link to the following program: "program".

Explanation: **Customize** could not create a symbolic link for one or more of the following Tivoli Workload Scheduler programs from the directory:

nullTWS_home>/bin to the directory:
 nullTWS_home>../bin:

- **datecalc**
- **jobstdl**
- **maestro**
- **mat**
- **mbatch**
- **morestdl**
- **parms**

program is one or more of the programs listed above.

System action: **Customize** stops. The installation has completed some steps but Tivoli Workload Scheduler is not usable.

Operator response: Determine the reason why **customize** could not create a symbolic link, using the tools of the operating system.

When you have resolved the problem, delete all files in the product directory and restart the installation.

AWSBIS010E **Customize could not create a symbolic link to the following program, because a link already exists: "program".**

Explanation: **Customize** could not create a symbolic link for one or more of the following Tivoli Workload Scheduler programs from the directory:

nullTWS_home>/bin to the directory:
 nullTWS_home>../bin:

- **datecalc**
- **jobstdl**
- **maestro**
- **mat**
- **mbatch**
- **morestdl**
- **parms**

program is one or more of the programs listed above.

This probably indicates that links made for a previous version of Tivoli Workload Scheduler were not deleted when the old version was uninstalled or upgraded.

System action: **Customize** stops. The installation has completed some steps, but Tivoli Workload Scheduler is not usable.

Operator response: Use the following procedure:

1. Use operating system tools to determine which links exist.
2. Use the following commands to remove the existing links:

```
""rm nullTWS_home>/usr/bin/mat"" ""rm
nullTWS_home>/usr/bin/mbatch"" ""rm
nullTWS_home>/usr/bin/datecalc"" ""rm
nullTWS_home>/usr/bin/maestro"" ""rm
nullTWS_home>/usr/bin/morestdl"" ""rm
```

nullTWS_home>/usr/bin/jobstdl"" ""rm
 nullTWS_home>/usr/bin/parms""

3. Delete all files in the product directory.
4. Restart the installation.

AWSBIS012W **User %s not found in /etc/passwd. Trying Yellow Pages.**

AWSBIS013E **The user ID cannot be found in /etc/passwd and Yellow Pages (NIS). Either it is not installed or it is not accessible from the PATH system variable.**

Explanation: The Yellow Pages is a centralized database of files including the passwd, group, and other system files. In a networked environment, these files are centralized on a NIS server which makes them available to all the machines on the network, for ease of maintenance. Users can also have the same password across the network.

Customize could not find the Tivoli Workload Scheduler user's login ID in the file /etc/passwd. It then tried to look up the user ID in Yellow Pages, but Yellow Pages was not installed or accessible on the system.

The user ID must be in either /etc/passwd or Yellow Pages.

System action: **Customize** stops. The installation is not completed.

Operator response: Define the Tivoli Workload Scheduler user in the /etc/passwd file, or in Yellow Pages.

If it is defined in Yellow Pages, ensure that the directory where the Yellow Pages executable program is stored is included in the PATH system variable.

Rerun customize.

AWSBIS014E **The following user ID cannot be found in either /etc/passwd or the Yellow Pages: "user_name".**

Explanation: The Yellow Pages is a centralized database of files including the passwd, group, and other system files. In a networked environment, these files are centralized on a NIS server which makes them available to all the machines on the network, for ease of maintenance. Users can have the same password across the network.

Customize could not find the Tivoli Workload Scheduler user's login ID either in the file /etc/passwd or in the Yellow Pages.

The user ID must be in either /etc/passwd or Yellow Pages.

System action: *Customize* stops. The installation is not completed.

Operator response: Define the Tivoli Workload Scheduler user in the `/etc/passwd` file, or in Yellow Pages.

AWSBIS015E The user running *customize* is not logged in as root.

Explanation: See message text.

System action: *Customize* cannot start.

Operator response: Log off and log in again as `""root""` and run *customize* again.

AWSBIS016E *Customize* cannot use the `chown` command.

Explanation: The `chown` command was either not found following the `PATH` environment variable or `/etc/chown` did not have `""execute""` permission.

System action: *Customize* stops. The installation is not completed.

Operator response: Determine what has caused the error and either add the directory that contains the `chown` command to the `PATH` environment variable or ensure that the user running *customize* has `""execute""` permission for the command.

Rerun *customize*.

AWSBIS017E The following user ID, for which you want to install Tivoli Workload Scheduler, does not exist or does not belong to any group: `"user_name"`.

Explanation: `user_name` is the missing user ID.

System action: *Customize* stops. The installation is not completed.

Operator response: Verify that the intended Tivoli Workload Scheduler user ID has been added to the `/etc/passwdfile`, and the `/etc/group` or to their equivalents in Yellow Pages (NIS).

Verify that the `groups` command runs correctly on the intended Tivoli Workload Scheduler user ID.

Rerun *customize*.

AWSBIS020E The supplied Tivoli Workload Scheduler home directory does not exist.

Explanation: Either you have supplied the wrong directory to *Customize*, or you have not created the directory.

System action: *Customize* stops. The installation is not completed.

Operator response: Depending on the reason for the

error, either rerun *Customize*, specifying the correct directory, or create the Tivoli Workload Scheduler home directory and extract the tar file into it before rerunning *Customize*.

AWSBIS021E An error occurred running one of the commands required for the installation. Determine which command had failed by examining the error messages issued previous to this one. Correct the problem and resubmit the command.

Explanation: See message text.

System action: *Customize* stops. The installation is not completed.

Operator response: Determine which command failed by examining the error messages issued previous to this one. Correct the problem and resubmit the command.

AWSBIS023E Unable to install %s properly.

AWSBIS024E *Customize* has been launched with the `-m nullmodule_namenu` option incorrectly specified more than once.

Explanation: See message text.

System action: *Customize* does not start.

Operator response: Rerun *Customize*, supplying the `""-m nullmodule_namenu""` option only once.

See The *Planning and Installation Guide* for details of the syntax of *customize*.

AWSBIS025E *Customize* has been issued with the following incorrect option: `"option"`.

Explanation: See message text.

`option` is the name of the incorrect option.

System action: *Customize* does not start.

Operator response: Run *customize* `-U` to see the valid command line options, or see the *Planning and Installation Guide*.

See The *Planning and Installation Guide* for details of the syntax of *customize*.

AWSBIS026E The Tivoli Workload Scheduler home directory does not exist.

Explanation: Either you have supplied the wrong directory to *Customize*, or you have not created the directory.

System action: *Customize* stops. The installation is not completed.

Operator response: Depending on the reason for the

error, either rerun *Customize*, specifying the correct directory, or create the Tivoli Workload Scheduler home directory and extract the tar file into it before rerunning *Customize*.

AWSBIS033E An error occurred while trying to extract Tivoli Workload Scheduler from the following tar file: "tar_file_name".

Explanation: The problem might be caused by the file not being present or because of lack of disk space to unpack it.

tar_file_name is the name of the tar file.

System action: *Customize* stops. The installation is not completed.

Operator response: Check that the file exists at the location you specified and that there is sufficient disk space available to extract it in the file set where you want to install Tivoli Workload Scheduler. If there is insufficient space, create some and rerun **customize**, or rerun *customize*, changing the options to install Tivoli Workload Scheduler in a different file set with sufficient space.

AWSBIS034E *Customize* encountered an error while installing Tivoli Workload Scheduler. Determine the details of the error by examining the error messages issued previous to this one. Correct the problem and rerun **customize**.

Explanation: See message.

System action: *Customize* stops. The installation is not completed.

Operator response: Determine the details of the error by examining the error messages issued previous to this one. Correct the problem and rerun **customize**.

AWSBIS035E Tar file %s.Z not found. Continuing with installation...

AWSBIS038E *Customize* script for module %s could not be found. exiting ...

AWSBIS042E *Customize* failed to decompress the following tar file: "tar_file_name".

Explanation: The problem might be caused by the file not being present or because of lack of disk space to decompress it.

tar_file_name is the name of the tar file.

System action: *Customize* stops. The installation is not completed.

Operator response: Check that the file exists at the location you specified and that there is sufficient disk

space available to decompress it in the file set where you want to install Tivoli Workload Scheduler. If there is insufficient space, create some and rerun **customize**, or rerun *customize*, changing the options to install Tivoli Workload Scheduler in a different file set with sufficient space.

AWSBIS044E There is a syntax error in the **customize options: -noexp should be specified only with a -new install**

Explanation: You specified the *-noexp* option when updating an installation. The *-noexp* option can only be specified with the *-new* option when running a new installation of Tivoli Workload Scheduler.

System action: *Customize* stops. The installation is not completed.

Operator response: If this is an update, rerun **customize** without the *-noexp* option.

See The *Planning and Installation Guide* for details of the syntax of *customize*.

AWSBIS045E There is a syntax error in the **customize options: the -uname option is not followed by a user ID, or the supplied user ID commences with a hyphen.**

Explanation: A user ID must be supplied with the *-uname* option. If the user ID that you tried to use commences with a hyphen "'-'", chose a different user ID that does not commence with a hyphen, or should change the user ID so that it does not commence with a hyphen.

System action: *Customize* stops. The installation is not completed.

Operator response: Rerun **customize**, specifying a valid user ID after the *-uname* option, that does not commence with a hyphen.

See The *Planning and Installation Guide* for details of the syntax of *customize*.

AWSBIS046E There is a syntax error in the **customize options: either the -update and -new options have both been specified, or one of them has been specified more than once.**

Explanation: See message.

System action: *Customize* stops. The installation is not completed.

Operator response: Rerun **customize** specifying either the *-new* or the *-update* option only once.

See The *Planning and Installation Guide* for details of the syntax of *customize*.

AWSBIS047E There is a syntax error in the customize options: the `-thiscpu` option cannot be used with the `-update` option.

Explanation: You specified the `-thiscpu` option with the `-update` option. The `-thiscpu` option can only be used during a new installation (with the `-new` option) to specify the name of the Tivoli Workload Scheduler workstation for that installation.

System action: `Customize` stops. The installation is not completed.

Operator response: If you are updating an installation, rerun `customize` without the `-thiscpu` option.

If you are running a fresh installation, specify the `-new` option, without the `-thiscpu` option.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS048E There is a syntax error in the customize options: the `-thiscpu` option is not followed by a workstation name, or the supplied workstation name commences with a hyphen.

Explanation: A workstation name must be supplied with the `-thiscpu` option. If the workstation name that you tried to use commences with a hyphen `"-"`, chose a different workstation name that does not commence with a hyphen, or should change the workstation name so that it does not commence with a hyphen.

System action: `Customize` stops. The installation is not completed.

Operator response: Rerun `customize`, specifying a valid workstation name after the `-thiscpu` option, that does not commence with a hyphen.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS049E There is a syntax error in the customize options: the `-master nullworkstation_namenu` option can only be specified with `-new` option.

Explanation: You specified the `-master nullworkstation_namenu` option (which identifies to which master domain manager you want the workstation where you are conducting the installation to belong) while running an update installation (with the `-update` option).

System action: `Customize` stops. The installation is not completed.

Operator response: If you are updating an installation, rerun `customize` without the `-master nullworkstation_namenu` option.

If you are updating an installation, and you want at the

same time to change the master domain manager for this workstation, you must first upgrade the installation, and then change the master domain manager.

If you intended to run a fresh installation, specify the `-new` option, with the `-master nullworkstation_namenu` option.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS050E There is a syntax error in the customize options: you are running a fresh installation (with the `-new` option) but have not supplied either the `-master nullworkstation_namenu` option or the `-thiscpu nullworkstation_namenu` option, which are both mandatory for a fresh installation.

Explanation: See message.

System action: `Customize` stops. The installation is not completed.

Operator response: If you intended to update an existing installation, you must rerun `customize` using the `-update` option, but without the `-master` or the `-thiscpu` options.

If you intended to run a fresh installation, specify the `-new` option with the `-master nullworkstation_namenu` and `-thiscpu nullworkstation_namenu` options.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS051E There is a syntax error in the customize options: the `-master` option is not followed by a workstation name, or the supplied workstation name commences with a hyphen.

Explanation: A workstation name must be supplied with the `-master` option. If the workstation name that you tried to use commences with a hyphen `"-"`, chose a different workstation name that does not commence with a hyphen, or should change the workstation name so that it does not commence with a hyphen.

System action: `Customize` stops. The installation is not completed.

Operator response: Rerun `customize`, specifying a valid workstation name after the `-master` option, that does not commence with a hyphen.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS052E There is a syntax error in the customize options: the `-netman` option is not followed by a directory name, or the supplied directory name commences with a hyphen.

Explanation: A directory name must be supplied with the `-netman` option. If the directory name that you tried to use commences with a hyphen `""-""`, chose a different directory name that does not commence with a hyphen, or should change the directory name so that it does not commence with a hyphen.

System action: `Customize` stops. The installation is not completed.

Operator response: Rerun `customize`, specifying a valid directory name after the `-netman` option, that does not commence with a hyphen.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS053E The following supplied netman home directory cannot be found or is not a directory: "netman_home_directory".

AWSBIS054E There is a syntax error in the customize options: the `-company` option is not followed by a company name, or the supplied company name commences with a hyphen.

Explanation: A company name must be supplied with the `-company` option. If the company name that you tried to use commences with a hyphen `""-""`, chose a different company name that does not commence with a hyphen, or should change the company name so that it does not commence with a hyphen.

System action: `Customize` stops. The installation is not completed.

Operator response: Rerun `customize`, specifying a valid company name after the `-company` option, that does not commence with a hyphen.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS055E There is a syntax error in the customize options: the `-execpath` option is not followed by a path name, or the supplied path name commences with a hyphen.

Explanation: A path name must be supplied with the `-execpath` option. If the path name that you tried to use commences with a hyphen `""-""`, chose a different path name that does not commence with a hyphen, or should change the path name so that it does not commence with a hyphen.

System action: `Customize` stops. The installation is not completed.

Operator response: Rerun `customize`, specifying a valid path name after the `-execpath` option, that does not commence with a hyphen.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS056E Error: Invalid option, specify `-m nullmodule-namenu`

AWSBIS057E Error: Invalid option, specify `-group nullinstall-groupnu`

AWSBIS058E There is a syntax error in the customize options: you are running a fresh installation (with the `-new` option) but have not supplied either the `-master nullworkstation_namenu` option or the `-thiscpu nullworkstation_namenu` option, which are both mandatory for a fresh installation.

Explanation: See message.

System action: `Customize` stops. The installation is not completed.

Operator response: If you intended to update an existing installation, you must rerun `customize` using the `-update` option, but without the `-master` or the `-thiscpu` options.

If you intended to run a fresh installation, specify the `-new` option with the `-master nullworkstation_namenu` and `-thiscpu nullworkstation_namenu` options.

See The *Planning and Installation Guide* for details of the syntax of `customize`.

AWSBIS059E `Customize` failed to decompress the following tar file: "tar_file_name".

Explanation: The problem might be caused by the file not being present or because of lack of disk space to decompress it.

`tar_file_name` is the name of the tar file.

System action: `Customize` stops. The installation is not completed.

Operator response: Check that the file exists at the location you specified and that there is sufficient disk space available to decompress it in the file set where you want to install Tivoli Workload Scheduler. If there is insufficient space, create some and rerun `customize`, or rerun `customize`, changing the options to install Tivoli Workload Scheduler in a different file set with sufficient space.

AWSBIS060E The following components directory identified in the `UNISON_COMPONENT_FILE` variable is not a directory, or does not exist: "`directory_name`".

Explanation: Customize found that the `UNISON_COMPONENT_FILE` variable is set, but that the path name it contains is incorrect, because the directory component of the pathname is not a directory or does not exist.

directory_name is the name of the directory that is incorrect or does not exist.

System action: `Customize` stops. The installation is not completed.

Operator response: Set the `UNISON_COMPONENT_FILE` variable correctly, and export it, and then rerun `customize`. Alternatively, delete the variable and rerun `customize`, which will use the default value documented in the *Planning and Installation Guide*.

See The *Planning and Installation Guide* for details of how to use `customize`.

AWSBIS061W No component group name was provided. Using the following default group name: `%s`.

AWSBIS062E An entry was found in the components file for the specified group, but it contained incorrect data.

Explanation: See message.

System action: `Customize` stops. The installation is not completed.

Operator response: Check the entry in the components file under the specified group, and verify that it is correct. Rerun `customize`.

AWSBIS063E More than one entry was found in the components file either for the following specified location: "`directory_name`" or the following group: "`group_name`".

Explanation: See message.

directory_name is the name of the Tivoli Workload Scheduler home directory that has more than one entry in the file. *group_name* is the name of the group that has more than one entry in the file.

System action: `Customize` stops. The installation is not completed.

Operator response: Check the Tivoli Workload Scheduler entries in the components file, and ensure that the locations and groups are not repeated.

AWSBIS064W Tivoli Workload Scheduler is installed under a different component group `%s`. Changing the component group name to be `%s`.

AWSBIS065W You are trying to install Tivoli Workload Scheduler in the following location: "`directory_name`" under the following group: "`group_name`". However, there is already an instance installed in that location and group.

Explanation: See message.

directory_name is the name of the directory that already holds a Tivoli Workload Scheduler installation.

group_name is the name of the group under which a Tivoli Workload Scheduler installation already exists.

System action: `Customize` stops. The installation is not completed.

Operator response: Rerun `customize`, selecting a different location or a different group for the Tivoli Workload Scheduler installation, or both.

AWSBIS066E Tivoli Workload Scheduler is already installed in `%s`. You can only update this installation.

AWSBIS067E There is more than one entry for Netman in the same group.

AWSBIS068W Netman is already installed in this group `%s` at location `%s`.

AWSBIS070E The netman directory was not found. Copy the netman directory and run `customize` again

AWSBIS071E Netman `customize` failed during execution. Correct the problem and run again.

AWSBIS072E An error occurred while creating or updating the components file.

Explanation: After Tivoli Workload Scheduler is installed successfully, `customize` runs the `ucomp` program to update the components file with the location and group of the Tivoli Workload Scheduler installation. If the components file does not exist, `customize` creates it. This message indicates that `customize` encountered an error during this process while creating or updating the components file. It could be a problem with file space or access permissions.

Operator response: Check the file system of the `nullTWS_home>` directory to ensure that there is sufficient space, and that the user has write permission.

AWSBIS303E There is a syntax error in the command. See the User's Guide and Reference for the correct syntax.

AWSBIS310E at: You are not authorized to use the at command.

AWSBIS311E batch: You are not authorized to use the batch command.

AWSBIS319E rep8 was not found.

AWSBIS320E The command failed while running %s.

AWSBIS326E No stdlist directory was found.

AWSBIS329E No netman stdlist was found in %s.

AWSBIS332E No manual entry was found for %s.

AWSBIS335E JnextPlan failed while running: %s.

AWSBIS338E Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBIS339E File %s does not exist.

AWSBIS340E There is a syntax error in the command. See the User's Guide and Reference for the correct syntax.

AWSBIS345E An internal error has occurred. ResetPlan failed while running: %s.

AWSBIS346W No Symphony file was found.

AWSBIS348E An internal error has occurred. MakePlan failed while running: %s.

AWSBIS349E An internal error has occurred. SwitchPlan failed while running: %s.

AWSBIS350W The application server is not running.

Explanation: The application server must be running for you to run JnextPlan.

System action: The script CheckPrerequisites stops. You cannot run JnextPlan.

Operator response: To start the application server, rerun CheckPrerequisites adding the option -start.

AWSBIS358E JnextPlan was canceled by user.

AWSBIS502E at: You are not authorized to use the at command.

Explanation: See message.

System action: The operation is not performed.

Operator response: Contact the Tivoli Workload Scheduler administrator to obtain the required authorization.

Chapter 119. AWSBIT - Customize messages

This section lists error and warning messages that might be issued.

The message component code is BIT.

AWSBIT502E You must be root to install Tivoli Workload Scheduler OpC integration.

AWSBIT507E Cannot locate the master domain manager. The following value for MASTER %s must be a valid host name or IP address, do not use the Tivoli Workload Scheduler workstation name.

AWSBIT508E Operations center not present on this system.

AWSBIT509W Installing only event recognition.

AWSBIT510W If not already done, this script should be run on the OpC management platform.

AWSBIT513E Incorrect choice %s

AWSBIT514E OpC 1.x is not supported on HP-UX 10.x

AWSBIT515E Cannot determine the operating system version. Unable to define the OpenView environment variables. Exiting.

Chapter 120. AWSBIU - Netview messages

This section lists error and warning Netview messages that might be issued.

The message component code is BIU.

AWSBIU001W Magent already running.

AWSBIU102E You must be root to decustomize TWS.

AWSBIU103E Cannot determine OS version. Unable to define OpenView environment variables. Exiting.

AWSBIU105E Error: Action is only valid for TWS events

AWSBIU106E Error: Action not defined for TWS trap %s

AWSBIU502E You must be root to customize TWS

AWSBIU503E Cannot reach node manager = %s. This must be a valid host name or IP Address, do not use the Tivoli Workload Scheduler workstation name.

AWSBIU504E openview does not exist on this system. You must specify -manager nullhostnull to perform the installation on a node to be managed.

AWSBIU506E %s already exists

AWSBIU516E You must run ovaddobj to add the local registration file %s or run magent and mdemon some otherway.

AWSBIU522W %s/trapd.conf has replaced the old file the previous version is in %s/trapd.conf.old

AWSBIU525W Be sure to add an appropriate entry to each workstation's rhost

AWSBIU528W will be managing from the management station.

AWSBIU529W see documentation on remsh and .rhosts for further information.

AWSBIU530W will install the agent reporting to %s

AWSBIU531W changing ownership and permissions on agent

AWSBIU533E /tmp/snmpd.peers contains the new version of /etc/snmpd.peers this file needs to be installed by you before you can start the agent.

AWSBIU534W /etc/snmpd.peers has been replaced the old file is /etc/snmpd.peers.old

AWSBIU535E /tmp/snmpd.conf contains the new version of /etc/snmpd.conf this file needs to be installed by you before you can start the agent.

AWSBIU536W /etc/snmpd.conf has been replaced the old file is /etc/snmpd.conf.old

AWSBIU538E /tmp/mib.defs contains the new version of /etc/mib.defs this file needs to be installed by you before you can start the agent.

AWSBIU539W /etc/mib.defs has been replaced the old file is /etc/mib.defs.old

AWSBIU540W After you have installed the changes to the system files you should refresh snmpd: refresh -s snmpd

AWSBIU544W /tmp/StartUp contains the new version of %s/StartUp On managed nodes this file needs to be installed by you before you can start the agent. It will restart the agent every time Netman is restarted.

AWSBIU545W %s/StartUp has been replaced

AWSBIU546W • AWSBIU557E

AWSBIU546W You should now restart
Netview/Openview and TWS

AWSBIU549E Invalid choice %s.

AWSBIU550E ERROR: OpenView 3.3 is not
supported on HP-UX 10.x

AWSBIU551E -client option can only be specified on
AIX

AWSBIU552E The trap definition file
nullmaehomenu/OV/mae.traps.hp must
be loaded with the following commands
before you can process the unison traps:

AWSBIU553E The trap definition file
nullmaehomenu/OV/mae.traps.aix
must be loaded with the following
command before you can process the
unison traps:

AWSBIU554E The file %s is missing. This file is
needed to configure the TWS subagent.

AWSBIU557E Cannot determine OS version. Unable
to define OpenView environment
variables. Exiting.

Chapter 121. AWSBIV messages

This section lists error and warning messages that might be issued.

The message component code is BIV.

AWSBIV001E Command too long.

AWSBIV002E Remote aborted connection without
initiating protocol: %d.

AWSBIV003E Remote aborted connection: %s

AWSBIV004E Failed to shutdown input socket

AWSBIV006E Can't get user name.

AWSBIV008E Fork for input passing failed

AWSBIV009E Error writing input to socket

AWSBIV010E Error reading from standard input

AWSBIV011E Error shutting input socket down

AWSBIV012E Fork for output passing failed

AWSBIV013E Error writing standard output

AWSBIV014E Error passing standard output from
socket

AWSBIV015E Error shutting down output socket

AWSBIV016E Error writing to standard error

AWSBIV017E Error passing standard error from
socket

AWSBIV018E Failed to shutdown standard error
socket

AWSBIV019E Could not register TCP/IP cleanup
function.

AWSBIV020E Lookup of server hostname failed

AWSBIV021E I/O socket creation failed: error=%d.

AWSBIV022E Failed to connect to host

AWSBIV023E Error: socket creation failed

AWSBIV024E Error: socket bind failed

AWSBIV025E Error: socket listen failed

AWSBIV026E Error: socket accept failed

Chapter 122. AWSBIX - Netman messages

This section lists error and warning Netman messages that might be issued.

The message component code is BIX.

AWSBIX002E Customize failed executing: %s. Please correct the problem and rerun customize.

AWSBIX003E FILE:%s does not exist.

AWSBIX006W User %s not found in /etc/passwd. Trying yellow pages.

AWSBIX007E Yellow Pages not installed or not accessible in PATH.

AWSBIX008E User %s not found in yellow pages.

AWSBIX009E You must be root to customize Netman.

AWSBIX012E ERROR: Reading components file.

AWSBIX013W More than one Netman entry in components file for location %s or group %s.

AWSBIX014W There is a netman is installed in %s under group %s.

AWSBIX015W There is already a netman installed in %s. This netman is updated.

AWSBIX016E Cannot determine the location of chown.

AWSBIX017E The user %s must exist in order for the install to succeed. Please check the install instructions in the Tivoli Workload Scheduler User Manual.

AWSBIX018E Netman home %s does not exist.

AWSBIX019E 'netman' directory tree exists partially or does not exist. Files have not been extracted from tape correctly.

AWSBIX020E ERROR: Error occurred while creating/updating product components file.

AWSBIX021E An error occurred executing commands. Please check the error condition and correct any problems and rerun customize.

Chapter 123. AWSBIY - Demo scripts messages

This section lists error and warning Demo scripts messages that might be issued.

The message component code is BIY.

AWSBIY001W Running the sample database setup deletes all job streams and jobs with the prefix SMPL from the database.

Explanation: The sample database contains a set of scheduling objects to be used in the tutorial. These objects are all identified by the presence in the object name of the prefix "SMPL". When you install the database, it automatically deletes any previous objects with the same prefix that it finds. This allows you to easily replace the database after you have used the tutorial and modified the objects (provided that you did not modify the prefix).

System action: The sample database installation waits for your response.

Operator response: Answer "y" or "n" at the prompt.

Chapter 124. AWSBIZ - Batchup messages

This section lists error and warning Batchup messages that might be issued.

The message component code is BIZ.

AWSBIZ001E Error: CreateProcess failed.

AWSBIZ002E Error: system failed.

AWSBIZ004E %s does not exist.

Chapter 125. AWSBJB messages

This section lists router error and warning messages that might be issued.

The message component code is BJB.

AWSBJB006E Error processing the message: !1

AWSBJB008E Adapter error: !1

AWSBJB010E Error opening stdlist and debug file

AWSBJB012E Catalog error

AWSBJB013E Error in COMAREA of Maestro

AWSBJB014E Error openig clbox.msg

AWSBJB015E Cannot open the Synphony file

AWSBJB016E Cannot read the master CPU

AWSBJB019E Error bulk discovery : !1

AWSBJB022E Adding job:!1, error: !2

AWSBJB024E Adding schedule:!1, error: !2

AWSBJB026E Modifying job:!1, error: !2

AWSBJB028E Modifying schedule:!1, error: !2

AWSBJB029E Send event error: !1

AWSBJB030E Error openig clevbox.msg

AWSBJB220E Job !1 is in failed status

Chapter 126. AWSBJG - Router messages

This section lists router error and warning messages that might be issued.

The message component code is BJG.

AWSBJG001E Router cannot initialize the communication or set the connection type and file descriptor for the connected socket to make an SSL connection to conman. The following error message is given: "error_message"

Explanation: *error_message* is the operating system error message text.

System action: Router stops and the operation fails.

Operator response: Check that the network is working correctly. Check that SSL is configured correctly. If you have corrected the error, use the workstation **stop** and **start** commands to restart **router**.

See the chapter on setting security in the *Planning and Installation Guide* for more information about SSL.

AWSBJG002E Router is unable to create the stdlist file.

Explanation: See message.

System action: Router stops and the operation fails.

Operator response: Check the file system of the `nullTWS_home>` directory to ensure that there is sufficient space, and that the user has write permission. If you have corrected the error, use the workstation **stop** and **start** commands to restart **router**.

AWSBJG004W Warning illegal timeout value: !!, using default

AWSBJG005E Router has been invoked with an incorrect number of arguments.

Explanation: If you have invoked **router** manually, you have not supplied the correct number of arguments.

If **router** has been invoked by a Tivoli Workload Scheduler process, this is an internal error.

System action: Router does not start.

Operator response: If you have invoked **router** manually, check the syntax by issuing the command with just the `""-u""` argument (**router -u**). Retry the operation.

If **router** has been invoked by a Tivoli Workload

Scheduler process, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBJG006E Router cannot perform the data translation between network format and host format required for SSL communication. (ntoh). The following error message is given: "error_message"

Explanation: *error_message* either identifies the record that could not be translated or gives more information about the error.

System action: Router stops and the operation fails.

Operator response: Check that the network is working correctly. Check that SSL is configured correctly. If you have corrected the error, use the workstation **stop** and **start** commands to restart the **router**. See also: See the chapter on setting security in the *Planning and Installation Guide* for more information about SSL.

AWSBJG007E Router cannot send router packets on the network. The following error message is given: "error_message"

Explanation: *error_message* either identifies the record that could not be sent or gives more information about the error.

System action: Router stops and the operation fails.

Operator response: Check that the network is working correctly. If you have corrected the error, use the workstation **stop** and **start** commands to restart **router**.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBJG008E Router cannot receive router packets from the network. The following error message is given: "error_message"

Explanation: *error_message* either identifies the record that could not be received or gives more information about the error.

System action: Router stops and the operation fails.

Operator response: Check that the network is working correctly. If you have corrected the error, use the workstation **stop** and **start** commands to restart **router**.

AWSBJG009E • AWSBJG017E

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSBJG009E Router ran out of memory allocating memory for internal data structures (comarea).

Explanation: See message.

System action: Router stops and the operation is not performed.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **router**. Use the workstation **stop** and **start** commands to restart **router**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then use the workstation **stop** and **start** commands to restart **router**.
3. If the problem persists, reboot the workstation, and then use the workstation **start** command to restart **router**.

See The *Release Notes* for details of memory requirements.

AWSBJG011E Scribner, called by router, cannot read the standard list file (stdlist) for the following job: "workstation_name"."job_stream_name": "job_name"

Explanation: *workstation_name*, *job_stream_name*, and *job_name* identify the job for which the standard list could not be read.

System action: Router stops and the operation is not performed.

Operator response: Verify if the standard list file exists and has read permission for the nullTWS_user>.

Check if there are any network problems that might prevent scribner from accessing the workstation where the job was running.

If you have solved the problem, use the workstation **stop** and **start** commands to restart **router**.

AWSBJG012E Router cannot open or read the Symphony file.

Explanation: See message.

System action: Router stops and the operation is not performed.

Operator response: Verify if the Symphony file exists and has read permission for the nullTWS_user>.

If you have solved the problem, use the workstation **stop** and **start** commands to restart **router**.

AWSBJG015E The following error occurred opening the configuration file "file_name": "error_message".

Explanation: See message.

System action: Router stops and the operation is not performed.

Operator response: Verify whether the configuration file exists and has read permission for the nullTWS_user>.

AWSBJG016E An error occurred reading the configuration file "file_name": "error_message".

Explanation: See message.

System action: Router stops and the operation is not performed.

Operator response: Verify whether the configuration file exists and has read permission for the nullTWS_user>.

AWSBJG017E An error occurred while closing the configuration file "file_name": "error_message".

Explanation: See message.

System action: Router stops and the operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 127. AWSBJH - Migration messages

This section lists error and warning migration messages that might be issued.

The message component code is BJH.

AWSBJH005E The `datamigrate` parameter "parameter" has been supplied more than once.

Explanation: You have supplied a parameter to the `datamigrate` command more than once. For example, you might have supplied the `""-path""` parameter more than once.

parameter is the parameter that has been supplied more than once.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the syntax of the command. Issue the command `datamigrate -u` to see the usage of the command, or consult the *Planning and Installation Guide*.

Reissue the command, supplying each parameter only once.

See The *Planning and Installation Guide* for more information about the syntax of this command.

AWSBJH006E An incorrect value has been supplied for a parameter.

Explanation: You have supplied a parameter to the `datamigrate` command that has an incorrect value.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the syntax of the command. Issue the command `datamigrate -u` to see the usage of the command, or consult the *Planning and Installation Guide*.

Reissue the command, supplying the correct parameters.

See The *Planning and Installation Guide* for more information about the syntax of this command.

AWSBJH009E More than one object type parameter has been supplied.

Explanation: The `datamigrate` command can import all mozart database objects or objects of one specified type. It cannot import more than one specified object type.

System action: The `datamigrate` command cannot be processed.

Operator response: Reissue the command, supplying either no object types (to import all objects) or specifying just one object type.

See The *Planning and Installation Guide* for more information about the syntax of this command.

AWSBJH011E The parameter "parameter" is not a recognized `datamigrate` parameter.

Explanation: See message.

parameter is the parameter that is not recognized.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the syntax of the command. Issue the command `datamigrate -u` to see the usage of the command, or consult the *Planning and Installation Guide*.

Reissue the command, supplying the correct parameters.

See The *Planning and Installation Guide* for more information about the syntax of this command.

AWSBJH012E One or more required parameters of the `datamigrate` command have not been supplied.

Explanation: See message.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the syntax of the command. Issue the command `datamigrate -u` to see the usage of the command, or consult the *Planning and Installation Guide*.

Reissue the command, supplying the correct parameters.

See The *Planning and Installation Guide* for more information about the syntax of this command.

AWSBJH013E Two or more incompatible parameters of the `datamigrate` command have been supplied.

Explanation: See message.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the syntax of the command. Issue the command `datamigrate -u` to see the usage of the command, or consult the *Planning and Installation Guide*.

Reissue the command, supplying the correct parameters.

See The *Planning and Installation Guide* for more information about the syntax of this command.

AWSBJH014E The supplied input file "input_file" does not exist.

Explanation: You have run the `datamigrate` command to import mozart database objects from an input file. The input file ought to have been created from the previous instance of Tivoli Workload Scheduler using the `composer create` command. However, `datamigrate` could not find the file using the supplied file name.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the supplied file name. Check that the file exists and that the path is supplied correctly. Check that if the path includes spaces, you have enclosed the whole path and file name in double quotes. Check that the user ID performing the import has read permission for the file.

Correct any errors and retry the command.

If the file has not been created, create it using the `composer create` command, and then rerun `datamigrate`. Alternatively, import the database objects directly from the previous instance of Tivoli Workload Scheduler.

The correct syntax for the `composer create` command to create the required input file depends on the type of object you want to import. Use one of the following:

```
composer create nulltopology_filename> from cpu=@
composer create nullprompts_filename> from prompts
composer create nullcalendar_filename> from calendars
composer create nullparms_filename> from parms
composer create nullresources_filename> from resources
composer create nulljobs_filename> from job=@#@
composer create nullscheds_filename> from sched=@#@
```

The `composer create` option for users exports user details without their passwords, so to include the passwords, use the following:

```
migrutility get_users nullTWS_8.x.x_user_mozart_file>
nullusers_filename>
```

See The *User's Guide and Reference* of the previous instance of Tivoli Workload Scheduler for information about the `composer create` command.

AWSBJH016E The supplied "prev_install_dir" does not identify a previous instance of Tivoli Workload Scheduler from which to import data.

Explanation: You have run the `datamigrate` command to import mozart database objects directly from a previous instance of Tivoli Workload Scheduler. However, `datamigrate` could not find the instance using the supplied directory.

`prev_install_dir` is the supplied directory name that does not contain a previous Tivoli Workload Scheduler instance.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the supplied directory name. Check that the directory exists and that the path is supplied correctly. Check that if the path includes spaces, you have enclosed the whole path in double quotes. Check that the user ID performing the import has read permission for the directory.

Correct any errors and retry the command.

Alternatively, use the `composer create` command in the previous instance of Tivoli Workload Scheduler to create input files of the objects to import, and import them using the appropriate `datamigrate` commands.

The correct syntax for the `composer create` command to create the required input file depends on the type of object you want to import. Use one of the following:

```
composer create nulltopology_filename> from cpu=@
composer create nullprompts_filename> from prompts
composer create nullcalendar_filename> from calendars
composer create nullparms_filename> from parms
composer create nullresources_filename> from resources
composer create nulljobs_filename> from job=@#@
composer create nullscheds_filename> from sched=@#@
```

The `composer create` option for users exports user details without their passwords, so to include the passwords, use the following:

```
migrutility get_users nullTWS_8.x.x_user_mozart_file>
nullusers_filename>
```

See The *Planning and Installation Guide* for more information about the syntax of this command, and the *User's Guide and Reference* of the previous instance of Tivoli Workload Scheduler for information about the `composer create` command.

AWSBJH018E The temporary directory "temporary_directory" does not exist.

Explanation: You have supplied the optional `-tmppath` option, but the directory associated with the option does not exist.

System action: The `datamigrate` command cannot be processed.

Operator response: Check the supplied directory name. Check that the directory exists and that the path is supplied correctly. Check that if the path includes spaces, you have enclosed the whole path in double quotes. Check that the user ID running `datamigrate` has write permission for the directory.

Correct any errors and retry the command.

AWSBJH022E The import of object type "object_type" has failed.

Explanation: See message.

object_type is the type of object you were trying to import.

System action: The `datamigrate` command has finished but no objects have been imported.

Operator response: Check the log to determine why the import failed. Correct any errors and rerun the command.

AWSBJH023W The import of object type "object_type" has completed with one or more warnings.

Explanation: See message.

object_type is the type of object you were importing.

System action: The `datamigrate` command has finished. Objects have been imported, but `datamigrate` found one or more ambiguities in the input data.

Operator response: Check the log and examine the warnings. For each warning message you must decide whether you can and want to fix the problem that was found using Tivoli Workload Scheduler version 8.6, or whether you can and want to correct the problem in the previous instance of the product and rerun the import.

AWSBJH024W No object of type "object_type" has been found.

Explanation: You have run the `datamigrate` command to import mozart database objects from an input file. The input file was created from the previous instance of Tivoli Workload Scheduler using the `composer create` command. However, the file contains no objects of the indicated *object_type*.

System action: The `datamigrate` command has finished but no objects of the indicated type have been imported.

Operator response: See the next message.

AWSBJH026E The import of object type "object_type" has completed with one or more errors.

Explanation: See message.

object_type is the type of object you were importing.

System action: The `datamigrate` command has finished. Objects have been imported, but `datamigrate` found one or more errors in the input data.

Operator response: Check the log and examine the errors. For each error message you must decide whether you can and want to fix the problem that was found using Tivoli Workload Scheduler version 9.2, or whether you can and want to correct the problem in the previous instance of the product and rerun the import.

AWSBJH029E The supplied input file !1 is not readable by the user !2 that is performing the data migration.

Explanation: The user might not have the correct access rights to the specified file, or the file does not have the correct permissions.

System action: The `datamigrate` command has finished. Objects have been imported, but the data in the indicated input file has not been migrated.

Operator response: Modify the permissions of the file or use a different user that has the correct permissions to read the file. Rerun the migration.

AWSBJH031E The application server is not running. The import cannot continue.

Explanation: See message.

System action: The `datamigrate` command stops without migrating any data. If the application server stops in the middle of the migration, the data is partially migrated.

Operator response: Start the application server and then rerun the `datamigrate` utility.

AWSBJH035E The migration was unable to export the data from the previous instance of Tivoli Workload Scheduler, because it could not copy the dataexporter program into the directory: "directory".

Explanation: See message.

System action: The `datamigrate` command cannot be processed.

Operator response: Check that there is sufficient space in the fileset where the directory resides, and that the user running `datamigrate` has write permission for the directory.

AWSBJH104E

Correct any errors and retry the command.

AWSBJH104E The supplied object type
"incorrect_object_type" is not a
recognized object type.

Explanation: See message.

incorrect_object_type is the supplied object type that is not correct.

System action: The **getmozart** utility stops. No data is exported.

Operator response: Retry the command, supplying a valid object type. Permitted values are `""topology""`, `""calendars""`, `""parms""`, `""prompts""`, `""resources""`, `""users""`, `""jobs""`, and `""schedules""`.

Chapter 128. AWSBSM messages

This section lists error and warning messages that might be issued.

The message component code is BSM.

AWSBSM102E The Tivoli Workload Scheduler event "event" has not been forwarded to the Tivoli Business Services Manager Console server. The return code is: "return_code".

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Contact IBM Software Support for assistance.

AWSBSM103E The Tivoli Workload Scheduler event has not been forwarded to the Tivoli Business Services Manager Console server. The reason is: "reason".

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Contact IBM Software Support for assistance.

AWSBSM104E The action type "action_type" is not supported.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Contact IBM Software Support for assistance.

AWSBSM105E The Tivoli Workload Scheduler event has been not forwarded to the Tivoli Business Services Manager Console server because the Tivoli Business Services Manager Console agent has not been initialized.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Initialize the Tivoli Business Services Manager Console agent.

Chapter 129. AWSBW - Datatract messages

This section lists error and warning messages that might be issued by datatract.

The message component code is BWX.

AWSBW002E An error has occurred opening the file "file_name" for writing.

Explanation: See message.

file_name is the file that cannot be opened.

System action: The action stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has read permission
- That there is sufficient disk space to open and read a file
- That there are sufficient file descriptors available to open a file.

Correct any errors that you find, and perform the action again.

AWSBW003E An error has occurred opening the file "file_name" for reading.

Explanation: See message.

file_name is the file that cannot be opened.

System action: The action stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has read permission
- That there is sufficient disk space to open and read a file
- That there are sufficient file descriptors available to open a file.

Correct any errors that you find, and perform the action again.

AWSBW004E An error has occurred writing the file "file_name".

Explanation: See message.

file_name is the file that cannot be written.

System action: The action stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has write permission
- That there is sufficient disk space to write the file

Resolve the problem and rerun the operation.

AWSBW005E An error has occurred renaming the file "file_name" in "file_name_renamed".

Explanation: See message.

file_name is the file that cannot be renamed.

file_name_renamed is the file renamed.

System action: The action stops.

Operator response: Check the following:

- That the file exists
- That the file is in the correct directory
- That the file has write permission
- That there is sufficient disk space to write the file

Resolve the problem and rerun the operation.

AWSBW006W An error occurred while creating the directory "directory". The book file is created in the default directory "default_directory".

Explanation: See message.

directory is the directory that cannot be created.

default_directory is the default directory where the book file will be created.

System action: The file is saved in the indicated default directory.

Operator response: If the creation of the book file in the default directory is acceptable, no action is required.

Otherwise, check the following:

- That the indicated directory name and path is valid
- That there is sufficient disk space to create the directory
- That the user performing the operation has write access to the directory path

AWSBWX007W

Correct any error that you find and repeat the operation.

AWSBWX007W An error occurred opening the file "*file_name*" for writing. The book file is created in the default directory "*default_directory*".

Explanation: See message.

file_name is the file that cannot be opened.

default_directory is the default directory where the book file will be created.

System action: The file is saved in the default directory.

Operator response: If the creation of the book file in the default directory is acceptable, no action is required.

Otherwise, check the following:

- That the specified directory name and path is valid
- That there is sufficient disk space to create the directory
- That the user performing the operation has write access to the directory path

Correct any error that you find and repeat the operation.

Chapter 130. AWSCCM - CCMDB integration messages

This section lists error and warning messages that might be issued by the CCMDB integration..

The message component code is CCM.

AWSCCM002W The workstation "workstation" has not been added in the book file. Cannot resolve the host name or host address.

Explanation: See message.

System action: The program continues and the book file is created correctly.

Operator response: Check that the correct host name or host address is specified in the workstation definition available in the Tivoli Workload Scheduler database.

Chapter 131. AWSCDW - Clustering messages

This section lists error and warning messages that might be issued when using the Windows clustering facility.

The message component code is CDW.

AWSCDW002E The cluster service is installed and configured on the node "node_name", but is not currently running.

Explanation: See message.

node_name identifies the node where the cluster service is installed and configured but not running.

System action: The program cannot proceed.

Operator response: Start the cluster service and retry the installation of the Tivoli Workload Scheduler cluster resource.

See Readme for the fix in which the clustering option was made available.

AWSCDW003E The cluster service is not installed on the node.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Install and configure the cluster service on the node, start the cluster service, and retry the installation of the Tivoli Workload Scheduler cluster resource.

See Readme for the fix in which the clustering option was made available.

AWSCDW004E The cluster service is installed on the node but has not yet been configured.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Configure the cluster service on the node, start the cluster service, and retry the installation of the Tivoli Workload Scheduler cluster resource.

See Readme for the fix in which the clustering option was made available.

AWSCDW005E An internal error has occurred. The program cannot read the cluster information.

Explanation: See message.

System action: The program cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSCDW006E An error has occurred opening the cluster "cluster_name".

Explanation: See message.

cluster_name identifies the cluster that has been opened.

System action: The program cannot proceed.

Operator response: Check that the correct name has been used for the cluster. If not, retry the operation using the correct name. If the correct name has been used, this is an internal error.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSCDW007E The program cannot identify the available nodes on the cluster.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Try to reinstall the Tivoli Workload Scheduler cluster resource again. You can optionally choose to specifically identify the hosts using the *hosts* parameter.

See Readme for the fix in which the clustering option was made available.

AWSCDW010E The program cannot install the remote service "service_name" on node : "node_name".

Explanation: See message.

service_name identifies the service which cannot be installed.

node_name identifies the node on which you are trying to install it.

System action: The program cannot proceed.

Operator response: Do the following:

AWSCDW011E • AWSCDW020E

1. Check that the user and password you are using are correct
2. Check the network connection
3. Check if Service Manager is running on the remote host and close it if it is.

Correct any errors and retry the remote installation.

See Readme for the fix in which the clustering option was made available.

AWSCDW011E The program cannot save the registry key on the node "node_name".

Explanation: See message. The probable reason is that the network connection has broken before the registry could be updated.

node_name identifies the node on which the installation cannot save the registry key.

System action: The program cannot proceed.

Operator response: Check the network connection. When you are sure that the network connection is working correctly, rerun the installation.

See Readme for the fix in which the clustering option was made available.

AWSCDW013E The program cannot copy the file "file_name" to "dest_name".

Explanation: See message.

file_name is the file that the installation needs to copy.

dest_name is the destination name for the copy that the program wants to use but cannot.

System action: The program cannot proceed.

Operator response: Check the following:

- That the file exists
- That the user running the program has read permission for the file
- That the destination path exists
- That the user running the program has write permission in the destination directory
- That there is sufficient space in the destination directory fileset

Correct any error that you find and retry the operation.

See Readme for the fix in which the clustering option was made available.

AWSCDW015E The program cannot register the cluster dll, and so cannot install the Tivoli Workload Scheduler resource.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check in the log for the system error to understand why the dll could not be registered. Use the cluster documentation and operating system documentation to resolve the problem. Then rerun the installation, or use the option to add the dll manually.

See Readme for the fix in which the clustering option was made available.

AWSCDW017E The program cannot open the cluster object "object_name".

Explanation: See message.

object_name identifies the object that cannot be opened. Probably an incorrect object name has been used.

System action: The program cannot proceed.

Operator response: Retry the installation, specifying valid values for the "group", "ip", and "net" parameters.

See Readme for the fix in which the clustering option was made available.

AWSCDW018E The program cannot add the Tivoli Workload Scheduler cluster resource to the group.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check in the log for the system error to understand why the cluster resource could not be added to the group. Use the cluster documentation and operating system documentation to resolve the problem. Retry the installation, or use the option to add the resource manually.

See Readme for the fix in which the clustering option was made available.

AWSCDW019E An internal error has occurred. The program cannot convert a string to or from UNICODE characters.

Explanation: See message.

System action: The program cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSCDW020E An internal error has occurred. The program cannot locate the Windows common directory.

Explanation: See message.

System action: The program cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSCDW021E The program cannot obtain the nullTWSHome> directory from the Tivoli Workload Scheduler Windows services. Check that the values for the domain and user parameters are valid.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check that the values for the domain and user parameters are valid.

Check that the Tivoli Workload Scheduler services are installed correctly by checking the Windows Services Manager utility. The following services must be present:

- Tivoli Workload Scheduler (for TWSuser)
- Tivoli Netman (for TWSuser)
- Tivoli Token Service (for TWSuser)
- WebSphere Application Server

If any are missing, Tivoli Workload Scheduler must be uninstalled and reinstalled. The cluster installation can then be repeated.

If no services are missing, this is an internal error.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See Readme for the fix in which the clustering option was made available.

AWSCDW022W The program cannot add the "key_name" key into the localopts file. Add the key manually.

Explanation: See message.

key_name identifies the key object that cannot be added/changed.

System action: The program proceeds.

Operator response: Add the clusterinstancename option to the localopts file on the computer before attempting to use the cluster service. The value of the option must be set to the Tivoli Workload Scheduler cluster resource instance name.

See Readme for the fix in which the clustering option was made available.

AWSCDW023W The program cannot modify the local security policy on the target host.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Perform the following manually before attempting to use the cluster service:

1. Manually add the following user privileges to the local security policy for the nullTWSUser> in all target hosts:
 - Act as part of the operating system
 - Increase quotas
 - Log on as batch job
 - Log on as a service
 - Log on locally
 - Replace a process level token
2. Add the nullTWSUser> to the local administrator group on all target hosts.

Note: only modify the *local* security policy and the *local* administrator group. The domain equivalents must be left unchanged.

See Readme for the fix in which the clustering option was made available.

AWSCDW026W The program cannot remove the Tivoli Workload Scheduler cluster service on the node "host_name".

Explanation: See message text.

host_name identifies the node from which the cluster services cannot be removed.

System action: The program proceeds.

Operator response: The Tivoli Workload Scheduler cluster service must be removed manually.

See Readme for the fix in which the clustering option was made available.

AWSCDW027W The program cannot remove the Tivoli Workload Scheduler registry key on the node "host_name".

Explanation: See message text.

host_name identifies the node from which the registry key cannot be removed.

System action: The program proceeds.

Operator response: The Tivoli Workload Scheduler registry key must be removed manually.

See Readme for the fix in which the clustering option was made available.

AWSCDW028W The program cannot check whether the custom Tivoli Workload Scheduler cluster resource type is already installed.

Explanation: See message text.

System action: The program proceeds.

Operator response: Check whether the custom Tivoli Workload Scheduler cluster resource type is already installed. Attempt to determine why the program could not check for its existence. Check that the user performing the cluster installation has permission to read the registry on the remote node. Correct any errors you find and rerun the command.

See Readme for the fix in which the clustering option was made available.

AWSCDW029E The program cannot determine the Windows boot disk from the remote registry on the node "host_name".

Explanation: See message text.

host_name identifies the remote node where the Windows boot disk cannot be determined.

System action: The program stops.

Operator response: Check the network connections. Check that the user performing the cluster installation has permission to read the registry on the remote node. Correct any errors you find and rerun the command.

See Readme for the fix in which the clustering option was made available.

AWSCDW031E The program cannot determine the version of the custom Tivoli Workload Scheduler cluster resource type dll.

Explanation: See message text.

System action: The program stops.

Operator response: Check the network connections. Check that the user performing the cluster installation has permission to access the custom Tivoli Workload Scheduler cluster resource type dll on the remote node. Check that the path to the dll indicated in the registry is correct. Correct any errors you find and rerun the command.

See Readme for the fix in which the clustering option was made available.

AWSCDW034E The program cannot determine the path to the custom Tivoli Workload Scheduler cluster resource type dll.

Explanation: See message text.

System action: The program stops.

Operator response: Check the network connections.

Check that the user performing the cluster installation has permission to access the custom Tivoli Workload Scheduler cluster resource type dll on the remote node. Correct any errors you find and rerun the command.

See Readme for the fix in which the clustering option was made available.

AWSCDW035E The program cannot update the custom Tivoli Workload Scheduler cluster resource type dll.

Explanation: See message text.

System action: The program stops.

Operator response: Update the dll using the Microsoft cluster command line.

See Readme for the fix in which the clustering option was made available.

AWSCDW036W The program cannot delete the temporary file "dll_temp_file_name".

Explanation: See message text.

dll_temp_file_name identifies the temporary file used in the remote cluster installation, that could not be deleted.

System action: The program continues.

Operator response: Check whether the file exists. If it does, delete it.

See Readme for the fix in which the clustering option was made available.

AWSCDW037W The custom Tivoli Workload Scheduler cluster resource type dll to be installed is older than the dll currently installed. Press ESC to exit from the installation or any key to continue. **Note:** during the upgrade the custom Tivoli Workload Scheduler cluster resource might be restarted.

Explanation: The program has compared the versions of the installed dll with the one to be installed, and has determined that the installed dll is newer. You are offered the choice to continue or exit from the installation. If you continue, the installation of an older dll might compromise the functioning of other programs on the computer that use the dll.

System action: The program waits for your response.

Operator response: Press ESC to exit from the installation or any key to continue.

See Readme for the fix in which the clustering option was made available.

AWSCDW039W The program cannot create the script to start or stop the Tivoli Workload Scheduler custom cluster resource instance.

Explanation: See message text.

System action: The program continues but the script is not created.

Operator response: Check that there is sufficient space in the nullTWSHome> directory to create a file. Check that the user has the rights to create a file in that directory.

After the installation has finished, create the file manually following the instructions in the readme.

See Readme for the fix in which the clustering option was made available.

AWSCDW042E The command-line parameter "parameter" is not correct.

Explanation: You have supplied an unrecognizable command-line parameter.

System action: The program cannot proceed.

Operator response: Check the syntax of the command by issuing it with just the "'-u'" parameter, or by looking in the documentation. Retry the command with the correct syntax.

AWSCDW043E The context of the supplied command line string "command_line" indicates that a pair of quotation symbols (") is required. However, the first of the pair is missing.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check the syntax of the command by issuing it with just the "'-u'" parameter, or by looking in the documentation. Retry the command with the correct syntax.

AWSCDW044E The context of the supplied command line string "command_line" indicates that a pair of quotation symbols (") is required. However, the last of the pair is missing.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check the syntax of the command by issuing it with just the "'-u'" parameter, or by looking in the documentation. Retry the command with the correct syntax.

AWSCDW045E The command-line parameter "parameter" is mandatory.

Explanation: You have issued a command omitting the indicated mandatory parameter.

System action: The program cannot proceed.

Operator response: Check the syntax of the command by issuing it with just the "'-u'" parameter, or by looking in the documentation. Retry the command with the correct syntax.

AWSCDW046E The command-line parameter "parameter" has been supplied with a value "parameter_value" that is outside the permitted range "range_value".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check the syntax of the command by issuing it with just the "'-u'" parameter, or by looking in the documentation. Retry the command with the correct syntax.

AWSCDW047W The password cannot be validated. Either you have specified an incorrect password or the program cannot validate it (probably because it does not have the correct permission to do so).

Explanation: The supplied password is either incorrect, or cannot be validated. It is not critical to the installation process, but is used by the process being installed. The installation program might not have the correct permissions to validate the password, in which case you can ignore this warning and continue the installation.

System action: The program waits for you decide what to do.

Operator response: Check that the password is correctly specified according to the rules of the computer where it is to be used. If the password is not correct, press **ESC** to exit from the installation and specify a new password. If you are certain that the password is correct, press any key to continue. Note that if you continue with an incorrect password, the service will be installed on all nodes on the cluster with that incorrect password, and you will have to change it on all of those nodes before the service can be made operational.

AWSCDW048E You cannot install Tivoli Workload Scheduler in this cluster environment. The only supported environment is the Microsoft Cluster service on Windows Server 2003.

Explanation: You have tried to install Tivoli Workload

Scheduler on a cluster environment that is not supported.

System action: The installer stops.

Operator response: Check the cluster environment where you want to install Tivoli Workload Scheduler. You might be able to upgrade it to the supported environment.

AWSCDW049W The user "user_ID" was not found. Press ESC to exit from the installation or any key to continue.

Explanation: The program is unable to find a user with the name specified.

System action: The program waits for you decide what to do.

Operator response: Verify that the user exists and that the Windows Domain Controller is reachable. If the problem can be resolved without stopping the installation, just press any key to continue. Otherwise, when you have corrected the error, retry the operation.

AWSCDW050E The operation cannot be completed because a Tivoli Workload Scheduler cluster resource called "cluster_resource_name" already exists, and also points to this Tivoli Workload Scheduler agent.

Explanation: You have tried to define a new cluster resource that points to the same Tivoli Workload Scheduler agent of an existing cluster resource.

cluster_resource_name identifies the name of the existing cluster resource that already points to this agent.

System action: The installer stops.

Operator response: Check the parameters of the command to ensure that you have not made an error with the resource name. Check whether the existing cluster resource is correctly named. Resolve the duplication and retry the command.

AWSCDW051E A cluster resource with the name "cluster_resource_name" already exists. Choose a different resource name.

Explanation: See message text.

cluster_resource_name identifies the name used to create the new Tivoli Workload Scheduler cluster resource.

System action: The installer stops.

Operator response: Choose a different resource name and retry the command.

AWSCDW052E The operation to rename the cluster resource "current_cluster_resource_name" in "new_cluster_resource_name" has failed.

Explanation: See message text.

current_cluster_resource_name identifies the name of the existing Tivoli Workload Scheduler cluster resource to rename.

new_cluster_resource_name identifies the selected new name of the Tivoli Workload Scheduler cluster resource.

System action: The installer stops.

Operator response: Check the system error message that follows to understand why the cluster resource could not be renamed. Use the cluster documentation and operating system documentation to resolve the problem. Retry the operation.

AWSCDW054E The program cannot obtain the Tivoli Workload Scheduler home directory from the "cluster_resource_name" cluster resource.

Explanation: See message text.

cluster_resource_name identifies the name of the Tivoli Workload Scheduler cluster resource.

System action: The installer stops.

Operator response: Check the system error message that follows to understand why the program cannot determine the home directory property. Use the cluster documentation and operating system documentation to resolve the problem. Retry the operation.

AWSCDW055E You have not specified the parameter collect or deploy options.

Explanation: See message text.

System action: The twsClusterCollector script cannot proceed.

Operator response: Run the script again, providing the correct options.

AWSCDW056E You did not provide data archive name.

Explanation: See message text.

System action: The twsClusterCollector script cannot proceed.

Operator response: Run the script again, specifying the archive name.

AWSCDW057E There was an error in generating data archive.

Explanation: See message text.

System action: The twsClusterCollector script cannot proceed.

Operator response: Check the path name, archive name, and available disk space, then run the script again.

AWSCDW061E Error deploying the data archive.

Explanation: See message text.

System action: The twsClusterCollector script cannot proceed.

Operator response: Check the path name, archive name, and available disk space, then run the script again.

AWSCDW071E You have specified a data archive name that does not exist.

Explanation: See message text.

System action: The twsClusterCollector script cannot proceed.

Operator response: Check the archive name, then run the script again.

AWSCDW072E You have specified an incorrect parameter: "param_name"

Explanation: See message text.

System action: The twsClusterCollector script cannot proceed.

Operator response: Run the script again, providing the correct parameter.

Chapter 132. AWSDAE - File system messages

This section lists error and warning messages that might be generated by the file system.

The message component code is DAE.

**AWSDAE003E Unexpected file system error Reading
\$STDIN**

AWSDAE005E Unexpected file system error.

Chapter 133. AWSDAG messages

This section lists error and warning messages that might be generated.

The message component code is DAG.

AWSDAG001E Unexpected CI error on command !1
!2

AWSDAG005E CI command error !1

Chapter 134. AWSDAH - Checking messages

This section lists error and warning checking messages that might be generated.

The message component code is DAH.

AWSDAH002E Your IBM Software demo has expired.

AWSDAH003E Software is incompatible with this cpu.

AWSDAH005E Invalid software code. Error = !1

AWSDAH007E Your IBM Software rental has expired.

AWSDAH008E Unexpected internal file system error.
Error = !1

AWSDAH009E Validate code not installed. See instructions.

AWSDAH011E Program is not part of installed product.

AWSDAH012E Software is not licensed for this cpu.

AWSDAH013W CM Software does not run on Precision Architecture CPUs.

AWSDAH101E Option !1 requires an argument.

AWSDAH102E Option !1 is not valid.

AWSDAH103E Option !1 is ambiguous, enter more significant characters.

AWSDAH107E Option !1 does not permit a value.

AWSDAH108E Parameter !1 is too long to be an option.

AWSDAH109W Option !1 was previously specified.

Chapter 135. AWSDAL - Audit messages

This section lists error and warning audit messages that might be generated.

The message component code is DAL.

AWSDAL001W Audit info is not initialized.

AWSDAL002E Unknown audit type !1 passed.

AWSDAL003E Audit file has not been opened.

AWSDAL004E Open failed on audit file !1.

AWSDAL005E Locking audit file failed: !2 (errnum
!1).

AWSDAL006E Unlocking audit file failed: !2 (errnum
!1).

Chapter 136. AWSDBY messages

This section lists error and warning messages that might be generated.

The message component code is DBY.

AWSDBY002E Too many parameters in RUN
command

AWSDBY005E Error 1 - PH capability required to
run program

AWSDBY008E Error 4 - Out of system resources to
run program

AWSDBY010E Error 6 - Program does not exist

AWSDBY011E Error 7 - Invalid program file

AWSDBY012E Error 8 - Entry name does not exist or
is invalid

AWSDBY013E CREATEPROCESS error 9

AWSDBY014E CREATEPROCESS error 10

AWSDBY015E CREATEPROCESS error 11

AWSDBY016E CREATEPROCESS error 12

AWSDBY017E CREATEPROCESS error 13

AWSDBY018E CREATEPROCESS error 14

AWSDBY019E Error 15 - Configuration MAXDATA
exceeded

AWSDBY020E Error 16 - 'Hard' load error

AWSDBY021E Error 17 - Illegal priority requested

AWSDBY022E Error 18 - \$STDIN could not be
opened

AWSDBY023E Error 19 - \$STDLIST could not be
opened

AWSDBY025E Expected G, P, or S

AWSDBY026E Expected a number

AWSDBY027E Missing close quote

AWSDBY028E Missing program name

AWSDBY029E Expected =

AWSDBY030E Parameter too long

AWSDBY031E Expected quote

AWSDBY032E Expected ;

AWSDBY033E Error opening !1

AWSDBY034E Error reading TPCONTRL record !1

Chapter 137. AWSDCI messages

This section lists error and warning messages that might be generated.

The message component code is DCI.

AWSDCI005E There is an error in the input data.
Select a database or exit.

AWSDCI006E The password is incorrect. Select a
database or exit.

AWSDCI007E The new password is not valid. It
must be 8 or less alphanumeric bytes.

AWSDCI008W The new password and the confirm
password did not match.

Chapter 138. AWSDCJ messages

This section lists error and warning messages that might be generated.

The message component code is DCJ.

AWSDCJ001E Error opening existing stdin, Error: !1

AWSDCJ002E Error purging old stdin, Error: !1

AWSDCJ003E Error building stdin, Error: !1

AWSDCJ004E Error closing new stdin, Error: !1

AWSDCJ005E Error opening new stdin, Error: !1

AWSDCJ006E Error opening old stdlist, Error: !1

AWSDCJ007E Error purging old stdlist, Error: !1

AWSDCJ008E Error building stdlist, Error: !1

AWSDCJ009E Error closing new stdlist, Error: !1

AWSDCJ010E Error opening new stdlist, Error: !1

AWSDCJ011E Error creating process, Error: !1

AWSDCJ012E Error pin is invalid, Error: !1

AWSDCJ013E Error could not activate process, Error:
!1

AWSDCJ014E Error stream facility not enabled.

AWSDCJ015E Signal error invalid option or !1

AWSDCJ016E Error no sons available.

AWSDCJ101E CREATEPROCESS error 1: The caller
must be prepared with PH capability.

AWSDCJ102E CREATEPROCESS error 2: A required
parameter is missing.

AWSDCJ103E CREATEPROCESS error 3: The
parameter address is out of bounds.

AWSDCJ104E CREATEPROCESS error 4: System
resources (such as PCB's) are not
available.

AWSDCJ105E CREATEPROCESS error 5: Non-valid
item numbers.

AWSDCJ106E CREATEPROCESS error 6: The
program does not exist.

AWSDCJ107E CREATEPROCESS error 7: The
program file is not valid.

AWSDCJ108E CREATEPROCESS error 8: The entry
name does not exist or is not valid

AWSDCJ115E CREATEPROCESS error 15: The
configuration maxdata has been
exceeded.

AWSDCJ116E CREATEPROCESS error 16: A hard
load error (for example an I/O error) has
occurred.

AWSDCJ117E CREATEPROCESS error 17: A
non-valid priority has been specified.

AWSDCJ118E CREATEPROCESS error 18: \$STDIN
could not be opened.

AWSDCJ119E CREATEPROCESS error 19: \$STDLIST
could not be opened.

AWSDCJ120E CREATEPROCESS error 20: An
INSIGHT internal error has occurred.

AWSDCJ200W Stopped with exit %d

AWSDCJ202W Stopped by:

AWSDCJ203W Stopped by signal: %d

AWSDCJ204E

**AWSDCJ204E ERROR: Attempted to call mkfifo on
NT.**

Chapter 139. AWSDDW - Std utility messages

This section lists std utility error and warning messages that might be issued.

The message component code is DDW.

AWSDDW002E Unable to build stdlist directory !2.
Errno = !1.

AWSDDW008E An I/O error occurred while
accessing a file. A memory dump has
been taken to aid IBM Software Support
with problem determination.

Explanation: See message.

System action: The program proceeds. The file is not accessed.

Operator response: See the messages that follow this one to understand why the file could not be accessed. If you can fix the problem that these messages reveal, stop the server, fix the problem, and then retry the operation.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

- A tar file of the Tivoli Workload Scheduler work directory (*nullTWS_home*)
- The memory dump.

AWSDDW051E Unknown product id null!1null
found.

AWSDDW052E Product '!1' is not installed under the
group '!2'.

AWSDDW053W No '!1' found in components file
installed under '!2'.

AWSDDW071E You specified an invalid product.

Chapter 140. AWSDEA - Standard functions messages

This section lists standard functions error and warning messages that might be issued.

The message component code is DEA.

AWSDEA001E Source file name is a null pointer or null string

AWSDEA002E Destination file name is a null pointer or null string

AWSDEA003E Error: Unable to open !1 for reading.

AWSDEA004E Error: Unable to open !1 for writing.

AWSDEA005E Error reading source file !1.

AWSDEA006E Error writing destination file !1.

AWSDEA007E Couldn't set the std. directory.

Chapter 141. AWSDEB - SSL messages

This section lists error and warning messages that might be issued when using SSL.

The message component code is DEB and the old message set code is 105 in the "unison" message catalog.

AWSDEB009E Data transmission is not possible because the connection is broken. The following gives more details of the error: "error_message".

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Use the `ping` command to check if the two workstations involved can connect to each other.

If not, resolve the network problem and restart the process that was trying to communicate.

If there is no network problem, and this is the first communication between two workstations, check that their SSL settings are compatible, and correct any discrepancy.

AWSDEB010E An error occurred in gethostbyname: "error_message" (getting the host IP address using the host name).

Explanation: While trying to look up the host IP address on the Domain Name Server (DNS), an error was received.

error_message describes the error and includes the operating system error message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Check the information in the error message. If it indicates that the host name does not exist on the DNS, verify that the value of the host name in the connection parameters is correct. The connection parameters might have been supplied as

part of a command, in a text file referenced in the command string, or from the default definitions in the `useropts` or `localopts` file. If the host has only been recently connected to the network, or has been reconnected after a host name change, you might have to wait for the DNS server to update its database with the new or changed host name.

If a different type of error is reported, attempt to resolve it.

If the error has been resolved, retry the operation.

AWSDEB011E The socket descriptor is incorrect. The following gives more details of the error: "error_message".

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Verify the connection definitions in the `localopts` file. For example the netman port must match the TCP port in the computer's workstation definition.

AWSDEB016E An internal error has occurred. The data structure area (comarea) cannot be initialized (is null).

Explanation: See message.

System action: The program stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEB017E The internal data structure area (comarea) cannot be initialized (memory error).

Explanation: See message.

System action: The program stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to the program. Rerun the program.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun the program.
3. If the problem persists, reboot the workstation, and then rerun the program.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSDEB024E An internal error has occurred. The program could not access the internal data structure (comarea) while opening the socket or accepting a connection in the socket descriptor sockfd (part of comarea). The following gives more details of the error: "error_message".

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: The program stops.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEB025E An internal error has occurred. The program cannot set the linger socket option. The following gives more details of the error: "error_message".

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: The program proceeds.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEB026E An internal error has occurred. Cannot set the reuseaddr socket option. The following gives more details of the error: "error_message".

Explanation: See message.

error_message describes the error and includes the operating system error message.

System action: The program proceeds.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEB027E Error setting close on exec/uninherit flag: !1

AWSDEB028E Error opening os handle: !1

AWSDEB045E An error has occurred during the creation of the local SSL context. The following gives more details of the error: "error_message".

Explanation: This error occurs when one of the Tivoli Workload Scheduler network processes (mailman, writer, netman or scribner) is unable to initialize the local SSL context. The problem could be related to either an invalid SSL setting specified within the localopts file or to an initialization error of the SSL.

error_message could be either the error number or a string explaining specifically the error if available.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: To solve this problem check all the values of the options specified within the localopts file of the node where the error is logged (see the appropriate chapter of the Planning and Installation guide for more details). One of the most common errors is related to the creation of the encrypted file that contains the password. If the source password file contains some spurious characters the resulting encrypted file is not useful and the initialization of the local SSL context fails.

See The *Planning and Installation* guide

AWSDEB046E An error has occurred during the SSL handshaking. The following gives more details of the error: "error_message".

Explanation: A problem has occurred during the SSL handshaking between a workstation and its domain manager or between a domain manager and its parent

domain manager. The most common reasons for this error are as follows:

- Could not connect to or accept the incoming communication
- Could not establish a common cipher between the SSL server and client
- Could not get the certificate from the connecting node
- The incoming certificate is not trusted or is expired
- The incoming node cannot be authenticated

The *error_message* could be either a standard SSL error number or a string explaining the error (if available).

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Use the information in the error message to determine the error and take the appropriate action.

If the message is not clear, do the following:

- Check that there are no network problems preventing the connection
- Check the SSL parameters in the local and global options files
- Check that the certificates in use by both server and client are compatible, trusted, and not expired.

When you have found and resolved the problem, rerun the process that was running when the error occurred.

AWSDEB047E The program could not access the localopts local options file.

Explanation: See message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Verify that the localopts file is present and that the *nullTWSuser*> has the rights to process it.

AWSDEB048E An internal error has occurred. Tivoli Workload Scheduler network processes (mailman, writer, netman or scribner) are unable to use the previously allocated SSL context.

Explanation: See message.

System action: This message is generated by a library

function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEB049E The counterparty workstation did not present an SSL peer certificate, or no connection was established.

Explanation: See message.

The probable cause is that the TCP/IP connection has broken or the localopts SSL settings of the node that is trying to connect are not correct.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Check that the network connection is good, by using the **ping** command.

If the network connection is good, check the localopts setting of the node that is trying to connect (see the appropriate chapter of the Planning and Installation guide for more details).

See The *Planning and Installation guide*.

AWSDEB051E The program cannot authenticate the SSL peer certificate: the requested level is not matched.

Explanation: See message.

The behavior of Tivoli Workload Scheduler during an SSL handshake is based on the value of the *SSL auth mode* localopts option as follows:

- *caonly*: The program checks the validity of the certificate and verifies that the peer certificate has been issued by a trusted Certificate Authority.
- *string*: The program checks the validity of the certificate and verifies that the peer certificate has been issued by a trusted Certificate Authority. It also verifies that the common name of the certificate subject matches the string specified in the *SSL auth string* option.
- *cpu*: The program checks the validity of the certificate and verifies that the peer certificate has been issued by a trusted Certificate Authority. It also verifies that the common name of the certificate subject matches the name of the workstation that requested the service.

System action: This message is generated by a library

function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Check the Authentication mode you have selected for the Workstation and verify that the peer certificate of the Workstation that is trying to connect respects the *SSL auth mode* you selected.

A useful command to view the contents of a certificate is the following:

```
openssl x509 -noout -text -in certificate.crt
```

AWSDEB052E An error occurred in getaddrinfo: "error_message" (getting the host IP address using the host name).

Explanation: An error was issued while the program was searching for the host IP address on the Domain Name Server (DNS).

error_message describes the error and includes the operating system error message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for following messages to find how Tivoli Workload Scheduler responds.

Operator response: Check the information in the error message. If it states that the host name does not exist on the DNS, verify that the value of the host name in the connection parameters is correct. The connection parameters might have been supplied as part of a command, in a text file referenced in the command string, or from the default definitions in the *useropts* or *localopts* file. If the host has just been connected to the network, or if it has been reconnected after a host name change, you might have to wait for the DNS server to update its database with the new or changed host name.

AWSDEB053E FIPS cannot be enabled. The connection is not possible.

Explanation: Tivoli Workload Scheduler cannot enable FIPS mode as requested in the configuration.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for the following messages to see how Tivoli Workload Scheduler responds.

Operator response: Checks GSKit module

AWSDEB054E An error occurred during an SSL connection using the OpenSSL Toolkit.

Explanation: An error was issued while the program was connecting to its peer agent.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for the following messages to see how Tivoli Workload Scheduler responds.

Operator response: Check your OpenSSL certificate in the *localopts* file.

AWSDEB055E An error occurred during an SSL connection using the GSKit libraries.

Explanation: An error was issued while the program was connecting to its peer agent.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for the following messages to see how Tivoli Workload Scheduler responds.

Operator response: Check your GSKIT certificate in the *localopts* file.

AWSDEB056E An error occurred a SSL connection using the OpenSSL Toolkit. The connection can not be accepted.

Explanation: An error was issued while the program was connecting to its peer agent.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for the following messages to see how Tivoli Workload Scheduler responds.

Operator response: .Check your OpenSSL certificate in the *localopts* file

AWSDEB057E An error occurred a SSL connection using the GSKit libraries.The connection can not be accepted.

Explanation: An error was issued while the program was connecting to its peer agent.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for the following messages to see how Tivoli Workload Scheduler responds.

Operator response: Check your GSKIT certificate in the localopts file.

AWSDEB058E An error occurred during the initialization of the ICC module in FIPS mode. Encryption is not possible.

Explanation: An error was issued while the program was trying to decrypt or crypt a password.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Search the log for the following messages to see how Tivoli Workload Scheduler responds.

Operator response: .Check your GSKIT/ICC libraries

AWSDEB059E An error occurred during the initialization of the GSKit module in FIPS mode. The configuration is not correct. Check the configuration in the localopts file.

Explanation: An error was issued while the program was trying to connect an agent.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Check if the label, key store, or other parameter in the localopts file is not correct.

Operator response: .Check your GSKIT/ICC configuration

AWSDEB060E An error occurred during the initialization of the OpenSSL Toolkit. The configuration is not correct. Check the configuration in the localopts file.

Explanation: An error was issued while the program was trying to connect an agent.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to handle the error displayed by this message. Check if the label, key store, or other parameter in the localopts file is not correct.

Operator response: .Check your OpenSSL configuration

Chapter 142. AWSDEC - Events file messages

This section lists events file error and warning messages that might be issued.

The message component code is DEC.

AWSDEC001E File system error !1 on events file.

AWSDEC002E An internal error has occurred. The following UNIX system error occurred on an events file: "error_number" at line = "line".

Explanation: See message.

line is the line number of the events file that was being processed when the error occurred.

error_number is the number that identifies the system error; it can supply you for more information about error causes.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEC004E IPC error !1 on events file.

AWSDEC005E DB error !1 on events file.

AWSDEC006E The program was unable to allocate an internal data structure area (comarea).

Explanation: This is probably an operating system error returned by the library function 'malloc'.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If not, you might need to increase the memory of the workstation or make

changes in memory management and paging to make more memory available to the program. Rerun the program.

2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun the program.
3. If the problem persists, reboot the workstation, and then rerun the program.
4. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSDEC008E An event file was created by a newer version of Tivoli Workload Scheduler than this version, and is not compatible.

Explanation: See message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Take the following steps:

1. Remove all existing event files
 2. Restart Tivoli Workload Scheduler. The event files are recreated, but with the current version.
-

AWSDEC009E An event file cannot be opened because it has been already opened by another process.

Explanation: See message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Use the operating system tools to determine which process is locking the event file. Wait for that process to finish. You might decide to stop that process immediately, but you must ensure that it is safe to do so. Restart the process that was prevented from running. If the problem persists, search the IBM

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEC010E An internal error has occurred. The open access mode is not valid: "access_mode".

Explanation: See message. *access_mode* is a number that identifies the type of access.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEC011W The time-out interval for messages arriving in an event file has elapsed.

Explanation: This message is generated by a library function that is called by more than one program. The time-out value is passed to the function by the calling program, and can be a positive number of seconds (between 2 and 10, depending on the program), 0 (do not wait), or a negative number (wait until a response is received).

System action: The calling program decides how to process the condition that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: No action required.

AWSDEC012E An internal error has occurred. The internal data structure area (comarea) for event file processing could not be initialized.

Explanation: See message.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEC014E The event file or the directory containing the event file does not exist or cannot be found.

Explanation: See message.

System action: This message is generated by a library

function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Verify that the Tivoli Workload Scheduler user has the correct permissions to access the Tivoli Workload Scheduler home directory. If not, add these permissions.

If the permissions are correct, verify that the Tivoli Workload Scheduler user has the correct permissions to access the file. If not, add these permissions.

Restart Tivoli Workload Scheduler to recreate the event file.

AWSDEC015E An internal error has occurred. The length ("record_length") of a record read from or written to the event file is not correct.

Explanation: The program is trying to read or write *record_length* bytes of an event file but *record_length* is not a valid integer because it is less than zero. *record_length* takes the value from `sizeof()`.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEC018E An internal error occurred while attempting to compact the file "event_file". The file is unusable.

Explanation: See message.

event_file is the file being processed that gave an error.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: The indicated file is corrupt.

Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEC019W The supplied maximum size of the file "event_file" is "max_size" bytes, which is too small. A higher value will be allocated.

Explanation: See message.

event_file is the file that will be allocated a larger maximum size than the stored value.

Operator response: You need take no action, but you might decide to change the maximum size to a value of your choice with the **evtsize** tool.

See *The Reference Guide* for more information about **evtsize**.

AWSDEC020W The maximum size of the file "event_file" has been changed to "max_size" bytes.

Explanation: See message.

event_file is the file that has been allocated the indicated maximum size.

Operator response: You need take no action, but you might decide to change the maximum size to a value of your choice with the **evtsize** tool.

See *The Reference Guide* for more information about **evtsize**.

AWSDEC100E An internal error has occurred. While processing an event file an error ("error_number") of type ("error_type") occurred.

Explanation: See message.

error_number is the operating system error number.

error_type is the type of error.

System action: This message is generated by a library function that is called by more than one program. The calling program decides how to process the error that this message has revealed. Look in the log for other messages following this one to see how Tivoli Workload Scheduler reacts.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 143. AWSDED - Date calculation messages

This section lists error and warning messages that might be issued by the date calculation.

The message component code is DED.

AWSDED001E internal error: time() failed

AWSDED002E An internal error has occurred:
mktime() failed.

AWSDED003E An internal error has occurred:
localtime() failed.

AWSDED004E An internal error has occurred:
gmtime() failed.

AWSDED005E An internal error has occurred:
strptime() failed.

AWSDED006E SCHEDDATE contains a non-valid
date.

AWSDED007E SCHEDDATE is null.

AWSDED008E The date specification is not correct.

AWSDED009E The time specification is not correct.

AWSDED010E The date specification is ambiguous.

AWSDED011E The input is too long.

AWSDED012E The number is too long.

AWSDED013E The identifier name is too long.

AWSDED014E The output format string is too long.

AWSDED015E No date or time has been specified.

AWSDED016E An internal error has occurred:
malloc() failed.

AWSDED017W Warning: setlocale() has
failed...continuing with the C language.

AWSDED018E The offset specification is not valid.

AWSDED019E The output format specification is not
valid.

AWSDED020E The input specification is not valid.

AWSDED022E Calendar name !1 is too long

AWSDED023E An error occurred while opening the
Symphony file.

AWSDED024E An internal problem has occurred.

AWSDED025E An error has occurred reading dates
from the calendar !1: !2.

AWSDED026E The offset expression exceeds the first
date in the calendar !1.

AWSDED027E The offset expression exceeds the last
date in the calendar !1.

AWSDED028E The month is not valid. The date
must conform to the input format !1
specified in unison.msg. [0-YMD,
1-MDY, 2-DMY].

AWSDED029E The day is not valid. The date must
conform to the input format !1 specified
in unison.msg. [0-YMD, 1-MDY,
2-DMY].

Chapter 144. AWSDEF messages

This section lists error and warning messages that might be issued.

The message component code is DEF.

AWSDEF001E Can not acquire heap.

AWSDEF002E On IPCDEST: !1

AWSDEF003E On IPCONNECT: !1

AWSDEF004E On IPCRECV: !1

AWSDEF005E On setting timeout: !1

AWSDEF006E On IPCREVCVCN: !1

AWSDEF007E On IPCGIVE: !1

AWSDEF008E On IPCGET: !1

AWSDEF009E This is not an IPC comarea.

AWSDEF011E On IPCSEND: !1

AWSDEF012E On IPCCREATE: !1

AWSDEF013E Unknown call: !1

AWSDEF014E On IPCRECV: !1

AWSDEF015E Timed out. !1

Chapter 145. AWSDEG messages

This section lists error and warning messages that might be issued.

The message component code is DEG.

AWSDEG001E Error: no comarea exists yet.

AWSDEG002E Error: This is not a valid comarea for isam access.

AWSDEG003W Warn: Isam access on !1, this operation not implemented.

AWSDEG004E Error: !1, is not open yet.

AWSDEG005E Error: !1, is not locked yet.

AWSDEG006E Error: On !1, Set !2, record was read before the lock.

AWSDEG007E Error: On !1, Set !2, Read called with invalid mode.

AWSDEG008W Warn: On !1, Set !2, End of chain reached.

AWSDEG009E Error: On !1, Set !2, Attempting to read detail when no master selected.

AWSDEG010E Error: On !1, Set !2, The remote record number: !3 could not be obtained.

AWSDEG011E Error: On !1, the remote record number: !3 could not be read.

AWSDEG012E Error: On !1, Duplicate key on primary.

AWSDEG013E Error: On !1, Close error unlocking: !3

AWSDEG014E Error: On !1, Close error: !3

AWSDEG015E Error: On !1, Lock error: !3

AWSDEG016E Error: On !1, Already locked.

AWSDEG017E Error: On !1, Unlock error: !3

AWSDEG018E Error: Can not malloc comarea: !1

AWSDEG019E Error: On !1, Can not open file: !3

AWSDEG020E Error: On !1, Can not sync file: !3

AWSDEG021E Error: On !1, The header doesn't agree with open cal

AWSDEG022E Error: On !1, Can not get desired access: !3

AWSDEG023E Error: On !1, Can not seek the begin of file: !3

AWSDEG024E Error: On !1, Can not read header: !3

AWSDEG025E Error: On !1, File header does not match.

AWSDEG026E Error: On !1, Is not this application.

AWSDEG027E Error: On !1, File is wrong version, use rebuild command.

AWSDEG028E Error: On !1, Wrong number of details, call IBM.

AWSDEG029E Error: On !1, Can not read extension: !3

AWSDEG030E Error: On !1, build could not open: !3

AWSDEG031E Error: On !1, build could not get access: !3

AWSDEG032E Error: On !1, build could not write header: !3

AWSDEG033E Error: On !1, build could not unlock the following: !3

AWSDEG034E • AWSDEG462E

AWSDEG034E Error: On !1, build not allowed from slave.

AWSDEG035E Error: On !1, build could not create key file: !3

AWSDEG036E Error: On !1, Open on key failed: !3

AWSDEG037E Error: On rebuild of !1, Could not open temp file: !3

AWSDEG038E Fatal: Validate must not be called without fdesc, on !1

AWSDEG039E Fatal: On !1, Validate calloc call: !3

AWSDEG040E Fatal: On !1, Extract calloc cal: !3

AWSDEG041E Error: On !1, Pattern too large for routine.

AWSDEG200E UNISDETAILERRORS place hold should never appear

AWSDEG239E Error: On !1, no such set as !2.

AWSDEG240E Error: On !1, Set !2, Rewrite failed on seek: !3

AWSDEG241E Error: On !1, Set !2, Rewrite failed on write: !3

AWSDEG242E Error: On !1, Set !2, Write failed on seek: !3

AWSDEG243E Error: On !1, Set !2, Write failed on write: !3

AWSDEG244E Error: On !1, Set !2, Key changed.

AWSDEG245E Error: On !1, Set !2, Record read before lock.

AWSDEG246E Error: On !1, Set !2, Record previous deleted or not read.

AWSDEG247E Error: On !1, Set !2, Wrong record type.

AWSDEG300E UNISRECORDERRORS place holder should never appear

AWSDEG349E Error: On !1, in write header could not seek record hdr !2: !3

AWSDEG350E Error: On !1, in write header could not write record hdr !2: !3

AWSDEG351E Error: On !1, in read header could not seek record hdr !2: !3

Chapter 146. AWSDEH messages

This section lists error and warning messages that might be issued.

The message component code is DEH.

AWSDEH001E Error: Incorrect Delimiter

AWSDEH002E Error: Call type mismatch on !1,
requires !2

AWSDEH003W Warning: Requires type !1, operand
type is !2

AWSDEH004E Error: Keyword not found.

AWSDEH005E Error: Command not found, use Help.

AWSDEH006E Error: Type not found.

AWSDEH007E Error: Can not format type.

AWSDEH008E Error: Variable not found.

AWSDEH009E Error: Duplicate variable.

AWSDEH010E Error: Can not create variable.

AWSDEH011E Error: Can not set variable.

AWSDEH012E Error: Procedure not found.

AWSDEH013E Error: Unknown keyword.

Chapter 147. AWSDEI messages

This section lists error and warning messages that might be issued.

The message component code is DEI.

AWSDEI003E System error !1 trying to open !2 for input.

AWSDEI004E System error !1 trying to open !2 for output.

AWSDEI005E Error: Too many characters in command line.

AWSDEI007E Error: Too many characters in input line.

Chapter 148. AWSDEJ - Security messages

This section lists security error and warning messages that might be issued.

The message component code is DEJ.

AWSDEJ001E The Security file is not valid.

Explanation: See message.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ002E The internal data structure area (comarea) could not be initialized.

Explanation: The reasons for the problem are normally one of the following:

- The security file is corrupted
- There is insufficient memory available and the memory allocation failed
- There is an internal error

For IBM Software Support use: Calloc library function has failed.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Perform the following to determine which of the problems has occurred, and to take the appropriate remedial action:

1. Recreate the Security file, following the instructions in the *Reference Manual*. Rerun the process that required user authorization.
2. If the problem persists, verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If it does not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to the program. Rerun the process that required user authorization.

3. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun the process that required user authorization.
4. If the problem persists, reboot the workstation, and then rerun the process that required user authorization.
5. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements. See the chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEJ003E Doing !1 on !2, action not defined.

AWSDEJ004E An internal error occurred performing the following action: "action" on the following object type: "object_type".

Explanation: *action* is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: The object was not defined. `utils/src/libs/security.c 2538`.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ005E You do not have permission to perform the following action: "action" on the following object type: "object_type".

Explanation: See message.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ007E A system error occurred while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: error converting length generated from the library function strtol.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ008E A system error occurred while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: error converting checksum generated from the library function strtol.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ009E An internal error occurred while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: The Security file might be corrupt, or there is an internal error.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: buffer too small.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ010E A system error occurred while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: read error. on the run-time library function fread.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ011E A decryption error occurred while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ012E An internal error occurred while performing the following action: "action" on the following object type: "object_type".

Explanation: There is an internal error.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: test returned invalid result.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ013E A non-valid keyword was encountered in the Security file while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message. The reason for this error is one of the following:

- A non.valid keyword exists in the Security file
- The Security file is corrupted
- There is an internal error

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Take the following steps to determine the cause of the problem and resolve it:

- Check the syntax in the file Security.conf. See the *Administration Guide* for details about the syntax. Correct the error in the Security.conf file and repeat the action that failed.
- If the problem persists, recreate the Security file. See the *Administration Guide* for details about how to create or recreate the Security file.
- If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ014E The following user: "user_name" could not be found in the Security file while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

user_name is the user that could not be found.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ015E The record for the following user: "user_name" could not be read in the Security file while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

user_name is the user whose details could not be read.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: read error from the run-time library function fread or fseek.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ016E An internal error occurred while performing the following action: "action" on the following object type: "object_type".

Explanation: This is an internal error.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: while checking the

security access for current user, the system received a non-valid return code. This is an internal error because this return code is set internally.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ017E Doing !1 on !2, testing user found invalid object in security file.

AWSDEJ018E The following user: "user_name" could not be found in the Security file while performing the following action: "action" on the following object type: "object_type". The Security file might be corrupt.

Explanation: See message.

user_name is the user that could not be found.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to be performed. It corresponds to one of the object keywords in the Security file.

For IBM Software Support use: this is an error related to Library function feof.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Take the following steps to determine the cause of the problem and resolve it:

- Check if the indicated user is in the file Security.conf. If it is not, add the user, recreate the Security.conf file and repeat the action that failed.
- If you find that the indicated user is in the Security file, it might be corrupt. Recreate the file and repeat the action that failed.
- If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ019E An error occurred while reading the header in the Security file for the following user: "user_name". The Security file might be corrupt.

Explanation: See message.

user_name is the user that could not be found.

For IBM Software Support use: this is an operating system error from the library function fgets.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ020E An error occurred while setting the initial position in the Security file for the following user: "user_name". The Security file might be empty or corrupt.

Explanation: See message.

user_name is the user that could not be found.

For IBM Software Support use: this is an operating system error from the library function ftell.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ021E The Security file is not valid (incorrect magic number).

Explanation: See message.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ022E The Security file is not valid (incorrect version).

Explanation: See message.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ023E The Security file is not valid (header record size is incorrect).

Explanation: See message.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *User's Guide and Reference* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *User's Guide and Reference* for more instructions on how to recreate the Security file.

AWSDEJ024E The program could not allocate sufficient memory (heap size).

Explanation: The reasons for the problem are normally one of the following:

- There is insufficient memory available and the memory allocation failed
- There is an internal error

For IBM Software Support use: malloc library function has failed.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Perform the following to determine which of the problems has occurred, and to take the appropriate remedial action:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler is provided in the *Release Notes*. If it does not, you might need to increase the memory of the

workstation or make changes in memory management and paging to make more memory available to the program. Rerun the process that required user authorization.

2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun the process that required user authorization.
3. If the problem persists, reboot the workstation, and then rerun the process that required user authorization.
4. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Release Notes* for details of memory requirements.

AWSDEJ025E The Security file is missing. As the user is not root, the file cannot be created by the program.

Explanation: See message.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ026E An error occurred while seeking the start position of the Security file. The following operating system error was returned: "error_number". The Security file might be corrupt.

Explanation: See message.

error_number is the operating system error number.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ027E Either the user for which authorization is being sought is not defined in the Security file, or it is defined but no associated access rights are defined. The Security file is probably either empty or corrupt.

Explanation: See message.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ028E An error has occurred while retrieving the password structure from the Security file. The file might be corrupt.

Explanation: This message shows a system error happened reading the Security file. An error number was set to indicate the error.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Administration Guide* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ029E The following action cannot be performed in an end-to-end Tivoli Workload Scheduler network: "action" on the following object type: "object_type".

Explanation: You tried to perform an action that is not permitted in an end-to-end Tivoli Workload Scheduler network (a network where a master domain manager on z/OS manages the workload on a network of distributed workstations. There are some actions (for example the **conman submit** command) that are not permitted in this environment.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

object_type is the object type on which the action is to

be performed. It corresponds to one of the object keywords in the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: If the action must be performed, you must either find a different way to achieve the same objective, or perform the action outside of the Tivoli Workload Scheduler network.

AWSDEJ101E Error writing user: !4

AWSDEJ102W While running `makesec`, a syntax error was found in the following file: "file_name", at line: "line_number". An incorrect delimiter has been used after the following keyword: "keyword".

Explanation: See message.

file_name is the name of the file where the error was found (usually `Security.conf`).

line_number is the line number in that file where the syntax error has been found.

keyword is the keyword after which the incorrect delimiter appears.

System action: `Makesec` stops. The Security file is not created.

Operator response: Verify the syntax of the identified file at the indicated point, and correct the error.

Rerun `makesec` to recreate the Security file (see the *Administration Guide* for details).

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ103W While running `makesec`, a possible issue was found in the following file: "file_name", at line: "line_number". The tilde delimiter (~) has been used before the first attribute for the following user: "user_name". This means that all physical users of all workstations in the Tivoli Workload Scheduler network, except that or those indicated in the attribute, now belong to the indicated user, and have the rights and restrictions of the indicated user. If this was your intention, take no action, otherwise correct the syntax and remake the security file.

Explanation: See message.

file_name is the name of the file where the possible issue was found (usually `Security.conf`).

line_number is the line number in that file where the syntax issue has been found.

user_name is the name of the user for which the tilde delimiter appears.

System action: `Makesec` continues. The Security file is created.

Operator response: Verify the syntax of the identified file at the indicated point, and ensure it represents the behavior you require.

See The chapter on setting security in the *Administration Guide* for more instructions on how to create the Security file.

AWSDEJ104E !1, line !2: Error writing begin for !3: !4

AWSDEJ105E !1, line !2: Error writing end for !3: !4

AWSDEJ106E An internal user-`seek` error has occurred while writing the Security file. The error occurred while reading from the following file: "file_name", at line: "line_number", for the following user: "user_name". The following gives more details of the error: "error_message".

Explanation: See message.

file_name is the name of the file that was being read when the error occurred (usually `Security.conf`).

line_number is the line number in that file that was being processed when the error occurred.

user_name is the user name being processed when the error occurred.

error_message is the operating system error message.

For IBM Software Support use: `fseek` failed writing Security, reading from `Security.conf`.

System action: `Makesec` stops. The Security file is not created.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ107E An internal user-`update` error has occurred while writing the Security file. The error occurred while reading from the following file: "file_name", at line: "line_number", for the following user: "user_name". The following gives more details of the error: "error_message".

Explanation: See message.

file_name is the name of the file that was being read when the error occurred (usually `Security.conf`).

line_number is the line number in that file that was being processed when the error occurred.

user_name is the user name being processed when the error occurred.

error_message is the operating system error message.

For IBM Software Support use: fprintf failed writing Security, reading from Security.conf.

System action: Makesec stops. The Security file is not created.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ108E While running makesec, a wrong exit state was found in the following file: "file_name", at line: "line_number". Either there is a syntax error in the Security.conf file or an internal error has occurred.

Explanation: See message.

file_name is the name of the file where the error was found (usually Security.conf.).

line_number is the line number in that file where the syntax error has been found.

System action: Makesec stops. The Security file is not created.

Operator response: Verify the syntax of the identified file at the indicated point, and correct the error.

Rerun **makesec** to recreate the Security file (see the *Administration Guide* for details). If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ109E !1, line !2: Unknown variable: !3.

AWSDEJ110E While running makesec, a syntax error was found in the following file: "file_name", at line: "line_number". The following incorrect keyword was used: "keyword". Contextually valid keywords are as follows: "keyword_list".

Explanation: See message.

file_name is the name of the file where the error was found (usually Security.conf.).

line_number is the line number in that file where the syntax error has been found.

keyword is the incorrect keyword.

keyword_list is a list of the keywords that can be used at this point.

System action: Makesec stops. The Security file is not created.

Operator response: Verify the syntax of the identified file at the indicated point, and correct the incorrect keyword.

Rerun **makesec** to recreate the Security file (see the *Administration Guide* for details).

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ111E An internal security-buffer error has occurred while writing the Security file. The error occurred while reading from the following file: "file_name", at line: "line_number", for the following user: "user_name". The following gives more details of the error: "error_message".

Explanation: See message.

file_name is the name of the file that was being read when the error occurred (usually Security.conf.).

line_number is the line number in that file that was being processed when the error occurred.

user_name is the user name being processed when the error occurred.

error_message is the operating system error message.

For IBM Software Support use: fwrite failed writing Security, reading from Security.conf.

System action: Makesec stops. The Security file is not created.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ112W An internal error has occurred while writing the Security file. The error occurred while reading from the following file: "file_name", at line: "line_number". One of the following keywords is missing: "keyword_list".

Explanation: See message.

file_name is the name of the file that was being read when the error occurred (usually Security.conf.).

line_number is the line number in that file that was being processed when the error occurred.

keyword_list is a list of keywords, one at least of which is missing.

System action: **Makesec** stops. The Security file is not created.

Operator response: Check the syntax of the input file at the point indicated. Correct the error and rerun **makesec**.

AWSDEJ113E An internal error has occurred while writing the Security file. The error occurred while reading from the following file: "file_name", at line: "line_number". An non-valid parse state occurred while processing the following keyword: "keyword".

Explanation: See message.

file_name is the name of the file that was being read when the error occurred (usually Security.conf.).

line_number is the line number in that file that was being processed when the error occurred.

keyword is the keyword that was being processed when the error occurred.

System action: **Makesec** stops. The Security file is not created.

Operator response: Check the syntax of the input file at the point indicated. Correct the error and rerun **makesec**.

AWSDEJ114E While running **makesec**, a syntax error was found in the following file: "file_name", at line: "line_number". The following keyword is not being used in the correct context: "keyword".

Explanation: See message.

file_name is the name of the file where the error was found (usually Security.conf.).

line_number is the line number in that file where the syntax error has been found.

keyword is the incorrect keyword.

System action: **Makesec** stops. The Security file is not created.

Operator response: Verify the syntax of the identified file at the indicated point, and correct the keyword being used in the wrong context.

Rerun **makesec** to recreate the Security file (see the *Administration Guide* for details).

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ115E The same user ("user_name") is defined more than once in the following file: "file_name", at line: "line_number".

Explanation: The syntax of the Security file allows for each user to be defined only once.

file_name is the name of the file where the error was found (usually Security.conf.).

line_number is the line number in that file where the syntax error has been found.

user_name is the name of the user defined more than once.

System action: **Makesec** stops. The Security file is not created.

Operator response: Edit the indicated file and ensure that each user is defined only once.

Rerun **makesec** to recreate the Security file (see the *Administration Guide* for details).

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ116E The following user name "user_name" is not valid in the following file: "file_name", at line: "line_number".

Explanation: The user names specified in the Security file must conform to a specified standard, details of which are given in the *Administration Guide*.

file_name is the name of the file where the error was found (usually Security.conf.).

line_number is the line number in that file where the syntax error has been found.

user_name is the user name that is not valid.

System action: **Makesec** stops. The Security file is not created.

Operator response: Edit the indicated file and ensure that all user names are valid. If you cannot find a user name that is not valid, an internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

If you have found and corrected an error, rerun **makesec** to recreate the Security file (see the *Administration Guide* for details).

See The chapter on setting security in the *Administration Guide* for more instructions on how to recreate the Security file.

AWSDEJ117E An internal error occurred while writing the Security file header record for the following user: "user_name" and the following action: "action".

Explanation: See message.

user_name is the user that was being processed when the error occurred.

action is the action required. It corresponds to one of keywords in the actions list in the Security file.

System action: Makesec stops. The Security file is not created.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSDEJ201E The Security file is not valid. An error occurred reading the user at the following byte: "byte".

Explanation: Other messages give more information about the error.

byte indicates the position of the error in the file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEJ202E The Security file is not valid. An error occurred reading the block at the following byte: "byte"

Explanation: Other messages give more information about the error.

byte indicates the position of the error in the file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference*

Manual for more instructions on how to recreate the Security file.

AWSDEJ203E The Security file is not valid. The object keyword at the following byte is not valid: "byte"

Explanation: Other messages give more information about the error.

byte indicates the position of the error in the file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEJ204E The Security file is not valid. The user attribute at the following byte is not valid: "byte"

Explanation: Other messages give more information about the error.

byte indicates the position of the error in the file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEJ205E The Security file is not valid. The variable at the following byte is not valid: "byte"

Explanation: Other messages give more information about the error.

byte indicates the position of the error in the file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that

was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEJ206E The Security file is not valid. The action keyword at the following byte is not valid: "byte"

Explanation: Other messages give more information about the error.

byte indicates the position of the error in the file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEJ207E An internal error has occurred while writing the Security file. The error occurred while reading from the following file: "file_name", at line: "line_number", for the following user: "user_name". The following gives more details of the error: "error_message".

Explanation: See message.

file_name is the name of the file that was being read when the error occurred (usually Security.conf.).

line_number is the line number in that file that was being processed when the error occurred.

user_name is the user name being processed when the error occurred.

error_message is the operating system error message.

For IBM Software Support use: fprintf failed writing Security, reading from Security.conf.

System action: Makesec stops. The Security file is not created.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 149. AWSDEK - Miscellaneous command messages

This section lists miscellaneous command error and warning messages that might be issued.

The message component code is DEK.

AWSDEK051E Options must precede arguments, use -- to close options.

AWSDEK052E An option was not valid.

AWSDEK053E An option was ambiguous.

AWSDEK054E An option was not found.

AWSDEK101E Error accessing !1: !2

AWSDEK102E An error occurred while rebuilding !1: !2.

AWSDEK301E Error opening work file !1: !2

AWSDEK302W Warning verify over rides other options.

AWSDEK303W Warning output over rides other options.

AWSDEK304W Warning local over rides network option.

AWSDEK305E Error opening security file !1: !2

AWSDEK306E Error writing header: !1

AWSDEK308E Error renaming !1 to !2: !3

AWSDEK310E Conversion of !1 from native format to utf8 failed.

AWSDEK401E Error reading header: !1

AWSDEK402E Can not access current security file: !1

AWSDEK404E Unable to open utf8 temporary file !1.

AWSDEK405E Unable to read utf8 security output file !1.

AWSDEK406E Error writing security file !1 to the screen.

AWSDEK701E Cannot open file %s, error: %s.

AWSDEK704E The message queue "event_file" cannot be resized without being compacted. Make a backup copy and then compact the file by running `evtsize -compact "event_file"`. Refer to the documentation for more details.

Explanation: *event_file* is the file being processed by the `evtsize` utility that was unable to resize the event queue because the queue is full and cannot be expanded without compacting events.

System action: `evtsize` stops without modifying the event file size.

Operator response: Try to run the `evtsize` utility again using the parameter `-compact`.

See the *Reference Guide* for more information about the `evtsize` utility.

AWSDEK705E An error occurred while processing the file "event_file". The error is: "error_message".

Explanation: An error occurred processing the event file. *event_file*.

error_message is a message that contains information about the error and includes the operating system error message.

System action: `evtsize` stops without compacting or resizing the event file.

Operator response: Attempt to resolve the operating system error.

Restore the backup copy and try to run the `evtsize` utility again.

See the *Reference Guide* for more information about running the `evtsize` utility.

AWSDEK706E An error occurred while attempting to processing the file "event_file". The error is: "error_message". The original event file has been recovered.

Explanation: The `evtsize` utility was unable to compact events within the event queue. The file being processed is `event_file`.

`error_message` is a message that contains information about the error and includes the operating system error message. The original event file has been recovered.

System action: `evtsize` stops without compacting the event file.

Operator response: Attempt to resolve the operating system error.

Try to run the `evtsize` utility again.

See The *Reference Guide* for more information about running the `evtsize` utility.

AWSDEK708E The message queue "event_file" cannot be re-sized without corrupting the contents.

Explanation: The `evtsize` utility was unable to re-size the event queue because the new size is lower the previous one and re-sizing the queue will corrupt the queue contents.

`event_file` is the file being processed.

System action: `evtsize` stops without modifying the event file size.

Operator response: Wait until the queue has been emptied before re-sizing it, or select a size greater than the stored size.

Try to run the `evtsize` utility again.

See The *Reference Guide* for more information about running the `evtsize` utility.

AWSDEK709E The supplied value for the size parameter is greater than the maximum allowed by the operating system: "max_size"

Explanation: The maximum value for the size parameter is determined by the `LONG_MAX` system variable.

`max_size` is the maximum value you can provide for the `evtsize` "size" parameter.

System action: `evtsize` stops without modifying the event file size.

Operator response: Run the `evtsize` utility again, supplying a lower value for the "size" parameter.

Try to run the `evtsize` utility again.

See The *Reference Guide* for more information about running the `evtsize` utility.

AWSDEK710W The `evtsize` command has been issued with too many parameters. Additional parameters are ignored.

Explanation: See message.

System action: `evtsize` command is processed, ignoring the additional parameters.

Operator response: Check why there were too many parameters. Check that the command as processed achieved your objective. If it did not, rerun the utility, specifying the parameters correctly.

See The *Reference Guide* for more information about running the `evtsize` utility.

AWSDEK711E The minimum size of a message queue must be "min_size"

Explanation: See message.

System action: `evtsize` command fails.

Operator response: The minimum size of message queue must be 1048576 bytes, please provide a value greater or equal to it

AWSDEK904E Unable to open the following Security file to initialize centralized security: "security_file". The file does not exist or cannot be found.

Explanation: See message.

`security_file` is the name of the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEK905E Unable to read the following Security file for centralized security: "security_file".

Explanation: See message.

`security_file` is the name of the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

AWSDEK906E Unable to write the following Security file for centralized security: "security_file".

Explanation: See message.

security_file is the name of the Security file.

System action: The action that required user authorization is not performed. The program performing that action might stop.

Operator response: Recreate the Security file (see the *Reference Manual* for details), and retry the action that was being performed when the error occurred. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The chapter on setting security in the *Reference Manual* for more instructions on how to recreate the Security file.

Chapter 150. AWSDEL - CPU access messages

This section lists error and warning messages that might be issued by the CPU access.

The message component code is DEL.

AWSDEL001E Error, attempt to open newer revision of file

AWSDEL018E u_print_cpu_data() got invalid cpu entry type %d.

AWSDEL002E Error, cpudata file has not been opened

AWSDEL019E add_cpu_agent_type(): unknown agent type.

AWSDEL003W End of chain/no more matches.

AWSDEL004E Could not create a temporary file: !1

AWSDEL005E File system error: !1

AWSDEL006E cpu not specified in cpudata file

AWSDEL007E error returned from index access functions

AWSDEL008E ADD: cpu definition already in database

AWSDEL010E Access denied to specified cpu definition

AWSDEL011E Unable to allocate memory

AWSDEL012E Invalid cpu definition read from file

AWSDEL013E Specified name is not a cpu class

AWSDEL014E Invalid cpu class definition read from file

AWSDEL015E ****ERROR**** !1: Modify access denied for cpu !2

AWSDEL016E Cpu !1 does not exist in cpudata file

AWSDEL017W ****WARNING**** Access method !1 does not exist on your system!

Chapter 151. AWSDEM - Workstation parsing messages

This section lists workstation parsing error and warning messages that might be issued.

The message component code is DEM.

AWSDEM001E There is an error in the workstation definition. The workstation definition for the `cpuname` keyword is not syntactically correct. It must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores. The Reference Manual lists certain reserved words that must be avoided.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM002E There is an error in the workstation definition. The workstation name for the `host` keyword is not syntactically correct. It must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores. The Reference Manual lists certain reserved words that must be avoided.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM003E `LINK cpuid` is syntactically invalid

AWSDEM004E There is an error in the workstation definition. The server ID is not syntactically correct. It must be a single letter or number (A-Z and 0-9).

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM007E There is an error in the workstation definition. The required `os` keyword is missing.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM008E There is an error in the workstation definition. The required `node` keyword is missing.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM009E There is an error in the workstation definition. The required `os` keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM010E There is an error in the workstation definition. The optional `description` keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

AWSDEM011E • AWSDEM020E

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM011E There is an error in the workstation definition. The required node keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM012E There is an error in the workstation definition. The optional tcpaddr keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM013E There is an error in the workstation definition. The host keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM014E There is an error in the workstation definition. The ignore keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM015E There is an error in the workstation definition. The autolink keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM016E There is an error in the workstation definition. The fullstatus keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM017E There is an error in the workstation definition. The resolvedep keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM018E There is an error in the workstation definition. The server keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM019E Duplicate alternative NODE keyword

AWSDEM020E Duplicate alternative TCPADDR keyword

AWSDEM021E Duplicate COMMAND keyword

AWSDEM022E There is an error in the workstation or the workstation class definition. The context suggests that you are trying to define a workstation or a workstation class, but the cpuname or cpuclass keyword is missing.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation and workstation class definition.

AWSDEM023E There is an error in the object definition. The supplied description keyword was not followed by a description enclosed in double quotes.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the object definition.

AWSDEM024E There is an error in the workstation definition. The supplied os keyword was not followed by a valid operating system type. Valid options are UNIX, WNT, ZOS, IBM i, or OTHER.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM025E There is an error in the workstation definition. The supplied node keyword was not followed by a valid host name or IP address.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM026E There is an error in the workstation definition. The supplied tcpaddr keyword is not set to a valid TCP port number.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM027E There is an error in the workstation definition. A maestro-type keyword has been included, but the for maestro keyword has not been supplied.

Explanation: A keyword such as host, type, ignore, autolink, behindfirewall, securitylevel, fullstatus, resolvedep, or server has been supplied, but was not preceded by the ""for maestro"" keyword.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM028E There is an error in the workstation definition. The supplied host keyword was not followed by a valid workstation name.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM029E There is an error in the workstation definition. The supplied autolink keyword was not followed by either on or off.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSD030E There is an error in the workstation definition. The supplied fullstatus keyword was not followed by either on or off.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSD031E There is an error in the workstation definition. The supplied resolvedep keyword was not followed by either on or off.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSD032E There is an error in the workstation definition. The supplied server keyword was not followed by a valid server ID. The server ID must be a single letter or number (A-Z and 0-9).

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSD033E Missing or invalid LINKTO cpuid

AWSD034E Expected LINKTO cpu details

AWSD035E Expected command(s) enclosed in quotes.

AWSD036E There is an error in the workstation definition. One or more of the following keywords has not been supplied: description, os, node, tcpaddr, timezone or vartable.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSD037E There is an error in the workstation definition. The end keyword has been found but no for maestro parameters have been included.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSD038E There is an error in the workstation definition. A new workstation definition has started or the end of file has been reached, but the end keyword for the previous definition is missing.

AWSD039E There is an error in the workstation class definition. The workstation class name for the cpuclass keyword is not syntactically correct. It must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores. The *Reference Manual* lists certain reserved words that must be avoided.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSD040E There is an error in the workstation class definition. A workstation name in the members keyword is not syntactically correct. All workstation names must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores. Alternatively, the @ wildcard must be used to indicate all workstations.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM041E There is an error in the workstation class definition. The supplied `cpuclass` keyword is not followed by the required `members` keyword.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM042E There is an error in the workstation class definition. All workstation names in the `members` keyword must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores. Alternatively, the `@` wildcard must be used to indicate all workstations.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM043E There is an error in the workstation class definition. After the workstation class name definition, one or more member workstations have been supplied without the required `members` keyword.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM044E There is an error in the workstation class definition. The required `members` keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM045E There is an error in the workstation definition. The access keyword was not followed by a valid method. Valid methods correspond with the name of a file in the `nullTWSHome>/methods` directory (the file need not be present when the access method is defined).

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM046E There is an error in the workstation definition. The access keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM047E There is an error in the workstation definition. The access keyword was not followed by a valid method. Valid methods correspond with the name of a file in the `nullTWSHome>/methods` directory (the file need not be present when the access method is defined).

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM048E There is an error in the domain definition. The context suggests that you are trying to define a domain, but the domain keyword is missing.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the

syntax of the domain definition.

AWSDEM049E There is an error in the workstation or domain definition. The domain keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation or domain definition.

AWSDEM051E There is an error in the workstation or domain definition. The domain keyword was not followed by a valid domain name.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation or domain definition.

AWSDEM052E There is an error in the domain definition. Neither the manager nor the parent keywords have been found.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the domain definition.

AWSDEM053E There is an error in the domain definition. The parent keyword has been supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the domain definition.

AWSDEM054E There is an error in the domain definition. The manager keyword was not followed by a valid manager name.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM055E There is an error in the domain definition. The manager keyword has been supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the domain definition.

AWSDEM056E There is an error in the domain definition. The manager keyword was not followed by a valid manager name. Manager name must be a valid workstation name, which must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the domain definition.

AWSDEM057E There is an error in the domain definition. The parent keyword was not followed by a valid parent name. Parent name must be a valid workstation name, which must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM058E There is an error in the domain definition. The required manager keyword has not been supplied.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the domain definition.

AWSDEM059E There is an error in the workstation definition. The type keyword is not followed by a valid workstation type. Valid values are fta, manager, s-agent, x-agent, and broker.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM060E There is an error in the workstation definition. The type keyword has been supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM061E There is an error in the workstation definition. The type keyword is not followed by a valid workstation type. Valid values are manager, fta, s-agent, x-agent, broker, agent, pool, d-pool, and rem-eng.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM062E There is an error in the domain definition. The parent keyword is not followed by a valid parent domain name.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the domain definition.

AWSDEM063E There is an error in the domain definition. The description keyword is not followed by a valid description.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the domain definition.

AWSDEM064E There is an error in the workstation definition. The timezone keyword has been supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM065E There is an error in the workstation definition. The timezone keyword is not followed by a valid timezone name. Valid timezone names are listed in the Reference Guide.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM066E There is an error in the workstation definition. The timezone name is too long (maximum 40 bytes). Valid timezone names are listed in the Reference Guide.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM067E There is an error in the workstation definition. The timezone keyword is not followed by a valid timezone name. Valid timezone names are listed in the Reference Guide.

AWSDEM068E • AWSDEM075E

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM068E There is an error in the workstation definition. The **timezone** keyword is not followed by a valid timezone name. Valid timezone names are listed in the Reference Guide.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM069E There is an error in the workstation definition. The **timezone** keyword is not followed by a valid timezone name. Valid timezone names are listed in the Reference Guide.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM070E There is an error in the workstation definition. The **behindfirewall** keyword is not followed by a valid value. Valid values are on or off.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM071E There is an error in the workstation definition. The **behindfirewall** keyword is supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM072E There is an error in the workstation definition. The **securitylevel** keyword is supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM073E There is an error in the workstation definition. The **securitylevel** keyword is not followed by a valid value. Valid values are enabled, on, or force.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM074E There is an error in the workstation definition. The **secureaddr** keyword is supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM075E There is an error in the workstation definition. The supplied **secureaddr** keyword is not set to a valid SSL port number.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM076E There is an error in the workstation definition. The protocol keyword is not followed by a valid value. Valid values are http or https.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM077E There is an error in the workstation definition. The protocol keyword is supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM078E There is an error in the workstation definition. The required members keyword is missing for pool workstation definition.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM079E There is an error in the workstation definition. The members keyword must be supplied only for workstation class or pool workstation definition.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM080E There is an error in the workstation definition. The required members keyword has been specified more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM081E There is an error in the workstation definition. All workstation names in the members keyword must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM082E There is an error in the workstation definition. A workstation name in the members keyword is not syntactically correct. All workstation names must start with an alphabetic character, followed by up to 15 alphanumeric bytes, including dashes and underscores.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM083E There is an error in the workstation definition. The requirements definition in the requirements keyword is not well formatted.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM084E There is an error in the workstation definition. The \$MANAGER keyword is supplied more than once.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM185E There is an error in the domain definition. You have supplied the **ismaster** keyword to indicate the domain is the master domain, but you have also supplied the parent keyword which is not valid for a master domain.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the domain definition.

AWSDEM186E There is an error in the domain definition. A domain cannot reference itself as its parent.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the domain definition.

AWSDEM187E There is an error in the workstation definition. The supplied node name exceeds the maximum length of 51 bytes.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM188E There is an error in the workstation definition. The **ismaster** keyword is followed by a value, rather than by another keyword. This keyword has no value.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM202W %s line %d: %s %d: %s

Explanation: This message is a container for various warning messages. It gives at least the following information:

- The name of the file containing the object definitions where the warning situation occurred
- The line number in the file where the warning situation occurred
- The text of the warning message, which is another Tivoli Workload Scheduler warning message.

System action: See the system action documented for the included warning message.

Operator response: See the operator response documented for the included warning message.

AWSDEM203E %s line %d: %s %d: %s

Explanation: This message is a container for various error messages. It gives at least the following information:

- The name of the file containing the object definitions where the error situation occurred
- The line number in the file where the error situation occurred
- The text of the error message, which is another Tivoli Workload Scheduler error message.

System action: See the system action documented for the included error message.

Operator response: See the operator response documented for the included error message.

AWSDEM206E There is an error in an object definition. The description of the object is too long (maximum 120 bytes).

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See *The Reference Manual* for full details about the syntax of the object definition.

AWSDEM207E The IPv6 address has too many colons.

Explanation: The IPv6 address you supplied has too many colons or fields. An IPv6 address is composed of eight fields separated by colons.

System action: The workstation definition ends in error.

Operator response: Correct the IPV6 address or provide a valid host name for the workstation.

AWSDEM208E The IPv6 address is too long.

Explanation: You might have specified a Link Local address with its interface name. You should not be using Link Local addresses to define Tivoli Workload Scheduler workstations.

System action: The workstation definition ends in error.

Operator response: Use another type of IPv6 address or provide a valid host name for the workstation.

AWSDEM209E There is a syntax error. The variable table name must not exceed 80 bytes. It must start with an alphabetic character and contain only alphanumeric characters, dashes, and underscores.

Explanation:

System action: The command is not processed.

Operator response: Resubmit the command, supplying a correctly formatted object definition.

See The *Reference Manual* for details of the command syntax.

AWSDEM210E There is a syntax error. The keyword VARTABLE is duplicated.

Explanation:

System action: The command is not processed.

Operator response: Correct the syntax to remove the duplicate VARTABLE keyword and resubmit the command.

See The *Reference Manual* for details of the command syntax.

AWSDEM211E There is a syntax error. The keyword VARTABLE is not included in the command.

Explanation:

System action: The command is not processed.

Operator response: Correct the syntax to include the VARTABLE keyword and resubmit the command.

See The *Reference Manual* for details of the command syntax.

AWSDEM212E There is an error in the workstation definition. The supplied ENGINEADDR keyword is not set to a valid TCP port number.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input and resubmit the command.

See The *Reference Manual* for full details about the syntax of the workstation definition.

AWSDEM213E There is a syntax error. The keyword ENGINEADDR is duplicated.

Explanation:

System action: The command is not processed.

Operator response: Correct the syntax to remove the duplicate ENGINEADDR keyword and resubmit the command.

See The *Reference Manual* for details of the command syntax.

AWSDEM214E There is a syntax error. The supplied TCP or SSL port must be in the range 1..65535.

Explanation:

System action: The command is not processed.

Operator response: Correct the syntax to remove the bad TCP or SSL port.

See The *Reference Manual* for details of the command syntax.

Chapter 152. AWSDEN - Workstation parsing messages

This section lists workstation parsing error and warning messages that might be issued.

The message component code is DEN.

AWSDEN002E Cannot change software to demo
Search the IBM Support database for a
solution at [http://www.ibm.com/
software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

AWSDEN003W Software has been converted to a
seven day demo.

AWSDEN004E This is not production software.

AWSDEN005E Can't determine software type. Search
the IBM Support database for a solution
at [http://www.ibm.com/software/
sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

Chapter 153. AWSDEO - SNMP messages

This section lists SNMP error and warning messages that might be issued.

The message component code is DEO.

AWSDEO001E Snmp error for !1 in !2: !3

AWSDEO002E SNMP allocate error for !1 in !2: !3

AWSDEO003E SNMP unknown case is for !1 in !2: !3

AWSDEQ013E Error getting file security !1:!2
message = !3.

AWSDEQ014E Error getting file owner !1:!2 message
= !3.

AWSDEQ015E No owner defined for file !1:!2.

AWSDEQ016E Unexpected success of ReadFile
routine. Expected failure !1:!2.

AWSDEQ017E Error converting SID to name !1:!2
message = !3.

AWSDEQ018E Error opening Service control
manager !1:!2 message = !3.

AWSDEQ019E Error opening service !1:!2 message =
!3.

AWSDEQ020E Error querying service status !1:!2
message = !3.

AWSDEQ021E Tivoli Workload Scheduler Token
Service is not running, restart the
service.

Explanation: This message indicates that the ""Tivoli
Token Service"" Windows Service is not running.

System action: The command or action is not
processed.

Operator response: Follow this procedure:

1. Restart the service using the StartUp command or the Windows Services panel (if you have multiple Tivoli Workload Scheduler installation on the machine, look at the one identified by the TWSUser of the interested installation).
2. If the service starts, try the action or command again. If it works, the problem was a temporary one which has now been resolved.
3. If the service will not start, check that the service has the TWSUser as its log on account, and that the password registered in the service properties panel is the one currently being used by the TWSUser. If there are any discrepancies, correct them, try and start the service, and if successful, retry the action or command. If it works, the problem was caused by incorrect credentials, and has now been resolved.
4. If the service still will not start, check that the rights of the TWSUser are as described in the Planning and Installation Guide. If there are any discrepancies, correct them, try and start the service, and if successful, retry the action or command. If it

AWSDEQ022E • AWSDEQ029E

works, the problem was caused by incorrect rights, and has now been resolved.

5. In all other cases this is an internal error, so search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

**AWSDEQ022E Error opening process token !1:!2
message = !3.**

**AWSDEQ023E Error getting token information !1:!2
message = !3.**

**AWSDEQ024E Error owner is not of type user in
!1:!2.**

AWSDEQ025E Error reverting context to self in !1:!2.

**AWSDEQ026E Error getting volume information in
!1:!2.**

AWSDEQ027E Error impersonating self in !1:!2.

**AWSDEQ028E Error setting token information in
!1:!2.**

AWSDEQ029E Error generic NT error !1:!2.

Chapter 156. AWSDER - Generic memory allocation messages

This section lists generic error and warning messages that might be issued by memory allocation.

The message component code is DER.

AWSDER001E Malloc failed !1:!2 error = !3.

AWSDER002E Calloc failed !1:!2 error = !3.

AWSDER003E Realloc failed !1:!2 error = !3.

Chapter 157. AWSDES - User parser messages

This section lists user parser error and warning messages that might be issued.

The message component code is DES.

AWSDES001E Expected the keyword USERNAME.

AWSDES002E Expected a valid user-id (domainuser or user) here.

AWSDES003E Expected the keyword END.

AWSDES004E Expected the user attributes to be entered.

AWSDES005E Password attributed is required.

AWSDES006E Duplicate PASSWORD keyword

AWSDES007E The domain name is syntactically invalid

AWSDES008E The user name is syntactically invalid

AWSDES009E The user name is longer than the maximum allowed length, which is 47 bytes. If the name contains special characters it must be enclosed in quotes ().

AWSDES010E The domain name is longer than the maximum allowed length, which is 47 bytes.

AWSDES011E The password is longer than the maximum allowed length, which is 31 bytes.

AWSDES012E The supplied workstation name is invalid.

AWSDES013E Invalid password syntax.

AWSDES014E Error opening input user definition file.

AWSDES015E The password is longer than the maximum allowed length, which is 31 bytes.

Chapter 158. AWSDET - User parser messages

This section lists user parser error and warning messages that might be issued.

The message component code is DET.

AWSDET001E Error, attempt to open newer revision
of file

AWSDET002E Error, userdata file has not been
opened

AWSDET003E End of chain/no more matches.

AWSDET004E Couldn't create a temporary file: !1

AWSDET005E File system error: !1

AWSDET006E user not specified in userdata file

AWSDET007E error returned from index access
functions

AWSDET008E ADD: user definition already in
database

AWSDET010E Access denied to specified user
definition

AWSDET011E Unable to allocate memory

AWSDET012E Invalid user definition read from file

Chapter 159. AWSDEU - Utilities library list messages

This section lists utilities library list error and warning messages that might be issued.

The message component code is DEU.

AWSDEU001E ****ERROR**** Adding domain !1 would cause a loop in the domain hierarchy.

AWSDEU004E Attempt to add item to list pointed to by null pointer.

AWSDEU005E Attempt to delete from a list pointed to by null pointer.

AWSDEU006E Attempt to delete from empty list.

AWSDEU007E Attempt to find last position in list pointed to by null pointer.

AWSDEU008E Attempt to find length of list pointed to by null pointer.

AWSDEU009E Attempt to find position at or before zeroth list element.

AWSDEU010E Attempt to find position in list pointed to by null pointer.

AWSDEU011E Attempt to free list pointed to by null pointer.

AWSDEU012E Attempt to insert a null pointer into list.

AWSDEU013E Attempt to insert after a null pointer.

AWSDEU014E Attempt to insert before a null pointer.

AWSDEU015E Attempt to insert before list header.

AWSDEU016E Attempt to insert into list pointed to by null pointer.

AWSDEU017E Attempt to insert list header into list.

AWSDEU018E Attempt to move element down empty list.

AWSDEU019E Attempt to move element in list pointed to by null pointer.

AWSDEU020E Attempt to move element up empty list.

AWSDEU021E Attempt to move header node of list.

AWSDEU022E Attempt to print list pointed to by null pointer.

AWSDEU023E Attempt to traverse list pointed to by null pointer.

AWSDEU024E Attempt to unvisit list pointed to by null pointer.

AWSDEU025E List is empty.

AWSDEU026E List to search for visited nodes is empty.

AWSDEU027E Master domain name is a null pointer.

AWSDEU028E Master domain name is a null string.

AWSDEU029E Move element down: failed.

AWSDEU030E Move element up: failed.

AWSDEU031E Null pointer supplied for delete.

AWSDEU032E Null pointer supplied for move.

AWSDEU033E Not enough elements in list.

AWSDEU034E Null domain pointer supplied.

AWSDEU035E • AWSDEU056E

AWSDEU035E Null input list node pointer supplied.

AWSDEU036E Null list node pointer supplied.

AWSDEU037E Null parent pointer supplied.

AWSDEU038E Null string pointer supplied.

AWSDEU039E Pointer to node is not in list.

AWSDEU040W Testing for empty list pointed to by null pointer.

AWSDEU041E Unable to allocate list node. malloc() failed.

AWSDEU042E Unable to create HM list node. malloc() failed.

AWSDEU043E Unable to create list node. malloc() failed.

AWSDEU044E Unable to initialize list.

AWSDEU045W WARNING: domain !1 has no parent.

AWSDEU046E Domain is a null pointer, not a string.

AWSDEU047E Domain not found in list.

AWSDEU048E Input list is empty.

AWSDEU049E List pointed to by null pointer.

AWSDEU050E Parent is a null pointer, not a string.

AWSDEU051E String to search pointed to by null pointer.

AWSDEU052E Null pointer supplied instead of string.

AWSDEU053E Attempt to find domain index in list pointed to by null pointer.

AWSDEU054E The domain loop would be: !1.

AWSDEU056E The name of a domain manager in the Symphony file is not valid. The file might be corrupt.

Explanation: For firewall support, Tivoli Workload Scheduler creates a list of domain managers that need to bypass the firewall. It obtains this information from the Symphony file.

The name of one of these domain managers in the Symphony file is null, or cannot be read.

System action: The program stops.

Operator response: Check the state of the local Symphony file using the **conman sc @!@** command. Check in the output of this command that all domain managers are correctly defined.

If you can find no error in the Symphony file, this is an internal error. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

If the Symphony file cannot be read, or the command gives an error, or the domain manager definition is missing or incorrect, the Symphony file is probably corrupt. See the chapter on Symphony file corruption in the *Troubleshooting Guide*.

Chapter 160. AWSDEV - TIS library messages

This section lists error and warning messages that might be issued by the TIS library, that converts files to UTF-8 format.

The message component code is DEV.

AWSDEV001E Unable to open input file !1 for reading.

AWSDEV002E Unable to examine input file !1.

AWSDEV003E Unable to allocate input buffer.

AWSDEV004E Unable to allocate output buffer.

AWSDEV005E Unable to read input file !1.

AWSDEV006E The user ID that is using Tivoli Workload Scheduler does not have the right ownership or access permissions to create the following output file: "file_name" for writing.

Explanation: See message.

file_name is the full path and name of the output file that could not be created.

System action: The operation is not performed.

Operator response: Do the following:

1. Check the permissions of the directory where the process was trying to create the indicated file
2. Check the umask of the user
3. Do one of the following:
 - Log off and log in again as a user with the appropriate permissions to create the indicated file
 - Change the operating system properties for this user so that the file can be written
 - Change the permissions of the directory where the process wants to write the file so that it can be written by the original user

AWSDEV007E Unable to write to output file !1.

AWSDEV009E Conversion not supported.

Chapter 161. AWSDEW messages

This section lists error and warning messages that might be issued.

The message component code is DEW.

AWSDEW001E Invalid flag Try -u for usage.

AWSDEW002E ucomp: Invalid parameter.

AWSDEW003E More than one command given. Try
-u for usage.

AWSDEW004E product name must be specified.

AWSDEW005E You must specify version, and path
with set command. Try -u for usage.

AWSDEW006E Unexpected arguments.

Chapter 162. AWSDEZ - Logging error messages

This section lists logging error and warning messages that might be issued.

The message component code is DEZ.

AWSDEZ001E Call count exceeded, serious bug

AWSDEZ002E ISSUEMSG Internal error at line %d

AWSDEZ003E ****ERROR****(cpu secs %li)

AWSDEZ004E ****ERROR****

Chapter 163. AWSDFC messages

This section lists error and warning messages that might be issued.

The message component code is DFC.

AWSDFC001E Can not deamonize.

Chapter 164. AWSDFD - Oslayer messages

This section lists Oslayer error and warning messages that might be issued.

The message component code is DFD.

AWSDFD002E The message catalog is corrupt.

AWSDFD003E Out of memory.

AWSDFD004E A premature end of file has been encountered.

AWSDFD005E Unable to allocate storage.

AWSDFD006E Unrecognized catalog version.

AWSDFD007E Wrong byte order.

AWSDFD008E The setId must be greater than zero

AWSDFD009E A message cannot be specified when the set does not exist.

AWSDFD010E The msgId must be greater than zero.

AWSDFD011E You cannot delete a message before defining the set.

AWSDFD012E A space was expected here.

AWSDFD013E A space was not expected here.

AWSDFD014E An unexpected quote character has been found, and is being ignored.

AWSDFD015E An octal number has been supplied greater than 7?!

AWSDFD016E The escape sequence is unrecognized.

AWSDFD017E The line is unrecognized.

AWSDFD020E User authentication has failed: !1

AWSDFD051W by Control-C

AWSDFD052E by access violation

AWSDFD053E by datatype misalignment

AWSDFD054E by breakpoint

AWSDFD055W by single step

AWSDFD056E by array bounds exceeded

AWSDFD057E by floating point denormal operand

AWSDFD058E by floating point divide by zero

AWSDFD059E by floating point inexact result

AWSDFD060E by floating point invalid operation

AWSDFD061E by floating point overflow

AWSDFD062E by floating point stack check

AWSDFD063E by floating point stack underflow

AWSDFD064E by integer divide by zero

AWSDFD065E by integer overflow

AWSDFD066E by privileged instruction

AWSDFD067E by in page error

AWSDFD068E by illegal instruction

AWSDFD069E by non continuable exception

AWSDFD070E by stack overflow

AWSDFD071E by invalid disposition

AWSDFD072E • AWSDFD303E

AWSDFD072E by guard page

AWSDFD074E exception

AWSDFD200E cannot allocate for sid.

AWSDFD201E cannot allocate for RefDom.

AWSDFD202E Error: getgrgid stub called.

AWSDFD300E %s: %s is version %d, we need %d.

AWSDFD302E !1: corrupt file.

AWSDFD303E !1: no more memory.

Chapter 165. AWSDFE messages

This section lists error and warning messages that might be issued.

The message component code is DFE.

AWSDFE001E File system error %d opening uconfig.

AWSDFE002E File system error %d creating uconfig.

AWSDFE003E Error %d reading uconfig.

AWSDFE004E File system error %d writing uconfig.

AWSDFE005E File system error %d closing uconfig.

AWSDFE025W WARNING: Extra parameters ignored
starting at: !1

AWSDFE030E No models defined.

AWSDFE032E No classes defined.

AWSDFE033E Invalid Software code, Status = %d.

AWSDFE034E Software code specifies expired demo.

Chapter 166. AWSDFE messages

This section lists error and warning messages that might be issued.

The message component code is DFE.

AWSDFE002E `execv failed; error %d`

AWSDFE003E `setuid failed; error %d`

Chapter 167. AWSDFG - Starter messages

This section lists starter error and warning messages that might be issued.

The message component code is DFG.

AWSDFG002E STARTER:Error calling logon user :
%d

AWSDFG003E STARTER:Error setuid failed: %s

AWSDFG004E STARTER:Error execv failed : %s

AWSDFG005E Error: could not find program: !1

AWSDFG006E STARTER:DuplicateHandle 0 failed:
%d

AWSDFG007E STARTER:CreateProcessAsUser failed
cmd = %s%s: %d

AWSDFG008E STARTER:Could not open %s : %s

AWSDFG009E STARTER:Could not find IFUser
value in %s.

AWSDFG010E STARTER:Error initializing starter
program.

AWSDFG011E STARTER:Error validating user: !1

AWSDFG012E STARTER:Error invalid password or
user.

Chapter 168. AWSDFH - Condition expression parsing messages

This section lists condition expression parsing error and warning messages that might be issued.

The message component code is DFH.

AWSDFH001E The following success condition comparison expression is missing one of a pair of parentheses: "expression"

Explanation: You have issued a job definition with an incorrect comparison expression for defining the return code or codes that indicate a successful completion of a job.

expression is the comparison expression with the unmatched parenthesis.

System action: The job definition that contains the incorrect expression cannot be used.

Operator response: Check the syntax of the expression using the *Reference Manual*, and match the pairs of opening and closing parentheses.

An example of a correctly-formed definition is as follows: `rccondsucc ""(RC=3) OR ((RC>=5) AND (RCnu1110))""`

Resubmit the job definition.

See The *Reference Manual* for details of the success condition comparison expression syntax.

AWSDFH002E The success condition comparison expression contains the following unsupported operator: "operator". Use one of the following operators: = null null != nullnull null= null= AND OR NOT

Explanation: You have submitted a job definition with an incorrect comparison expression for defining the return code or codes that indicate a successful completion of a job.

Operator is the unsupported operator.

Valid operators are:

- = (equal to)
- null (less than)
- null (greater than)
- != (not equal to)
- nullnull (not equal to)
- null= (not less than)
- null= (not greater than)

- AND (boolean)
- OR (boolean)
- NOT (boolean)

System action: The job definition that contains the incorrect expression cannot be used.

Operator response: Correct the expression to contain only valid operators and resubmit the job definition.

An example of a correctly-formed definition is as follows: `rccondsucc ""(RC=3) OR ((RC>=5) AND (RCnu1110))""`

See The *Reference Manual* for details of the success condition comparison expression syntax.

AWSDFH003E The following success condition comparison expression is incorrect: "expression".

Explanation: You have issued a job definition with an incorrect comparison expression for defining the return code or codes that indicate a successful completion of a job.

expression is the comparison expression that is incorrect.

System action: The job definition that contains the incorrect expression cannot be used.

Operator response: Check the syntax of the expression using the *Reference Manual*, and correct it.

An example of a correctly-formed definition is as follows: `rccondsucc ""(RC=3) OR ((RC>=5) AND (RCnu1110))""`

Resubmit the job definition.

See The *Reference Manual* for details of the success condition comparison expression syntax.

AWSDFH004E The success condition comparison expression contains the following non-valid operand: "operand". The operand must be an integer between -2147483647 and 2147483647.

Explanation: You have issued a job definition with an incorrect comparison expression for defining the return

code or codes that indicate a successful completion of a job.

Operand is the incorrect operand.

System action: The job definition that contains the incorrect expression cannot be used.

Operator response: Change the operand in the job definition to an integer.

An example of a correctly-formed definition is as follows:
rccondsucc "(RC=3) OR ((RC>=5) AND (RCnull10))"

Resubmit the job definition.

See *The User's Guide and Reference* for details of the success condition comparison expression syntax.

Chapter 169. AWSECM - Event Configuration messages

This section lists error and warning messages that might be generated by event configuration.

The message component code is ECM.

AWSECM001E The general attributes for this workstation in the thiscpuvariable have not been found in the localopts file.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Ask your Tivoli Workload Scheduler administrator to verify the Tivoli Workload Scheduler installation by checking first that the localopts file exists in the Tivoli Workload Scheduler installation directory, and then that the `""thiscpu""` variable is defined inside it.

If the localopts file does not exist, it might have been stored in a different location than normal during the Tivoli Workload Scheduler installation. If so, try moving it to the standard location, as documented in the *Planning and Installation Guide* and repeating the operation.

If the file does not exist at all, it might indicate that the installation of the instance did not complete successfully. Try uninstalling and reinstalling the instance.

If the file exists but the `""thiscpu""` variable is missing, this also indicates an anomalous condition. It might not be enough to create the variable, as other variables might also be missing. Try uninstalling and reinstalling the instance.

AWSECM002E The Event Manager definition has not been found.

Explanation: The Event Manager is not defined in the Tivoli Workload Scheduler database.

System action: The operation cannot be performed.

Operator response: Ask your Tivoli Workload Scheduler administrator to verify the Tivoli Workload Scheduler installation.

AWSECM003E The Event Manager workstation is not in the Symphony file.

Explanation: The Event Manager does not exist in the Symphony file.

System action: The operation cannot be performed.

Operator response: Check the definition of the

indicated workstation in the database. If it is defined as the Event Manager workstation, and does not have the `""ignore""` attribute set, run JnextPlan to add the workstation to the Symphony file.

Chapter 170. AWSEDW - Netman messages

This section lists error and warning messages that might be generated by the netman component.

The message component code is EDW.

AWSEDW001E The following value: "value" for the following netman command line option: "option" is not in the correct format.

Explanation: See message: *option* is the command line option (-timeout, -port, -mortal). *value* is the value for either the -timeout or the -port options.

System action: Netman stops.

Operator response: Use the command **netman -U** to display the correct usage for netman, or look in the *Reference Manual*. Make sure that netman is invoked correctly in the file named StartUp located in the Tivoli Workload Scheduler directory. When you have corrected the problem, run **StartUp** to start **netman**.

See The *Reference Manual* for the syntax of the netman command.

AWSEDW002E System error

AWSEDW003W Not running with root permissions

AWSEDW004E Message file already opened by another process: !1, !2

AWSEDW005E Netman was unable to open its configuration file: "file_name". The following error was given by the operating system: "system_error"

Explanation: See message text.

file_name is the fully qualified name of the netman configuration file.

system_error is the operating system error message.

System action: Netman stops.

Operator response: Use the operating system error message to determine what the problem is. Make sure that the netman configuration file exists and that netman has read permission for the file. Correct any errors you find and run **StartUp** to start **netman**.

AWSEDW006E Netman could not process the service information in its configuration file: "file_name". If the problem is with a specific entry, the details are as follows (if the following fields are blank the problem is a general one): "service_entry": "service_number".

Explanation: See message text.

file_name is the fully qualified configuration file name.

service_entry is the number of the service entry being processed, if any.

service_number is the service request number (for example, 2001, or 2002), if any.

Operator response: Ensure that the identified Netman configuration file exists, and is in the correct directory (see the *Administration Guide* for details of the file and the services it defines).

Edit the configuration file and make sure that all the entries are valid service entries. When you have corrected the problem, run **StartUp** to start **netman**.

See *Administration Guide* for details of the services.

AWSEDW007E Unable to open both message file and net connection

AWSEDW008E Error opening stdlist

AWSEDW009E Error duping stdlist

AWSEDW011E Unable to create stdlist

AWSEDW012E An internal error has occurred. Netman has stopped because the following non-valid unlink request has been received: "service_request ". The error message and number are as follows: "error_number": "error_message"

Explanation: This request may be an obsolete request type.

service_request is the service request packet received by Netman.

AWSEDW013E • AWSEDW021E

error_number and *error_message* provide more information about the error. Depending on the type of error, they might contain null values, or other information.

System action: Netman continues, but the operation is not performed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW013E An internal error has occurred.
Netman received the following unlink request "service_request" from the following message file: "message_file". Unlink requests received from a message file are not allowed.

Explanation: This may be an obsolete service request and therefore an obsolete error message.

service_request is the service request packet received by Netman.

message_file is the name of the file from which the request was received.

System action: Netman continues, but the operation is not performed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW014E Invalid request !3 on !1: !2

AWSEDW015E Netman received the following unknown service request: "service_request"

Explanation: *service_request* is the service request packet received by Netman

System action: Netman continues, but the operation is not performed.

Operator response: Make sure that the Netman configuration file is not corrupted and that it contains entries for all the valid services. When you have corrected the problem, run **StartUp** to start netman.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW017E Netman received a service request for the following service that has a service type of disabled : "service_request"

Explanation: *service_request* is the service request packet received by Netman.

System action: Netman continues, but the operation is not performed.

Operator response: Make sure that the Netman configuration file is not corrupted and that it contains entries for all the valid services. When you have corrected the problem, run **StartUp** to start netman.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW018E Error building message file: !1, !2

AWSEDW019E An internal error has occurred.
Netman was unable to open its message file, NetReq.msg, for reading. The following messages were given:
Operating system error: "system_error"
Events file library error: "library_error".

Explanation: *system_error* is the operating system error message.

library_error is a message retrieved from the events file library describing the error.

System action: Netman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW020E An internal error has occurred.
Netman was unable to set up its TCP/IP port to listen for service requests. The following operating system message was received: "error_message".

Explanation: *error_message* is the operating system error message for the error.

System action: Netman stops.

Operator response: Use the error message to try and identify and solve the problem. Make sure that the port number is not being used by another process. When you have corrected the problem, run **StartUp** to start netman.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW021E Netman was unable to stop the following service as part of the child process cleanup procedures performed before exiting: "service". The following error message was given by the operating system: "error_message".

Explanation: *service* identifies the service that cannot be stopped.

error_message is a message that contains the operating system error.

System action: Netman continues, but the operation is not performed.

Operator response: Use the operating system error message to determine the reason for the problem. Use operating system commands to stop any child processes that are still running. When you have corrected the problem, run **StartUp** to start **netman**.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW022E An internal error has occurred.
Netman encountered an IPC error when waiting for a service request to arrive or when reading a service request, from the following port: "port_number". The error message is as follows: "system_error"

Explanation: *port_number* is the port to which Netman is waiting on request.

system_error indicates when the error occurred and the operating system error message.

Note: if the error occurred while *waiting* for a request, the *port_number* variable contains the *system_error* and the second variable is unused.

System action: Netman continues, but the operation is not performed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW023E An internal error has occurred.
Netman encountered an IPC error when trying to close the connection with the client process on the following port: "port_number", "system_error".

Explanation: *port_number* is the connection port number.

system_error is a message that contains the operating system error.

System action: Netman continues, but the operation is not performed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW024E An internal error has occurred.
Netman encountered an error while it was trying to read a service request from the following message file: "message_file". The following operating system error message is given: "error_message".

Explanation: *message_file* contains the fully qualified name for the message file.

error_message contains the operating system error message.

System action: Netman continues, but the operation is not performed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW025E An internal error has occurred.
Netman was unable to pass the circuit information as an argument to the program associated with the following service request: "service_request". The operating system error message is as follows: "error_message".

Explanation: Old message: Error forming string to pass circuit information.

error_message contains the operating system error message.

service_request is the service request packet received by netman.

System action: Netman continues, but the operation is not performed.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW026E Netman was unable to run the child process associated with the following service request: "service_request". The operating system error message is as follows: "error_message".

Explanation: *service_request* is the service request packet received by netman

error_message contains the error type and the operating system error message. See the NetConf file for the list of service numbers and the associated programs.

System action: Netman continues, but the operation is not performed.

Operator response: Check that the associated program specified in the NetConf file is present and can be run

by the nullTWS_user>. If you find a problem and correct it, run **StartUp** to restart **netman**. If the program specifications in the NetConf file are correct, an internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The network troubleshooting chapter in *Administration and Troubleshooting* for details of the valid services.

AWSEDW027E An internal error has occurred. Netman is unable to send an acknowledgment packet in response to the following service request: "service_request ". The following error message is given: "error_message"

Explanation: *service_request* is the service request packet received by Netman.

error_message gives more information about the error.

System action: Netman continues, but the operation is not performed

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW029E Error closing net link: !1, !2

AWSEDW030E An internal error has occurred. Netman was unable to set the signal handler to ignore one of the following signals: SIGTTOU, SIGTTIN, and SIGTSTP. The signal number is as follows: "signal_number". The operating system error message is as follows: "system_error"

Explanation: Old message: System error in sigaction.

signal_number is the number of the signal.

system_error is the operating system error message.

System action: Netman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW031E An internal error has occurred. Netman was unable to create a new session when trying to become a daemon process. The operating system error message is as follows: "error_number", "error_message".

Explanation: Old message: System error in setsid.

error_number and *error_message* give more information about the error.

System action: Netman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW032E An internal error has occurred. Netman was unable to change the current working directory to the root directory when trying to become a daemon process. The operating system error message is as follows: "error_number", "error_message".

Explanation: Old message: System error in chdir.

error_number and *error_message* give more information about the error.

System action: Netman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW033W The following duplicate service request has been received: "service_request". The following is the error message: "error_message"

Explanation: *service_request* is the service request packet received by Netman

error_message gives more information about the error.

System action: Netman continues, but the duplicate service request is ignored.

Operator response: The service you are trying to start is already running. If you are trying to restart the service, issue a `conman stop` command and issue the start request again.

AWSEDW035W The following request cannot be performed because netman is emptying its request cache: "service_request"

Explanation: Netman empties service requests from its message file, NetReq.msg, at startup, and at other times, as required. All requests are discarded, except for the last one. The last one is also discarded if it is a netman stop request.

service_request is the service request received by netman.

System action: Netman continues.

Operator response: None. However, if this message appears repeatedly, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW044W Son !1 pin !2 is gone, status: !3

AWSEDW045W Client pin !1 is gone, status: !2

AWSEDW050E An internal error has occurred. Netman, while attempting to launch itself as a daemon, cannot set the real group id (gid) to the Tivoli Workload Scheduler group id. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_message", !4.

Explanation: *file_name* is the name of the source file where the error occurred.

line_number is the line number of the source file where the error occurred.

error_message is the operating system error message.

System action: Netman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW051E An internal error has occurred. Netman, while attempting to launch itself as a daemon, cannot set the real user id (uid) to the Tivoli Workload Scheduler user id. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_message", !4.

Explanation: *file_name* is the name of the source file where the error occurred.

line_number is the line number of the source file where the error occurred.

error_message is the operating system error message.

System action: Netman stops.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW052W IP address validation not performed for request: !1. Connection received from IP address: !2. !3. Service request accepted.

AWSEDW053E Netman could not validate the IP address for a service. Service request: "service_request" IP address: "IP_address" Error type: "error_type" Error message: "validation_error".

Explanation: *service_request* is the service request packet received by Netman

IP_address is the IP address of the client process.

error_type is a string containing either the string "****ERROR****" or the string "****WARNING****".

validation_error is a message containing the validation error.

System action: Netman continues, but the operation is not performed.

Operator response: Refer to the Tivoli Workload Scheduler *Administration Guide* for a description of IP validation operations.

See The chapter on troubleshooting the network in the *Administration Guide* for details on IP validation.

AWSEDW056E Netman was unable to retrieve its product group name from the components file. Netman might not have been installed correctly, or the components file might not be correct.

Explanation: See message.

System action: Netman stops.

Operator response: Update the components file so that there is a valid entry for Netman.

On UNIX, the default components file is located in /usr/unison/components. The following environment variable can be used to specify another location: "UNISON_COMPONENT_FILE".

On Windows, the location of the components file is stored in the following Registry entry: "HKEY_LOCAL_MACHINE\SOFTWARE\Unison Software, Inc\ComponentLocationDB\DBPath".

When you have corrected the problem, run **StartUp** to restart **netman**.

AWSEDW058E Netman cannot find the program file associated with the following service number: "service_number" and action number: "action_number" in its configuration file "netman_configuration_file".

Explanation: *service_number* identifies the service for which the program cannot be found.

action_number identifies the action in the netman configuration file.

netman_configuration_file is the name of the

configuration file for netman.

System action: The program continues. The service is not launched.

Operator response: Verify the existence and accessibility of the program file associated with the service that Netman failed to launch. Correct the location and name of the file, if appropriate, either on disk or in the file, and run **StartUp** to restart **netman**.

AWSEDW059E Netman was unable to get information about its configuration file, "file_name". The operating system error message is as follows: "system_error"

Explanation: Netman periodically reads this file to update its internal service table.

file_name is the fully qualified name of the configuration file.

system_error is the operating system error message.

System action: If this problem occurs at start up, **Netman** stops. Otherwise, **netman** continues, using the configuration data it has in memory.

Operator response: Make sure that the configuration file exists and that the nullTWS_user> has read access to it. If you find and correct an error, run **StartUp** to restart **netman**.

AWSEDW060E Netman found a non-valid service request in its configuration file. [SEE AWSEDW058 FOR FORMATS , NetConf. "file_name":"ServiceEntry": "service_number" !4 !5

Explanation: *file_name* is the fully qualified name for the configuration file.

ServiceEntry specifies the entry number in the configuration file.

service_number is the invalid service number.

System action: **Netman** continues, but the operation is not performed.

Operator response: Edit the Netman configuration file, NetConf, and make sure that all the entries are valid service entries. If you find and correct an error, run **StartUp** to restart **netman**.

AWSEDW061E Netman was unable to create a new thread. Pipe connections are not supported.

Explanation: Old message: CreateThread failed

An API Window has failed.

System action: The program proceeds. Netman can continue supporting socket connections.

Operator response: An internal error has occurred.

Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW062E Netman cannot enable a named pipe server process to wait for a client process. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_number", from the following call: "system_call".

Explanation: Old message: ConnectNamedPipe() failed

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_number is the operating system error number.

system_call is the system call being performed when the error occurred.

System action: The program proceeds. Netman can continue supporting socket connections.

Operator response: Read the description of the internal system error and try to correct it. If you find and correct an error, run **StartUp** to restart **netman**.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW063E An internal error has occurred. Netman was unable to identify the following user that is trying to start a service: "user_ID".

Explanation: This Windows problem occurs when gconman starts a connection as the logged-on user.

Old message: Received NULL token from token list for id:

user_ID is the ID of the user running gconman.

System action: **Netman** proceeds. The process will not be started.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW065E CreateEvent() failed: File !1 (line !4): Error !2 from !3

AWSEDW066E Netman encountered an error trying to write data to a pipe. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_number", from the following call: "system_call".

Explanation: Old message: WriteFile() failed:

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_number is the operating system error number.

system_call is the system call being performed when the error occurred.

System action: The program proceeds.

Operator response: Read the description of the internal system error and try to correct it. If you find and correct an error, run **StartUp** to restart **netman**.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW067E Netman encountered an error trying to read data from a pipe. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_number", from the following call: "system_call".

Explanation: Old message: ReadFile() failed:

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_number is the operating system error number.

system_call is the system call being performed when the error occurred.

System action: The program proceeds.

Operator response: Read the description of the internal system error and try to correct it. If you find and correct an error, run **StartUp** to restart **netman**.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW068E Netman encountered an error trying to create a named pipe. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_number", from the following call: "system_call".

Explanation: Old message: CreateNamedPipe() failed:

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_number is the operating system error number.

system_call is the system call being performed when the error occurred.

System action: The program proceeds.

Operator response: Read the description of the internal system error and try to correct it. If you find and correct an error, run **StartUp** to restart **netman**.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW069E Netman was unable to create a handle for a new thread starting Service Client thread. The error occurred in the following source file: "file_name", at line: "line_number". The operating system error message is as follows: "error_number", from the following call: "system_call".

Explanation: Old message: CreateThread() failed

file_name is the name of the file where the error occurred.

line_number is the line number in the file where the error occurred.

error_number is the operating system error number.

system_call is the system call being performed when the error occurred.

System action: The program proceeds. Netman can continue supporting socket connections.

Operator response: Read the description of the internal system error and try to correct it. If you find and correct an error, run **StartUp** to restart **netman**.

If the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW070E An internal error has occurred. Netman could not write to the Windows event log. The operating system error message is as follows: "error_number". The error occurred in the following source code file: "file_name" at line "line_number".

Explanation: *error_number* is the error code returned by the system.

file_name is the source code file name.

line_number is the source code line number.

System action: Netman continues, but the operation is not performed.

Operator response: This is a system error. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSEDW081W SSL port set to 0 - no SSL IPC opened

AWSEDW090E An attempt has been made to perform a non-secure action from a remote workstation to the local workstation. The remote workstation does not have the correct security rights to access the local workstation.

Explanation: It is possible that the Security or Symphony files have been in some way corrupted on the remote workstation. It is also possible that the Security file on the remote workstation might have been hacked.

System action: The program proceeds.

Operator response: Verify that the Security file on the remote workstation is the same as that sent by the master domain manager during the centralized security initialization. Check that the Symphony files on both the remote and the local workstations are the same.

To resolve a problem of Symphony file corruption, see the chapter on the subject in the *Troubleshooting guide*.

If you find and correct an error, run **StartUp** to restart netman.

See The chapter on Symphony file corruption in the *Troubleshooting guide*.

AWSEDW091E Netman was unable to start a new process. Your Tivoli Workload Scheduler license expired "exp_date".

Explanation: Your Tivoli Workload Scheduler license has expired.

System action: The program proceeds. Netman can continue but it is not able to start new processes.

Operator response: An internal error has occurred. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 171. AWSERB - Event rule builder messages

This section lists error and warning messages that might be generated by the rule builder component.

The message component code is ERB.

AWSERB001E An internal error has occurred. The rule builder is not initialized.

Explanation: See message.

System action: The rule builder cannot build the rule, so the operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERB002E An internal error has occurred during the build configuration.

Explanation: See message.

System action: The rule builder cannot build the rule, so the operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERB003E An internal error has occurred when the rule builder loaded the workstation in the plan.

Explanation: See message.

System action: The rule builder cannot build the rule, so the operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERB004E An internal error has occurred. During the build of an event rule of type sequence or set, it has been verified that the rule has only an event condition.

Explanation: See message.

System action: The rule builder cannot build the rule, so the operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSERB005E An internal error occurred when the rule builder tried to get the workstation configuration.

Explanation: See message.

System action: The rule builder cannot build the rule, so the operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERB006W The plug-in "plug-in" that impacts the event rule "eventrule" does not exist.

Explanation: See message.

System action: The rule builder cannot build the rule.

Operator response: Verify if the plug-in is present in the evtPlugIn directory.

Chapter 172. AWSERP - Event rule parser messages

This section lists error and warning messages that might be generated by the event rule parser component.

The message component code is ERP.

AWSERP001E An internal error has occurred. A field of the AttributeFilter object in the input to the event rule parser is null.

Explanation: The problem described has occurred in the algorithm that creates the filtering predicate.

System action: The attribute filter object cannot be created.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP002E An internal error has occurred. A condition object in the input to the event rule parser is null.

Explanation: The problem described has occurred in the algorithm that creates the filtering predicate.

System action: The attribute filter object cannot be created.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP003E An internal error occurred while configuring the event rule parser properties and features.

Explanation: See message.

System action: The XML string cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP004E An internal error occurred while parsing the string in input. It is not a valid XML string.

Explanation: See message.

System action: The XML string cannot be parsed, so

the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP005E An internal error occurred while parsing the XML file created by the XML Formatter component.

Explanation: See message.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP006E An internal error occurred while loading the Filtering Predicate XML Schema file used by the XML parser.

Explanation: See message.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP007E An internal error has occurred. An incorrect number of conditions has been supplied for the range operator. It requires two.

Explanation: The problem described has occurred because two values are necessary for the range operator.

System action: The attribute filter object cannot be created.

Operator response: If you cannot resolve the problem,

AWSERP008E • AWSERP009E

search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP008E An internal error has occurred. The operator in the input is not valid.

Explanation: The problem described has occurred because the operator in input is not valid.

System action: The attribute filter object cannot be created.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSERP009E An internal error has occurred. An incorrect number of conditions has been supplied for either the le or the ge operator. Both require only one condition.

Explanation: The problem described has occurred because two values are necessary for the range operator.

System action: The attribute filter object cannot be created.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 173. AWSETO - Object monitor plug-in messages

This section lists error and warning messages that might be generated by the object monitor plug-in.

The message component code is ETO.

AWSETO001E An internal error has occurred. The Tivoli Workload Scheduler Object Monitor plug-in is unable to write the configuration for the agent "workstation_name", the reason is "reason".

Explanation: This problem indicates that the Tivoli Workload Scheduler Object Monitor plug-in has encountered an error while attempting to produce the configuration file for the agent *workstation_name*.

reason is the system error that is causing the problem.

System action: The configuration for the agent is not produced. The monitors on the agent do not work correctly.

Administrator response: See and resolve the error reported as reason.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSETO002E The event "event_name" of type "event_type" is not valid, because filters are not allowed on Stop reason when Running=true is specified.

Explanation: The user has created an event rule where the event *event_name* of type *event_type* has both ""Running=true"" and ""Stop reason"" filters specified.

This is not allowed because, for WorkstationStatusChanged events, the StopReason field is present only when the workstation is going down and then when Running=false

System action: The event rule is not saved.

Operator response: Specify only one of the two filters.

AWSETO003E The event "event_name" of type "event_type" is not valid, because filters are not allowed on Restarting when Running=true is specified.

Explanation: The user has created an event rule where the event *event_name* of type *event_type* has both ""Running=true"" and ""Restarting"" filters specified.

This is not allowed because, for events of type *event_type*, the Restarting field is present only when the process on the workstation is going down and then when Running=false

System action: The event rule is not saved.

Operator response: Specify only one of the two filters.

AWSETO004E The event "event_name" of type "event_type" is not valid, because filters are not allowed on No restart reason when Restarting=true is specified.

Explanation: The user has created an event rule where the event *event_name* of type *event_type* has both ""Restarting=true"" and the ""No restart reason"" filters specified.

This is not allowed because, for events of type *event_type*, the ""No Restart Reason"" field is present only when the process is not automatically restarted, and then when Restarting=false

System action: The event rule is not saved.

Operator response: Specify only one of the two filters.

AWSETO005E The event "event_name" of type "event_type" is not valid, because filters are not allowed on No restart reason when StopReason=Stop is specified.

Explanation: The user has created an event rule where the event *event_name* of type *event_type* has both ""Restarting=true"" and the ""No restart reason"" filters specified.

This is not allowed because, for events of type *event_type*, the ""No Restart Reason"" field is present only when the process is not automatically restarted, and then when Restarting=false

System action: The event rule is not saved.

Operator response: Specify only one of the two filters.

AWSETO006E The event "event_name" of type "event_type" is not valid, because filters are not allowed on Unlink reason when LinkStatus=Linked is specified.

Explanation: The user has created an event rule where

the event *event_name* of type *event_type* has both ""LinkStatus=Linked"" and the ""Unlink reason"" filters specified.

This is not allowed because, for ParentWorkstationLinkChanged and ChildWorkstationLinkChanged events, the UnlinkReason field is present only when the link to the parent or to the child workstation is lost and then when LinkStatus=Unlinked.

System action: The event rule is not saved.

Operator response: Specify only one of the two filters.

Chapter 174. AWSEVP - Event processing messages

This section lists error and warning messages that might be generated by the event processor.

The message component code is EVP.

AWSEVP002E The event processor is not running.

Explanation: The event processor must be started to perform the required action

System action: The operation cannot be performed.

Operator response: Start the event processor and retry the required action

Operator response: None. The event rule instances will be rebuilt automatically next time the event processor is started.

If this message appears frequently, you should investigate to determine why the event processor is not able to save the state of the event rule instances, and fix the problem, as having to rebuild the instances slows down the start of the event processor and clears incomplete sequences and sets of events.

AWSEVP010W The event processor started with the internal persistence feature enabled. A problem occurred while recovering the state of the event rule instances, which have been rebuilt.

Explanation: An error occurred while recovering the state of the event rule instances, most likely because the database connection was not available or because of a problem found during the restore of state files on the file system.

System action: The event processor starts but the state of the event rule instances is not recovered.

Operator response: None. The event rule instances have been rebuilt automatically.

If this message appears frequently, you should investigate to determine why the event processor is not able to recover the state of the event rule instances, and fix the problem, as having to rebuild the instances slows down the start of the event processor and clears incomplete sequences and sets of events.

AWSEVP014W The event processor stopped with the internal persistence feature enabled. A problem occurred while storing the state of the event rule instances, which will be rebuilt at the next start.

Explanation: An error occurred while storing the state of the event rule instances, most likely because the database connection was not available or because the event processor was stopped during the deployment of event rules and could not complete this process in a reasonable time. The state of the event rule instances will not be recovered at the next startup of the event processor because it was not saved.

System action: The event processor stops but the state of the event rule instances is not saved.

Chapter 175. AWSFAB - Installation messages (twinsinst)

This section lists error and warning messages that might be issued when using the twinsinst script to install the product.

The message component code is FAB.

AWSFAB003E The twinsinst script cannot run on this operating system: "operating_system".

Explanation: See message text.

System action: The twinsinst script cannot proceed.

Operator response: Check in the *IBM Tivoli Workload Scheduler Release Notes* for details of supported platforms.

See *IBM Tivoli Workload Scheduler Release Notes* and *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB004E Only the user root can run the twinsinst script.

Explanation: See message text

System action: The twinsinst script cannot proceed.

Operator response: Login as the ""root"" user and rerun the twinsinst script.

AWSFAB005E No parameters have been specified for twinsinst.

Explanation: The twinsinst script needs to be supplied with at least one parameter.

System action: The twinsinst script cannot proceed.

Operator response: Check the usage of the twinsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twinsinst -u** to the see a list of the available parameters.

Rerun the twinsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB007E The supplied installation type parameter is not correct. It must be one of the following: -new, -update, -uninst, -modify, -restore.

Explanation: See message text.

System action: The twinsinst script cannot proceed.

Operator response: Check the usage of the twinsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command

twinsinst -u to the see a list of the available parameters.

Rerun the twinsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB008E You supplied more than one installation type parameter. Supply only one of the following: -new, -update, -uninst, -modify, -restore.

Explanation: See message text.

System action: The twinsinst script cannot proceed.

Operator response: Check the usage of the twinsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twinsinst -u** to the see a list of the available parameters.

Rerun the twinsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB009E A parameter to twinsinst has been supplied that is not appropriate for the supplied installation type. Specify the "installation_parameter" parameter only when "installation_type" installation type is specified.

Explanation: The *installation_parameter* is a parameter that you supplied, that is not appropriate for the supplied installation type.

The *installation_type* is a list of the only installation types with which you can use the supplied *installation_parameter*.

System action: The twinsinst script cannot proceed.

Operator response: Check the usage of the twinsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twinsinst -u** to the see a list of the available parameters.

Rerun the twinsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB010E An incorrect value has been supplied for a parameter. The parameter must be as follows: "installation_parameter".

Explanation: The parameter you have supplied is correct, and is valid for this installation type. However, the value supplied for the parameter is not correct.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter value.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB011E The following parameter has been supplied more than once:"installation_parameter".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB012E The following installation parameter "installation_parameter" has been supplied that is not allowed with the installation type "installation_type".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB014E The following is not a recognizable installation parameter "installation_parameter".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB015E The "parameter_name" option is missing.

Explanation: The indicated parameter is required for this installation type.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB016E The following user account has been supplied that does not exist on the local computer: "user_account". You must create the user account before running twsinst.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that the correct account name was supplied. If it was not, rerun the twsinst script, supplying the correct account name.

If the correct account name was supplied, create the account before rerunning the twsinst script.

AWSFAB017E The script was unable to locate the home directory of the specified user: "user_account".

Explanation: Tivoli Workload Scheduler is installed in the home directory of the TWSUser. The installation script cannot locate the home directory of user you have nominated as the TWSUser.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, specifying the home directory of the TWSUser using the **inst_dir** parameter.

If in doubt, check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB018E The script was unable to locate the home directory of the specified user, and the installation directory has not been supplied. Supply the installation directory explicitly using the following parameter: "parameter_name".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, specifying the home directory of the TWSUser using the indicated parameter.

If in doubt, check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

AWSFAB019E The supplied target installation directory "directory_name" does not exist.

Explanation: The home directory of the TWSUser must exist before running the installation.

System action: The twsinst script cannot proceed.

Operator response: Create the home directory of the TWSUser and then rerun the twsinst script.

AWSFAB020E You are upgrading Tivoli Workload Scheduler, but the twsinst script cannot locate the configuration file "configuration_file" of the version you are upgrading.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Locate the indicated configuration file and move it to the correct directory (see the documentation for the version you are upgrading for the exact location of the configuration file). Then rerun the twsinst script.

AWSFAB021E You are trying to run an "installation_type" installation but the installation script has not found the Tivoli Workload Scheduler configuration files belonging to the existing instance.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: You can do one of the following:

- Either locate the configuration files (localopts and globalopts) and move them into the TWSHome directory before rerunning the twsinst script.
- Or, change the installation type to -new or -uninst, as appropriate, and rerun the installation.

AWSFAB022E You are running a fresh installation but the installation script has found a previous instance of Tivoli Workload Scheduler, or at least one previously installed Tivoli Workload Scheduler configuration file, in the following directory: "directory_name".

Explanation: You cannot install more than one instance of Tivoli Workload Scheduler on the same directory. If you want to perform a fresh installation into a directory that previously contained Tivoli Workload Scheduler, you must first remove any existing Tivoli Workload Scheduler configuration files.

System action: The twsinst script cannot proceed.

Operator response: You can do one of the following:

- Either uninstall the existing instance of Tivoli Workload Scheduler and then rerun the twsinst script as a fresh installation.
- Or, change the installation type to -update, -uninst, or -restore, as appropriate, and rerun the installation.
- Rename, backup, or delete all the old Tivoli Workload Scheduler configuration files.

AWSFAB023E You are trying to run a fresh installation but the installation script has found one or both of the Tivoli Workload Scheduler configuration files in the following directory: "directory_name".

Explanation: This message might indicate that a previous uninstallation of Tivoli Workload Scheduler did not complete correctly.

System action: The twsinst script cannot proceed.

Operator response: You can do one of the following:

- Either uninstall the existing instance of Tivoli Workload Scheduler and then rerun the twsinst script as a fresh installation. If you have already uninstalled the product, check the home directory of the TWSUser, and delete any files and directories there that belong to Tivoli Workload Scheduler.
- Or, change the installation type to -update, -uninst, or -restore, as appropriate, and rerun the installation.

AWSFAB024E You are performing a fresh installation, but the installation script has found a previous instance of Tivoli Workload Scheduler in the registry file. The instance belongs to the following user:"user_name" and is in the registry file: "registry_file_name".

Explanation: This message might indicate that a previous uninstallation of Tivoli Workload Scheduler did not complete correctly.

System action: The twsinst script cannot proceed.

Operator response: You can do one of the following:

- Either uninstall the existing instance of Tivoli Workload Scheduler and then rerun the twsinst script as a fresh installation.
- Or, change the installation type to -update, -uninst, or -restore, as appropriate, and rerun the installation.
- Or, edit the indicated registry file to delete the previous registry keys. See the chapter on troubleshooting the installation for a description of the registry keys.

See The chapter on troubleshooting the installation in this manual.

AWSFAB025E You are performing an update or uninstall or modify operation, but the installation script has failed to find a previous instance of Tivoli Workload Scheduler in the Tivoli Workload Scheduler registry file. The script expected to find an entry belonging to the following user:"user_name" and in the following registry file: "registry_file_name". Either the user that is performing the operation is not the owner of the existing Tivoli Workload Scheduler instance.

Explanation: Either the user that is performing the operation is not the owner of the existing Tivoli Workload Scheduler instance, or the Tivoli Workload Scheduler registry file contains incorrect information.

System action: The twsinst script cannot proceed.

Operator response: Check the indicated registry file.

- If the existing instance is registered for a different user than that running the installation, either log off and log on again as that user, or change the registry file to show your user name.
- If the existing instance is not present at all, or is corrupt, try uninstalling and reinstalling the instance.

AWSFAB026E The following parameter: "first_parameter" cannot be used with the following parameter: "second_parameter".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB027E The installation was unable to retrieve the following parameter: "parameter" from the following Tivoli Workload Scheduler configuration file: "configuration_file".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the indicated configuration file.

- If the file is corrupt or unreadable, and you have no good backup of it, you must uninstall Tivoli Workload Scheduler and make a fresh installation of it.
- If the file is readable but the indicated parameter is absent, you can add it, and rerun the twsinst script.
- If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAB028E The supplied port number is not in the range 1 - 65535.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying a value for the port number parameter in the indicated range.

AWSFAB029W The supplied port number "port_number" is normally used by other services, such as ftp, or telnet, but will be used.

Explanation: See message text.

System action: The twsinst script proceeds using the port number you supplied.

Operator response: After the installation has

completed, you might decide to change the port number to a different value by editing the localopts file. The default value for Tivoli Workload Scheduler is 31111, but you can use any value between 1 - 65535 that is not being used by another application or service.

AWSFAB030E The supplied company name too long. The limit is 40 bytes.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying a value for the company parameter which is not more than 40 bytes.

AWSFAB031E You can not promote an agent from "original_agent_type" to "promoted_agent_type".

Explanation: You can only promote a lower type of agent to a higher type. For example, you can promote a standard agent to a fault-tolerant agent, but not a fault-tolerant agent to a standard agent. If you need to do the latter, uninstall the previous agent and make a fresh installation of the new agent.

System action: The twsinst script cannot proceed.

Operator response: Either promote a different agent or uninstall the previous agent and make a fresh installation of the new agent.

AWSFAB032E The installation script was unable to obtain the name of the TWSuser group from the following component file of the existing instance of Tivoli Workload Scheduler: "component_file_name".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the indicated component file.

- If the file is corrupt or unreadable, and you have no good backup of it, you must uninstall Tivoli Workload Scheduler and make a fresh installation of it.
- If the file is readable but the indicated TWSuser group name is absent, you can add it, and rerun the twsinst script.
- If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAB035E The installation has failed. For more details see the log file: "log_file_name".

Explanation: An internal error has occurred that has caused the installation to fail.

System action: The twsinst script cannot proceed.

Operator response: Look in the log file for messages that indicate the cause of the failure. If you are able to identify and resolve the problem, rerun the installation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAB036E The uninstallation has failed. For more details see the log file: "log_file_name".

Explanation: An internal error has occurred that has caused the uninstallation to fail.

System action: The twsinst script cannot proceed.

Operator response: Look in the log file for messages that indicate the cause of the failure. If you are able to identify and resolve the problem, rerun the uninstallation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAB037E The twsinst script is being run from the wrong directory.

Explanation: You are attempting to install Tivoli Workload Scheduler on a UNIX platform using the twsinst utility copied from the installation CD to the home directory of the user that you have nominated as the TWSuser during the installation. This is not allowed.

You can run twsinst from any of the following places:

- The Tivoli Workload Scheduler CD
- A disk image of the CD
- A copy of the twsinst utility and its associated files placed in any local directory other than the home directory of the user that you have nominating as the TWSuser in the twsinst parameters.

System action: The twsinst script cannot proceed.

Operator response: Rerun the installation from a permitted directory.

AWSFAB039E The installation script was not able to locate the following file needed set up the installation environment: "file_name."

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAB040E The installation script has been run from the wrong directory. Rerun the script from the following directory:"directory_name".

Explanation: You have run the twsinst script from the home directory of a different user than that identified in the -uname parameter. If you wanted that the user identified in the -uname parameter is the TWSUser, run the installation from that user's home directory.

directory_name is the home directory of the user identified in the -uname parameter.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst installation script from the indicated directory.

AWSFAB041E The installation script has detected that at least one Tivoli Workload Scheduler process is running. No processes can be running when you perform an installation, upgrade, promotion, restore or uninstallation.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Follow the instructions in *Tivoli Workload Scheduler: Administration and Troubleshooting* to shut down all Tivoli Workload Scheduler processes.

See *Tivoli Workload Scheduler: Administration and Troubleshooting*

AWSFAB042E The installation script has detected that at least one Tivoli Workload Scheduler process is running. No processes can be running when you perform an installation, upgrade, promotion, restore or uninstallation.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Follow the instructions in *Tivoli Workload Scheduler: Administration and Troubleshooting* to shut down all Tivoli Workload Scheduler processes.

AWSFAB043W At least one warning message has been issued during the installation.

Explanation: See message text.

System action: The twsinst script proceeds.

Operator response: Check the install log file and read

the warning message or messages.

AWSFAB044W At least one warning message has been issued during the uninstallation.

Explanation: See message text.

System action: The twsinst script proceeds.

Operator response: Check the install log file and read the warning message or messages.

AWSFAB046E An inconsistent parameter has been used. You cannot specify the "parameter1" parameter when the "parameter2" parameter has been specified.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB047E An inconsistent parameter has been used. When the parameter -cputype "agent_type" is specified, the nullcpunamenu provided with the -thiscpu and the -master parameters must be different.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB048E The company name cannot contain blank characters (spaces).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying a company name that does not contain blank characters (spaces).

AWSFAB049E The installation directory cannot contain blank characters (spaces).

Explanation: If you did not specify the installation directory explicitly, it means that the home directory of the TWSuser contains blank characters (spaces).

System action: The twsinst script cannot proceed.

Operator response: If you have explicitly supplied the installation directory, rerun the twsinst script, supplying an installation directory that does not contain blank characters (spaces).

If the home directory of the TWSuser contains blank characters (spaces), choose another user as the TWSuser, or change the name of the home directory of the TWSuser to not contain blank characters (spaces).

AWSFAB050E The following parameter: "parameter" cannot contain more than "number" bytes.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying the indicated parameter with a value not more than that indicated.

AWSFAB055E The supplied installation type parameter is not correct. It must be one of the following: -new, -uninst, -update.

Explanation: See message text.

System action: The installAgent script cannot proceed.

Operator response: Check the usage of the installAgent script by referring to the installation instructions,, or use the command **installAgent -u** to the see a list of the available parameters and their values.

Rerun the installAgent script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB094E The -restore parameter cannot be used either because the previous instance of Tivoli Workload Scheduler has not yet been modified or because the new installation has completed successfully.

Explanation: The -restore parameter is only used to restore a backed-up version of a previous instance of Tivoli Workload Scheduler where an upgrade or promotion has failed, and you want to return to that previous instance.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst

script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to the see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB095E A parameter is missing. Rerun the installation script, adding the following parameter: "parameter_name".

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to the see a list of the available parameters.

Rerun the twsinst script, adding the missing parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB098E The values specified for -master and -thiscpu cannot be the same.

Explanation: If you are trying to install a master domain manager you do not supply the ""-master"" parameter. If you are trying to install a different type of agent, the ""-thiscpu"" parameter must identify the computer where you are installing the agent, and the ""-master"" parameter must identify the workstation that is its master domain manager.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying different values for the ""-master"" and ""-thiscpu"" parameters.

AWSFAB099E You have identified an instance of Tivoli Workload Scheduler that is a master domain manager, a backup master domain manager, a dynamic domain manager, a backup dynamic domain manager, an agent with a distributed connector, an agent integrated with a Tivoli Dynamic Workload Console or a Tivoli Workload Scheduler for z/OS connector. You cannot upgrade or install any of these using twsinst.

Explanation: Using twsinst you can upgrade or uninstall only the following components:

- A standard agent to a fault-tolerant agent.
- A fault-tolerant agent to a fault-tolerant agent
- A fault-tolerant agent to a domain manager or a backup domain manager

- A domain manager or backup domain manager to a domain manager or a backup domain manager
- A dynamic agent to a dynamic agent.
- A Tivoli Workload Scheduler for z/OS agent to a Tivoli Workload Scheduler for z/OS agent.

System action: The twsinst script cannot proceed.

Operator response: If you want to upgrade or uninstall a master domain manager, a backup master domain manager, a dynamic domain manager, or a backup dynamic domain manager use the installation wizard or a silent installation.

If you want to upgrade an agent with a distributed connector installed using twsinst, you must first uninstall the distributed connector using the installation wizard or a silent installation and then run twsinst again.

If you want to upgrade an agent integrated with a Tivoli Dynamic Workload Console you must first uninstall the Tivoli Dynamic Workload Console using the installation wizard or a silent installation or upgrade the Tivoli Dynamic Workload Console to the version 9.2, uninstall the old version of the Tivoli Dynamic Workload Console and upgrade the agent using twsinst.

If you want to upgrade an agent integrated with a Tivoli Workload Scheduler for z/OS connector installed using twsinst script, you must first uninstall the Tivoli Workload Scheduler for z/OS connector using the installation wizard or a silent installation and run twsinst again.

If you want to upgrade or uninstall one of the agents listed above, choose an instance on which you installed one of them and rerun the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB100E The script was unable to copy the file **maestro.tar.gz** to the Tivoli Workload Scheduler home directory (TWSHome).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that there is sufficient space available on the file system of the Tivoli Workload Scheduler home directory (TWSHome). Check that the user performing the installation has write access to TWSHome. Resolve any problem you find and rerun the script.

AWSFAB101E The script was unable to copy the file **maestro.tar.z** to the Tivoli Workload Scheduler home directory (TWSHome).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that there is sufficient space available on the file system of the Tivoli Workload Scheduler home directory (TWSHome). Check that the user performing the installation has write access to TWSHome. Resolve any problem you find and rerun the script.

AWSFAB102E The script was unable to expand the file **maestro.tar.gz** in the Tivoli Workload Scheduler home directory (TWSHome).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that there is sufficient space available on the file system of the Tivoli Workload Scheduler home directory (TWSHome). Resolve any problem you find and rerun the script.

AWSFAB103E The script was unable to expand the file **maestro.tar.z** in the Tivoli Workload Scheduler home directory (TWSHome).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that there is sufficient space available on the file system of the Tivoli Workload Scheduler home directory (TWSHome). Resolve any problem you find and rerun the script.

AWSFAB104E The script was unable to untar the file **maestro.tar.gz** in the Tivoli Workload Scheduler home directory (TWSHome).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that there is sufficient space available on the file system of the Tivoli Workload Scheduler home directory (TWSHome). Resolve any problem you find and rerun the script.

AWSFAB105E The script was unable to untar the file **maestro.tar.z** in the Tivoli Workload Scheduler home directory (TWSHome).

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that there is sufficient space available on the file system of the Tivoli Workload Scheduler home directory (TWSHome). Resolve any problem you find and rerun the script.

AWSFAB106E An incorrect value has been supplied for the parameter `-thiscpu`.

Explanation: See message.

System action: The `twsinst` script cannot proceed.

Operator response: Rerun the `twsinst` script, supplying a correct value for the `""-thiscpu""` parameter.

See The *Planning and Installation guide* for full details of the syntax of the `twsinst` script.

AWSFAB107E An incorrect value has been supplied for the parameter `-master`.

Explanation: See message.

System action: The `twsinst` script cannot proceed.

Operator response: Rerun the `twsinst` script, supplying a correct value for the `""-master""` parameter.

See The *Planning and Installation guide* for full details of the syntax of the `twsinst` script.

AWSFAB108E The option `-restore` is not allowed on operating system `"operating_system"`.

Explanation: The `-restore` operation is not allowed as a parameter to an installation performed on the indicated operating system (for example, IRIX64, OSF1 DYNIX-ptx).

System action: The `twsinst` script cannot proceed.

Operator response: If you need to restore the original installation, uninstall the upgraded installation, and then perform a manual restore of the backup image stored in the backup directory: `""twsuserdir_BACKUP""`.

AWSFAB109E You are performing an upgrade to version 9.2, but the installation script has found a previous instance of Tivoli Workload Scheduler, version 9.2 in the registry file `"registry_file"`, belonging to the same TWSUser: `"TWSUser_name"`.

Explanation: A TWSUser cannot own more than one instance of Tivoli Workload Scheduler, version 9.2, on the same workstation.

System action: The `twsinst` script cannot proceed.

Operator response: Firstly, check that the TWSUser has been typed correctly. If it is not, retry the command.

Check if you are performing the upgrade on the correct computer. If you are not, retry the upgrade from the correct computer.

If the supplied TWSUser is the one you intended, on

the correct computer, you must be in one of the following scenarios:

You are trying to upgrade an instance of Tivoli Workload Scheduler that has already been upgraded to version 9.2

Verify if this has happened as follows:

1. Check the instance of Tivoli Workload Scheduler, version 9.2 on this computer:
 - a. Go to the `nullTWSHome>` directory
 - b. Run the environment enabling script `tws_env`
 - c. Run a command such as `conman` or `composer` to display the product version.
2. If the version is 9.2 you have already upgraded the product and can quit the wizard.

You want to have two instances of the product, one of which is upgraded from a previous instance

To have two instances of the product on the same computer you must have them installed under different TWSUsers. Because you cannot change the TWSUser ID during an upgrade, you must do the following:

1. Quit this installation.
2. Uninstall the other fresh installation that you made.
3. Upgrade the old version of Tivoli Workload Scheduler
4. Install the other fresh instance using a different TWSUser.

Your environment contains traces of a previous installation of Tivoli Workload Scheduler that you thought had been completely uninstalled.

1. Look in the `registry_file` for the supplied TWSUser and determine the installation directory
2. Check if there is a valid installation in that directory.
 - If there is a valid installation of version 9.2 that you do not want, uninstall it. If it will not uninstall using the uninstaller, follow the instructions in this manual for uninstalling the product manually.
 - If there is no installation, remove the entries in the `registry_file` relating to version 9.2.
3. Rerun the upgrade.

AWSFAB110E The supplied Job Manager port number is not in the range from 1 to 65535.

Explanation: See message text.

AWSFAB111W • AWSFAB132E

System action: The twsinst script cannot proceed.

Operator response: Run the twsinst script again, supplying a value for the Job Manager port number parameter within the indicated range.

AWSFAB111W The supplied Job Manager port number "port_number" is normally used by other services, such as FTP or Telnet. The twsinst script proceeds using the Job Manager port number that you supplied.

Explanation: See message text.

System action: The twsinst script proceeds using the Job Manager port number that you supplied.

Operator response: After the installation completes, you can change the Job Manager port number to a different value by editing the JobManager.ini file. The default value for the Tivoli Workload Scheduler agent is 31114. You can use any value in the range from 1 to 65535 that is not being used by another application or service.

AWSFAB112E The supplied Job Manager port number is equal to the same as the netman port number. Specify a different value.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Specify a different value for the Job Manager port number. Run the twsinst installation again. The default value for Tivoli Workload Scheduler is 31114, but you can use any value in the range from 1 to 65535 that is not being used by another application or service.

AWSFAB120E The supplied TDWB port number is not within the valid range. The valid range is from 0 to 65535.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Run the twsinst script again, supplying a value for the DWB port number parameter within the indicated range.

AWSFAB121W The supplied DWB port number "port_number" is normally used by other services, such as FTP or Telnet. The twsinst script proceeds using the DWB port number that you supplied.

Explanation: See message text.

System action: The twsinst script proceeds using the DWB port number that you supplied.

Operator response: After the installation completes, you can change the DWB port number to a different value by editing the JobManager.ini file.

AWSFAB122E The supplied DWB port number is the same as the netman port number. Specify a different value.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Specify a different value for the TDWB port number. Run the twsinst installation again.

AWSFAB123E The supplied TDWB port number is the same as the jimport number. Specify a different value.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Specify a different value for the DWB port number. Run the twsinst installation again.

AWSFAB124E The value you specified for the "parameter" is incorrect. Valid values are true and false.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Specify ""true"" or ""false"". Run the twsinst installation again.

AWSFAB128E The value you specified for the -adjruntime is incorrect for the agent that you are installing. You can add the runtime for Java job plug-ins only to Tivoli Workload Scheduler for z/OS agents (z-centric) or to dynamic agents.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: If you are installing the fault-tolerant agent, specify ""false"" for the -adjruntime parameter or install the Tivoli Workload Scheduler for z/OS agent (z-centric) or the dynamic agent. Run the twsinst installation again.

AWSFAB132E The uninstallation process failed for one of these reasons: You logged into the system with an incorrect user You specified an incorrect username You are running the twsinst script from the wrong directory.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Either change the value of the username to the same username used during installation, or run the `""twsinst""` script from the installation folder. For details see the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

Rerun the `twsinst` script, supplying the correct parameter.

AWSFAB133E The `-password` parameter is missing.

Explanation: The indicated parameter is required for this type of installation.

System action: The `twsinst` script cannot proceed.

Operator response: Verify the usage of the `twsinst` script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command `twsinst -u` to see a list of the parameters.

Run the `twsinst` script again, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB134E You specified an incorrect password for the user "username".

Explanation: The indicated parameter is incorrect.

System action: The `twsinst` script cannot proceed.

Operator response: Run the `twsinst` script again, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB135E The "user_account" user account you supplied does not exist on the local computer. The operation cannot proceed.

Explanation: The indicated parameter is incorrect.

System action: The `twsinst` script cannot proceed.

Operator response: Run the `twsinst` script again, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB136E An error occurred when creating the "user_account" user on the local computer. The `twsinst` installation cannot proceed.

Explanation: The indicated parameter is incorrect.

System action: The `twsinst` script cannot proceed.

Operator response: Run the `twsinst` script again, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB141E An instance of Tivoli Workload Scheduler is already installed for another user in the "directory" directory you specified as installation directory.

Explanation: See message.

System action: The `twsinst` script cannot proceed.

Operator response: Specify a different installation directory and launch the installation again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB142E The directory "directory" you specified is incorrect or is not a fully qualified path.

Explanation: See text.

System action: The `twsinst` script cannot proceed.

Operator response: Specify a correct fully qualified path for the installation directory and run the installation again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB143W The user "user" is a domain user. Verify if he has all the required permissions to perform the installation.

Explanation: See text.

System action: The `twsinst` script proceeds.

Operator response: The domain user must have the following permissions:

- Act as part of the operating system
- Allow logon locally
- Impersonate a client after authentication right
- Logon:
 - Locally
 - As batch job
 - As service
- Replace process level token

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB151E The specified parameter "parameter" must have an integer value or -1.

Explanation: See text.

System action: The `twsinst` script cannot proceed.

Operator response: Run the `twsinst` script again, supplying another directory.

AWSFAB154E • AWSFAB163E

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB154E The following processes are still running "processes". Close them before running the operation again.

Explanation: See text.

System action: The twsinst script cannot proceed.

Operator response: Perform the following steps:

1. Verify which processes are still running by performing the following actions:
 - On Windows:
 - a. Open Task Manager->Processes.
 - b. Select Show processes from all users.
 - On UNIX
 - a. Run the ps -ef command.
2. Wait for processes completion or stop them.
3. Run the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB155E The following processes are still running "processes". Either close them or wait for their completion before running the operation again.

Explanation: See text.

System action: The twsinst script cannot proceed.

Operator response: Perform the following steps:

1. Verify which processes are still running by performing the following actions:
 - On Windows:
 - a. Open Task Manager->Processes.
 - b. Select Show processes from all users.
 - On UNIX
 - a. Run the ps -ef command.
2. Wait for processes completion or stop them.
3. Run the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB161E There are still jobs running. The twsinst operation cannot continue. Use the coman sj @#@.@ command to verify which jobs are still running.

Explanation: See text.

System action: The twsinst script cannot proceed.

Operator response:

1. >Use the coman sj @#@.@ command to verify which jobs are still running.
2. Wait for job completion.
3. Run the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB162E The following processes are still running. Close them before running the operation again.

Explanation: See text.

System action: The twsinst script cannot proceed.

Operator response: Perform the following steps:

1. Verify which processes are still running by performing the following actions:
 - On Windows:
 - a. Open Task Manager->Processes.
 - b. Select Show processes from all users.
 - On UNIX
 - a. Run the ps -ef command.
2. Wait for processes completion or stop them.
3. Run the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB163E The following processes are still running. Either close them or wait for their completion before running the operation again.

Explanation: See text.

System action: The twsinst script cannot proceed.

Operator response: Perform the following steps:

1. Verify which processes are still running by performing the following actions:
 - On Windows:
 - a. Open Task Manager->Processes.
 - b. Select Show processes from all users.
 - On UNIX
 - a. Run the ps -ef command.
2. Wait for processes completion or stop them.
3. Run the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB164E The values specified for "parameter1" and "parameter2" cannot be the same.

Explanation: See message.

parameter1 and *parameter2* identify two parameters that cannot have the same value.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying different values for the "" *parameter1* "" and "" *parameter2* "" parameters.

AWSFAB165E You are trying to install the standard agent or the fault-tolerant agent, from the wrong eImage.

Explanation: See message.

The eImage you downloaded does not contain the images to install the files for the standard agent or the fault-tolerant agent.

System action: The twsinst script cannot proceed.

Operator response: Download the correct eImage using the Passport Advantage Online website and run the twsinst script again.

AWSFAB166E You are trying to add the runtime for Java job plugins, but the eImage you downloaded does not contain the appropriate installation files.

Explanation: See message.

It is not possible to add the runtime for Java job plugins using the current eImage.

System action: The twsinst script cannot proceed.

Operator response: Download the Java extensions eImage using the Passport Advantage Online website and run the twsinst script again.

AWSFAB167E You are trying to upgrade or modify a standard agent or a fault-tolerant agent, but the eImage you downloaded does not contain the related installation files.

Explanation: See message.

The eImage you downloaded does not contain the images to install the files for the standard agent or the fault-tolerant agent.

System action: The twsinst script cannot proceed.

Operator response: Download the correct eImage using the Passport Advantage Online website and run the twsinst script again.

AWSFAB168E You are trying to upgrade or modify the runtime for Java job plugins, but the eImage you downloaded does not contain the related installation files.

Explanation: See message.

The eImage you downloaded does not contain the images to update the runtime for Java job plugins.

System action: The twsinst script cannot proceed.

Operator response: Download the Java extensions eImage using the Passport Advantage Online website and run the twsinst script again.

AWSFAB169E Operating system not supported.

Explanation: It is not possible to run the installation process on the operating system running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation process on one of the operating systems supported by Tivoli Workload Scheduler.

AWSFAB170E Linux distribution is not supported.

Explanation: It is not possible to run the installation process on the Linux distribution running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation process on one of the Linux distributions supported by Tivoli Workload Scheduler.

AWSFAB171E The Linux version: "operating_system" "major_version" "minor_version"; is not supported.

Explanation: It is not possible to run the installation process on the Linux version running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation on one of the Linux versions supported by Tivoli Workload Scheduler.

AWSFAB172E The Linux service pack: "operating_system" "major_version" "minor_version"; is not supported. Update the Operating system to service pack: "operating_system" "major_version" "correct_minor_version".

Explanation: It is not possible to run the installation

AWSFAB173E • AWSFAB181E

process on the Linux service pack running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation process on one of the Linux service packs supported.

AWSFAB173E Operating system version is not supported.

Explanation: It is not possible to run the installation process on the operating system version running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation process on one of the Operating System versions supported.

AWSFAB174E AIX operating system maintenance package is not supported.

Explanation: It is not possible to run the installation process on the operating system maintenance package running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation on one of the operating system maintenance packages supported.

AWSFAB175E Found library "library" but not "softlink". Softlink "softlink" to "library".

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Create the softlink to the required library.

AWSFAB176E Library libXp.so.6 and libXmu.so.6 are not found. The graphical installation process cannot work.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required libraries libXp.so.6 and libXmu.so.6.

AWSFAB177E Required libraries are not installed on the running system.

Explanation: SEE TEXT

System action: The install process cannot proceed.

Operator response: Install the required libraries on the running system.

AWSFAB178E 32-bit AIX operating system is not supported. Only AIX 64-bit system are supported by Tivoli Workload Scheduler.

Explanation: It is not possible to run the installation process on the 32-bit AIX operating system running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation on a 64-bit AIX operating system supported by Tivoli Workload Scheduler.

AWSFAB179E The AIX maintenance package "maintenance_package" is not supported. Update the running operating system to the maintenance package "maintenance_package".

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Run the installation process on one of the AIX maintenance packages supported by Tivoli Workload Scheduler.

AWSFAB180E The AIX fix "fix" was not found on the running system.

Explanation: It is not possible to run the installation process on the running AIX machine because the required fix is not installed.

System action: The installation process cannot proceed.

Operator response: Run the installation on an AIX system containing the required fixes.

AWSFAB181E C++ runtime level "runtime_level" not supported. Update the C++ runtime level to "required_runtime_level".

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Run the installation on a system having the required C++ runtime level.

AWSFAB193E The library "library" must be installed on the running system.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required libraries on the running system.

AWSFAB194E The 64 bit library "library" must be installed on the running system.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required libraries on the running system.

AWSFAB196E The patch "patch" must be installed on the running system.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required patches on the running system.

AWSFAB197E Upgrade patch "patch" "bundle" to version "version".

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required patch on the running system.

AWSFAB198E Operating system required patches are missing.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required patches on the running system.

AWSFAB199E Required cluster patch "patch" is missing.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required cluster patch on the running system.

AWSFAB200E Required security patch is missing.

Explanation: A required security patch is missing.

System action: The installation process cannot proceed.

Operator response: Install the required security patch on the running system.

AWSFAB201W WebSphere recommended patches are missing.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the recommended WebSphere patches on the running system.

AWSFAB203E Unsupported quality pack. Update the quality pack to "var1" "var2" or December 2004.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install the required quality pack on the running system.

AWSFAB205E The operating system release level is not supported. Update the release level "release_level" to "required_release_level".

Explanation: SEE TEXT

System action: The installation process cannot proceed.

Operator response: Update the operating system to a release level supported by Tivoli Workload Scheduler

AWSFAB211W The minimum required patch "patch" was not found on the running system.

Explanation: SEE TEXT.

System action: The installation process proceeds, but some errors might occur.

Operator response: Install the 19964-05 patch on the running system.

AWSFAB212E Operating system release "os_release" not supported.

Explanation: The operating system release is not supported

System action: The installation process cannot proceed.

AWSFAB213E • AWSFAB228E

Operator response: Install an operating system release supported by Tivoli Workload Scheduler.

AWSFAB213E Not enough free disk space on file system "fs". "disk_space" "ds_measure_unit" are required.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Free some space on the specified file system

AWSFAB214E Not enough free disk space on swap file system.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Free some space on the swap file system

AWSFAB215E The directory "dir" is not found.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Create the required directory

AWSFAB216E You specified a non existing installation path.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Specify an existing installation path.

AWSFAB218E Hardware "hw" not supported. The required hardware is "hw_required".

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install Tivoli Workload Scheduler on required hardware.

AWSFAB219E Hardware model "model" not supported. The required hardware model is "model_required".

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Install Tivoli Workload Scheduler on required hardware model.

AWSFAB220W Recommended memory requirements are not satisfied.

Explanation: SEE TEXT.

System action: The installation process continues, but some problems might occur.

Operator response: Increase the quantity of memory to satisfy the recommended requirements.

AWSFAB221E The Memory requirements are not satisfied. The minimum requirement is "min_mem" Kbytes and recommended is "rec_mem" Kbytes.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Increase the quantity of memory to satisfy the minimum or the recommended memory requirements.

AWSFAB224W Kernel parameter "kparam" not defined.

Explanation: The kernel parameter is not defined.

System action: The installation process continues, but some problems might occur.

Operator response: Specify the requested kernel parameter.

AWSFAB225E Kernel parameter "kparam" not defined.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Specify the required kernel parameter.

AWSFAB228E Required kernel parameter(s) not defined.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Specify the required kernel parameters.

AWSFAB229W Recommended kernel parameters are not defined.

Explanation: SEE TEXT.

System action: The installation process continues, but some problems might occur.

Operator response: Specify the recommended kernel parameters.

AWSFAB230W Some prerequisites were not satisfied during the check, look at the log for more details.

Explanation: SEE TEXT.

System action: The installation process continues, but some problems might occur.

Operator response: Look at the log for more details.

AWSFAB231E The prerequisites scan detected missing prerequisites. Check the prerequisites scan logs, precheck_result.txt and result.txt, located in the "installation_log" folder, for details. Install the missing prerequisites and rerun the installation command. If no prerequisites are missing, rerun the installation command with the -skipcheckprereq option.

Explanation: SEE TEXT.

System action: If you specified the -skipcheckprereq flag, the installation continues, otherwise it stops.

Operator response: Consult the result.txt file for any missing prerequisites. Install the missing prerequisites and then run the installation procedure again with the -skipcheckprereq flag.

AWSFAB233W The free disk space available on the swap file system does not meet the recommended requirements.

Explanation: SEE TEXT.

System action: The installation process continues, but some problems might occur.

Operator response: Free some space on the swap file system

AWSFAB236E You are trying to install or upgrade a Tivoli Workload Scheduler instance from the wrong eImage for the target operating system.

Explanation: See message.

The current eImage is not the appropriate one for your operating system.

System action: The twsinst script cannot proceed.

Operator response: Download the correct eImage and run the twsinst script again.

AWSFAB237E You are trying to upgrade or modify the Tivoli Workload Scheduler for z/OS agent (z-centric), but the images on the workstation do not contain the related installation files.

Explanation: See message.

The images on the workstation do not contain the files, needed to upgrade the Tivoli Workload Scheduler for z/OS agent.

System action: The twsinst script cannot proceed.

Operator response: Download the Tivoli Workload Scheduler for z/OS agent eImage using the Passport Advantage Online website or copy the images from the Tivoli Workload Scheduler for z/OS agent DVD and run the twsinst script again.

AWSFAB238E You are trying to install the Tivoli Workload Scheduler dynamic agent, but you did not specify the -tdwbport nullport_numbernull installation parameter with a nullport_numbernull value different from 0.

Explanation: See message.

You have not specified the installation parameter ""-tdwbport nullport_numbernull"" to install the Tivoli Workload Scheduler dynamic agent.

System action: The twsinst script cannot proceed.

Operator response: Specify the installation parameter ""-tdwbport nullport_numbernull"" with a ""nullport_numbernull"" value different from ""0"" and run the twsinst script again.

AWSFAB239W You are installing a dynamic agent but you provided some parameters that are not necessary for the dynamic agent installation. These parameters are ignored.

Explanation: SEE TEXT.

System action: The installation process continues and the unnecessary parameters are ignored.

Operator response: None.

AWSFAB240W You are installing a fault-tolerant agent but you provided some parameters that are not necessary for a fault-tolerant agent installation. These parameters are ignored.

Explanation: SEE TEXT.

AWSFAB243E • AWSFAB286E

System action: The installation process continues and the unnecessary parameters are ignored.

Operator response: None.

AWSFAB243E An error occurred running the option that recreates the Tivoli Workload Scheduler installation on the specified path "twa_path". Check the installation log for details.

Explanation: SEE TEXT.

System action: The installation process cannot proceed.

Operator response: Specify an existing installation path.

AWSFAB246E The value you specified for the -addjruntime is incorrect for the fault-tolerant agent that you are upgrading. You can add the runtime for Java job plug-ins only to dynamic agents. To install and configure a dynamic agent during upgrade you must specify the -tdwbpport nullport_numbernull parameter with a nullport_numbernull value different from 0.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: If you are upgrading the fault-tolerant agent, specify "false" for the -addjruntime parameter or install the dynamic agent specifying the "-tdwbpport nullport_numbernull" parameter with a "nullport_numbernull" value different from "0". Run the twsinst installation again.

AWSFAB247E The user account you specified: "user_account" is a reserved IBM i User Profile. You cannot use a reserved account. Specify an existing user account different from the following reserved accounts: QDBSHR, QDFTOWN, QDOC, QLPAUTO, QLPINSTALL, QRJE, QSECOFR, QSPL, QSYS, QTSTRQS.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that the correct account name was supplied. If it was not, rerun the twsinst script, supplying the correct account name.

Check that the supplied account name is not a reserved IBM i User Profile. You cannot use a reserved account. Run the twsinst script again, specifying an existing user account different from the following reserved accounts:

""QDBSHR"", ""QDFTOWN"", ""QDOC"",
""QLPAUTO"", ""QLPINSTALL"", ""QRJE"",
""QSECOFR"", ""QSPL"", ""QSYS"", ""QTSTRQS"".

The account must exist before rerunning the twsinst script.

AWSFAB248E There is already the IBM i "user_account" library in the system. You must rename or remove the library, or you must specify a different user account.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Specify a library that does not exist or supply a different account name.

AWSFAB249E 32-bit "os" operating system is not supported. Only "os" 64-bit system are supported by Tivoli Workload Scheduler.

Explanation: See message text.

System action: The installation process cannot proceed.

Operator response: Run the installation on a 64-bit operating system supported by Tivoli Workload Scheduler. See the Detailed System requirement for a complete list of the supported operating systems and the H/W and S/W requirements.

AWSFAB284E The Linux "operating_system" service pack "minor_version" is not supported. Update the Operating system to service pack "correct_minor_version".

Explanation: It is not possible to run the installation process on the Linux service pack running on this machine.

System action: The installation process cannot proceed.

Operator response: Run the installation process on one of the Linux service packs supported.

AWSFAB286E The elmage on your workstation is corrupt. You must run the TAR command on QP2TERM or AIXTERM shell to untar the elmage otherwise your "script_name" script fails.

Explanation: See message text.

System action: The installation process cannot proceed.

Operator response: You must run the TAR command on QP2TERM or AIXTERM shell to untar the elmage otherwise your installation fails.

AWSFAB287E The current shell is not supported for "script_name" script. Use QSH shell to run the "script_name" script.

Explanation: See message text.

System action: The installation process cannot proceed.

Operator response: Use QSH shell to run the installation process.

AWSFAB289W The Java extension is already installed for the user "user_name" that you specified.

Explanation: See message.

System action: The installation process proceeds and it does not install the java extension.

Operator response: Check the install log file and read the warning message or messages.

AWSFAB290E You are modifying a product version different from 9.2. The modify action can be applied only to a Tivoli Workload Scheduler, version 9.2 instance.

Explanation: See message.

System action: The installation process cannot proceed.

Operator response: Specify another user or another instance and rerun the operation.

AWSFAB294E The value you specified for -addjruntime is incorrect for the agent, version 9.2 that you are modifying. You can add the runtime for Java job plug-ins only to dynamic agents or Tivoli Workload Scheduler for z/OS agents with dynamic capabilities. For fault-tolerant agents and Tivoli Workload Scheduler for z/OS agents you must enable the dynamic capabilities before performing a modify.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: To solve the problem, specify ""false"" for the -addjruntime parameter or enable the dynamic capabilities. Run the twsinst script again.

For more information about how to enable dynamic scheduling, see the Planning and Installation Guide.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB295W You can add the runtime for Java job plug-ins only to dynamic agents or Tivoli Workload Scheduler for z/OS agents with dynamic capabilities. For fault-tolerant agents and Tivoli Workload Scheduler for z/OS agents you must enable the dynamic capabilities before running the upgrade. The step to add the runtime for Java job plug-ins is ignored.

Explanation: See message text.

System action: The installation process proceeds without installing the java extension.

Operator response: To add the runtime for Java job plug-ins, enable the dynamic capabilities. Run the twsinst script after the upgrade with the -modify and -addjruntime parameters.

For more information about how to enable dynamic scheduling, see the Planning and Installation Guide.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB296E The operation -restore for the user "user_name" cannot be performed, because the instance you want to restore is not at version "version" or later.

Explanation: The -restore operation can be performed only if the instance is at version 9.1 or later.

System action: The installation process cannot proceed.

Operator response: Install version 9.1 or later.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB303E The parameter "parameter_name" is invalid.

Explanation: See message.

parameter_name identifies the parameter that is invalid.

System action: The twsClusterUpg script cannot proceed.

Operator response: Run the twsClusterUpg script again, supplying a different value for the ""*parameter_name*"" parameter.

AWSFAB304E You cannot specify the -passwords parameter if you do not specify the -groups parameter.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, supplying both the parameters.

AWSFAB305E You specified an invalid path. The specified path "`path_name`" is not valid either because it does not exist or because it does not contain the file `twsinst.vbs`.

Explanation: See message.

`path_name` identify the path that is not valid.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Rrun the `twsClusterUpg` script again, supplying the path that contains the file `twsinst.vbs`.

AWSFAB306E If you specify the "`par1_name`" parameter, you must also specify the "`par2_name`".

Explanation: See message.

`par1_name` and `par2_name` identify the two parameters that must be specified together.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, supplying both the parameters.

AWSFAB307E You cannot specify the "`par1_name`" parameter, because this image is the General Availability version image.

Explanation: See message.

`par1_name` is the parameter that you cannot specify.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, removing the parameter.

AWSFAB308E This is the General Availability image, you must specify the "`par1_name`" parameter.

Explanation: See message.

`par1_name` is the parameter that you must specify.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, supplying the missing parameter.

AWSFAB309E You supplied the parameter "`par1_name`" more than once.

Explanation: See message.

`par1_name` is the parameter specified more than once.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, supplying the parameter only once.

AWSFAB310E You did not specify any values for the parameter "`par1_name`". Specify a value for the parameter "`par1_name`".

Explanation: See message.

`par1_name` is the parameter for which you did not specify a value.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, supplying a value for the parameter.

AWSFAB311E The syntax you specified for the parameter "`par1_name`" value is incorrect.

Explanation: See message.

`par1_name` is the parameter whose value contains errors.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: Run the `twsClusterUpg` script again, specifying a valid value for the parameter.

AWSFAB312E An error occurred while using the Windows Management Instrumentation (WMI) service. Error code: "`err_code`".

Explanation: See message.

`error_code` is the Microsoft error code that the script received.

System action: The `twsClusterUpg` script cannot proceed.

Operator response: See in the Microsoft documentation for the solution to solve the error.

AWSFAB314W The group named "`group_name`" is not upgraded because it contains more than one Tivoli Workload Scheduler resource.

Explanation: See message.

`group_name` is the group that is not upgraded.

System action: The twsClusterUpg script continues with the next group.

Operator response: Upgrade manually the group that the script could not upgrade automatically when the procedure completes the automatic upgrade.

AWSFAB315E The group named "group_name" is not upgraded because it does not contain a Tivoli Workload Scheduler resource.

Explanation: See message.

group_name is the group that does not contain any Tivoli Workload Scheduler resource.

System action: The twsClusterUpg script cannot proceed.

Operator response: Rrun the twsClusterUpg script again, removing the group that does not contain any Tivoli Workload Scheduler resources.

AWSFAB316E The group named "group_name" is not upgraded because it contains more than one Tivoli Workload Scheduler resource.

Explanation: See message.

group_name is the group that you specified for upgrade that contains more than one Tivoli Workload Scheduler resource.

System action: The twsClusterUpg script cannot proceed.

Operator response: From the list of the groups to upgrade, remove the group that contains more than one Tivoli Workload Scheduler resource, then upgrade manually when the procedure completes the automatic upgrade.

AWSFAB317E An error occurred while running the cluster.exe command.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB318E An internal error occurred while parsing the node names.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB320E The product cannot pause the node "node_name" because it is in the incorrect status "status".

Explanation: See message.

node_name is the node that cannot be paused.

status is the incorrect status.

System action: The twsClusterUpg script cannot proceed.

Operator response: Verify with the Cluster Administrator the status of the node.

AWSFAB321W The resume of the node "node_name" is not performed because it is in the status "status".

Explanation: See message.

node_name is the node that cannot be resumed.

status is the incorrect status.

System action: The twsClusterUpg script cannot proceed.

Operator response: Verify with the Cluster Administrator the status of the node.

AWSFAB322W The resume of the nodes is not performed, because some groups were not upgraded successfully.

Explanation: See message.

System action: The twsClusterUpg script completed.

Operator response: Verify the message above for details about the failures, and correct them. Then resume the nodes.

AWSFAB324E An error occurred while pausing the node "node_name"

Explanation: See message.

node_name is the node that cannot be paused.

System action: The twsClusterUpg script cannot proceed.

Operator response: Verify the status of the node. Put it in pause status and run the command again.

AWSFAB326E The product cannot retrieve the status of the node "node_name".

Explanation: See message.

node_name is the node whose status cannot be retrieved.

System action: The twsClusterUpg script cannot proceed.

Operator response: Verify with the Cluster Administrator the status of the node.

AWSFAB327E The node "node_name" was not paused within the timeout period.

Explanation: See message.

node_name is the node that cannot be paused within the timeout period.

System action: The twsClusterUpg script cannot proceed.

Operator response: Pause the node manually and rrun the script again.

AWSFAB329E An error occurred while resuming node "node_name"

Explanation: See message.

node_name is the node that cannot be resumed.

System action: The twsClusterUpg script cannot proceed.

Operator response: Check with the Cluster Administrator the status of the node.

AWSFAB330E The node "node_name" was not resumed within the timeout period.

Explanation: See message.

node_name is the node that cannot be resumed within the timeout period.

System action: The twsClusterUpg script cannot proceed.

Operator response: Check with the Cluster Administrator the status of the node.

AWSFAB331E An internal error occurred while parsing the nodes and the group lists.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these

commands failed, analyze its corresponding log for further details.

AWSFAB332E An internal error occurred while parsing the nodes and the resource lists.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB333E The product cannot find the Tivoli Workload Scheduler resource DLL path.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze the corresponding log for further details.

AWSFAB337E An error occurred while setting the resource "resource_name" to offline.

Explanation: See message.

resource_name is the resource that cannot be taken offline.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB338E The product cannot retrieve the status of the resource "resource_name".

Explanation: See message.

resource_name is the resource whose status cannot be retrieved.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB339E The resource "resource_name" was not set to offline within the timeout period.

Explanation: See message.

resource_name is the resource that cannot be taken offline within the timeout period.

System action: The twsClusterUpg script cannot proceed.

Operator response: Check with the Cluster Administrator the status of the resource.

AWSFAB341E An error occurred while setting the resource "resource_name" to online.

Explanation: See message.

resource_name is the resource that cannot be taken online.

System action: The twsClusterUpg completed, but the specified resource was not set to online.

Operator response: Check with the Cluster Administrator the status of the resource.

AWSFAB342E The resource "resource_name" was not set to online within the timeout period.

Explanation: See message.

resource_name is the resource that cannot be taken online within the timeout period.

System action: The twsClusterUpg completed, but the specified resource was not set to online.

Operator response: Check with the Cluster Administrator the status of the resource.

AWSFAB343E An internal error occurred while parsing resources and group lists.

Explanation: See message.

System action: The twsClusterUpg script cannot proceed.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB346E The cluster group "group_name" was not upgraded successfully.

Explanation: See message.

group_name is the group that was not upgraded successfully.

System action: The twsClusterUpg script continues with the remaining groups.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB349E The file "file_name" does not exist, the tool cannot upgrade the resource "resource_name".

Explanation: See message.

file_name is the file that cannot be accessed.

resource_name is the resource that is not upgraded.

System action: The twsClusterUpg script continues with the remaining groups.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB350E The product cannot find the version of the Tivoli Workload Scheduler resource DLL "file_name".

Explanation: See message.

file_name is the Tivoli Workload Scheduler DLL file name.

System action: The twsClusterUpg script continues with the remaining groups.

Operator response: For further information, see the TWSClusterMainLog.txt log. The twsClusterUpg command launches the twsinst.vbs, twspatch.vbs, and the twsClusterAdm.exe commands. If the TWSClusterMainLog.txt indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB352E The upgrade to version "version" is impossible because the version of the product present in the instance is incorrect.

Explanation: See message.

version is the version to which the upgrade is being attempted.

System action: The `twClusterUpg` script continues with the remaining groups.

Operator response: For further information, see the `TWClusterMainLog.txt` log. The `twClusterUpg` command launches the `twinst.vbs`, `twspatch.vbs`, and the `twClusterAdm.exe` commands. If the `TWClusterMainLog.txt` indicated that one of these commands failed, analyze its corresponding log for further details.

AWSFAB356E The number of passwords ("pws_num") that you specified, is not equal to the number of groups ("grp_num") that must be upgraded. Check the -groups and -passwords parameters.

Explanation: See message.

pws_num is the number of provided passwords.

grp_num is the number of provided groups.

System action: The `twClusterUpg` script cannot proceed.

Operator response: Run the `twClusterUpg` script again, supplying an equal number of passwords and groups.

AWSFAB357E None of the groups you specified contain Tivoli Workload Scheduler resources.

Explanation: See message.

System action: The `twClusterUpg` script cannot proceed.

Operator response: Run the `twClusterUpg` script again, supplying at least one group containin a Tivoli Workload Scheduler resource.

AWSFAB374E JM port is already used in some other instance. Please specify some other port value.

Explanation: See message text.

System action: The `twinst` script cannot proceed.

Operator response: Rerun the `twinst` script, supplying a value for the port number parameter in the indicated range.

AWSFAB375E An error occurred when creating the "directory" folder on the local computer. The operating system error is: "error". The `twinst` installation cannot proceed.

Explanation: See message text.

System action: The `twinst` script cannot proceed.

Operator response: Analyze the cause of the failure in the output of the script. Solve the problem and rerun the script. A possible cause of failure is that you do not have the correct permission to create the directory.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB380E A parameter to `twinst` has not been supplied. The "installation_parameter" parameter must be specified when "installation_parameter2" parameter is supplied.

Explanation: The *installation_parameter* is a parameter that you did not supplied, that is required when *installation_parameter2* parameter is supplied.

System action: The `twinst` script cannot proceed.

Operator response: Check the usage of the `twinst` script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command `twinst -u` to see a list of the available parameters.

Rerun the `twinst` script, supplying the required parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB381E An instance of Tivoli Workload Scheduler is already installed for same user in the "directory" directory you specified as installation directory.

Explanation: See message.

System action: The `twinst` script cannot proceed.

Operator response: Specify a different user and launch the installation again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB382E Accept the license and terms conditions before proceeding with the installation.

Explanation: See message.

System action: The `twinst` script cannot proceed.

Operator response: Accept the license and terms conditions specifying the parameter `-acceptlicense yes`.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB383E An incorrect value has been supplied for the parameter `gwid`. The accepted values must start with either a letter or underscore (`_`) and may contain only letters, digits, underscores (`_`), hyphens (`-`), and periods (`.`).

Explanation: See message text.

System action: The `twinsinst` script cannot proceed.

Operator response: Check the usage of the `twinsinst` script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command `twinsinst -u` to see a list of the available parameters.

Rerun the `twinsinst` script, supplying the correct parameter value.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB384E It is not possible to retrieve the domain name for the user "user". Check user rights and permissions.

Explanation: See message.

System action: The `twinsinst` script cannot proceed.

Operator response: Check user rights and permissions.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB385E If you specify the `-domain` parameter you cannot specify the username in the format `domain\username`.

Explanation: See message.

System action: The `twinsinst` script cannot proceed.

Operator response: Verify the syntax of the script, make the necessary changes and run the script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB386E It is not possible to retrieve the domain name for the user "user". Check user rights and permissions.

Explanation: See message.

System action: The `twinsinst` script cannot proceed.

Operator response: Verify the user rights and permissions, make the necessary changes, and run the script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB389E You can specify the "parameter1" parameter only when the "parameter2" parameter has been specified.

Explanation: See message text.

System action: The `twinsinst` script cannot proceed.

Operator response: Check the usage of the `twinsinst` script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command `twinsinst -u` to see a list of the available parameters.

Rerun the `twinsinst` script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB403W You upgraded PeopleSoft method. In order to continue schedule PeopleSoft jobs you have to copy `psjoa.jar` file under "parameter1" folder.

Explanation: See message text.

System action: Copy `psjoa.jar` file under `methods` folder in the installation directory.

Operator response: Copy `psjoa.jar` file under `methods` folder in the installation directory.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAB404E The installation cannot run because the user running the `twinsinst` installation script must either be the root user or the same user specified for the `uname` parameter.

Explanation: See message text.

System action: The `twinsinst` script cannot proceed.

Operator response: Login as the "root" user and rerun the `twinsinst` script specifying the correct account name in the "uname" parameter.

The account must exist before rerunning the `twinsinst` script.

Login as the the correct account name and rerun the `twinsinst` script without specifying the "uname" parameter.

AWSFAB405E No root installation is supported only for dynamic agent installation.

Explanation: See message text.

System action: The `twinsinst` script cannot proceed.

Operator response: If you need to install a Tivoli Workload Scheduler fault-tolerant agent or both Tivoli Workload Scheduler fault-tolerant agent and Tivoli Workload Scheduler dynamic agent, login as the

AWSFAB406E • AWSFAB411E

""root"" user and rerun the twsinst script specifying the account name in the ""uname"" parameter.

The account must exist before rerunning the twsinst script.

AWSFAB406E Tivoli Workload Scheduler dynamic agent instance can be updated only by the same user who previously installed it.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: If you need to update or uninstall a Tivoli Workload Scheduler dynamic agent, login as the ""InstallationLoginUser"" user and rerun the twsinst script.

The ""InstallationLoginUser"" is logged into the JobManager.ini file.

AWSFAB407W You are proceeding with the installation process in spite of missing prerequisites being detected by the prerequisites scan.

Explanation: SEE TEXT.

System action: If you specified the -skipcheckprereq flag the installation continue, otherwise it stops.

Operator response: Consult the result.txt file for the missing prerequisites. Install the missing prerequisites and then run the installation procedure again with the -skipcheckprereq flag.

AWSFAB408W The prerequisites scan detected missing prerequisites. Check the prerequisite scan logs, precheck_result.txt and result.txt, located in the installation log folder, for details. Installation will continue because the missing prerequisites do not affect the installation process.

Explanation: SEE TEXT.

System action: If you specified the -skipcheckprereq flag the installation continue, otherwise it stops.

Operator response: Consult the result.txt file for the missing prerequisites. Install the missing prerequisites and then run the installation procedure again with the -skipcheckprereq flag.

AWSFAB409E Home directory for the user "user" does not exist. Please create it and then run the installation procedure again.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Create the home directory for the installing user or run the installation procedure with the -inst_dir option for specifying a different installation folder.

AWSFAB411E gateway_eif_port port is already used by another process. Please specify some other port value.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst script, supplying a value for the port number parameter in the indicated range.

Chapter 176. AWSFAF - Installation messages (fix pack)

This section lists error and warning messages that might be issued when using the script to install a fix pack for the product.

The message component code is FAF.

AWSFAF003E The twspatch script cannot run on this operating system: "operating_system".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check in the *readme* file supplied with the fix pack for details of supported platforms.

See *readme* file.

AWSFAF004E Only the user root can run the twspatch script.

Explanation: See message text

System action: The twspatch script cannot proceed.

Operator response: Login as the ""root"" user and rerun the twspatch script.

AWSFAF005E No parameters have been specified for twspatch.

Explanation: The twspatch script needs to be supplied with at least one parameter.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* file supplied with the fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter.

See *readme* file.

AWSFAF007E The supplied installation type parameter is not correct. It must be one of the following: -install, -undo, -commit, -remove, -repair.

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* file supplied with the fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter.

See *readme* file.

AWSFAF008E More than one installation type parameter has been supplied. Supply only one of the following: -install, -undo, -commit, -remove, -repair.

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* file supplied with the fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter.

See *readme* file.

AWSFAF009E A parameter to twspatch has been supplied that is not appropriate for the supplied installation type. Specify the "installation_parameter" parameter only when "installation_type" installation type is specified.

Explanation: The *installation_parameter* is a parameter that you supplied, that is not appropriate for the supplied installation type.

The *installation_type* is a list of the only installation types with which you can use the supplied *installation_parameter*.

System action: The twsinst script cannot proceed.

Operator response: Check the usage of the twsinst script by referring to the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*, or use the command **twsinst -u** to see a list of the available parameters.

Rerun the twsinst script, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAF010E An incorrect value has been supplied for a parameter. The parameter must be

as follows: "installation_parameter".

Explanation: The parameter you have supplied is correct, and is valid for this installation type. However, the value supplied for the parameter is not correct.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* supplied with this fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter value.

See *readme* file.

AWSFAF011E The following parameter has been supplied more than once: "installation_parameter".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* file supplied with this fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter.

See *readme* file.

AWSFAF012E The twspatch fix pack installation cannot be used because the Tivoli Workload Scheduler registry file is missing.

Explanation: The Tivoli Workload Scheduler registry file contains the relevant information that the fix pack installation uses to identify and update the existing instance. Without it, the installation cannot go ahead.

System action: The twspatch script cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF014E The following is not a recognizable installation parameter "installation_parameter".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* file supplied with the fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter.

See *readme* file.

AWSFAF015E The -uname option is missing.

Explanation: The indicated parameter is required for this installation type.

System action: The twspatch script cannot proceed.

Operator response: Check the usage of the twspatch script by referring to the *readme* supplied with this fix pack, or use the command **twspatch -u** to see a list of the available parameters.

Rerun the twspatch script, supplying the correct parameter.

See *readme* file.

AWSFAF016E You supplied a user account that does not exist on the local computer or that contains an invalid character: "user_account". Create the user account before running twsinst, or verify that it does not contain an invalid character.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Check that the correct account name was supplied. If it was not, rerun the twsinst script, supplying the correct account name.

If the correct account name was supplied, create the account before rerunning the twsinst script.

AWSFAF017E The script was unable to locate the home directory of the specified user: "user_account".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: The script has located an entry for the user in the Tivoli Workload Scheduler registry, but the directory that the entry points to does not contain an instance of a previous version of Tivoli Workload Scheduler. Check that a previous installation of Tivoli Workload Scheduler exists in the indicated directory. If the instance for the supplied user exists, but in a different directory, modify the entry in the Tivoli Workload Scheduler registry file to identify the correct installation directory and rerun the script.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF019E The script was unable to determine the installation type from the Tivoli Workload Scheduler registry file "file".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF020E The script was unable to find the configuration file "configuration_file" of the Tivoli Workload Scheduler instance to which you want to apply the fix pack.

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Locate the indicated configuration file and move it to the correct directory (see the documentation for the version you are upgrading for the exact location of the configuration file). Then rerun the twsinst script.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF021E The script has located an entry for the user in the Tivoli Workload Scheduler registry, but the directory that the entry points to does not contain an instance of a previous version of Tivoli Workload Scheduler. Check that a previous installation of Tivoli Workload Scheduler exists in the directory "directory". If the instance for the supplied user exists, but in a different directory, modify the entry in the Tivoli Workload Scheduler registry file to identify the correct installation directory and rerun the script.

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check that a previous installation of Tivoli Workload Scheduler exists in the indicated directory. If the instance for the supplied user exists, but in a different directory, modify the entry in the Tivoli Workload Scheduler registry file to identify the correct installation directory and rerun the script.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF022E The script was unable to determine the installation directory from the Tivoli Workload Scheduler registry file "file".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: The script could not find an entry for the user in the Tivoli Workload Scheduler registry file. Check that you have entered the user name correctly. Check that the supplied user owns a previous version of Tivoli Workload Scheduler installed in his or her home directory. Check that the Tivoli Workload Scheduler registry file contains an entry for the installation directory for this user. If you have identified the wrong user, rerun the patch installation. If the correct user has been identified, and owns an old instance of Tivoli Workload Scheduler, but the registry has no entry for that user, you cannot install the patch.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF023E The installed component (workstation type) "installed_component" in the Tivoli Workload Scheduler registry file "file" is not valid.

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF025E No previous instances of Tivoli Workload Scheduler belonging to the supplied user "user" have been detected in the Tivoli Workload Scheduler registry file "file".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: Check that the supplied user is the correct owner of the instance of Tivoli Workload Scheduler on this computer. If not, resubmit the script supplying the correct user.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF027E The "installation_type" fix pack installation has failed. For more details see the log file "file".

Explanation: See message text.

System action: The twspatch script stops without

successfully installing the fix pack.

Operator response: This message will have been preceded by other messages explaining the nature of the failure. Follow the Operator Response of those messages to determine the appropriate action.

AWSFAF028W At least one warning message was issued during the "installation_type" fix pack installation.

Explanation: See message text.

System action: The twspatch script stops. The fix pack has been installed, but one or more warnings were issued.

Operator response: This message will have been preceded by the specific warning messages. Follow the Operator Response of those messages to determine the appropriate action.

AWSFAF030E The twspatch script is being run from the wrong directory.

Explanation: This depends on the type of installation you are performing:

-install or -repair

You might be attempting to install a fix pack for Tivoli Workload Scheduler on a UNIX platform using the twspatch utility copied from the installation CD to the home directory of the TWSuser. This is not allowed.

You can run twspatch from any of the following places:

- The Tivoli Workload Scheduler fix pack CD
- A disk image of the CD
- A copy of the twspatch utility and its associated files placed in any local directory other than the home directory of the TWSuser.

-undo, -commit, or -repair

These installation types must be run from the copy of the twspatch utility that has been installed for you in the home directory of the TWSuser.

System action: The twspatch script cannot proceed.

Operator response: Rerun the fix pack installation from a permitted directory.

AWSFAF032E The installation script was not able to locate the file "file" needed set up the operation environment "operation_environment".

Explanation: See message text.

System action: The twspatch script cannot proceed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFAF033E The installation script has been run from the wrong directory. You must run the script from the following directory:"directory_name".

Explanation: The ""-undo"", ""-commit"", or ""-repair"" installation types must be run from the copy of the twspatch utility that has been installed for you in the home directory of the TWSuser.

System action: The twsinst script cannot proceed.

Operator response: Rerun the twsinst installation script from the indicated directory.

AWSFAF034W The remove operation has been completed successfully. The Tivoli Workload Scheduler instance belonging to the user "user" is now unusable. You must recover the previous installation from backup.

Explanation: See message text.

System action: The twspatch script has completed successfully and has removed the instance of Tivoli Workload Scheduler.

Operator response: You must now recover the previous instance of Tivoli Workload Scheduler from backup.

AWSFAF037E The twspatch script is being run from the wrong directory.

Explanation: See message.

System action: The twspatch script cannot proceed.

Operator response: Run twspatch directly from the product CD. If the computer where you are installing the product does not have a CD drive, copy either an image of the CD or just the platform-specific folder to the target computer; place them anywhere other than the home directory of the ""TWSuser"".

AWSFAF046E The "user_account" user account you supplied does not exist on the local computer. The patching cannot proceed.

Explanation: The indicated parameter is incorrect.

System action: The twspatch script cannot proceed.

Operator response: Run the twspatch script again, supplying the correct parameter.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAF047E You specified an incorrect password for the user "username".

Explanation: The indicated parameter is incorrect.

System action: The twsinst script cannot proceed.

Operator response: Run the twsinst script again, supplying the correct password.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

AWSFAF132E The uninstallation failed. Either you specified an incorrect username or you are running the twspatch script from the wrong directory.

Explanation: See message text.

System action: The twsinst script cannot proceed.

Operator response: Either change the value of the username to the same username used during installation, or run the ""twsinst"" script from the installation folder. For details see the *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

Rerun the twsinst script, supplying the correct parameter.

AWSFAF161E There are still jobs running. The twspatch operation cannot continue. Use the coman sj @#@.@ command to verify which jobs are still running.

Explanation: See text.

System action: The twspatch script cannot proceed.

Operator response:

1. >Use the coman sj @#@.@ command to verify which jobs are still running.
2. Wait for job completion.
3. Run the twsinst script again.

See *IBM Tivoli Workload Scheduler: Planning and Installation Guide*

Chapter 177. AWSFMP - File monitor plug-in messages

This section lists error and warning messages that might be generated when using the file monitor plug-in.

The message component code is FMP.

AWSFMP001E The filtering value "expression" is not valid for the filtering attribute "attribute" for the event "event" defined in the plug-in "plug-in".

Explanation: See message.

System action: The event rule cannot be saved.

Operator response: Specify a valid filtering value and retry the operation.

AWSFMP002E Only one instance of the filtering attribute "attribute" is supported for the event "event" defined in the plug-in "plug-in".

Explanation: See message.

System action: The event rule cannot be saved.

Operator response: Specify the event with only one filtering attribute and retry the operation.

Chapter 178. AWSFWD - event forwarder plug-in messages

This section lists error and warning messages that might be generated when using the event forwarder plug-in.

The message component code is FWD.

AWSFWD102E The Tivoli Workload Scheduler event "event" has not been forwarded to the Tivoli Enterprise Console server. The return code is: "return_code".

Explanation: See message.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFWD103E The Tivoli Workload Scheduler event has not been forwarded to the Tivoli Enterprise Console server. The reason is: "reason".

Explanation: See message.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFWD104E The action type "action_type" is not supported.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSFWD105E The Tivoli Workload Scheduler event has been not forwarded to the Tivoli Enterprise Console server because the Tivoli Enterprise Console agent has not been initialized.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Initialize the Tivoli Enterprise Console agent.

Chapter 179. AWSGAP - Generic action messages

This section lists error and warning messages that might be generated when using the generic action processing.

The message component code is GAP.

AWSGAP002E An error occurred performing the action. The reason is: "reason".

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check all the parameters related to this action and ensure that they are correct. Retry the action.

AWSGAP003E The action cannot be performed because a valid command has not been supplied (it is null or empty).

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the command and verify that it is neither null nor empty.

AWSGAP004E The action type is not valid. It must be: `GeneralAction`.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Supply the correct action type and revalidate the action.

AWSGAP005E The plug-in name is not valid. It must be `GenericActionPlugin`.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Supply the correct plug-in name and revalidate the action.

AWSGAP006E The command argument is not valid. It must not be empty.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Supply the correct command argument and revalidate the action.

AWSGAP007E The value "env_var_value" specified for the environment variable "env_var_key" in the Generic action plug-in exceeds the maximum allowed size of "max_size" KBytes.

Explanation: The value you specified for the environment variable exceeds the maximum supported size.

System action: The operation cannot be performed.

Operator response: Reduce the size of the environment variable and retry the operation.

Chapter 180. AWSGEP - Generic event plug-in messages

This section lists error and warning messages that might be generated when using the generic event plug-in.

The message component code is GEP.

AWSGEP001E A security error has occurred. The user "user_name" is not allowed to modify the event plug-in configuration.

Explanation: See message.

user_name identifies the user who is requesting to modify the plug-in configuration.

System action: The operation is not completed.

Operator response: Either give the user who wants to modify the event plug-in configuration the appropriate rights, or retry the operation with a user which has the appropriate rights.

AWSGEP002E The following error in the XML format of the event plug-in configuration has been verified: "parser_message".

Explanation: See message.

parser_message is the error message received from the XML parser.

System action: The operation is not completed.

Operator response: Correct the event plug-in configuration XML structure and retry the operation.

AWSGEP003E Event name "event_name" is duplicated in the event plug-in configuration.

Explanation: See message.

event_name is the name of an event defined in the plug-in configuration.

System action: The operation is not completed.

Operator response: Remove the duplicate event reference in the event plug-in configuration, and retry the operation.

AWSGEP004E Incorrect plug-in name: "current_plug-in_name". The name of the plug-in specified in the configuration must be "expected_plug-in_name".

Explanation: See message text.

current_plug-in_name is the name of the event plug-in defined in the configuration.

expected_plug-in_name is the required name for the event plug-in.

System action: The operation is not completed.

Operator response: Correct the plug-in name in the event plug-in configuration, and retry the operation.

AWSGEP005E The specified configuration is null or empty.

Explanation: See message text.

System action: The operation is not completed.

Operator response: Supply the data for the event plug-in configuration, and retry the operation.

AWSGEP006E An internal error has occurred. The schema referenced in the event plug-in configuration is null or empty.

Explanation: See message.

System action: The operation is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSGEP007E Parameter "parameter_name" is duplicated in the event definition.

Explanation: See message.

parameter_name identifies an event parameter defined in the plug-in configuration.

System action: The operation is not completed.

Operator response: Remove the duplicate parameter reference in the event plug-in configuration, and retry the operation.

AWSGEP008E The following internal error has occurred: "error_message"

Explanation: See message.

error_message is the internal error message.

System action: The operation is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 181. AWSGTW - Gentwsevn messages

This section lists error and warning messages that might be generated when using the gentwseven program that generates events.

The message component code is GTW.

AWSGTW101E The specified parameter "parameter" is not valid.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify a supported parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW102E The arguments exceed the maximum input size.

Explanation: See message.

System action: The operation is not performed.

Operator response: Use the correct input size.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW103E The parameter "parameter" has been specified more than once.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify the parameter only once.

AWSGTW104E The parameters "parameter1" and "parameter2" are specified in the wrong order.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify the parameters in the correct order.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW105E The value specified for the parameter "parameter" is not valid.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify a supported value for the specified parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW106E The mandatory parameters "parameter1" and "parameter2" are missing.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify all required parameters.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW107E The format of the argument "argument" is not valid.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify a valid format for the specified parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW108E Parameter "parameter" has a missing value.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify a value for the specified parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW109E The following error occurred while opening the configuration file "file_name": "error_message".

Explanation: See message.

System action: The operation is not performed.

Operator response: Use the information in the *error_message* to solve the problem that prevented the

AWSGTW110E • AWSGTW121E

file from being opened. Retry the operation.

AWSGTW110E The following error occurred while writing the configuration file "file_name": "error_message".

Explanation: See message.

System action: The operation is not performed.

Operator response: Use the information in the *error_message* to solve the problem that prevented the file from being written. Retry the operation.

AWSGTW111E An internal error has occurred. An error occurred while initializing the Tivoli Enterprise Console agent.

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSGTW112E An internal error has occurred. An error occurred while creating the Event Integration Facility handle.

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSGTW114E An error occurred while sending the event.

Explanation: See message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSGTW116E The mandatory parameter "parameter" is missing.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify the mandatory parameter and retry the operation.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSGTW117E An internal error has occurred. Sendevent encountered the following error when attempting to open the Symphony file: "error_message".

Explanation: *error_message* contains the operating system error message.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSGTW118W An internal error has occurred. The event has not been sent. Instead it has been cached in the file "cache_file".

Explanation: *cache_file* is the cache file.

System action: The operation is not performed.

Operator response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSGTW120E The following error occurred while opening the template configuration file "file_name": "error_message".

Explanation: See message.

System action: The operation is not performed.

Operator response: Use the information in the *error_message* to solve the problem that prevented the file from being opened. Retry the operation.

AWSGTW121E The parameters "parameter_1" and "parameter_2" cannot both be specified.

Explanation: See message.

System action: The operation is not performed.

Operator response: Specify only one of the indicated parameters.

See *The User's Guide and Reference* for full details of the parameters for sendevent.

Chapter 182. AWSITA - Job management messages

This section lists error and warning messages that might be generated by the routines that handle job management.

The message component code is ITA.

AWSITA001E The command is incorrect and cannot be processed.

Explanation: There is an error in the communication protocol utilized.

System action: The action is not performed.

Operator response: If the user was trying to connect to the agent through the APIs, the developer should check the protocol utilized.

AWSITA002E Cannot save the job with ID "job_id" in the job store.

Explanation: An error occurred while saving the job instance in the job store of the agent. The job store is a persistent hashtable implemented on the file system.

System action: The job is not submitted to the endpoint.

Operator response: Check the trace file.

AWSITA003E Cannot cancel the job with ID "job_id" because it is not present in the agent job store.

Explanation: An error occurred while retrieving the job instance in the job store of the agent. The job store is a persistent hashtable implemented on the file system.

This can happen if the job is not valid, if the job was already archived, or if the job store is incorrectly structured.

More detailed information about this error is available in the trace file on the agent.

System action: The job is not cancelled.

Operator response: If the job is not valid, this is more likely a script error. If the job was archived, no action is required.

AWSITA004E Cannot find the executor for the job with ID "job_id".

Explanation: This can happen only if there is an inconsistency in the job store or if the job instance in the job store points to an executable that is no longer available.

System action: The job is not cancelled.

Operator response: If a patch was rolled back, reapply the patch before cancelling this job.

AWSITA005E Unable to create the spool directory "spool_directory" to store the output data of the job. The error is "error_message".

Explanation: The agent was creating a directory to store the output and the results of the jobs, but there was an error while creating this directory.

System action: The job cannot run.

Operator response: Check the error message.

AWSITA007E Cannot get the output of the job with ID "job_id" because it is not available in the agent job store.

Explanation: An error occurred while retrieving the job instance in the job store of the agent. The job store is a persistent hashtable implemented on the file system.

This can happen if the job is not valid, if the job was already archived, or if the job store is incorrectly structured.

More detailed information about this error is available in the trace file on the agent.

System action: None

Operator response: If the job is not valid, this is more likely a script error. If the job was archived, no action is required.

AWSITA008E Cannot find the executor for the job with ID "job_id".

Explanation: This can happen only if there is an inconsistency in the job store or if the job instance in the job store is referring to an executable that is no longer available.

System action: None

Operator response: If a patch was rolled back, reapply the patch before getting the job output.

AWSITA009E Unable to start the task launcher "task_launcher_binary" to store the output data of the job. The error is "error_message".

Explanation: The agent is attempting to start the task launcher but the process fails.

System action: The job cannot run.

Operator response: Check the error message.

AWSITA010W The job has completed or was previously cancelled.

Explanation: The job has either completed or was previously cancelled.

System action: None

Operator response: None

AWSITA011E The job definition is missing from the job submit operation.

Explanation: This error is due to a protocol error in the job submit operation.

System action: The job is not submitted to the endpoint.

Operator response: If the user was trying to connect to the agent through the APIs, the developer should check that the jmgr:JobDefinitionDocument stanza is present.

AWSITA012E The job cancel task failed while it was getting the information to connect to the job monitor. The error is "error_message".

Explanation: An error occurred while cancelling the job on the agent.

System action: The job is not cancelled.

Operator response: Check the error message.

AWSITA013E The job cancel task failed while it was creating a connection to the job monitor. The error is "error_message".

Explanation: An error occurred while cancelling the job on the agent.

System action: The job is not cancelled.

Operator response: Check the error message.

AWSITA014E The job cancel task failed while it was connecting to the job monitor. The error is "error_message".

Explanation: An error occurred while cancelling the job on the agent.

System action: The job is not cancelled.

Operator response: Check the error message.

AWSITA015E The job cancel task failed while it was contacting the job monitor. The error is "error_message".

Explanation: An error occurred while cancelling the job on the agent.

System action: The job is not cancelled.

Operator response: Check the error message.

AWSITA016E The job cancel task failed to reconnect to the job monitor. The error is "error_message".

Explanation: An error occurred while cancelling the job on the agent.

System action: The job is not cancelled.

Operator response: Check the error message.

AWSITA017E The job cancel task failed while it was sending the cancel command to the job monitor. The error is "error_message".

Explanation: An error occurred while cancelling the job on the agent.

System action: The job is not cancelled.

Operator response: Check the error message.

AWSITA018E Unable to get the job output because of a problem while reading the "output_file" output file. The error is "error_message".

Explanation: The agent returned an error while it was creating a UTF8 version of the output file.

System action: The job output is not returned.

Operator response: Check the agent trace file.

AWSITA019E The get job output task failed while it was opening the output file. The error is "error_message".

Explanation: The agent failed to open the converted version of the output file.

System action: The job output is not returned.

Operator response: Check the error message.

AWSITA020E The get job output task failed because the start parameter value looks higher than the output length. The error is "error_message".

Explanation: The agent failed to find the start position

inside the utf8 conversion file of the job output.

System action: The job output is not returned.

Operator response: Check the error message.

AWSITA021E The get job output task failed because it ran into an error as it was reading the output file. The error is "error_message".

Explanation: The agent failed to read the utf8 conversion file of the job output.

System action: The job output is not returned.

Operator response: Check the error message.

AWSITA022E Unable to get the job output because the "output_file" output file does not exist.

Explanation: The output file does not exist. This can only happen if the job did not start.

System action: The job output is not returned.

Operator response: Check the agent trace file.

AWSITA023E Cannot get the output of the job with ID "job_id" because the job has not started yet.

Explanation: The output file does not exist because the job has not started yet.

System action: The job output is not returned.

Operator response: None.

AWSITA024E The job failed to start because the error "error_message" was returned while preparing the process attributes of the task launcher.

Explanation: There was an internal error while creating the process attributes of the task launcher.

System action: The job is not started.

Operator response: Check the error message.

AWSITA025E The job failed to start because the error "error_message" was returned while setting the process attributes of the task launcher.

Explanation: There was an internal error while setting the process attributes of the task launcher.

System action: The job is not started.

Operator response: Check the error message.

AWSITA026E The job failed to start because the error "error_message" was returned while setting the command type of the task launcher.

Explanation: There was an internal error while setting the process command type of the task launcher.

System action: The job is not started.

Operator response: Check the error message.

AWSITA027E The job failed to start because the error "error_message" was returned while creating the arguments to drive the task launcher.

Explanation: There was an internal error while creating the arguments to drive of the taks launcher.

System action: The job is not started.

Operator response: Check the error message.

AWSITA028E The job failed to start. The following error has been generated: "error_description".

Explanation: The job failed to start. See the error message to find what went wrong.

System action: The job is not started.

Operator response: Check the error message.

AWSITA029E The job has terminated with signal "signal_number".

Explanation: The job was killed by a signal.

System action: The job was killed by a signal.

Operator response: See the job log.

AWSITA030E The job failed.

Explanation: The job failed.

System action: The job failed.

Operator response: See the job log.

AWSITA032E The job with ID "job_id" failed to start. The error is "error_message".

Explanation: The error returned in the error message occurred while starting the job.

System action: The job is not started.

Operator response: Check the error message.

AWSITA033E The job with ID "job_id" completed with error: "error_message".

Explanation: The error returned in the error message occurred while the job was running.

System action: The job completed but returned an error.

Operator response: Check the error message

AWSITA036W Cannot get the status of the job with ID "job_id". The error is "error_message".

Explanation: The task launcher is not returning the status of the job.

System action: The job completed but returned an error.

Operator response: Check the job trace file or job output to understand if the job completed and if it succeeded or not.

AWSITA037E Failed to create the memory pool of the thread that will execute the job. The error is "error_message".

Explanation: The job manager was allocating a memory pool for the thread of the task launcher, but there was an error while allocating this memory pool.

System action: The job will not start.

Operator response: Check the error message.

AWSITA038E Failed to schedule the thread that will execute the job. The error is "error_message".

Explanation: The job manager was scheduling the thread of the task launcher, but there was an error.

System action: The job will not start.

Operator response: Check the error message.

AWSITA039E Cannot find the executor for application "application_name".

Explanation: This can happen only if the application in the JSDL is not supported.

System action: The job is not started.

Operator response: Modify the job definition.

AWSITA040E Cannot save the job with ID "job_id" in the job store.

Explanation: An error occurred while saving the job instance in the job store of the agent. The job store is a persistent hashtable implemented on the file system.

System action: The result is unpredictable.

Operator response: Check the trace file.

AWSITA041E Unable to get the list of the jobs because the error: "error_message" was returned while reading the job store file with key"key".

Explanation: The job store is corrupted or cannot be accessed.

System action: The job list is not returned.

Operator response: Check the error message.

AWSITA042E Failed to create the memory pool of the job manager thread. The error is "error_message".

Explanation: An error occurred while the job manager was allocating a memory pool for a thread needed to reconnect the task launcher to the jobs.

System action: The jobs are not archived and the job manager is not contacting the task launcher of the jobs that are running when the job manager is started.

Operator response: Check the error message.

AWSITA043E The job manager failed schedule the thread needed to reconnect the task launcher to the jobs. The error is "error_message".

Explanation: An error occurred while the job manager was starting a thread needed to reconnect the task launcher to the jobs.

System action: The jobs are not archived and the job manager is not contacting the task launcher of the jobs that are running when the job manager is started.

Operator response: Check the error message.

AWSITA044E Failed to create the memory pool for the thread that will reconnect to the task launcher of the job with ID "job_id". The error is "error_message".

Explanation: An error occurred while the job manager was allocating a memory pool for the thread of the task launcher.

System action: The job will not be monitored.

Operator response: Check the error message and restart the agent to attempt to reconnect again.

AWSITA045E Failed to create the thread that will reconnect to the the job with ID "job_id". The error is "error_message".

Explanation: An error occurred while the job manager was starting the thread of the task launcher.

System action: The job will not be monitored.

Operator response: Check the error message and restart the agent to attempt to reconnect again.

AWSITA046E Cannot find the executor for the job with ID "job_id" while reconnecting to the task launcher.

Explanation: This can happen only if there is an inconsistency in the job store or if the job instance in the job store is referring to an executable that is no longer available.

System action: The job will not be monitored.

Operator response: If a patch was rolled back, apply the patch and then restart the agent.

AWSITA048E The subagent cannot be created. The error is "error_message". The error code is "error_code".

Explanation: The subagent cannot be created due to the reason detailed in the error message.

System action: The agent is not started.

Operator response: Check the error message and restart the agent.

AWSITA049E Cannot create the memory pool to handle the connection. The error is "error_message". The error code is "error_code".

Explanation: The subagent cannot be created due to the reason detailed in the error message.

System action: The agent is not started.

Operator response: Check the error message and restart the agent.

AWSITA051E The agent failed to accept connections. The error is "error_message". The error code is "error_code".

Explanation: The error message provides details.

System action: The request is not served and the agent will attempt a new connection in 10 seconds.

Operator response: Check the error message and restart the agent.

AWSITA053E The agent failed to create the thread needed to handle the request. The error is "error_message". The error code is "error_code".

Explanation: The error message provides details.

System action: The request is not served and the agent will attempt a new connection in 10 seconds.

Operator response: Check the error message.

AWSITA054E The task type "task_type" specified within the definition of the extended agent job with ID "job_id" is either unknown or unsupported.

Explanation: An invalid task type was specified in the job definition.

System action: The job does not start.

Operator response: Open the extended agent job definition and correct the task type.

AWSITA055E An error occurred while waiting to receive the IP address from where the task launcher will listen when it communicates with the job manager. The error is "error_message".

Explanation: The task launcher did not return to the job manager the IP address from where it is going to listen. The reason for this error is to be looked for in the task launcher.

System action: The job is not started.

Operator response: Check both the error message and the task launcher log located in the job output directory.

AWSITA056E An error occurred while waiting to receive the IP port where the task launcher will listen when it communicates with the job manager. The error is "error_message".

Explanation: The task launcher did not return to the job manager the IP port from where it is going to listen. The reason for this error is to be looked for in the task launcher.

System action: The job is not started.

Operator response: Check both the error message and the task launcher log located in the job output directory.

AWSITA057E A request was made to reconnect to job "job_id" that is not running.

Explanation: The job manager is trying to reconnect to a job that is not in the EXECUTING state. This error should not take place.

System action: The job manager does not reconnect to this job.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA058E Reconnection to job "job_id" failed while getting the information to connect to the job monitor. The error is "error_message".

Explanation: An error occurred while reconnecting the job on the agent.

System action: The job is not reconnected to the endpoint.

Operator response: Check the error message.

AWSITA059E Reconnection to job "job_id" failed while creating the connection to the job monitor. The error is "error_message".

Explanation: An error occurred while reconnecting the job on the agent.

System action: The job is not reconnected to the endpoint.

Operator response: Check the error message.

AWSITA060E Reconnection to job "job_id" failed while connecting to the job monitor. The error is "error_message".

Explanation: An error occurred while reconnecting the job on the agent.

System action: The job is not reconnected to the endpoint.

Operator response: Check the error message.

AWSITA061E The access method specified to launch "job_id" is unknown. Check either the JobManager.ini file on the agent or the job definition.

Explanation: An unknown target or access method is specified in the job definition.

System action: The job is not started.

Operator response: Check that the target job in the extended agent is correct in the job definition. Verify that the JobManager.ini file on the agent points to the correct access method.

AWSITA062E The options file of extended agent "target_name" includes option UTF8cmdline set to 1, which is not supported. Set it to 0 and rerun the job.

Explanation: See message.

System action: The job is not started.

Operator response: Correct the options file in the extended agent by setting UTF8cmdline equal to zero.

AWSITA063E Could not change to the specified working directory.

Explanation: See message..

System action: The job does not run.

Operator response: Check the path of the working directory specified in the JSDL definition.

AWSITA064E The login user specified in the job definition could not authenticate on the agent

Explanation: See message..

System action: The job does not run.

Operator response: Check the login user specified in the job definition. For Windows job types, ensure that the user was correctly configured.

AWSITA065E The group name is incorrect.

Explanation: See message..

System action: The job does not run.

Operator response: Check the group name specified in the JSDL definition.

AWSITA066E Privileged user is not allowed to run jobs on this executor.

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA067E An error occurred setting the process group ID.

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA068E An error occurred setting the process user ID.

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA069E Job monitor internal error (return code "error_code")

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA070E Cannot open the specified input file.

Explanation: See message..

System action: The job does not run.

Operator response: Check the path of the input file specified in the JSDL definition.

AWSITA071E Cannot open the internal output log file.

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA072E Cannot open the internal error log file.

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA073E Cannot open the specified output file.

Explanation: See message..

System action: The job does not run.

Operator response: Check the path of the output file specified in the JSDL definition.

AWSITA074E Cannot open the specified error file.

Explanation: See message..

System action: The job does not run.

Operator response: Check the path of the error file specified in the JSDL definition.

AWSITA075E Error creating the job process (return code "error_code").

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA077E Abnormal end of job (the exit code is the termination signal number).

Explanation: See message..

System action:

Operator response:

AWSITA079E Unable to convert a specified parameter to the local codeset.

Explanation: See message..

System action: The job does not run.

Operator response:

AWSITA080E The Job Executor Agent cannot find the executable file specified in the JSDL definition.

Explanation: See message..

System action: The job does not run.

Operator response: Check the path to the executable file specified in the JSDL definition. In the Job Brokering Definition Console, this path is specified in the Executable File field in the Application pane. If the executable is a shell command, change the executable type to ""Script"" in the Application pane of the Job Brokering Definition Console.

For further troubleshooting, check the trace.log file for this job.

AWSITA081E The agent can not send the resource information to "server_uri". The error is: "error_message".

System action: The resource information is not sent to the server. If the error persists, the agent is down.

Operator response: Analyze the error and perform the correct action.

AWSITA082E The agent got an error response while sending the resource information to the server. The error code is "error_code" and the error message is "error_message".

Explanation: See message..

System action: The resource information is not sent to the server. If this error persists, the computer system will result as unavailable.

Operator response: None

AWSITA084W The Resource Advisor Agent is disabled and will not start. Check the ResourceAdvisorUrl property in the JobManager.ini file.

Explanation: The user disabled the Resource Advisor Agent in the JobManager.ini file.

System action: The Resource Advisor Agent does not start and the agent is not available on the workload broker.

Operator response: Set the ResourceAdvisorUrl in the

JobManager.ini file to a valid value to enable the Resource Advisor Agent.

AWSITA085E Failed to create the memory pool of the command handler thread. The error is "error_message".

Explanation: An error occurred while the command handler was allocating a memory pool.

System action: The agent does not start.

Operator response: Check the error message.

AWSITA086E Failed to create the thread pool of the Job Manager. The error is "error_message".

Explanation: An error occurred while the job manager was creating a thread pool.

System action: The agent does not start

Operator response: Check the error message.

AWSITA087E Failed to create the memory pool of the Job Status Notification Manager. The error is "error_message".

Explanation: An error occurred while the Job Status Notification Manager was allocating a memory pool.

System action: The job status change events are not sent to the server.

Operator response: Check the error message.

AWSITA088E Failed to create the thread pool of the Job Status Notification Manager. The error is "error_message".

Explanation: An error occurred while the Job Status Notification Manager was creating the thread pool.

System action: The job status change events are not sent to the server.

Operator response: Check the error message.

AWSITA089E The thread of the Job Status Notification Manager failed to start. The error is "error_message".

Explanation: An error occurred while starting Job Notifier.

System action: The job status change events are not sent to the server.

Operator response: Check the error message.

AWSITA091W The Job Status Notification Manager is already running.

Explanation: An unexpected attempt to start the Job Status Notification Manager occurred.

System action: None.

Operator response: None.

AWSITA093W The thread of the Job Status Notification Manager is already stopped.

Explanation: An unexpected attempt to stop the Job Status Notification Manager occurred.

System action: None.

Operator response: None.

AWSITA094E Failed to schedule the thread that will send notification for the job status changes. The error is "error_message".

Explanation: The Job Status Notification Manager was scheduling the thread to send the job status change to the server, but there was an error.

System action: The job status change is not sent.

Operator response: Check the error message.

AWSITA095E Unable to change the following configuration properties: "error_message".

Explanation: The name of the listed properties is invalid or an error occurred while they were being updated.

System action: The listed properties will not be updated

Operator response: Check the correct name of the listed properties.

AWSITA096E An error occurred while waiting to receive the local job process id. The error is "error_message".

Explanation: The task launcher did not return to the job manager the local job process id. The reason for this error is to be looked for in the task launcher.

System action: The job is not started.

Operator response: Check both the error message and the task launcher log located in the job output directory.

AWSITA097E Unable to cancel the job because the specified job ID is not valid.

Explanation: The job ID contains invalid or unexpected characters.

System action: The job is not cancelled.

Operator response: Check the correct syntax of the job ID.

AWSITA098E Unable to get the job output because the specified job ID is not valid.

Explanation: The job ID contains invalid or unexpected characters.

System action: The job output is not returned.

Operator response: Check the correct syntax of the job ID.

AWSITA099E Unable to get the job properties because the specified job ID is not valid.

Explanation: The job ID contains invalid or unexpected characters.

System action: The job properties are not returned.

Operator response: Check the correct syntax of the job ID.

AWSITA100E Unable to get the job(s) properties because the specified job alias "job_alias" is not valid.

Explanation: The job alias contains invalid or unexpected characters.

System action: The job(s) properties are not returned.

Operator response: Check the correct syntax of the job alias.

AWSITA101E Unable to get the job(s) properties because the specified job status "job_status" is not valid.

Explanation: The job status contains invalid or unexpected characters.

System action: The job(s) properties are not returned.

Operator response: Check the correct syntax of the job status.

AWSITA102E Unable to change the configuration properties because the specified XML request "xml_request" is not valid.

Explanation: The XML request contains invalid or unexpected characters/sections.

System action: The configuration properties are not changed.

Operator response: Check the correct syntax of the XML request.

AWSITA103E Unable to perform the dynamic resources scan. The error is "error_message".

Explanation: See message..

System action: The dynamic resources scan is not performed.

Operator response: None

AWSITA104E Unable to perform the system resources scan. The error is "error_message".

Explanation: See message..

System action: The system resources scan is not performed.

Operator response: None

AWSITA105E Unable to notify scan results to the server because of a resources scanner error.

Explanation: See message..

System action: The scan results are not sent to the server.

Operator response: None

AWSITA106E The agent failed to accept a connection.

Explanation: The agent process returned a NULL while accepting a connection.

System action: The request is not served and the agent will attempt a new connection in 10 seconds.

Operator response: None.

AWSITA107E Could not load the library "library name". The error is "error_message".

Explanation: There was an error loading a dynamic library.

System action: A library was not loaded.

Operator response: Check the error message.

AWSITA108E Unable to get port information from URI "uri_value".

Explanation: Port information is missing or not valid.

AWSITA110E • AWSITA124E

System action: The attempt to connect to the URI failed.

Operator response: Check that the port information is specified correctly in the URI.

AWSITA110E Unable to send the notification of status of the job with ID "job_id" to the URI "uri_value".

Explanation: The URI is not valid or the server accepting connections on that URI is down

System action: The attempt to connect to the URI failed.

Operator response: Check that the URI is valid and/or that the server accepting connections on that URI is up and running.

AWSITA114E The job cannot start since the user is missing in the job definition.

Explanation: If the "RequireUserName" variable is set to true in the JobManager.ini configuration file, the user name is required in the job definition.

System action: The job is not started.

Operator response: Change the job definition or disable the "RequireUserName" setting in the JobManager.ini configuration file.

AWSITA117E The Java method call request is not correct: "elem" is missing.

Explanation: The XML request does not contain a required sections.

System action: The method call is not performed.

Operator response: Check the correct syntax of the XML request.

AWSITA118E A Java Exception occurred while running job "job". "error"

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA119E A Java exception occurred while retrieving the output of job "job". "error"

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA120E A Java exception occurred while retrieving the length of the output of job "job". "error"

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA121E An error occurred while calling a Java method: "elem" is null.

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA122E A Java exception occurred while calling the command "command". "error"

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA123E A Java Exception occurred while canceling job "job". "error"

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA124E A Java Exception occurred in "method". "error"

Explanation: An unexpected error occurred while running a Java method.

System action: The Java method does not complete.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA125E Cannot find a suitable application job plug-in for "plug-in".

Explanation: The agent is attempting to call a command on application job plug-in that is not available.

System action: The command is not completed.

Operator response: Verify that you are calling the command on the correct agent.

AWSITA126E Malformed JSON string: error "error" at position "position".

Explanation: See message..

System action: The command is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA127E Access Method field is empty.

Explanation: The required field ""access method"" was not filled before invoking the picklist.

System action: The command is not completed.

Operator response: Verify if you filled the access method field before running picklist.

AWSITA128E No method found.

Explanation: The methods directory is empty or not accessible.

System action: The command is not completed.

Operator response: Verify if the methods directory is empty or not accessible.

AWSITA129E No option file found for the method "string".

Explanation: The method does not have options files.

System action: The command is not completed.

Operator response: Verify if the methods has options files.

AWSITA130E The option file "string" does not exist.

Explanation: See message..

System action: The command is not completed.

Operator response: Verify if the specified option file exists.

AWSITA131E The option file "string" is too big.

Explanation: See message..

System action: The command is not completed.

Operator response: Verify the size of the option file.

AWSITA132E Unable to access to the option file "string".

Explanation: See message..

System action: The option file is accessible.

Operator response: Verify if the specified option file is accessible.

AWSITA139E The requested operation cannot be completed. The error is: "error_msg"

Explanation: See message..

System action: The command is not completed.

Operator response: Verify the parameters passed to the operation.

AWSITA140E Option File field is empty.

Explanation: The field ""option file"" was not filled before invoking the picklist.

System action: The command is not completed.

Operator response: Verify if you filled the option file field before running picklist.

AWSITA141E The job cannot start because the job definition does not include either the executable or the script field.

Explanation: Field ""executable"" or ""script"" is required in the job definition.

System action: The job is not started.

Operator response: Change the job definition.

AWSITA142E Missing variable name after "string" option.

Explanation: See message..

System action: The command is not completed.

Operator response: Specify the variable name after the option flag.

AWSITA143E Unexpected command argument(s) found.

Explanation: See message..

System action: The command is not completed.

Operator response: Run the command with the -u option to see the command usage and then look for the incorrect argument(s).

AWSITA145E The value cannot be empty.

Explanation: See message..

System action: The command is not completed.

Operator response: Enter a value for the variable.

AWSITA147E Unknown option "string".

Explanation: See message..

System action: The command is not completed.

Operator response: Run the command with the -u option to see the command usage and then specify a valid option.

AWSITA150E Cannot set variable "string" to value "string" because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA151E Cannot get the value of variable "string" because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA152E Cannot remove variable "string" because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA153E Unable to load the "string" variables file because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA154E Unable to update the "string" variables file because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA155E Cannot get the namespace details for variable "string".

Explanation: See message..

System action: The command is not completed.

Operator response: Ensure that the syntax of the variable name follows the `""[[nullfilename>.]nullsectionname>.]nullvariablename>""` pattern. You can omit the filename only if the variable is located in the jm_variables default file. You can omit the section name only if the variable is not within a section. Retry the command using wildcard *; for example, `*.*.nullvariablename>`.

AWSITA156E Cannot find variable "string"."string"."string".

Explanation: See message..

System action: The command is not completed.

Operator response: Ensure that you entered the correct file name, section name, and variable name.

AWSITA157E Cannot find section "string" within file "string".

Explanation: See message..

System action: The command is not completed.

Operator response: Ensure that you entered the correct section name.

AWSITA158E Cannot get a list of the sections of file "string".

Explanation: See message..

System action: The command is not completed.

Operator response: Check that you entered the command correctly. Run the command with the -u option to see the command usage.

AWSITA159E Cannot encrypt variable "string"."string"."string".

Explanation: The encrypting algorithm ran into an error.

System action: The variable is not defined.

Operator response: Use the param command to delete the variable and define it once again.

AWSITA160E Cannot decrypt the variable "string"."string"."string".

Explanation: The decrypting algorithm ran into an error.

System action: The variable is not decrypted.

Operator response: Use the param command to delete the variable and define it once again.

AWSITA161E Unable to create directory "string" to store the variables file. The error is: "string"

Explanation: The agent ran into an error while creating the directory for the variables file.

System action: The command was unsuccessful and the variable was not created.

Operator response: Check the error message and take action.

AWSITA162E Cannot create variable "string"."string"."string".

Explanation: See message..

System action: The command is not completed.

Operator response: Check that you entered the command correctly. Run the command with the -u option to see the command usage.

AWSITA163E Cannot create variable "string" because the '*' and/or '?' characters are included in its name.

Explanation: The asterisk and question mark are used as wildcard characters to list or delete variables or their namespaces and cannot be used to define them.

System action: The command is not completed.

Operator response: Check that no '*' and/or '?' chars are contained within the variable name.

AWSITA164E Cannot remove variable "string"."string"."string".

Explanation: See message..

System action: The command is not completed.

Operator response: Check that you entered the command correctly. Run the command with the -u option to see the command usage.

AWSITA165E Variable syntax error. End tag "string" not found.

Explanation: An agent variable has the following syntax: \${agent:nullvariable>}, but the end tag was not found.

System action: The action is not completed.

Operator response: Check the agent variable syntax.

AWSITA166E Cannot set the following variables: "string"

Explanation: See message..

System action: The action is not completed.

Operator response: Check the error messages for each variable.

AWSITA167E Cannot set the variables because the specified XML request "string" is not valid or is empty.

Explanation: See message..

System action: The action is not completed.

Operator response: Check that the XML request is valid and not empty.

AWSITA172E The value you entered does not match the previous value.

Explanation: See message..

System action: The action is not completed.

Operator response: Check that the entered values are the same.

AWSITA173E Cannot update the specified trace property value because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA174E Cannot obtain the trace properties values because of this error: "string"

Explanation: See message..

System action: The command is not completed.

Operator response: Check the error message and take action.

AWSITA177E The value specified for command argument "string" must be a positive integer.

Explanation: See message..

System action: The command is not completed.

Operator response: Enter a positive integer for the trace property value.

AWSITA178E The value specified for variable "string" exceeds the allowed maximum size.

Explanation: See message..

System action: The command is not completed.

Operator response: Enter a value with a smaller length

AWSITA179E Cannot find variable "string".

Explanation: See message..

System action: The command is not completed.

Operator response: Ensure that the variable specified exists.

AWSITA180E Cannot obtain a valid date from variable "string" value.

Explanation: See message..

System action: The command is not completed.

Operator response: Ensure that the variable value is correct.

AWSITA181E Cannot obtain the value of parameter "string" from url.

Explanation: See message..

System action: The command is not completed.

Operator response: Ensure that all parameters are correctly specified.

AWSITA182E Unable to fill the job header because the specified job ID is not valid.

Explanation: The job ID contains invalid or unexpected characters.

System action: The command is not completed.

Operator response: Check the correct syntax of the job ID.

AWSITA184E Cannot invoke the rerun or restart command for the job with ID "jobId" because it is not available in the agent job store.

Explanation: See message..

System action: The job is not restarted.

Operator response: Make sure the MaxAge parameters is correctly configured in the JobManager.ini file.

AWSITA185E Malformed JSON string restarting the job: error "error" at position "position".The json string with the error is "jsonString"

Explanation: See message..

System action: The job is not restarted.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>..

AWSITA186E Malformed JSON string restarting the job: the parameter "parameter" is missing.The json string with the error is "jsonString"

Explanation: See message..

System action: The job is not restarted.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>..

AWSITA187E Malformed JSON string invoking a job command: error "error" at position "position".The json string with the error is "jsonString"

Explanation: See message..

System action: The job action is not executed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>..

AWSITA188E The rerun action cannot be performed because the job is still running or did not start yet.

Explanation: This can happen if a the rerun action is invoked from different users at the same time.

System action: The rerun is not executed.

Operator response: Check the job status an

AWSITA189E The rerun action cannot be performed because of errors accessing the agent job store.

Explanation: See message..

System action: The rerun is not executed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>..

AWSITA190E The rerun action cannot be performed because there was an error saving the job with ID "job_id" in the job store.

Explanation: An error occurred while saving the job instance in the job store of the agent. The job store is a persistent hashtable implemented on the file system.

System action: The rerun is not executed.

Operator response: Check the trace file.

AWSITA191E You specified the parameter "parameter_name" without the required argument.

Explanation: See message..

System action: The command does not run.

Operator response: Add the missing parameter and run the command again.

AWSITA192E You specified the same parameter "parameter_name" twice.

Explanation: See message..

System action: The command does not run.

Operator response: Remove the duplicated parameter and run the command again.

AWSITA193E You specified two mutually exclusive parameters.

Explanation: See message..

System action: The command does not run.

Operator response: Verify the syntax of command using the -u option. Resubmit the command specifying only one of the two parameters.

AWSITA194E The .ini file "property_file" cannot be loaded. The error is: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Perform the action indicated in the error message and submit the command again.

AWSITA195E You specified an invalid port number "port_number".

Explanation: See message..

System action: The command does not run.

Operator response: Modify the command syntax specifying a valid port number and submit the command again.

AWSITA196E You specified an invalid protocol "protocol". Valid values are http and https.

Explanation: See message..

System action: The command does not run.

Operator response: Modify the command syntax specifying a valid protocol and submit the command again.

AWSITA197E The property "file"."section"."property" cannot be loaded from the .ini file "iniFile".

Explanation: See message..

System action: The command does not run.

Operator response: Open the ini file and add the required property.

AWSITA198E You did not specify a value for the port number, either in the command line arguments or in the .ini file.

Explanation: See message..

System action: The command does not run.

Operator response: Modify the command syntax by specifying a valid port number or add the required property in the .ini file and submit the command again.

AWSITA199E An internal error occurred when configuring the open SSL communication.

Explanation: See message..

System action: The command does not run.

Operator response: Verify that the password_file property was set correctly in the .ini file.

AWSITA200E An error occurred when contacting the agent at the following address: "protocol":/"hostname":"port". The error is: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Verify that the agent is up and running, that the port you specified is correct, and that the host name or IP address is correct.

AWSITA201E An error occurred when allocating memory. The error is: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Verify that there is memory available and that the ulimit settings are not limiting the memory usage of a process.

AWSITA202E An error occurred when opening the zip file "zip_file". The error is: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Verify that the path of the zip file is correct and that you have the permissions required to create the file.

AWSITA203E An error occurred when writing the zip file "zip_file". The error is: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Verify that the path to the zip file is correct and that you have the permissions required to create the file.

AWSITA205E You specified an invalid port number "port_number" for the protocol "protocol" in the .ini file "ini_file". The valid range is from 1 to 65535.

Explanation: See message..

System action: The command does not run.

Operator response: Specify the correct port number, either in the property for the port of that protocol in the .ini file or in the command line.

AWSITA206E The following error was returned by the agent: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Check the error returned by the agent and take the appropriate action. This error message can occur if the agent is not at the correct fix pack level.

AWSITA207E An unexpected error was returned by the agent. The following error message has more details: "error_message".

Explanation: See message..

System action: The command does not run.

Operator response: Check the error returned by the agent and take the appropriate action. This error message can occur if the JobManager process is down or if you did not specify the agent port.

AWSITA208E An error occurred trying to establish the connection to the agent using the following address: "protocol":// "hostname": "port". The agent is down or the port is incorrect.

Explanation: See message..

System action: The command does not run.

Operator response: Verify that the agent is up and running, that the port you specified is correct, and that the host name or IP address is correct.

AWSITA209E The agent can not send the resource information to "server_uri" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The resource information is not sent to the server. If the error persists, the agent is down.

Operator response: Analyze the error and perform the correct action.

AWSITA211W Failed to set the stack size of command handler thread pool. The error is "error_message".

Explanation: An error occurred while setting the stack size of the command handler thread pool.

System action: The default stack size is used.

Operator response: Check the error message.

AWSITA212E Failed to create the thread pool of the command handler. The error is "error_message".

Explanation: An error occurred while the command handler was creating the thread pool.

System action: The agent does not start.

Operator response: Check the error message.

AWSITA229E The wappman command cannot run because one or more input arguments are missing.

Explanation: See message..

System action: The command is not completed.

Operator response: Run the command specifying the -u option to display the command usage, and then resubmit the command with the correct arguments.

AWSITA230E An error was encountered processing the properties file "property_file_name".

Explanation: See message..

System action: The command cannot complete.

Operator response: Ensure that the properties file exists and that you have the required access rights to the file. Also, ensure that the properties file is well formed.

AWSITA231E The connection property "property_name" must be specified.

Explanation: A required connection property was not specified. Specify the connection property either in the command string, in the custom properties file, or in either of the useropts or localopts files.

System action: The command cannot complete.

Operator response: Modify the command to include the missing connection property or add it to a property file and then resubmit the command.

AWSITA236E An error was encountered reading the file "file_name".

Explanation: See message..

System action: The command cannot complete.

Operator response: Ensure that the properties file exists and that you have the required access rights to the file.

AWSITA237E The protocol must be either HTTP or HTTPS.

Explanation: See message.

System action: The command cannot complete.

Operator response: Modify the protocol connection property to either HTTP or HTTPS and then resubmit the command.

AWSITA238E The user is not authorized to access the server.

Explanation: See message.

System action: The command cannot complete.

Operator response: Verify the user and password specified and modify either the command string, custom properties file, or useropts file with the correct user and password and then resubmit the command.

AWSITA241E An error occurred creating the file "file_name" that stores the result of the HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA242E An error occurred writing the file "file_name" that stores the result of the HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA243E An error occurred writing the file "file_name" that stores the result of the HTTP request. The error is "error_message".

Explanation: >An error occurred flushing the file on disk

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA244E An error occurred closing the file "file_name" that stores the result of the HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA245E An error occurred getting the response of the HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA246E An error occurred getting the response of the HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA247E An error occurred invoking a POST HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA248E An error occurred invoking a GET HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA249E An error occurred getting the response of the HTTP request. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA250E An error occurred connecting to "hostname". The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA251E Cannot connect to "hostname" because the protocol "protocol" is not supported.

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA252E An error occurred connecting to "hostname". The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA253E An error occurred connecting to "hostname".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA255E The Event Driven Workload Automation component cannot start because an error occurred creating a thread. The error message is "error_message".

Explanation: >The thread that takes care of managing the Event Driven Workload Automation did not start.

System action: The Event Driven Workload Automation feature did not start.

Operator response: If the error is temporary, restart the agent.

AWSITA256E The Event Driven Workload Automation component cannot start because an error occurred allocating a memory pool. The error message is "error_message".

Explanation: >The thread that takes care of managing the Event Driven Workload Automation did not start.

System action: The Event Driven Workload Automation feature did not start.

Operator response: If the error is temporary, restart the agent.

AWSITA258E The active rules output task failed while opening the configuration file. The error is "error_message".

Explanation: The agent failed to open the converted version of the configuration file.

System action: The active rules output is not returned.

Operator response: Check the error message.

AWSITA259E The active rules output task failed because the start parameter value looks higher than the output length. The error is "error_message".

Explanation: The agent failed to find the start position inside the UTF-8 conversion file of the active rules output.

System action: The active rules output is not returned.

Operator response: Check the error message.

AWSITA260E The active rules output task failed because it encountered an error reading the configuration file. The error is "error_message".

Explanation: The agent failed to read the UTF-8 conversion file of the active rules output.

System action: The active rules output is not returned.

Operator response: Check the error message.

AWSITA261E Unable to return the active rules output because the "output_file" configuration file does not exist.

Explanation: The output file does not exist. This occurs when Monman does not start.

System action: The active rules output is not returned.

Operator response: Check the agent trace file.

AWSITA262E The user cannot launch this job because he does not have the required permissions.

Explanation: >The user does not have the required permission to run the job.

System action: The job does not run.

Operator response: Modify the permissions of the file to allow the user to launch it.

AWSITA264E The parameter, "parameter", has been specified more than once.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify the parameter only once.

AWSITA265E The parameters, "parameter_1" and "parameter_2", cannot both be specified.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify only one of the indicated parameters.

AWSITA266E The value specified for the parameter "parameter" is not valid.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify a supported value for the specified parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSITA267E The sendevent command cannot run because one or more input arguments is missing.

Explanation: See message..

System action: The command is not completed.

Operator response: Run the command specifying the -u option to display the command usage, and then resubmit the command with the correct arguments.

AWSITA268E A value has not been specified for parameter "parameter".

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify a value for the specified parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSITA269E The specified parameter, "parameter", is not valid.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify a valid parameter.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSITA270E The format of the argument, "argument", is not valid.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify a valid format for the argument..

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSITA271E The mandatory parameters, "parameter1" and "parameter2", are missing.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify all required parameters.

See *The User's Guide and Reference* for full details of the parameters for the command line.

AWSITA272E The mandatory parameter, "parameter", is missing.

Explanation: See message.

System action: The operation is not completed.

Operator response: Specify the mandatory parameter and retry the operation.

See The *User's Guide and Reference* for full details of the parameters for the command line.

AWSITA273E The template configuration file, "file_name", does not exist.

Explanation: See message.

System action: The operation is not completed.

Operator response: The template configuration file, *file_name*, cannot be read. The file has been deleted or the product installation did not complete successfully. Try reinstalling the product.

AWSITA274E The template configuration file "file_name" cannot be read.

Explanation: See message.

System action: The operation is not completed.

Operator response: The template configuration file *file_name* cannot be read. Verify the file permissions and retry the operation.

AWSITA275E The sendevent command was not executed because an error occurred allocating a memory pool. The error message is "error_message".

Explanation: The command did not complete.

System action: The operation is not completed.

Operator response: If the memory allocation error is a temporary problem, try rerunning the command.

AWSITA276E The sendevent command was not executed because an error occurred locking the file "file_name".

Explanation: The command did not complete.

System action: The operation is not completed.

Operator response: The locked file error might be a temporary problem, try rerunning the command.

AWSITA277E An internal error has occurred. An error occurred while creating the Event Integration Facility handle.

Explanation: See message.

System action: The operation is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA278E An internal error has occurred. An error occurred while reading the value for "key_value" from the configuration file "onfiguration_file". Either the key is not present, or the configuration file cannot be read

Explanation: See message.

System action: The operation is not completed.

Operator response: Correct the problem and rerun the command

AWSITA279E An internal error has occurred. The event was not sent and was instead cached in the file "cache_file".

Explanation: The event was cached in the cache file *cache_file*.

System action: The operation is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA282E The event was filtered out and not sent.

AWSITA283E An error occurred while sending the event. The error code is "error_code".

Explanation: See message.

System action: The operation is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA284E The configuration file "file_name" does not exist.

Explanation: See message.

System action: The operation is not completed.

Operator response: The configuration file *file_name* cannot be read. The file has either been deleted or an error occurred when the product created it.

AWSITA285E The configuration file "file_name" cannot be read.

Explanation: See message.

System action: The operation is not completed.

Operator response: The configuration file *file_name* cannot be read. Verify the permissions of the directory containing the file and retry the operation.

AWSITA286E An internal error has occurred. An error occurred while initializing the environment to send the event.

Explanation: See message.

System action: The operation is not completed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSITA288E The JobManagerGW subagent cannot be created. The error is "error_message". The error code is "error_code".

Explanation: The subagent cannot be created due to the reason detailed in the error message.

System action: The agent is not started.

Operator response: Check the error message and restart the agent.

AWSITA289E The JobManagerGW subagent cannot be created. The error is "error_message". The error code is "error_code".

Explanation: The subagent cannot be created due to the reason detailed in the error message.

System action: The agent is not started.

Operator response: Check the error message and restart the agent.

AWSITA291E The main component of the gateway process cannot start because an error occurred creating a thread. The error message is "error_message".

Explanation: >The thread that takes care of managing the gateway did not start.

System action: The gateway did not start.

Operator response: If the error is temporary, restart the agent.

AWSITA292E The main component of the gateway process cannot start because an error occurred allocating a memory pool. The error message is "error_message".

Explanation: >The thread that takes care of managing the gateway did not start.

System action: The gateway did not start.

Operator response: If the error is temporary, restart the agent.

AWSITA295E Cannot create the memory pool to handle the connection. The error is "error_message". The error code is "error_code".

Explanation: The subagent cannot be created due to the reason detailed in the error message.

System action: The agent is not started.

Operator response: Check the error message and restart the gateway.

AWSITA297E The gateway failed to accept connections. The error is "error_message". The error code is "error_code".

Explanation: The error message provides details.

System action: The request is not served and the gateway will attempt a new connection in 10 seconds.

Operator response: Check the error message and restart the gateway.

AWSITA298E The gateway failed to create the thread needed to handle the request. The error is "error_message". The error code is "error_code".

Explanation: The error message provides details.

System action: The request is not served and the gateway will attempt a new connection in 10 seconds.

Operator response: Check the error message.

AWSITA299E The gateway failed to accept a connection.

Explanation: The agent process returned a NULL while accepting a connection.

System action: The request is not served and the agent will attempt a new connection in 10 seconds.

Operator response: None.

AWSITA300E Failed to create the memory pool of the command handler thread. The error is "error_message".

Explanation: An error occurred while the command handler was allocating a memory pool.

System action: The agent does not start.

Operator response: Check the error message.

AWSITA301W Failed to set the stack size of command handler thread pool. The error is "error_message".

Explanation: An error occurred while setting the stack size of the command handler thread pool.

System action: The default stack size is used.

Operator response: Check the error message.

AWSITA302E Failed to create the thread pool of the command handler. The error is "error_message".

Explanation: An error occurred while the command handler was creating the thread pool.

System action: The gateway does not start.

Operator response: Check the error message.

AWSITA304E The command is incorrect and cannot be processed.

Explanation: There is an error in the communication protocol utilized.

System action: The action is not performed.

Operator response: If the user was trying to connect to the agent through the APIs, the developer should check the protocol utilized.

AWSITA305E The http method returned the following error code: "error_code" and with the following error message "error_message".

Explanation: There is an error in the http communication.

System action: The action is not performed.

Operator response: Check the error message and the error code.

AWSITA306E Unable to get port information from URI "uri_value".

Explanation: Port information is missing or not valid.

System action: The attempt to connect to the URI failed.

Operator response: Check that the port information is specified correctly in the URI.

AWSITA308E The gateway got an error response while sending the resource information to the server. The error code is "error_code" and the error message is "error_message".

Explanation: See message..

System action: The resource information is not sent to the server. If this error persists, the computer system will result as unavailable.

Operator response: None

AWSITA309E The gateway can not send the resource information to "server_uri". The error is: "error_message".

System action: The resource information is not sent to the server. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA310E The gateway can not send the resource information to "server_uri" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The resource information is not sent to the server. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA311E The gateway can not send the resource information due to Basic Authentication conversion problem.

Explanation: See message..

System action: The resource information is not sent to the server. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA312E Unable to get address information in payload.

Explanation: Address information is missing or not valid.

System action: The payload information is not updated.

Operator response: Check that address information is specified correctly in the payload.

AWSITA313E Unable to get resource EPR information in payload.

Explanation: Resource EPR information is missing or not valid.

System action: The payload information is not updated.

Operator response: Check that Resource EPR information is specified correctly in the payload

AWSITA314E Unable to get Resource Advisor URI information in payload.

Explanation: Resource Advisor URI information is missing or not valid.

System action: The payload information is not updated.

Operator response: Check that Resource Advisor URI information is specified correctly in the payload

AWSITA315E The gateway failed to create the thread needed to handle the request. The error is "error_message". The error code is "error_code".

Explanation: The error message provides details.

System action: The request is not served and the gateway will attempt a new connection in 10 seconds.

Operator response: Check the error message.

AWSITA317E Unable to get port information from URI "uri_value".

Explanation: Port information is missing or not valid.

System action: The attempt to connect to the URI failed.

Operator response: Check that the port information is specified correctly in the URI.

AWSITA320E The gateway was not able to contact the broker server at the address "server_uri" to obtain the list of actions to execute. The error is: "error_message".

System action: The polling broker action queue information request not send to borker. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA321E The gateway was not able to contact the broker server at the address "server_uri" to obtain the list of actions to execute for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The polling broker action queue information request not send to borker. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA322E The gateway can not send the polling broker action queue information request due to Basic Authentication conversion problem.

Explanation: See message..

System action: The polling broker action queue information request is not sent to the broker. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA323E The gateway got an error response while processing a submit request to "server_uri". The error is: "error_message".

Explanation: See message..

System action: The submit request not send to agent. If this error persists, the gateway is down

Operator response: None

AWSITA324E The gateway can not send the submit request to "server_uri" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The submit request not send to agent. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA325E The gateway got an error response while processing a Job log request to "server_uri". The error is: "error_message".

Explanation: See message..

System action: The Job log request not send to agent. If this error persists, the gateway is down

Operator response: None

AWSITA326E The gateway can not send the Job log request to "server_uri" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The Job log request not send to agent. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA327E Unable to get port information from URI "uri_value".

Explanation: Port information is missing or not valid.

System action: The attempt to connect to the URI failed.

Operator response: Check that the port information is specified correctly in the URI.

AWSITA329E The gateway got an error response while sending the result to "server_uri". The error is: "error_message".

Explanation: See message..

System action: The result not send to borler. If this error persists, the gateway is down

Operator response: None

AWSITA330E The gateway can not send the result to "server_uri" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The result not send to broker. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA331E Unable to get port information from URI "uri_value".

Explanation: Port information is missing or not valid.

System action: The attempt to connect to the URI failed.

Operator response: Check that the port information is specified correctly in the URI.

AWSITA333E The gateway got an error response while sending Job Status to agent. The error code is "error_code" and the error message is "error_message".

Explanation: See message..

System action: The Job Status request is not sent to

the agent. If this error persists, the computer system will result as unavailable.

Operator response: None

AWSITA334E The gateway can not send the Job Status information to "server_uri". The error is: "error_message".

System action: The Job status information is not sent to the server. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA335E The gateway can not send the Job status information to "server_uri" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The Job status information not send to agent. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA336E The gateway can not send Job status information due to Basic Authentication conversion problem.

Explanation: See message..

System action: The Job status information is not sent to the agent. If the error persists, the gateway is down.

Operator response: Analyze the error and perform the correct action.

AWSITA340E The command "action" is not supported.

Explanation: An unsupported command was sent by the broker server to the gateway.

System action: The operation is not completed.

Operator response: Upgrade the gateway to the latest release.

AWSITA342E The PUT method was not executed on the uri "uri". The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA343E The kill of the job with the uri "uri" failed. The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA345E The executor command on the agent with the uri "uri" failed. The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA347E The executor command on the agent with the uri "uri" failed. The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA349E The component command on the agent with the uri "uri" failed. The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA350E Cannot able to decrypt gateway password.

Explanation: The decrypting algorithm ran into an error.

System action: The variable is not decrypted.

Operator response: Use the param command to delete the variable and define it once again.

AWSITA351E Cannot able to encrypt gateway password.

Explanation: The encrypting algorithm ran into an error.

System action: The variable is not encrypted.

Operator response: Use the param command to delete the variable and define it once again.

AWSITA352E Cannot able to update gateway password in file.

Explanation: See message..

System action: The password is not updated.

Operator response: Analyze the error and perform the correct action.

AWSITA353E Cannot able to retrieve gateway password from file.

Explanation: See message..

System action: The password is not retrieved.

Operator response: Analyze the error and perform the correct action.

AWSITA354E The gateway could not poll the broker action queue on "server_uri". The error code is: "error_code" and the error message is "error_message".

Explanation: See message..

System action: The operation is not completed..

Operator response: Check the error message and the error code. The error code 500 usually means the broker server is down.

AWSITA355E Error while preparing URI's of gateway.

Explanation: See message..

System action: The operation is not completed..

Operator response: Check the error message and update gateway settings.

AWSITA356E An error occurred setting the http proxy. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA357E The Event Driven Workload Automation file download failure from "event processor address". The error message is "error_message".

Explanation: See message..

System action: The Event Driven Workload Automation file download failure.

Operator response: None

AWSITA358E The Event Driven Workload Automation file download failure, retry requested from "event processor address". The error message is "error_message".

Explanation: See message..

System action: The Event Driven Workload Automation file download failure. Retry requested.

Operator response: None

AWSITA360E Unable to send Event Driven Workload Automation file download request on "event processor address" for a network connection problem. The error is: "error_message".

Explanation: See message..

System action: The Event Driven Workload Automation file download request not send. If the error persists, the Job Manager is down.

Operator response: Analyze the error and perform the correct action.

AWSITA361E An error occurred parsing the following JSON string "string".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA362E An error occurred processing the action. The error is "error_message".

Explanation: >See message.

System action: The operation is not completed.

Operator response: Check the error message.

AWSITA364E The reset command on the agent with the uri "uri" failed. The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

AWSITA366E The POST method was not executed on the uri "uri". The error is: "error_message".

Explanation: See message..

System action: The operation is not completed.

Operator response: Retry the operation.

Chapter 183. AWSJCL - Command line messages

This section lists error and warning messages that might be generated when using the command line.

The message component code is JCL.

AWSJCL001E The object "object_key" cannot be updated because it is locked by you in another session or by another user.

Explanation: The server is trying to update and unlock the indicated object but it is locked by the user but in another session, or by another user.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

System action: The operation cannot be performed.

Operator response: Try to unlock the object and then retry the update.

AWSJCL002E An internal error has occurred. The command "command" passed to the server from the command line client is not a recognizable Tivoli Workload Scheduler command.

Explanation: See message.

command is the command that cannot be recognized.

System action: The operation cannot be performed.

Operator response: Retry the operation to ensure that the problem was not caused by a communication error between the command line client and the command line server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL004E The command "command" relating to object "object_key" has completed with errors. The reason is "reason".

Explanation: See message.

command identifies the command that has failed.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where

`nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

reason is the reason why the command failed, in the form of another message.

System action: The operation cannot be performed.

Operator response: Check the message in the *reason*, and take the indicated action.

AWSJCL005E The server could not encrypt the user password.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: You might have supplied a password that cannot be encrypted. If the password contains unusual characters or is unusually short or long, change the password and retry the operation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL006E The object "object_key" cannot be locked because it is already locked by the following user "user" in another session.

Explanation: The server is trying to lock the indicated object before working on it, either as the result of a specific lock command or because the command you have issued needs to modify the object.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

user identifies the user that has locked it.

System action: The operation cannot be performed.

Operator response: Do the following:

- Retry the operation after a brief interval.
- If the problem persists and you are the user that has locked the object in another session, try and return to that session and unlock the object.
- If the problem persists and you are not the user that has locked the object, get the user who locked the object to reopen the other session, if possible, and unlock the object.

If the other session cannot be identified, or the session cannot be reopened, or the other user cannot be contacted, get the ""superuser"" to unlock the object.

AWSJCL007E The object "object_key" cannot be locked because it is already locked by the following user "user".

Explanation: The server is trying to lock the indicated object before working on it, either as the result of a specific lock command or because the command you have issued needs to modify the object.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example ""ws"" is the short name for ""workstation""), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

user identifies the user that has locked it.

System action: The operation cannot be performed.

Operator response: Do the following:

- Retry the operation after a brief interval.
- If the problem persists, get the user who has locked the object to unlock it.
If the other user cannot be contacted, get the ""superuser"" to unlock the object.

AWSJCL008E The server has encountered an unexpected error communicating with the client.

Explanation: Either a network problem has broken the connection, or the user has stopped composer at the client.

System action: The operation cannot be performed.

Operator response: Establish the context of the message from the user and the information in the log, to determine whether the loss of connection is an event that needs resolving.

If composer has been stopped by the user, restart it and check that the operation that was being performed when the error occurred has completed successfully.

If there is a network problem, contact your network

administrator to resolve the problem. Then retry the operation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL010W You have attempted to delete the master domain ("domain"), which is not allowed.

Explanation: See message.

domain identifies the master domain that you are trying to delete.

System action: The operation cannot be performed.

Operator response: If you intended to delete a different domain which is not the master, change the domain name and retry the operation.

Otherwise, the master domain cannot be deleted.

AWSJCL011E An internal error has occurred. The expected parameter "parameter" was missing for the command "command".

Explanation: See message.

command identifies the command sent by the command line client.

parameter is the parameter that was expected for this command but was not found in the command string.

System action: The operation cannot be performed.

Operator response: Retry the operation to ensure that the problem was not caused by a communication error between the command line client and the command line server. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL012E The object "object_key" cannot be unlocked because you have no UNLOCK authorization for this object in the security file or because it is locked by the user "user" in a different session.

Explanation: The server is trying to unlock the indicated object before working on it, probably as the result of a specific unlock command or because the command you have issued has finished to modify the object.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example ""ws"" is the short name for ""workstation""), and `nullkey>` identifies the object.

The object type short names are documented in the *User's Guide and Reference*.

user identifies the user that has locked it in a different session.

System action: The operation cannot be performed.

Operator response: Do the following:

- Verify that you are authorized to unlock objects and retry the operation after a brief interval.
- If the problem persists and you are the user that has locked the object in another session, try and return to that session and unlock the object.
- If the problem persists and you are not the user that has locked the object, get the user who locked the object to reopen the other session, if possible, and unlock the object.

If the other session cannot be identified, or the session cannot be reopened, or the other user cannot be contacted, get the `""superuser""` to unlock the object.

AWSJCL013E The object "object_key" cannot be updated because it is not locked.

Explanation: The server is trying to update and unlock the indicated object but it has not been previously locked.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

System action: The operation cannot be performed.

Operator response: Try and lock the object and then retry the update and unlock operation.

AWSJCL014W The object "object_key", which you locked using the lock command, is no longer locked. The lock might have been removed by another user or it could have been removed by your own process. This can happen when the modify command fails to update some of the selected objects and you choose to re-edit failed objects.

Explanation: *object_key* identifies the object that is the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

System action: Message AWSJCL016I is displayed, prompting you to decide whether or not to proceed.

Operator response: Check whether the object has been modified by another user before responding to the prompt. If you are using the re-edit function in the `""modify""` command, you might decide that this check is not required.

AWSJCL015W The object "object_key" already exists.

Explanation: You are trying to create an object but an object with the same key already exists.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

System action: Message AWSJCL016I is displayed, prompting you to decide whether or not to proceed.

Operator response: Check that the object indicated in the message is the one that you wanted to create:

- If it is, decide whether you want to maintain the existing object, or overwrite it with the one you are creating.
- Otherwise, change the object key and retry the command.

AWSJCL017W No objects have been found that match the criteria in the command.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Change the object identification criteria and retry the command.

AWSJCL019E An internal error has occurred. The parameter "parameter" is not in the correct format.

Explanation: See message.

parameter is the parameter that is not in the correct format.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/> support.

AWSJCL020E The master domain manager workstation has not been defined in the database.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check that the definition of the master domain manager workstation in the localopts or useropts file is correct and corresponds to the master domain manager defined in the database on the master domain manager. If you find a discrepancy, correct it and rerun the command.

AWSJCL021E An internal error has occurred. Unable to retrieve the master domain manager workstation name. The reason is as follows: "reason".

Explanation: See message.

reason is the reason why the program was unable to retrieve the master domain manager workstation name.

System action: The operation cannot be performed.

Operator response: Look at the *reason* to determine why the program was unable to retrieve the master domain manager workstation name.

- If you find a problem that you can correct, do so and retry the command.
- If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL022E An internal error has occurred. Unable to retrieve a global option "option" from the database. The reason is as follows: "reason".

Explanation: See message.

option identifies the option that cannot be retrieved.

reason is the reason why.

System action: The operation cannot be performed.

Operator response: Look at the *reason* to determine why the database retrieval failed.

- If you find a problem that you can correct, do so and retry the command.
- If the problem is the permissions of the user, check that the user is set up correctly in the Security file and has permission for the action being performed.
- If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL023E The object "object_key" cannot be unlocked because you have no UNLOCK authorization for this object in the security file or because it is locked by the following user "user".

Explanation: The server is trying to unlock the indicated object before working on it, probably as the result of a specific unlock command or because the command you have issued has finished modify the object.

object_key identifies the object which was the subject of the command. It is presented in the form `nullobject_type_short_name>=nullkey>`, where `nullshort_name>` is the short name of the object type (for example `""ws""` is the short name for `""workstation""`), and `nullkey>` identifies the object. The object type short names are documented in the *User's Guide and Reference*.

user identifies the user that has locked it.

System action: The operation cannot be performed.

Operator response: Do the following:

- Verify that you are authorized to unlock objects and retry the operation after a brief interval.
- If the problem persists, get the user who has locked the object to unlock it.
If the other user cannot be contacted, get the `""superuser""` to unlock the object.

AWSJCL024W You have included one or more time zone definitions in the command but time zone support is not enabled.

Explanation: See message.

System action: The program continues, but the time zone part of the definition is ignored.

Operator response: If you do not need time zone support, you need take no action, but should be aware that the time zone part of the definition has been ignored.

If you need time zone support, see the product documentation for information on the implications of, and procedure for, enabling it. When you have enabled it, retry the operation.

See The *User's Guide and Reference* for general information about time zone support and *Planning and Installation* for information about how to enable it.

AWSJCL025W The job "job" defined in job stream "job_stream" has a schedtime time that is later than its until time.

Explanation: See message.

job identifies the job that contains the incompatible date values.

job_stream identifies the job stream to which the job belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The job as defined can never run.

Operator response: Edit the job, changing either the ""schedtime"" time or the ""until"" time so that the former precedes the latter.

AWSJCL026W The runcycle "run_cycle" defined in job stream "job_stream" has a schedtime time that is later than its until time.

Explanation: See message.

run_cycle identifies the run cycle that contains the incompatible date values.

job_stream identifies the job stream to which the run cycle belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The run cycle as defined can never run.

Operator response: Edit the run cycle, changing either the ""schedtime"" time or the ""until"" time so that the former precedes the latter.

AWSJCL027W The job "job" defined in job stream "job_stream" has an until time that is later than its deadline time.

Explanation: See message.

job identifies the job that contains the incompatible date values.

job_stream identifies the job stream to which the job belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The job as defined can never run.

Operator response: Edit the job, changing either the ""until"" time or the ""deadline"" time so that the former precedes the latter.

AWSJCL028W The runcycle "run_cycle" defined in job stream "job_stream" has an until time that is later than its deadline time.

Explanation: See message.

run_cycle identifies the run cycle that contains the incompatible date values.

job_stream identifies the job stream to which the run cycle belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The run cycle as defined can never run.

Operator response: Edit the run cycle, changing either the ""until"" time or the ""deadline"" time so that the former precedes the latter.

AWSJCL029W The job "job" defined in job stream "job_stream" has a schedtime time that is later than its deadline time.

Explanation: See message.

job identifies the job that contains the incompatible date values.

job_stream identifies the job stream to which the job belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The job as defined can never run.

Operator response: Edit the job, changing either the ""schedtime"" time or the ""deadline"" time so that the former precedes the latter.

AWSJCL030W The runcycle "run_cycle" defined in job stream "job_stream" has a schedtime time that is later than its deadline time.

Explanation: See message.

run_cycle identifies the run cycle that contains the incompatible date values.

job_stream identifies the job stream to which the run cycle belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The run cycle as defined can never run.

Operator response: Edit the run cycle, changing either the ""schedtime"" time or the ""deadline"" time so that the former precedes the latter.

AWSJCL031W The job "job" defined in job stream "job_stream" has a dependency in which its from time is later than its to time.

Explanation: See message.

job identifies the job that contains the incompatible date values.

job_stream identifies the job stream to which the job belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The job as defined can never run.

Operator response: Edit the job, changing either the ""from"" time or the ""to"" time so that the former precedes the latter.

AWSJCL032W The job stream "job_stream" defines a matching criteria definition in which its from time is later than its to time.

Explanation: See message.

job_stream identifies the job stream to which the job belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The job as defined can never run.

Operator response: Edit the job, changing either the "from" time or the "to" time so that the former precedes the latter.

AWSJCL033W The job stream "job_stream" has a dependency on the job "job" in which its from time is later than its to time.

Explanation: See message.

job identifies the job dependency that contains the incompatible date values.

job_stream identifies the job stream to which the dependency belongs

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The job as defined can never run.

Operator response: Edit the job, changing either the "from" time or the "to" time so that the former precedes the latter.

AWSJCL034W Insufficient resource units are available. Resource "resource" has "available_units" units available, but the job stream "job_stream" requires "required_units" units.

Explanation: See message.

job_stream identifies the job stream to which the dependency belongs

resource identifies the resource required

available_units identifies the number of units of the resource that are available.

required_units identifies the number of units of the resource that are required by the job stream.

System action: The incompatible values are stored in the database for you to correct later. The dependency can never be satisfied. The program continues

Operator response: Either make more resource units available or reduce the requirement of the job stream. Issue a command or use the Tivoli Dynamic Workload Console to effect the choice made.

AWSJCL035W Insufficient resource units are available. The resource "resource" has "available_units" units available, but the job "job" defined in the job stream "job_stream" requires "required_units" units.

Explanation: See message.

job identifies the job to which the dependency belongs

job_stream identifies the job stream to which the job belongs

resource identifies the resource required

available_units identifies the number of units of the resource that are available.

required_units identifies the number of units of the resource that are required by the job.

System action: The incompatible values are stored in the database for you to correct later. The dependency can never be satisfied. The program continues

Operator response: Either make more resource units available or reduce the requirement of the job. Issue a command or use the Tivoli Dynamic Workload Console to effect the choice made.

AWSJCL036W The resource is not defined for the same workstation or workstation class as the job stream. Job stream "job_stream" is defined for workstation or workstation class "job_stream_target"; resource "resource" is defined for workstation or workstation class "resource_target".

Explanation: See message.

job_stream identifies the job stream to which the dependency belongs.

job_stream_target identifies the workstation or workstation class defined for the job stream.

resource identifies the resource required.

resource_target identifies the workstation or workstation defined for the resource.

System action: The incompatible values are stored in the database for you to correct later. The dependency can never be satisfied. The program continues.

Operator response: Change the workstation or workstation class either in the job stream definition or in the resource definition. Issue a command or use the Tivoli Dynamic Workload Console to effect the choice made.

AWSJCL037W The resource is not defined for the same workstation or workstation class as the job. Job "job" is defined for workstation or workstation class "job_target"; resource "resource" is defined for workstation or workstation class "resource_target".

Explanation: See message.

job identifies the job to which the dependency belongs.

job_target identifies the workstation or workstation class defined for the job.

resource identifies the resource required.

resource_target identifies the workstation or workstation defined for the resource.

System action: The incompatible values are stored in the database for you to correct later. The dependency can never be satisfied. The program continues.

Operator response: Change the workstation or workstation class either in the job definition or in the resource definition. Issue a command or use the Tivoli Dynamic Workload Console to effect the choice made.

AWSJCL038W The job stream "job_stream" has a schedtime time that is later than its until time.

Explanation: See message.

job_stream identifies the job stream to which the time restriction belongs.

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The run cycle as defined can never run.

Operator response: Edit the job stream, changing either the "schedtime" time or the "until" time so that the former precedes the latter.

AWSJCL039W The job stream "job_stream" has an until time that is later than its deadline time.

Explanation: See message.

job_stream identifies the job stream to which the time restriction belongs.

System action: The program continues, and the incompatible values are stored in the database, for you to correct later.

Operator response: If you do nothing, the job stream might not complete when you want it to. Edit the job stream, changing either the "until" time or the "deadline" time so that the former precedes the latter.

AWSJCL040W The job stream "job_stream" has a schedtime time that is later than its deadline time.

Explanation: See message.

job_stream identifies the job stream to which the time restriction belongs.

System action: The program continues, and the incompatible values are stored in the database, for you to correct later. The run cycle as defined can never run.

Operator response: Edit the job stream, changing either the "schedtime" time or the "deadline" time so that the former precedes the latter.

AWSJCL041E The object "object" does not exist.

Explanation: The identified object has been either deleted or not been created, or you have mistyped the object identifier.

object identifies the object that does not exist.

System action: The operation cannot be performed.

Operator response: Retry the command, identifying a different object that exists. If the object needs to exist, create it before retrying this command.

AWSJCL042E The object "object" cannot be deleted because it is referenced by the following object or objects:

Explanation: See message.

object identifies the object that you are trying to delete.

System action: The operation cannot be performed.

Operator response: Check the details of the command that you are trying to perform. If you have selected the wrong *object* select the correct one and repeat the operation. If you must delete this object, you must first either remove the references to the object you want to delete, or delete the objects that reference it.

AWSJCL043W The job stream "job_stream" contains the following critical jobs "job_name_list" but the database property "db_property_name" is set to "db_property_value".

Explanation: See message.

job_stream identifies the job stream to which the critical jobs belong.

job_name_list identifies the list of the critical jobs.

db_property_name identifies the database property name.

db_property_value identifies the database property value.

System action: The critical jobs are created or updated even though the calculation of the critical path is not

AWSJCL044W • AWSJCL053E

enabled. The program continues.

Operator response: Change the value of the database property to specify that the critical path is to be calculated.

AWSJCL044W You have attempted to delete the default variable table ("variable_table"), which is not allowed.

Explanation: See message.

variable_table identifies the default variable table that you are trying to delete.

System action: The operation cannot be performed.

Operator response: If you intended to delete a different variable table which is not the default, change the variable table name and retry the operation.

Otherwise, the default variable table cannot be deleted.

AWSJCL045E The default variable table has not been defined in the database.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL046E An internal error has occurred. Unable to retrieve the default variable table name. The reason is as follows: "reason".

Explanation: See message.

reason is the reason why the program was unable to retrieve the default variable table name.

System action: The operation cannot be performed.

Operator response: Look at the *reason* to determine why the program was unable to retrieve the default variable table name.

- If you find a problem that you can correct, do so and retry the command.
- If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL047W You have defined "new_table" to become the default variable table: "old_table", which is the current default, will be modified to become an ordinary variable table.

Explanation: See message.

new_table is the name of the new default variable table, as defined by the user.

old_table is the name of the current default variable table, which will be modified to become an ordinary variable table.

System action: The new or updated variable table becomes the default. The program continues.

Operator response: If you intended to add or modify a variable table without changing the default, edit the old default variable table and add the ISDEFAULT keyword again.

Otherwise, the defined variable table becomes the default.

AWSJCL048W The run cycle group "run_cycle_group" has a schedtime time that is later than the until time.

Explanation: See message.

run_cycle_group identifies the run cycle group on which the time restriction is set.

System action: The program continues, and the incompatible values are stored in the database, to be corrected at a later time.

Operator response: Edit the run cycle group, changing either the "schedtime" time or the "until" time so that the former precedes the latter.

AWSJCL049W The run cycle group "run_cycle_group" has an until time that is later than the deadline time.

Explanation: See message.

run_cycle_group identifies the run cycle group on which the time restriction is set.

System action: The program continues, and the incompatible values are stored in the database, to be corrected at a later time.

Operator response: If you do nothing, the job streams that reference the run cycle group might not complete when expected. Edit the run cycle group, changing either the "until" time or the "deadline" time so that the former precedes the latter.

AWSJCL053E An internal error has occurred. The command passed one or more parameters to this program that are not valid.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Retry the command, in case the problem that caused the error is no longer present. If you cannot resolve the problem, search the IBM

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL054E The command "command" has failed, for the following reason: "reason".

Explanation: See message.

command identifies the command that has failed.

reason is the reason why. This is normally another message.

System action: The operation cannot be performed.

Operator response: Check the *reason* to understand why the command failed. Follow the instructions relating to the reason.

AWSJCL075E Symphony file load has failed. Check the application server logs for additional information.

Explanation: See message.

exception_message describes the error.

System action: The plan is not loaded on RDBMS. The Tivoli Dynamic Workload Console is automatically switched to work on the Symphony file instead of the RDBMS.

Operator response: Fix the problem causing the failure and run `planman resync` to reload the Symphony in the Database.

AWSJCL080W The run cycle group "run_cycle_group" has a schedtime time that is later than the deadline time.

Explanation: See message.

run_cycle_group identifies the run cycle group on which the time restriction is set.

System action: The program continues, and the incompatible values are stored in the database, to be corrected at a later time.

Operator response: Edit the run cycle group, changing either the `schedtime` time or the `deadline` time so that the former precedes the latter.

AWSJCL081W The run cycle "run_cycle" defined in the run cycle group "run_cycle_group" has a schedtime time that is later than the until time.

Explanation: See message.

run_cycle identifies the run cycle that contains the incompatible date values.

run_cycle_group identifies the run cycle group within which the run cycle is defined

System action: The program continues, and the

incompatible values are stored in the database, to be corrected at a later time. The run cycle as defined can never run.

Operator response: Edit the run cycle, changing either the `schedtime` time or the `until` time so that the former precedes the latter.

AWSJCL082W The run cycle "run_cycle" defined in the run cycle group "run_cycle_group" has an until time that is later than the deadline time.

Explanation: See message.

run_cycle identifies the run cycle within which the run cycle is defined.

run_cycle_group identifies the run cycle group to which the run cycle belongs

System action: The program continues, and the incompatible values are stored in the database, to be corrected at a later time. The run cycle as defined can never run.

Operator response: Edit the run cycle, changing either the `until` time or the `deadline` time so that the former precedes the latter.

AWSJCL083W The run cycle "run_cycle" defined in the run cycle group "run_cycle_group" has a schedtime time that is later than the deadline time.

Explanation: See message.

run_cycle identifies the run cycle that contains the incompatible date values.

run_cycle_group identifies the run cycle group within which the run cycle is defined.

System action: The program continues, and the incompatible values are stored in the database, to be corrected at a later time. The run cycle as defined can never run.

Operator response: Edit the run cycle, changing either the `schedtime` time or the `deadline` time so that the former precedes the latter.

AWSJCL084E The object "object" cannot be deleted because it is referenced by the following object or objects: "object_name_list"

Explanation: See message.

object identifies the object that you are trying to delete.

object_name_list identifies the object or list of objects referencing this object.

System action: The operation cannot be performed.

Operator response: Check the details of the command that you are trying to perform. If you have selected the

wrong *object* select the correct one and repeat the operation. If you must delete this object, you must first either remove the references to the object you want to delete, or delete the objects that reference it.

AWSJCL100E The option short name "option_short_name" is not valid. Valid short names are as follows: "option_short_name_list".

Explanation: See message.

option_short_name is the option short name which is not valid.

option_short_name_list is a list of valid option short names.

System action: The **optman** command cannot be processed.

Operator response: Select a valid option short name from the list and reissue the command.

AWSJCL101E The option long name "option_long_name" is not valid. Valid long names are as follows: "option_long_name_list".

Explanation: See message.

option_long_name is the option long name which is not valid.

option_long_name_list is a list of valid option long names.

System action: The **optman** command cannot be processed.

Operator response: Select a valid option long name from the list and reissue the command.

AWSJCL102E An internal error has occurred. The internal option database name "option_database_name" is not valid. Valid option database names are: "option_database_name_list".

Explanation: See message.

option_database_name is the name with which the option is stored in the database, and which is not valid.

option_database_name_list is a list of valid option database names.

System action: The **optman** command cannot be processed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL103E The input format of the option "option_input_format" is not valid. Valid option input formats are as follows: "option_input_format_list".

Explanation: See message.

option_input_format is the input format in which the option is stored in the database, and which is not valid.

option_input_format_list is a list of valid option input formats.

System action: The **optman** command cannot be processed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL105E The property "Property name" is empty.

AWSJCL106E The provider URI " " is malformed.

AWSJCL300E An internal error occurred while loading the XML Schema file "schema_file_name" used by the XML parser.

Explanation: See message.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL301E An internal error occurred while configuring the Tivoli Workload Scheduler parser properties and features.

Explanation: See message.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL302E An internal error occurred while parsing the XML file created by the XML Formatter component.

Explanation: See message.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL303E An internal error has occurred with the syntax of the created XML file. The object type "object_type" with key "key" is not valid.

Explanation: See message.

object_type and *key* identify the object that has an incorrect syntax.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL305E A date format is not valid.

Explanation: See message.

System action: A date cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL306E The following error has occurred with the syntax of the created XML file: "reason"

Explanation: See message.

reason is a message explaining the error that the parser has found.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

AWSJCL307E The value "attribute_value" specified for the attribute "attribute_name" is not allowed.

Explanation: See message.

attribute_name identifies the object that has an incorrect value.

attribute_value identifies the incorrect value assigned to the object.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Use a permitted value for that attribute, and retry the operation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL308E The following error occurred while parsing the value "attribute_value" specified for the attribute "attribute_name": "reason"

Explanation: See message.

attribute_name identifies the object that has an incorrect value.

attribute_value identifies the incorrect value assigned to the object.

reason is a message explaining the error that the parser has found.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Use a permitted value for that attribute, and retry the operation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL309E The attribute "attribute_name" is not allowed inside the tag: "tag_name".

Explanation: See message.

tag_name identifies the tag containing the wrong attribute.

attribute_name identifies the attribute that has an incorrect value.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Use a permitted value for that attribute, and retry the operation.

If you cannot resolve the problem, search the IBM

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL310E The tag name "tag_name" is not allowed.

Explanation: See message.

tag_name identifies the wrong tag inserted in the rule definition.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Use a permitted tag, and retry the operation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL311E The required attribute "attribute_name" is missing inside the tag "tag_name".

Explanation: See message.

tag_name identifies the tag that does not contain a required attribute.

attribute_name identifies the required attribute that is missing.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Use a permitted value for the attribute of the indicated tag, and retry the operation.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL312E The line "line", in the created XML file, contains the following error: "reason"

Explanation: See message.

line is the line containing the error.

reason is a message explaining the error that the parser has found.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Repeat the operation, as the problem might be transient.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL500W The workstation "workstation" was not migrated because it has the same name as the master workstation in the version 8.4 database.

Explanation: See message.

workstation identifies the workstation that has the same name as the master workstation in the 8.4 database.

System action: The workstation data is not migrated. All scheduling objects that reference this workstation are linked to the master domain manager in the version 8.4 database. The migration continues.

Operator response: If the workstation was of minor importance in the previous scheduling environment, it is quicker to recreate it in the version 8.4 database and modify the references that were set to the master domain manager so that they point to the newly created workstation.

However, if the workstation was important in the previous scheduling environment, with many references from jobs, job streams and other objects, it is quicker to choose a different name for the master workstation in the 8.4 database and repeat the migration procedure.

AWSJCL501W The workstation "workstation" has been created as full status because it is a domain manager.

Explanation: During the migration the workstation *workstation* has been identified as a domain manager but did not have the "full status" attribute set. In version 8.4 a domain manager must have the "full status" attribute set.

System action: The workstation data is migrated with the "full status" attribute set. The migration continues.

Operator response: If you do not want the workstation to be a domain manager, change it after the migration is complete.

AWSJCL502W The domain "domain" referenced by workstation "workstation" does not exist. The workstation has been created as belonging to the master domain.

Explanation: See message.

workstation identifies the workstation that had a nonexistent domain.

domain is the domain to which the workstation belonged, but that does not exist in the migrated database.

System action: The workstation data is migrated with the master domain set as its *domain*. The migration continues.

Operator response: Optionally, after the migration is complete, change the domain of the workstation to the appropriate value.

AWSJCL503W The host "host_workstation" referenced by workstation "workstation" does not exist. The workstation has been created with the master domain manager as its host.

Explanation: See message.

workstation identifies the workstation that had an incorrect host workstation.

host_workstation is the workstation that does not exist in the migrated database.

System action: The workstation data is migrated with the domain manager set as its *host_workstation*. The migration continues.

Operator response: Optionally, after the migration is complete, change the host of the workstation to the appropriate value.

AWSJCL504W The parent domain "parent_domain" referenced by domain "domain" does not exist. The domain has been created with the master domain as its parent.

Explanation: See message.

domain identifies the domain that has a nonexistent parent domain.

parent_domain is the domain that does not exist in the migrated database.

System action: The domain data is migrated with the master domain set as its *parent_domain*. The migration continues.

Operator response: Optionally, after the migration is complete, change the parent domain of the domain to the appropriate value.

AWSJCL505W The workstation "workstation" referenced by workstation class "workstation_class" does not exist. The workstation class has been created omitting the workstation.

Explanation: See message.

workstation_class identifies the workstation class that contains a nonexistent workstation.

workstation is the workstation that does not exist in the migrated database.

System action: The workstation class data is migrated but the *workstation* is omitted. The migration continues.

Operator response: None.

AWSJCL506E The workstation or workstation class "workstation_or_workstation_class" referenced by job stream "job_stream" does not exist. The job stream is not migrated.

Explanation: See message.

job_stream is the job stream that cannot be migrated.

workstation_or_workstation_class identifies the workstation or workstation class for which the job stream was defined, and that does not exist in the migrated database.

System action: The job stream is not migrated.

Operator response: Optionally, after the migration is complete, recreate the job stream for the correct workstation or workstation class.

AWSJCL507W The calendar "calendar" referenced by job stream "job_stream" does not exist. The calendar reference is not migrated with the job stream.

Explanation: See message.

job_stream identifies the job stream that contains a reference to an nonexistent calendar.

calendar is the calendar that does not exist in the migrated database.

System action: The job stream data is migrated but the *calendar* reference is omitted. The migration continues.

Operator response: Optionally, after the migration is complete, create the calendar required by this job stream and modify the job stream to use it.

AWSJCL508W The calendar "calendar" referenced by a run cycle in job stream "job_stream" does not exist. The run cycle reference is not migrated with the job stream.

Explanation: See message.

job_stream identifies the job stream that contains a run cycle with a reference to an nonexistent calendar.

calendar is the calendar that does not exist in the migrated database.

System action: The job stream data is migrated but the *run_cycle* with the incorrect calendar reference is omitted. The migration continues.

Operator response: Optionally, after the migration is complete, add a run cycle with a valid calendar reference to the job stream.

AWSJCL509W The job definition "job_definition" referenced by job "job" in job stream "job_stream" does not exist. A dummy job definition is created and the job is modified to refer to it.

Explanation: See message.

job_stream identifies the job stream that contains a reference to a nonexistent job definition.

job identifies the job that contains a reference to a nonexistent job definition.

job_definition is the job definition that does not exist in the migrated database.

System action: The job stream data is migrated, a dummy job definition with the name ""TWS_INITIAL_DUMMY_JOBDEFINITION"" is created (if it has not already been created), and the job is modified to refer to it.

Operator response: Optionally, after the migration is complete, create an appropriate job definition and modify the job to refer to it.

AWSJCL510W The prompt "prompt" referenced as a dependency by job stream "job_stream" does not exist. A dummy prompt is added and the migrated job stream is modified to refer to it.

Explanation: See message.

job_stream is the job stream that refers to a nonexistent prompt.

prompt is the prompt that does not exist in the migrated database.

System action: The job stream data is migrated, and a dummy prompt with the name ""DUMMY"" is created (if it has not already been created), and the job stream is modified to refer to it.

Operator response: Optionally, after the migration is complete, create the required prompt and modify the job stream to refer to it.

AWSJCL511W The resource "resource" referenced as a dependency by job stream "job_stream" does not exist. The resource is created and the job stream is migrated.

Explanation: See message.

job_stream identifies the job stream that refers to a nonexistent resource.

resource is the resource that does not exist in the migrated database.

System action: The job stream data is migrated, and the resource is added to the migrated database. The

new resource has the same name and an availability of 0. If the workstation that owns the resource does not exist it is allocated to the master domain manager and a warning issued.

Operator response: Optionally, after the migration is complete, modify the availability and description of the created resource to your requirements.

AWSJCL512W The workstation "workstation" referenced in a file dependency by job stream "job_stream" does not exist. A dummy file dependency is created and the migrated job stream is modified to refer to it.

Explanation: See message.

job_stream identifies the job stream that has a dependency on a file on a nonexistent workstation.

workstation is the workstation that does not exist in the migrated database.

System action: The job stream data is migrated, and a dummy file dependency with the name ""TWS_INITIAL_UPGRADE_DUMMY_FILE"" is created (if it has not already been created) with the master domain manager as the workstation. The job stream is modified to refer to the dummy dependency.

Operator response: Optionally, after the migration is complete, modify the job stream's file dependency to refer to a real file.

AWSJCL513W The job stream "dependent_job_stream" referenced in an external dependency by job stream "job_stream" does not exist. This dependency has been removed in the migrated job stream.

Explanation: See message.

job_stream identifies the job stream that has a dependency on a nonexistent job stream.

dependent_job_stream is the dependent job stream that does not exist in the migrated database.

System action: The job stream data is migrated, but the external dependency is removed.

Operator response: Optionally, after the migration is complete, create a new external dependency for this job stream.

AWSJCL514W The job "dependent_job" referenced in an external dependency by job stream "job_stream" does not exist. This dependency has been removed in the migrated job stream.

Explanation: See message.

job_stream identifies the job stream that has a dependency on a nonexistent job.

dependent_job is the dependent job that does not exist in the migrated database.

System action: The job stream data is migrated, but the external dependency is removed.

Operator response: Optionally, after the migration is complete, create a new external dependency for this job stream.

AWSJCL515W The workstation "workstation" referenced in a network dependency by job stream "job_stream" is not an extended agent. A dummy extended agent is created and the migrated job stream is modified to refer to it.

Explanation: See message.

job_stream identifies the job stream that has a network dependency on a workstation that is not an extended agent.

workstation is the workstation that is not defined as an x-agent in the migrated database.

System action: The job stream data is migrated, a dummy extended agent with the name ""TWS_DUMMY_XAGENT"" is created and the network dependency is modified to point to it.

Operator response: Optionally, after the migration is complete, create a new network dependency for this job stream.

AWSJCL516W The workstation "workstation" referenced in a network dependency by job stream "job_stream" does not exist. This dependency has been removed in the migrated job stream.

Explanation: See message.

job_stream identifies the job stream that has a network dependency on a workstation that does not exist.

workstation is the workstation that does not exist in the migrated database.

System action: The job stream data is migrated, but the network dependency is removed.

Operator response: Optionally, after the migration is complete, create a new network dependency for this job stream.

AWSJCL517E The workstation or workstation class "workstation_or_workstation_class" referenced by job definition "job_definition" does not exist. The job definition has not been migrated

Explanation: See message.

job_definition identifies the job definition that refers to a nonexistent workstation or workstation class.

workstation_or_workstation_class is the workstation or workstation class that does not exist.

System action: The job definition is not migrated.

Operator response: Optionally, after the migration is complete, create a new job definition to replace this one that was not migrated.

AWSJCL518W The recovery job "recovery_job" referenced by job "job" does not exist. The job is migrated without its recovery job.

Explanation: See message.

job identifies the job that refers to a nonexistent recovery job.

recovery_job is the recovery job that does not exist.

System action: The job definition is migrated without its recovery job.

Operator response: Optionally, after the migration is complete, create a new job recovery definition and modify the job definition to refer to it.

AWSJCL519E The workstation or workstation class "workstation_or_workstation_class" referenced by resource "resource" does not exist. The resource is not migrated.

Explanation: See message.

resource identifies the resource that refers to a nonexistent workstation or workstation class.

workstation_or_workstation_class is the workstation or workstation class that does not exist.

System action: The resource is not migrated.

Operator response: Optionally, after the migration is complete, create a new resource to replace this one that was not migrated.

AWSJCL520E The workstation "workstation" referenced by Windows user "Windows_user" does not exist. The user is not migrated.

Explanation: See message.

Windows_user identifies the Windows user that refers to a nonexistent workstation.

workstation is the workstation that does not exist.

System action: The Windows user is not migrated.

Operator response: Optionally, after the migration is complete, create a new Windows user to replace this one that was not migrated.

AWSJCL521E The password specified for the Windows user "Windows_user" does not comply with password security policy requirements.

Explanation: See message.

Windows_user identifies the user whose password is invalid.

System action: The Windows user is not migrated.

Operator response: Assign a different password to the user that satisfies the password rules of the computer, and then add the user to the version 8.3 database. The Windows user can then be migrated.

AWSJCL522W The file dependency referenced in job stream "job_stream" is incorrect. The file name "filename" exceeds the maximum length of "max_length" bytes. This dependency has been removed from the migrated job stream and the priority is set to 0.

Explanation: See message.

job_stream identifies the job stream that has a file dependency that is incorrect.

filename is the filename that is too long.

max_length is the maximum length in bytes of the filename.

System action: The job stream data is migrated, but the file dependency is removed.

Operator response: Optionally, after the migration is complete, create a new and correct file dependency for this job stream.

AWSJCL523W The file dependency referenced in the job stream "job_stream" is incorrect. The concatenation of the file path "path" and the file qualifier "qualifier" exceeds the maximum length of "max_length" bytes. This dependency has been removed from the migrated job stream and the priority is set to 0.

Explanation: See message.

job_stream identifies the job stream that has the file dependency that is incorrect.

path is the path of the file specified in the file dependency.

qualifier is the qualifier of the file in the file dependency.

max_length is the maximum length in bytes of the filename.

System action: The job stream data is migrated, but the file dependency is removed.

Operator response: Optionally, after the migration is complete, create a new and correct file dependency for this job stream.

AWSJCL524E The job definition "job" contains a null value for one or more of the following keywords: docommand , scriptname , or streamlogon . The job definition has not been migrated.

Explanation: See message.

job_definition identifies the job definition that has null values for one or more keywords.

System action: The job definition is not migrated.

Operator response: Optionally, after the migration is complete, create a new and correct job definition to replace this one that was not migrated.

AWSJCL525E The server was unable to load the requested objects within the timeout period of "timeout" seconds

Explanation: See message.

timeout is the configurable timeout period that has been exceeded by this operation.

System action: The requested operation is not performed.

Operator response: Retry the operation. If the error persists, change the timeout setting ""
com.ibm.tws.conn.queue.timeout

"" in the
TWSConfig.properties

file to a larger value, and retry the operation.

AWSJCL526W The workstation "workstation" (previously defined as MANGER) has been imported as a fault-tolerant agent because the domain manager already exists.

Explanation: See message.

workstation is the workstation defined as MANAGER in the old database and which has been imported as a fault-tolerant agent in the new one.

System action: The workstation is imported, but as a fault-tolerant agent.

Operator response: Check if it is correct that this workstation that used to be a domain manager is now to be a fault-tolerant agent.

- If it is correct, take no further action
- If it is not correct, check why you have a domain manager already defined. You may need to change the domain manager definition manually.

AWSJCL531E The event rule "event_rule" contains a duplicate action parameter: "parameter_name".

Explanation: See message.

event_rule identifies the event rule to which the action belongs.

parameter_name identifies the duplicate action parameter.

System action: The XML file cannot be parsed, so the operation cannot proceed.

Operator response: Do not specify duplicate action parameters when defining an event rule.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCL533E The operating system value, "osType", specified for the workstation "ftaName" being defined, is not a supported operating system value for a fault-tolerant agent workstation. Valid values are: UNIX, WNT or OTHER

Explanation: See message.

System action: The workstation is not created.

Operator response: Assign a valid value to the OS key and submit the operation again.

AWSJCL534E An error occurred when encoding the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request format and try the operation again.

AWSJCL535E An error occurred when encoding the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request format and try the operation again.

AWSJCL536E An error occurred when encoding the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request format and try the operation again.

AWSJCL537E An error occurred when encoding the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request format and try the operation again.

AWSJCL538E An error occurred when encoding the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request format and try the operation again.

AWSJCL539E An error occurred when parsing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request format and try the operation again.

AWSJCL540E An error occurred when initializing the connection for plan. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the connection properties and try the operation again.

AWSJCL541E An error occurred when initializing the connection for plan. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the connection properties and try the operation again.

AWSJCL542E An error occurred when initializing the connection for plan. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the connection properties and try the operation again.

AWSJCL543E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL544E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL545E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL546E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL547E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL548E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL549E An error occurred when processing the request. The following error message has additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the request and try the operation again.

AWSJCL550E There is an error in the URI syntax.
The following error message has
additional details: "errorMsg"

Explanation: See message.

errorMsg is the actual error message that was issued.

System action: The requested operation is not performed.

Operator response: Check the URI and try the operation again.

Chapter 184. AWSJCO - Connectors messages

This section lists error and warning messages that might be generated by the connectors.

The message component code is JCO.

AWSJCO001E An internal error has occurred. The properties "missing_properties" that are needed to initialize the connection factory internal component are missing.

Explanation: See message.

missing_properties identifies the properties required to initialize the connection factory internal component that are missing.

System action: The connector stops. The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO002E An internal error has occurred. The properties "unsupported_properties" that are needed to initialize the connection factory internal component are not supported.

Explanation: See message.

unsupported_properties identifies the properties required to initialize the connection factory internal component that are not supported.

System action: The connector stops. The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO003E An internal error has occurred. The connection properties that are needed to initialize the connection factory internal component are null.

Explanation: See message.

System action: The connector stops. The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO004E The WebSphere Application Server is down.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Start the WebSphere Application Server and retry the operation.

AWSJCO005E WebSphere Application Server has given the following error: "error_message".

Explanation: See message.

error_message is the message from WebSphere Application Server.

System action: The operation cannot be performed.

Operator response: Use the information in the error message to resolve the problem with WebSphere Application Server. Restart WebSphere Application Server and retry the operation.

AWSJCO006E An internal error has occurred. The method "method" is not supported.

Explanation: See message.

method identifies the method that is unsupported.

System action: The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the method you are calling is supported by the back-end Tivoli Workload Scheduler engine (distributed or z/OS). If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO007E An internal error has occurred. An incorrect parameter "parameter" was used in API "API". The reason for the error is "reason".

Explanation: See message.

parameter is the parameter that is incorrect.

API is the name of the API in which the incorrect parameter was used.

reason explains why the parameter is incorrect.

System action: The operation cannot be performed.

Operator response: If you are writing an application to use the indicated API, check your parameters, correct the error and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO008E The name specified for the workstation host "*incorrect_workstation_host*" is not allowed. You cannot, in the same action, change the workstation name and use the previous workstation name as the workstation host.

Explanation: See message.

incorrect_workstation_host is the name that you want to use for the workstation host that is not allowed.

System action: The workstation definition is not modified.

Operator response: Check the details of the operation that the connector is trying to perform, supply a different workstation host that is not the same as the old or new workstation names and repeat the operation.

AWSJCO009E An internal error has occurred. The method "*method*" has been called with an object of an unsupported class "*class*".

Explanation: See message.

method identifies the method that is unsupported.

class identifies the class of the object that was called by the unsupported method.

System action: The connector stops. The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the data in the API call, correct any errors you find and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO010E An internal error has occurred. A null parameter "*parameter*" was used in API "*API*" called by module "*module*".

Explanation: See message.

parameter is the API parameter that had a null value.

API is the API in which the null parameter was used.

module is the module that called the API.

System action: The operation cannot be performed.

Operator response: If you are writing an application to use the indicated API, check your parameters, correct the error and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO011E An internal error has occurred. The parameters "*parameter1*" and "*parameter2*" used in API "*API*" called by module "*module*" are inconsistent. An object cannot be unlocked if it is not already locked.

Explanation: See message.

parameter1 and *parameter2* are the parameters that are inconsistent with each other.

API is the API in which the inconsistent parameters were used.

module is the module that called the API.

System action: The operation cannot be performed.

Operator response: If you are writing an application to use the indicated API, check your parameters, correct the error and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO012E An internal error has occurred. The parameters "*parameter1*" and "*parameter2*" used by API "*API*" called by module "*module*" are inconsistent. It is not possible to specify an empty context when the object is expected to be locked.

Explanation: See message.

parameter1 and *parameter2* are the parameters that are inconsistent with each other.

API is the API in which the inconsistent parameters were used.

module is the module that called the API.

System action: The operation cannot be performed.

Operator response: If you are writing an application to use the indicated API, check your parameters, correct the error and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO013E An internal error has occurred. The parameter how many used in API "API" called by module "module" must be zero or a positive integer.

Explanation: See message.

API is the API in which the incorrect parameter was used.

module is the module that called the API.

System action: The operation cannot be performed.

Operator response: If you are writing an application to use the indicated API, check your parameters, correct the error and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO014E The database has been locked by the planner process.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Wait for ""planner"" to finish with the database and retry the operation.

AWSJCO015E An internal error has occurred. Java class "class" could not be found.

Explanation: See message.

class identifies the class that could not be found.

System action: The connector stops. The operation cannot be performed.

Operator response: Verify that the jar files of the product have not been damaged. You can do this by attempting to open them. If the files are damaged, or the *class_name* is not present in the files, the product must be uninstalled and reinstalled.

If the class is present, there is an internal error. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO016E The object "object" cannot be created or updated because it already exists or overlaps with an existing one.

Explanation: Either the object has already been created, or you have incorrectly identified the object.

object identifies the object that already exists.

System action: The operation cannot be performed.

Operator response: Check the context of the operation that the connector is trying to perform. Correct the original input request and repeat the operation.

AWSJCO017E The domain "domain" cannot be created or modified because to do so would create the following looped domain chain "looped_domain_chain", where the domain "domain" (the first in the list) is linked in one or more child-parent relationships to itself.

Explanation: See message.

domain identifies the domain you are trying to create or modify.

looped_domain_chain illustrates the loop that would be created if the operation were to be completed. The first domain in the sequence is the child of the second domain, and so on. You will see that the last domain in the chain is the same as the first, which is not allowed.

System action: The domain definition is not created or modified.

Operator response: Check the details of the operation that the connector is trying to perform. Correct the original input request and repeat the operation.

AWSJCO018E The job stream cannot be created or modified as the job "job" contains a dependency that would create the following looped dependency chain within the job stream "looped_job_dependency_chain".

Explanation: See message.

job identifies the job definition you are trying to modify.

looped_job_dependency_chain illustrates the loop that would be created if the operation were to be completed.

System action: The job stream definition is not created or modified.

Operator response: Check the details of the operation that the connector is trying to perform. Correct the original input request and repeat the operation.

AWSJCO019E The name specified for the parent domain "incorrect_parent" is not allowed. You cannot, in the same action, change the domain name and use the previous domain name as its parent.

Explanation: See message.

incorrect_parent is the name that you want to use for the parent that is not allowed.

System action: The domain definition is not created or modified.

Operator response: Check the details of the operation that the connector is trying to perform, supply a different parent domain that is not the same as the old or new domain names and repeat the operation.

If you want to change a domain so that it has a new name and becomes the child of the domain with the old name, use the following procedure:

1. Change the domain name of *name_B* to *name_C* without changing its parent (*name_A*)
2. Create domain *name_B* with parent *name_A*
3. Change the parent of *name_C* to *name_B*

AWSJCO020E The parent domain "parent_domain" referenced by domain "domain" does not exist.

Explanation: See message.

domain identifies the domain that you are creating or modifying.

parent_domain identifies the parent of the domain that does not exist.

System action: The domain definition is not created or modified.

Operator response: Check the details of the operation that the connector is trying to perform, supply a different parent domain and repeat the operation.

AWSJCO021E The object "object" cannot be deleted because it is referenced by the following objects: "referencing_objects".

Explanation: See message.

object identifies the object that you are trying to delete.

referencing_objects identifies the objects that reference the object that you are trying to delete.

System action: The operation cannot be performed.

Operator response: Check the details of the operation that the connector is trying to perform. If you have selected the wrong *object* select the correct one and repeat the operation. If you must delete this object, you must first either remove the references to the object you want to delete, or delete the objects that reference it.

AWSJCO022E The workstation "workstation" cannot become the domain manager of the domain "domain" because the domain already has a domain manager: "domain_manager".

Explanation: See message.

workstation identifies the workstation you are trying to create or modify.

domain identifies the domain of which you are trying to make this workstation domain manager.

domain_manager identifies the workstation currently assigned as the domain manager.

System action: The switch manager operation cannot be performed.

Operator response: Check the details of the operation that the connector is trying to perform. If you want to make *workstation* the new domain manager, you must first modify the definition of the existing *domain_manager* so that it is no longer domain manager. Then you can make *workstation* become the domain manager of *domain*.

AWSJCO023E The string used to identify the session "session_string" is longer than 36 bytes.

Explanation: See message.

session_string is the session identification string that is longer than 36 bytes.

System action: The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the data in the API call, correct the session identifier to not more than 36 bytes and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO024E Task type "non-valid_task_type" is not valid for job definition "job_definition". For this job definition the only valid task type is: "valid_task_type".

Explanation: See message.

job_definition identifies the job definition being created or modified.

non-valid_task_type is the task type that is not valid.

valid_task_type is the task type that is valid for the indicated job definition.

System action: The operation cannot be performed.

Operator response: Check the details of the operation that the connector is trying to perform, supply the valid task type and repeat the operation.

AWSJCO025E A master domain manager cannot be created. It must be installed.

Explanation: See message.

System action: The workstation definition is not created or modified.

Operator response: A master domain manager cannot be created. Use the installation process to install a master domain manager or to promote an appropriate existing workstation.

See *Planning and Installation* for information about installing or promoting a master domain manager.

AWSJCO026E User "user" is not authorized to perform the action "action" on an object "object_type" and key "object".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action, *object*, and *object_type* fully identify the action that is not authorized and the object to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO028E The object cannot be accessed because the user "user" is not defined in the Security file.

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition for this user.

user identifies the user that is not in the Security file.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, add the selected user to the Security file and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO029E The name specified for the workstation "workstation" is not allowed. A workstation and its host cannot have the same name as its host.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the workstation and host information. Change one of them and retry the operation.

AWSJCO030E The host "host" supplied for workstation "workstation" cannot be used because it is an extended agent.

Explanation: An extended agent cannot be the host of a workstation.

workstation identifies the workstation being validated.

host identifies the supplied host name that is an extended agent.

System action: The workstation definition is not created or modified.

Operator response: Check the host . Change it to a valid workstation that is not an extended agent and retry the operation.

AWSJCO031E The host "host" supplied for workstation "workstation" cannot be used because it is a workstation class.

Explanation: A workstation class cannot be a host.

workstation identifies the workstation being validated.

host identifies the supplied host name which is a workstation class.

System action: The workstation definition is not created or modified.

Operator response: Check the host. Change it to a valid workstation that is not a workstation class and retry the operation.

AWSJCO032E The workstation "workstation" referenced by job definition "job_definition" does not exist.

Explanation: See message.

job_definition identifies the job definition in which there are references to a workstation that does not exist.

workstation identifies the workstation that does not exist.

System action: The operation cannot be performed.

Operator response: Check the job definition. Change the workstation references to refer only to existing workstations, and retry the operation.

AWSJCO033E The host "host" supplied in the definition of workstation "workstation" does not exist.

Explanation: See message.

workstation identifies the workstation definition being validated.

host is the supplied host name which identifies a workstation that does not exist.

AWSJCO034E • AWSJCO040E

System action: The workstation definition is not created or modified.

Operator response: Check the host. Change it to a valid existing workstation and retry the operation.

AWSJCO034E The workstation "workstation" referenced by user "user" does not exist.

Explanation: See message.

workstation identifies the workstation that does not exist.

user identifies the user that has referenced it.

System action: The operation cannot be performed.

Operator response: Check the workstation definition. Change it to a valid existing workstation and retry the operation.

AWSJCO035E The Windows user "Windows_user" cannot be added for workstation "workstation" because the workstation operating system is not Windows.

Explanation: See message.

Windows_user is the Windows user you are trying to add.

workstation identifies the workstation definition to which you want to add the Windows user.

operating_system is the operating system of the workstation.

System action: The operation cannot be performed.

Operator response: Check the workstation in the job definition. Change it to a valid existing Windows workstation and retry the operation.

AWSJCO036E The workstation type of workstation "workstation" cannot be changed to extended agent (XA) as the workstation is the host of the extended agent workstation "extended_agent_workstation", and extended agents cannot be hosts of other extended agents.

Explanation: See message.

workstation identifies the workstation you are trying to modify.

extended_agent_workstation identifies the extended agent workstation of which *workstation* is the host.

System action: The workstation definition is not created or modified.

Operator response: If you want to change the workstation type of *workstation* to ""extended agent"", you must first assign a different workstation to be the

host of *extended_agent_workstation*. When you have done so, retry the operation.

AWSJCO037E The recovery job "recovery_job" referenced by a job definition "job_definition" does not exist.

Explanation: See message.

job_definition identifies the job definition in which there are references to a recovery job that does not exist.

recovery_job identifies the recovery job that does not exist.

System action: The job definition is not created or modified.

Operator response: Check the details of the operation that the connector is trying to perform, supply a different recovery job and repeat the operation.

AWSJCO038E The domain "domain" referenced by workstation "workstation" does not exist.

Explanation: See message.

domain identifies the domain that does not exist.

workstation identifies the workstation that has referenced it.

System action: The workstation definition is not created or modified.

Operator response: Check the details of the operation that the connector is trying to perform, supply a different domain and repeat the operation.

AWSJCO039E The value specified for the parent domain "parent_domain_name" is not allowed. A domain and its parent cannot have the same name.

Explanation: See message.

System action: The domain definition is not created or modified.

Operator response: Change the name of the parent domain to an existing domain other than the domain being created or modified.

AWSJCO040E The job definition "job_definition" of job "job" in job stream "job_stream_name" does not exist.

Explanation: See message.

job_definition is the job definition that does not exist.

job is the job that references a job definition that does not exist.

job_stream identifies the job stream definition you are

creating or modifying and which contains the indicated job.

System action: The operation cannot be performed.

Operator response: Check the reference to the definition of the indicated job in the job stream definition. Change it to identify an existing job definition, and retry the operation.

AWSJCO041E The time zone "time_zone" is not valid in the definition of the object type "object_type" with the following key "object_key".

Explanation: See message.

time_zone is the time zone that is not in the list of valid time zones.

object and *object_type* identify the object that cannot be modified or created.

System action: The operation cannot be performed.

Operator response: Check the time zone you have used. Change it to a valid time zone value and retry the operation.

AWSJCO042E An internal error has occurred. The specified key type "key_type" is not valid. The expected key type is: "expected_key_type".

Explanation: See message.

key_type is the instance type of the input key.

expected_key_type is the expected instance type of the input key.

System action: The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the data in the API call, correct the key type and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO043E An error occurred decrypting the Windows user password. The decryption key (the domain name concatenated with the user name) might be incorrect.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the information you are supplying as domain name and user name, correct it and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/>

[software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

AWSJCO044E An error occurred encrypting the Windows user password. The encryption key (the domain name concatenated with the user name) might be incorrect.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the information you are supplying as domain name and user name, correct it and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO045E While trying to lock multiple objects as the result of the use of a wildcard in the selection criteria, one or more of the objects could not be locked.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Follow this procedure:

1. Use the same wildcards to list details of the objects you want to lock
2. Check their status and find out which ones are locked
3. Contact the user that has locked them to have them unlocked
4. Retry the operation

AWSJCO046E The workstation "workstation" defined in job stream "job_stream" does not exist.

Explanation: See message.

job_stream identifies the job stream definition you are creating or modifying.

workstation is the referenced workstation that does not exist.

System action: The job stream definition is not created or modified.

Operator response: Check the workstation reference in the job stream definition. Change it to identify an existing workstation, and retry the operation.

AWSJCO047E The name specified for the recovery job "recovery_job_name" is not allowed. A job and its recovery job cannot have the same name.

Explanation: A job definition cannot reference itself as the recovery job.

recovery_job_name is the recovery job name that you have used that is the same as the job name.

System action: The job definition is not created or modified.

Operator response: Check the recovery job name in the job definition. Change it to be different to the job name, and retry the operation.

AWSJCO048E The name specified for the recovery job "recovery_job_name" is not allowed. You cannot, in the same action, change the job definition name and use the old job definition name as the recovery job name.

Explanation: *recovery_job_name* is the name you want to use for the recovery job that is not allowed.

System action: The job definition is not created or modified.

Operator response: Check the recovery job name in the job definition. Change it to be different to the old and new job names, and retry the operation.

AWSJCO049E The host "host" supplied for workstation "workstation" cannot be used because it must be a workstation of type broker.

Explanation: The host of an agent, or pool, or dynamic pool workstation must be a workstation of type broker.

workstation identifies the workstation being validated.

host identifies the supplied host name.

System action: The workstation definition is not created or modified.

Operator response: Check the host. Change it to a valid workstation that is not an extended agent and retry the operation.

AWSJCO050E User "user" is not authorized to perform the action "action" on object type "object_type" with key "object".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action, *object*, and *object_type* fully identify the action that is not authorized and the object to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO051E The length of the specified Windows user password, "supplied_password_length" bytes, exceeds the maximum length of "max_password_length" bytes.

Explanation: See message.

max_password_length is the maximum number of bytes allowed for the password of a Windows user.

supplied_password_length is the length of the password supplied with the Windows user to be created or modified.

System action: The Windows user definition is not created or modified.

Operator response: Check the length of the password in the Windows user definition. Change it to satisfy the maximum length, and retry the operation.

AWSJCO052E User "user" is not authorized to perform the action "action" on the file "file_name".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action, and *file_name* fully identify the action that is not authorized and the file name to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this file and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO053E User "user" is not authorized to perform the action "action" on the report "report_name".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action, and *report_name* fully identify the action that is not authorized and the report name to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO054E The option "option" does not exist.

Explanation: See message.

option identifies the option you are trying to show or change, that does not exist.

System action: The operation cannot be performed.

Operator response: Check the option you are trying to show or change against the options documented in the *Planning and Installation Guide*, or run the **optman ls** command to see a list of the existing options. Change the option to a valid existing option and retry the operation.

AWSJCO055E User "user" is not authorized to perform the action "action" on the line of business "lob_name".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action, and *lob_name* fully identify the action that is not authorized and the line of business name to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry

the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO056E You cannot specify the plan ID for the operation "operation".

Explanation: See message.

operation is the operation you are performing.

System action: The operation cannot be performed.

Operator response: If this error results from a call to an API from a program you are writing, check the data in the API call, correct the error, and retry the operation. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO057E The job stream "job_stream" cannot be created or modified as the workstation "workstation" is not an extended agent, and only extended agents can have internetwork dependencies.

Explanation: See message.

job_stream identifies the job stream you are trying to create or modify with an internetwork dependency.

workstation identifies the workstation of the job stream you are trying to modify.

System action: The job stream definition is not created or modified.

Operator response: Change the workstation type to ""extended agent"" or remove the internetwork dependency or dependencies. Repeat the operation.

AWSJCO058E The dependency for the job "job" cannot be added to the job stream "job_stream" as the workstation "workstation" is not an extended agent, and only extended agents can act as network agents.

Explanation: See message.

job identifies the job with an internetwork dependency you are trying to add to a job stream.

job_stream identifies the job stream you are trying to modify.

workstation identifies the workstation of the job stream you are trying to modify.

System action: The job is added to the job stream without the internetwork dependency.

Operator response: If you need the internetwork dependency, change the workstation type to ""extended agent"". Add the dependency again.

AWSJCO059E The workstation "workstation_name" is of type "workstation_type", it cannot be manually created.

Explanation: See message.

Manual creation is not supported for workstations of type: *workstation_type*.

System action: The workstation is not created.

Operator response: To create this type of workstation, install the Agent. The workstation is automatically created and registered in the Tivoli Workload Scheduler database with the name you specify.

AWSJCO060E A job definition cannot have a different workstation class than the workstation class of its job stream. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but workstation class "workstation_class" is defined in job definition "job_definition" of job "job" in that job stream.

Explanation: *job_stream* identifies the job stream to which the job you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

job is the job you are adding to the job stream.

job_definition is the job definition with wrong workstation class.

workstation_class is the workstation class you have supplied for that job.

System action: The job stream definition is not created or modified.

Operator response: Check the job definition. Change the workstation class to be the same as that of the job stream for which you are defining the job, and retry the operation.

AWSJCO061E A job cannot be defined for a workstation class if the job stream to which it belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but a workstation class ("workstation_class") has been defined in job definition "job_definition" of job "job" of that job stream.

Explanation: *job_stream* is the job stream you are creating or modifying.

job_stream_workstation is the workstation of that job stream.

job identifies the job you are trying to add or modify.

job_definition is the job definition of that job.

workstation_class is the workstation class you have supplied for the job definition of that job (which must be a workstation).

System action: The job stream definition is not created or modified.

Operator response: Check the job definition. Change the workstation class to be a workstation - the same workstation as that of the job stream for which you are defining the job, and retry the operation.

AWSJCO062E A resource cannot have a different workstation class than the workstation class of its job stream. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but workstation class "workstation_class" is defined in the dependency on resource "resource" in that job stream.

Explanation: *job_stream* identifies the job stream to which the resource dependency you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

resource is the resource dependency you are adding.

workstation_class is the workstation class you have supplied for that resource dependency.

System action: The operation cannot be performed.

Operator response: Check the resource dependency definition. Change the workstation class to be the same as that of the job stream for which you are defining the job, and retry the operation.

AWSJCO063E A resource dependency of a job cannot have a different workstation class than the workstation class of the job stream to which the job belongs. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but workstation class "workstation_class" is defined in the dependency on resource "resource" of job "job" in that job stream.

Explanation: *job_stream* identifies the job stream to which the resource dependency you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

resource is the resource dependency you are adding.

workstation_class is the workstation class you have supplied for that resource dependency.

job is the job to which the resource dependency belongs.

System action: The operation cannot be performed.

Operator response: Check the resource dependency definition in the job definition. Change the workstation class to be the same as that of the job stream for which you are defining the resource dependency, and retry the operation.

AWSJCO064E A resource dependency cannot be defined for a workstation class if the job stream to which it belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but a workstation class ("workstation_class") has been defined in the dependency on resource "resource" in that job stream.

Explanation: *job_stream* is the job stream you are creating or modifying.

job_stream_workstation is the workstation of that job stream.

resource identifies the resource dependency of the job stream that you are trying to create or modify.

workstation_class is the workstation class you have supplied for this resource dependency (which must be a workstation).

System action: The operation cannot be performed.

Operator response: Check the resource dependency definition. Change the workstation class to be a workstation - the same workstation as that of the job stream for which you are defining the resource dependency, and retry the operation.

AWSJCO065E A resource dependency of a job definition cannot be defined for a workstation class if the job stream to which the job belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but a workstation class ("workstation_class") has been defined in the dependency on resource "resource" of job "job" in that job stream.

Explanation: *job_stream* is the job stream you are creating or modifying.

job_stream_workstation is the workstation of that job stream.

job identifies the job of that job stream being created or modified

resource identifies the resource dependency of the job being created or modified

workstation_class is the workstation class you have supplied for this resource dependency (which must be a workstation).

System action: The operation cannot be performed.

Operator response: Check the resource dependency definition of the job. Change the workstation class to be a workstation - the same workstation as that of the job stream for which you are defining the job and its resource dependency, and retry the operation.

AWSJCO066E A file dependency cannot be for a different workstation class than the workstation class of its job stream. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but workstation class "workstation_class" is defined in the dependency on file "file" in that job stream.

Explanation: *job_stream* identifies the job stream to which the file dependency you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

file is the file dependency you are adding.

workstation_class is the workstation class you have supplied for that file dependency.

System action: The operation cannot be performed.

Operator response: Check the file dependency definition. Change the workstation class to be the same as that of the job stream for which you are defining the job, and retry the operation.

AWSJCO067E A file dependency of a job cannot have a different workstation class than the workstation class of the job stream to which the job belongs. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but workstation class "workstation_class" is defined in the dependency on file "file" of job "job" in that job stream.

Explanation: *job_stream* identifies the job stream to which the file dependency you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

file is the file dependency you are adding.

workstation_class is the workstation class you have supplied for that file dependency.

job is the job to which the file dependency belongs.

System action: The operation cannot be performed.

Operator response: Check the file dependency definition in the job definition. Change the workstation class to be the same as that of the job stream for which you are defining the file dependency, and retry the operation.

AWSJCO068E A file dependency cannot be defined for a workstation class if the job stream to which it belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but a workstation class ("workstation_class") has been defined in the dependency on file "file" in that job stream.

Explanation: *job_stream* is the job stream you are creating or modifying.

job_stream_workstation is the workstation of that job stream.

file identifies the file dependency of the job stream that you are trying to create or modify.

workstation_class is the workstation class you have supplied for this file dependency (which must be a workstation).

System action: The operation cannot be performed.

Operator response: Check the resource dependency definition. Change the workstation class to be a workstation - the same workstation as that of the job stream for which you are defining the resource dependency, and retry the operation.

AWSJCO069E A file dependency of a job definition cannot be defined for a workstation class if the job stream to which the job belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but a workstation class ("workstation_class") has been defined in the dependency on file "file" of job "job" in that job stream.

Explanation: *job_stream* is the job stream you are creating or modifying.

job_stream_workstation is the workstation of that job stream.

job identifies the job of that job stream being created or modified

file identifies the file dependency of the job being created or modified

workstation_class is the workstation class you have supplied for this file dependency (which must be a workstation).

System action: The operation cannot be performed.

Operator response: Check the file dependency definition of the job. Change the workstation class to be a workstation - the same workstation as that of the job stream for which you are defining the job and its file dependency, and retry the operation.

AWSJCO070E An external dependency cannot be created on a job stream with a different workstation class than the workstation class of the job stream to which the dependency belongs. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but the external job stream on which you want it to be dependent "external_job_stream" runs on a different workstation class "external_job_stream_workstation_class".

Explanation: *job_stream* identifies the job stream to which the external dependency you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

external_job_stream is the job stream on which the indicated *job_stream* is dependent.

external_job_stream_workstation_class is the workstation class of the *external_job_stream*.

System action: The operation cannot be performed.

Operator response: Check the external dependency definition. Change the dependency to be on an external job stream of the same workstation class as that of the job stream for which you are defining the dependency, and retry the operation.

AWSJCO071E An external dependency cannot be created on a job with a different workstation class than the workstation class of the job stream to which the dependency belongs. Job stream "job_stream" runs on workstation class "job_stream_workstation_class", but the external job on which you want it to be dependent "external_job" in external job stream "external_job_stream" runs on a different workstation class "external_job_workstation_class".

Explanation: *job_stream* identifies the job stream to which the external dependency you are creating or modifying belongs.

job_stream_workstation_class is the workstation class of that job stream.

external_job is the job on which the indicated *job_stream* is dependent.

external_job_stream is the job stream to which the

indicated *external_job* belongs.

external_job_workstation_class is the workstation class of the *external_job*.

System action: The operation cannot be performed.

Operator response: Check the external dependency definition. Change the dependency to be on an external job of the same workstation class as that of the job stream for which you are defining the dependency, and retry the operation.

AWSJCO072E An external dependency cannot be created on a job stream defined for a workstation class if the job stream to which the dependency belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but the external job stream on which you want it to be dependent "external_job_stream" runs on a workstation class: "external_job_stream_workstation_class".

Explanation: *job_stream* identifies the job stream to which the external dependency you are creating or modifying belongs.

job_stream_workstation is the workstation of that job stream.

external_job_stream is the job stream on which the *job_stream* is dependent.

external_job_stream_workstation_class is the workstation class of the *external_job_stream*.

System action: The operation cannot be performed.

Operator response: Check the external dependency. Change the dependency to be on an external job stream for the same workstation as that of the job stream for which you are defining the dependency, and retry the operation.

AWSJCO073E An external dependency cannot be created on a job defined for a workstation class if the job stream to which the dependency belongs runs on a workstation. Job stream "job_stream" runs on workstation "job_stream_workstation", but the external job on which you want it to be dependent "external_job" in external job stream "external_job_stream" runs on workstation class "external_job_workstation_class".

Explanation: *job_stream* identifies the job stream to which the external dependency you are creating or modifying belongs.

job_stream_workstation is the workstation of that job stream.

external_job is the job on which the *job_stream* is dependent.

external_job_stream is the job stream to which the *external_job* belongs.

external_job_stream_workstation_class is the workstation class of the *external_job*.

System action: The operation cannot be performed.

Operator response: Check the external dependency. Change the dependency to be on an external job for the same workstation as that of the job stream for which you are defining the dependency, and retry the operation.

AWSJCO074E The job definition in the action with plug-in name "plug-in_name" and action type "action_type" does not exist.

Explanation: See message.

plug-in_name identifies the plug-in name of the action in which there are references to a job definition that does not exist.

action_type identifies the type of the action in which there are references to a job definition that does not exist.

System action: The rule containing this action is not created or modified.

Operator response: Check the details of the operation that you are trying to perform, supply a different job definition and repeat the operation.

AWSJCO075E The job stream in the action with plug-in name "plug-in_name" and action type "action_type" does not exist.

Explanation: See message.

plug-in_name identifies the plug-in name of the action in which there are references to a job stream that does not exist.

action_type identifies the type of the action in which there are references to a job stream that does not exist.

System action: The rule containing this action is not created or modified.

Operator response: Check the details of the operation that you are trying to perform, supply a different job stream and repeat the operation.

AWSJCO080E The workstation "workstation" referred to in a job stream internetwork dependency does not exist.

Explanation: *workstation* is the referenced workstation that does not exist.

System action: The operation cannot be performed.

Operator response: Check the workstation reference in the job stream internetwork dependency definition. Change it to identify an existing workstation, and retry the operation.

AWSJCO081E The resource "resource" referred to in a resource dependency in job stream "job_stream" does not exist.

Explanation: *resource* is the referenced resource that does not exist.

job_stream is the job stream to which you are trying to add or modify the dependency.

System action: The operation cannot be performed.

Operator response: Check the resource reference in the job stream resource dependency definition. Change it to identify an existing resource, and retry the operation.

AWSJCO082E The resource "resource" referred to in a resource dependency in job "job" in job stream "job_stream" does not exist.

Explanation: *resource* is the referenced resource that does not exist.

job identifies the job to which you are trying to add or modify the dependency.

job_stream is the job stream to which the job belongs.

System action: The operation cannot be performed.

Operator response: Check the resource reference in the job resource dependency definition. Change it to identify an existing resource, and retry the operation.

AWSJCO083E The object "object" cannot be found.

Explanation: *object* is the key of the object that does not exist.

System action: The operation cannot be performed.

Operator response: Check the indicated object key to identify an existing object and retry the operation.

AWSJCO084E The user "user" is not authorized to work with the planner process.

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the use of the planner process by this user.

user identifies the user that is not authorized to use the ""planner"" process.

System action: The operation cannot be performed.

Operator response: Check the user ID displayed in

the message. If it is incorrect, retry the operation with the correct user ID.

Otherwise, update the Security file to allow the selected user to use the planner process.

See *Administration Guide* for information about managing the Security file.

AWSJCO085E The workstation "workstation" referenced by object "object" does not exist.

Explanation: See message.

workstation identifies the workstation that does not exist.

object identifies the object that has referenced it.

System action: The operation cannot be performed.

Operator response: Check the reference to the indicated workstation in the object definition. Correct the object definition to refer to an existing workstation or create the workstation in question. Then retry the operation.

AWSJCO086E The list of TWSObjects passed in input to the validateTWSObjects connector API cannot be null or empty.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Correct the input to the indicated API and retry the operation.

AWSJCO087E The name and workstation of job stream "job_stream" cannot be changed because another job stream already exists with the supplied name and workstation. Two job streams can only have the same name and workstation if one has been created, not updated, as a version of the other.

Explanation: A job stream is identified by the job stream name and the workstation or workstation class it is to run on. But different versions of the job stream can exist with different *valid-from* dates, but only provided they are created as such. An existing job stream cannot be updated to become a version of another existing job stream.

job_stream identifies the job stream which already exists.

System action: The operation cannot be performed.

Operator response: If you want the indicated *job_stream* to become a version of another job stream, you must create it. If you selected the name and workstation of an existing job stream by mistake, select a different job stream name or workstation that does not exist and retry the update operation.

AWSJCO090E An external dependency cannot be created on a job stream with a different workstation class than the workstation class of the job to which the dependency belongs. Job "job" in job stream "job_stream" runs on workstation class "job_workstation_class", but the external job stream on which you want it to be dependent "external_job_stream" runs on a different workstation class "external_job_stream_workstation_class".

Explanation: *job* identifies the job to which the external dependency you are creating or modifying belongs.

job_stream is the job stream to which the job belongs.

job_workstation_class is the workstation class of that job.

external_job_stream is the job stream on which the indicated *job* is dependent.

external_job_stream_workstation_class is the workstation class of the *external_job_stream*.

System action: The operation cannot be performed.

Operator response: Check the external dependency definition. Change the dependency to be on an external job stream of the same workstation class as that of the job for which you are defining the dependency, and retry the operation.

AWSJCO091E An external dependency cannot be on a job with a different workstation class than the workstation class of the job to which the dependency belongs. Job "job" in job stream "job_stream" runs on workstation class "job_workstation_class", but the external job on which you want it to be dependent "external_job" in external job stream "external_job_stream" runs on a different workstation class "external_job_workstation_class".

Explanation: *job* identifies the job to which the external dependency you are creating or modifying belongs.

job_stream is the job stream to which the job belongs.

job_workstation_class is the workstation class of that job.

external_job is the job on which the *job* is dependent.

external_job_stream is the job stream to which the *external_job* belongs.

external_job_workstation_class is the workstation class of the *external_job*.

System action: The operation cannot be performed.

Operator response: Check the external dependency definition. Change the dependency to be on an external

job in a job stream of the same workstation class as that of the job for which you are defining the dependency, and retry the operation.

AWSJCO092E An external dependency cannot be on a job stream defined for a workstation class if the job to which the dependency belongs runs on a workstation. Job "job" in job stream "job_stream" runs on workstation "job_workstation", but the external job stream on which you want it to be dependent "external_job_stream" runs on a workstation class "external_job_stream_workstation_class".

Explanation: *job* identifies the job to which the external dependency you are creating or modifying belongs.

job_stream is the job stream to which the job belongs.

job_workstation is the workstation of that job.

external_job_stream is the job stream on which the *job* is dependent.

external_job_stream_workstation_class is the workstation class of the *external_job_stream*.

System action: The operation cannot be performed.

Operator response: Check the external dependency. Change the dependency to be on an external job stream for the same workstation as that of the job for which you are defining the dependency, and retry the operation.

AWSJCO093E An external dependency cannot be on a job defined for a workstation class if the job to which the dependency belongs runs on a workstation. Job "job" in job stream "job_stream" runs on workstation "job_workstation", but the external job on which you want it to be dependent "external_job" in external job stream "external_job_stream" runs on workstation class "external_job_workstation_class".

Explanation: *job* identifies the job to which the external dependency you are creating or modifying belongs.

job_stream is the job stream to which the job belongs.

job_workstation is the workstation of that job.

external_job is the job on which the *job* is dependent.

external_job_stream is the job stream to which the *external_job* belongs.

external_job_workstation_class is the workstation class of the *external_job*.

System action: The operation cannot be performed.

Operator response: Check the external dependency. Change the dependency to be on an external job for the same workstation as that of the job for which you are defining the dependency, and retry the operation.

AWSJCO094E Job stream "job_stream" has an external dependency that refers to itself, but the dependency resolution criteria is not closest preceding (previous).

Explanation: You have defined a self external dependency. Self external dependencies are external dependencies where the target abstract job stream is the same job stream that owns the dependency (or the job with the dependency). The resolution of these dependencies must be "closest preceding" (on the GUI) or "previous" (using the CLI).

job_stream identifies the job stream to which the external dependency you are creating or modifying belongs.

System action: The operation cannot be performed.

Operator response: Check the external dependency. Change the dependency resolution to be "closest preceding" (on the GUI) or "previous" (using the CLI), and retry the operation.

AWSJCO095E The number of output lines must be greater than zero.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Change the number of lines in the job output request to a value greater than zero and retry the operation.

AWSJCO096E The job key "key" is not in the correct format, which is: workstation_name#job_name.

Explanation: You have specified a non-valid job key format.

The correct format is *workstation_name#job_name* where *workstation_name* is the name of the workstation and *job_name* is the name of the job definition

System action: The operation cannot be performed.

Operator response: Correct the job key format and retry the operation.

AWSJCO097E The job stream key "key" is not in the correct format, which is: workstation_name#job_stream_name.

Explanation: You have specified a non-valid job stream key format.

The correct format is

workstation_name#job_stream_name where *workstation_name* is the name of the workstation and *job_stream_name* is the name of the job stream definition

System action: The operation cannot be performed.

Operator response: Correct the job stream key format and retry the operation.

AWSJCO098E The job stream cannot be submitted because no job stream with key "key" and valid on "scheduled_date" at "scheduled_time" was found.

Explanation: Either the job stream does not exist, or no version of the job stream is valid on the *scheduled_date* at the *scheduled_time*.

scheduled_date and *scheduled_time* are resolved from the supplied "schedtime" or "at" time.

System action: The operation cannot be performed.

Operator response: Modify the job stream key or submit the job stream with a "schedtime" or "at" time for which the job stream is valid.

AWSJCO099E The supplied Web Service parameter "parameter" is not a valid parameter.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the parameters used to call the Web Service. Correct any error you find and retry the operation.

AWSJCO100E The value "value" specified for the supplied Web Service parameter "parameter" is not valid.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the parameters used to call the Web Service. Correct any error you find and retry the operation.

AWSJCO101E The specified filter "filter" is not a valid filter.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Specify a valid filter and retry the operation.

AWSJCO102E The value specified for filter "filter" is not valid.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Specify a valid value for the filter, and retry the operation.

AWSJCO103E The value specified for filter "filter" is not valid for the following reason: "reason".

Explanation: See message.

reason is a description of the error that makes the value non valid.

System action: The operation cannot be performed.

Operator response: Specify a valid value for the filter, and retry the operation.

AWSJCO104E The required service "service" can only be run on a domain manager or backup domain manager, as it requires a server configuration that can access the modelling information.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Direct the call for the service to the master domain manager or a backup master domain manager.

AWSJCO105E The job cannot be submitted because no job with key "job_key" was found in the database.

Explanation: See message.

job_key identifies the job that cannot be submitted.

System action: The operation cannot be performed.

Operator response: Check the submitted *job_key*. If you mistyped the job key, correct the error and retry the operation. If the job key is correct, the job might have been deleted from the database. Check in the database. You might need to recreate the job in the database before it can be submitted.

AWSJCO106E The chosen object was created or modified with a version of the engine, Tivoli Dynamic Workload Console, or application that is later than the version of the Tivoli Dynamic Workload Console or application you are currently using. To view or modify the object, upgrade the Tivoli Dynamic Workload Console or the application.

Explanation: You are using the Tivoli Dynamic Workload Console or an application developed with the Tivoli Workload Scheduler Application Programming Interface. You have tried to access a scheduling object that was created, or has been modified, with a more-recent version of the engine, Tivoli Dynamic Workload Console or application than you are using.

The Tivoli Dynamic Workload Console and Application Programming Interface are only compatible with objects created at the same version or lower.

System action: The object cannot be accessed.

Operator response:

Tivoli Dynamic Workload Console

Ask your Tivoli Workload Scheduler administrator to install a compatible version of the Tivoli Dynamic Workload Console.

Application developed with the Tivoli Workload Scheduler Application Programming Interface

Ask your Tivoli Workload Scheduler administrator to generate a version of the application you are using which is compatible with the version of the engine and the connector.

AWSJCO107E Message GJS0073E is not completely accurate. The chosen object can be viewed but not modified because it was created or modified with a version of the engine, Tivoli Dynamic Workload Console, or application that is later than the version of the Tivoli Dynamic Workload Console or application you are currently using. To modify the object, upgrade the Tivoli Dynamic Workload Console or the application.

Explanation: You are using the Tivoli Dynamic Workload Console or an application developed with the Tivoli Workload Scheduler Application Programming Interface. You have tried to access a scheduling object that was created, or has been modified, with a more recent version of the engine, Tivoli Dynamic Workload Console or application than the one you are using.

The Tivoli Dynamic Workload Console and Application Programming Interface are only compatible with objects created with the same version of the program or with a previous version.

System action: The object cannot be accessed.

Operator response:

Tivoli Dynamic Workload Console

Ask your Tivoli Workload Scheduler administrator to install a compatible version of the Tivoli Dynamic Workload Console.

Application developed with the Tivoli Workload Scheduler Application Programming Interface.

Ask your Tivoli Workload Scheduler administrator to generate a version of the application you are using which is compatible with the version of the engine and the connector.

AWSJCO108E An internal error has occurred.

Explanation: This message is displayed because the EventRuleValidator has called the EventManagerFactory.getActionPluginManager() but the TWSPugin.properties file cannot be found.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO109E Unable to create an instance of the action plug-in "plug-in_name".

Explanation: See message.

plug-in_name identifies the name of the action plug-in instance which cannot be created.

System action: The operation cannot be performed.

Operator response: Check whether the action plug-in exists or provide a different action plug-in and repeat the operation.

AWSJCO110E Unable to create an instance of the event plug-in "plug-in_name".

Explanation: See message.

plug-in_name identifies the name of the event plug-instance which cannot be created.

System action: The operation cannot be performed.

Operator response: Check whether the action plug-in exists or provide a different action plug-in and repeat the operation.

AWSJCO111E An internal error occurred when the event processor was attempting to create an instance of the plug-in "plug-in_name".

Explanation: See message.

plug-in_name identifies the name of the plug-in which caused the error.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO112E An internal error occurred when the event processor was attempting to access the event rule "rule_name".

Explanation: See message.

rule_name identifies the name of the rule which caused the error.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO117E The event rule "rule_name" contains two or more event conditions having the same name: "event_name".

Explanation: See message.

rule_name identifies the name of the rule which caused the error.

event_name identifies the event name duplicated inside the event rule.

System action: The operation cannot be performed.

Operator response: Rename one or more event conditions as required.

AWSJCO118E An error occurred while event processor was attempting to get the basename for an event condition of type "event_type" inside the event rule "rule_name".

Explanation: See message.

rule_name identifies the name of the rule containing the event condition for which the basename caused the error.

event_type identifies the type of the event condition for which the basename caused the error.

System action: The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO120W It is not possible to build the event rule "rule_name". The rule status is set to ERROR.

Explanation: See message.

System action: Processing continues but the specified rule is not built. The rule status is set to ERROR.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCO121E The active start offset and end offset must differ by at least 1 second.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Specify an appropriate interval and retry the operation.

AWSJCO122E The valid to value must be greater than the valid from value.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Specify an appropriate value and retry the operation.

AWSJCO123E The user "user" is not authorized to perform the action "action" on an object "object_type" with attributes: "attributes".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the indicated action on this object by this user.

user identifies the user that is not authorized to perform the action.

action, *attributes*, and *object_type* fully identify the action that is not authorized and the rule action or the event condition to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the user ID displayed in the message. If it is incorrect, retry the operation with the correct user ID.

Otherwise, update the Security file to allow the selected user to perform the action on the object with these attributes.

See *Administration Guide* for information about managing the Security file.

AWSJCO124E The user "user" is not authorized to perform the action "action" on an object "object_type" with name "rule_name".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action, *rule_name*, and *object_type* identify the action that is not authorized and the object to which the action relates.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO127E The event processor (rule builder) has stopped because the timeout has expired. When the event processor is restarted all rules will be rebuilt.

Explanation: The event processor was stopped by user action while a **planman deploy** action was being run. The event processor normally waits for the **planman deploy** action to finish, but the fixed timeout period expired before the action finished.

System action: The event processor stops. When it is restarted, all rules are rebuilt.

Operator response: There is no specific action to take. Be aware that while the event processor is stopped, no event-based scheduling can be performed.

AWSJCO128E The rule builder cannot build the rules because the event processor is not running.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Start the event processor and retry the operation.

AWSJCO131E User "user" is not authorized to perform the action "action" on the variable with key "key" because the user is not authorized to perform the action "variable_table_action" on the VariableTable with key "variable_table_key".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action and *key* fully identify the action that is not authorized and the variable to which the action relates.

variable_table_action and *variable_table_key* fully identify the action that is not authorized to be performed on the indicated variable table.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO132E User "user" is not authorized to perform the action "action" on the variable with key "key" because the user is not authorized to perform the action "variable_table_action" on the default VariableTable with key "default_variable_table_key".

Explanation: User definitions in the Security file control the objects that users can access and the actions they can perform on the objects. The Security file does not include a user definition that authorizes the specified action by this user.

user identifies the user that is not authorized to perform the action.

action and *key* fully identify the action that is not authorized and the variable to which the action relates.

variable_table_action and *default_variable_table_key* fully identify the action that is not authorized to be performed on the indicated default variable table.

System action: The operation cannot be performed.

Operator response: Check the information displayed in the message. If any of the details are incorrect, retry the operation with the correct information.

Otherwise, update the Security file to allow the selected user to perform this action on this object and retry the operation.

See *Administration Guide* for information about managing the Security file.

AWSJCO133E You cannot add "variable" variable because the variable table is locked, probably by different user.

Explanation: You cannot create the variable object because the specified variable table is locked. The supplied information does not allow your session to be associated with the user that set the lock.

System action: The operation cannot be performed.

Operator response: Ensure that the session information is correct or unlock the variable table.

AWSJCO134E You cannot modify the object "object_key" because it contains functions that are not supported by current client.

Explanation: See message.

For Example, the modification of objects that contain variable tables is not supported.

System action: The requested action did not complete successfully

Operator response: Use the Tivoli Dynamic Workload Console or the command line to modify the object.

AWSJCO135W The global option "option" cannot be obtained from the database. The default value "value" is used instead.

Explanation: Workload Service Assurance feature uses this option to calculate the hot list of a critical job but it was unable to read its value from the database.

System action: The default value for the option is used.

Operator response: If the default value is not acceptable, see a previous message explaining why the option cannot be read from the database.

Fix the problem and restart the WebSphere Application Server or run **planman confirm** or **JnextPlan** to reload the option.

AWSJCO136E No more than "max_users" users can perform this operation at the same time. The maximum number of concurrent requests was reached: try again later.

Explanation: To avoid slowing down other scheduling activities, the system does not process more than the specified number of ""Plan View"" queries at the same time. When the maximum value is reached, further requests are rejected.

max_users identifies the maximum number of users that are allowed to run the ""Plan View"" query at the same time.

System action: The system denies execution of the ""Plan View"" query at this time. No action is performed.

Operator response: Wait for other users to complete the current operation and try again. If the problem persists, contact the system administrator.

AWSJCO137E The workstation "memeber" supplied in the definition of workstation "workstation" cannot be used because it must be a workstation of type agent.

Explanation: The member workstation of a pool workstation must be a workstation of type agent.

workstation identifies the workstation being validated.

member identifies the supplied workstation member name.

System action: The workstation definition is not created or modified.

Operator response: Check the workstation member name. Change it to a valid workstation that is an agent and retry the operation.

AWSJCO138E The workstation "member" supplied in the definition of workstation "workstation" does not exist.

Explanation: See message.

workstation identifies the workstation definition being validated.

member is the supplied workstation member name which identifies a workstation that does not exist.

System action: The workstation definition is not created or modified.

Operator response: Check the workstation member. Change it to a valid existing workstation and retry the operation.

AWSJCO139E The workstations "members" specified as `jsdl:orderedCandidatedWorkstations` in the dynamic pool with key "dpool" are not agents or remote engines.

Explanation: See message.

You have specified one or more candidate workstations for the dynamic pool in the requirements definition.

One or more of the workstations you specified are not agents or remote engines.

members is the list of workstation that are not agents or remote engines.

dpool is the key of the dynamic pool to be created.

System action: The dynamic pool was not created.

Operator response: Check the workstations you specified within the `""jsdl:orderedCandidatedWorkstations""` tag and ensure that only agents or remote engines are listed. Retry the operation.

AWSJCO140E The workstation "workstation" referenced by job definition "job_definition" is not agent, pool, dynamic pool, or remote engine.

Explanation: See message.

job_definition identifies the job definition in which there are references to not valid workstation.

workstation identifies the workstation that is not valid.

System action: The operation cannot be performed.

Operator response: Check the job definition. Change the workstation reference to refer only to agent, pool, dynamic pool, and remote engine workstations, and retry the operation.

AWSJCO141E For the workstation "workstation", the OS value in not valid. For remote engine workstations, the OS value must be different from OTHER.

Explanation: You are trying to save a workstation with an unsupported operating system. For remote engine workstations, supported values are Windows, Unix, and ZOS.

workstation is the workstation identifier.

System action: The workstation definition cannot be saved.

Operator response: Check the workstation definition. Choose a supported operating system and retry the operation.

AWSJCO142E You cannot use the reserved keyword "keyword" as a value in a workstation definition.

Explanation: You are trying to use a reserved keyword as a value in a workstation definition.

keyword is a reserved keyword.

System action: The workstation definition is not saved.

Operator response: Check the workstation definition.

AWSJCO143E The workstation "workstation" referenced by job definition "job_definition" is not of type broker.

Explanation: See message.

job_definition identifies the job definition in which there are references to not valid workstation.

workstation identifies the workstation that is not valid.

System action: The operation cannot be performed.

Operator response: Check the job definition. Change the workstation reference to refer only to broker

workstations, and retry the operation.

AWSJCO144E There was an error getting the address of the workstation "workstation".

Explanation: There was an error accessing the database table that stores the URIs of the workstation mentioned in the error message.

System action: The operation is not performed.

Operator response: None.

AWSJCO145E The workstation "workstation" cannot be defined on the domain "domain" because another workstation with type broker "broker" is defined on the same domain.

Explanation: See message. Only one workstation with type broker is supported in a domain.

workstation identifies the workstation you are trying to create or modify.

domain identifies the domain in which you are trying to define the broker workstation.

broker identifies the workstation with type broker currently assigned to the domain.

System action: The operation is not performed.

Operator response: If you want to make *workstation* the new workstation with type broker, perform the following steps:

1. modify the existing *broker* so that it is no longer defined in the domain as the broker workstation.
2. Define *workstation* as the new broker workstation.

AWSJCO146E The workstation "workstation" with type agent cannot be created because the already existing workstation "agent" of type agent has the same agent identifier.

Explanation: You are trying to create a workstation with type agent and the same agent identifier as another agent workstation. Only one workstation with type agent and the same agent identifier is supported.

workstation identifies the workstation you are trying to create.

agent identifies the workstation with type agent currently assigned to the agent with the same agent identifier.

System action: The operation is not performed.

Operator response: To create the workstation *workstation* with type agent, perform the following steps:

1. remove the existing *agent* so that it is no longer defined as the agent workstation.
2. Define *workstation* as the new agent workstation.

AWSJCO147E A file dependency cannot be defined on a workstation "workstation" of type agent, pool, dynamic pool, remote engine, or broker.

Explanation: You are trying to create a file dependency on a workstation of type agent, pool, dynamic pool, remote engine, or broker.

workstation is the workstation of type agent, pool, dynamic pool, remote engine, or broker you are trying to define for the file dependency.

System action: The operation cannot be performed.

Operator response: Define the file dependency on a workstation of a supported type and retry the operation.

AWSJCO148E The calendar "calendar" referenced by object "object" does not exist.

Explanation: See message.

calendar identifies the calendar that does not exist.

object identifies the object that references the calendar.

System action: The operation cannot be performed.

Operator response: Check the reference to the specified calendar in the object definition. Correct the object definition to refer to an existing calendar or create the calendar if it does not already exist, and then retry the operation.

AWSJCO500E The operation "operation" can be performed only on the master domain manager.

Explanation: See message.

operation is the operation you are trying to perform.

System action: The operation cannot be performed.

Operator response: Connect to the master domain manager and retry the operation.

AWSJCO501E The operation "operation" cannot be performed because the following error occurred "error".

Explanation: See message.

operation is the operation you are performing.

error explains the internal error that occurred, which is normally another Tivoli Workload Scheduler message.

System action: The operation cannot be performed.

Operator response: Check the message help of the quoted error message and follow the operator response of that message.

AWSJCO502E The operation "operation" cannot be performed because no workstation can be found for the job stream "job_stream".

Explanation: See message.

job_stream is the job stream for which no valid workstation is associated.

operation is the operation you are performing.

System action: The operation cannot be performed.

Operator response: Check on the database that at least one workstation without the "ignore" flag set is defined for the specified job stream. Retry the operation.

AWSJCO503E The job cannot be submitted because no workstation with key "workstation_key" was found in the plan.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the submitted *workstation_key*. If you mistyped the workstation key, correct the error and retry the operation. If the workstation key is correct, the workstation might have been deleted from the plan. Check in the plan. You might need to recreate the workstation in the plan before the job can be submitted.

AWSJCO504E The plan object statistics cannot be calculated because group field "group_field" is not valid for object type "plan_object_type".

Explanation: See message.

plan_object_type is the type of the plan object for which it is not possible to calculate the statistics.

group_field is the field on which statistics calculation is requested.

System action: The operation cannot be performed.

Operator response: Check the consistency between the specified plan object type and the group field. Repeat the operation.

AWSJCO505E The task can be run only for the current plan.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Select the current plan and run the task again.

AWSJCO506E The task cannot be run because the Workload Service Assurance feature is not enabled.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Enable the feature and run the task again.

AWSJCO507E The task cannot be run because the critical jobs predecessors network table has yet to be uploaded.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Wait for the critical jobs predecessors network table to be loaded and run the task again.

AWSJCO508E The task cannot be run because the job is not defined as critical.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Flag the job as critical.

AWSJCO509E No job stream was submitted. It is possible that the workstation where the job stream was defined is set to ignore.

Explanation: See message.

System action: The operation cannot be performed.

Operator response: Check the workstation definition and retry the operation.

Chapter 185. AWSJCS - Common services messages

This section lists error and warning messages that might be generated by the routines that handle common services.

The message component code is JCS.

AWSJCS001E The message catalog "catalog_file" does not exist.

Explanation: *catalog_file* is the message catalog that has either not been installed or has been deleted after installation.

System action: The program might stop or continue, depending on what type of message was trying to be written, but the message is not written to the screen or log file.

Operator response: Check for the existence of the *catalog_file* file within the installation jar file. If it present in the jar file, either the installation did not complete successfully or after a successful installation the *catalog_file* file has been subsequently deleted, moved or renamed. You must uninstall and then reinstall the product, restart the program, and then repeat the action that provoked the error. If this does not resolve the problem, or the *catalog_file* file is not present in the jar file, this is an internal error. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS002E A format error has been found in the message catalog "catalog_file".

Explanation: *catalog_file* is the message catalog that is not correctly formatted: either the message has more variables than expected, or fewer than expected, or a variable is not of the type expected by the program.

System action: The program might stop or continue, depending on what type of message was trying to be written, but the message is not written to the screen or log file.

Operator response: An internal error has occurred. Reinstalling the product might resolve the error.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS003E An internal error has occurred. The message "message_ID" was not found in the message catalog "catalog_file".

Explanation: *message_ID* is the internal identifier of

the message that cannot be found in the *catalog_file* message catalog.

System action: The program might stop or continue, depending on what type of message was trying to be written, but the message is not written to the screen or log file.

Operator response: An internal error has occurred.. Reinstalling the product might resolve the error.

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS004E An internal error has occurred. The configuration file "configuration_file" does not exist.

Explanation: *configuration_file* is the configuration file that has either not been installed or has been deleted after installation.

System action: The program stops.

Operator response: Check for the existence of the *configuration_file* within the installation jar file. If it present in the jar file, either the installation did not complete successfully or after a successful installation the *configuration_file* has been subsequently deleted, moved or renamed. Uninstall and then reinstall the product, restart the program, and then repeat the action that provoked the error. If this does not resolve the problem, or the *configuration_file* is not present in the jar file, this is an internal error. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS005E An internal error has occurred. The configuration file "configuration_file" cannot be read.

Explanation: *configuration_file* is the configuration file that cannot be read.

The *configuration_file* is probably corrupt. Either it did not install correctly or it has been corrupted after installation.

System action: The program stops.

Operator response: If you think the installation did

not complete successfully, or the file has been subsequently corrupted, uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS006E An internal error has occurred. The required property "property" cannot be found in the configuration file: "configuration_file".

Explanation: *property* is the required property that is missing from the *configuration_file*.

The *configuration_file* is corrupt. Either it did not install correctly or it has been corrupted after installation.

System action: The program stops.

Operator response: Uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS007W An internal error has occurred. The value of the required property "property" in the configuration file: "configuration_file" is not numeric, as expected. The default value stored in the program code is used.

Explanation: *property* is the required property that has a non-numeric value in the *configuration_file*.

The *configuration_file* is corrupt. Either it did not install correctly or it has been corrupted after installation.

The default value is hard-coded in the program.

System action: The program continues, using the default value.

Operator response: If you do not want to use the default value, stop the program.

If you want to try and correct the problem, uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS008E An internal error has occurred. The value of the required property "property" in the configuration file "configuration_file" is outside the permitted range.

Explanation: *property* is the required property that has

an out-of-range value in the *configuration_file*.

The *configuration_file* is corrupt. Either it did not install correctly or it has been corrupted after installation.

System action: The program stops.

Operator response: Uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS009E An internal error has occurred. The default value (stored in the program code) of the required property "property" in the configuration file "configuration_file" must be one of the following values: "permitted_values".

Explanation: When a program finds that the value of a property expected to be a number is not numeric, it uses the hard-coded default value, instead. However, it checks that the default value has an acceptable value, and gives this message if it has not.

property is the required property that has a default value that is not in the set of *permitted_values* in the *configuration_file*.

The *configuration_file* is corrupt and the code has a non-valid default value. Either the product did not install correctly or it has been corrupted after installation.

System action: The program stops.

Operator response: Uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS010E An internal error has occurred. The value of the required property "property" in the configuration file "configuration_file" must be one of the following values: "permitted_values".

Explanation: *property* is the required property that has a value that is not in the set of *permitted_values* in the *configuration_file*.

The *configuration_file* is corrupt. Either it did not install correctly or it has been corrupted after installation.

System action: The program stops.

Operator response: Uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support

database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS011E An internal error has occurred. The error is the following: "exception_message".

Explanation: See message.

exception_message describes the error.

System action: The program stops. The operation cannot be performed.

Operator response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS012E The value of the property "property" is not correct. It must be between "minimum_value" and "maximum_value".

Explanation: *property* is the property that has an out-of-range value.

minimum_value and *maximum_value* define the range of permitted values.

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using a value for the property within the indicated range.

AWSJCS013E The value of the property "property" is not correct. It must be no more than the following length: "maximum_length".

Explanation: *property* is the property that is too long.

maximum_length is the maximum number of bytes allowed for the property value.

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using a value for the property that is not longer than the maximum indicated.

AWSJCS014E The value of the property "property" is not correct. It must be not less than the following length: "minimum_length".

Explanation: *property* is the property that is too short.

minimum_length is the minimum number of bytes allowed for the property value.

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using a

value for the property that is longer than the minimum length.

AWSJCS015E The value of the property "property" is not in the correct format.

Explanation: *property* is the property that is not in the correct format. For example, a numeric property might contain alpha characters.

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using a value for the property that is in the correct format.

AWSJCS016E The value of the property "property" is not correct. It must be one of the following values: "permitted_values".

Explanation: *property* is the property that is not in the list of permitted values.

permitted_values is the list of values permitted for this property.

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using a value for the property that is in the list of permitted values.

AWSJCS017E The value of the property "property" is not correct. It must contain one or more of the following: "permitted_values". Multiple values must be separated by the separator: "separator".

Explanation: *property* is the property that is not in the list of permitted values.

permitted_values is the list of values permitted for this property.

separator is the character that separates multiple values.

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using one or more values for the property from the list of permitted values. Multiple values must be separated by the indicated separator.

AWSJCS018E The value of the property "property" is not in the correct time format (HHMM).

Explanation: *property* is the property that must be in the correct time format: (HHMM).

System action: The program stops.

Operator response: Check the operation that provoked the error. Resubmit the operation, using a

value for the property that is in the correct time format (HHMM).

AWSJCS019E An internal error has occurred in Java class "class".

Explanation: See message.

class identifies the Java class that gave an error.

System action: The program stops. The operation cannot be performed.

Operator response: If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS020E An internal error has occurred. The required property "property" cannot be found.

Explanation: *property* is the required property that is missing.

System action: The program stops.

Operator response: Uninstall and reinstall the product. Restart the program and repeat the action that provoked the error.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS021E The application job plug-in with ID "plugin_id" cannot be found.

Explanation: *plugin_id* is the application job plug-in identifier.

System action: The application job plug-in interface cannot be created.

Operator response: Check for the existence of the file *plugin_id.jar* in the folder `nullinstallation_dir>/TWS/applicationJobPlugIn`.

If the file exists and has the correct read permissions, try restarting the server.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS022E The JobExecutor class for application job plug-in with ID "plug-in_ID" cannot be found.

Explanation: *plug-in_ID* is the plug-in identifier.

System action: The job definition cannot be saved.

Operator response: Check for the existence of the JobExecutor class in the file *plug-in_ID.jar* located in the

folder `nullinstallation_dir>/TWS/applicationJobPlugIn`.

If the file exists and has the correct read permissions, try restarting the server.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS023E Unable to create the JSDL for application job plug-in with ID "plug-in_ID" because of the following error: "exception".

Explanation: *plug-in_ID* is the plug-in identifier.

exception is the exception returned by the `parametersToJsdL` method.

System action: The job definition cannot be saved.

Operator response: If you wrote your own `parametersToJsdL` method, check its correctness.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS024E Unable to extract parameters from JSDL for application job plug-in with ID "plugin_ID" because of the following error: "exception".

Explanation: *plugin_ID* is the application job plug-in identifier.

exception is the exception returned by the `parametersToJsdL` method.

System action: The job definition cannot be loaded

Operator response: If you wrote your own `jsdlToParameters` method, check its correctness.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS025E The JSDL validation for application job plug-in with ID "plugin_ID" returns the following error: "exception".

Explanation: *plugin_ID* is the application job plug-in identifier.

exception is the exception returned by the `validateJsdL` method.

System action: The job definition cannot be saved.

Operator response: If you wrote your own `validateJsdL` method, check its correctness.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS026E An internal error has occurred. One or more parameters provided by the Tivoli Dynamic Workload Console to the application job plug-in with ID "plugin_ID" are incorrect.

Explanation: The parameters provided to the application job plug-in are not in the right format. *plugin_ID* is the application job plug-in identifier.

System action: The operation cannot be performed.

Operator response: Retry the command, in case the problem that caused the error is no longer present.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS027E The command cannot be run on the workstation with name "workstation_name" because it is of type "workstation_type". The supported workstation types are: "supported_workstation_type".

Explanation: You are trying to run a command on an unsupported workstation type. *workstation_name* is the workstation name.

workstation_type is the workstation type.

supported_workstation_type is a list of supported workstation types.

System action: The operation cannot be performed.

Operator response: Choose a supported workstation type and retry the operation.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS028E The command cannot be run on the workstation with name "workstation_name" because the operating system installed on it is of type "os_type". The supported operating systems are "supported_os".

Explanation: You are trying to run a command on an unsupported operating system. *workstation_name* is the workstation name.

os_type is the operating system.

supported_os is a list of supported operating systems.

System action: The operation cannot be performed.

Operator response: Choose a workstation with a supported operating system and retry the operation.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS029E The XML definition is incorrect. The following XML error was returned: "xml_error".

Explanation: The XML definition does not match the XML schema. One or more required fields might be empty.

System action: The operation cannot be performed.

Operator response: Correct the XML definition and retry the operation.

If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJCS030E You specified an incorrect value for the "property" property. The value must be alphanumeric.

Explanation: *property* is the property for which you specified a non-alphanumeric value.

System action: The program stops.

Operator response: Verify which operation generated the error. Resubmit the operation, specifying an alphanumeric value for the property.

AWSJCS031E The operation cannot be performed because the job was not submitted to the agent yet.

Explanation: The job number was not assigned yet.

System action: The operation cannot be performed.

Operator response: Wait until the job is submitted to the agent.

Chapter 186. AWSJDB - Common objects messages

This section lists error and warning messages that might be generated by the routines that handle common objects.

The message component code is JDB.

AWSJDB101E The object "object" was not found.

Explanation: See message.

object identifies the object.

System action: The operation cannot be performed.
The program continues.

Operator response: Check that you have specified the object correctly. If you have, check that the object has not been deleted from the database. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB102E The global option "property" was not found.

Explanation: See message.

property identifies the global option.

System action: The operation cannot be performed.
The program continues.

Operator response: Check that you have specified the global option name correctly. If you have, check that the option has not been deleted from the database. You can see a list of the global options from the command line by using the command **optman ls**. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

See The *Planning and Installation Guide* for a full description of the options.

AWSJDB201E The object "object" cannot be locked, updated, or deleted because it is locked by user "user_name".

Explanation: See message.

object identifies the object.

user_name identifies the user that has locked the object.

System action: The operation cannot be performed.
The program continues.

Operator response: Retry the operation to see if the object is still locked (the lock might have been momentary). If the problem persists, contact the indicated user to have the object unlocked. When it is

unlocked, retry the operation.

AWSJDB202E The object "object" cannot be unlocked or updated because it is not locked.

Explanation: See message.

object identifies the object.

System action: The operation cannot be performed.
The program continues.

Operator response: Check that you have specified the object correctly. If you have, check the object's status in the database. If it is not locked, lock it and retry the operation.

AWSJDB203E The object "object" cannot be unlocked or updated because it was not originally locked by you ("user1_name"), and is currently locked by user "user2_name".

Explanation: See message.

object identifies the object.

user1_name identifies the user that has initiated the unlock or update operation.

user2_name identifies the user that has locked the object.

System action: The operation cannot be performed.
The program continues.

Operator response: Check that you are the user identified in the message. Check that you have specified the object correctly. If either are not true, correct the error and retry the operation.

If you are the user and have specified the object correctly, check the object's status in the database. If it is locked by another user, contact the other user to have it unlocked. When it is unlocked retry the operation.

AWSJDB204E The object "object" cannot be unlocked or updated because it is locked by you ("user_name"), but in another session.

Explanation: If you lock an object in one session, you can only update or unlock it in that same session. A

session is an instance of any of the following:

- The Tivoli Dynamic Workload Console
- The command line
- A GUI or command line developed by your own organization

Each time you open one of these instances, whether on the same or a different computer, is treated as a separate session.

This message is displayed when you commence operations on an object which was locked in a different session.

object identifies the object.

user_name identifies the user that has initiated the unlock or update operation.

System action: The operation cannot be performed. The program continues.

Operator response: Check that you are the user identified in the message. Check that you have specified the object correctly. If either are not true, correct the error and retry the operation.

If you are the user and have specified the object correctly, check the circumstances surrounding the update of this object.

- If you have used a second session by accident, return to the first session to continue
- If you have been forced to use a new session for some reason, use the force option to unlock the object and then recommence the operation you originally intended to perform

There are many scenarios that cover the appearance of this message, but the following are two examples:

Scenario 1 - a second session is opened by accident

1. You open a command line session on your computer and lock an object for editing
2. Something distracts you and when you return to the work you were doing you forget that you had already started and open another command line session
3. When you try to lock the object for editing this message is given.
4. Check to see if you have any other sessions open. When you find the original session, close the second session
5. Continue working in the first session, editing and then unlocking the object

Scenario 2 - a session fails

1. You open a Tivoli Dynamic Workload Console session on your computer and lock an object for editing

2. Your computer crashes (for some reason unconnected with Tivoli Workload Scheduler), and needs to be rebooted
3. After restarting, you open a new Tivoli Dynamic Workload Console session and try to continue editing the object. You get this message.
4. Unlock the object using the force option
5. Lock the object, edit it and unlock it afterwards.

Note that, if you use the force option in a second session when the first session is still open, if you return to the first session and try to edit the object you receive this message again.

AWSJDB205E While trying to lock multiple objects (for example, as the result of the use of a wildcard in the selection criteria), at least one of the objects could not be locked, because it was already locked.

Explanation: See message.

System action: All objects that could be locked have been locked. Objects that were already locked are not modified. The program continues.

Operator response: Follow this procedure:

1. View the details of the objects you want to lock
2. Check their status and find out which ones are already locked
3. Contact the user that has locked them to have them unlocked
4. Retry the operation

AWSJDB206E While trying to unlock multiple objects (for example, as the result of the use of a wildcard in the selection criteria), at least one of the objects could not be unlocked because it was not originally locked by you ("user_name").

Explanation: See message.

user_name identifies the user that has initiated the unlock operation.

System action: All objects that could be unlocked have been unlocked. Objects that were locked by a different user are not modified. The program continues.

Operator response: Follow this procedure:

1. View the details of the objects you want to unlock
2. Check their status and find out which ones are locked by a user other than the indicated user
3. Contact the user that has locked them to have them unlocked

AWSJDB207E While trying to unlock multiple objects (for example, as the result of the use of a wildcard in the selection criteria), at least one of the objects could not be unlocked because it was locked by you ("user_name"), but in another session.

Explanation: If you lock an object in one session, you can only update or unlock it in that same session. A session is an instance of any of the following:

- The Tivoli Dynamic Workload Console
- The command line
- A GUI or command line developed by your own organization

Each time you open one of these instances, whether on the same or a different computer, is treated as a separate session.

This message is displayed when you commence operations on an object which was locked in a different session.

user_name identifies the user that has initiated the unlock or update operation.

System action: The operation cannot be performed. The program continues.

Operator response: Check that you are the user identified in the message. Check that you have specified the object correctly. If either are not true, correct the error and retry the operation.

If you are the user and have specified the object correctly, check the circumstances surrounding the update of this object.

- If you have used a second session by accident, return to the first session to continue
- If you have been forced to use a new session for some reason, use the force option to unlock the object and then recommence the operation you originally intended to perform

There are many scenarios that cover the appearance of this message, but the following are two examples:

Scenario 1 - a second session is opened by accident

1. You open a command line session on your computer and lock an object for editing
2. Something distracts you and when you return to the work you were doing you forget that you had already started and open another command line session
3. When you try to lock the object for editing this message is given.
4. Check to see if you have any other sessions open. When you find the original session, close the second session

5. Continue working in the first session, editing and then unlocking the object

Scenario 2 - a session fails

1. You open a Tivoli Dynamic Workload Console session on your computer and lock an object for editing
2. Your computer crashes (for some reason unconnected with Tivoli Workload Scheduler), and needs to be rebooted
3. After restarting, you open a new Tivoli Dynamic Workload Console session and try to continue editing the object. You get this message.
4. Unlock the object using the force option
5. Lock the object, edit it and unlock it afterwards.

Note that, if you use the force option in a second session when the first session is still open, if you return to the first session and try to edit the object you receive this message again.

AWSJDB301E Unused message.

AWSJDB302E The job "job_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

job_key identifies the referenced job that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing job instance and retry the operation.

AWSJDB303E The job definition "job_definition_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

job_definition_key identifies the referenced job definition that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing job definition and retry the operation.

AWSJDB304E The job stream "job_stream_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

job_stream_key identifies the referenced job stream that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing job stream and retry the operation.

AWSJDB305E The workstation "workstation_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

workstation_key identifies the referenced workstation that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing workstation and retry the operation.

AWSJDB306E The workstation class "workstation_class_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

workstation_class_key identifies the referenced workstation class that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing workstation class and retry the operation.

AWSJDB307E The workstation or workstation class "workstation_or_workstation_class_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

workstation_or_workstation_class_key identifies the referenced workstation or workstation class that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing workstation or workstation class and retry the operation.

AWSJDB308E The calendar "calendar_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

calendar_key identifies the referenced calendar that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing calendar and retry the operation.

AWSJDB309E The domain "domain_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

domain_key identifies the referenced domain that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing domain and retry the operation.

AWSJDB310E The resource "resource_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

resource_key identifies the referenced resource that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing resource and retry the operation.

AWSJDB311E The prompt "prompt_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

prompt_key identifies the referenced prompt that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing prompt and retry the operation.

AWSJDB312E A master domain manager cannot be created, it must be installed as such.

Explanation: See message.

System action: The operation cannot be performed. The program continues.

Operator response: A master domain manager cannot be created. You must use the installation process to install a master domain manager or to promote an appropriate existing workstation.

AWSJDB313E A master domain cannot be modified to become a lower level domain.

Explanation: You can change the name of a master domain, but you cannot remove it from its role as master.

System action: The operation cannot be performed. The program continues.

Operator response: The operation you wanted to perform is not allowed. Examine the existing domain structure and the required domain structure, and plan any changes so that the master always remains the master. For example, if you want the master (A) to have the name of an existing lower domain (B), you must first rename that lower domain to something else (C) and then rename the master domain to the old name of the lower domain (B).

AWSJDB314E A lower level domain cannot be modified to become the master domain.

Explanation: Domains cannot be promoted to become the master.

System action: The operation cannot be performed. The program continues.

Operator response: The operation you wanted to perform is not allowed. Examine the existing domain structure and the required domain structure, and plan any changes so that the master always remains the master. For example, if you want the master (A) to

have the name of an existing lower domain (B), you must first rename that lower domain to something else (C) and then rename the master domain to the old name of the lower domain (B).

AWSJDB315E The master domain cannot be deleted.

Explanation: See message.

System action: The operation cannot be performed. The program continues.

Operator response: You cannot remove the master domain. Examine the existing domain structure and the required domain structure, and plan any changes so that the master always remains the master. For example, if you want the master (A) to have the name of an existing lower domain (B), you must first rename that lower domain to something else (C) and then rename the master domain to the old name of the lower domain (B).

AWSJDB316E The supplied job stream definition contains a duplicate run cycle name: "run_cycle_name".

Explanation: See message.

run_cycle_name is the run cycle name that is duplicated in the job stream.

System action: The operation cannot be performed. The program continues.

Operator response: Check the job stream specification. Correct the run cycle information, ensuring that it does not contain duplicate run cycle names, and retry the operation.

AWSJDB317E The supplied job stream definition contains a duplicate job name: "job_name".

Explanation: See message.

job_name is the job name that is duplicated in the job stream.

System action: The operation cannot be performed. The program continues.

Operator response: Check the job stream specification. Correct the job information, ensuring that it does not contain duplicate job names, and retry the operation.

AWSJDB318E A prompt with name "prompt_name" already exists.

Explanation: See message.

prompt_name is the prompt name that already exists.

System action: The operation cannot be performed. The program continues.

Operator response: Check the prompt specification. If

AWSJDB319E • AWSJDB325E

you intended to create a prompt with a different name, change the name and resubmit the operation. If the prompt that exists (indicated above) is the one that you require, you need take no further action.

AWSJDB319E A resource with name "resource_name" defined for workstation or workstation class "workstation_or_workstation_class" already exists.

Explanation: See message.

resource_name is the resource name that already exists.

workstation_or_workstation_class identifies the workstation or workstation class to which the resource belongs.

System action: The operation cannot be performed. The program continues.

Operator response: Check the resource specification. If you intended to create a resource with a different name, or for a different workstation or workstation class, change the name and resubmit the operation. If the resource that exists (indicated above) is the one that you require, you need take no further action.

AWSJDB320E The supplied variable table definition contains a duplicate variable name: "variable_name".

Explanation: See message.

variable_name is the variable name that is duplicated in the variable table.

System action: The operation cannot be performed. The program continues.

Operator response: Check the variable table specification. Correct the variable information, ensuring that it does not contain duplicate variable names, and retry the operation.

AWSJDB321E The object "variable_key" already exists.

Explanation: See message.

variable_key identifies the object that already exists.

System action: The operation cannot be performed. The program continues.

Operator response: Correct the variable name or specify a different variable table name and retry the operation.

AWSJDB322E The variable table "variable_table_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

variable_table_key identifies the referenced variable table that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Ensure that it refers to an existing variable table and retry the operation.

AWSJDB323E The default variable table cannot be found or it is being updated by another user, and cannot be modified to become an ordinary variable table.

Explanation: The default variable table does not exist in the database or is being updated by a concurrent request.

System action: The operation cannot be performed. The program continues.

Operator response: Retry the operation (this might be a temporary problem).

If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB324E The default variable table cannot be deleted.

Explanation: You cannot remove the default variable table.

System action: The operation cannot be performed. The program continues.

Operator response: To remove this table you must first specify a new default variable table. To do this, create a new table or modify an existing table and set the default flag. The new or updated table becomes the default and you can remove the previous default variable table.

AWSJDB325E The default variable table cannot be modified to become an ordinary variable table.

Explanation: You cannot remove the default variable table from its role as default.

System action: The operation cannot be performed. The program continues.

Operator response: If you want to specify a new default variable table, create a new table or modify an existing table and set the default flag. The new or updated table becomes the default.

AWSJDB326E The availability calendar "calendar_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

calendar_key identifies the referenced availability calendar that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing availability calendar and retry the operation.

AWSJDB327E The run cycle group "run_cycle_group_key" referenced by object "object_key" does not exist.

Explanation: See message.

object_key identifies the object that owns the unresolved reference.

run_cycle_group_key identifies the referenced run cycle group that does not exist.

System action: The operation cannot be performed. The program continues.

Operator response: Check the object specification. Correct it to refer to an existing run cycle group and retry the operation.

AWSJDB401E Unused message.

AWSJDB402E An internal error occurred while reading or writing a UUID in the database, or while generating a UUID for a new object.

Explanation: There is a problem in the algorithm that creates unique identifiers.

System action: The identifier cannot be created. A database transaction might be rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB403E An internal error has occurred. The operation "operation_name" cannot be performed because the DAO context state "context_state" is not correct.

Explanation: See message.

operation_name identifies the action that the program was trying to perform.

context_state is the DAO context state that does not allow the operation to be performed.

System action: The operation cannot be performed. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB404E An internal error has occurred while parsing the Identifier. The internal error message is: "error_message".

Explanation: See message.

error_message is the message that explains what went wrong while parsing the Identifier.

System action: The identifier cannot be created. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB501E Unused message.

AWSJDB601E An internal error has occurred. A database integrity constraint has been violated. The internal error message is: "error_message".

Explanation: The database write operation cannot be executed because it violates an integrity constraint.

error_message explains more about the error.

System action: The write operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB602E An internal error has occurred. A database not null constraint has been violated. The internal error message is: "error_message".

Explanation: The database write operation cannot be executed because it violates a "not null" constraint.

error_message explains more about the error.

System action: The write operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB603E An internal error has occurred. A database check constraint has been violated. The internal error message is: "error_message".

Explanation: The database write operation cannot be executed because it violates a "foreign key" constraint.

error_message explains more about the error.

System action: The write operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB604E An internal error has occurred. A database unique constraint has been violated. The internal error message is: "error_message".

Explanation: The database write operation cannot be executed because it violates a "unique" constraint.

error_message explains more about the error.

System action: The write operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB605E An internal error has occurred. A database foreign key constraint has been violated. The internal error message is: "error_message".

Explanation: The database write operation cannot be executed because it violates a "foreign key" constraint.

error_message explains more about the error.

System action: The write operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB606E An internal error has occurred. A foreign key constraint prevents the remove operation. The internal error message is: "error_message".

Explanation: The database remove operation cannot be executed because it is restricted by a "foreign key" constraint.

error_message explains more about the error.

System action: The remove operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB607E An internal error has occurred. The value defined for a database field exceeds its column bounds. The internal error message is: "error_message".

Explanation: The database write operation cannot be executed because a value exceeds its column bounds.

error_message explains more about the error.

System action: The remove operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB801E An internal error has been found while accessing the database. The internal error message is: "error_message".

Explanation: See message.

error_message explains more about the error.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB802E An internal error has occurred while connecting to the database. The database connection is not available.

Explanation: See message.

System action: The database cannot be accessed

properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB803E An internal deadlock or timeout error has occurred while processing a database transaction. The internal error message is: "error_message".

Explanation: See message.

error_message explains more about the error.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB804E The operation cannot be completed because a concurrent update has been detected that would lead to a database inconsistency.

Explanation: See message.

System action: The write operation was not executed. The database transaction is rolled back. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB805E The requested operation cannot be performed because the database is locked by the planner process.

Explanation: Write operations are not allowed because the plan is being generated by ""planner"", which has locked the database.

System action: The write operation cannot be performed. The database transaction is rolled back. The program continues.

Operator response: Wait until the end of the plan generation process (planner) and retry the operation.

AWSJDB806W The collection of database statistics on the pre-production plan tables has failed. The production plan will be generated using the current database statistics.

Explanation: The statistics used by the database optimizer cannot be updated. Performance cannot be optimized, but the procedure continues.

System action: No database statistics are collected. The program continues.

Operator response: Make sure you are using a version of the RDBMS that supports this feature and the required stored procedures have been created in the database. Failure to collect the statistics on large and medium-sized databases has an adverse affect on performance.

If you have a small database with little data it is possible to ignore the failure to collect the database statistics on the pre-production plan tables. In this case you need take no action.

AWSJDB807E An internal error occurred while checking that all the global options and internal global settings are stored in the database. The internal error message is: "error_message".

Explanation: It is not possible to check that all expected global options and internal global settings are stored in the database.

error_message explains more about the error.

System action: The check operation was not performed. The action is rolled back. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB808E An internal error has occurred while connecting to the database. The database server may be down or unreachable.

Explanation: See message.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB809E An internal error has occurred while connecting to the database. The requested database was not found.

Explanation: See message.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB810E An internal error has occurred while connecting to the database. The requested table was not found or cannot be accessed.

Explanation: See message.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB811E An internal error has occurred while connecting to the database. The supplied user name and password are not valid.

Explanation: See message.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB812E Multiple threads are trying to access the database using the same transaction. The names of the threads are: "thread_name_list".

Explanation: See message.

thread_name_list list the threads that are trying to access the database using the same transaction.

System action: The operation requested by the current thread is not performed. The system rolls back the affected transaction. The program continues.

Operator response: An internal error has occurred. If

you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB813E Multiple threads are trying to access the database using the same DAO module. The names of the threads are: "thread_name_list".

Explanation: See message.

thread_name_list lists the threads that are trying to access the database using the same DAO module.

System action: The operation requested by the current thread is not performed. The program continues.

Operator response: An internal error has occurred. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB814E The input file "file_path" cannot be found or accessed for reading.

Explanation: See message.

file_path identifies the path of the input file with contents that must be written to the database.

System action: The file contents cannot be written to the database. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. However, you might be able to resolve the problem. Check whether the indicated file exists in the path shown, and with "read" permission for the user performing the operation. If you find an error, fix it. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB815E The output file "file_path" cannot be created or accessed for writing.

Explanation: See message.

file_path identifies the path of the output file that must be written using contents read from the database.

System action: The file cannot be written using the contents read from the database. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. However, you might be able to resolve the problem. Check that there is sufficient disk space to write the file. Check whether the permissions of the indicated path for the user performing the operation allow the file to be written. If you find an error, fix it. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB816E A property with name "property_name" and object identifier "object_id" already exists.

Explanation: See message.

property_name is the name of the property that already exists.

object_id is the identifier of the object that owns the property.

System action: The operation cannot be performed. The program continues.

Operator response:

AWSJDB817E The object "object" cannot be accessed.

Explanation: See message.

object identifies the object.

System action: The operation cannot be performed. The program continues.

Operator response: Check that you can access the object. If you have, check that the object's permissions are correctly set in the Security file. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB818E An internal error has occurred while connecting to the database. The internal error message is: "error_message".

Explanation: See message.

error_message explains more about the error.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJDB819E An internal error has occurred while connecting to the database. The resource allocation ends with error.

Explanation: See message.

System action: The database cannot be accessed properly. The system attempts to roll back the current transaction. The program continues.

Operator response: An internal error has occurred. It might be a temporary problem. If you cannot resolve the problem, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 187. AWSJIS messages

This section lists error and warning messages that could be issued.

The message component code is JIS.

AWSJIS002E An internal error has occurred. The command or script "command_or_script" has failed. The exit code is as follows: "exit_code". Contact IBM Software Support.

Explanation: See message.

command_or_script is the command that has failed. It might be an operating system command or a Tivoli Workload Scheduler installation script.

exit_code is the error code given by the command or script.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message. The Diagnose Failure window is opened.
2. If you want to diagnose the problem without leaving the wizard (recommended) select **Diagnose failure** and click **Next**, and follow the procedure described in *Planning and Installation* for diagnosing a failed installation.
Otherwise, select **Quit installation**. The wizard closes.

- Silent wizard

Look in the installation log to see if there is any additional information.

Check any available information related to the *exit_code*. In the case of an operating system command you might have to consult the operating system documentation.

If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.

If you cannot correct the problem, contact IBM Software Support for assistance.

If you think you can solve the problem, make any necessary corrections to the installation environment. Proceed as follows:

- Interactive wizard

Resume the step that has failed.

- Silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Restart the step that failed.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS004E The version of the Tivoli Workload Scheduler instance selected to upgrade is neither 8.1 nor 8.2. Click Back and select a different, valid instance.

AWSJIS005E The version of the Tivoli Workload Scheduler instance selected is not 8.2. Click Back and select a different, valid instance.

AWSJIS006E No valid instance of Tivoli Workload Scheduler has been found to upgrade. Select a valid instance or make a fresh installation.

Explanation: Either no instance of Tivoli Workload Scheduler was found at the indicated location, or the instance found is not at the correct version. Only versions 8.3, 8.4, 8.5 or 8.5.1 can be upgraded to version 8.6. All other versions must first be upgraded to 8.3, 8.4, 8.5 or 8.5.1.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message window.
2. Click **Back** to return to the previous panel and change the Tivoli Workload Scheduler instance definition to identify an instance of version 8.2, 8.2.1, 8.3 or 8.4, or choose to make a fresh installation.
3. Click **Next** to continue.

- Silent wizard

1. Look in the installation log to see if there is any additional information
2. Edit the response file used by the silent wizard, changing the parameter that identifies the existing Tivoli Workload Scheduler instance to an instance of version 8.2, 8.2.1, 8.3 or 8.4, or choosing to make a fresh installation.
3. Rerun the silent wizard.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS007E An error occurred reading file.

AWSJIS008E The passwords do not match. Retype the password and the verification password, ensuring that they are both the same.

Explanation: You have supplied a password for the ""TWS_user"" and have confirmed it, but the passwords are different.

System action: The wizard stops.

Operator response:

1. Click **OK** to close the error message.
2. Retype the passwords, ensuring that they are both the same.
3. Click **Next** to continue.

AWSJIS009E The following field: "field_name" is longer than the maximum of "max_length" bytes.

Explanation: See message.

field_name is the name of the field that is too long.

max_length is the maximum number of bytes it can be.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message.

2. Re-enter the indicated field, ensuring that it does not exceed the maximum length, and click **Next** to continue.

- Silent wizard

1. Edit the response file, and ensure that the field does not exceed the maximum length.
2. Rerun the silent wizard.

AWSJIS010E The following field: "field_name" is either not a number or outside the following range: "from_value" - "to_value".

Explanation: See message.

field_name is the name of the field that is either not a number or out of range.

from_value and *to_value* indicate the minimum and maximum values it can take.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message.
2. Re-enter the indicated field, ensuring that the value is a number, that it falls within the indicated range, and click **Next** to continue.

- Silent wizard

1. Edit the response file, and ensure that the field value is a number and falls within the indicated range.
2. Rerun the silent wizard.

AWSJIS011E The supplied installation path is not valid.

Explanation: See message. For example, you might have supplied one or more characters that cannot be used in a file path.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message.
2. Re-enter the installation path, ensuring that the path is fully qualified and valid, and click **Next** to continue.

- Silent wizard

1. Edit the response file, and ensure that the installation path is fully qualified and valid.
2. Rerun the silent wizard.

AWSJIS012E There is insufficient disk space available in the directory "directory" to complete the installation. The installation requires "required_space" megabytes, but only "available_space" megabytes are available. Either make more space available or change the installation directory.

Explanation: See message.

directory is the install directory that has insufficient space.

required_space and *available_space* indicate what space the installation requires and how much is available.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response:

- Make space in the original path

If you want to persist with the original installation path, use the operating system's commands and utilities to make more space available. When you have done this, proceed as follows:

Interactive wizard

1. Click **OK** to close the error message.
2. Click **Next** to continue.

Silent wizard

1. Rerun the silent wizard.

- Choose another directory

If you cannot make sufficient space, you need to change the installation path to one with sufficient available space. To do this, proceed as follows:

Interactive wizard

1. Click **OK** to close the error message.
2. Reenter the installation path, ensuring that the path is fully qualified and valid, and points to a directory with sufficient space. Click **Next** to continue.

Silent wizard

1. Edit the response file, and ensure that the installation path is fully

qualified and valid, and points to a directory with sufficient space.

2. Rerun the silent wizard.

Proceed as follows:

AWSJIS013E The specified installation path doesn't exist.

AWSJIS017E You are correcting an installation parameter by editing the parameters of an installation step, but an incorrect parameter has been supplied during the correction.

Explanation: See message.

System action: The installation cannot continue.

Operator response: Check the parameters that you have changed or supplied during the resume of an installation, and ensure that you have supplied valid values:

- If you locate the error, correct it and continue.
- If you cannot locate the error quit the installation and resume it.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS018E An internal error has occurred. The directory specified as the location of the existing Tivoli Workload Scheduler instance does not exist.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message.
2. Click **Back** to return to the previous panel and change the directory of the Tivoli Workload Scheduler instance, or choose to make a fresh installation.
3. Click **Next** to continue.

- Silent wizard

1. Look in the installation log to see if there is any additional information
2. Edit the response file used by the silent wizard, changing the parameter that identifies the directory of the existing Tivoli Workload Scheduler instance, or choosing to make a fresh installation.

3. Rerun the silent wizard.

AWSJIS019E An internal error has occurred. The directory to be used for the install directory of the embedded WebSphere Application Server does not exist.

Explanation: The install directory for the embedded WebSphere Application Server is created by the install program within the Tivoli Workload Scheduler install directory. This message could arise if the directory in question has not been created correctly, or has been deleted before being used.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check the installation log to see if there is any further information that helps you to understand why the directory could not be found.

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. If you are running the interactive wizard, click **OK** to close the error message window. The Diagnose Failure window is opened.
2. Select **Quit installation**. The wizard closes.
3. If you previously copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS020E The directory specified as the location of the existing DB2 instance does not exist. Specify the correct location of the DB2 instance.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check the path you supplied for the existing DB2 instance that you would like to use with Tivoli Workload Scheduler.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message.
2. Correct the DB2 instance path and click **Next** to continue.

- Silent wizard

1. Edit the response file, changing the DB2 instance path to the correct value.
2. Rerun the silent wizard.

AWSJIS021E An internal error has occurred. The application server profile "profile" for the embedded WebSphere Application Server could not be created.

Explanation: The installation program needs to create an application server profile for the embedded WebSphere Application Server, and then populate it with the information specific to Tivoli Workload Scheduler. This message is displayed because the profile could not be created.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check that the computer where you are installing Tivoli Workload Scheduler satisfies the prerequisite requirements of the embedded WebSphere Application Server . These can be found by clicking the **System requirements** link on the product information Web page for the embedded WebSphere Application Server at www.ibm.com.

Check that there is sufficient space in the standard temporary directory of the computer.

Check that you have copied the installation images correctly to the computer where you are running the installation wizard.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, check the installation log for more information.

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. If you are running the interactive wizard, close the Step Status window and click **Finish** on the Step List window. The wizard closes.
2. If you previously copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
3. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS022E An internal error has occurred. The application server profile archive "profile_archive" for the embedded WebSphere Application Server could not be read.

Explanation: The installation program needs to create an application server profile for the embedded WebSphere Application Server , and then populate it with the information specific to Tivoli Workload Scheduler. This message is displayed because the profile archive that contains the information needed to populate the profile could not be read.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check that you have copied the installation images correctly to the computer where you are running the installation wizard.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)

2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, check the installation log for more information.

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. If you are running the interactive wizard, close the Step Status window and click **Finish** on the Step List window. The wizard closes.
2. If you previously copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
3. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS023E An internal error has occurred. The update of the configuration of the embedded WebSphere Application Server has failed.

Explanation: The embedded WebSphere Application Server is installed with a default configuration, which is then updated for Tivoli Workload Scheduler. The update has failed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check that you have copied the installation images correctly to the computer where you are running the installation wizard.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further

information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, check the installation log for more information.

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. If you are running the interactive wizard, close the Step Status window and click **Finish** on the Step List window. The wizard closes.
2. If you previously copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
3. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS024E The application server "application_server" could not be started.

Explanation: The indicated *application_server* runs Tivoli Workload Scheduler on the embedded WebSphere Application Server, but the application server could not be started after the installation.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check the application server's logs to determine why the server could not be started.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you can solve the problem, do so, and proceed as follows:

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Restart the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS025E An internal error has occurred. The script "script" used by the installation wizard has failed.

Explanation: See message.

script identifies the script that has failed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check the installation log to determine why the script failed.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you can solve the problem, do so, and proceed as follows:

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.

3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS029E An internal error has occurred. The directory where the installation expected to find the JRE files does not exist.

Explanation: The installation program is trying to locate the directory where the Java Runtime Environment files were unpacked at the beginning of the installation, but has failed to find it. Either the

unpacking of the installation bundle failed, or the directory has subsequently been renamed or deleted.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

Ensure that you are not trying to run two installations concurrently, which is not possible.

If you can solve the problem, do so, and proceed as follows:

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS030E An internal error has occurred. The build file that the installation program expected to find does not exist.

Explanation: The installation program is trying to locate the build file that was unpacked at the beginning of the installation, but has failed to find it. Either the unpacking of the installation bundle failed, or the file has subsequently been renamed or deleted.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

Ensure that you are not trying to run two installations concurrently, which is not possible.

If you can solve the problem, do so, and proceed as follows:

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full

details of the recovery process from a failed installation.

AWSJIS031E An internal error has occurred. An internal program has failed.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you can solve the problem, do so, and proceed as follows:

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS032E An internal error has occurred. An internal program has not been supplied with a required parameter.

Explanation: The internal program that creates the Tivoli Workload Scheduler instance (Ant) is called by the installation program, which supplies the parameters it requires. One of these parameters is missing. It is possible that during a previous resume of a failed installation, a required value was inadvertently deleted from a step or modified.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you have already tried resuming this installation, check that you did not inadvertently invalidate any of the step parameters, by looking at the values in the **Properties** tab on the **Step Status** panel of the step that failed. You might have to return to a previous step to be able to modify the field.

If you can solve the problem, do so, and proceed as follows:

In the interactive wizard, if you think you have corrected an error in the step properties, you might be able to resume the modified step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS036W The temporary directory created previously by the Tivoli Workload Scheduler installation does not exist.

Explanation: The internal program that cleans up after the Tivoli Workload Scheduler instance is trying to delete the temporary files that the installation used, but the directory that contains those files cannot be found. It might have been deleted or renamed during the installation by a user or process other than the installation. Alternatively, the value of the directory name might have been inadvertently changed during the editing of the data in a step while recovering from an installation failure.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The installation has completed at this point, so remedial action is not necessary. The temporary files might still be present on your disk, and if you can easily find them and delete them, do so. However, they might not be easy to find (if another user or process has changed the directory name) and do not occupy enough space to make it worth while spending time searching for and deleting them.

AWSJIS037W Message not used.

AWSJIS038E An internal error has occurred. An unspecified internal error has occurred during the installation process.

Explanation: The installation process has determined that an error has occurred, but is unable to give any more-detailed information.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error message window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

Ensure that you are not trying to run two installations concurrently, which is not possible.

If you can solve the problem, do so, and proceed as follows:

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS039E Tivoli Workload Scheduler cannot be started. Start it manually.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

However, in both cases the installation is complete, provided that you can solve the reason why Tivoli Workload Scheduler cannot be started.

Operator response: Look in the Tivoli Workload Scheduler log files to determine why it cannot be started. If you can solve the problem that is revealed,

do so. Then start Tivoli Workload Scheduler manually, as described in the *User's Guide and Reference*.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

See *User's Guide and Reference* for a description of how to start Tivoli Workload Scheduler.

AWSJIS041E The installation cannot add the following key to the Windows registry: "registry_key".

Explanation: The installation was attempting to add the following registry key

```
\IBM\Tivoli Workload Scheduler
```

to the standard

```
HKEY_LOCAL_MACHINE\SOFTWARE
```

registry key.

The attempt has failed, probably because the standard HKEY_LOCAL_MACHINE\SOFTWARE

registry key has been deleted or renamed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The product cannot run successfully without the indicated registry key. You are strongly advised to treat this as an internal error and contact IBM Software Support for assistance.

However, you might decide to attempt to use **regedit** to add the key. Bear in mind that Microsoft warn you that the incorrect use of **regedit** might render the computer unusable. If you do decide to go ahead using **regedit**, verify that your Windows registry has the key

```
HKEY_LOCAL_MACHINE\SOFTWARE
```

. Add it if it does not. Remember to close **regedit** before proceeding.

The installation can now be resumed at the failed step, as follows:

- Resume the step of the interactive wizard

1. Click **OK** to close the error message window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready

5. Click **Apply**. The Step List window is displayed again.
6. Click **Run all** to resume the installation from that step.

- Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed, as described above.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS042E The installation cannot add the following key to the Windows registry: "registry_key" with values "registry_key_values".

Explanation: The installation is attempting to add the indicated values to a key it expects to exist. Maybe the key does not exist or has been renamed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The product cannot run successfully without the indicated registry key. You are strongly advised to treat this as an internal error and contact IBM Software Support for assistance.

However, you might decide to attempt to use **regedit** to add the key. Bear in mind that Microsoft warn you that the incorrect use of **regedit** might render the computer unusable. If you do decide to go ahead using **regedit**, verify that your Windows registry has the indicated key. Add it if it does not. Remember to close **regedit** before proceeding.

The installation can now be resumed at the failed step, as follows:

- Resume the step of the interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready
5. Click **Apply**. The Step List window is displayed again.

6. Click **Run all** to resume the installation from that step.

- Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed, as described above.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS043E The installation cannot delete the following key from the Windows registry: "registry_key".

Explanation: The installation is attempting to delete the indicated registry key that it expects to exist. Maybe the key does not exist or has been renamed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The product cannot run successfully without deleting the indicated registry key. You are strongly advised to treat this as an internal error and contact IBM Software Support for assistance.

However, you might decide to attempt to use **regedit** to delete the key. Bear in mind that Microsoft warn you that the incorrect use of **regedit** might render the computer unusable. If you do decide to go ahead using **regedit**, verify whether your Windows registry has the indicated key. Delete it if it does. Remember to close **regedit** before proceeding.

The installation can now be resumed at the failed step, as follows:

- Resume the step of the interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready
5. Click **Apply**. The Step List window is displayed again.
6. Click **Run all** to resume the installation from that step.

- Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed, as described above.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS044E The installation cannot install the following Windows service: "service_name".

Explanation: The reason might be that you do not have the correct rights to install services, the service might already exist or the user account name specified might not exist.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Follow these steps:

1. Using the Windows user account management facilities, check that the user performing the installation exists, and has the right to install services. If not, add this right. Remember to close the user account management facilities window before proceeding.
2. If the user exists and its rights are correct, open the Windows Services panel. Check if the indicated service already exists. If it does, probably a previous uninstallation of Tivoli Workload Scheduler failed, without deleting the service. If you suspect this to be the case, contact IBM Software Support. Remember to close the Windows Services panel before proceeding.

If you are able to solve the problem so that the installation is capable of installing a service, the installation can be resumed at the failed step, as follows:

- Resume the step of the interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready

5. Click **Apply**. The Step List window is displayed again.

6. Click **Run all** to resume the installation from that step.

- Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed, as described above.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS045E The installation cannot delete the following Windows service: "service_name".

Explanation: The reason might be that you do not have the correct rights to delete services, or the service might not exist.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Follow these steps:

1. Using the Windows user account management facilities, check that the user performing the installation exists, and has the right to delete services. If not, add this right. Remember to close the user account management facilities window before proceeding.
2. If the user exists and its rights are correct, open the Windows Services panel. Check if the indicated service already exists. If it does not, it might have been manually deleted in error. If you suspect this to be the case, contact IBM Software Support. Remember to close the Windows Services panel before proceeding. You are not advised to attempt to add the service manually.

If you are able to solve the problem so that the installation is capable of deleting a service, the installation can be resumed at the failed step, as follows:

- Resume the step of the interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.

3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready
5. Click **Apply**. The Step List window is displayed again.
6. Click **Run all** to resume the installation from that step.

- Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed, as described above.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS046E The installation could not find an operating system dll to complete the user verification tasks.

Explanation: The installation needs to use a standard operating system dynamic link library (dll) to complete its task of verifying, and if necessary creating, the supplied user.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Verify that the Path system variable points to the location of all the operating system dlls, and that the dlls are available. Depending on what you find, you might need to reinstall the operating system before continuing with the installation.

If you are able to solve the problem so that the installation is capable of using the operating system dlls to verify and create users, the installation can be resumed at the failed step, as follows:

- Resume the step of the interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready
5. Click **Apply**. The Step List window is displayed again.

6. Click **Run all** to resume the installation from that step.

- Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed, as described above.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS047E The installation encountered an error running the Tivoli Workload Scheduler Windows configuration script.

Explanation: The reason for the failure is documented in the installation log file.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why the configuration script failed.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready

2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS048E The installation cannot read the following file: "file_name".

Explanation: The *file_name* is the fully qualified path of the file that cannot be read.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Verify that the file exists and has read permission for the user performing the installation. Ensure that it has not been locked by another application, such as a file editor.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why the file cannot be read.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS049E The installation cannot write the following file: "file_name".

Explanation: The *file_name* is the fully qualified path of the file that cannot be written.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Verify that the user performing the installation has write permission for the file. Check if the file exists, and ensure that it has not been locked by another application, such as a file editor.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why the file cannot be written.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard**Resume the step of the interactive wizard**

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard**Resume the step of the silent wizard**

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.

2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS050E The installation cannot move the following file: "file_name".

Explanation: The *file_name* is the fully qualified path of the file that cannot be moved.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Verify that the file being moved has read permission for the user performing the installation. Verify that the directory where the installation wants to move the file to has write permission for the user performing the installation.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why the file cannot be moved.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS052E Composer could not update the database.

Explanation: If you are upgrading this instance of Tivoli Workload Scheduler, the problem could be that the user who is performing the upgrade is not authorized to use composer. The upgrade process needs to use composer to check the security data contained in the Security file.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If the user who is performing the upgrade is not authorized to use composer, locate and delete the Security file, and resume the final ""commit"" phase of the installation. In the absence of a Security file the installation recreates it with the correct rights.

If this not the case you need to find out why the commit phase failed.

If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why **Composer** could not update the database.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that

the entire disk image was copied, and that the binary option was set if ftp was used.

4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS053E The installation could not create the Security file.

Explanation: See message text.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why the Security file could not be created.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.

2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS054E The installation could not run the final installation commit phase.

Explanation: See message text.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that explain why the installation could not run the final installation ""commit"" phase.

If you can solve the problem, do so, and proceed as follows.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Status tab set the **status** to Ready
2. Click **Apply**. The Step List window is displayed.
3. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window

2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Resume the step that failed.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS056E The directory that contains the embedded WebSphere Application Server installation files cannot be found.

Explanation: The installation program is trying to locate the directory where the embedded WebSphere Application Server files were unpacked at the beginning of the installation, but has failed to find it. Either the unpacking of the installation bundle failed, or the directory has subsequently been renamed or deleted.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The problem might be resolved by

rerunning the installation from the beginning.

- If you are running the interactive wizard, click **Cancel** to exit from the wizard.
- If you are running the silent wizard, the wizard has already stopped.

If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.

Rerun the installation. If the problem persists contact IBM Software Support.

AWSJIS057E The tar file that contains the embedded WebSphere Application Server installation files cannot be found.

Explanation: The installation program is trying to locate the tar file that contains the embedded WebSphere Application Server files, but has failed to find it. Either the unpacking of the installation bundle failed, or the file has subsequently been renamed or deleted.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The problem might be resolved by rerunning the installation from the beginning.

- If you are running the interactive wizard, click **Cancel** to exit from the wizard.
- If you are running the silent wizard, the wizard has already stopped.

If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.

Rerun the installation. If the problem persists contact IBM Software Support.

AWSJIS058E The script db2profile used to create the DB2 environment cannot be found in the DB2 installation directory.

Explanation: The installation program is trying to locate the db2profile file that contains the DB2 installation files, but has failed to find it. Either the unpacking of the installation bundle failed, or the file has subsequently been renamed or deleted.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation

step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Administration and Troubleshooting*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

Ensure that you are not trying to run two installations concurrently, which is not possible.

If you can solve the problem, do so, and proceed as follows:

The problem is resolved by just rerunning the installation.

- Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance

AWSJIS059E The fully qualified domain name of this computer is null. The installation requires the fully qualified domain name to configure Tivoli Workload Scheduler correctly.

Explanation: The computer where you are installing Tivoli Workload Scheduler is not correctly set up in your network with its fully qualified domain name. Perhaps you are installing Tivoli Workload Scheduler on a new computer which has not yet been configured for network access. The installation program requires the fully qualified domain name (for example, mycomputer.rome.ibm.com) to be defined on the local computer to configure Tivoli Workload Scheduler correctly.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Resolve the problem by configuring the computer for network access.

If you are running the interactive wizard stop the installation program to reconfigure the network access. Do this as follows:

1. Click **OK** to close the error popup. The Diagnose Failure window is opened.
2. Click **Quit** to close the wizard.

Resume either an interactive or a silent installation from the failed step by rerunning the installation program, adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step. Proceed as follows:

1. Double-click the failed installation step and the Step Status window opens.
2. On the Status tab set the **status** to Ready
3. Click **Apply**. The Step List window is displayed again.
4. Click **Run all** to resume the installation from that step.

If the problem persists contact IBM Software Support for assistance.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS060E The supplied TWS_user could not be created.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Administration and Troubleshooting*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

AWSJIS061W

If you are running the silent wizard, see the installation log file for the error messages that might explain why the user cannot be created.

The probable cause is that in correcting a failed installation using the step resume facility, the ""TWS_user"" ID was changed to a non-valid ID. This is because the ID was checked for validity at input, and you would not have been able to start the installation if the user ID was not valid.

The reason why the ID has now been rejected could be one of the following:

- The user performing the installation does not have the rights to create a user
- The supplied user name does not satisfy the requirements of the local account policy
- The supplied password of the ""TWS_user"" does not satisfy the requirements of the local security policy
- The Windows account management administration wizard is open

Correct any errors you find.

You might be able to resume the step, or you might have to rerun the installation from the beginning.

- Interactive wizard

Resume the step of the interactive wizard

1. On the Properties tab change the ""TWS_user"" ID. If it is not available for editing, return to previous steps, until you find one where you can edit the value or values.
2. Repeat this step for all other steps, checking to see if the user account is included as a property for that step, and changing it if it is. This is because the installation wizard creates each step as a separate action, complete with its properties; changing a value on one does not change it automatically also on the others.
3. On the Status tab set the **status** to Ready
4. Click **Apply**. The Step List window is displayed.
5. Click **Run all** to resume the installation from that step.

If the problem is not resolved, try exiting from the wizard and recommencing the installation, as follows.

Rerun the interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
4. Rerun the wizard.

- Silent wizard

Resume the step of the silent wizard

You cannot troubleshoot a failed installation with the silent wizard. Instead, do as follows:

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Follow the procedure described for the interactive wizard to correct the user ID and resume the installation.

If this does not resolve the problem, try rerunning the silent wizard, as follows.

Rerun the silent wizard.

1. If you have copied the installation images to the local hard disk or to a remote workstation, ensure that the entire disk image was copied, and that the binary option was set if ftp was used.
2. Rerun the silent wizard.

If the problem persists contact IBM Software Support for assistance.

AWSJIS061W The supplied TWS_user exists on the local computer but does not have the correct rights. The installation is attempting to modify the rights.

Explanation: See message.

System action: The wizard continues. When the installation starts, the wizard attempts to modify the rights of the ""TWS_user"".

Operator response: None.

AWSJIS063E The supplied password is incorrect for the supplied TWS_user.

Explanation: You have specified an existing user but the supplied password is not correct for that user.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Supply a different password or a different user ID and password.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Either change the ""TWS_user"", or its password, (or both) so that the correct password is supplied for the user.
3. Click **Next** to continue.

- Silent wizard

1. Look in the installation log to see if there is any additional information
2. Edit the response file used by the silent wizard, changing the ""TWS_user"", or its password, (or both), so that the correct password is supplied for the user.
3. Rerun the silent wizard.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS064E The supplied TWS_user account cannot be verified automatically. This is because the user running the installation program does not have the Act as part of the operating system privilege, or the password of the user has expired.

Explanation: The user running an installation on Windows 2000 (but not on Windows XP and later) requires the ""Act as part of the operating system"" privilege. The check for this privilege also fails if the password has expired, whether or not the account has the privilege.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Add the privileges to the account of the user running the installation, renew the password, or rerun the installation as a different user. If you change the account on the computer you will almost certainly need to reboot the computer. Thus, in all cases, if you are running the interactive wizard you must stop it, as follows:

1. Click **OK** to close the error popup window.

2. Click **Cancel** to exit from the installation.

Change the account or its password, or log off and on again using a different user that has the correct privileges or whose password has not expired.

Rerun the wizard from scratch.

Note:This message might also be given when the *Create User* step is run. This only occurs if, between the time that the wizard validates the input values for the user ID and password, and the time it runs the *Create User* step, any changes are made to the user ID or its password, either on the computer or in the step properties dialogs as a result of a failed installation. This is unlikely to occur, but if it does you must rerun the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS065E The user running the installation does not have the correct privileges to verify the privileges of the supplied TWS_user.

Explanation: The installation program has verified that either the ""Act as part of the operating system"" privilege is not required, or is present in the profile of the user running the installation, but the attempt to verify the ""TWS_user"" has failed for another reason associated with privileges. It might be that the user does not have the Windows default Administrator privileges.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Add the Windows default Administrator privileges to the account of the user running the installation, or rerun the installation as a different user. If you change the account on the computer you will almost certainly need to reboot the computer. Thus, in either case, if you are running the interactive wizard you must stop it, as follows:

1. Click **OK** to close the error popup window.
2. Click **Cancel** to exit from the installation.

Change the account, or log off and on again using a different user that has the correct privileges.

Rerun the wizard from scratch.

Note:This message might also be given when the *Create User* step is run. This only occurs if, between the time that the wizard validates the input values for the user ID, and the time it runs the *Create User* step, any changes are made to the user ID, either on the computer or in the step properties dialogs as a result of

a failed installation. This is unlikely to occur, but if it does you must rerun the installation.

See The *Planning and Installation Guide*: contains details of the privileges required to run the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS066E The installation was unable to check the existence of the supplied TWS_user.

Explanation: The user running the installation has the correct privileges to verify the existence of the ""TWS_user"", but a problem associated with the user ID or password has prevented it from doing so. It is possible that the user name or password you supplied contained special characters or characters that do not belong to the codeset of the computer. It is possible that the account management facilities of the computer are in use, not working or are blocked in some other way.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Ensure the following:

- Ensure that the ""TWS_user"" ID and password do not contain any unusual characters that might give codeset translation problems
- Ensure that the user account management facilities on the computer are not in use by you or any other user
- Ensure that the user account management facilities are available and working. To do this, attempt to access the details of a user account, but be sure to close the account management facilities window when you have finished

If you have found and fixed a problem with the account management facilities you can continue the installation. Otherwise, close the installation and rerun it as a different user

- Interactive wizard

Continue the installation

1. Click **OK** to close the error popup window.
2. Click **Next** to continue.

Rerun the installation

1. Click **OK** to close the error popup window.
2. Click **Cancel** to quit the installation.
3. Login as a different user.
4. Rerun the wizard.

- Silent wizard

Just rerun the wizard in either case.

Note:This message might also be given when the *Create User* step is run. This only occurs if, between the time that the wizard validates the input values for the user ID, and the time it runs the *Create User* step, any changes are made to the user ID, either on the computer or in the step properties dialogs as a result of a failed installation. This is unlikely to occur, but if it does you must rerun the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS067E The installation could not modify the privileges of the supplied TWS_user.

Explanation: You have supplied a ""TWS_user"" that exists on the local computer but has insufficient rights. The installation has tried to modify those rights but cannot. Probably, the user that is running the installation does not have the correct rights to modify the supplied user's rights.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Add the Windows default Administrator privileges to the account of the user running the installation, or rerun the installation as a different user. If you change the account on the computer you will almost certainly need to reboot the computer. Thus, in either case, if you are running the interactive wizard you must stop it, as follows:

1. Click **OK** to close the error popup window.
2. Click **Cancel** to exit from the installation.

Change the account, or log off and on again using a different user that has the correct privileges.

Rerun the wizard from scratch.

Note:This message might also be given when the *Create User* step is run. This only occurs if, between the time that the wizard validates the input values for the user ID, and the time it runs the *Create User* step, any changes are made to the user ID, either on the computer or in the step properties dialogs as a result of a failed installation. This is unlikely to occur, but if it does you must rerun the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS068E The installation could not add the supplied TWS_user to the Administrators group.

Explanation: You have supplied a ""TWS_user"" ID that did not exist on the computer and the installation

has created an account for it. However, it could not add the account to the ""Administrators"" group. Probably, the user that you are using to run the installation does not have the correct privileges to add a user to that group.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Add the Windows default Administrator privileges to the account of the user running the installation, or rerun the installation as a different user. If you change the account on the computer you will almost certainly need to reboot the computer. Thus, in either case, if you are running the interactive wizard you must stop it, as follows:

1. Click **OK** to close the error popup window.
2. Click **Cancel** to exit from the installation.

Change the account, or log off and on again using a different user that has the correct privileges.

Rerun the wizard from scratch.

Note:This message might also be given when the *Create User* step is run. This only occurs if, between the time that the wizard validates the input values for the user ID, and the time it runs the *Create User* step, any changes are made to the user ID, either on the computer or in the step properties dialogs as a result of a failed installation. This is unlikely to occur, but if it does you must rerun the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS069E The installation could not find an operating system dll to complete the TWS_user verification tasks.

Explanation: The installation needs to use a standard operating system dynamic link library (dll) to complete its task of verifying, and if necessary creating, the supplied user.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Verify that the PATH system variable points to the location of all the operating system dlls, and that the dlls are present (your operating system documentation might identify which dlls are responsible for user account verification). Depending on what you find, you might need to reinstall the operating system before continuing with the installation. Verify also that the user running the installation has execute permission for operating system dlls.

Whatever the solution to the problem, rerun the wizard. If you are running the interactive wizard you need to stop the installation program. Do this as follows:

1. Click **OK** to close the error popup.
2. Click **Cancel** to close the wizard.

Rerun the wizard from scratch.

Note:This message might also be given when the *Create User* step is run. This only occurs if, between the time that the wizard validates the input values for the user ID, and the time it runs the *Create User* step, any changes are made to the dlls. This is unlikely to occur, but if it does you must rerun the installation.

AWSJIS070E The supplied TWS_user could not be created.

Explanation: You have supplied a ""TWS_user"" ID that did not exist on the computer but the installation has not been able to create it.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, look at the Output tab on the failed installation step for further information. Do the following:

1. Note down the error code (so that you can later find it in *Planning and Installation*, if needed)
2. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
3. Select **Diagnose failure** and click **Next**. The Step List window is opened.
4. Select the failed installation step and double click it to open the Step Status window.
5. Select the Output tab.

If you are running the silent wizard, see the installation log file for the error messages that might explain why the user cannot be created.

Ensure the following:

- Ensure that the ""TWS_user"" ID and password respect local security policy
- Ensure that the user running the installation has the rights to create a user. Remember to close the account management facilities before proceeding. If it does not, add those rights, or run the installation using a user that has those rights.

The problem resolution depends on what you found:

- Problems with an existing nullTWS_user> ID or password

Supply a different ""TWS_user"" ID and password. As everything in the installation relates to this user, you must rerun the installation, supplying the new ""TWS_user"" ID.

Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Click **Quit** to exit from the installation.
3. Rerun the installation, supplying a different ""TWS_user"" ID and password.

Silent wizard

1. Edit the response file used by the silent wizard, changing the ""TWS_user"" and its password.
2. Rerun the silent wizard.

- Problems with the password supplied for a nullTWS_user> that is being created

Supply a different password.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Properties tab change the ""TWS_user"" password. If it is not available for editing, return to previous steps, until you find one where you can edit the value or values.
5. Repeat this step for all other steps, checking to see if the password is included as a property for that step, and changing it if it is. This is because the installation wizard creates each step as a separate action, complete with its properties; changing a value on one does not change it automatically also on the others.
6. On the Status tab set the **status** to Ready
7. Click **Apply**. The Step List window is displayed.

8. Click **Run all** to resume the installation from that step.

- Silent wizard

1. Edit the response file used by the silent wizard, changing the ""TWS_user"" password.
2. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
3. Follow the procedure described for the interactive wizard to correct the user ID and resume the installation.

- Problems with the user privileges

Choose one of these options:

Rerun with a different user

1. If you are running the interactive wizard you need to stop the installation program . Do this as follows:
 - a. Click **OK** to close the error popup. The Diagnose Failure window is opened.
 - b. Click **Quit** to close the wizard.
2. Log on as a different user with the Windows default Administrator privileges.
3. Rerun the installation without a resume. You cannot do a step resume of an installation if you have changed the user that is running it; you must rerun the installation from scratch.

Add the missing privileges to your user profile

1. If you are running the interactive wizard you need to stop the installation program . Do this as follows:
 - a. Click **OK** to close the error popup. The Diagnose Failure window is opened.
 - b. Click **Quit** to close the wizard.
2. Add the necessary privileges to the profile of the user running the installation, so that it has the default Administrator privileges (you might need to log on as an Administrator to do this).
3. Reboot the computer.
4. Resume the installation adding the parameter **-resume**. The wizard

resumes in interactive mode at the **Step List** window showing the failed step.

5. Double-click the failed installation step and the Step Status window opens.
6. On the Status tab set the **status** to Ready
7. Click **Apply**. The Step List window is displayed again.
8. Click **Run all** to resume the installation from that step.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS071E The supplied TWS_user name incorrectly contains a period.

Explanation: This message indicates that during the recovery operation of a previously failed installation, you modified the `""TWS_user""` name and included a period in the name. The `""TWS_user""` ID was validated on input, and the presence of a period would not have allowed the installation to go ahead.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: You must rerun the wizard, reinputting the `""TWS_user""` ID as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Click **Quit** to exit from the installation.
3. Rerun the installation, resupplying the `""TWS_user""` ID and password.

- Silent wizard

1. Rerun the silent wizard.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS072E The supplied TWS_user ID is longer than the maximum length of "maximum_length" bytes.

Explanation: See message.

`maximum_length` is the maximum permitted length in bytes of the `""TWS_user""` ID.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Click **Back** to return to the previous panel and change the TWS_user to a value no longer than the maximum length.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard, changing the TWS_user to a value no longer than the maximum length.
2. Rerun the silent wizard.

AWSJIS073E The supplied TWS_user "_ID" does not exist on the local computer, but the installation cannot create this user, because another object exists with the supplied name.

Explanation: You have supplied a user ID that does not exist. The installation has tried to create a user with the supplied ID, but has found another object exists (such as a domain or a user group) with the supplied ID.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Choose a different user ID that does not exist on this computer in any form and rerun the installation without a resume. You cannot do a step resume of an installation if you have changed the `""TWS_user""`, you must rerun the installation from scratch.

Interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. Rerun the wizard.

Silent wizard.

1. Rerun the silent wizard.

AWSJIS074E The supplied TWS_user ID incorrectly contains a period.

Explanation: This message indicates that during the recovery operation of a previously failed installation, you modified the `""TWS_user""` ID and included a period in the name. The `""TWS_user""` ID was validated on input, and the presence of a period would not have allowed the installation to go ahead.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: You must rerun the wizard, reinputting the `""TWS_user""` ID as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Click **Quit** to exit from the installation.
3. Rerun the installation, resupplying the ""TWS_user"" ID and password.

- Silent wizard

1. Rerun the silent wizard.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Administration and Troubleshooting* for full details of the recovery process from a failed installation.

AWSJIS075E The supplied TWS_user does not exist. On UNIX platforms the user chosen for the TWS_user must exist with the correct permissions before starting the installation program.

Explanation: See message text.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Choose an existing user or create an account expressly for the installation. You must rerun the wizard, changing the ""TWS_user"" ID as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Click **Quit** to exit from the installation.
3. Rerun the installation, supplying a different ""TWS_user"" ID and its password.

- Silent wizard

1. Edit the response file, changing the ""TWS_user"" ID and its password.
2. Rerun the silent wizard.

See The *Planning and Installation Guide* for information about the required characteristics of the nullTWS_user>.

AWSJIS076E The supplied port: "port_number" is already in use.

Explanation: See message.

port_number identifies the port that is already in use.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Supply a different port that is not in use.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the port.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard, changing the value of the indicated port.
2. Rerun the silent wizard.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS077E The user running the installation is not in the Administrator group, or does not have Administrator rights.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The user performing the installation must be both in the ""Administrator"" group, and have Administrator rights. Either choose a different Administrator user, or modify the rights, and the group, (or both), of the user performing the installation. In the latter case you might have to reboot the computer. In either case rerun the installation.

- Interactive wizard

1. Close the Step Status window
2. Select **Quit installation**. The wizard closes.
3. Log on as a user in the ""Administrator"" group, and with Administrator rights.
4. Rerun the wizard.

- Silent wizard.

1. Log on as a user in the ""Administrator"" group, and with Administrator rights.
2. Rerun the silent wizard.

AWSJIS078E The user running the installation is not root.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: The user performing the installation must be ""root"". Rerun the installation as ""root"".

- Interactive wizard

1. Close the Step Status window

2. Select **Quit installation**. The wizard closes.
3. Log on as root.
4. Rerun the wizard.

- Silent wizard.

1. Logon as root.
2. Rerun the silent wizard.

AWSJIS079E The supplied ports are not unique. Specify a different value for each port.

Explanation: See message.

port_number identifies the port that is already in use.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check the port numbers you have used. Make sure that a unique value has been supplied for each port and that the supplied ports are available.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the port or ports.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard, changing the value of the indicated port or ports.
2. Rerun the silent wizard.

AWSJIS080E The directory "directory" cannot be created.

Explanation: See message.

directory identifies the directory that cannot be created.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Ensure the following in the path indicated:

- Ensure that the directory does not already exist.
- Ensure that there is sufficient space in the file set for the installation.
- Ensure that the user running the installation has write permission for that path.
- Ensure that the directory name is allowed in the system.

When you have located the problem, fix it either by making it possible to use the chosen directory, or by deciding to use a different directory, depending on the nature of the problem.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. If you have decided to use a different directory, change it on the wizard panel.
3. Click **Next** to continue.

- Silent wizard

1. If you have decided to use a different directory, edit the response file used by the silent wizard, changing the value of the directory.
2. Rerun the silent wizard.

AWSJIS081E The directory "directory" does not have write permission.

Explanation: See message.

directory identifies the directory that does not have write permission for the user running the installation.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Either give write permission in the directory to the user running the installation, or decide to choose a different directory.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. If you have decided to use a different directory, change it on the wizard panel.
3. Click **Next** to continue.

- Silent wizard

1. If you have decided to use a different directory, edit the response file used by the silent wizard, changing the value of the directory.
2. Rerun the silent wizard.

AWSJIS082E The following fields "field1" and "field2" cannot contain the same value.

Explanation: See message.

field1 and *field2* identify two fields that cannot have the same value.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Change one or both of the fields so that they are unique.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Change one or both of the fields on the wizard panel.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard, changing one or both of the fields.
2. Rerun the silent wizard.

AWSJIS083E The directory "directory" is not a valid directory.

Explanation: See message.

directory is the directory path you have supplied, which is not a valid directory.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Choose a different directory.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the directory on the wizard panel.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard, changing the value of the directory.
2. Rerun the silent wizard.

AWSJIS084E The command line client for Tivoli Workload Scheduler, version 8.6 is already installed in the specified installation location.

Explanation: The wizard has found an existing installation of the command line client in the chosen installation path.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Either stop the installation, or choose a different directory.

To choose a different directory, proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the directory on the wizard panel.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard, changing the value of the directory.
2. Rerun the silent wizard.

AWSJIS085E The connection to the database has failed. Check that the DB2 server is running and that the user and password are correct.

Explanation: The installation is attempting to connect to the database but the connection cannot be established.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check that DB2 is up and running. Check that the specified user and password have the rights to connect to the database. Start the database manager, if it is stopped. Connect to the database with a user that has the rights to connect.

If you make a successful connection, resume the installation at the failed step, as follows:

- Interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed installation step and the Step Status window opens.
4. On the Status tab set the **status** to Ready
5. Click **Apply**. The Step List window is displayed.
6. Click **Run all** to resume the installation from that step.

- Silent wizard

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Follow the procedure described for the interactive wizard and resume the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation in Administration and Troubleshooting* for full details of the recovery process from a failed installation.

AWSJIS086W The credentials for using the Tivoli Workload Scheduler command line client are already present on this computer (in the useropts file), but they are overwritten by this installation.

Explanation: The connection parameters used to connect to the command line client are stored in the

local `""useropts""` file. When you install the command line client they normally contain default values. They are now overwritten by the actual values determined by the installation wizard.

System action: The wizard proceeds.

Operator response: None.

AWSJIS088E An error occurred while stopping the embedded WebSphere Application Server.

Explanation: See message.

System action: The uninstallation stops.

Operator response: Check that the credentials supplied for accessing the embedded WebSphere Application Server are correct. If they are not, correct them and retry the uninstallation.

If the credentials are correct, stop the embedded WebSphere Application Server by using the appropriate command, and retry the operation.

See The appropriate publications for the embedded WebSphere Application Server for information about the commands.

AWSJIS090E An error occurred while uninstalling the Tivoli Workload Scheduler instance.

Explanation: See message.

System action: The uninstallation stops.

Operator response: Check the log for other messages that might help you to understand why the action failed.

Check that the Tivoli Workload Scheduler instance is defined in the IBM Tivoli Configuration Manager catalog. To do this, follow this procedure:

1. Set the IBM Tivoli Configuration Manager by running `./swd_env.sh` from the `nullinstall_dir>/_uninstall/CLI` directory.
2. Run the command `wdlssp`
3. Check if the instance of Tivoli Workload Scheduler is listed.

If it is not listed, either the instance has already been uninstalled, or it was not installed correctly. In the latter case, see *Planning and Installation* for details of how to manually complete an installation that could not be uninstalled normally.

If it is listed, continue the uninstallation using the `twRemove` script located in the `nullinstall_dir>/_uninstall/ACTIONTOOLS` directory.

AWSJIS091E The uninstall wizard could not find any instances of Tivoli Workload Scheduler on this computer to uninstall.

Explanation: See message. It is possible that Tivoli Workload Scheduler was not installed correctly, or has already been uninstalled.

System action: The uninstallation stops.

Operator response: Determine the original installation directory (the *Planning and Installation Guide* indicates the default directory) and check if it is present. If the installation directory is present on the computer, and contains data, Tivoli Workload Scheduler was not installed correctly. In this case, see *Planning and Installation* for instructions on uninstalling Tivoli Workload Scheduler manually.

If the installation directory is not present, or contains no data, Tivoli Workload Scheduler has been uninstalled without removing the uninstaller. Locate the uninstaller and delete it.

AWSJIS092E An error has occurred while uninstalling the Tivoli Workload Scheduler command line client.

Explanation: See message. It is possible that the Tivoli Workload Scheduler command line client has already been uninstalled.

System action: The uninstallation stops.

Operator response: Check whether the command line client has been uninstalled by checking the presence of the `nullTWS_homenu1/c1i` directory. If it does not exist, the command line client has been uninstalled without removing the uninstaller. Locate the uninstaller and delete it.

If the directory is present, attempt to delete it. If you succeed, the uninstallation is almost complete, so just locate and delete the uninstaller.

If the directory cannot be deleted, a process has locked one or more of the files. Check the Tivoli Workload Scheduler processes running on the computer. If any processes are running, make sure that they have completed all activities and stop them. Rerun the uninstallation.

AWSJIS098E An internal error has occurred. A program has failed unexpectedly.

Explanation: See message.

System action: The installation stops.

Operator response: Contact IBM Software Support.

AWSJIS099E The DB2 response file does not exist:

Explanation: The installation creates a response file to install DB2 silently, based on your input on the DB2 installation wizard panel. This response file cannot be found in the location where it was created. Between the installation step that created the file and the installation step that needed to use the file, the file was moved, deleted or renamed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: You must resume the installation at the step that creates the DB2 response file, as follows:

- Interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Locate the step entitled: ""Create the DB2 response file"".
4. Double-click the step and the Step Status window opens.
5. On the Status tab set the **status** to Ready
6. Click **Apply**. The Step List window is displayed.
7. Click **Run all** to resume the installation from that step.

- Silent wizard

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Follow the procedure described for the interactive wizard and resume the installation.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for full details of the recovery process from a failed installation.

AWSJIS100E You have supplied a path to identify the supported DB2 installation: "DB2_path" but either no installation exists at that location, or the installation that exists is not a supported version. Supported versions are 9.5 and 9.7. Versions 8.2 (8.1 with Fix Pack 7) and 9.1 are supported during the installation, but you are advised to migrate it to a supported version after completing the installation. For the HP-UX operating system the supported version is 9.1. Version 8.2 is supported during the installation, but you are advised to migrate it to a supported version after completing the installation. See the System Requirements document in the Information Center for a detailed explanation of the supported versions. Check the help for this message (in the Messages manual) to determine the correct path to supply.

Explanation: Possible reasons are:

- You have identified a DB2 directory, but that directory is not the one where the instance is installed. The correct directory is as follows:

UNIX

The fully-qualified path must point to the `sql11ib` directory in the DB2 structure.

Windows

The fully-qualified path must identify a tree in the DB2 structure that includes the `db2level.exe` file.

- You are installing on a version of DB2 that is not supported.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Install on a supported version of DB2.

If the supplied location is not correct, supply a different DB2 location.

Proceed as follows:

- Interactive wizard

1. Click **OK** to close the error message window.
2. Change the DB2 location on the wizard panel.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard. Change the DB2 location.
2. Rerun the silent wizard.

If the

AWSJIS101E The supplied existing DB2 installation cannot be used because the version is lower than the minimum supported version: 9.5. Versions 8.2 (8.1 with Fix Pack 7) and 9.1 are supported during the installation, but you are advised to migrate it to a supported version after completing the installation. For the HP-UX operating system the supported version is 9.1. Version 8.2 is supported during the installation, but you are advised to migrate it to a supported version after completing the installation. see the System Requirements document in the Information Center for a detailed explanation of the supported versions). Check the help for this message (in the Messages manual) to determine the correct path to supply.

Explanation: You have supplied a path to identify the supported DB2 installation that already exists on this computer. The installation that exists is not a supported version: minimum version is 9.5.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Either supply a different DB2 location, or ask the wizard to install DB2 for you. In this latter event, you must ensure that the computer where you are performing the installation satisfies the DB2 prerequisites.

In either case, proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the DB2 location on the wizard panel or click **Back** to return to the DB2 Installation Actions panel and choose to install DB2.
3. Click **Next** to continue.

- Silent wizard

1. Edit the response file used by the silent wizard. Change the DB2 location, or select the option to install DB2, and supply all the required DB2-related information.
2. Rerun the silent wizard.

AWSJIS102E The port specified for the DB2 instance is not in use.

Explanation: You have identified the port on which the DB2 server instance is listening, but that port is not in use. Either the DB2 server is not running or you have supplied an incorrect port.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check that the DB2 server is active and the DB2 instance port you have supplied is correct.

If the DB2 server is inactive, start the server and continue the installation.

If the DB2 instance port is incorrect, supply a different instance port and continue the installation.

In either case, proceed as follows:

- Interactive wizard

1. Click **OK** to close the error popup window.
2. If the DB2 instance port is incorrect, change it on the wizard panel
3. Click **Next** to continue.

- Silent wizard

1. If the DB2 instance port is incorrect, edit the response file used by the silent wizard. Change the DB2 instance port.
2. Rerun the silent wizard.

Note: This message might also be given during the installation steps that configure DB2 and verify that it is working correctly. This only occurs if, between the time that the wizard validates the input values for the instance port, and the time it runs these steps, the DB2 server is stopped or its port changed. This is unlikely to occur, but if it does you must rerun the installation.

AWSJIS103E The installation could not create the backup directory with the supplied name: "backup_directory"

Explanation: You are running an upgrade and have identified a backup directory that does not yet exist for the previous version of Tivoli Workload Scheduler. However, when the wizard tried to create the backup directory an error was given by the operating system. There might be a problem with permissions or disk space.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check the following:

- Check that the user running the installation has permission to create a directory at that location. If not, change the user permissions or choose to run the installation from a different user. In either case you might need to exit from the installation (for example if you need to reboot your computer after changing user permissions), and rerun it from scratch, as described below.
- Check that there is sufficient disk space in the fileset of the indicated directory. If not, make more space in the fileset and continue the installation, or go back and change the backup directory to a fileset with sufficient space. Check the size of the current installation to determine how much space is required.
- Check that the directory name is valid for the operating system. If not, go back and change the backup directory name.

- Rerun the installation

1. If you are running the interactive wizard, click **OK** to close the error popup window.
2. Either log on as a different user or change the user permissions.
3. Rerun the wizard, interactively or silently, with a different user.

- Continue the installation

Interactive wizard

1. Click **OK** to close the error popup window.
2. If you need to, change the backup directory on the wizard panel
3. Click **Next** to continue.

Silent wizard

1. If you need to, edit the response file used by the silent wizard. Change the backup directory.
2. Rerun the silent wizard.

AWSJIS104E The installation could not read the file "backup_program_files_list_file" containing a list of the files that need to be backed up.

Explanation: You are running an upgrade and have identified a backup directory in which to back up the previous version. To perform the backup the installation needs to access and read a file containing a list of the files that need to be backed up. This file is supplied as part of the installation package. If it cannot be read, it might have been damaged in copying it to the hard disk.

backup_program_files_list_file is the name of the file that contains a list of the program files to backup.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check if the file exists. If it does not, or it seems to have been edited or damaged, you could attempt to replace it from the version on the product CD, after which you can continue the installation. However, if this file is missing or damaged, it is likely that other files are missing or damaged, as well. In this case rerun the installation, either directly from the CD, or by copying the installation files from the CD to hard disk again, ensuring that you use the *binary* option if the copy mode is ftp.

Proceed as follows:

1. If you are running the interactive wizard, click **OK** to close the error popup window. Then click **Cancel** to exit from the wizard.
2. Rerun the wizard, interactively or silently.

If the problem persists, contact IBM Software Support for assistance.

AWSJIS105E The installation could not read the file "backup_config_files_list_file" containing the names of the configuration files that need to be backed up.

Explanation: You are running an upgrade and have identified a backup directory in which to back up the previous version. To perform the backup the installation needs to access and read a file containing a list of the files that need to be backed up. This file is supplied as part of the installation package. If it cannot be read, it might have been damaged in copying it to the hard disk.

backup_config_files_list_file is the name of the file that contains a list of the configuration files to backup.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check if the file exists. If it does not, or it seems to have been edited or damaged, you could attempt to replace it from the version on the product CD, after which you can continue the installation. However, if this file is missing or damaged, it is likely that other files are missing or damaged, as well. In this case rerun the installation, either directly from the CD, or by copying the installation files from the CD to hard disk again, ensuring that you use the *binary* option if the copy mode is ftp.

Proceed as follows:

1. If you are running the interactive wizard, click **OK** to close the error popup window. Then click **Cancel** to exit from the wizard.
2. Rerun the wizard, interactively or silently.

If the problem persists, contact IBM Software Support for assistance.

AWSJIS106E The path "backup_directory" supplied for the backup directory is too long.

Explanation: You are running an upgrade and have identified a backup directory that does not yet exist for the previous version of Tivoli Workload Scheduler. However, the supplied directory path is too long.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Back up the Tivoli Workload Scheduler instance selected for upgrade

Operator response: Check the value of the backup directory path you have chosen. Either choose a different directory in a shorter path, or change the directory names in the path of the chosen directory so that the path is shorter.

Resume the installation, as follows:

- Interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the ""Back up the Tivoli Workload Scheduler instance selected for upgrade"" step and the Step Status window opens.
4. On the Properties tab change the directory path to the new or amended directory you have chosen.
5. On the Status tab set the **status** to Ready
6. Click **Apply**. The Step List window is displayed.
7. Click **Run all** to resume the installation from that step.

- Silent wizard

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.
2. Follow the procedure described for the interactive wizard and resume the installation.

AWSJIS107E The installation cannot rename the file "file".

Explanation: See message.

file identifies the file that could not be renamed.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check that the user running the installation has permission to rename a file at that location. If not, change the user permissions or choose to rerun the installation from a different user. In either case you might need to exit from the installation (for example if you need to reboot your computer after changing user permissions), and rerun it from scratch.

Proceed as follows:

1. If you are running the interactive wizard, click **OK** to close the error popup window. Then click **Cancel** to exit from the wizard.
2. Either log on as a different user or change the user permissions.
3. Rerun the wizard, interactively or silently, with a different user.

If the problem persists, contact IBM Software Support for assistance.

AWSJIS109E You are trying to install Tivoli Workload Scheduler on a workstation where one or more agent processes are still running. You must stop all Tivoli Workload Scheduler processes before installing another instance or upgrading an existing instance.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Stop any active processes as described in the *Planning and Installation Guide*.

Resume the installation, as follows:

- Interactive wizard

1. Click **OK** to close the error popup window. The Diagnose Failure window is opened.
2. Select **Diagnose failure** and click **Next**. The Step List window is opened.
3. Double-click the failed step and the Step Status window opens.
4. On the Status tab set the **status** to Ready
5. Click **Apply**. The Step List window is displayed.
6. Click **Run all** to resume the installation from that step.

- Silent wizard

1. Resume the installation adding the parameter **-resume**. The wizard resumes in interactive mode at the **Step List** window showing the failed step.

2. Follow the procedure described for the interactive wizard and resume the installation.

AWSJIS110E The installation cannot read the file "installation_program_files_list_file" that contains the names of the installation programs.

Explanation: The installation needs to access and read a file containing a list of the installation program files. If it cannot be read, it might have been damaged in copying it to the hard disk.

installation_program_files_list_file is the name of the file that contains a list of the installation program files.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check if the file exists. If it does not, or it seems to have been edited or damaged, you could attempt to replace it from the version on the product CD, after which you can continue the installation. However, if this file is missing or damaged, it is likely that other files are missing or damaged, as well. In this case rerun the installation, either directly from the CD, or by copying the installation files from the CD to hard disk again, ensuring that you use the *binary* option if the copy mode is ftp.

Proceed as follows:

1. If you are running the interactive wizard, click **OK** to close the error popup window. Then click **Cancel** to quit the wizard.
2. Rerun the wizard, interactively or silently.

If the problem persists, contact IBM Software Support for assistance.

AWSJIS111E The installation was unable to access one or more Windows processes.

Explanation: You are probably running the installation with a Windows system management application open. Possible applications which must be closed include: Task Manager, Services, Computer Management, and RegEdit.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Verify if the Windows Task Manager, Services, Computer Management, RegEdit or other system management processes are running. If so, close it or them and continue the installation. If none appear to be open, reboot the workstation and rerun the installation.

The following describes how to continue or to rerun the installation:

- Continue the installation

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard.

- Rerun the installation

1. If you are running the interactive wizard, click **OK** to close the error popup window.
2. Reboot the computer.
3. Rerun the wizard, interactively or silently, with a different user.

AWSJIS112E The installation cannot start the process "process_name".

Explanation: The file containing the process might be missing or corrupt.

process_name identifies the process that cannot be run.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are not running the installation from the original CD, delete the copy you have made of the installation directories and recopy the files from the original CD. If you have ftp'd the install files to the local computer, ensure that you specified the binary option. Now rerun the installation.

Proceed as follows:

1. If you are running the interactive wizard, click **OK** to close the error popup window. Then click **Cancel** to quit the wizard.
2. Rerun the wizard, interactively or silently.

If the problem persists, contact IBM Software Support for assistance.

AWSJIS113E Either the userdata or the userdata.KEY file, required for the migration of the user information, was not found in the Tivoli Workload Scheduler instance to be upgraded.

Explanation: In order to import the passwords of the users of the previous version, the upgrade needs to directly access the *userdata* and *userdata.KEY* files, which form part of the *Mozart* database of the instance being upgraded.

One, other, or both of these files could not be found.

These files are required for the correct running of the previous instance of Tivoli Workload Scheduler.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Check for the existence of these files in the previous instance of Tivoli Workload Scheduler. Ensure that the user running the installation has read access to them. If the files have been moved, renamed, or deleted, recover them from a backup of the previous Tivoli Workload Scheduler instance, and use the facilities in the instance to check that the data in them is complete.

When you have fixed the problem, continue the installation as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard.

AWSJIS114E There is insufficient disk space available in the directory "directory" to perform the installation of the DB2 component. The installation requires "required_space" megabytes, but only "available_space" megabytes are available. Either make more space available or change the installation directory.

Explanation: See message.

directory is the install directory that has insufficient space.

required_space and *available_space* indicate what space the installation requires and how much is available.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response:

- What to do if you can make space

If you want to persist with the original installation path, use the operating system's commands and utilities to make more space available. When you have done this, proceed as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard.

- What to do if you cannot make space

If you cannot make sufficient space, you need to change the installation path to one with more available space. To do this, proceed as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Back** to return to where you supplied the installation path, change it, ensuring that it satisfies the operating system's requirements for a valid path, and click **Next** to continue.
- If you were running the silent wizard, edit the response file, changing the installation path so that it satisfies the operating system's requirements for a valid path. Rerun the silent wizard.

AWSJIS115E There is insufficient disk space available in the directory "directory" to complete the installation of the DB2 programs. The installation requires "required_space" megabytes, but only "available_space" megabytes are available. Either make more space available or change the installation directory.

Explanation: See message.

directory is the install directory that has insufficient space.

required_space and *available_space* indicate what space the installation requires and how much is available.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response:

- What to do if you can make space

If you want to persist with the original installation path, you might be able to use the operating system's commands and utilities to make more space available. When you have done this, proceed as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard.

- What to do if you cannot make space

On Linux and UNIX, the DB2 binaries are installed on a hard-coded path. If there is insufficient space for them, the installation cannot continue, and you must quit the installation and increase the size of the indicated file system before attempting to rerun the installation. The path for the binaries is as follows:

Linux

/opt/ibm/db2/V9.5

UNIX

/opt/IBM/db2/V9.5

AWSJIS116E There is insufficient disk space available in the directory "directory" to complete the installation of the Tivoli Workload Scheduler database. The installation requires "required_space" megabytes, but only "available_space" megabytes are available. Either make more space available or change the installation directory.

Explanation: See message.

directory is the install directory that has insufficient space.

required_space and *available_space* indicate what space the installation requires and how much is available.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response:

- What to do if you can make space

If you want to persist with the original installation path, use the operating system's commands and utilities to make more space available. When you have done this, proceed as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard.

- What to do if you cannot make space

If you cannot make sufficient space, you need to change the installation path to one with more available space. To do this, proceed as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Back** to return to where you supplied the installation path, change it, ensuring that it satisfies the operating system's requirements for a valid path, and click **Next** to continue.
- If you were running the silent wizard, edit the response file, changing the installation path so that it satisfies the operating system's requirements for a valid path. Rerun the silent wizard.

AWSJIS117E The supplied port: "port_number" is registered for use by another application in the Services file.

Explanation: See message. *port_number* is the port that is not free.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the indicated port number on the wizard panel to a value that is not in use.
3. Click **Next** to continue.

Silent wizard

1. Edit the response file used by the silent wizard. Change the indicated port number to a value that is not in use.
2. Rerun the silent wizard.

AWSJIS119W The specified user is a domain user. Check that it has the required rights. See Planning and Installation for details.

Explanation: A domain user must have the following rights:

- On a computer that is a member of a domain

Only a domain user can start the application server process. It must have the following characteristics:

- It is a member of the domain administrative groups in the domain controller
- It has the ""Act as part of the operating system"" privilege in the Domain Security Policy on the domain controller
- It has the ""Act as part of the operating system"" privilege in the Local Security Policy on the local computer
- If the server is run as a service, it has the ""Log on as a service"" privilege on the local computer.

- On a computer that is a domain controller

It must have the following characteristics:

- It is a member of the domain administrative groups in the domain controller
- It has the ""Act as part of the operating system"" privilege in the Domain Security Policy on the domain controller
- If the server is run as a service, it has the ""Log on as a service"" privilege on the domain controller

System action: The installation panel flow waits for you to continue.

Operator response: Check the rights of the domain user and click **Next** to continue.

AWSJIS120E The TWS_user ID of the previous instance of Tivoli Workload Scheduler is longer than the maximum of "max_length" bytes. You cannot upgrade this instance of Tivoli Workload Scheduler.

Explanation: The ""TWS_user"" in version 8.6 must be no more than 8 bytes in length. As the ""TWS_user"" in the previous instance is longer, you cannot upgrade the instance.

System action: The installation stops.

Operator response: Click **Back** to select a different instance. Click **Cancel** to exit from the wizard.

Perform a fresh installation and then migrate the data independently from the old instance to the new.

See *Planning and Installation Guide* for details of how to migrate data independently.

AWSJIS122W The user specified for the DB2 installation "user" already exists. You must be absolutely certain that this user was created by a previous installation of DB2 to go ahead. If in any doubt, either go back and choose another user, or delete the user before continuing with the installation, and let the wizard create it for you.

Explanation: The attributes and permissions of the user ID must be correct for using DB2.

user is the user that already exists.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: You have three options:

- Continue, using the user ID originally chosen (created for a previous installation of DB2)

- If you are running the interactive wizard, click **OK** to close the error popup and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard without changing the parameters or the response file.

- Delete the user ID, letting the wizard create an ID with the correct attributes

1. Delete the user ID using the system's facilities
2. Proceed as follows:
 - If you are running the interactive wizard, click **OK** to close the error popup and click **Next** to continue.

- If you were running the silent wizard, rerun the wizard without changing the parameters or the response file.

- Go back and change the user ID

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Back** to return to where you supplied the user ID, change it to one that was used to create a DB2 instance, and click **Next** to continue.
- If you were running the silent wizard, edit the response file, changing the user ID to one that was used to create a DB2 instance. Rerun the silent wizard.

AWSJIS123E Unable to find the selected instance to uninstall in the Tivoli Workload Scheduler registry file. You cannot uninstall this instance using the wizard.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, cancel the uninstallation.

Uninstall the instance manually.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Planning and Installation* for instructions on uninstalling Tivoli Workload Scheduler manually.

AWSJIS124E Unable to find the selected instance of the command line client to uninstall in the Tivoli Workload Scheduler registry file. You cannot uninstall this instance using the wizard.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: If you are running the interactive wizard, cancel the uninstallation.

Uninstall the instance manually.

See The chapter on *Troubleshooting installation, migration, and uninstallation* in *Administration and Troubleshooting* for instructions on uninstalling Tivoli Workload Scheduler manually.

AWSJIS125E There is insufficient disk space available in the temporary directory "directory" to complete the installation. The installation requires "required_space" megabytes, but only "available_space" megabytes are available. Make more space available in the temporary installation directory.

Explanation: See message.

directory is the temporary directory that has insufficient space.

required_space and *available_space* indicate what space the installation requires and how much is available.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Make space in the temporary directory. Or, on Windows, you can change the location of the temporary directory, by temporarily or permanently changing the value of the TMP environment variable.

Proceed as follows:

- If you are running the interactive wizard, click **OK** to close the error popup, and click **Next** to continue.
- If you were running the silent wizard, rerun the wizard.

AWSJIS126E The user ID "user_ID" must not begin with sys, ibm, or sql, as these are reserved terms.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the indicated *user_ID* on the wizard panel to a value that does not begin with any of the indicated values.
3. Click **Next** to continue.

Silent wizard

1. Edit the response file used by the silent wizard. Change the indicated *user_ID* to a value that does not begin with any of the indicated values.
2. Rerun the silent wizard.

AWSJIS127E The user ID "user_ID" must not be: admins, guests, local, public, or users, nor any SQL key word, as these are reserved terms.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the indicated *user_ID* on the wizard panel to a value that is not any of the indicated names.
3. Click **Next** to continue.

Silent wizard

1. Edit the response file used by the silent wizard. Change the indicated *user_ID* to a value that is not any of the indicated names.
2. Rerun the silent wizard.

AWSJIS128E You specified a TWS_user that already owns an existing Tivoli Workload Scheduler instance. Click Back and specify a different user for the TWS_user.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Change the nullTWS_user> ID on the wizard panel to a value that does not own an existing instance.
3. Click **Next** to continue.

Silent wizard

1. Edit the response file used by the silent wizard. Change the nullTWS_user> ID to a value that does not own an existing instance.
2. Rerun the silent wizard.

AWSJIS129E The field "field_name" is required.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Provide a valid value for the indicated field.
3. Click **Next** to continue.

Silent wizard

1. Edit the response file used by the silent wizard. Provide a valid value for the indicated field.
2. Rerun the silent wizard.

AWSJIS130E The field "field_name" must contain a valid value.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.

Operator response: Proceed as follows:

Interactive wizard

1. Click **OK** to close the error popup window.
2. Provide a valid value for the indicated field.
3. Click **Next** to continue.

Silent wizard

1. Edit the response file used by the silent wizard. Provide a valid value for the indicated field.
2. Rerun the silent wizard.

AWSJIS131E The character "character" is not valid.

Explanation: See message.

System action: If you are running the interactive wizard, the wizard stops.

If you are running the silent wizard, the wizard fails.
