

Interactive System Productivity Facility (ISPF)

Planning and Customizing

z/OS Version 2 Release

Note

Before using this information and the product it supports, read the information in "Notices" on page 333.

First Edition (September 2013)

This edition applies to ISPF for Version 2 Release 1.0 of the licensed program z/OS (program number 5650-ZOS) and to all subsequent releases and modifications until otherwise indicated in new editions.

IBM welcomes your comments. For information on how to send comments, see "How to send your comments to IBM" on page xv.

The ISPF development team maintains a site on the World Wide Web. The URL for the site is: <http://www.ibm.com/software/awdtools/ispf/>

How to send your comments to IBM	xv
If you have a technical problem	xv

Summary of changes	xvii
Product function changes made in z/OS V2R1.0 ISPF	xvii
ISPF product changes	xvii
ISPF Dialog Manager component changes	xvii
ISPF PDF component changes	xviii
ISPF SCLM component changes	xviii
Migration considerations	xviii
Changes to this document for z/OS V2R1.0 ISPF	xix

What's in the z/OS V2R1.0 ISPF library?	xxi
----------------------------------------------------------	------------

Part 1. Planning and customizing 1

Chapter 1. z/OS V2R1.0 ISPF planning.	3
Hardware and software requirements	3
Notes on migrating from previous releases to z/OS V2R1.0 ISPF	3
Installation, maintenance, and migration diagnostics	4
Language Environment considerations	5
Software Configuration and Library Manager (SCLM)	6
Maintenance considerations	6
Load module search order	7
TSO logon procedure	7
Edit backup and recovery considerations	9

Chapter 2. The ISPF Configuration Table	11
Using the ISPF Configuration utility before installation is complete	12
System requirements	12
Running the Configuration utility with a special logon procedure	12
The ISPF Configuration utility	14
Create/Modify Settings and Regenerate Keyword File	16
Edit Keyword File Configuration Table	34
Verify Keyword Table Contents	35
Build Configuration Table Load Module	36

Convert Assembler Configuration Table to Keyword File	37
Build SMP/E USERMOD	38
Convert Configuration Table LoadMod to Keyword File	40

Chapter 3. Customizing ISPF	43
Allocating optional image ISPF library	43
Customizing action bars	43
Invoking the ISPDTLC conversion utility	44
Customizing for profile sharing	49
Customizing the ISPF Configuration utility	49
Temporary data set names	50
SYSIKJUA enqueue	50
Limitation of other products	50
TSO/ISPF client gateway	50
Gateway description	51
Installing and customizing the gateway	51
Using the gateway	60

Chapter 4. Improving ISPF performance 75	
Use virtual I/O	75
Remove or tailor Edit functions	75
Change the block size of the edit recovery data set	75
Disable SETUNDO STORAGE	76
Disable Edit extended highlighting	76
Remove action bars from ISPF panels	76
Remove scrollable areas from ISPF panels	77
Preprocess all ISPF panels	77
Preprocessed panel utility	77
Add load modules to the pageable link-pack area (LPA)	79
Moving load modules	79
ISPF load module descriptions	80
Allocate execution data sets	81
Disable generic high-level qualifiers	82
Preallocate ISPF temporary data sets to VIO	84
Compress SCLM listings	86

Chapter 5. Customizing DM	87
Changing the default name for the ISPF Client/Server component download data set	87
Set up ISPF GUI for TSO Line Mode support	87
SMF command accounting	88
Preallocation of List/Log data sets to SYSOUT	91
Specifying the maximum number of split screens	91
Setting ISPF site-wide defaults	92
Customizing command tables	92
Application command table	93
User command tables	93
Site command tables	93
System command table	94
Creating ISPF terminal translation tables	94
Uppercase character translation table	95

Lowercase character translation table	95
Valid terminal output translation table	95
Generic string master translation table	96
Alphabetic character translation tables	96
Collating sequence translation table	97
Specifying terminal types.	98
Creating ISPF code page translation tables.	103
Base code pages for terminals	105
ISPCCSID translation load modules	106
Adding translation tables for extended code page support	106
Displaying square brackets used in C programs	112
ISPEXEC processing	112
ISPF-to-APL2 terminal type mappings	113
Load APL2 workspace	113
Tailoring ISPF defaults	114
Customizing the ISPF TSO command table (ISPTCM).	114
Sample ISPTCM definition	117
ISPTCM usage notes	117
Alternate option 7.1 panels	118
ISPF multicultural support	119
Changing the session language default value	119

Chapter 6. ISPF installation-wide exits 121

How to install the installation-wide exits	122
How to use the macros to define ISPXDT	123
Sample ISPXDT definition	125
Exit parameter list.	126
Error processing	126

Chapter 7. Customizing PDF 129

Edit mode defaults	129
Site-wide edit profile initialization	130
Creating a ZDEFAULT profile	130
Action bars and extended color in Edit	131
Edit backup and recovery	131
Data set allocation defaults for the Outlist utility	132
Using the Hardcopy utility with DBCS support	133
SCLM Batch considerations.	133
Converting from LMF To SCLM	136
General conversion	136
Converting LMF dialogs to SCLM	138
Creating PDF translation tables	138
PDF Foreground and Batch customizing	139
Foreground processing panels and CLISTs.	139
Batch processing panels, CLISTs, and skeletons	154
ISRSCAN and ISRLEMX programs	173
Customizing Browse and Edit	178
Providing customized Browse and Edit panels	178
Enabling Browse panels to display Unicode data	182
Customizing member list panels	182
Customizing the z/OS UNIX directory list panel	187
IBM Products option	187

Part 2. Reference 191

Chapter 8. PDF installation-wide exits 193

Data set list filter exit.	193
Data set allocation exit	194

Activity monitoring exits	198
Exit 1: BROWSE primary command start	199
Exit 2: BROWSE primary command end	199
Exit 3: EDIT primary command start	199
Exit 4: EDIT primary command end.	199
Exit 5: EDIT macro start.	200
Exit 6: EDIT macro end	200
Exit 7: EDIT line command start	200
Exit 8: EDIT line command end	200
Exit 9: Library/Data Set utility sub-function start	200
Exit 10: Library/Data Set utility sub-function end	201
Exit 11: Data Set List utility line command start	201
Exit 12: Data Set List utility line command end	202
Data set list line command exit	202
Print utility exit	204
Print utility exit on ISPF termination and LOG/LIST commands	206
Compress request exit	208
Data set name change exit	210
Member list filter exit	212
Analyzing patterns with the member list filter exit	212
Analyzing member names with the member list filter exit	213
Member list built-in line command exit.	214

Chapter 9. ISPF Configuration Table

keywords and values 217

PDF exits.	217
Data set allocation settings	218
Outlist data set specifications	219
SuperC data set specifications	219
LMF	220
Edit recovery data set specifications	220
Move/Copy settings	221
DSLISL removable media interface settings	221
Edit-related settings	223
Edit site-wide profile customizations	226
ISPF site-wide profile customizations	231
Default CUA color settings	241
Miscellaneous settings	246
VSAM data set restrictions	250
ISPSPROF general values	250
ISPSPROF workstation defaults	257
ISPSPROF workstation download defaults.	262

Chapter 10. Exits 265

Exit macros	265
Exit 1: ISPF session initialization exit	266
Exit 2: ISPF session termination exit	267
Exit 3: SELECT service start exit	268
Exit 4: select service end exit	269
Exit 5: TSO command start exit	271
Exit 6: TSO command end exit	272
Exit 7: LIBDEF service exit	272
Exit 8: RESERVE exit	273
Exit 9: RELEASE exit	274
Exit 10: logical screen start exit	275
Exit 11: logical screen end exit.	275
Exit 12: ISPF service start exit	276
Exit 13: ISPF service end exit	277

Exit 14: SWAP exit	277
Exit 15: DISPLAY service exit	278
Exit 16: log, list, trace, and temporary data set allocation exit	279

Chapter 11. PDF translation tables 283

Translation table for valid data set name characters	283
Translation table for invalid data set name characters	283
Translation table for hexadecimal characters	283
Translation table for numeric characters	284
Translation table for alphanumeric characters.	284
Translation table for edit terminal output characters	285
Translation table for generic string characters.	285
Translation table for generic string special characters	285
Usage notes for the GSC and GSS tables	286
Translation table for uppercase characters	286
Translation table for lowercase characters	287
Modifying the GSM to use the user character subset	287
Generic string master translation table	287
ISPF and PDF terminal translation table relationship	289

Chapter 12. Dialog development model listings 291

DM and PDF services in CLIST commands	291
DM and PDF services in COBOL programs	293
DM and PDF services in EXEC commands	296
DM and PDF services in FORTRAN programs	297
Message format	300
Panel formats and statements	300
DM and PDF services in PL/I programs	303
File tailoring control statements	305
DM and PDF services in Pascal programs	306
DM and PDF services in TSO/REXX commands	308
SCLM architecture definition formats	310
SCLM project definition macros and templates	311

ISPF Dialog Tag Language models	311
DM and PDF services in C/370 programs	312
Dialog Tag Language models	314

Chapter 13. Programming interface macros for customers 319

Chapter 14. ISPF data set descriptions 321

Part 3. Appendixes 323

Appendix A. ISPF enqueue processing for data integrity 325

RESERVE processing for partitioned data set extended	325
Serializing with non-ISPF TSO and BATCH	325
ISPF data set integrity enqueue	326
Member name enqueue	326
z/OS UNIX file Enqueue	326
ISPF GUI TSO line mode message queue enqueue	327
Workstation file name enqueue	327
SCLM VSAM enqueue	327

Appendix B. Accessibility 329

Accessibility features	329
Using assistive technologies	329
Keyboard navigation of the user interface	329
Dotted decimal syntax diagrams	329

Notices 333

Policy for unsupported hardware.	334
Minimum supported hardware	335
Programming Interface Information	335
Trademarks	335

Index 337

Preface

The Interactive System Productivity Facility (ISPF) product assists in program development. It is designed to take advantage of the characteristics of IBM® display terminals, and to increase programmer productivity in an interactive environment.

About this document

This document provides guidance and reference information for the planning and customizing of ISPF under z/OS® with the Time Sharing Option Extensions (TSO/E). It consists of three parts:

Part 1. Planning and customizing

Contains detailed planning information and procedures you need to install and customize ISPF. It explains how to specify configuration options, modify the distributed menus and options, and tune ISPF performance.

Part 2. Reference

Provides a lookup reference for static information such as the ISPF Configuration Table keywords and values, PDF translation tables, dialog development model listings, and so on.

Part 3. Appendixes

This part provides information about ISPF enqueue processing for data integrity, accessibility, notices, and index.

Who should use this document

z/OS ISPF Planning and Customizing is designed for system programmers or other people whose responsibilities include installing, customizing, and tuning ISPF. You should be familiar with MVS™, ISPF concepts and terminology as described in the *z/OS ISPF Dialog Developer's Guide and Reference*, and with the System Modification Program Extended (SMP/E).

What is in this document?

This publication contains:

- Chapter 1, “z/OS V2R1.0 ISPF planning,” on page 3 describes planning procedures you need to know before installing ISPF.
- Chapter 2, “The ISPF Configuration Table,” on page 11 describes the ISPF Configuration Utility.
- Chapter 3, “Customizing ISPF,” on page 43 describes how to modify items that affect both the DM and PDF components to suit the needs of your installation.
- Chapter 4, “Improving ISPF performance,” on page 75 describes how to tune ISPF to reduce system load and improve response times for interactive users.
- Chapter 5, “Customizing DM,” on page 87 describes how to modify items that affect the DM function of ISPF to suit the needs of your installation.
- Chapter 6, “ISPF installation-wide exits,” on page 121 describes how you can write exit routines to collect system-related information.
- Chapter 7, “Customizing PDF,” on page 129 describes how to modify the distributed release of PDF to suit the needs of your installation.

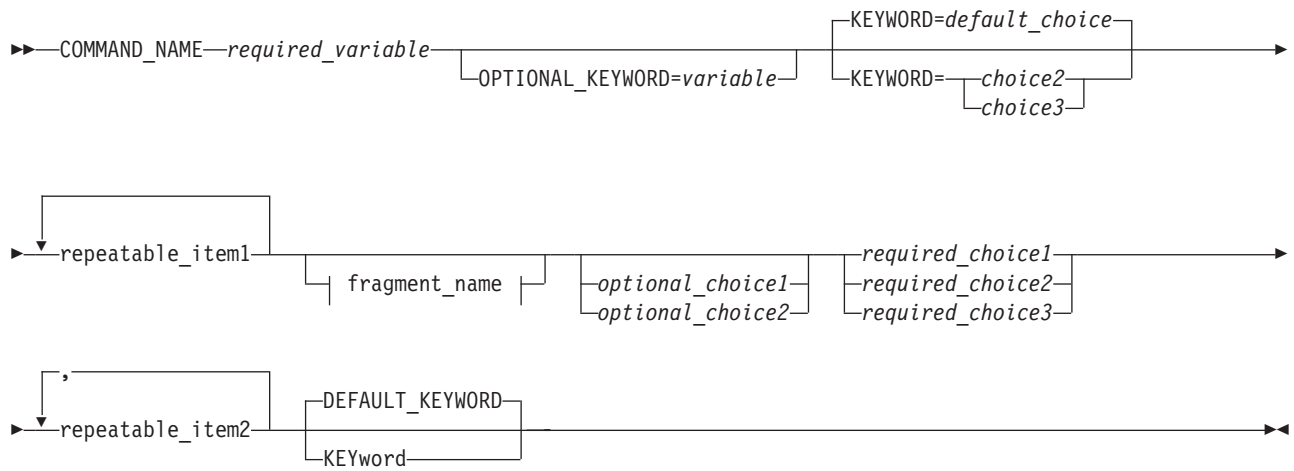

- Chapter 8, “PDF installation-wide exits,” on page 193 describes the installation-wide exits that allow you to customize the behavior of ISPF utilities such as Edit, Browse, Print, and Compress, as well as data set lists and member lists.
- Chapter 9, “ISPF Configuration Table keywords and values,” on page 217 lists the keywords in the ISPF Configuration Table and their allowable and default values.
- Chapter 10, “Exits,” on page 265 lists ISPF the installation-wide exits.
- Chapter 11, “PDF translation tables,” on page 283 lists the PDF translation tables.
- Chapter 12, “Dialog development model listings,” on page 291 lists all of the edit models included in the ISPF SKELS library.
- Chapter 13, “Programming interface macros for customers,” on page 319 lists the macros provided by ISPF as programming interfaces.
- Chapter 14, “ISPF data set descriptions,” on page 321 lists the target and distribution data sets used by ISPF, and their contents.
- Appendix A, “ISPF enqueue processing for data integrity,” on page 325 explains how ISPF ensures data integrity.

How to read the syntax diagrams

The syntactical structure of commands described in this document is shown by means of syntax diagrams.

Figure 1 on page ix shows a sample syntax diagram that includes the various notations used to indicate such things as whether:

- An item is a keyword or a variable.
- An item is required or optional.
- A choice is available.
- A default applies if you do not specify a value.
- You can repeat an item.

fragment_name:

Figure 1. Sample syntax diagram

Here are some tips for reading and understanding syntax diagrams:

Order of reading

Read the syntax diagrams from left to right, from top to bottom, following the path of the line.

The \blacktriangleright symbol indicates the beginning of a statement.

The \longrightarrow symbol indicates that a statement is continued on the next line.

The \blacktriangleright symbol indicates that a statement is continued from the previous line.

The $\longrightarrow\blacktriangleleft$ symbol indicates the end of a statement.

Keywords

Keywords appear in uppercase letters.

Sometimes you only need to type the first few letters of a keyword, The required part of the keyword appears in uppercase letters.

In this example, you could type "KEY", "KEYW", "KEYWO", "KEYWOR" or "KEYWORD".

The abbreviated or whole keyword you enter must be spelled exactly as shown.

Variables

Variables appear in lowercase letters. They represent user-supplied names or values.

Required items

Required items appear on the horizontal line (the main path).

Optional items

Optional items appear below the main path.

Choice of items

If you can choose from two or more items, they appear vertically, in a stack.

If you *must* choose one of the items, one item of the stack appears on the main path.

If choosing one of the items is optional, the entire stack appears below the main path.

If a default value applies when you do not choose any of the items, the default value appears above the main path.

Repeatable items

An arrow returning to the left above the main line indicates an item that can be repeated.

If you need to specify a separator character (such as a comma) between repeatable items, the line with the arrow returning to the left shows the separator character you must specify.

Fragments

Where it makes the syntax diagram easier to read, a section or *fragment* of the syntax is sometimes shown separately.

⋮

fragment_name:

z/OS information

This information explains how z/OS references information in other documents and on the web.

When possible, this information uses cross-document links that go directly to the topic in reference using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see *z/OS Information Roadmap*.

To find the complete z/OS library, including the z/OS Information Center, see z/OS Internet Library (<http://www.ibm.com/systems/z/os/zos/bkserv/>).

How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or provide any other feedback that you have.

Use one of the following methods to send your comments:

1. Send an email to mhvrcfs@us.ibm.com.
2. Send an email from the "Contact us" web page for z/OS (<http://www.ibm.com/systems/z/os/zos/webqs.html>).
3. Mail the comments to the following address:
IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
US
4. Fax the comments to us, as follows:
From the United States and Canada: 1+845+432-9405
From all other countries: Your international access code +1+845+432-9405

Include the following information:

- Your name and address.
- Your email address.
- Your telephone or fax number.
- The publication title and order number:
z/OS V2R1.0 ISPF Planning and Customizing
SC19-3623-00
- The topic and page number that is related to your comment.
- The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute the comments in any way appropriate without incurring any obligation to you.

IBM or any other organizations use the personal information that you supply to contact you only about the issues that you submit.

If you have a technical problem

Do not use the feedback methods that are listed for sending comments. Instead, take one of the following actions:

- Contact your IBM service representative.
- Call IBM technical support.
- Visit the IBM Support Portal at z/OS support page (<http://www.ibm.com/systems/z/support/>).

Summary of changes

This summary lists changes and enhancements made in z/OS V2R1.0 ISPF. It has two parts:

Product function changes

Describes the functional changes made in z/OS V2R1.0 ISPF, listed by each ISPF component. This part appears in most of the ISPF documents.

Changes to this document

Lists the changes and enhancements made in z/OS V2R1.0 ISPF which affect this document, including cross-references to the new or changed sections.

Product function changes made in z/OS V2R1.0 ISPF

z/OS V2R1.0 ISPF contains the following changes and enhancements:

- “ISPF product changes”
- “ISPF Dialog Manager component changes” (including DTL changes)
- “ISPF PDF component changes” on page xviii
- “ISPF SCLM component changes” on page xviii
- “Migration considerations” on page xviii

For details of migration actions relating to ISPF and other z/OS elements, see *z/OS Migration*.

ISPF product changes

There are no ISPF product changes relating to this release.

ISPF Dialog Manager component changes

The DM component of ISPF includes the following new functions and enhancements:

- Support is added for the processing of data sets allocated with an extended task I/O table (XTIOT) entry.
- The ISPF Services Guide is updated to include a new section documenting the format of JSON messages exchanged between TSO/ISPF and a client. This JSON API enables the user interface for an ISPF application to operate in the client environment.
- The ISPF Dialog Developers Guide and Reference is updated to describe ISPF variables that can be used by an application to pass information to the client by means of the JSON API.
- Support is provided for users to define a command stack to be run at ISPF invocation. This can be used to start multiple logical screens.
- Scroll amounts up to 9,999,999 are now supported.
- A new options panel allows a user to customize the display format for the SWAPBAR.
- Dialog Tag Language (DTL) changes:
There are no changes to Dialog Tag Language (DTL) for this release.

ISPF PDF component changes

The ISPF PDF component contains the following new functions and enhancements:

- The ISPF editor FIND and CHANGE commands have been enhanced to support regular expressions.
- The ISPF editor CREATE, REPLACE, COPY, MOVE, and CUT commands have been enhanced to support data conversion to/from EBCDIC, ASCII, and UTF-8.
- The ISPF editor HILITE command has been enhanced to show invalid use of lower-case characters in JCL.
- The member count field on member list panels is expanded to support values up to 9,999,999.
- The following enhancements have been made to the z/OS UNIX Directory List Utility:
 - Pattern matching characters can now be used to specify a path name filter for a z/OS UNIX directory list display.
 - A SRCHFOR command is provided to search for strings in regular files in the directory.
 - Directory list line commands can now be entered in blocks.
 - The file name column in the directory list can now have a display width of up to 110 characters.
 - A command shell is now provided allowing users to save and retrieve z/OS UNIX commands.
- The Data Set List Utility is changed to allow a path name to be entered in the Dsname Level field in order to have a z/OS UNIX Directory List displayed.
- The F (free) line command of the Data Set List Utility can now be used against a multi-volume data set to free unused space.
- The MEMLIST service supports the new DEFAULT keyword which allows the caller to specify a line command that is used to replace an “S” line command entered on the member list display.
- The ISPF editor provides support to view and edit Unicode data in data sets and z/OS UNIX files.
- The following enhancements have been made to the ISPF editor COMPARE command:
 - The VOL parameter is provided to support comparing against an uncataloged data set.
 - The target data set or path name can now be entered on the options panel displayed when the COMPARE command is entered without any parameters.
- To support the input of long editor commands, the editor command field can be expanded to a length of 255 characters using the ZEXPAND command.
- The UDLIST command is enhanced to convert the specified pathname to lowercase and re-issue the directory find if the directory for the pathname initially specified with the UDLIST command is not found.
- Data in the PROMPT column of the enhanced member list is now passed as an argument to a command entered against a member.

ISPF SCLM component changes

There are no ISPF SCLM component changes relating to this release.

Migration considerations

There are no migration considerations relating to this release.

Changes to this document for z/OS V2R1.0 ISPF

This book contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

The "Readers' Comments - We'd Like to Hear from You" section at the back of this publication has been replaced with a new section "How to send your comments to IBM" on page xv. The hardcopy mail-in form has been replaced with a page that provides information appropriate for submitting comments to IBM.

Extended attributes

The extended member list format display has been updated to add an I(Info) command to display a panel with all the relevant extended information.

For changes to this document relating to this modification, see:

- "Exit 11: Data Set List utility line command start" on page 201

Updated samples

The APL samples, ISPAPLTT and ISRAPLTT, have been updated to add APL characters X'70', X'76', and X'77'.

Edit recovery data sets

ISPF has been enhanced to use TYPE=T on CLOSE for Edit Backup/Recovery data sets. The PARTIAL_RELEASE allocation restriction has been removed.

What's in the z/OS V2R1.0 ISPF library?

Part 1. Planning and customizing

Chapter 1. z/OS V2R1.0 ISPF planning

Application dialogs that were created to run under earlier versions of ISPF will run under z/OS V2R1.0 ISPF with no change.

All the components of ISPF (DM, PDF, SCLM, and the Client/Server) are considered one element in all releases of z/OS. Attempting to run one of the components from one release of z/OS with a component from a different release of z/OS or with any component of a standalone release of ISPF or ISPF/PDF is not supported.

Hardware and software requirements

For hardware and software requirements for ISPF, refer to *z/OS Planning for Installation*, number GA22-7504.

Notes on migrating from previous releases to z/OS V2R1.0 ISPF

For information about migrating from a previous supported release of ISPF, refer to *z/OS Migration*.

It is also possible to migrate to z/OS V2R1.0 ISPF from earlier versions of ISPF.

Customization of ISPF had major changes in OS/390® Version 2 Release 8.0. When migrating from a version of OS/390 earlier than V2R8.0 you must convert your ISPF customization to the new format. See Chapter 2, “The ISPF Configuration Table,” on page 11 for more information.

Major changes were made to the ISPF profiles for OS/390 V1R1.0. The profiles for earlier versions of ISPF are not compatible with z/OS ISPF.

IPV6 ISPF C/S component does not support TCPIP connections in an IPV6 environment. ZIPADD6 will be formatted correctly however.

Use this information to help you during the transition stage.

- The z/OS V2R1.0 ISPF data sets are all named ISP.SISPxxxx and ISP.AISPxxxx. Version 4 ISPF data sets were named ISP.V4RxM0.xxxxx.
- Using SMP to install z/OS V2R1.0 ISPF deletes these licensed programs:
 - ISPF Version 3.n and ISPF/PDF Version 3.n
 - ISPF Version 4.n
 - OS/390 VnRn.0 ISPF
 - z/OS V1R2.0 ISPF
 - z/OS V1R5.0 ISPF
 - z/OS V1R6.0 ISPF
 - z/OS V1R7.0 ISPF
 - z/OS V1R8.0 ISPF

During the transition stage, maintain the previous programs on a separate set of back-up packs or in a set of libraries that does not interfere with the execution of z/OS V2R1.0 ISPF.

- During the transition stage, it is assumed that the predecessor programs reside in the system pageable link pack area. ISPF and the new programs are assumed to be running from a set of execution libraries, as described in the *z/OS Program Directory*.
- Many of the modules in ISPF have the same names as modules in the previous licensed programs. Therefore, the ISPF module libraries should not be in your system LNKLSTxx definition during the transition period.
- During the initial testing period, ISPF should be run from the SISpload and SISPLPA data sets created during the SMP APPLY processing step. Use a STEPLIB DD statement in the TSO LOGON procedure to accomplish this.
If you are using the ISPF client/server feature or the z/OS UNIX Directory List utility, include the Language Environment® run-time library data sets SCEERUN and SCEERUN2 in the STEPLIB if they are not already in the LNKLIST.
If you are also running with an ISPLLIB DD statement, you must include the z/OS V2R1.0 ISPF SISpload and SISPLPA data sets in the ISPLLIB concatenation and remove any load library data sets from a previous version or release of ISPF.
- If only the top modules of z/OS V2R1.0 ISPF (ISPICP and alias ISPSTART as well as ISRPCP and alias entries PDF and ISPF) are in the step libraries, and the other load modules for the new and previous ISPF versions are in libraries allocated to the ISPLLIB ddname, both the old programs and the new programs can be executed concurrently under the same LOGON procedure. Concurrent execution assumes that a CLIST is used to provide the allocations of the other required ISPF libraries.
- *Do not* use the command names ISPF, PDF, or ISPSTART during the transition stage. Conflicts can occur if you invoke modules from earlier versions of ISPF with the same names. One solution is to rename the alias entries of the top ISPF modules in the step library to temporary names (for example, from ISPF to NEWISPF) until the transition stage is complete.
- After the transition stage, the z/OS V2R1.0 ISPF LPA-eligible load modules (data set SISPLPA) should be put in LPA, and the LPA-ineligible load modules (data set SISpload) should be put in LNKLST. See Chapter 4, “Improving ISPF performance,” on page 75 for more information. At that time, remove any DD statements for a STEPLIB or ISPLLIB definition of the ISpload/ISPLPA data set from the LOGON procedure.
- Panel ISRLOGO was renamed to ISR@LOGO at z/OS Version 1 Release 1.0. If you have a modified version of ISR@PRIM, check that the correct panel value is used in the HELP Action Bar pull-down menu.

Installation, maintenance, and migration diagnostics

This information describes common situations you may encounter during installation, maintenance, and migration.

Problem:

Unpredictable results such as 0C4 or 0C1 abends upon invocation of ISPF.

Cause: This problem can occur when internal LINKs and LOADs are used in conjunction with the ISPF ISPLLIB DCB.

Solution:

When using STEPLIB to test new maintenance, releases, or versions of products and an ISPLLIB is allocated, data sets allocated to STEPLIB should also be allocated to ISPLLIB.

Problem:

New levels of code residing in STEPLIB do not appear to be executed. This includes changes to customer applications, new levels of code, and changes made by PTFs, for example.

Cause: This problem can occur when internal LINKS and LOADs are used in conjunction with the ISPF ISPLLIB DCB.

Solution:

When using STEPLIB to test new maintenance, releases, or versions of products and an ISPLLIB is allocated, data sets allocated to STEPLIB should also be allocated to ISPLLIB.

Problem:

Abends occur when invoking or exiting HELP, KEYS, or ISPPREP.

Cause: An older level of ISPF exists in LPA or LINKLIB; an ISPLLIB or STEPLIB is used to allocate libraries for the new release of ISPF; and a LIBDEF for ISPLLIB that does not include the new level of ISPF libraries has been issued.

Not all of ISPF is loaded at initialization, for example, ISPTUTOR is linked when HELP is requested. The LIBDEF of ISPLLIB results in the older level of any modules that are not loaded on ISPF entry to be picked up from LPA or LINKLIB due to internal search orders. For more information, refer to the LIBDEF command in *z/OS ISPF Services Guide*.

Solution:

Include the new level of ISPF in any LIBDEFs issued for ISPLLIB.

Problem:

Abend code 806 for ISPLINK or Abend code 0C1 in user application.

Cause: During installation, the SMP/E install logic for ISPF deletes the existing ISPLINK load module.

Solution:

Relink-edit ISPLINK to user application.

Problem:

Abends in load modules IGC0009C and IGC0009D.

Cause: Failure to install ISPF in the same zone as TSO/E will result in the supplied ISPF SVC 93 and SVC 94 exits (ISPSC93, ISPSC94), creating SVC 93 and SVC 94 load modules without the proper link-edit information.

Failure to use the correct version of either IGC0009C or IGC0009D or both.

Solution:

TSO/E, ISPF, and ISPF/PDF must all be installed in the same zone. Verify that the correct versions are copied from a test system to the production system.

Language Environment considerations

The ISPF client/server (ISPF C/S) feature and the z/OS UNIX Directory List utility include code are compiled with the IBM C/C++ compiler. Therefore, the Language Environment SCEERUN and SCEERUN2 run-time library data sets must be available to this code through either STEPLIB or LNKLIST at execution time. Using the usual ISPLLIB allocation will not make the run-time library available to this code.

Software Configuration and Library Manager (SCLM)

Use the Software Configuration and Library Manager (SCLM) to create, control, maintain, and track software components for a project.

The SCLM project database consists of a series of related ISPF libraries (partitioned data sets). These contain source and non-source software components. SCLM project definition and control information is contained in an assembled and linked PROJDEFS data set. SCLM project cross-reference and accounting data sets are VSAM clusters.

SCLM requires RACF® (or equivalent) to protect the SCLM-controlled data sets. Individual developers should have READ authority to all levels of the hierarchy to draw down members from the hierarchy using the SCLM edit option. Those developers who promote the modified members up the hierarchy will need UPDATE authority for the libraries into which they are promoting. The Build Coordinator should have UPDATE access to the libraries containing the non-editable parts (non-editable parts are the output from the build process) and READ access to all levels of the hierarchy to allow the builds to be done.

For information about converting from LMF to SCLM see “Converting from LMF To SCLM” on page 136. For detailed information about SCLM, refer to *z/OS ISPF Software Configuration and Library Manager Guide and Reference*.

Maintenance considerations

ISPF is packaged using the features of SMP/E that allow multiple multicultural support language features to be installed in a single target zone. We recommend that you take advantage of this by installing all of the base code and all multicultural support language features in one target zone and one distribution zone. This simplifies the installation of maintenance.

If you do not install your multicultural support features in the same target and distribution zones as the base, SMP/E cannot properly track maintenance (PTFs) that contains REQ or IF REQ statements. When you install PTFs for the multicultural support features that contain REQ statements for PTFs that apply to the base or PTFs for the base that contain IF REQ statements for PTFs that apply to the multicultural support features, you must use this procedure:

1. APPLY the base PTF that is REQed by the multicultural support feature PTF or contains an IF REQ for an multicultural support feature PTF.
2. APPLY the multicultural support feature PTF using BYPASS(REQ).
3. Test the maintenance according to your normal procedures.
4. ACCEPT the base PTF that is REQed by the multicultural support feature PTF or contains and IF REQ for a multicultural support feature PTF.
5. ACCEPT the multicultural support feature PTF using BYPASS(REQ).

PTFs for ISPF do not contain preprocessed panels. If you are using preprocessed panels in your execution data sets, after installing PTFs that contain panels you must preprocess the panels in the PTF into your execution data set to fully install the maintenance.

Load module search order

When using STEPLIB to test either new maintenance, releases, or versions of ISPF, and an ISPLLIB is allocated, those data sets allocated to STEPLIB that contain ISPF load modules should also be allocated to ISPLLIB. This prevents the possibility of mixed code (production code versus code to be tested).

The exceptions to this search order are the Language Environment run-time library data sets SCEERUN and SCEERUN2. Modules in these data sets are not searched for using the ISPLLIB task library. SCEERUN and SCEERUN2 must be in STEPLIB or LNKLST if you are using the ISPF C/S feature or the z/OS UNIX Directory List utility. See “Language Environment considerations” on page 5 for more information about SCEERUN and SCEERUN2.

For more information about search order, refer to *z/OS ISPF User's Guide Vol I*.

TSO logon procedure

Figure 2 is a sample TSO logon procedure (logon proc) to allocate the ISPF data sets required to execute ISPF.

```
//ISPF      PROC
//ISPF      EXEC PGM=IKJEFT01,DYNAMBR=100
//*
//STEPLIB  DD DSN=ISP.SISPLPA,DISP=SHR
//          DD DSN=ISP.SISPLAD,DISP=SHR
//          DD DSN=CEE.SCEERUN,DISP=SHR
//          DD DSN=CEE.SCEERUN2,DISP=SHR
//*
//ISPLLIB  DD DSN=ISP.SISPMxxx,DISP=SHR
//          DD DSN=SYS1.SBPXMENU,DISP=SHR
//*
//*SYSHelp DD DSN=ISP.SISPHELP,DISP=SHR
//*
//ISPLLIB  DD DSN=ISP.SISPPxxx,DISP=SHR
//          DD DSN=SYS1.SBPXPENU,DISP=SHR
//*
//ISPSLIB  DD DSN=ISP.SISPSxxx,DISP=SHR
//          DD DSN=ISP.SISPSLIB,DISP=SHR
//*
//ISPTLIB  DD DSN=userid.ISPTABLE,DISP=SHR
//          DD DSN=ISP.SISPTxxx,DISP=SHR
//          DD DSN=SYS1.SBPXTENU,DISP=SHR
//*
//ISPILIB  DD DSN=ISP.SISPSAMP,DISP=SHR
//*
//SYSPROC  DD DSN=ISP.SISPCLIB,DISP=SHR
//          DD DSN=SYS1.SBPXEXEC,DISP=SHR
//*
//SYSEXEC  DD DSN=ISP.SISPEXEC,DISP=SHR
//*
//ISPTABL  DD DSN=userid.ISPTABLE,DISP=SHR
//*
//ISPPROF  DD DSN=userid.ISPTABLE,DISP=OLD
//*
```

Figure 2. TSO logon procedure

The default names `ISP.SISPyxxx` are used for the ISPF data sets, where `xxx` represents the national language:

Language

xxx

US English

ENU

Japanese

JPN

German

DEU

Swiss German

DES

Uppercase English

ENP

Note: For information about data sets that are required by other products for them to run under ISPF, see the *z/OS Program Directory* and the documentation for the specific product.

This logon procedure assumes that all data sets are cataloged and that SYSEXEC is included in the search order for REXX execs on your system. See *z/OS TSO/E REXX User's Guide* and *z/OS TSO/E Command Reference* for details about controlling the search order for REXX execs.

If you are using TSO line mode support, your logon procedure must invoke the alternate entry point **PGM=IKJEFT11**. The TSO Line mode support cannot be used with the ISPF load modules in STEPLIB. Many of the ISPF load modules must be in the pageable link-pack area. See "Set up ISPF GUI for TSO Line Mode support" on page 87 for more information.

This logon procedure includes the optional ISPILIB allocation. ISPILIB is used for images in Graphic Image Format (GIF) that are used by ISPF when running in GUI mode. For more information about using ISPF's image support, refer to the *z/OS ISPF User's Guide Vol 1*.

If an ISPLLIB is allocated when you use a STEPLIB to test new maintenance, releases, or versions of ISPF, you must include the data sets allocated to STEPLIB that contain ISPF load modules in the ISPLLIB allocation. This prevents mixing production code with code to be tested. For more information about library search order, refer to the *z/OS ISPF Services Guide*.

The SCEERUN and SCEERUN2 libraries are required in STEPLIB or LNKLST if you plan to use either the ISPF Client/Server feature or the z/OS UNIX Directory List utility. SCEERUN and SCEERUN2 are the Language Environment run-time library data sets and contain run-time modules required by C/C++ code used by these ISPF features. These libraries must be in STEPLIB or LNKLST for the modules to be loaded at execution time. These modules are not searched for using the ISPLLIB allocation. See "Language Environment considerations" on page 5 for more information.

If you plan to use the z/OS UNIX Directory List utility, these libraries must be allocated as shown in Figure 2 on page 7: SYS1.SBPXMENU, SYS1.SBPXPENU, SYS1.SBPTMENU, SYS1.SBPXEXEC.

You must use a unique user profile data set (userid.ISPTABLE) in the sample logon procedure for each national language. If you do not, the result is mixed language messages and prompts. The data set *userid.ISPTABLE* must have record format FB, LRECL 80, and a block size that is a multiple of 80. You might want to allocate the

ISPPROF, ISPTABLE, and ISPTLIB DDs in a REXX exec that is executed by the PARM on the EXEC statement of the logon procedure.

Edit backup and recovery considerations

Edit backup and recovery helps you to recover data that might otherwise be lost. For example, you would use edit recovery to re-establish the edit session at the point of failure after a power outage or system failure.

Edit backup and recovery is enabled when you enter Edit mode and recovery mode is on. You can set recovery mode on or off with the RECOVERY command.

If recovery mode is on, Edit writes data to an *edit recovery data set* which is used if a recovery is required. Some restrictions apply to the type of data set that can be used as an edit recovery data set.

For more information about backup and recovery, see “Edit backup and recovery” on page 131.

Chapter 2. The ISPF Configuration Table

In earlier versions of ISPF, changing configuration defaults involved two separate entities: the ISPF Configuration table (ISRCONFIG) and the ISPF Defaults member (ISPDFLT). In OS/390 Version 2 Release 8.0 these two parts were combined into a single configuration table, which included keywords for all the existing ISRCONFIG and ISPDFLT values.

The ISPF Configuration table is a keyword-driven flat file. Each entry is in the format `KEYWORD = value`. A slash and asterisk (`/*`) in columns 1 and 2 indicate a comment line. Some advantages of this keyword approach are:

- Only one place to go for all configuration needs.
- No need to rename sample ISRCNFIG to ISRCONFIG to get the correctly named load module created.
- No need to modify ISPF standard parts.
- No need to modify any keywords or values EXCEPT those for which you DO NOT want the default value.
- Different keyword files, representing different configurations, can be saved in different members of a PDS. Each one can be generated into a load module for different sets of users.

Use the ISPF Configuration table to change site-wide defaults and to indicate that installation exit routines are provided for some of the ISPF functions. The ISPF functions that allow installation-written exit routines are data set allocation, print utility, data set compression, the data set list utility, member list filter, and data set name change. ISPF checks the configuration table to determine, first, if exit routines are provided, and second, whether those routines are programs or CLISTS. If you specify both a CLIST and a program, ISPF uses the program.

A default configuration load module (ISPCFIG) is included with ISPF. It is used if you choose to make no customizations for your installation. If you do want to create your own configuration table, simply use the ISPF Configuration utility to edit the flat file (name and data set of your choosing, but it must be a PDS) and convert it into a load module called ISPCFIGU. Optionally, you can use the same file to create load module called ISPCFIGV for VSAM support. The converted load module must be placed in the standard MVS search sequence or allocated to ISPLLIB for ISPF to use the values specified. For more information about the ISPF Configuration utility, see “The ISPF Configuration utility” on page 14.

It is recommended that you always use the latest release as the common configuration, though older releases will work with the newest table. Newer releases will also work with an older table, but the ability to configure the settings added in the latest release is lost.

Chapter 9, “ISPF Configuration Table keywords and values,” on page 217

Using the ISPF Configuration utility before installation is complete

You might want to run the ISPF Configuration utility for a new release to set configuration options added by the new release before you actually IPL your new system for the first time. If you are installing with CBPDO you can run the utility after the SMP/E APPLY step of the ISPF FMIDs. If you are installing with ServerPac you can run the utility after the ISPF target libraries are restored to your system.

System requirements

The utility must be run on a supported release of z/OS, and have High Level Assembler (HLASM) 1.3.0 or later, and a supported release of SMP/E. If your system does not have the required level of HLASM or SMP/E, you can use STEPLIB DD statements to access HLASM in the target system's SASMMOD1 data set, and SMP/E in the target system's SYS1.MIGLIB data set.

Running the Configuration utility with a special logon procedure

To run the ISPF Configuration utility using a special TSO logon procedure, follow these steps.

1. Allocate the ISPF target libraries in the appropriate DDs in a TSO logon procedure as shown in Figure 3 on page 13. The ISPF libraries should be first in each concatenation except ISPTLIB where your profile data set should be first. The default ISPF names are given with xxx representing the national language identifier for your installed language. If the ISPF data sets for the new release are not cataloged on the system you are using to run the utility then you must include **UNIT** and **VOL=SER** parameters on the DD statements for those data sets.
2. Include **HLASM(SASMMOD1)** and **SMP/E(SYS1.MIGLIB)** in STEPLIB if they are not at the required level on your system. If the data sets are not cataloged on the system you are using to run the ISPF Configuration utility then you must include **UNIT** and **VOL=SER** parameters on the DD statements for those data sets.
3. Include your ISPF profile data set in ISPTLIB and ISPTABL as shown in Figure 3 on page 13.
4. Logon to TSO using your modified logon procedure.
5. Start ISPF with the **ISPF** or **PDF** command.
6. Enter command **TSO ISPCCONF** to start the ISPF Configuration utility.

```

//STEPLIB DD DISP=SHR,DSN=ISP.SISPLPA      ISPF LPA load library
//        DD DISP=SHR,DSN=ISP.SISPLOAD    ISPF LNKLST load library
//        DD DISP=SHR,DSN=ASM.SASMMOD1    High Level Assembler
//        DD DISP=SHR,DSN=SYS1.MIGLIB     SMP/E library
//*
//SYSEXEC DD DISP=SHR,DSN=ISP.SISPEXEC    ISPF Exec library
//*
//ISPMLIB DD DISP=SHR,DSN=ISP.SISPMxxx    ISPF Messages library
//*
//ISPPLIB DD DISP=SHR,DSN=ISP.SISPPxxx    ISPF Panels library
//*
//ISPSLIB DD DISP=SHR,DSN=ISP.SISPSxxx    ISPF Language Skels library
//        DD DISP=SHR,DSN=ISP.SISPSLIB    ISPF Base Skels library
//ISPTLIB DD DISP=SHR,DSN=your.profile    Your ISPF Profile
//        DD DISP=SHR,DSN=ISP.SISPTxxx    ISPF Tables library
//*
//ISPTABL DD DISP=SHR,DSN=your.profile    Your ISPF Profile
//*
//ISPPROF DD DISP=SHR,DSN=your.profile    Your ISPF Profile

```

Figure 3. ISPF Configuration utility logon procedure

Running the Configuration utility with a REXX Exec

To run the ISPF Configuration utility using a REXX Exec, the ISPF data sets for the new release must be cataloged on the system you are using to run the utility. If the system you are using to run the utility does not have the required level of HLASM or SMP/E, you can do one of two things. You must either use STEPLIB DD statements in your logon procedure to access HLASM in the target system's SASMMOD1 data set, and SMPE in the target system's SYS1.MIGLIB data set, or catalog the HLASM and SMP/E data sets on the system you are using to run the utility.

To run the utility using a REXX Exec, follow these steps.

1. Copy member ISPFCU from the SISPSAMP library for the new release to a library that is in your normal SYSEXEC or SYSPROC concatenation. You can rename it if you want to, but avoid names that start with the characters "ISP".
2. Modify the data set names in the exec as indicated in the comments. Use fully qualified data set names.
3. If the required level of HLASM is in LPA or LNKLST, or in the STEPLIB of the TSO logon procedure that you will be using then set the value for **asm_load** to null (''). If you want to access the required level of HLASM through this exec the data set must be cataloged on your running system.
4. If the required level of SMP/E is in LPA or LNKLST, or in the STEPLIB of the logon procedure that you will be using, then set the value for **gim_load** to null (''). If you want to access the required level of SMP/E through this exec the data set must be cataloged on your running system.
5. The default names for the ISPF libraries are supplied. They must be cataloged on your running system. Change them as needed.
6. Logon to TSO.
7. Run the exec from TSO Ready. ISPF for the new release will start.
8. Enter the command **TSO ISPCCONF** to start the ISPF Configuration utility.

The ISPF Configuration utility

The ISPF Configuration utility enables you to:

- modify the configuration settings saved in the keyword files
- generate a configuration table load module or SMP/E USERMOD for use on your ISPF system
- convert existing ISPF configuration table assembler files from earlier releases of ISPF (SAMPLIB member ISRCNFIG) into the keyword file format

The ISPF Configuration utility sets two types of values: system-wide values and user-specific values. System-wide values are values that are used for all users and are re-read from the Configuration Table at the beginning of each ISPF session. For example, the PDF Exits and PDF Default Unit are system-wide values.

User-specific values are used as initial values when a new profile is created. For example, if a user has an ISPSPROF or Edit Profile, it is used instead of the Configuration Table values. These profiles hold user-specific values.

As system administrator you can, if you choose, ensure that even user-specific values are set according to your specifications. Some of the user-specific Edit Profile fields have corresponding FORCE fields. The FORCE fields enable you to require the user to use the specified configuration values even if the user already has an edit profile. If the user attempts to modify one of the "forced" values, an error message is displayed. Some of the user-specific ISPSPROF fields have corresponding RESET fields. The RESET fields enable you to reset these values once for each user. The reset is done when the Sitewide Defaults Version Level is incremented. Any ISPSPROF fields that do not have RESET fields are not used by a user unless they are creating a new ISPSPROF table.

You can generate the keyword file in one of two ways:

- Use the **Convert Assembler Configuration Table to Keyword File** option on the ISPF Configuration utility main menu.
- Use the **Create/Modify Settings and Regenerate Keyword File** option on the ISPF Configuration utility main menu.

To start the ISPF Configuration utility run the command **TSO ISPCCONF** while in ISPF. This displays the ISPF Configuration utility main menu panel, as shown in Figure 4 on page 15.

Figure 4. ISPF configuration utility main menu panel (ISPPCONF)

These options are available on the ISPF Configuration utility main menu:

1. Create/Modify Settings and Regenerate Keyword File (see “Create/Modify Settings and Regenerate Keyword File” on page 16).
2. Edit Keyword File Configuration Table (see “Edit Keyword File Configuration Table” on page 34).
3. Verify Keyword Table Contents (see “Verify Keyword Table Contents” on page 35).
4. Build Configuration Table Load Module (see “Build Configuration Table Load Module” on page 36).
5. Convert Assembler Configuration Table to Keyword File (see “Convert Assembler Configuration Table to Keyword File” on page 37).
6. Build SMP/E USERMOD (see “Build SMP/E USERMOD” on page 38).
7. Convert Configuration Table LoadMod to Keyword File (see “Convert Configuration Table LoadMod to Keyword File” on page 40).

These input fields are available on the ISPF Configuration utility main menu panel:

Keyword File Data Set

The name of the data set and member containing the keyword file you want to use. The data set must exist and have a record length of at least 255 bytes for variable-length files, and 251 bytes for fixed-length files. This must be a Partitioned Data Set (PDS).

Configuration Table Assembler Source Data Set

The name of the sequential data set or partitioned data set and member containing the Configuration Table assembler source code to be converted into a keyword file.

Output File Content for Keyword File

The entry in this field determines the type of data written to the keyword file when the Convert Assembler Configuration Table to Keyword file option, or the Create/Modify Settings and Regenerate Keyword File option is used. Valid values are:

- 1 Only those values that are different than the default values are included in the keyword file.
- 2 Those values different than the default values are included in the keyword file, and all default values are included as comment lines.
- 3 All values are included in the keyword file.

Create/Modify Settings and Regenerate Keyword File

If you choose Option 1, **Create/Modify Settings and Regenerate Keyword File** on the ISPF Configuration utility main menu panel, the Create/Modify ISPF Configuration panel appears, as shown in Figure 5.

This option enables you to create a new keyword file or modify an existing keyword file containing ISPF configuration settings. Each time you use this option the keyword file is regenerated with the new or modified settings values. Note that any comments that have been added, or any reformatting changes that you might have made to the keyword file by editing it directly *do not* appear in the regenerated file.

```

```

Figure 5. Create/modify ISPF Configuration panel (ISPPMOD)

From this panel you can choose to modify these groups of configuration options by entering the option number on the command line.

- General ISPF Settings (see “General ISPF Settings Panels”)
 - 1 Editor Settings
 - 2 Edit/View/Browse VSAM Settings
 - 3 PDF Exits and Other PDF Settings
 - 4 ISPF Site-wide Defaults
 - 5 ISPDFLT, CUA Colors, and Other DM Settings
- System Profile (ISPSPROF) Settings (see “System Profile (ISPSPROF) Settings panels” on page 28)
 - 6 Log and List Defaults
 - 7 Terminal and User Defaults
 - 8 Workstation Defaults
 - 9 Workstation Download Defaults

As you choose a group of settings to modify, a panel specific to that group of settings is displayed. If you are creating a new keyword file, the panel fields are initialized with the default values for each setting. If you are modifying an existing keyword file, the panel reflects the current values in that keyword file.

Each of the selected panels has field-level help for the individual fields on the panel. To display a pop-up help panel for a field, put the cursor on the field and press the Help function key, or enter HELP on the command line.

The Output Keyword File entry fields enable you to save the generated keyword file to a data set or member other than the data set or member used as input. If you leave this field blank, the data is saved back to the input data set and member specified on the ISPF Configuration utility main menu panel (ISPPCONF).

General ISPF Settings Panels

Selecting Option 1, **Editor Settings** on the Create/Modify ISPF Configuration panel (ISPPMOD) displays the Modify PDF Edit Configuration Settings panel (ISPPMOD1). Scroll down to display all the fields on this panel.

```

Edit Keyword File Configuration Table

If you choose Option 2, **Edit Keyword File Configuration Table** on the ISPF Configuration utility main menu panel, the Edit Keyword File panel appears, as shown in Figure 37 on page 35.

This option enables you to directly edit the keyword file and manually modify the configuration settings.

Comments can be added to the keyword file and the keywords can be rearranged, but such additions and changes are not preserved if you later use Option 1 **Create/Modify Settings and Regenerate Keyword File**. Only the changed values of keywords are carried forward. Full line comments are denoted by an asterisk (*) in column one, or a forward slash and asterisk (/*) in columns one and two. Comments on the same line as a keyword begin with a forward slash and asterisk, and end at the end of the line.

```

File Edit Edit_Settings Menu Utilities Compilers Test Help
ISPCEDIT LSACKV.CONFIG.KEYWORD.FILE(SYSTEM1) - 01.00 Columns 00001 00072
Command ==>

Modify, Add or Delete the keywords and values listed here. Enter END or EXIT
to save your changes, CANCEL to exit without saving your changes.

Note: Changes in the order of the keywords, or comments added to the file will
not be preserved if the file is regenerated using option 1.

```

ISPPVERQ Keyword File Verification
Command ==>

The Keyword file has been saved. You can run the ISPF
keyword verification to check the keywords and values in
the keyword file now, or exit without running the
verification. If you choose to exit without verifying the
keyword file you can run the verification later using the
Verify Keyword Table Contents option.

Instructions:
Press Enter to verify the keyword file.
Enter END or EXIT to exit without verification.

F1=Help F2=Split F3=Exit F7=Backward
F8=Forward F9=Swap F12=Cancel

```

Figure 38. Keyword File Verification panel (ISPPVERQ)

On this Keyword File Verification window, you can indicate whether you want to run ISPF's keyword verification routine to check the keywords and values in your keyword file. If you want to run the verification exec, press the Enter key. If you do not want to verify your changes, enter the END command, or EXIT.

Verify Keyword Table Contents

If you choose Option 3, **Verify Keyword Table Contents** on the ISPF Configuration utility main menu panel, ISPF verifies that the keyword file is correct in these respects:

- each record is in the correct format

- each keyword specified is a recognized keyword
- each value is syntactically correct.

If any verification errors are found, a listing similar to the one shown in Figure 39 is displayed. The listing shows the line in error and the reason that ISPF flagged it as incorrect.

```

Figure 39. Verification Failure Listing

Build Configuration Table Load Module

If you choose Option 4, **Build Configuration Table Load Module** on the ISPF Configuration utility main menu panel, ISPF displays the Build Configuration Table Load Module panel, as shown in Figure 40 on page 37.

This option enables you to convert the keyword file you specify into a load module for ISPF to use to determine the session settings. You can create two separate load modules: the configuration table load module (default name ISPCFIGU), and the VSAM configuration load module (default name ISPCFIGV). The configuration table load module is always created, the VSAM configuration load module is only created if one of the VSAM restriction keywords is used in your file.

While you can create the load modules with any name initially (for example, if you want to create several different configurations for your installation), ISPF only recognizes the default names of ISPCFIGU and ISPCFIGV. If you create load modules with other names and want to use them, you must rename them when they are moved into the ISPF execution data sets.

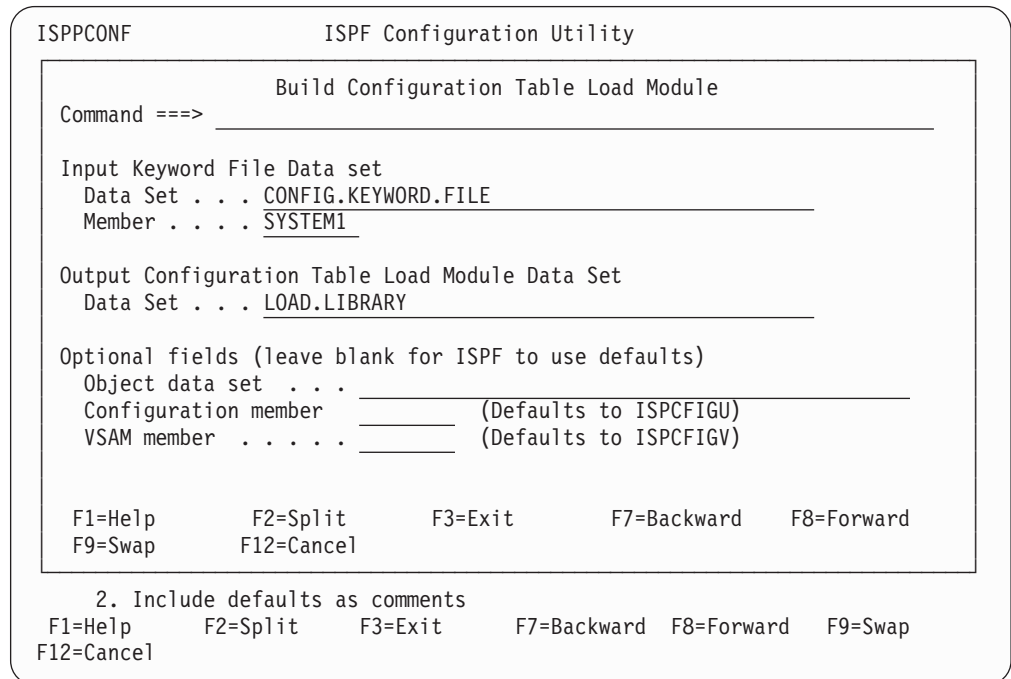

Figure 40. Build Configuration Table Load Module panel (ISPPBLD)

When the Build Configuration Table Load Module panel appears, the Input Keyword File Data Set field value is initialized with the name found on the ISPF Configuration utility main menu panel. Verification of the keyword file specified is automatically run before the keyword file is converted into a load module. If ISPF finds any errors during the verification process, they are logged to a temporary data set, and ISPF puts you into View mode on the messages data set when the verification is complete. The build *is not* done until the verification completes without error.

The other entry fields found on the Build Configuration Table Load Module panel are:

Output Configuration Table Load Module Data Set

The name of the pre-existing partitioned data set into which the generated configuration table load module is to be stored.

Object Data Set

Optional. The name of the pre-existing partitioned data set into which the generated configuration table object module is to be stored. If no object data set is specified, ISPF uses a temporary data set.

Configuration Member

Optional. The member name of the configuration table load module created. If no member name is specified, a value of ISPCFIGU is used.

VSAM Member

Optional. The member name of the VSAM configuration load module created. If no member name is specified, a value of ISPCFIGV is used.

Convert Assembler Configuration Table to Keyword File

If you choose Option 5, **Convert Assembler Configuration Table to Keyword File** on the ISPF Configuration utility main menu panel, ISPF converts a configuration table assembler source file used in releases of ISPF before OS/390 Version 2 Release 8.0 into the new keyword format.

You specify the assembler source file in the Configuration Table Assembler Source Data Set field on the ISPF Configuration utility main menu panel. The keyword file that is generated is placed into the data set and member you specify in the Keyword File Data Set field.

The Output File Content for Keyword File field controls how much data is written to the keyword file during the conversion. Valid values for this field are:

- 1 Only those values that are different than the default values are included in the keyword file.
- 2 Those values different than the default values are included in the keyword file, and all default values are included as comment lines.
- 3 All values are included in the keyword file.

If the output keyword file specified in the Keyword File Data Set field already exists, the Confirm Conversion panel asks if you want to overwrite it. If you want to overwrite the file press the Enter key, otherwise enter END or CANCEL to exit.

Build SMP/E USERMOD

If you choose Option 6, **Build SMP/E USERMOD** on the ISPF Configuration utility main menu panel, ISPF displays the Build SMP/E USERMOD panel (ISPPSMP), as shown in Figure 41.

```

Build SMP/E USERMOD
Command ==> _____

F9=Swap      F12=Cancel

```

Figure 41. Build SMP/E USERMOD panel (ISPPSMP)

This option enables you to convert the keyword file you specify into load modules (a configuration table load module and a VSAM configuration load module), and to package the keyword file source code and the generated load modules in an SMP/E USERMOD. The configuration table load module is always created. The VSAM configuration load module is only created if one of the VSAM restriction keywords is used in your keyword file. The default names of ISPCFIGU (for the configuration load module) and ISPCFIGV (for the VSAM configuration load module) are always used when the load modules are packaged in an SMP/E USERMOD.

When the Build SMP/E USERMOD panel appears, the Keyword File Data Set field is initialized with the name found on the ISPF Configuration utility main menu panel. All entry fields on the Build SMP/E USERMOD panel are required except the "Prior USERMOD to supersede" fields. The other entry fields on the Build SMP/E USERMOD panel are:

SMP/E Data Set

The name of the pre-existing partitioned data set into which the SMP/E USERMOD is to be stored. The USERMOD is stored in a member named the same as the SYSMOD ID used for the USERMOD. This data set must be record format FB with LRECL 80.

SYSMOD Identifier for USERMOD

A seven-character identifier for the SMP/E USERMOD. The identifier is used in the ++USERMOD statement and is used for the member name in the SMP/E Data set.

FMID for USERMOD

The FMID for the FMID operand of the SMP/E USERMOD. The FMID for ISPF z/OS Version 2 Release 1.0 is HIF5H02.

Target Library DDDEF names

SYSLIB for keyword file source

The DDDEF name to be used as the SYSLIB for the keyword source in the SMP/E USERMOD. The DDDEF must exist in the target zone that has ISPF installed. The data set in the DDDEF entry must have the same record format and LRECL as your keyword source data set.

SYSLIB for load modules

The DDDEF name to be used as the SYSLIB for the load modules in the SMP/E USERMOD. The DDDEF must exist in the target zone that has ISPF installed. The data set in the DDDEF entry must have record format U and LRECL 0 with a block size equal to or greater than 6144.

Distribution Library DDDEF names

DISTLIB for keyword file source

The DDDEF name to be used as the DISTLIB for the keyword source in the SMP/E USERMOD. The DDDEF must exist in the target zone and distribution zone that has ISPF installed. The data set in the DDDEF entry must have the same record format and LRECL as your keyword source data set.

DISTLIB for load modules

The DDDEF name to be used as the DISTLIB for the load modules in the SMP/E USERMOD. The DDDEF must exist in the target zone and distribution zone that has ISPF installed. The data set in the DDDEF entry must have record format U and LRECL 0 with a block size equal to or greater than 6144.

Prior USERMODs to supersede (SUP)

Four optional fields for the seven-character name of a previous USERMOD to be superseded by this SMP/E USERMOD. The previous USERMODs (up to four) are included in the SUP operand of the SMP/E USERMOD. The four fields must be filled from top to bottom.

When you complete the required fields on the panel and press Enter, the keyword file specified is automatically verified before it is converted into load modules and

an SMP/E USERMOD is built. If ISPF finds any errors during verification, the errors are logged to a temporary data set and ISPF puts you into View mode on the messages data set.

If the verification process completes without error the keyword file is packaged in an SMP/E USERMOD as ++DATA (ISPCFIGU). The configuration load module is generated and packaged as ++PROGRAM (ISPCFIGU).

The VSAM load module, if required, is generated and packaged as ++PROGRAM (ISPCFIGV).

The SMP/E USERMOD is stored in the data set specified in the SMP/E Data Set field on the Build SMP/E USERMOD panel (ISPPSMP), using a member name equal to the SYSMOD ID specified in the SYSMOD Identifier for USERMOD field.

Installing the USERMOD on your system

To install the resulting SMP/E USERMOD on your system, perform these steps.

1. Create target and distribution libraries for the keyword source file. The target and distribution libraries for the keyword source must have the same record format and LRECL as the keyword file that you used to build the USERMOD. One or two tracks will be sufficient space.
2. Create target and distribution libraries for the load modules. The target and distribution load libraries must be record format U, LRECL 0, with a block size equal to or greater than 6144. One or two tracks will be sufficient space.
3. Add DDDEFs to your target zone for the target and distribution libraries using the DDDEF names you specified on the Build SMP/E USERMOD panel, with the names of the appropriate target or distribution libraries you created.
4. Add DDDEFs to your distribution zone for the distribution libraries using the DDDEF names you specified on the Build SMP/E USERMOD panel, with the names of the appropriate distribution libraries you created.
5. SMP/E RECEIVE and APPLY the USERMOD.
6. Place the load module target library in the normal MVS search order on your system or allocate it to ISPLLIB in your logon procedure.

Note:

1. You only need to create the distribution libraries and distribution DDDEFs if you SMP/E ACCEPT the USERMOD. However, the Distribution Library DDDEF names fields on the panel must be filled in when building the USERMOD to make the MCS statements in the USERMOD complete.
2. You might need an SMPTLOAD DDDEF in your target and distribution zone. The temporary data set for the ISPCFIGU and ISPCFIGV load modules is created with DSORG(PO) UNIT(SYSCALLDA) and will be either a PDS or a PDSE depending on the setup of your system. The temporary load data set is IEBCOPY unloaded to produce the ++PROGRAM elements in the USERMOD. See the *SMP/E for z/OS Reference* for more information about the requirement for SMPTLOAD.

Convert Configuration Table LoadMod to Keyword File

If you choose Option 7, **Convert Configuration Table LoadMod to Keyword File** on the ISPF Configuration utility main menu panel, ISPF converts a configuration table load module to a keyword file that can be used as input to Options 1 and 2. The active configuration or a module from a data set can be chosen.

This can be used to reconstruct source that may have been lost.

| All keywords are produced.

| This feature was added to ISPF via APAR OA42680.

Chapter 3. Customizing ISPF

Here are the ways in which you can customize ISPF.

Allocating optional image ISPF library

The data set described in Table 1 is not a required ISPF library. You must allocate it only if an application in GUI mode uses images.

Table 1. Image data set

DDNAME	Description	RECFM	LRECL	BLKSIZE
ISPILIB	Image Input Library	FB	80	(See note)

Note: The block size can be established by the application. It must be a multiple of 80.

If you plan to use ISPF's image support, you must allocate the image input data set to ddname ISPILIB before using the images. You can accomplish this by allocating the image input data set before you invoke ISPF. Image files in the Graphics Interchange Format (GIF) should reside in this input data set. This data set must be a partitioned data set. It can be allocated with DISP=SHR.

Note: The LIBDEF service does *not* result in the allocation of ISPILIB.

ISPF ships sample image files in the sample library SISPSAMP. The ISPF panel ISR@PRIM uses three of the sample image files: ISPFGIFL, ISPFGIFS, and ISPEXIT. You can copy the sample image files to your own image input data set allocated to ddname ISPILIB.

Customizing action bars

Many ISPF action bar items are common to multiple panels. These action bar definitions are coded in separate files that are embedded into the various panels. The embedded DTL source fields are written in Generalized Markup Language (GML), as part of the DTL panel source.

To customize one or more action bar items:

1. Update the appropriate embed file from Table 2. These embed files are distributed in the ISP.SISPGENU library.

Table 2. Embedded DTL source files

File name	DTL File for...
ISPDFIL1	File action bar choice
ISPFMENU	SCLM menu action bar choice
ISPDFUNC	Functions action bar choice
ISPDHUCM	Action bar choice
ISPDHYXM	Action bar choice
ISPFJOB	Jobcard action bar choice
ISPDLANG	Compilers action bar choice
ISPFMENU	Menu action bar choice
ISPDREFE	Reflist action bar choice

Table 2. Embedded DTL source files (continued)

File name	DTL File for...
ISPDREFL	Reflist action bar choice
ISPDREFM	Refmode action bar choice
ISPDSAVE	Save action bar choice
ISPFSCLM	SCLM action bar choice
ISPDTEST	Test action bar choice
ISPDUTIL	Utilities action bar choice

2. Reconvert the affected panels by specifying the appropriate list of members (Table 3) and running the ISPDTLC conversion utility.

Table 3. DTL list of panels

File name	DTL List for...
ISPFAB	All action bar GMLs
ISPFALL	All product GMLs
ISPFIL1	File action bar choice
ISPMENU1	SCLM menu action bar choice
ISPFUNC	Functions action bar choice
ISPHUCM	Action bar choice
ISPHYXM	Action bar choice
ISPJOB	Jobcard action bar choice
ISPLANG	Compilers action bar choice
ISPMENU	Menu action bar choice
ISPREFE	Reflist action bar choice
ISPREFL	Reflist action bar choice
ISPREFM	Refmode action bar choice
ISPSAVEB	Save action bar choice
ISPSCLM	SCLM action bar choice
ISPTEST	Test action bar choice
ISPUTIL	Utilities action bar choice

The lists of panels for different types of modifications are contained in ISP.SISPSAMP. ISPDTLC will convert all of the members in a list that are used as input member names.

Invoking the ISPDTLC conversion utility

ISPDTLC can be run either interactively or in a batch job. Because of the number of panels to be converted, a batch job might be the best choice. The information that follows describes both interactive and batch conversions.

Note: After conversion, you might want to preprocess the panels to improve performance. For more information about preprocessing panels, see “Preprocess all ISPF panels” on page 77.

For more information about ISPDTLC invocation, refer to *z/OS ISPF Dialog Tag Language Guide and Reference*.

Running interactively

To run interactively, invoke the conversion utility from any command line by entering:

```
ISPDTLC
```

Figure 42 shows the first screen of the ISPDTLC invocation panel with the default data set names and with the required options selected.

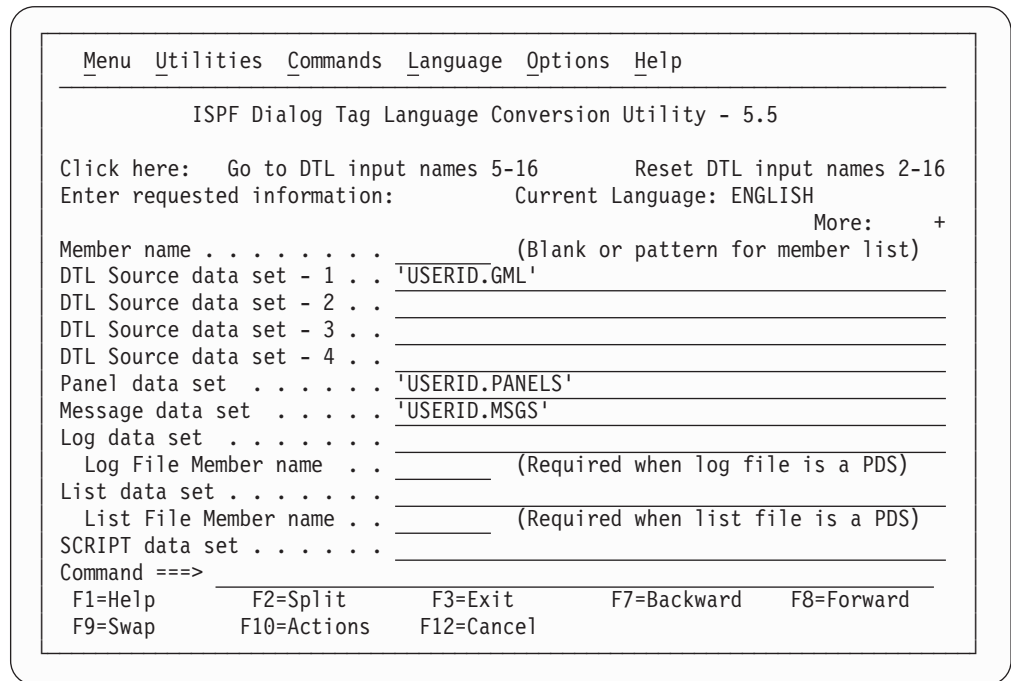

Figure 42. First ISPDTLC screen

The member name ISPMENU will cause all of the panels with the Menu action bar item to be converted.

When the interactive panel is displayed, change the data set names shown as required for your installation. Fill in the name of your input and output files where indicated. The first DTL source file should contain any local panel modifications. The second DTL source file contains the product panel source. The third DTL source file contains the conversion list member ISPMENU.

Note: The current language selection appears on all screens. A different language can be selected from the action bar.

After typing in your file names, scroll to the next screen (Figure 43 on page 46).

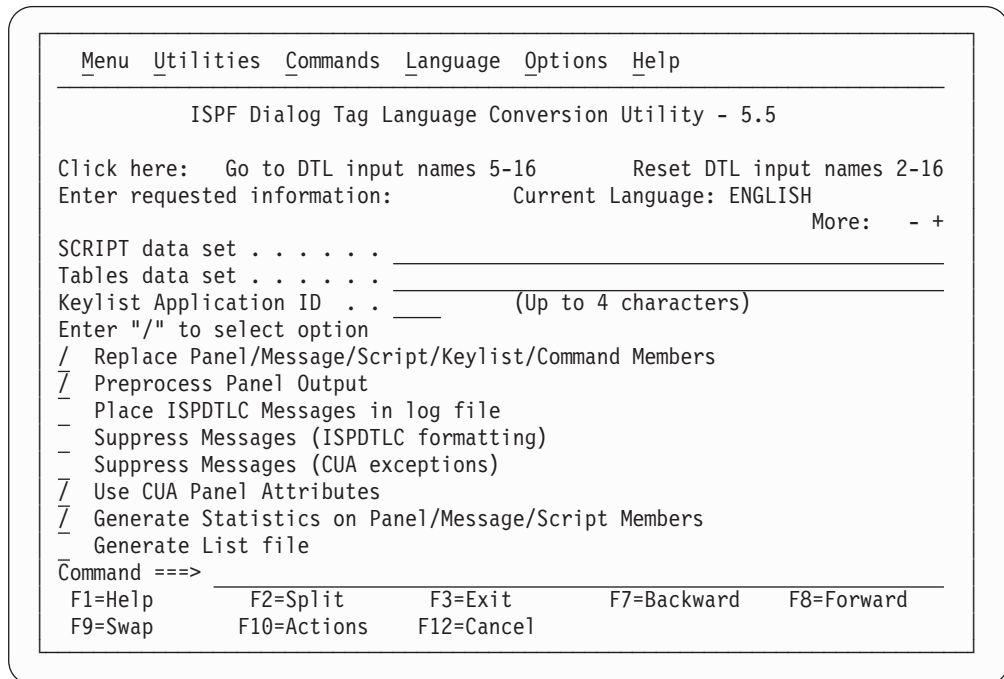

Figure 43. Second ISPD TLC screen

Note: To reduce the amount of screen output you can select options Suppress Messages (ISPD TLC formatting) and Suppress Messages (CUA exceptions).

Enter ISR as the Keylist Application ID and select the options as shown. Scroll to the next screen (Figure 44).

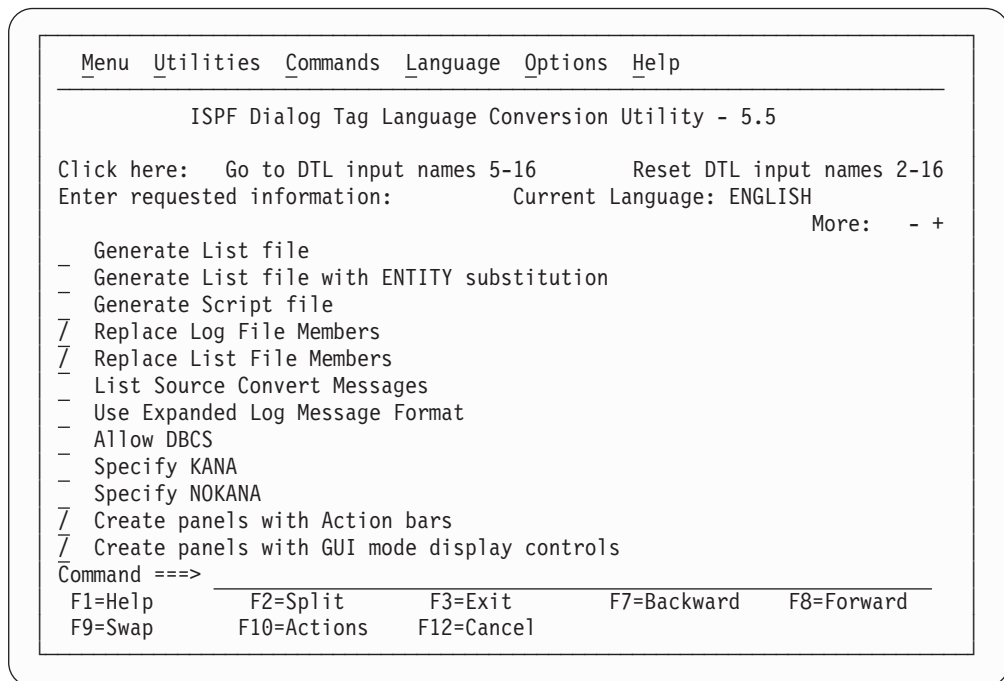

Figure 44. Third ISPD TLC screen

Scroll to the next screen (Figure 45 on page 47).

F9=Swap      F10=Actions   F12=Cancel

```

Figure 46. Fifth ISPDTLC screen

Note: ISPF product panels require that the options “Preserve leading ENTITY blanks when "space" is not specified” and “Process multiple line comment blocks” be selected as shown in the figures here.

If a double byte language conversion is in process, the DBCS and KANA options might be required.

your.gml.dataset(profile) should include:

```
DTLGML
    your.appl.gml.dataset
DTLGML
    ISP.SISPGENU
DTLGML
    ISP.SISPGMLI
DTLGML
    ISP.SISPSAMP
DTLPAN
    your.output.panel.dataset
DTLMSG
    your.output.message.dataset
DTLLOG
    your.log.dataset
```

your.gml.dataset(profileu) for creating uppercased English panels should include:

```
DTLGML
    your.appl.gml.dataset
DTLGML
    ISP.SISPGENU
DTLGML
    ISP.SISPGMLI
DTLGML
    ISP.SISPSAMP
DTLPAN
    your.output.uppercase.panel.dataset
DTLMSG
    your.output.message.dataset
DTLLOG
    your.log.dataset
```

Your updated GML files should be stored in *your.appl.gml.dataset*. The converted files will be in *your.output.panel.dataset* or *your.output.uppercase.panel.dataset*, and the messages generated will be in *your.log.dataset*.

The log file will contain the results of the conversion processing. Most of the messages generated by ISPD TLC are related to ISPF extensions to the Dialog Tag Language and have been suppressed. The expected message number from compiling the panel source will appear in a comment near the top of the DTL source file for that panel source.

Customizing for profile sharing

Customizing for profile sharing shows how you can customize shared profiles within ISPF.

Note: Profile sharing is intended to be used by the same user logging concurrently onto multiple systems. The contents of the ISPF profile are often user-specific.

Customizing the ISPF Configuration utility

You can customize the ISPF Configuration utility with these configuration options:

- PROFILE_SHARING
- PROFILE_ENQLOCK_WAIT
- PROFILE_ENQLOCK_RETRY_COUNT

- PROFILE_ENQLOCK_PROMPT
- PROFILE_SYSPROF_CONFLICT
- PROFILE_ISPPROF_CONFLICT
- PROFILE_APPPROF_CONFLICT
- PROFILE_REFLIST_CONFLICT
- PROFILE_EDIT_CONFLICT
- PROFILE_BATCH_CONFLICT
- PROFILE_OTHER_CONFLICT
- RESET_PROFILE_SHARING_SETTINGS

For further details about configuration options, see “ISPF site-wide profile customizations” on page 231.

Temporary data set names

The ISPF Configuration utility provides an option to specify an additional qualifier for ISPF temporary data sets, including Log, List and temporary control and work data sets. The use of this qualifier also includes trace data sets from ISPVCALL, ISPDPTRC and ISPFTTRC. When Profile Sharing has been enabled and no value has been specified for the additional qualifier, a value of "ISP&SEQ" is used, where &SEQ is a system symbolic variable that has the same value as defined by the ISPF dialog variable ZSEQ.

SYSIKJUA enqueue

To enable the ISPF multi-logon support in a sysplex, you must comment out or remove the RNLDEF statement specifying SYSIKJUA in the GRSNLxx member of the system parmlib concatenation:

```
/* RNLDEF RNL(INCL) TYPE(GENERIC)          */
/* QNAME(SYSIKJUA)                        */
```

Limitation of other products

These limitations apply with shared profiles:

TSO/E Reconnect

TSO/E users can only reconnect to their sessions from the same system where they were already logged on, not from a remote z/OS system.

SDSF ULOG Console

In a sysplex, the responses for MVS and JES2 commands are only seen on the first system that activates an EMCS console. By default, SDSF creates an EMCS console name that is the same as your userid. You can change the console name used by SDSF using the SET CONSOLE (*console-name*) command.

Note: Other ISPF applications may experience unexpected results when they attempt to use the ISPF profile data set to store application specific information.

TSO/ISPF client gateway

ISPF provides an interface or gateway for client applications to connect to the z/OS host and run TSO and ISPF commands. This section describes how the gateway works, how to install and customize the interface, and how client applications can use the interface.

Gateway description

The gateway runs within z/OS UNIX and is invoked upon a request for a TSO or ISPF command from the client application. To run a requested command, the gateway establishes a TSO address space and, if the request is for an ISPF command, data sets are allocated and an ISPF session is also initialized. After completion of the command, the results are returned to the client.

If requested by the client, the gateway maintains the state of the TSO/ISPF session for any subsequent client function requests for the user. Otherwise, the interface terminates the TSO/ISPF session. The advantages of maintaining a user's TSO/ISPF session on z/OS are in bypassing the overhead of having to establish a new session for every TSO or ISPF command request and in adding an inherent ability to maintain state data between calls from the client.

The gateway does not provide the data transport between the client and z/OS host. The gateway is designed to interface with an authenticated connection between the client and z/OS host such as the HTTP protocol (web-based services), direct TCP/IP socket connections, or any other means through which data and commands can be exchanged between the client and z/OS host.

Note: ISPF commands invoked by means of the gateway run in an ISPF batch environment.

Installing and customizing the gateway

This section describes installing and customizing the gateway.

Installation considerations

Consider these points before you configure your system:

- A RACF OMVS segment (or equivalent) that specifies a valid non-zero uid, home directory, and shell command must be defined for each user of the interface.
- Set MAXPROCUSER in BPXPRMxx parmlib member to a minimum of 50. This can be checked and set dynamically (until the next IPL) with the following commands (as described in *z/OS MVS System Commands*, SA22-7627):

```
DISPLAY OMVS,0  
SETOMVS MAXPROCUSER=50.
```

Setting a value that is too low can cause the interface to fail.

- Table 4 describes the load modules that comprise the gateway:

Table 4. Load modules comprising the gateway

Name	Library	Description
ISPZINT	ISP.SISPLPA	Gateway initialization - routes processing to ISPZINO or ISPZINL.
ISPZINO	ISP.SISPLPA	Gateway initialization - manages spawned TSO sessions, routes command requests to these sessions.
ISPZINL	SYS1.SIEALNKE	Gateway and TSO initialization - uses CEA TSO/E address spaces services to start and stop TSO sessions.
ISPZTSO	SYS1.LINKLIB	TSO initialization - attaches a TSO session to run a command. ISPZTSO must run APF-authorized.

Table 4. Load modules comprising the gateway (continued)

Name	Library	Description
ISPZCNT	ISP.SISPLOAD	ISPF initialization - allocates data sets and starts an ISPF session.
ISPZCMD	ISP.SISPLOAD	ISPF command interface - invokes an ISPF command and, if required, keeps the ISPF session active.
ISPZTMO	ISP.SISPLOAD	Reusable session time-out processor.

These load modules must be available to run under the server used to communicate between the client and z/OS host.

A PROGRAM class profile that identifies ISPZINT as being a controlled program should be defined using the command:

```

RDEFINE PROGRAM ISPZINT ADDMEM('ISP.SISPLPA'//NOPADCHK) UACC(READ)

```

(Refer to your security server's documentation for details.) Failure to define ISPZINT as being controlled might result in messages, such as CSV042I or ICH422I, being issued.

- Table 5 describes the gateway files installed into the z/OS UNIX file system:

Table 5. Gateway files installed into the z/OS UNIX file system

Name	Description
/usr/lpp/ispf/bin/ISPZINL	A stub file with the sticky bit set on to enable invocation of the gateway and TSO initialization load module ISPZINL.
/usr/lpp/ispf/bin/ISPZINO	A stub file with the sticky bit set on to enable invocation of the gateway initialization load module ISPZINO.
/usr/lpp/ispf/bin/ISPZINT	A stub file with the sticky bit set on to enable invocation of the gateway initialization load module ISPZINT.
/usr/lpp/ispf/bin/ISPZTSO	A stub file with the sticky bit set on to enable invocation of the TSO initialization load module ISPZTSO.
/usr/lpp/ispf/bin/ISPZXENV	A REXX routine called by the gateway XML API routine, ISPZXML, to set up environment variables.
/usr/lpp/ispf/bin/ISPZXML	A REXX routine that is the XML API for the gateway.

Installing the gateway

To install the gateway, customize and run the JCL in the member ISPZINS1 in the ISPF samples data set ISP.SISPSAMP. Customize the JCL according to the instructions in the member.

This job performs these tasks:

- Creates CONFIG and WORKAREA directories in the z/OS UNIX file system at the directory you specify.
- Copies the sample ISPF configuration table from member ISPZISPC in the samples data set ISP.SISPSAMP to file ISPF.conf in the CONFIG directory. This file requires customization.

The recommended base directory for the configuration files is /etc/ispf. The part of the directory up to ISPF must exist before running this job.

You must have read and write access to the WORKAREA directory /var/ispf/WORKAREA. The WORKAREA is used for the transfer of files. Temporary directories of the format /var/ispf/WORKAREA/userid/* are created during use of the interface.

Note: Some temporary session files might be created in the /tmp directory. Ensure all users have write access to the /tmp directory.

The interface removes any temporary files it creates in the WORKAREA directory. However, temporary output is sometimes left over, for example, if there is a communication error while processing. For this reason, it is recommended that you clear out the WORKAREA directory from time to time. To do this, use these commands in OMVS:

```
cd /var/ispf/WORKAREA
rm -r *
```

Where /var/ispf/WORKAREA depends on where you create the WORKAREA directory.

Customizing the gateway

You must customize the ISPF configuration file ISPF.conf to host site requirements for ISPF data set allocation. This file is stored, by default, in directory /etc/ispf. The provided sample ISPF.conf has instructions to complete customization so your user site can:

- Include the minimum ISPF data set allocations for the gateway to operate. This means allocating the minimum ISPF data sets required to initialize an ISPF session. In the sample provided, these are specified as the isp.sisp* data sets. You might need to change these for your site-specified data set names.
- Add additional DDNAME file allocations or concatenate additional ISPF data sets.
- Launch a customer-defined allocation executable (exec) to provide further data set allocation by user ID. A sample exec is provided in member ISPZISP2 in the ISPF samples data set ISPSISPSAMP.

The allocations for each of the ISPF DDs must be specified on a single line with each data set separated by a comma. The maximum length of the string defining the data sets for a DD is 255 characters. If the data sets you want to define for a DD exceed this length, use the customer defined allocation exec to allocate the DD. Comment lines can be added by beginning the line with an asterisk (*). Here is a sample ISPF.conf:

```
* REQUIRED:
* Below is the minimum requirements for ISPF allocation.
* Change the default ISPF data set names below to match your
* host site.
* Add additional dsn concatenations on same line and separate
* by comma.
* Order of data sets listed is search order in concatenation.
*
sysproc=ISP.SISPLIB
sysexec=SYS1.LOCAL.EXEC,ISP.SISPEXEC
ispmlib=ISP.SISPMENU
```

```
isptlib=ISP.SISPTENU
isplib=ISP.SISPPENU
ispslib=ISP.SISPSLIB
ispllib=ISP.SISPLOAD,SYS1.LOCAL.LOAD
```

The ISPF_timeout option in the ISPF configuration file can be used to specify a time out value for reusable ("stateful") ISPF sessions. The time out value specifies the number of seconds a user's ISPF session can remain idle between service call requests. If the idle time exceeds the time out value, the session is terminated and the next service request for the user results in a new ISPF session being established. The default reusable ISPF session time out value is 900 seconds (15 minutes).

Here is an example of setting a time out value of 300 seconds (5 minutes):

```
ISPF_timeout = 300
```

Note: If you have the PDSMAN product installed, it must be disabled for use with the gateway by including the record in the ISPF.conf file:

```
ezyoff=nullfile
```

Customizing the HTTP server

If you plan to use the HTTP server to invoke the gateway, these changes must be made to the HTTP environment and configuration files:

- The HTTP environment file, httpd.env, must be updated to include directives that identify the workarea and configuration directories for the gateway. The CGI_ISPWORK directive is used to define the path for the WORKAREA directory used by the gateway. The CGI_ISPCONF directive is used to define the path for the CONFIG directory where the ISPF configuration file ISPF.conf is stored. Shown here are examples of the CGI_ISPWORK and CGI_ISPCONF directives specifying the default paths for the WORKAREA and CONFIG directories:

```
CGI_ISPWORK=/var/ispf
CGI_ISPCONF=/etc/ispf
```

- Update the path statement in httpd.env to include /usr/lpp/ispf/bin. If dot(.), the current directory, is already specified then no update is required.
- These pass and exec directives must be added into the HTTP configuration file httpd.conf:

```
Pass          /ISPZIVP.html /usr/lpp/ispf/bin/ISPZIVP.html
Exec          /ISPZINT      /usr/lpp/ispf/bin/ISPZINT
Exec          /ISPZXML     /usr/lpp/ispf/bin/ISPZXML
Exec          /ISPZIVP.cgi /usr/lpp/ispf/bin/ISPZIVP.cgi
```

Note: The path specified for these directives must be the path of the directory where the gateway was installed.

If the gateway modules (see Table 4 on page 51) are not in the LINKLIST, then update the HTTP server STEPLIB DD to include the load library data sets containing these modules.

Note: To use the gateway, the client is required to supply a valid z/OS user ID and password.

For additional information about configuring IBM HTTP Web servers, review these IBM manuals:

- *HTTP Server Planning, Installing and Using*, (SC31-8690)
- *OS/390 e-business Infrastructure: IBM HTTP Server V5.1 for OS/390*, (SG24-5603-00)

Verifying the HTTP server customization

This Installation Verification Process (IVP) applies if you have configured the HTTP server to invoke the gateway. The HTTP server must be running and the IVP pass/exec directives configured in the httpd.conf file for successful verification processing.

From a browser, type the location URL address:

`http://hostname:portnumber/ISPZIVP.html`

where:

hostname

Is the TCP/IP host name the HTTP server is running on.

port number

Is the port used in the job and the httpd.conf file (default port 80).

If the HTTP server is running, you are prompted for a valid TSO user ID and password for the system the Web server is started on:

Connect to pthisd1.au.ibm.com

System_Logon

User name:

Password:

Remember my password

OK Cancel

After you have entered your TSO user ID and password, the browser initially displays the HTTP welcome screen:

Figure 48. HTTP welcome screen

If you fail to connect, then check that:

- The HTTP server has successfully initialized.
- The z/OS UNIX System Services file system mount point containing the TSO/ISPF Client Gateway installation is mounted.
- The hostname:port are correct (try pinging the Hostname).
- There are no firewall restrictions.
- The PASS directive in the httpd.conf file is set correctly:

```
Pass          /ISPZIVP.html /usr/lpp/ispf/bin/ISPZIVP.html
```

After you receive the welcome screen, continue with the IVP, which checks and validates your installation and customization process, by taking these steps:

1. Enter the command `tso lista` in the ISPF command field.
2. Select the **Run installation verification** checkbox.
3. Click on the **Submit** push-button.

The sample screen shown in Figure 49 on page 57 and Figure 50 on page 58 give an example of the expected validation responses:

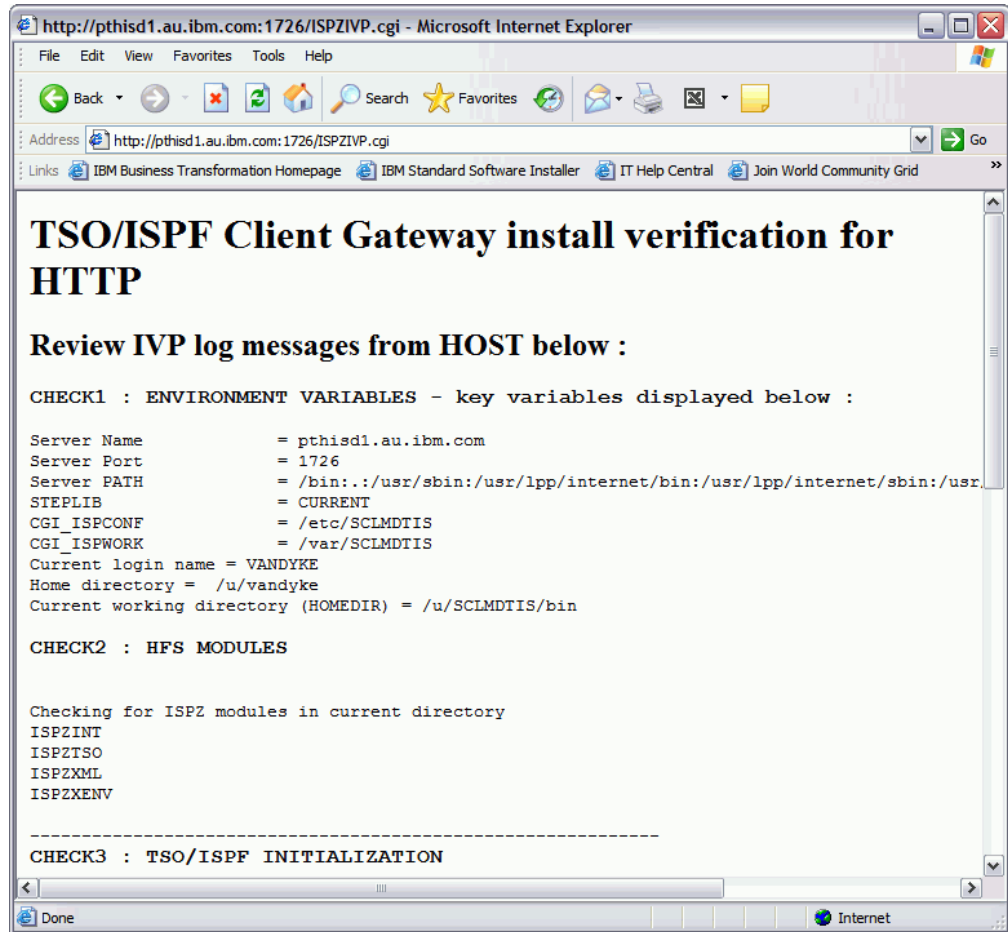

Figure 49. Example of expected validation response

Figure 50. Example of expected validation response (contd.)

Customizing Remote Systems Explorer

If you plan to use IBM Rational® Developer for System z's Remote Systems Explorer (RSE) to invoke the gateway, the RSE environment file must be customized. The environment file for your RSE connection is `rсед.envvars` which, by default, is in `/etc/rdz`.

These environment variables used by the gateway should already have been defined in `rсед.envvars` during base RSE customization:

```

_CMDSERV_BASE_HOME
_CMDSERV_CONF_HOME
_CMDSERV_WORK_HOME
  
```

These following changes are required to the `rсед.envvars` file:

- If the gateway modules (see Table 4 on page 51) are not in the LINKLIST, then update the STEPLIB environment variable value to include the load library data sets containing these modules.

For additional information about installing and configuring RSE, review these IBM documents:

- *Program Directory for IBM Rational Developer for System z*[®] (GI11-8298-00)
- *IBM Rational Developer for System z Host Configuration Guide* (SC31-6930-02)

Configuration for other environments

If you plan to invoke the gateway by means other than through the HTTP server of RSE (for example, from the OMVS shell), configuration is required to ensure values are set for environment variables used by the gateway. This requires the environment set-up routine, `ISPZXENV`, to be modified to set values for the environment variables shown in Table 6.

Table 6. Environment variables to be set by the environment set-up routine, `ISPZXENV`

Environment variable	Description
STEPLIB	Specifies the STEPLIB data sets from where MVS load modules are run. This environment variable must be set to the names of the load library data sets containing the gateway modules (see Table 4 on page 51) if these modules are not in the LINKLIST.
CGI_ISPCONF	Specifies the CONFIG directory path where the configuration files are stored.
CGI_ISPWORK	Specifies the WORKAREA directory path that is used for temporary files.
CGI_ISPPREF	Specifies the temporary data set prefix.

A sample of this REXX routine is provided in member `ISPZXENV` in the ISPF installation directory (`/usr/lpp/ispf/bin`). These lines in `ISPZXENV` may require modification:

STEPLIB = 'ISP.SISPLPA:ISP.SISLOAD'

The `STEPLIB` variable should specify the data sets containing the load modules for the TSO/ISPF client gateway (see Table 4 on page 51). If these load modules reside in the LINKLIST, then the `STEPLIB` variable should be set to a null value (that is, "").

CGI_ISPCONF = '/etc/ispf'

The `CGI_ISPCONF` variable specifies the HOME directory path where the configuration files reside for the gateway. For more information on the CONFIG directory, see “Installing the gateway” on page 52.

CGI_ISPWORK = '/var/ispf'

The `CGI_ISPWORK` variable specifies the pathname of the directory where work files for the gateway are stored. For more information on the work directory, see “Installing the gateway” on page 52.

CGI_ISPPREF

The `CGI_ISPPREF` variable specifies the prefix to be used to allocate cataloged z/OS work files. It supports the use of system variables `&SYSUID`, `&SYSPREF` and `&SYSNAME`. These system variables are described in “Using the native API” on page 68. If not specified, `&SYSPREF.ISPF.VCMTEMP` is used. The prefix must resolve to a value of 35 characters or less.

Place the amended version of `ISPZXENV` in a directory referenced before `/usr/lpp/ispf/bin` in your `PATH` variable, otherwise you may lose your changes when system maintenance is applied.

Using the gateway

This section describes how to provide TSO/ISPF service and command requests to the gateway and the format of the output returned by the gateway.

Passing requests to the gateway

TSO/ISPF service and command requests are passed to the gateway in XML format. The XML schema shown here, which is supplied in member ISPZXSDI in the ISPF samples data set ISP.SISPSAMP, describes the format and can be used to validate the XML for a service request:

```
<?xml version="1.0" encoding="ISO-8859-1" ?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">

  <xs:element name="ISPF-INPUT">
    <xs:complexType>
      <xs:all>

        <xs:element name="SERVICE-REQUEST">
          <xs:complexType>
            <xs:all>

              <xs:element name="service">
                <xs:simpleType>
                  <xs:restriction base="xs:string">
                    <!-- Specifies native TSO or ISPF service call -->
                    <xs:enumeration value="ISPF"/>
                    <xs:enumeration value="TSO"/>
                  </xs:restriction>
                </xs:simpleType>
              </xs:element>

              <xs:element name="session" minOccurs="0">
                <xs:simpleType>
                  <xs:restriction base="xs:string">
                    <!-- Default NONE : Session terminates after service call -->
                    <xs:enumeration value="NONE"/>
                    <!-- Reusable ISPF session stays active between calls -->
                    <xs:enumeration value="REUSE"/>
                  </xs:restriction>
                </xs:simpleType>
              </xs:element>

              <!-- Use existing ISPF profile in call -->
              <xs:element name="ispprof" type="xs:string" minOccurs="0"/>

              <!-- Free form TSO/ISPF command -->
              <xs:element name="command" type="xs:string"/>

            </xs:all>
          </xs:complexType>
        </xs:element>

      </xs:all>
    </xs:complexType>
  </xs:element>

</xs:schema>
```

This is an example of the XML to request a TSO LISTCAT command:

```
<?xml version="1.0"?>
<ISPF-INPUT>
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="ispf.xsd">
  <SERVICE-REQUEST>
  <service>TSO</service>
```

```

<session>NONE</session>
<command>LISTC ENT('SYS1.LINKLIB')</command>
</SERVICE-REQUEST>
</ISPF-INPUT>

```

This is an example of the XML to request to run REXX program DINFO in a "reusable" ISPF session which remains active to run subsequent commands for this user:

```

<?xml version="1.0"?>
<ISPF-INPUT>
xml:ns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="ispf.xsd">
<SERVICE-REQUEST>
<service>ISPF/service>
<session>REUSE</session>
<command>TSO DINFO sys1.linklib</command>
<ispprof>USER.ISPPROF</ispprof>
</SERVICE-REQUEST>
</ISPF-INPUT>

```

This shows the REXX program DINFO:

```

/* REXX */
parse upper arg dsn .
address "ISPEXEC" "dsinfo dataset('dsn')"
if rc = 0 then do
    say 'Volume           = ' zdsvol
    say 'Primary allocation = ' strip(zds1ex) zdsspc
    say 'Secondary allocation = ' strip(zds2ex) zds2spc
end
else do
    say 'DSINFO rc = ' rc
    say 'ZERRMSG   = ' zerrmsg
end
exit rc

```

The Java™ program shown here, which is supplied in member ISPZXJAV in the ISPF samples data set ISP.SISPSAMP, shows an example of invoking the interface through a HTTP server and passing XML to request running the TSO PROFILE command:

```

package com.ibm.ispfcall;

import java.io.*;
import java.net.*;
import java.util.*;

public class XmlIspf {

    public static void main(String[] args) {

        try {

            BufferedReader in = new BufferedReader(new FileReader("C:\\logon.txt"));
            String logon = in.readLine();
            in.close();

            Date d = new Date() ;
            System.out.println("START Transfer DATE/TIME is : " + d.toString() );

            // URL details for CGI POST
            URL url = new URL("http", "SITE.COM", 1234, "/ISPZXML");
            HttpURLConnection con = (HttpURLConnection) url.openConnection();

            con.setUseCaches(false);
            con.setDoInput(true);

```

```

con.setDoOutput(true);
con.setRequestMethod("POST");
con.setRequestProperty( "Authorization", "Basic "
                        + Base64Encoder.encode( logon ));

System.out.println("At url.openConnection.. ");

// POST CGI routines
doPut(url, con, "POST", "");
doGet(url, con);

Date c = new Date() ;
System.out.println("TOTAL Completion DATE/TIME is :" + c.toString() );

}
catch (IOException exception)
{
System.out.println("Error: " + exception);
}
}

public static void doPut(URL url, HttpURLConnection con, String ISPFFUNC,
                        String fileIn) throws IOException
{
if (ISPFFUNC.equals("POST"))
{
PrintWriter out = new PrintWriter(con.getOutputStream());
// Below is a sample inline XML input for an ISPF service request
// This could alternatively be read from an external file
out.println( "<?xml version=\"1.0\"?>" );
out.println( "<ISPF-INPUT>" );
out.println( "xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" );
out.println( "xsi:noNamespaceSchemaLocation=\"ispf.xsd\">" );
out.println( "<SERVICE-REQUEST>" );
out.println( "<service>ISPF</service>" );
out.println( "<session>NONE</session>" );
out.println( "<command>TSO PROFILE</command>" );
out.println( "<ispprof>USERID.ISPPROF</ispprof>" );
out.println( "</SERVICE-REQUEST>" );
out.println( "</ISPF-INPUT>" );
out.flush();
out.close();
}
}

public static void doGet(URL url, HttpURLConnection con) throws IOException
{
BufferedReader in;
try
{
System.out.println("About to accept response from Server");
in = new BufferedReader(new InputStreamReader(con.getInputStream()));
System.out.println("Response from Server received");
}
catch (FileNotFoundException exception)
{
InputStream err = ((HttpURLConnection)con).getErrorStream();
if (err == null) throw exception ;
in = new BufferedReader(new InputStreamReader(err));
}

String line;
while ((line = in.readLine()) != null)
System.out.println(line);
}

```

```

    in.close();
  }
}

```

Note: System symbols &SYSUID and &SYSPREF can be used as the high-level qualifier for the ISPF profile data set name specified with the <ispprof> tag.

Receiving output from the gateway

The output from a service request is returned by the gateway to the client in XML format. The XML schema shown here, which is supplied in member ISPZXSDO in the ISPF samples data set ISP.SISPSAMP, describes the format and can be used to process the XML returned for a service request:

```

<?xml version="1.0" encoding="ISO-8859-1" ?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">

  <xs:element name="ISPF-OUTPUT">
    <xs:complexType>
      <xs:all>

        <xs:element name="SERVICE-REQUEST"/>

        <xs:element name="SERVICE-RESPONSE">
          <xs:complexType>
            <xs:all>
              <xs:element name="ISPF-COMMAND"/>
              <xs:element name="RETURN-CODE"/>
              <xs:element name="ISPF"/>
            </xs:all>
          </xs:complexType>
        </xs:element>

        <xs:element name="OPERATIONS-LOG"/>

      </xs:all>
    </xs:complexType>
  </xs:element>

</xs:schema>

```

Here is the XML returned for the TSO LISTCAT command above:

```

<?xml version="1.0"?>
<ISPF-OUTPUT>
  <SERVICE-REQUEST>
    <service>TSO</service>
    <session>NONE</session>
    <command>LISTC ENT('SYS1.LINKLIB')</command>
  </SERVICE-REQUEST>
  <SERVICE-RESPONSE>
    <ISPF-COMMAND>

    </ISPF-COMMAND>

Return and reason codes from the gateway

The RETURN-CODE tag provides the value of the return code from the TSO or ISPF service. If there is an error in the gateway, a value of 8 or 12 is returned with the RETURN-CODE tag and REASON-CODE tags of this format are also provided to describe the error:

```

<REASON-CODE id="isppcISPZ0007">ISPF OR SCLM SERVICE HAS ENDED
ABNORMALLY</REASON-CODE>

```

Table 7 lists the possible reason codes when there is a return code of 8 from the gateway:

Table 7. Possible reason codes for a return code of 8 from the gateway

Reason Code	Description
ISPZ0001	Error in ALLOCATION/WRITE to <i>dsname</i> .
ISPZ0002	Processing terminates.
ISPZ0003	Following function has failed: MSG: <i>function</i>
ISPZ0009	Error reading the ISPF.conf configuration file.
ISPZ0010	Ensure file exists in directory specified by the environment variable CGI_ISPCONF in the server configuration.
ISPZ0012	Error in ISPF data set allocation: See error message below
ISPZ0013	Error in allocating the following DD and data set names: MSG: DD= <i>ddname</i> MSG: <i>dsname1 dsname2... dsnamen</i>
ISPZ0014	Verify that the ISPF configuration file ISPF.conf on the host is correct.
ISPZ0224	*** Operation Cancelled ***
ISPZ0225	Possible previous request still active. Either cancel host session or retry once processing terminates.

Table 8 lists the possible reason codes when there is a return code of 12 from the gateway:

Table 8. Possible reason codes for a return code of 12 from the gateway

Reason Code	Description
ISPZ0007	ISPF or SCLM service has ended abnormally.
ISPZ0008	Review log for error details.

Using the native API

This section documents the native API used by some IBM products to invoke the gateway. It is recommended, however, that applications use the XML structured API to invoke the gateway.

Service request format: Service call requests consist of a parameter string passed by means of STDIN to the interface module ISPZINT. The first word of the service request string identifies if the request is for a TSO or ISPF service:

```
TSO service-request
```

or
ISPF service-request

A TSO service request results in the TSO service running in a TSO address space without the overhead of establishing an ISPF environment. Shown here are some examples of TSO service requests:

```
TSO time  
TSO alloc fi(temp1) da('hlq.filetemp') shr
```

An ISPF service request can be for a TSO or ISPF service. The service runs in an ISPF environment established in a TSO address space. The caller can request the ISPF environment be "reusable" (that is, remain active for running subsequent service requests) by including &SESSION=SPAWN in the parameter string. Also the caller can request an existing ISPF profile be dynamically allocated by including &ISPPROF= my.profile.dataset in the parameter string. Shown here are some examples of ISPF service requests:

```
ISPF tso profile  
ISPF select cmd(%myexec)  
ISPF tso listalc&SESSION=SPAWN&ISPPROF=HLQ.ISPPROF  
ISPF tso ex 'my.dataset(exec1)'\&SESSION=SPAWN
```

ISPPROF may contain the strings &SYSUID., &SYSPREF. and &SYSNAME. in any order. These strings can also be used in the CGI_ISPWORK environment variable. Note that the trailing dot (.) must exist for the variable to be recognised correctly. **&SYSUID.**

Replaced by the userid of the active session.

&SYSPREF.

Replaced by the TSO PREFIX, if that can be determined; otherwise, it has the same value as &SYSUID..

&SYSNAME.

Replaced by the SYSNAME IPL parameter.

For example, for this command (where PREFIX is mypref and SYSUID is myuser):

```
ISPF tso mycmd&SESSION=SPAWN&ISPPROF=HLQ.&SYSPREF..&SYSUID..LLQ
```

where &SYSPREF is "mypref" and &SYSUID is "myuse" the string becomes:

```
ISPF tso mycmd&SESSION=SPAWN&ISPPROF=HLQ.mypref.myuser.LLQ
```

To terminate a "reusable" ISPF session, pass the parameter string shown here to ISPZINT:

```
ISPPFUNC=SHUTDOWN
```

or
ISPPFUNC=CANCEL

Service response format: Service response data is returned in a tagged format as shown in this section. However this is not valid XML format. Tagged data may be incorporated within system log messages and be stripped out at the client end by means of the encapsulating tags <ISPINFO> </ISPINFO>.

```
System logging data  
:  
:  
<ISPINFO>  
ISPF COMMAND : ISPF command issued  
RC=X  
MSG: xxxxxx  
<Specific function request tags>
```

```

xxxxxx
xxxxxx
</End of specific function request tags>
</ISPINFO>
System logging data
:
:

```

Service request and response examples: Shown here is the request parameter string and response data returned for an ISPF service request:

Request

```
ISPF TSO PROFILE&SESSION=SPAWN&ISPPROF=&SYSUID..TEST.ISPPROF
```

Response

Chapter 4. Improving ISPF performance

To improve ISPF performance consider using these methods, which are described in detail here:

- Use virtual I/O (VIO) (see “Use virtual I/O”).
- Remove or tailor edit functions (see “Remove or tailor Edit functions”).
- Remove action bars from ISPF panels (see “Remove action bars from ISPF panels” on page 76).
- Remove scrollable areas from ISPF panels (see “Remove scrollable areas from ISPF panels” on page 77).
- Preprocess ISPF panels (see “Preprocess all ISPF panels” on page 77).
- Add load modules to LPALST (see “Add load modules to the pageable link-pack area (LPA)” on page 79).
- Allocate execution data sets (see “Allocate execution data sets” on page 81).
- Disable generic searches (see “Disable generic high-level qualifiers” on page 82).
- Preallocate ISPF temporary data sets to VIO (see “Preallocate ISPF temporary data sets to VIO” on page 84).

Here are some other suggestions, which require no further description:

- Use a workstation editor to make many changes to a file
- Use Browse instead of View for large files
- Use a workstation compiler (whether in SCLM or not) for unit test compiles (such as C++SET/2 or COBOL Productivity Suite)
- Use an action bar to call other functions from Edit or Browse if you intend to return to the Edit or Browse session
- Use the IBM REXX compiler to compile ISPF dialogs written in REXX.

Use virtual I/O

Unit name SYSALLDA is the default specified in the ISPF Configuration table (keyword name PDF_DEFAULT_UNIT). When defining SYSALLDA, or another unit if you modify the configuration table, use the VIO=YES option on the UNITNAME macro. PDF allocates its temporary data sets using VIO if it is available. See Chapter 2, “The ISPF Configuration Table,” on page 11 for information about modifying the configuration table.

Remove or tailor Edit functions

Using the ISPF configuration table, you can tailor or remove functions that are likely to increase resource use. These include:

- Edit recovery data set attributes (RECOVERY ON)
- Edit in-storage change tracking (SETUNDO STORAGE)
- Edit enhanced highlighting (HILITE)

Change the block size of the edit recovery data set

The performance of the edit recovery function can be enhanced by changing the block size of the edit recovery data set. This change is to the keyword EDIT_RECOVERY_BLOCK_SIZE in the ISPF configuration table. Similar fields exist

in the ISPF configuration table for other less frequently used data sets. See Chapter 2, “The ISPF Configuration Table,” on page 11 for more information about the ISPF configuration table.

Disable SETUNDO STORAGE

The SETUNDO STORAGE function of the editor lets users undo changes made within edit sessions by keeping a record of those changes in storage. This provides better performance for individual users but can have a negative impact on overall system performance on systems where the editor is heavily used.

The function of saving the record of changes in storage can be completely disabled by setting the keyword UNDO_STORAGE_SIZE to zero in the ISPF configuration table. The UNDO function will still be available to users who are running with RECOVERY ON.

By default, existing user edit profiles that have never had SETUNDO explicitly changed, will have SETUNDO STORAGE enabled. Newly created profiles will have SETUNDO STORAGE turned off. If you want to force most of the existing, heavily used profiles to specify SETUNDO OFF, disable the function by changing the configuration table keyword UNDO_STORAGE_SIZE to zero and run the system like that for several days or weeks. When the function is disabled, edit profiles are changed to reflect SETUNDO OFF when they are used.

After several days or weeks, you might want to enable the function by again changing the configuration table. See Chapter 2, “The ISPF Configuration Table,” on page 11 for more information on the ISPF configuration table.

Note: If you normally place a copy of the edit profile table (normally ISREDIT) containing a ZDEFAULT profile in your ISPTLIB concatenation, you should ensure that it reflects the SETUNDO setting of your choice, because this will override the programmed defaults for newly created edit profiles.

Disable Edit extended highlighting

Although edit extended highlighting provides powerful features (such as language sensitive color), it might require an unacceptable amount of CPU time system wide. To disable the feature, change the value of the keyword DEFAULT_EDIT_DISPLAY in the ISPF configuration table to a value of 0 or 1.

To completely disable extended highlighting, even for applications that use their own edit panels, set the value of keyword ALLOW_EDIT_HIGHLIGHTING in the ISPF configuration table to N0. See Chapter 2, “The ISPF Configuration Table,” on page 11 for more information about the ISPF configuration table.

Remove action bars from ISPF panels

Some of the panels that are provided with the Dialog Tag Language (DTL) source can be recompiled to remove the action bars. This can result in some performance benefits. To recompile the DTL source:

1. Invoke ISPD TLC with the NOACTBAR option by specifying:
ISPD TLC (NOACTBAR

or by de-selecting the option “Create panels with Action bars” on the invocation panel.

2. Modify the convert EXEC to include the NOACTBAR parameter:

```
'ISPDTLC ISPFAB (DISK KEYLAPPL=ISR MSGSUPP CUAATTR CUASUPP PLEB MCOMMENT
  NOSTATS NOACTBAR PROFILE=your.gml.dataset(profile)' ;
```

3. If you are recompiling DBCS versions of the panels, you must add the DBCS option to the command syntax. Japanese panels require the KANA option as well.

```
'ISPDTLC ISPFALL (DISK KEYLAPPL=ISR MSGSUPP CUAATTR CUASUPP PLEB MCOMMENT
  JAPANESE DBCS KANA NOSTATS NOACTBAR PROFILE=your.gml.dataset(profile)' ;
```

For more information about invoking ISPDTLC, see “Invoking the ISPDTLC conversion utility” on page 44.

Remove scrollable areas from ISPF panels

Some of the panels that are provided with the Dialog Tag Language (DTL) source can be recompiled to remove scrollable areas (where the resulting panel fits within a standard 24 line screen). This can result in some performance benefits. To recompile the DTL source:

1. Invoke ISPDTLC with the MERGESAREA option by specifying:

```
ISPDTLC (MERGESAREA
```

or by selecting the option “Combine scrollable areas into panel body” on the invocation panel.

2. Modify the convert EXEC to include the MERGESAREA parameter:

```
'ISPDTLC ISPFALL (DISK KEYLAPPL=ISR MSGSUPP CUAATTR CUASUPP PLEB MCOMMENT
  NOSTATS MERGESAREA PROFILE=your.gml.dataset(profile)' ;
```

3. If you are recompiling DBCS versions of the panels, you must add the DBCS option to the command syntax. Japanese panels require the KANA option as well.

```
'ISPDTLC ISPFALL (DISK KEYLAPPL=ISR MSGSUPP CUAATTR CUASUPP PLEB MCOMMENT
  JAPANESE DBCS KANA NOSTATS MERGESAREA PROFILE=your.gml.dataset(profile)' ;
```

Note: The NOACTBAR AND MERGESAREA options can be combined to provide both results.

For more information about invoking ISPDTLC, see “Invoking the ISPDTLC conversion utility” on page 44.

Preprocess all ISPF panels

Preprocessed panels are displayed much faster than if they are not preprocessed. However, panels that must be sized at run time (dynamic panels) cannot be preprocessed. After preprocessing the ISPF panels, copy all panels into your execution data set, specifying NOREPLACE. This will copy only those members that could not be preprocessed.

Note: The preprocessed versions of the ISPF panels are not updated by PTFs from IBM. If a panel is updated by a PTF, you must preprocess it into your execution data set again.

Preprocessed panel utility

The preprocessed panel utility is an ISPF dialog called ISPPREP. This utility converts panel definitions to a form ISPF can display more quickly. The converted panels can be defined to ISPF in place of normal panel definitions. This improves ISPF's performance.

When you install ISPF, consider creating a panel library to contain the preprocessed versions of the ISPF panels. Be aware that a preprocessed panel is in an encoded form and cannot be changed through the normal edit procedure. For a general discussion of ISPPREP and its use, refer to the *z/OS ISPF Dialog Developer's Guide and Reference*.

This example shows how to create preprocessed versions of the ISPF panels contained in the data set ISP.SISPPENU. The example assumes this data set is cataloged. However, this is not necessary and both the panel input and panel output data sets can be uncataloged.

Before continuing, you must allocate the data set that will contain the preprocessed panels. For this example, catalog the data set and name it ISP.PREPPLIB. Allocate the data set with the same record format, logical record length, and block size of the ISPF panel data set, ISP.SISPPENU. However, the entire ISPF panel data set in the preprocessed format will take up about 25% less space than the original data set, so allocate the new data set accordingly.

To convert the ISPF panel library, issue the ISPSTART command as follows:

```
ISPSTART PGM(ISPPREP) PARM(INPAN('ISP.SISPPENU'),  
                          OUTPAN('ISP.PREPPLIB'))
```

Note: This command creates all members in the output library with ISPF statistics included. Be sure that you have enough directory blocks to contain the members and their statistics, or use the NOSTAT parameter for ISPPREP. See the *z/OS ISPF Dialog Developer's Guide and Reference* for more information about ISPPREP.

The panel output data set name in the previous example is a suggested naming convention. Regardless of how you name the data set, be sure you modify your TSO LOGON procedure or the CLIST that allocates the ISPF data sets to allocate the new panel library. See the *z/OS ISPF User's Guide Vol I* for more information about allocating ISPF libraries.

The previous example shows the use of ISPPREP in foreground batch mode. You can also run ISPPREP as a background job, as an interactive dialog by selecting option 2 on the ISPF Primary Option Menu, or by entering the ISPPREP command on any Command line.

These restrictions apply to the panels you can convert to preprocessed panels. You cannot convert any panel that contains these items in the panel definition:

- A dialog variable specified with the WIDTH keyword in the)BODY header statement of a panel.
- A dialog variable that defines a model line in a table display panel definition.
- A dynamic or graphic area that has EXTEND(ON) specified for the attribute character.

If ISPPREP is passed a panel definition that does not meet these restrictions, a message is issued to the ISPF log data set that specifies the name of the panel that violated the restrictions. In this case, the panel definition is not converted to the preprocessed format. However, you can copy the original panel definitions into the new panel library to keep your panels grouped accordingly. In any case, be sure to check the ISPF log data set after invoking ISPPREP. The messages in the log data set help you identify any problems ISPPREP encounters during the conversion. For more information, refer to the *z/OS ISPF Dialog Developer's Guide and Reference*.

Add load modules to the pageable link-pack area (LPA)

Once you have installed and verified ISPF, you can enhance its performance by adding the LPA-eligible load modules (in the SISPLPA library) to the LPA list in an LPALSTxx member of PARMLIB. Add those load modules not eligible for LPA (that is, those in the SISpload library that are not re-entrant) to the link list in an LNKLSTxx member of PARMLIB. For information about adding data sets to the Link and LPA lists, see *z/OS MVS Initialization and Tuning Reference*. You can then remove these data sets from the STEPLIB in your TSO LOGON procedure. After adding SISPLPA to LPALST and SISpload to LNKLST, specify CLPA as an initial program load (IPL) parameter to force the SISPLPA modules into the link pack area and to have SISpload added as a system link library.

ISPF performance directly relates to the number of load modules that reside in the pageable LPA because these modules are not loaded into the user's private storage when they are called. For optimum performance, all of the eligible ISPF licensed program load modules should be in the LPA. However, to load all eligible modules to the LPA, your system would need a very large LPA.

Any module that is re-entrant (that is, has the RN attribute) is eligible for the LPA.

No modules are required in the LPA. Table 9 on page 80 lists the load modules recommended for inclusion in the LPA.

To conserve LPA space:

- Move some of the infrequently used modules to a system-link library. Keep the modules you most frequently use in the LPA.
- If you are not using SCLM, move all load modules that begin with FLM from the SISPLPA library to the SISpload library so that they are in a system link library instead of the Link-Pack area.

Moving load modules

To move load modules from one library to another, use SMP/E ++MOVE statements. SMP/E moves the load modules and all associated aliases and updates the SMP CSI. This ensures that the load modules are available to SMP/E for subsequent maintenance.

Sample usermods that contain SMP/E ++MOVE statements are included with ISPF to help you customize your system if you decide to put only part of the SISPLPA load modules into LPA.

Usermod ISPMOVE1 contains a **sample** ++MOVE statement to move a load module from SISPLPA to SISpload. Usermod ISPMOVE2 contains a **sample** ++MOVE statement to move a load module from SISpload to SISPLPA.

Note:

1. These sample usermods are not complete. They do not contain ++MOVE statements for the possible load modules that may be moved. They contain a sample ++MOVE statement to show you the format required. Before using them, you must edit them for applicability to your environment. Provide statements for those load modules that you want to move from one library to another. See the instructions in the samples for more information about changes you need to make.

2. Be aware that some PTFs may change the JCLIN for ISPF load modules. If the JCLIN is changed for a load module that you have moved, after application of the PTF, the load module may reside back in the library you moved it from. You should carefully examine the output from the application of any PTF, and also the information in your SMP/E zone, and if necessary re-apply the usermod.

If you move the modules without using SMP/E ++MOVE statements, consider:

- You can use the ISPF Move and Copy utility (option 3.3) to move load modules between the SISpload and SISPLPA data sets. If you do this, you must also update the load module SYSLIB subentries in the SMP CSI to reflect the move, otherwise the modules will not be available to SMP/E for maintenance.
- Many of the load modules have aliases. You can determine the alias of any load module by viewing the data set list (from ISPF option 3.4) of SISPLPA and SISpload. When you use ISPF option 3.3 to move modules that have aliases, make sure that 'Process member aliases' is selected in the panel where you specify the "To" data set.

Five SCLM load modules are shipped as ++PROGRAMs. They are: FLMCQBLD, FLMCQCNT, FLMCQINT, FLMCQPRM, and FLMCQSTQ. You cannot use the usermods to move these load modules as SMP/E does not allow for moving a ++PROGRAM by a ++MOVE statement.

ISPF load module descriptions

This section contains information describing ISPF load modules.

Table 9 lists the frequently used ISPF load modules that should be in the LPA and a brief description of each.

Any load module distributed in SISpload that does not have the re-entrant (RN) attribute is not eligible for the LPA and should not be moved to SISPLPA.

Load modules shipped with the attribute RMODE(24) reside below the 16M line.

Note: Load module ISPLINK is shipped with the attribute RMODE(24) to provide compatibility with dialogs that are AMODE(24) and use a LOAD and CALL interface to ISPLINK. However, programs that will reside above the 16MB line (RMODE(ANY)) and include ISPLINK in their load module can override the RMODE(24) at link-edit time. ISPLINK code can reside and execute above the 16MB line.

Table 9. Minimum recommended load modules for the LPA

Load Module	Description

ISRSUBX	Main below 16M PDF subroutine module
ISRSUPC	Superc
ISRUDA	PDF Utilities
ISRUMC	PDF Move Copy
ISR32mmm	where mmm designates the terminal types in use

ISRSUPC is shipped RMODE(24) and is large. Installations that do not use Edit Compare or Superc functions frequently could consider moving this module from LPA to free up below the line storage.

Include FLMS7C to enhance the performance of SCLM batch jobs and tools or dialogs that use the FLMCMD interface to SCLM services. Include FLMS\$LNK for tools or dialogs using the FLMLNK interface to SCLM services. Include FLMLPCBL if you are using COBOL source; FLMLPFRT if you are using FORTRAN source; or FLMLPGEN if you are using Assembler, REXX, PLI, or text source.

Allocate execution data sets

Consider these points when creating data sets that are used at execution time and when setting up ISPF applications.

- System-Determined Block size (SDB) should be used for the ISPxLIB data sets. To allocate a data set with SDB, code DCB=BLKSIZE=0 in JCL, or specify a block size of zero in ISPF Option 3.2 when allocating the data set. The exception to this is ISPLLIB data sets with a record format of U. These should be allocated using a block size consistent with your system conventions.

- If you do not use a system-determined block size, use a block size for the ISPxLIB data sets that is a half of a 3380/3390 track. Use a block size of 32760 for load module data sets including those allocated to ISPLLIB, if any.
- Use cached controllers for the ISPxLIB data sets.
- Use PDSEs for the ISPxLIB data sets. Pay careful attention to the parameters with which the PDSEs are defined. The direct MSR (millisecond response time) parameter of the storage class affects PDSE performance. Low values of this parameter will improve PDSE performance at the expense of increased storage use.
- Make sure the ISPxLIB data sets are on lightly used volumes. You can spread them out over multiple volumes.
- Minimize the number of ISPLLIB data sets:
 - If ISPF modules are in the LPA and LNKLIST, do not include them in ISPLLIB. It is not necessary.
 - Put commonly used ISPF applications in the LPA and LNKLIST.
 - Use LIBDEFs where possible for infrequently used applications.

Disable generic high-level qualifiers

ISPF allows a generic high-level qualifier when using option 3.4 to print or display a list of data set names. A generic high-level qualifier is one that contains a wildcard character. You can restrict the search limits (and improve performance) by disabling the use of wildcard characters in the first qualifier. You can do this in two ways:

- Through the `DISALLOW_WILDCARDS_IN_HLQ` setting in the ISPF Configuration table.
- By writing an exit that sets a return code to prevent the list from being generated when it finds a wildcard character. This method allows more flexibility, for example if you wish to allow a wildcard character at the end of a high-level qualifier but not at the start.

For more information about using the data set list filter exit, see “Data set list filter exit” on page 193.

Figure 51 on page 83 is an example of a data set list exit that disables wildcards. A copy of this exit is included in your SISPSAMP data set in member ISRNOGEN. Note that this example as written is nonreentrant, so it should not be put in the LPA. If nonreentrant exits are put in the LPA, abends can occur.

```

Preallocate ISPF temporary data sets to VIO

ISPF uses temporary data sets to generate JCL or utility control statements or to generate listings. To preallocate these data sets to VIO, include the DD statements in Figure 53 on page 85 in the TSO LOGON procedure.

Preallocation of these data sets to VIO is not mandatory; ISPF automatically allocates them to real data sets if required. However, preallocation is recommended, because it reduces overhead and eliminates potential problems from insufficient space.

```

//ISPCTL0 DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=80,BLKSIZE=800,RECFM=FB)

//ISPCTL1 DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=80,BLKSIZE=800,RECFM=FB)
:
//ISPCTLW DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=80,BLKSIZE=800,RECFM=FB)

/* In this section of JCL, there is one DD for each screen
/* defined, based on the value of keyword MAXIMUM_NUMBER_OF_
/* SPLIT_SCREEN in the configuration table.
/* The DD name is in the form ISPCTLx, where x can be
/* 1-9, A-W. For example, if the keyword value = 8, only
/* ISPCTL1 to ISPCTL8 need to be coded.
/* ISPCTL0 is a special case, used only by Edit for the Submit
/* command.

//ISPWRK1 DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=256,BLKSIZE=2560,RECFM=FB)

//ISPWRK2 DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=256,BLKSIZE=2560,RECFM=FB)
:
//ISPWRKW DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=256,BLKSIZE=2560,RECFM=FB)

/* In this section of JCL, there is one DD for each screen
/* defined, based on the value of keyword MAXIMUM_NUMBER_OF_
/* SPLIT_SCREEN in the configuration table.
/* The DD name is in the form ISPWRKx, where x can be
/* 1-9, A-W. For example, if the value of the keyword = 8,
/* only ISPWRK1 to ISPWRK8 need to be coded.

//ISPLST1 DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=121,BLKSIZE=1210,RECFM=FBA)

//ISPLST2 DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=121,BLKSIZE=1210,RECFM=FBA)
:
//ISPLSTW DD DISP=NEW,UNIT=VIO,SPACE=(CYL,(1,1)),
//          DCB=(LRECL=121,BLKSIZE=1210,RECFM=FBA)

/* In this section of JCL, there is one DD for each screen
/* defined, based on the value of keyword MAXIMUM_NUMBER_OF_
/* SPLIT_SCREEN in the configuration table.
/* The DD name is in the form ISPLSTx, where x can be
/* 1-9, A-W. For example, if the value of the keyword = 8,
/* only ISPLST1 to ISPLST8 need to be coded.

```

Figure 53. DD statements to preallocate data sets

Note:

1. When allocating to VIO, make sure that enough auxiliary storage is dedicated to VIO so that system availability is not affected.
2. Use of the BUFNO parameter on allocation of ISPF libraries is not supported.
3. The ISPF temporary data set default names associated with the ISPCTLx are SPFTEMPx.CNTL, respectively, where x= value 0-9, A-W.
4. The ISPF temporary data set default names associated with the ISPWRKx are SPFTEMPx.WORK, respectively, where x= value 1-9, A-W.

5. The ISPF temporary data set default names associated with the ISPLSTx are SPFTEMPx.LIST, respectively, where x= value 1-9, A-W.
6. The ddnames ISPWRKx are used by ISPF for file tailoring services with ISPFILe allocated to a PDS. The ddnames ISPLSTx are used for generated listings.
7. The ddname ISPCTL0 is used with the edit SUBMIT command. The ddnames ISPCTLx are used with ISPF compress (both interactive and the LMCOMP service) and ISPF background (option 5), and for processing the file tailoring service FTOPEN TEMP.
8. ISPCTL1 is a required ddname when using SCLM. The data set should be allocated as an ISPF temporary data set for SCLM foreground processing and should be added to the FLMLIBS skeleton for batch processing.
9. ISPF does not support multivolume temporary data sets. If DFSMS is installed, temporary data sets dynamically allocated by ISPF must be assigned a data class with a volume count of one. This can be controlled in the ACS routines by testing the execution mode (&XMODE) for a value of TSO.
10. If you have dialogs that need to edit or browse temporary data sets, use the LMINIT service to associate a DATAID with ddname ZTEMPN and invoke edit or browse using the DATAID parameter. For more information, refer to the BROWSE and EDIT services in the *z/OS ISPF Services Guide*.

Compress SCLM listings

The ISPF sample library ISP.SISPSAMP contains two sample members that demonstrate how to compress SCLM listings using the PACK option on the LMCOPY service. FLM03ASM is the language definition. FLM03LMC is a sample REXX exec. Comments explaining how to use these members are included in the code.

Chapter 5. Customizing DM

Customizing DM describes procedures you can use to customize the DM component of ISPF to suit the particular needs of your installation:

- “Changing the default name for the ISPF Client/Server component download data set”
- “Set up ISPF GUI for TSO Line Mode support”
- “SMF command accounting” on page 88
- “Preallocation of List/Log data sets to SYSOUT” on page 91
- “Specifying the maximum number of split screens” on page 91
- “Setting ISPF site-wide defaults” on page 92
- “Customizing command tables” on page 92
- “Creating ISPF terminal translation tables” on page 94
- “Creating ISPF code page translation tables” on page 103
- “Displaying square brackets used in C programs” on page 112
- “ISPEXEC processing” on page 112
- “ISPF-to-APL2 terminal type mappings” on page 113
- “Load APL2 workspace” on page 113
- “Tailoring ISPF defaults” on page 114
- “Customizing the ISPF TSO command table (ISPTCM)” on page 114
- “Alternate option 7.1 panels” on page 118
- “ISPF multicultural support” on page 119

See also Chapter 6, “ISPF installation-wide exits,” on page 121.

Changing the default name for the ISPF Client/Server component download data set

If the default data set names are not used for the ISPF data sets, use the ISPF Configuration utility to set the default data set name for the Client/Server Component Download. See Chapter 2, “The ISPF Configuration Table,” on page 11 for details.

Set up ISPF GUI for TSO Line Mode support

When running ISPF in GUI mode, users connected by TCP/IP on a z/OS UNIX system, and all users connected by APPC, have the option to display all non-fullscreen TSO data in an ISPF/TSO GUI window. This window is scrollable and it contains an input field for entering required user responses. The data in the window can be selected and copied to a file of your choice. This enables you to minimize the emulator window from which you logged on without missing any messages that might appear in the emulator window.

To use the TSO line mode support for ISPF GUI, execute these steps:

- The Language Environment run-time library data sets, SCEERUN and SCEERUN2, must be in LPA or Linklist and must be APF authorized.
- These ISPF modules and aliases must be in LPA: ISPDTSI, ISPDWIN, ISPDTSK, ISPDINI, IKJDTINI, ISPDTER, IKJDTTER, ISPDTPUT, IKJDTPUT, ISPDGET, IKJDTGET, ISPDTPC, and ISPQGUI.
- The ISPF subsystem initialization routine, ISPDTSI, must be invoked at system IPL. To do this, add this to your IEFSSNxx member in SYS1.PARMLIB.

```
SUBSYS SUBNAME(ISPF) INITRTN(ISPDTSSI)
```

One of these messages will appear on your console indicating whether the routine was successfully invoked:

```
ISPDT001 ISPF Subsystem Initialization: Completed successfully
ISPDT002 ISPF Subsystem Initialization: Error creating PC number - is
        ISPDTPC in LPA
ISPDT003 Subsystem name in IEFSSNxx is not ISPF
```

- These are required for TCP/IP communications:
 - z/OS Communications Server: IP
 - user ID with an OMVS segment defined
 - default group with an OMVS segment defined
 - z/OS UNIX home directory

See “Tailoring ISPF defaults” on page 114 for more information.

- Your logon procedure must invoke the alternate entry point of IKJEFT1I. The EXEC card must contain 'PGM=IKJEFT1I'.

SMF command accounting

The MVS System Management Facility (SMF) collects and records a variety of system and job-related information. ISPF uses SMF to format information for a type 32 record. This type 32 record contains the names of the program functions and TSO commands being executed and the number of times each is used during the session. SMF also allows the installation to specify that the record is to include resources such as the total processor time under TCBs and SRBs and the total number of TGETs, TPUTs, and transactions associated with each name. The record is written when a TSO user logs off or when an SMF recording interval expires.

ISPF issues an SVC 109 (the extended service router, code X'19') to start and stop this functional accounting before and after the link to a program function, and before and after attaching a command. When processing command (CLIST) functions, the SVC 109 is issued before and after attaching the EXEC command processor. Therefore, the command name EXEC will be recorded, rather than the actual CLIST name.

The calls to SVC 109 can be nested depending on the nature of the program function or CLIST. The commands (and service units attributed to each command, if recorded) are accounted to the appropriate logical screen and are recorded as such. The command name ISPF SWAP is passed to SMF to indicate the user has swapped screens.

You must specify in module IEEMB846 the name of each module that is invoked for ISPF subfunctions or subcommands. You should also specify the command used to invoke ISPF. *z/OS MVS System Management Facilities (SMF)* provides details on including additional names. Without these additions to IEEMB846, ISPF will cause extensive counts of ***OTHER to be recorded in the SMF type 32 records.

Table 10 lists the ISPF options and their related module names plus any additional commands that can be implicitly or explicitly invoked by a particular option.

Preallocation of List/Log data sets to SYSOUT

ISPF normally allocates the ISPF list and log data sets (sequential data sets) the first time a user requests printed output or takes action that generates log output. The user can control the printing and disposition of these data sets at ISPF termination and by issuing the ISPF LOG and LIST commands.

You can preallocate the list and log data sets directly to SYSOUT by including one or both of these DD statements in the TSO LOGON procedure:

```
//ISPLIST DD SYSOUT=A,  
//        DCB=(LRECL=121,BLKSIZE=1210,RECFM=FBA)  
  
//ISPLOG  DD SYSOUT=A,  
//        DCB=(LRECL=125,BLKSIZE=129,RECFM=VA)
```

If you preallocate these data sets to SYSOUT, they are automatically printed when the user logs off TSO. Also, when the user exits from ISPF, the termination menu is bypassed. If the user reenters ISPF before logging off, any new output is added to the end of the SYSOUT data sets.

Note:

1. You cannot use ISPF option 7.5 to browse log data sets allocated to SYSOUT.
2. You can use the ISPF Log/List pop-up on the Settings panel to specify either the number of lines per page or to bypass logging altogether (by specifying zero primary pages). The rest of the information on these panels is ignored if the list and log data sets are allocated to SYSOUT.
3. The defaults for the list data set are LRECL=121, line length=120, RECFM=FBA, as they were in the previous licensed programs. However, you can use the Log/List pop-up on the Settings panel to change the characteristics of the list data set so screen images wider than 121 characters can be printed.
4. You cannot issue the LOG or LIST command to process a preallocated log or list data set.
5. The ISPF temporary data set default names associated with the ISPLOG ddname are SPFLOGx.LIST, where x=numeric value 0-9.
6. The ISPF temporary data set default names associated with the ISPLIST ddname are SPFx.LIST, where x=numeric value 0-9.

Specifying the maximum number of split screens

ISPF can run up to 32 logical screens at one time. You can specify the maximum number of logical screens allowed for your installation by modifying the ISPF configuration table. See Chapter 2, "The ISPF Configuration Table," on page 11 for more information about modifying the ISPF configuration table. Set the value of keyword MAXIMUM_NUMBER_OF_SPLIT_SCREEN to any number from 4 to 32. The default value is 8. Be sure to consider your users' region size when you set the limit for the maximum number of screens.

Setting ISPF site-wide defaults

You can set these site-wide defaults for ISPF by changing the ISPF configuration table:

- ISPF's Settings options
- CUA panel elements
- KEYLIST ON|OFF
- PFSHOW ON|OFF
- Log and List final disposition
- Default Primary panel
- SCROLL_DEFAULT (CSR|DATA|HALF|MAX|PAGE)
- SCROLL_MIN (minimum scroll value)
- SCROLL_MAX (maximum scroll value)
- STATUS_AREA_DEFAULT (CAL|FUN|OFF|SES|UPS|USE)

For this list of defaults, except SCROLL and STATUS AREA, ISPF provides a force option which indicates the default set in the ISPF configuration table should be used, even though users may have a value set in their system or user profile. The SCROLL and STATUS AREA defaults are included in the ISPSPROF when the initial profile is built. The user can later override the site-wide default.

You can also set these site-wide defaults by changing the ISPF configuration table:

- Log, list, and temporary data set block size.
- Log and temporary data set logical record length.
- PRINTDS operands, DEST, or WRITER

This list of defaults cannot be overridden by the end user.

See Chapter 2, "The ISPF Configuration Table," on page 11 for more information about modifying the Configuration table.

Customizing command tables

While running an application, you can use commands defined in eight different command tables. These command tables are:

- Application command table
- 3 User command tables
- 3 Site command tables
- System command table.

The user command tables and the site command tables are optional to use. They must be defined for your installation and present when ISPF is initialized. To make use of them, you must update the ISPF configuration table to include their application identification.

ISPF uses a specific order when searching the tables for commands you enter. However, you do have some control over the search order when using the optional site command tables. The site command tables can be searched either before or after the system command table. To define the search order relative to the site and system command tables, update the ISPF configuration table.

The keywords in the ISPF configuration table that determine the search order between the site command tables and the system command table, and whether or not user command tables and site command tables are defined, are:

APPLID_FOR_USER_COMMAND_TABLE

The application ID for up to 3 user command tables. The default for each

is NONE (no user command tables). The user command tables are searched after the command table for the current application, that is, the command table for the current APPLID, and before the site-wide and default system command tables.

APPLID_FOR_SITE_COMMAND_TABLE

The application ID for up to 3 site command tables. The default for each is NONE (no site-wide command tables). The search order for the site command tables depends on the SITE_COMMAND_TABLE_SEARCH_ORDER_SETTING.

SITE_COMMAND_TABLE_SEARCH_ORDER

Determines if the site-wide command tables are to be searched before or after the default ISPF command table. Valid values are BEFORE and AFTER. The default is BEFORE.

When you enter a command, the application command table is searched first. If the command is found, no further searching is necessary. If the command is not found in the application command table, up to 3 user command tables are searched. If the command is not found in the user command tables, up to 3 site command tables are searched or the system command table is searched (depending on the search order defined in the ISPF configuration table). Finally, if the command is still not found, the remaining command table(s), site or system, are searched. User command tables and site command tables are only searched if they have been defined in the ISPF configuration table and are present at ISPF initialization.

See Chapter 2, “The ISPF Configuration Table,” on page 11 for more information about modifying the ISPF configuration table.

Application command table

Commands in the application command table are in effect only for the application you are running. Defining commands in the application command table lets you customize the set of commands you need for a particular application without redefining the system command table for each application.

ISPF provides a utility to create and modify the command tables. Enter ISPF option 3.9 from the ISPF Primary Option Menu. For more information about creating application command tables, refer to the *z/OS ISPF User's Guide Vol II* or the *z/OS ISPF Dialog Developer's Guide and Reference*.

User command tables

Commands in up to 3 user command tables are in effect for all applications. These commands can override identically named commands in the site or system command tables, and are themselves overridden by identically named commands in the application command table.

You must specify the application ID of the user command tables in the ISPF configuration table, or the user command tables cannot be used. If you do not have a user command table that matches the application ID, the ID is ignored until the table is present and ISPF is reinitialized.

Site command tables

Commands in up to 3 site command tables are in effect for all applications. An option in the ISPF configuration table enables a site to specify that up to 3 site command tables are searched before or after the system command table. If the site

command tables are searched first, then commands in the site command tables can override identically named commands in the system command table, and in turn can be overridden by identically named commands in the application or user command tables. If the site command tables are searched after the system command table, then their commands override no others, but can be overridden by identically named commands in either the application, user, or system command tables.

You must specify the application ID of up to 3 site command tables in the ISPF configuration table, or the site command tables cannot be used. If you do not have a site command table that matches the application ID, the ID is ignored until the table is present and ISPF is reinitialized.

System command table

Commands in the system command table are in effect for all applications. However, these commands can be overridden by an identically named command in an application or user command table, or a site command table if it is defined to be searched first.

Creating ISPF terminal translation tables

Creating ISPD terminal translation tables describes how to perform these tasks:

- Create a set of ISPF translation tables.
- Modify existing ISPF panels to use with the set of translation tables.

The ISP.SISPSAMP library includes sample assembler source programs, ISPOWNTT and ISPAPLTT. Use these as examples of what a completed module should look like. You can modify the sample module to suit your requirements and supply your own values for each of the translation tables.

ISPF uses these translation tables:

- 2-byte input translation table
- 2-byte output translation table
- Uppercase character translation table
- Lowercase character translation table
- Valid terminal output translation table
- Generic string master translation table
- Alphabetic character translation table
- Collating sequence translation table

The sample assembler modules include all of these translation tables. Each translation table consists of 32 consecutive DC instructions. Each DC instruction consists of eight hexadecimal values. You must supply the 256 hexadecimal values that make up each of the translation tables. The address of each table is at the start of the assembler module. Ignore addresses such as TBIP, which are set to zero.

The sample ISPOWNTT corresponds to an English 3278/3279 terminal except that the collating sequence translation table is not used in English.

Note: If the set of terminal translation tables has to support Katakana characters, you must perform these steps:

1. Change the DPRP pointer in the source from A(0) to A(TTDPR).
2. Rename table TTUPP to TTDPR.
3. Add another 256-character table labeled TTUPP in which all characters translate to themselves except X'08', X'1C', X'1D', and X'1E', which translate to X'40'.

Uppercase character translation table

The uppercase character translation table (TTUPP in the example shown in Table 12) translates screen input data as follows:

- Lowercase alphabetic characters translate to uppercase.
- X'08', X'1C', X'1D', and X'1E' translate to blank (X'40').
- All other hexadecimal values translate to themselves.

Table 12. Uppercase character translation table example

Table	Hexadecimal Code	Position
TTUPP	DC X'0001020304050607'	(X'00' to X'07')
	DC X'40090A0B0C0D0E0F'	(X'08' to X'0F')
	DC X'1011121314151617'	(X'10' to X'17')
	DC X'78797A7B7C7D7E7F'	(X'78' to X'7F')
	DC X'80C1C2C3C4C5C6C7'	(X'80' to X'87')
	DC X'E8E9EAEBECEDEEEF'	(X'E8' to X'EF')
	DC X'F0F1F2F3F4F5F6F7'	(X'F0' to X'F7')
	DC X'F8F9FAFBFCFDFEFF'	(X'F8' to X'FF')

Table 12 shows how the uppercase character translation table might be represented in the assembler module. For example, this is true for Table 12:

- The hexadecimal position for a lowercase 'a' (X'81'), contains the hexadecimal value for an uppercase 'A' (X'C1').
- The hexadecimal position for an uppercase 'A' (X'C1') contains the hexadecimal value for an uppercase 'A' (X'C1').

Enter the values you want in the 256 hexadecimal positions of the uppercase translation table. When you finish with the table, you are ready to move on to the second translation table.

Lowercase character translation table

The lowercase character translation table (TTLOW) must be left as it is. Its function is internal to ISPF.

Valid terminal output translation table

The valid terminal output translation table (TTVAL in the example shown in Table 13) represents display characters, in hexadecimal, as follows:

- Valid display characters are represented with X'00'.
- Invalid display characters are represented with X'FF'.

Table 13. Valid terminal output translation table example

Table	Hexadecimal Code	Position
TTVAL	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	DC X'FF00000000000000'	(X'78' to X'7F')
	DC X'FF00000000000000'	(X'80' to X'87')
	DC X'0000FFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'0000000000000000'	(X'F0' to X'F7')
	DC X'0000FFFFFFFFFFFF'	(X'F8' to X'FF')

Generic string master translation table

The positions in the generic string master translation table (TTGSM in the example shown in Table 14) are filled in as follows:

X'00'	Blank character
X'01'	Invalid character
X'02'	Special character
X'04'	APL/TEXT special characters (only for APL and TEXT keyboards)
X'08'	APL/TEXT alphabetic characters (only for APL and TEXT keyboards)
X'10'	Lowercase alphabetic character
X'20'	Uppercase alphabetic character
X'40'	Numeric character
X'80'	User character subset

Table 14. Generic string master translation table example

Table	Hexadecimal Code	Position
TTGSM	DC X'0101010101010101'	(X'00' to X'07')
	DC X'0101010101010101'	(X'08' to X'0F')
	DC X'0101010101010101'	(X'10' to X'17')
	...	
	DC X'0102020202020202'	(X'78' to X'7F')
	DC X'0110101010101010'	(X'80' to X'87')
	...	
	DC X'2020010101010101'	(X'E8' to X'EF')
	DC X'4040404040404040'	(X'F0' to X'F7')
	DC X'4040010101010101'	(X'F8' to X'FF')

Modifying the GSM to use the user character subset

The Generic String Master (GSM) translation table and its related tables can be modified to add an additional character subset to be used in picture string processing by the ISPF EDIT, FIND, and CHANGE commands.

These steps allow you to modify the GSM to use a character subset:

1. Choose which character is used to represent your subset. For example, Edit uses an @ to stand for alphabetic.
2. Modify the entry in the Generic String Special Character (GSS) table found in "Translation table for generic string special characters" on page 285 corresponding to the character you wish to use for a value of X'08'. This indicates where in the Generic String Character Code (GSC) table the mask for your character set is located. The GSC does not need to be changed as it is initially set for user character sets.
3. Modify the GSM entries of those characters you wish to include in your special character set so the high order bit is on.

Alphabetic character translation tables

There are two alphabetic translation tables:

- TTALP, which includes the number sign (#), the dollar sign (\$), and the at sign (@) (Table 15 on page 97).
- TTALB, which does not include the number sign (#), the dollar sign (\$), and the at sign (@) (Table 16 on page 97).

Note: Valid alphabetic characters are represented with X'00'. For example, the hexadecimal position for an uppercase 'A' contains X'00'. Non-alphabetic characters are represented with X'FF'. For example, the hexadecimal position for a blank contains X'FF'.

Table 15. Sample alphabetic character translation table including #, \$, and @

Table	Hexadecimal Code	Position
TTALP	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFFF0000FFFFFF'	(X'78' to X'7F')
	DC X'FF00000000000000'	(X'80' to X'87')
	...	
	DC X'0000FFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'FFFFFFFFFFFFFFFF'	(X'F0' to X'F7')
	DC X'0000FFFFFFFFFFFF'	(X'F8' to X'FF')

Table 16. Sample alphabetic character translation table excluding #, \$, and @

Table	Hexadecimal Code	Position
TTALB	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFFFFFFFFFFFF'	(X'50' to X'57')
	DC X'FFFFFFFFFFFFFFFF'	(X'58' to X'5F')
	...	
	DC X'FFFFFFFFFFFFFFFF'	(X'78' to X'7F')
	DC X'FF00000000000000'	(X'80' to X'87')
	DC X'0000FFFFFFFFFFFF'	(X'88' to X'8F')
	...	
	DC X'0000FFFFFFFFFFFF'	(X'E8' to X'EF')
DC X'FFFFFFFFFFFFFFFF'	(X'F0' to X'F7')	
DC X'FFFFFFFFFFFFFFFF'	(X'F8' to X'FF')	

Collating sequence translation table

The collating sequence translation table (TTCOL in the example shown in Table 17 on page 98) contains the sort order of the 256 table entries, represented in hexadecimal (0-255). This table is used by TBSORT/TBADD services when the sort type is 'C', and by the ISPF Edit SORT command. See *z/OS ISPF Dialog Developer's Guide and Reference* for further information.

Example 1: If you want an 'A' to sort before a 'B', as shown in Table 17 on page 98, the hexadecimal position for an 'A' will contain a value that is less than the sort value found in the hexadecimal position for 'B'. Similarly, to sort a blank (X'40') before an 'A', the hexadecimal table position for a blank will contain a sort value less than that of the 'A'.

Example 2: If you want a blank (X'40') to sort last (not shown here), set the hexadecimal table position for a blank (X'40') to X'FF'.

Table 17 on page 98 shows an example of how the table would look if you wanted to sort strictly on the basis of hexadecimal values (for example, 'a' before 'b', 'A' before 'A').

Table 17. Collating sequence translation table example

Table	Hexadecimal Code	Position
TTCOL	DC X'0001020304050607'	(X'00' to X'07')
	DC X'08090A0B0C0D0E0F'	(X'08' to X'0F')
	DC X'1011121314151617'	(X'10' to X'17')
	...	
	DC X'78797A7B7C7D7E7F'	(X'78' to X'7F')
	DC X'8081828384858687'	(X'80' to X'87')
	...	
	DC X'E8E9EAEBECEDEEEF'	(X'E8' to X'EF')
	DC X'F0F1F2F3F4F5F6F7'	(X'F0' to X'F7')
	DC X'F8F9FAFBFCFDFEFF'	(X'F8' to X'FF')

If you want to sort strictly on the basis of hexadecimal codes (as ISPF does for English), set the pointer to the collating sequence table (COLP) to zero. In the case of a pure hexadecimal sort, ISPF does not require a table.

After you supply the values for these six tables, assemble and link-edit the module. After the load module is created, go to the next step.

Specifying terminal types

Having created a new set of translation tables you must provide a way for users to select the appropriate terminal type to refer to it. The simplest way is for the user to select the option OTHER in the ISPF Settings panel (ISPISMMN) and then enter the name of the load module (see Settings (Option 0) in the *z/OS ISPF User's Guide Vol II*). The load module is a member of a partitioned data set that is either allocated to the ISPLLIB ddname, or exists in STEPLIB, JOBLIB, or LINKLIB.

Validity checks are conducted on the load module to help prevent a user from loading bad translation tables. This could cause ISPF to fail until the faulty specification is removed by manually editing or deleting the user system profile. These checks are performed:

- verify that the module name matches an 8-byte constant at the start of the module (as in the sample program ISPOWNTT)
- verify that the uppercase translate table immediately follows the address pointer for the collating sequence translate table
- verify that the uppercase and lowercase translate tables are 256 bytes long

If the load of the new translation tables fails, ISPF reverts to the previous terminal type setting.

Older methods for specifying translation tables are still supported. See these topics for more information:

- "Changing the DTL source for ISPISMMN"
- "Changing the DTL source for ISPOPTxx panels" on page 101
- "Invoking ISPTTDEF" on page 102

Changing the DTL source for ISPISMMN

To change the ISPISMMN Dialog Tag Language source, use the Edit option to update the DTL source file members ISPZMMCH and ISPZMMSO. The member ISPISMMN defines the basic panel. This panel does not have to be modified but it does have to be reconverted with ISPD TLC after the changes to the imbed members ISPZMMCH and ISPZMMSO are complete.

The last <SELFLD tag in DTL source member ISPISMMN (see Figure 54) defines the list of terminal types. Four columns of choices are specified. The number of choices in each column is calculated by the conversion utility. The choice definitions are found in file imbed ISPZMMCH.

```
<selfld type=single name=ztm pmtloc=before listtype=ddlist
      required=yes msg=ispo901 help=ispo901h autotab=no
      entwidth=2 selfmt=end selwidth=60 choicecols=4 choicedepth=*>
      &selfld_3_prompt;

&ispzmmch;      <!-- include CHOICE tags for terminal types -->

</selfld>
```

Figure 54. DTL source for terminal type selection - SELFLD tag

This example illustrates adding terminal type XXXX using module ISPOWNTT to panel ISPISMMN. Alternatively, you can replace an existing set of translation tables by typing over the terminal type and the name of the load module that the newly defined set replaces.

The modification to the DTL source member ISPZMMCH adds the terminal type selection to the panel display (see Figure 55) and creates panel logic to determine which selection number will match a certain terminal type.

Terminal Type	3	1. 3277	2. 3277A	3. 3278	4. 3278A
		5. 3290A	6. 3278T	7. 3278CF	8. 3277KN
		9. 3278KN	10. 3278AR	11. 3278CY	12. 3278HN
		13. 3278HO	14. 3278IS	15. 3278L2	16. BE163
		17. BE190	18. 3278TH	19. 3278CU	20. DEU78
		21. DEU78A	22. DEU78T	23. DEU90A	24. SW116
		25. SW131	26. SW500	27. 3278GR	28. 3278L1
		29. OTHER	30. XXXX		

Figure 55. Example: adding a terminal type to panel ISPISMMN

Modified DTL source for the English-language section of the member ISPZMMCH follows:

```

:
<condexec lang=english>
  <choice selchar=1  checkvar=ztermp  match=3277>3277      <:-- 01 -->
  <choice selchar=5  checkvar=ztermp  match=3290A>3290A     <:-- 02 -->
  <choice selchar=9  checkvar=ztermp  match=3278KN>3278KN   <:-- 03 -->
  <choice selchar=13 checkvar=ztermp  match=3278HO>3278HO   <:-- 04 -->

  <choice selchar=24 checkvar=ztermp  match=SW116>SW116    <:-- 27 -->
  <choice selchar=28 checkvar=ztermp  match=3278L1>3278L1   <:-- 28 -->
  <choice selchar=30 checkvar=ztermp  match=XXXX>XXXX      <:-- 29 -->
</condexec>
:

```

Figure 56. DTL source for terminal type selection - CHOICE tags

The conversion utility formats CHOICE tags in a top-to-bottom, left-to-right order, placing the first seven CHOICE tags in column 1 (choice numbers 1, 5, 9, 13, 17, 21, and 25), CHOICE tags 8 through 14 in column 2 (selection numbers 2, 6, 10, 14, 18, 22, and 26), and so on. The number of entries in each column is based on 28 total lines of CHOICE and CHDIV tags divided by the specified number of choice columns, in our example, 4 (as defined in Figure 54 on page 99 by the CHOICECOLS keyword). These tags are arranged so that the choices appear in a left-to-right, top-to-bottom order).

By modifying the DTL source member ISPZMMSO, the new terminal type XXXX will be associated with its load module name ISPOWNNTT. Modified DTL source for the English-language section of the member ISPZMMSO follows:

```

/* set translate load module name based on terminal type */
:
:
&ZCHARLM = TRANS(&ZTERM
                3277 , ISP3277
                3277A , ISP3277A

```

Figure 57. DTL source for valid terminal types and associated load module names

In Figure 57, the left entries (for example 3277, 3277A and 3278) are valid terminal types a user can specify. The right entries (for example ISP3277, ISP3277A and ISP3278) are the associated load module names.

The delivered ISPF terminal table names start with the prefix “ISP”. ISPF does not require that user-defined terminal table names begin with the prefix “ISP”; however, PDF terminal names require the “ISR” prefix. PDF searches for the load module beginning with the fourth position of the actual table name and prefixes it with “ISR”. See “Creating PDF translation tables” on page 138 for a discussion of PDF translation tables.

Changing the DTL source for ISPOPTxx panels

If you still use the old options panels ISPOPT1 or ISPOPT1A, use ISPF Edit to update the DTL source file imbed member ISPZPTTT. ISPZPTTT is used by both ISPOPT1 and ISPOPT1A. It is a conversion-language-sensitive file that includes both the terminal type verification statement and the terminal type load module selection translation construct. ISPZPTTT is distributed in ISP.SISPGMLI.

After this member is updated, run ISPD TLC to convert all of the listed panels.

To add a new terminal type XXXX using load module ISPOWNTT to these panels, update ISPZPTTT as follows:

```
<source type=proc>
  VER (&ZTERM NB LIST
      3277,3277A,3278,3278A,3278T,3278CF,3277KN,3278KN,3290A,3278AR,
      BE163,BE190,3278CY,3278HN,3278HO,3278IS,3278L2,3278TH,3278CU,
      DEU78,DEU78A,DEU90A,SW116,SW131,SW500,3278L1,DEU78T,3278GR,

Figure 58. ISPZPTTT modified to add new terminal type XXXX

Invoking ISPTTDEF

The ISPTTDEF program offers you an alternative approach to specifying the terminal type or the corresponding set of translation tables (the load module). You can invoke ISPTTDEF from a selection panel, command table, or dialog function. To invoke the program, enter:

```
SELECT PGM(ISPTTDEF) PARM(xxx)
```

where *xxx* is the terminal type (one of the types listed on the distributed panel ISPISMMN) or the name of the load module. When you specify a terminal type,

the ISPTTDEF program loads and uses the appropriate load module for that terminal type. If you specify a load module, the program attempts to load a module with that name.

Creating ISPF code page translation tables

ISPF supports extended code pages that allow ISPF to display panels, messages, and variable application data correctly on terminals using any of the supported code pages. For example, ISPF can display a German panel on a French CECP (Country Extended Code Page) terminal, with all common characters displayed correctly. Any characters in the panel that do not exist in the terminal code page are displayed as periods.

The code page and character set are specified by CCSID (Coded Character Set Identifier) as defined by Character Data Representation Architecture (CDRA). ISPF supports these EXTENDED CODE PAGE CCSIDs for the TRANS service and also with the use of the CCSID keyword on panels and messages.

Table 18. Extended CCSID1 Supported

CCSID	Character Set	Code Page	Country/Language
00037	697	37	U.S.A. Canada Netherlands Portugal Brazil Australia New Zealand
00273	697	273	Austria Germany

16804	1461	0420	Arabic

These Extended CCSIDs (shown in Table 20 on page 105) are also supported for panels and messages that specify an extended code page. These are the mixed SBCS/DBCS CCSIDs for these languages.

Japanese (Katakana) and Simplified Chinese EXTENDED CODE PAGES are not supported on any terminal but these EXTENDED CODE PAGES are supported for the TRANS service and with the CCSID keyword on panels and messages.

Table 20. Extended SBCS and DBCS CCSIDs Supported

CCSID	Character Set	Code Page	Country
00930	1172	290	Japanese (Katakana)
00939	1172	1027	Japanese (Latin)
00933	1173	833	Korean

00937	1175	037	Traditional Chinese
01159	65535	1159	Traditional Chinese
01364	65535	0834	Korean
01371	65535	0835	Traditional Chinese
01388	65535	0837	Simplified Chinese
01390	65535	0300	Japanese
01399	65535	0300	Japanese
05123	65535	1027	Japanese
08482	65535	0290	Japanese

Base code pages for terminals

ISPF provides direct translation between each BASE CODE PAGE and its EXTENDED CODE PAGE for panels or messages. It also provides direct translation between extended Japanese (Latin or English) and both base Japanese (English) and base Japanese (Katakana). All translation between the single-byte EXTENDED CODE PAGEs for the double-byte languages and the CECP code pages is through CCSID 00500.

ISPF supports the base code pages (including mixed SBCS/DBCS CCSIDs for the DBCS languages) shown in Table 21.

Table 21. Base CCSIDs Supported

CCSID	Character Set	Code Page	Country/Language
00803	1147	424	Hebrew (Old)

ISPCCSID translation load modules

ISPCCSID translation load modules translate data from one CCSID to another. There is one translation load module for each of the supported CCSIDs. The name, or alias, of each CCSID translation load module is made up of a 5-digit CCSID, prefixed with "ISP". For example, load module ISP00111 supports translation of the CCSID 00111. Each CCSID translation load module must contain at least two translation tables. These translation tables convert data between the respective CCSID and CCSID 00500. In addition each CCSID load module can contain up to 256 pairs of optional "direct" translation tables. ISPF uses the direct translation tables when available. Otherwise, ISPF translates the characters through CCSID 00500. Translating through CCSID 00500 can result in valid characters being lost as CCSID 00500 does not have all possible code points defined.

You can add direct "To" and "From" translation tables for direct translation to prevent possible loss of characters through CCSID 00500 for character sets other than 697 or to augment the extended code page translation tables provided by ISPF. The direct translation CCSID must be one of the CCSIDs supported by ISPF (see "Extended code page translation tables provided by ISPF" on page 107) or added by the user.

Both "To" and "From" translation tables must be provided for direct translation tables as well as CCSID 00500 tables, even though there might be no translation needed. For example, to translate from a base CCSID to an extended CCSID for the same code page, all characters will translate to themselves.

Adding translation tables for extended code page support

You can provide support for additional code pages by creating or modifying translation tables using the sample assembler module ISPEXCP in the ISP.SISPSAMP library.

Any translation tables that are added must be named ISP`nnnnnn`, where `nnnnnn` is the CCSID, and must be a CCSID defined in the Character Data Representation Architecture Registry. This CCSID must be different from any of the supported CCSIDs. The translation tables should include code points X'40' through X'FE'.

Table 22 on page 107 and Table 23 on page 107 show examples of the "To" and "From" translation tables needed to translate characters between CCSID 00500 and CCSID 00037.

Table 22. Table for translating from CCSID 00037 to CCSID 00500.

Table	Hexadecimal Code	Position
TO_500	DC X'4041424344454647'	(X'40' to X'47')

Table name	CCSID	Description
ISPSTC15	00870	Latin 2
ISPSTC16	00880	Cyrillic
ISPSTC17	01025	Cyrillic

ISPCCSID translation load module generation macro

You can use the assembler macro, ISPCCSID, to generate custom ISPCCSID translation load modules. The macro also allows you to add “direct” translation tables to the ISPCCSID translation load modules ISPF supplies with the product. Calls to this macro must also be coded for the To_500 and From_500 tables and any “To” and “From” tables for direct translation. The load module must have either the name ISPxxxxx (where xxxxx is new CCSID) or an alias of ISPxxxxx. In both cases, the load module should be a CCSID defined in the Character Data Representation Architecture Registry.

Note that only the values for the hexadecimal digits X'40' through X'FE' are defined in a given translation table. These are the only code points that vary from CCSID to CCSID.

The first time you use the ISPCCSID macro, you must identify the CCSID of the ISPCCSID translation load module and provide the addresses of the “To” and “From” CCSID 00500 translation tables.

You can use the ISPCCSID macro again with the same ISPCCSID translation load module generation to identify the CCSID and translation table addresses of optional direct “To” and “From” translation tables.

The format of calls to the ISPCCSID assembler macro is:

```
ISPCCSID CCSID=nnnnn,T0=to-address,FROM=from-address
```

The required parameters of the ISPCCSID macro are:

nnnnn

This parameter is a 5-digit decimal (5 characters) number that specifies a CCSID. The *nnnnn* value on the first or only ISPCCSID macro definition is the CCSID associated with the ISPCCSID translation load module. The *nnnnn* value on other than the first ISPCCSID macro definition is the CCSID associated with direct “To” and “From” translation tables. If this parameter is not 5 digits, it causes an assembly error.

to-address

On the first or only ISPCCSID macro definition, this parameter specifies the address of the translation table that converts data from the CCSID associated with the respective ISPCCSID translation load module to CCSID 00500. On subsequent ISPCCSID macro definitions within the same ISPCCSID translation load module, this parameter specifies the address of the translation table that converts data from the CCSID associated with the respective ISPCCSID translation load module to the CCSID specified on this ISPCCSID macro definition.

from-address

On the first or only ISPCCSID macro definition, this parameter specifies the address of the translation table that converts data from CCSID 00500 to the CCSID associated with the respective ISPCCSID translation load module. On

subsequent ISPCCSID macro definitions within the same ISPCCSID translation load module, this parameter specifies the address of the translation table that converts data from the CCSID specified on this ISPCCSID macro definition to the CCSID associate with the respective ISPCCSID translation load module.

ISPCCSID translation load module definition examples

Each ISPCCSID translation load module must be compiled separately using High Level Assembler (or a functional equivalent).

This example shows the ISPCCSID macro used with the Basic ISP00111 translation module.

```

                ISPCCSID CCSID=00111,TO=TRT0500,FROM=TRFR500
*
*
TRT0500  DC    XL191'...           00111 TO 00500
TRFR500  DC    XL191'...           00111 FROM 00500 (00500 TO 00111)
                END

```

This example shows the ISPCCSID macro used with the ISP00222 translation module with two direct CCSID entries.

```

                ISPCCSID CCSID=00222,TO=TRT0500,FROM=TRFR500
                ISPCCSID CCSID=00333,TO=TRT00333,FROM=TRF00333
                ISPCCSID CCSID=00444,TO=TRT00444,FROM=TRF00444
*
*
TRT0500  DC    XL191'...           00222 TO 00500
TRFR500  DC    XL191'...           00222 FROM 00500 (00500 TO 00222)
*
*
TRT00333 DC    XL191'...           00222 TO 00333

```

Example of user-modifiable ISPF translation table

This is the module for CCSID 00037 (ISPSTC1). The existing tables can be modified, or more pairs of direct translation tables can be added. To add direct translation tables, add a new ISPCCSID macro call for the new direct translation tables, and add the new tables. The assembler program should be renamed to ISPTTC nn , where nn is the last 1-digit or 2-digit number of the ISPSTC nn name. For example, ISPSTC1 should be renamed ISPTTC1, and ISPSTC14 renamed ISPTTC14.

```

* THESE MACROS WILL GENERATE THE CCSID 00037 MODULE.

Displaying square brackets used in C programs

The standard non-APL terminals that ISPF supports do not have the left and right brackets used in a C program. Therefore, the translation tables provided with ISPF are defined so that these characters are not valid and are displayed as periods.

If you have a terminal that supports these characters, you can modify the translation tables TTVAl and TTGSM. To do so, simply indicate that these characters are valid.

Note that the C/370™ compiler expects the brackets at code points AD and BD. On an APL or TEXT terminal, if you use the ISPF-supplied terminal type 3278A, the code points AD and BD are displayed correctly as left and right brackets.

ISPEXEC processing

ISPEXEC is an external entry point in module ISPLINK. This is how ISPF supports the Call ISPEXEC interface in module dialogs. As a result of executing a CLIST that is not under ISPF, if the CLIST contains ISPEXEC dialog service statements, CLIST might try to invoke the ISPEXEC module as a command processor. The results of this change are as follows:

- If the ISPLINK module (or its alias entry points ISPLNK, ISPEXEC, ISPEX, or ISPQRY) is not invoked under ISPF, TSO issues an error message with a return code of 20.
- The ISPEXEC entry point can interfere with your installation's setup if someone creates a CLIST called ISPEXEC, or if a CLIST specifically checks for a return code of 12 (TSO issues return code 12 if you try to invoke ISPEXEC when not under ISPF). To eliminate this problem, you make this change:
 - Move the ISPLINK load module (and alias entry points ISPLNK, ISPEXEC, ISPEX and ISPQRY) to a library that is not defined in the search sequence for attaching commands under ISPF.
- The ISPLINK load module is usually link-edited with dialog functions coded in a programming language. Therefore, you should copy ISPLINK to an "automatic call" link-edit library. Modify existing CLISTs to recognize the ISPEXEC return code of 20 for invocation outside of an ISPF environment (testing for a return code not equal to 0 is recommended). If you choose, you can turn off (NOP) the error message issued from the ISPLINK (and ISPEXEC) module by applying this SUPERZAP:

NAME	ISPLINK	ISPLINK	
VER	00FC	0A5D	TPUT SVC
REP	00FC	0700	NOP INSTRUCTION

Remember that the location of the 0A5D instruction can change from 00FC as a result of maintenance.

ISPF-to-APL2 terminal type mappings

ISPF-to-APL2 terminal type mappings provides information about how to add or change mappings, if you need to do so. See *z/OS ISPF Dialog Developer's Guide and Reference* for a description of the ISPF/APL2 terminal type dialog, ISPAPTT.

ISPAPTT consists of an 8-character header (with value ISPAPTT), and fifteen 20-character entries. Each 20-character entry contains three fields. All fields are left-justified and padded on the right with blanks.

- The first 13 entries each appear as follows:
 - A 4-character EBCDIC sequence number; for example, "0001," "0002"
 - An 8-character EBCDIC ISPF terminal type
 - An 8-character EBCDIC APL2[®] terminal type
- The 14th entry consists of:
 - A 4-character EBCDIC sequence number; for example, "0014"
 - An 8-character EBCDIC value of "BATCH" noting the ISPF terminal type used if executing in the background (dialog ISPAPTT looks for this value)
 - An 8-character EBCDIC value of "1" noting the APL2 terminal type to be used if executing in the background
- The last (15th) entry contains:
 - A 4-character EBCDIC value equal to "LAST"
 - An 8-character value composed of all hexadecimal Fs, indicating the end of the list (dialog ISPAPTT looks for this value)
 - An 8-character EBCDIC value of "3277" indicating the APL2 terminal type to be used if the ISPF terminal type is not found in the list

You can change any of these values by performing a zap of the module. Include the APL2 terminal type to use in the background, and the APL2 terminal type to use if the ISPF terminal type is not found in the list.

Note: Do not alter the ISPF terminal type "BATCH" in the 14th entry or the 8-character hexadecimal Fs in the 15th entry.

Several of the first 13 entries can be changed to allow new terminal types. These entries contain a 4-character EBCDIC sequence number followed by 16 characters (two 8-character areas) of binary zeros. To change these entries use a zap and enter the ISPF terminal type into the first 8-character area, and the corresponding APL2 terminal type into the second 8-character area.

Load APL2 workspace

If you run APL2 with ISPF, each ISPF/APL user must load an APL2 workspace from the ISPALIB library. This assumes APL2 is correctly installed and the VSAM cluster needed to hold existing workspaces is defined. The ISPF/APL user only has to perform this step once.

The workspace to use is in the ISP.SISPALIB data set. To place the workspace into the VSAM cluster with your existing APL2 workspaces:

Operand Description

HEADER

Parameter values are as follows:

NOUSRFLG

The number of user flag bytes defined. The value can be a number between 0 and 4, inclusive. The default is 0.

DFUSRFLG

The user flag that is to be used for an entry when the USRFLG operand is not specified. This must be a hexadecimal string, whose length in bytes must be NOUSRFLG. If you define a default user flag with this operand, the value for the NOUSRFLG operand must be greater than 0. If you do not define a default user flag and you indicated on the NOUSRFLG operand that a user flag exists, ISPF uses a string of binary zeros of whatever the length is in NOUSRFLG for the default user flag.

DFFLAG

The value of the ISPF flag to be used for the default entry in ISPTCM. The default entry determines the characteristics of commands not found in ISPTCM. The value should be a 1-byte hexadecimal string. The default is 61.

DFCLRLNS

The number of lines to clear from the bottom of the physical screen for line I/O when the CLRLNS operand is not specified. The value must be in the range from 0 to 99. The default is 3.

ENTRY

Parameter values are as follows:

ENTNAME

A valid TSO command name. This operand is required for ENTRY calls. The alphabetic characters in ENTNAME must be in uppercase letters. Duplicate entry names cause an error message to be issued.

FLAG The value of the ISPF flag byte for the current entry. The default is 02.

Flag Field Description

B'1.....'
Reserved.

B'.1.....'
Command requires function pool. Set this bit on for a command processor program that issues dialog services.

B'..1.....'

Command requires authorization check. Set this bit on for a command processor that must be invoked as an authorized command.

B'...1.....'

Command is not to be logged. Set this bit on if the TSO command buffer should not be written to the ISPLOG data set.

B'....1....'

Command is not supported by ISPF. Set this bit on for commands that cannot be invoked under ISPF.

B'.....1..'

Command is command procedure (CLIST). Set this bit on if this is the name of a CLIST member.

B'.....1.'

Command is a command processor. Set this bit on if this is the name of a command processor program module.

B'.....1'

Command requires a BLDL to be issued. Set this bit on if a BLDL is to be issued to determine whether this is a command processor module or a CLIST.

USRFLG

The value of the user flag for the current entry. Specify this parameter only if NOUSRFLG is not 0. If you do not specify a value and NOUSRFLG is greater than 0, ISPF uses the default user flag (DFUSRFLG). If specified, USRFLG must be a hexadecimal string with a length equal to the value of NOUSRFLG.

CLRLNS

The minimum number of lines to clear if line mode is entered for this entry. The value should be an integer from 0 to 99. Specifying a value of 0 causes the entire physical screen to be erased. If you do not specify a value for CLRLNS, the DFCLRLNS value in the type HEADER call is used.

When the value for the number of lines to clear is nonzero, ISPF determines where to clear the screen according to:

1. ISPF calculates a value = (number of lines in the visible portion of the active logical screen - 1) - CLRLNS
2. The lesser of this calculated value and the number of lines in the panel displayed on the active logical screen (but not less than 0) is the number of the line after which the screen is cleared. Thus, ISPF will clear more than the CLRLNS number of lines if it can do so without overlaying the displayed panel.

Note:

1. If a CLRLNS value is larger than the visible portion of the active logical screen, ISPF erases the screen beginning at the top of the logical screen.
2. In split-screen mode, if line mode is entered when the top screen is active, the bottom screen will always be cleared. If the bottom screen is active, the bottom screen will be cleared (even if CLRLNS is greater than the physical screen size).

3. For DBCS devices, ISPF always erases the screen beginning at the top of the current logical screen, regardless of the CLRLNS value.
4. For 3290 devices, the entire physical screen is always cleared before going into line mode.

END Must be last macro call.

Sample ISPTCM definition

An example of how to use the ISPTCM macro to build ISPTCM is shown in Figure 59.

```
ISPTCM  HEADER,DFCLRLNS=5,NOUSRFLG=2,DFFLAG=61

ISPTCM  ENTRY,ENTNAME=ALLOCATE,CLRLNS=4

ISPTCM  ENTNAME=MYCMDA,USRFLG=FFFF
ISPTCM  ENTNAME=MYCMD1,CLRLNS=10,FLAG=14

ISPTCM  END
```

Figure 59. Sample ISPTCM definition

ISPTCM usage notes

- ISPTCM is a load module that contains a list of command names and their characteristics. ISPF processes each command in ISPTCM according to the FLAG field defined for its entry. If a command is not in ISPTCM, the DFFLAG parameter is used. The default value of DFFLAG is 61, which indicates to ISPF that commands not contained in ISPTCM require a function pool, an authorization check, and must be logged. Also, a BLDL should be done to locate the command. If the BLDL cannot locate the command, ISPF assumes it to be CLIST and attaches the EXEC command processor.
You can alter DFFLAG to suit the needs of your installation. If you have not changed DFFLAG, or changed it so that it still calls for a BLDL, if a command processor is to run from the link pack area, its name *must* be in ISPTCM.
- Certain commands, such as, LOGON and ISPF are invalid under ISPF. Do not attempt to make these entries valid by changing the FLAG. The results are unpredictable.
- The USRFLG is an optional field for an entry in ISPTCM. If you define exit routines for TSO command start or TSO command end user exits, or both, you can define USRFLG according to your installation's needs. If you do, ISPF passes these flags to the exit routines. These flags do not affect ISPF execution. See Chapter 6, "ISPF installation-wide exits," on page 121 for a description of how the parameters are passed.
- One, and only one, of the last 3 bits of FLAG and DFFLAG must be 1. Otherwise, the results will be unpredictable.
- The presence or absence of a command in the TCM can affect the search sequence, as depicted in this table.

Search sequence for attaching commands

ISPF attaches a command invoked through the SELECT command, ISPF option 6, or TSO command. The search sequence for locating the command is shown in Figure 60 on page 118.

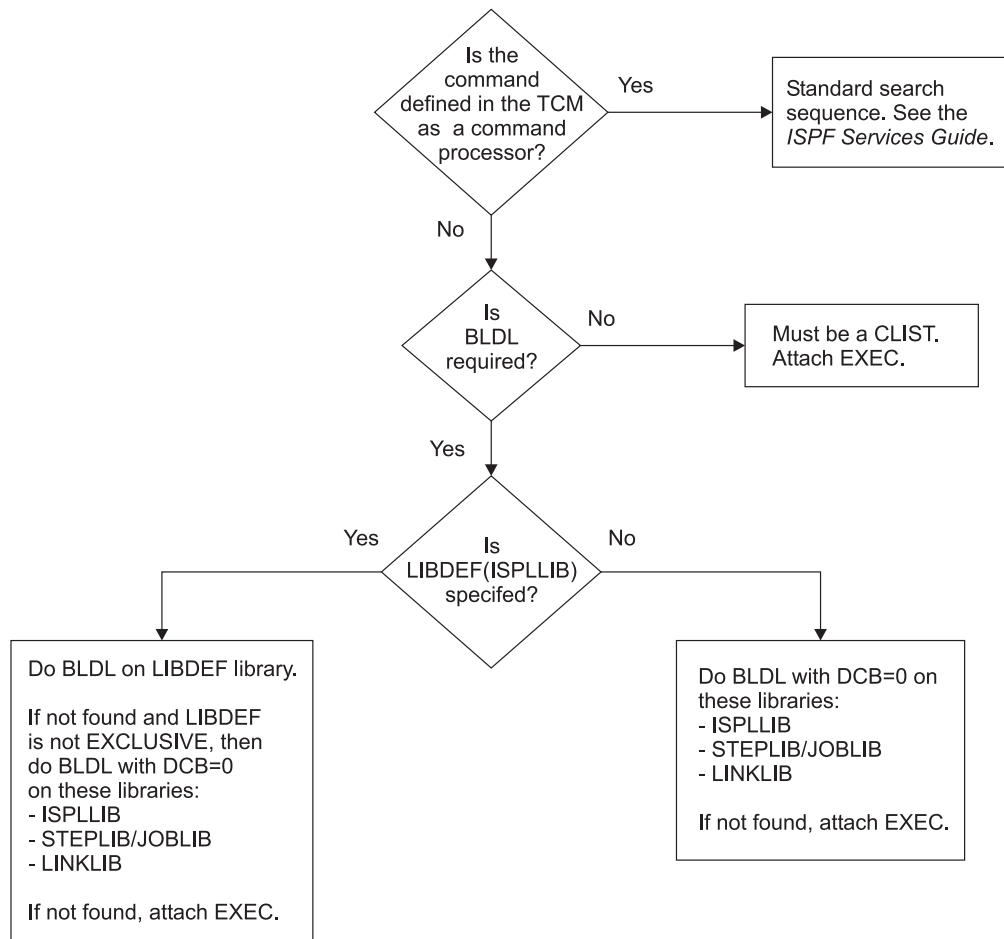

Figure 60. Search sequence for attaching commands

Alternate option 7.1 panels

Panel ISPYFP, the normal panel displayed with option 7.1, requires extra scrolling to display some of the test entry fields and options. Because this can be inconvenient, ISPF provides alternate panels for ISPYFP. The alternate panels present all of the same entry fields and options in revised formats.

Panel ISPYFPA places most of the commonly used information within the first 24 panel lines. This format often eliminates the need for panel scrolling.

Panel ISPYFPB is similar to panel ISPYFPA, but it has a selection field that enables the user to select a function: panel, command, program, or request. Unlike panels ISPYFP or ISPYFPA, on panel ISPYFPB the panel, command, program, or request fields can all contain values.

All three panels are included in the product panel library. To select which panel to use, set the ISPF Configuration table keyword `USE_ALTERNATE_DIALOG_TEST_PANEL` to one of these options:

- 1 ISPYFP panel
- 2 ISPYFPA panel

ISPF multicultural support

Note: The term "multicultural support" has replaced the previous term "National Language Support" (or "NLS").

To make ISPF available at your installation in a language other than or in addition to English, follow these instructions. You can install as many of the supported languages as needed by your installation.

1. Allocate and load libraries specific to the language. See the *z/OS Program Directory* for installation instructions.
2. Optionally, set up a default language for your installation.

With the standard version of ISPF, the default session language is English. You must invoke ISPF (ISPSTART) with a language keyword to get the session in a different language. If ISPF is used at your installation primarily in a non-English language, it is recommended that you change the default language. The benefits of doing this are:

- Not having to enter the language keyword when invoking ISPSTART
- Improved initialization time
- Possibly smaller LPA use
- Initialization error messages are issued in the default language.
- See "Changing the session language default value" for further details.

3. Set up the execution environment.

To run ISPF in any session language, perform these steps:

- Allocate panel, message, skeleton, table, and profile table libraries according to the language desired. The ddnames ISPPPLIB, ISPMLIB, ISPSLIB, ISPTLIB do not change with the language used.
- Issue the ISPSTART command (with the desired language keyword if this language is different from the default language).

To run PDF in a language other than the default, issue the PDF command with the desired language keyword (for example, PDF GERMAN).

Changing the session language default value

The Session Language Default value is a keyword, `DEFAULT_SESSION_LANGUAGE`, in the ISPF Configuration Table (see 248). For information about changing Configuration Table settings, see Chapter 2, "The ISPF Configuration Table," on page 11.

Chapter 6. ISPF installation-wide exits

Programming interface information

ISPF provides 16 installation-wide exits that allow you to collect system-related information such as accounting, activity monitoring, authorization checking, and installation tailoring. These installation-wide exits occur at selected places during ISPF execution and pass control to your exit routines in the order you define them when you install the routines. You can define one or more exit routines to process at each user exit.

Table 25 summarizes the ISPF installation-wide exits. The exit ID is a unique number that identifies that installation-wide exit to ISPF.

Table 25. ISPF installation-wide exits

Exit ID	Installation Exit Name	Possible Uses for the Routine
1	ISPF initialization	Provides accounting and monitoring capabilities before ISPF initialization.
2	ISPF termination	Provides accounting and monitoring capabilities before ISPF termination.
3	SELECT service start	Provides monitoring information and lets you restrict access to applications selected through ISPF.
4	SELECT service end	Marks the end of a program, command, or menu invoked through any of the SELECT services.
5	TSO command start	Provides for monitoring and restricting commands invoked through ISPF; allows commands newly added to the system to be invoked without updating ISPTCM.
6	TSO command end	Provides for monitoring of TSO commands invoked through ISPF.
7	LIBDEF service	Provides for restrictions on the use of the LIBDEF service.
8	RESERVE	Allows use of your own method of serializing resources in addition to the RESERVE done by ISPF.
9	RELEASE	Provides for the release of any resources acquired at the RESERVE user exit.
10	Logical screen start	Allows for installation-wide exits to gather accounting and monitoring information for each logical screen.
11	Logical screen end	Gathers accounting and monitoring information for each logical screen.
12	ISPF/PDF service start	Monitors ISPF and PDF dialog services invoked through the ISPLINK or ISPEXEC interfaces.
13	ISPF/PDF service end	Marks the termination of ISPF or PDF dialog services invoked through the ISPLINK or ISPEXEC interfaces.
14	SWAP logical screens	Indicates a change of the active logical screen. Together with the logical screen start and end installation-wide exits, the routine can monitor resource use for each ISPF logical screen.
15	DISPLAY service start	Provides for tailoring of panels to be displayed.

Table 25. ISPF installation-wide exits (continued)

Exit ID	Installation Exit Name	Possible Uses for the Routine
16	Log, list, and temporary data set allocation	Controls data set naming conventions for log, list, and temporary data sets.

The ISPF installation-wide exits are linked together in the ISPEXITS load module. The main entry point of ISPEXITS is ISPXDT. ISPXDT defines which of the 16 installation-wide exits you plan to use and the names of the exit routines that receive control at each user exit. To assist you in building ISPXDT, ISPF provides seven assembler macros. These macros are described in “Exit macros” on page 265.

As you write exit routines for the ISPF installation-wide exits, remember that:

- Even though you can define multiple exit routines for a user exit, if an exit routine returns a return code of 12 or greater in register 15, control returns to ISPF without executing the remaining routines.
- You cannot activate or deactivate a user exit while an ISPF session is in progress. However, you can make changes to the ISPEXITS load module at any time, but remember that ISPF loads the module only once at session initialization. Therefore, the changes are not recognized until the next ISPF session.
- Because ISPF loads the ISPEXITS load module only once, consider making any exit routines that you write re-usable, and preferably reentrant. If you write exits that are *not* reentrant, they cannot be put in the Link Pack Area (LPA) library. Non-reentrant exit routines placed in the LPA can cause abend errors.
- You cannot invoke an ISPF service from within the exit routines.
- The installation-written exit routines receive control in an addressing mode of AMODE=31. The exit routines must support 31-bit addressing. ISPF does not restrict the residency mode of the installation-wide exits.
- Input-output exit routines can modify parameters. If there are multiple exit routines, successive routines receive these parameters as modified by the previous routine. The first exit routine receives parameters as described.
- You can define a data area to be used by each exit routine. These data areas can be shared by different exit routines.
- At initialization, ISPF gets the storage for the data area. It provides the length and the address of the data area in the parameter list when calling an exit routine that uses that data area. (ISPF obtains the storage from subpool 0 below the 16 MB line.) The first time ISPF calls the exit routine, the data area contains binary zeros. The information in the data area is retained between invocations of the exit routines and the storage is available for the entire ISPF session (independent of logical screen abends and restarts). It is released at ISPF termination.
- Data areas are on double-word boundaries.

How to install the installation-wide exits

To install an ISPF installation-wide exit:

1. Indicate in installation tailoring that ISPF installation-wide exits are defined. When you install ISPF, you indicate that exit routines might exist by setting the ENABLE_ISPF_EXITS keyword in the ISPF Configuration table to YES. As a result, you can replace, add, or remove exit routines by simply reassembling

ISPXDT and relinking ISPEXITS. Otherwise, ISPF uses the default value of NO and does not load the ISPEXITS module. In this case, you cannot invoke any exit routines and you have to repeat part of the installation process if you want to change this value. See Chapter 2, “The ISPF Configuration Table,” on page 11 for more information.

2. Use the exit macros to assemble the exit definition table (ISPXDT). This process is discussed in detail in “Exit macros” on page 265. These macros reside in ISP.SISPMACS.
3. Link-edit the ISPEXITS load module. ISPXDT is the main entry point of this module. There is no need to include any other ISPF-supplied CSECTS in ISPEXITS. Figure 61 contains sample JCL to link-edit ISPEXITS.

```
//LKED EXEC PGM=IEWL,REGION=1024K,
// PARM='XREF,LET,LIST,RENT,SIZE=(512K,128K)'
//SYSPRINT DD SYSOUT=A
//SYSUT1 DD UNIT=SYSDA,SPACE=(TRK,(10,5))
//SYSLMOD DD DISP=SHR,DSN=ISP.SISPLoad
/* All exit routines and ISPXDT CSECT must be in SYSLIB,
/* but an INCLUDE SYSLIB statement is only required for
/* ISPXDT and not for the exit routines.
//SYSLIB DD DSN=ISP.LOCOBJ,DISP=SHR
//SYSLIN DD *
        ORDER ISPXDT
        ENTRY ISPXDT
        INCLUDE SYSLIB(ISPXDT)
        NAME ISPEXITS(R)
/*
//
```

Figure 61. Sample JCL to Link-Edit ISPEXITS

4. ISPXDT does not contain any executable code. If your exit routines are reentrant, ISPEXITS can be copied into the LPA library. Otherwise, it must be copied into the system link library.

“Exit macros” on page 265

How to use the macros to define ISPXDT

To define ISPXDT using the exit macros:

1. Indicate the beginning of the exit entry definition section of ISPXDT by coding one ISPMXED macro with the START operand. For example:

```
ISPMXED START
:
:
```

2. Define the installation-wide exits you plan to use. Code the ISPMXLST macro, listing the numeric codes for each user exit in ascending order, enclosed within parentheses. This example shows that exit routines will be installed at ISPF installation-wide exits 3, 7, and 14.

```
ISPMXED START
ISPMXLST (3,7,14)
:
:
```

If no operand is specified, a dummy ISPXDT is built.

3. For each user exit that you define on the ISPMXLST macro, use the ISPMXDEF, ISPMEPT, and ISPMXEND macros to define one or more exit routines. These three macros are a set and must be coded for each user exit you identify.

- Code the ISPMXDEF macro with the exit ID as its operand.
- Code the ISPMEPT macro for each exit routine and, if required, its data areas.
- Code the ISPMXEND macro to end the exit routine definitions for this user exit.

In this example, three exit routines are defined at user exit 7. The first two share a common data area (DAREA015) and the third uses a different data area (DAREA027). ISPF calls entry points EXPT7EP1, EXPT7EP2, and EXPT7EP3 in that order unless one of the routines returns a return code of 12 or greater. For example, if entry point EXPT7EP2 returns a return code of 12, control returns to ISPF without executing entry point EXPT7EP3. Therefore, if you define more than one exit routine at a given user exit, define them in the correct order of priority.

```
ISPMXED START
ISPMXLST (3,7,14)

:
ISPMXDEF 7
ISPMEPT EXPT7EP1,DAREA015
ISPMEPT EXPT7EP2,DAREA015
ISPMEPT EXPT7EP3,DAREA027
ISPMXEND
```

:

If you use the ISPMXDEF macro to define an exit ID that is not listed on the ISPMXLST macro, ISPF issues a warning message. You can still use ISPXDT, but the user exit is defined. As a result, you can easily disable a user exit by deleting its exit ID on the ISPMXLST macro. However, for every exit point listed on the ISPMXLST macro, there must be a corresponding ISPMXDEF macro.

4. Indicate the end of the exit entry definition section of ISPXDT by coding the END operand on the ISPMXED macro. For example:

```
ISPMXED START
ISPMXLST (3,7,14)
```

:

```
ISPMXED END
```

5. Define the data areas used by the exit routines in the exit data area definition section of ISPXDT. Indicate the start of this section by using the START operand on the ISPMXDD macro. For example:

:

```
ISPMXED END
ISPMXDD START
```

:

6. Use the ISPMDAD macro to define the name and size of each data area defined on an ISPMEPT macro. Every data area referenced on an ISPMEPT macro must be defined by an ISPMDAD macro.

This example defines DAREA015 to be 100 bytes long. (ISPF rounds the length to 104 in this case.)

:

```
ISPMXDD START
ISPMDAD DAREA015,100
```

⋮

If you use the ISPMDDAD macro to define a data area that is not coded on an ISPMEPT macro, a warning message is issued during assembly and storage for the area is not obtained during execution. If none of your exit routines require a data area, you need not code an ISPMDDAD macro, but you must still code ISPMXDD START and ISPMXDD END.

7. Use the ISPMXDD macro to indicate the end of the exit data area definition section. For example:

⋮

```
ISPMXDD START  
ISPMDDAD DAREA015,100
```

⋮

```
ISPMXDD END
```

Sample ISPXDT definition

Figure 62 shows a sample ISPXDT definition that defines exit routines for installation-wide exits 2 and 12.

```

```

Figure 62. Sample ISPXDT definition

At user exit 2, exit routines with entry points MYEXT021, MYEXT022, and MYEXT023 are called, in that order.

At user exit 12, exit routines with entry points MYEXT121, MYEXT122, MYEXT123, and MYEXT124 are called, in that order.

MYAREA01 (1024 bytes) is used by exit routines at MYEXT021 and MYEXT122.

MYAREA02 (2048 bytes) is used by exit routines at MYEXT022, MYEXT023, and MYEXT124.

MYAREA03 (256 bytes) is used by the exit routine at MYEXT121.

Exit routine MYEXT123 does not require a data area.

Exit parameter list

Each of the ISPF exit routines is passed a parameter list that contains parameters common to all the installation-wide exits and parameters that are specific to the user exit. The parameters are in the order shown here, followed by exit-specific parameters in the order shown under the individual user exit description. The common parameters are:

exitid A fullword binary number that identifies the numeric code for the user exit.

userid An 8-character field that contains the TSO user ID (left-justified) of the current TSO session. If ISPF is running in batch and there is no TSO user ID, the DSN prefix (as set by the TSO PROFILE PREFIX command) is placed in the Userid field. If there is no DSN prefix, the Userid field contains the characters 'BATCH '.

screenid

An 8-character field that identifies the active ISPF logical screen. Because ISPF supports up to 32 logical screens, the possible values are 0 through 9 and A through W.

At initialization and termination exit points, 0 indicates no active logical screens.

These identifiers are left-justified and the field is padded with blanks.

ZENVIR

32 characters of environmental information that is provided by the ZENVIR ISPF system variable. This variable is described in *z/OS ISPF Reference Summary*.

datalen

A fullword binary number that identifies the length of the exit data area, in bytes.

dataptr

The fullword address of the data area ISPF acquires for the exit routine. If you do not provide a data area name on the ISPMPT macro, this address, as well as the data length, is 0. Note that the data area is always on a doubleword boundary and data length is a multiple of eight.

Standard OS linkage conventions are followed. For example: Register 1 (which points to a list of addresses; each address points to a different parameter) is used to pass the parameter list to the exit program. For more information about linkage conventions, refer to *z/OS MVS Programming: Assembler Services Guide*.

Error processing

The installation-wide exit interface is a system programmer interface and, as such, no special error protection is provided for the exit routines. The ESTAE and ESTAI exit routines ISPF uses for abend recovery are used to recover from errors in the code for the user exit.

Abends within exit routines at these installation-wide exits cause ISPF to terminate:

- ISPF session initialization exit

- ISPF session termination exit
- Logical screen start exit
- Logical screen end exit
- SWAP exit

Abends within exit routines at any other user exit do not terminate ISPF, but do result in a logical screen restart, unless running in test mode or with ENBLDUMP on.

_____ **End Programming interface information** _____

Chapter 7. Customizing PDF

Customizing PDF describes procedures you can use to customize PDF.

Installation options modify the distributed release of PDF to suit your installation's particular needs. Most of the installation options are in the configuration table described in Chapter 2, "The ISPF Configuration Table," on page 11. You make some of these modifications by editing the panel descriptions in the ISPF panel library (ISPLIB data set).

All panels in the ISPLIB data set are in ISPF panel format. All messages in the ISPLIB data set are in ISPF message format. These formats are described in the *z/OS ISPF Dialog Developer's Guide and Reference*.

These topics describe how to modify the distributed release of PDF:

"Edit mode defaults"

"Data set allocation defaults for the Outlist utility" on page 132

"Using the Hardcopy utility with DBCS support" on page 133

"SCLM Batch considerations" on page 133

"Converting from LMF To SCLM" on page 136

"Creating PDF translation tables" on page 138

"PDF Foreground and Batch customizing" on page 139

"Customizing Browse and Edit" on page 178

"Customizing member list panels" on page 182

"IBM Products option" on page 187

See also Chapter 8, "PDF installation-wide exits," on page 193.

Edit mode defaults

PDF saves several different edit modes in an edit profile. The user can specify the desired edit profile on the Edit Entry Panel. If the Profile field is left blank, the data set type is used as the profile name. For more information about edit profiles, refer to *z/OS ISPF Edit and Edit Macros*.

To preinitialize a set of edit profiles for first-time users, perform these steps:

1. Enter PDF.
2. Select the Edit option.
3. Set the edit profile with the defaults you chose.

For example, to set "COBOL FIXED 80" in your profile, edit a member of a partitioned data set that has a RECFM of F or FB, a LRECL of 80, and a type qualifier of COBOL (or enter COBOL as the profile name on the Edit Entry Panel).

ISPF provides two methods for initializing new edit profiles; you can set up a profile called ZDEFAULT in the ISPTLIB concatenation, or you can modify the edit profile defaults in the ISPF configuration table. The ISPF configuration table method is recommended because it is easier to maintain than the ZDEFAULT method. The ZDEFAULT method can still be used by individual users.

Site-wide edit profile initialization

When no ZDEFAULT profile exists in the ISPTLIB concatenation and the user has no edit profile member in the ISPPROF concatenation, new edit profiles are created based on the settings in the ISPF configuration table. Using the configuration table, you can change any of the defaults for new edit profiles and you may override (force) settings for PACK, RECOVERY, WARN, SETUNDO, STATS, and IMACRO in existing profiles. When a setting is forced the editor WILL CHANGE the users' profiles, so be very careful if you override the IMACRO setting. IBM recommends that you use the site-wide initial macro instead of forcing the initial macro in each user's profile.

It is helpful to understand when the ZDEFAULT profile is used and where it exists in a user's concatenations. The ZDEFAULT profile exists as a row of the edit profile table named xxxEDIT where xxx is the application profile.

If ZDEFAULT exists in the edit profile table in the ISPTLIB concatenation, and the user has NO edit profile table in the ISPPROF allocation, the ZDEFAULT profile is copied from ISPTLIB into the user's edit profile when the user's edit profile is created. Therefore, many of your existing users may already have a ZDEFAULT profile in their edit profile. Individual users may delete their ZDEFAULT profiles using the PROFILE RESET command from within an edit session. Doing so will allow them to use the site-wide configuration for new profiles. You may also use a site-wide edit initial macro to issue a PROFILE RESET for all users. ISPF does not ship any edit profiles.

Note: If you use the force settings such as PACK OFF, edit macro commands which attempt to change forced settings will not get a failing return code, but the settings will not change.

Creating a ZDEFAULT profile

Set up a special edit profile named ZDEFAULT (enter ZDEFAULT as the profile name on the Edit Entry Panel). The ZDEFAULT profile is the one used for the initial settings whenever a new edit profile is generated, regardless of the RECFM and LRECL values. For example, if you do not have an ASM profile and you edit an ASM data set, an ASM profile is generated using ZDEFAULT for the initial settings. If no ZDEFAULT profile exists, one is automatically generated with settings obtained from the ISPF Configuration Table.

The number of profiles you can establish also is described in the configuration table. See Chapter 2, "The ISPF Configuration Table," on page 11 for more details. When you finish, exit PDF. Your entire set of edit profiles is saved in your profile library (referenced by ddname ISPPROF) as the ISREDIT member.

The previous discussion assumes you are using Edit from the Edit Entry Panel, which is option 2 of the ISPF Primary Option Menu. If Edit is invoked from another dialog or if this dialog is altered, Edit might be invoked using a NEWAPPL value other than ISR. If this is the case, the table name begins with the NEWAPPL ID rather than ISR. Therefore, you must create a new set of defaults for the NEWAPPL ID. Copy this member to the table input library (referenced by ddname ISPTLIB). When a first-time user enters ISPF, there is no ISREDIT member in that user's profile library. As a result, Edit searches the table input library for member ISREDIT and uses it as the initial set of profiles for the new user. No ISREDIT member is distributed with the ISPF table input library.

Action bars and extended color in Edit

Two ISPF configuration table keywords control whether action bars and highlighting are displayed in ISPF Edit. Disabling action bars provides more space to display data in the Edit panel. Disabling extended color support can improve system performance.

The keyword `ALLOW_EDIT_HIGHLIGHTING` can disable extended color support for all applications, including PDF itself and applications that use their own panels enabled for extended highlighting.

The `DEFAULT_EDIT_DISPLAY` keyword can be used to set the attributes of edit sessions invoked directly by PDF or by programs that invoke the edit service panel name other than `ISREDDE2`, `ISREDDE3`, `ISREDDE4`, or `ISREDDE5`. Using `DEFAULT_EDIT_DISPLAY`, you can make the edit session have:

- Neither action bars nor extended highlighting
- Extended highlighting with no action bars
- Action bars with no extended highlighting
- Both action bars and extended highlighting

`DEFAULT_EDIT_DISPLAY` can also be used to configure the editor to use the display method used in previous releases. This method does not support action bars or extended highlighting, but it performs much faster than the other methods. For more information, see “Disable Edit extended highlighting” on page 76.

If `ALLOW_EDIT_HIGHLIGHTING` is set to `NO`, the extended highlight support is disabled regardless of how `DEFAULT_EDIT_DISPLAY` is set.

See “Edit-related settings” on page 223 for more information about these keywords.

Edit backup and recovery

Edit backup and recovery is controlled by two edit recovery tables. Table `ISREDRT` is used for PDF edit without the Edit Interface (EDIF) service. Table `ISREIRT` is used for PDF edit with the EDIF service. A copy of the tables is automatically saved in each user's profile library. The number of entries (rows) in each table controls the number of recursion levels supported for backup and recovery. CLIST `ISREDRTI` or `ISREIRTI` for the EDIF service, builds the edit recovery table (`aaaaEDRT`, where `aaaa` is the ZAPPLID) the first time edit recovery is used for a given user and application ID.

The default table allows eight levels of recursion. After the table is built, you can execute CLIST `ISREDRTS` or `ISREIRTS` for the Edit Interface service to display it. To change the default size of the table, change the ‘SET N = ’ statement in CLIST `ISREDRTI` or `ISREIRTI` to any number from 1 to 99.

When a user enters Edit mode and recovery mode is on, or when a user attempts to turn on recovery mode, Edit automatically allocates a recovery data set if there is an unused entry in the edit recovery table. The edit recovery data set name is generated and placed in the table. The names generated are `ZPREFIX.ZUSER.AAAAxxx.BACKUP`, (where `AAAA` is the application ID and `xxx` is a 4-digit number between 0000 and 9999) if `ZPREFIX` and `ZUSER` are different, and `ZUSER.AAAAxxx.BACKUP` if `ZPREFIX` and `ZUSER` are the same.

The edit interface recovery table contains data set names with a last qualifier of `BACKUPI` instead of `BACKUP`. These data set names are passed to the data set

name change exit, if one exists, and the installation can change the names, if desired. Whenever the data set name change exit changes the recovery data set name, the PDF-generated recovery data set name is deleted and reused. The data set name change exit should check the recovery table and generate a unique data set name. The modified name is placed in the recovery table. If there is no unused entry, a message is displayed indicating recovery mode is not available. The user can continue editing with recovery mode off.

When you enter Edit, the edit profile controls the initial setting of recovery mode. When you terminate Edit, the system automatically deletes the recovery data set and frees the corresponding entry in the edit recovery table.

These restrictions apply to edit recovery data sets:

- They must be allocated as sequential data sets of record format U.
- They cannot be striped, or striped and compressed data sets.
- They cannot be multivolume data sets.

Edit recovery will not delete edit recovery data sets listed in the edit recovery table when the table has a disposition field set to 'K' associated with the recovery data set name. This is an obsolete facility for preallocating edit recovery files or enforcing naming conventions for edit recovery files. Instead, use the data set name change exit for this purpose.

Data set allocation defaults for the Outlist utility

The Outlist utility (option 3.8) is available as either a CLIST (ISRUOL) or a program (ISRUOLP). The default used by ISPF is the program. To use the CLIST instead, perform these steps:

1. Modify panel ISRUTIL, changing:

```
      8, 'PGM(ISRUOLP)'  
to  
      8, 'CMD(ISRUOL)'
```

2. Modify the utilities action bar member (ISPDUTIL), changing:

```
<pdcc unavail=zut7 acc1=alt acc2=8>Outlist  
  <action run=ISRROUTE parm=U8>  
to  
  <pdcc unavail=zut7 acc1=alt acc2=8>Outlist  
  <action run=ISRUOL type=CMD>
```

3. Use Option 3.9 to create a command table entry called ISRUOL, specifying this as the action:

```
SELECT CMD(ISRUOL)
```

The Outlist utility invokes the TSO OUTPUT command to retrieve data from the SYSOUT queue. For the browse and print options of this utility, ISPF allocates a print data set and passes its name to the OUTPUT command by means of the PRINT parameter. The parameters in CLIST ISRUOL or the ISPF configuration table for program ISRUOLP determine the attributes of the print data set.

You can modify these print data set attributes to meet the needs of your installation. The default value for each attribute is shown in parentheses:

```
LRECL (133)  
BLKSIZE (3059)  
Primary space in tracks (200)  
Secondary space in tracks (100)
```

To change the attributes for CLIST ISRUOL, edit these lines as shown:

```

ATTR SPFUOL1 BLKSIZE(3059) LRECL(133)+
DSORG(PS) RECFM(FB &ZR)
ALLOC DA('&DSN') TRACKS /* */+
USING(SPFUOL1) RELEASE /* */+
SPACE(200 100) CATALOG /* */

```

To change the attributes for program ISRUOLP, modify the appropriate fields in the ISPF configuration table.

Using the Hardcopy utility with DBCS support

When double-byte character set (DBCS) data and field-ruling information are in a data set, you cannot use the print program provided with Hardcopy utility (option 3.6). You must modify the ISRUHCP panel and the ISRUHCS1 skeleton to print the contents of the data set.

Use the ISRUHCP panel to specify print information to ISPF. Also, include the printout destination. Modify the panel as follows:

1. Add these input fields to the)BODY section:
 - A field to indicate a user-supplied print program is going to execute
 - Fields to provide information to the user-supplied program.
2. Add this logic to the)PROC section:
 - After all input checking is finished, if the user-supplied program is requested and a local terminal ID is specified, copy the terminal ID to a variable and clear out the original variable. Set a dummy SYSOUT class, if not set already.
 - VPUT all newly defined variables to the profile pool.

For information on modifying the)BODY and)PROC sections of a panel, see the *z/OS ISPF Dialog Developer's Guide and Reference*.

The ISRUHCS1 skeleton uses IEBGENER to print the data set. Make these changes to this skeleton:

1. If the user-supplied print program is requested, modify the SYSUT2 DD statement from SYSOUT to a temporary data set. Modify the DCB information also.
2. If the user-supplied program is requested, add a job step for initiating the user-supplied program that prints the temporary data set. You can get all information for the user-supplied program from the variables in the profile pool.

SCLM Batch considerations

Before using the SCLM batch facility, modify the FLMLIBS skeleton to allow for batch submissions. FLMLIBS is found in the ISPF skeleton target data set ISP.SISPSLIB. It is the common imbed for the other SCLM skeletons used for batch submission. Modify the data set names in FLMLIBS to match your installation's naming conventions.

Note: In Figure 63 on page 135, the 'ISP' data set high-level qualifier represents your ISPF data sets. *xxx* corresponds to a national language as follows:

Language
 xxx
US English
 ENU (the default)

Uppercase English

ENP

Swiss German

DES

Japanese

JPN

German

DEU

Figure 63. Sample FLMLIBS skeleton

Converting from LMF To SCLM

The LMF function was removed from ISPF in z/OS V1R2.0. Users of LMF are encouraged to migrate their existing LMF-controlled libraries to SCLM. There are several differences between LMF and SCLM, but the basic library manager function is similar, so migrating the hierarchy from LMF to SCLM is straightforward. SCLM has a full set of services, so most dialogs that use LMF services can be converted easily to SCLM. SCLM also includes a complete set of Configuration Management options.

General conversion

Before doing the conversion, you should review the *z/OS ISPF Software Configuration and Library Manager Guide and Reference*, particularly these chapters:

- “Defining the Project Environment”, which describes the steps for setting up a project definition.
- “Converting Projects to SCLM”, which shows the steps for working with existing project data sets.

SCLM and LMF are similar in function, but there are some basic differences to consider when converting a project:

- In SCLM, all data sets in the hierarchy are controlled. This includes the data sets where the developers do their editing (called the *development level* in SCLM). These data sets are not controlled in the LMF environment.
- SCLM does not use a started task to update the controlled libraries. Users must have UPDATE authority to any level of the hierarchy that they must change, including the development level for editing, and any level into which they need to promote.
- SCLM uses a VSAM data set to hold its control information. Control information includes information about where members exist in the hierarchy, statistics, and dependency information.
- SCLM automates the BUILD step (compile, assemble, link-edit, and so on) and requires it to be done. This means SCLM must know what language is assigned to a part, and how the language is to be processed at BUILD time (called “SCLM Language Definition”).
- Output data, such as compiled object and load modules, can be automatically generated by SCLM. Review your processes to determine how to take advantage of SCLM's synchronization of source modules and assigned outputs.

To convert from LMF to SCLM, follow the steps listed in “Defining the Project Environment” in *z/OS ISPF Software Configuration and Library Manager Guide and Reference*. This takes you through the creation of the SCLM project definition and control data sets needed for SCLM.

The steps involved in defining the project environment are:

1. Determine the project hierarchy. For an existing project the hierarchy has already been defined, but a review is recommended.
2. Identify the types of data to support. Again, this has already been done with an existing project.
3. Establish authorization codes. Authorization codes control the movement of data within the hierarchy. The purpose of this step is to assign authorization codes to the hierarchy. Authorization codes restrict the drawdown and promotion of members to certain groups within the hierarchy. The concept is

similar to LMF's concepts of authorized promoters and member access control, except that LMF uses userids and SCLM uses group names to restrict drawdown and promotion.

4. Allocate the PROJDEFS data sets. The PROJDEFS data sets are used to store the project definition data for an individual project. The project definition contains some of the same types of information as the LMF control file, such as the structure of the hierarchy.
5. Allocate the project partitioned data sets. Because you are using an existing project, most of these data sets already exist. Since all data sets are controlled in the SCLM environment, you will have to create development level data sets as part of the hierarchy for the developers to use when editing data.
6. Allocate and create the control data sets. Control data sets are used to track and control application programs within the hierarchy. There are 5 types of VSAM data sets that can be associated with a project:

Primary Accounting

The accounting data sets contain information about the software components in the project including statistics, dependency information and build maps (information about the last build of a member). At least one accounting data set is required for a project. The accounting data set contains some of the same types of information as the LMF control file, such as the member locking data.

Secondary Accounting

This is an optional backup of the information in the primary accounting data set.

Export Accounting

The export accounting data set contains accounting information that has been exported from the accounting data set. It is only required if the Import/Export functions of SCLM are used.

Primary Audit Control

The audit control data set contains audit information about changes to the software components in the project for groups that have auditing turned on. The audit data set contains the same types of information as the LMF activity log, as well as versions of members, if requested.

Secondary Audit Control

This is an optional backup of the information in the primary Audit Control data set.

7. Protect the project environment. This step should be reviewed because SCLM is structured slightly differently than LMF. Remember that developers must have UPDATE authority to the levels they need to change.
8. Create the project definition. The project definition is an assembler program, created using SCLM macros. Much of the definition is similar to the information that was entered in LMF's Library Controls (Option 8.1).
9. Assemble and link the project definition.

After the project has been defined, follow the steps in the *z/OS ISPF Software Configuration and Library Manager Guide and Reference* to put your existing project under SCLM control. In general, the steps are:

- Prepare the hierarchy. Delete all unnecessary data from the libraries. If any groups are to be non-key, make sure they don't contain any data.
- Create alternate project definitions.
- Create architecture definitions for the project.

- Register existing members with SCLM.

Converting LMF dialogs to SCLM

There were eight ISPF services relating to LMF. Some of these have SCLM equivalents, some do not because of the differences between SCLM and LMF. The eight services are:

LMPROM

Use the SCLM PROMOTE service.

EDIT with the LOCK parameter

Use the SCLM EDIT service.

LMMFIND with the LOCK parameter.

Use the SCLM LOCK service if locking is required. Use the DBUTIL service to find members in an SCLM project. ISPF services which use the LOCK keyword can also be modified to remove the keyword. Alternatively, you can use the ISPF Configuration option FAIL_ON_LMF_LOCK. If this option is set to NO, dialogs will continue to operate correctly without code modifications.

LMCOPY with the LOCK parameter

Use the SCLM LOCK service, then use LMCOPY to copy the member.

LMHIER

Use the SCLM NEXTGRP service. The NEXTGRP service returns the target group for a specified group. To simulate the data returned by LMHIER, loop on the NEXTGRP service until a return code greater than zero is returned. See SCLM example FLMNXTGP in ISP.SISPSAMP for an example.

LMREVIEW

There is no equivalent function in SCLM because the project control information is much different. Information about the contents of the hierarchy can be obtained using the SCLM DBUTIL service.

LMACT and LMDEACT

SCLM does not follow the concept of active and inactive projects. Updates are done by updating the SCLM project definition, then reassembling and relinking to create an updated load module. This load module is accessed when you enter SCLM (or exit and reenter, if SCLM is active when the new module is built).

Creating PDF translation tables

Creating PDF translation tables describes how to create a set of PDF translation tables.

Sample assembler modules are included in the ISP.SISPSAMP sample library (members ISROWNTT and ISRAPLTT). Module ISROWNTT contains a complete set of translation tables for an English 3278/3279 terminal, and module ISRAPLTT contains a complete set of translation tables for the 3278/3276 APL terminals. Use these as an example of what a completed module should look like. You can modify the samples to suit your requirements, supplying the desired values for each of the translation tables.

PDF uses these translation tables:

- Valid data set name character translation table
- Invalid data set name character translation table

- Hexadecimal character translation table
- Numeric character translation table
- Alphanumeric character translation table
- Edit terminal output character translation table
- Generic string character translation table
- Generic string special character translation table
- Uppercase character translation table
- Lowercase character translation table.

The sample Assembler module includes all of these translation tables. Each translation table consists of 32 consecutive DC statements, where each DC statement consists of eight hexadecimal values. You are free to supply the desired 256 hexadecimal values that comprise each of the translation tables. The only exception to this is the generic string character translation table that consists of 32 consecutive DC statements, each consisting of one hexadecimal value. This table should not be modified. The address of each table is located at the start of the Assembler module. If a table is not used, the address for that table is set to 0 (for example: EDIP DC A(0)).

PDF Foreground and Batch customizing

With PDF you can customize the Foreground and Batch processing options. You can add and modify existing Foreground or Batch options, develop new primary options to provide an interface to the Foreground or Batch processing mechanisms, and modify the tutorial to reflect installation-developed modifications.

Attention: Do not try to customize PDF Foreground and Batch options unless you are a system programmer who is thoroughly familiar with ISPF.

Review the *z/OS ISPF Dialog Developer’s Guide and Reference* for a description of panel and message definition formats, and also for specific requirements for selection panels (menus) and tutorial panels. The distributed panels provide examples of ISPF selection and tutorial panels. The ISPF Primary Option Menu is named ISR@PRIM and the first tutorial panel is named ISR00000.

The PDF Foreground and Batch options use selection and data entry panels in combination with CLISTs and file skeletons (Batch only). The specific requirements for foreground and batch panels, CLISTs, and skeletons are described in these sections.

Foreground processing panels and CLISTs

The Foreground processing option uses ISPF dialog management services. Figure 64 on page 140 shows the Foreground selection panel definition. See the *z/OS ISPF Dialog Developer’s Guide and Reference* for a general description of panel definition formats.

Note: In Figure 64 on page 140, attribute characters have been replaced by blanks. Also, some of the ISPF-supplied CLISTs contain a specific library (such as SYS1.LINKLIB) on the program call. If the called program does not reside in that library, you might need to customize the CLIST.

Figure 72 on page 149 shows the overall flow of control for foreground processing.

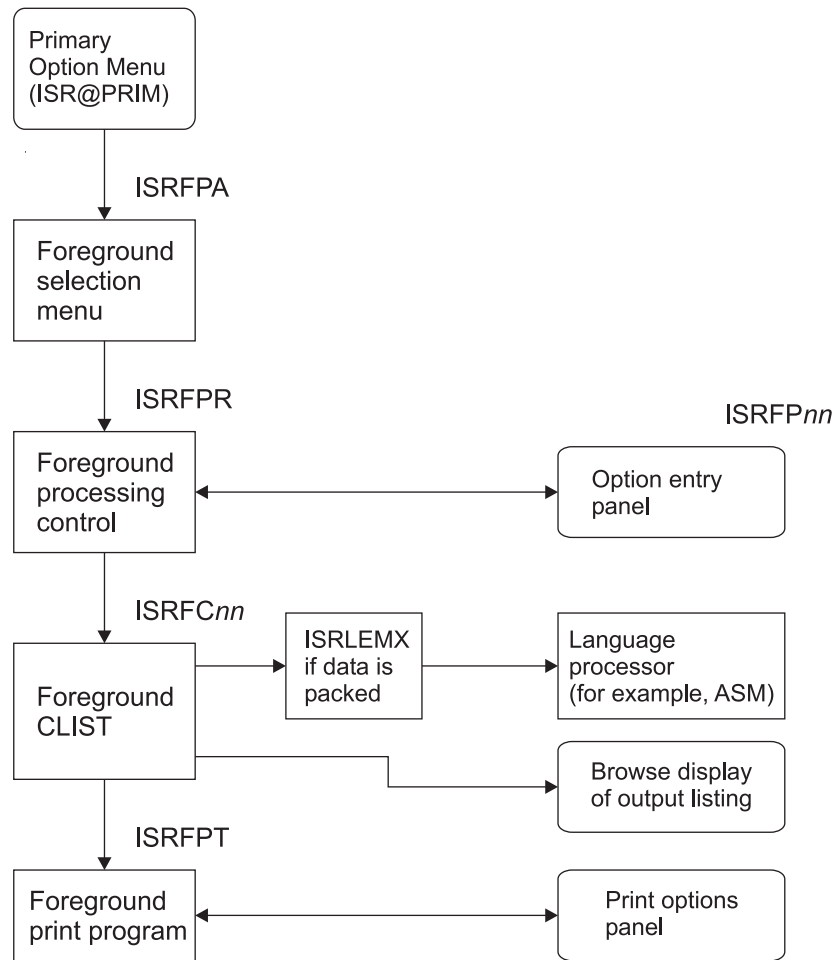

Figure 72. Foreground processing flow

ISRFPA is the Foreground Selection Panel. Each option on this menu translates to these selection keywords:

```
'PGM(ISRFPR) PARM((ISRFPnn) nn) NEWPOOL'
```

For all options, program ISRFPR receives control and is passed a parameter containing a list of panel names and the option number. The list of panel names is parsed and the first panel found in the ISPLLIB concatenation sequence is displayed.

Attention: To avoid possible conflicts with ISPF coding, do not use the numbers 12 or 19 for your options.

Each option panel (ISRFP01-ISRFP12) sets certain dialog variables that the ISRFPR program interprets. See “Required option entry panel variables” on page 150. One of these variables, ZSEL, is set to a string of selection keywords (following the rules for selection panels) that indicate which CLIST name (CMD) or load module name (PGM) receives control next.

Note: For foreground processing, ZSEL cannot be set to the PANEL keyword.

The designated CLIST or program does not receive control immediately, because ISRFPR uses the DISPLAY service to display the option panel, rather than the SELECT service. After the option panel is displayed, ISRFPR allocates the

user-designated libraries or data sets, displays a member list (if one is required), and scans the concatenated sequence of libraries (if specified) to find the designated member. Then ISRFPR invokes the SELECT service, passing as input the string of selection keywords specified in ZSEL. This causes the corresponding CLIST or program to receive control. (The distributed Foreground option uses CLISTs exclusively.)

The CLIST sets up and issues the appropriate TSO commands to invoke the language processor. The CLIST also initiates automatic browsing of the list data set and subsequent display of the Foreground Print Options panel. When the CLIST finishes, ISRFPR regains control and redisplay the option entry panel.

The PDF interface to VS COBOL II Interactive Debug uses the Debug Productivity Aid (DPA) integrated into VS COBOL II. If your installation does not have VS COBOL II Release 2 or if the panel for DPA (IGZTPIN2) is not in your ISPLIB concatenation, PDF displays a panel stating DPA is not installed or could not be accessed.

The PDF FORTRAN Interactive Debug option supports both FORTRAN Interactive Debug Version 2 (5668-903) and FORTRAN Interactive Debug Version 1 (5734-F05). If FORTRAN Interactive Debug Version 2 is installed (panel AFFFFP11 is found in the ISPLIB concatenation), PDF executes the Debug Dialog supplied by FORTRAN Interactive Debug Version 2. If FORTRAN Interactive Debug Version 1 is installed (panel DDBFP11), PDF executes that Debug Dialog. PDF looks for FORTRAN Interactive Debug Version 2 first, then Version 1, and finally its own Debug Dialog.

Required option entry panel variables

These dialog variables are explicitly required and must be defined either in the)BODY,)PROC or)INIT section of the suboption panel displayed by ISRFPR. For example, if your application does not require libraries two through four, initialize LIB2, LIB3, and LIB4 to the system variable &Z (blank) in the)INIT section of the suboption panel. This would fill the requirement and allow you to leave these fields out the)BODY section of the suboption panel.

- PRJ1** ISPF project name
- LIB1** First ISPF library
- TYP1** ISPF library type (initially set to nulls in ISRFPR)
- MEM** ISPF member name (required if DSN is blank)
- DSN** "Other" data set name
- ZSEL** Selection string used by ISRFPR to select either a CLIST (CMD) or a program (PGM) with parameters.
- LIB2** Second ISPF library
- LIB3** Third ISPF library
- LIB4** Fourth ISPF library

This field is optional:

- PSWD**
OS password

The ISRFPR program verifies and processes these variables and then stores these variables in the shared variable pool, so that they can be referenced by the selected CLIST or program.

ZDSQMEM

fully qualified input data set name (without quotes), with the member name in parentheses.

ZDSQ fully qualified input data set name (without quotes), for the first input data set (without member name)

ZDSQ2

Same as ZDSQ for the second input data set (library)

ZDSQ3

Same as ZDSQ for the third input data set (library)

ZDSQ4

Same as ZDSQ for the fourth input data set (library)

ZDS Same as ZDSQ without the last qualifier (if ZDSQ has only a one level qualifier, then ZDSQ = ZDS.)

ZDS2 Same as ZDS for the second input data set (library)

ZDS3 Same as ZDS for the third input data set (library)

ZDS4 Same as ZDS for the fourth input data set (library)

ZMEM

Input member name (blank for a sequential data set)

ZORG

Input data set organization:

PO=partitioned

PS=sequential

Note: If an asterisk (*) is entered as the member name (from the option panel), ISRFPR does not process the member name. Instead, it sets the ZMEM variable to blank. The CLIST must handle this case.

Other option entry panel variables

ISRFPR does not verify or process other variables from the option panel, such as list ID, compiler options, and additional input libraries. Instead, ISRFPR stores these variables in the shared variable pool (by including VPUT statements in the panel definition) so the CLIST can process them.

Several variables in the option panel are saved in the user profile (again by including VPUT statements in the panel definition) so that they are retained across sessions. In general, variables saved in the profile are also saved in the shared pool to prevent their being modified by another process in split-screen mode. Variables in the profile can be referenced by either screen, but those in the shared pool can be referenced only by the screen in which they are set.

An optional variable, ZSEL2, can be set in the panel. It causes ISRFPR to select a second CLIST or program after successful completion (return code = 0) of the first CLIST or program. ZSEL2 is used with the COBOL and FORTRAN Interactive Debug options.

These sections describe additional variables.

Variables that control automatic Browse and Print

The process of automatically invoking the Browse function for a generated list data set, and subsequently displaying the Foreground Print Options panel is completely external to the ISRFPR program. The ZFBROWS and ZFPRINT variables control these functions. These variables reside in the shared variable pool. Select the distributed Foreground option on the ISRFPA Foreground Selection panel to store ZFBROWS and ZFPRINT in the shared variable pool. ZFBROWS is set to "ISRBROB" (use any nonblank name) and ZFPRINT is set to "ISRFPPRT" (the print panel name).

Use the BROWSE service to invoke the browse function from each CLIST. Use the SELECT service to invoke the print function from each CLIST. SELECT service invokes the ISRFPT program (load module). ISRFPT is distributed with PDF.

ZFPRINT is the variable that is set to the name of the panel to set the print options panel name the dialog developer calls.

The ZFLID variable in ISRFPPRT (Foreground Print Options panel) should be set to the data set name you are going to print. Use the VPUT service to put both the ZFPRINT and ZFLID variables in the shared variable pool. If you do not want to invoke automatic browse or print, set the corresponding variables to blank in either the individual option panels or CLISTs. If you want to set the variables from a panel, remember to use VPUT to store the variables in the shared variable pool so the CLISTs can access them.

When the language processor sends a return code greater than 12 to the ISPF-supplied CLISTs, CLIST bypasses automatic browse and display of the print panel. The exceptions to this are the PL/I Checkout compiler and the COBOL and FORTRAN Interactive Debug programs. The CLISTs for these programs do not display browse or print if the return code is a system return code (for example, "SOC1").

Variables that control option panel redisplay

When an option is processed, normally the original option panel is redisplayed when the specified CLIST or program finishes. ISRFPR stores the original panel name in ZNEXTPN, a variable that controls the next panel to be displayed. You can change the value of ZNEXTPN in your CLIST or panel. For example, to display the linkage edit panel (ISRF07) after processing the FORTRAN panel (ISRF03), set ZNEXTPN to ISRF07 either in the)PROC section of the FORTRAN panel or in the FORTRAN CLIST (ISRFC03). Then place the variable in the shared pool. You can extend this type of panel linkage to any length you want.

Variables used by Foreground CLISTs

In the distributed Foreground option, all option panels select a CLIST to set up and issue the TSO commands. (Only a CLIST or a program can be selected from the option panel.) To obtain variables set from the panel and by program ISRFPR, the CLIST references the shared variable pool. Based on these variables, the CLIST sets up and issues the TSO command required to invoke the language processor. The return code from the TSO command is saved in variable ZFPRFC, which is referenced in various error messages. After completion of the TSO command, the check for automatic browse and print is made. The CLIST issues any log messages. The CLIST also does some specific error checking and can override ISRFPR messages by setting variable ZFPRFC to the return code, issuing a VPUT of ZFPRFC, and invoking the SETMSG service.

The FORTRAN and COBOL interactive CLISTs differ from other CLISTs. These interactive programs attempt to read subsequent lines from the CLIST as input. Therefore, the CLIST is divided into two parts. All functions after the TSO command are in the second CLIST, which is referenced by the ZSEL2 variable described in “Required option entry panel variables” on page 150.

Foreground modifications

Most of the Foreground processing logic resides in the option panels and associated CLISTs to make modifications as easy as possible. Before modifying existing options or adding new ones, you should study one or more of the distributed panel/CLIST pairs to understand the relationships that exist among the panel, the CLIST, and the program ISRFPR. In particular, be aware of these items:

- Additional variables such as LANG and ZORG are used to pass information to log messages, error messages, and panels.
- These commands cannot be invoked under the Foreground option: SPF, PDF, ISPF, ISPSTART, LOGON, LOGOFF, TEST, or a CALL to an authorized program.
- If the CLIST returns a nonzero return code in the EXIT statement, ISRFPR does not attempt to process any second CLIST that was specified by ZSEL2.

Steps to add a new Foreground primary option to PDF: The steps required to add a new PDF primary option that uses the Foreground processing mechanism are listed here.

1. Add the new option (for example, '10') to the ISPF Primary Option Menu, panel ISR@PRIM. In the translated value for option 10, use the PANEL keyword to specify the name of the selection panel to be displayed next. For example:

```
)PROC
  &ZSEL = TRANS( TRUNC(&ZCMD, '.')
                . . .
                10, 'PANEL(XYZ)')
```

2. Add new selection panel XYZ to the panel library. Use panel ISRFPA as a model. For each option, use the PGM keyword to specify that program ISRFPR is to receive control, and use the PARM keyword to pass the name of the option panel. For example:

```
)PROC
  &ZSEL = TRANS( TRUNC(&ZCMD, '.')
                . . .
                2, 'PGM(ISRFPR) PARM((FORNEW) 2)')
```

3. Proceed as specified in “Steps to add a new Foreground option to the Foreground Selection Panel,” starting at step 2.

Steps to add a new Foreground option to the Foreground Selection Panel: The steps required to add a new option to the PDF Foreground Selection Panel are listed here.

1. Add new option (for example, '99') to the Foreground Selection Panel, ISRFPA. Use the PGM keyword to specify that program ISPFPR is to receive control, and use the PARM keyword to pass the name of the new option panel. For example:

```
)PROC
  &ZSEL = TRANS( TRUNC(&ZCMD, '.')
                . . .
                99, 'PGM(ISRFPR) PARM((FORNEW) 99)')
                . . .
```

2. Add new option panel FORNEW to the panel library. Use one of the distributed option panels (for example, ISRFP01) as a model.
3. Develop a corresponding CLIST (referenced from panel FORNEW by the ZSEL variable). Use one of the distributed CLISTs (for example, ISRFC01) as a model. Add the CLIST to a library accessible to ddname SYSPROC.

Batch processing panels, CLISTs, and skeletons

The Batch option uses ISPF dialog management services. Figure 73 on page 155 and Figure 77 on page 159 show the Batch Selection and Batch JCL generation panel formats. See the *z/OS ISPF Dialog Developer's Guide and Reference* for a general description of panel definition formats.

Note: In Figure 73 on page 155 and Figure 77 on page 159, attribute characters have been replaced by blanks.

Figure 80. Batch JCL generation panel definition (ISRJPB) (Part 4 of 4)

The Batch option includes eight suboptions. Each Batch option has an associated panel, CLIST, and skeleton. For option 1, for example, the option panel name is ISRJP01, the CLIST name is ISRJC01, and the skeleton name is ISRJS01. Figure 81 on page 163 shows the Batch Assembler H panel definition.

Note: In Figure 81 on page 163, attribute characters have been replaced by blanks.

The overall flow of control for Batch processing is shown in Figure 86.

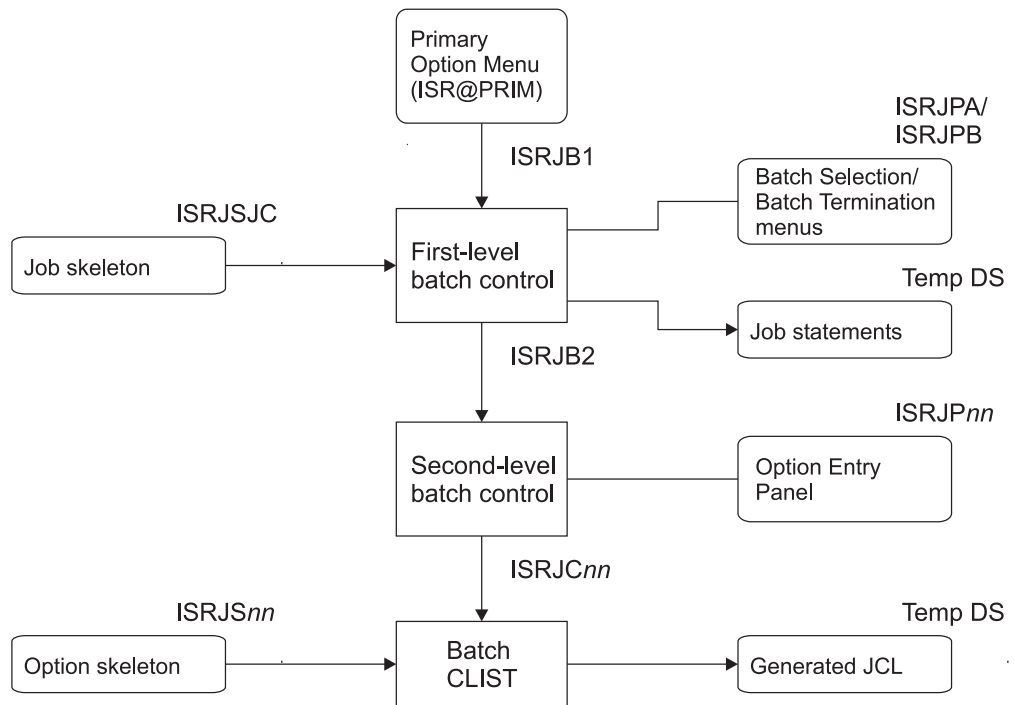

Figure 86. Batch processing flow

Two PDF programs control Batch processing: ISRJB1 and ISRJB2. Program ISRJB1 receives control directly from the ISPF Primary Option Menu, ISR@PRIM, through specification of these selection keywords when you select primary option 5:

```
'PGM(ISRJB1) PARM(ISRJPA) NOCHECK'
```

The parameter specifies the name of the Batch Selection panel. The NOCHECK keyword allows ISRJB1 to receive control if you specify option 5.n, where “n” is a batch option.

ISRJB1 either displays the Batch Selection panel (if you entered option 5 on the ISPF Primary Option Menu) or processes the Batch Selection panel in non-display mode (if you entered 5.n). ISRJB1 makes this determination by examining the ZTRAIL variable, which is set from the ISPF Primary Option Menu. ZTRAIL contains either the option number, or a blank if no option was specified.

Regardless of whether the Batch Selection panel is actually displayed, ISRJB1 invokes file tailoring services to write the four job statements from the Batch Selection panel to a temporary data set. Skeleton ISRJSJC is used to generate the job statement output. ISRJB1 then invokes program ISRJB2 (through the SELECT service) and passes a parameter containing the name of the first (or only) option panel to be displayed.

The selection keywords used to invoke ISRJB2 actually come from the Batch Selection panel, ISRJPA, where they are stored in variable ZSEL. ISRJB1 uses the DISPLAY service, rather than the SELECT service, to display the Batch Selection panel, and subsequently passes ZSEL as input to the SELECT service when it is ready to invoke ISRJB2.

Program ISRJB2 is analogous to the Foreground control program ISRFPR. See “Foreground processing panels and CLISTs” on page 139. ISRJB2 displays and processes the option panel and invokes the corresponding CLIST. The CLIST, in turn, uses file tailoring services to generate JCL statements for the particular option. All Batch JCL is accumulated in the same temporary data set that contains the four job statements.

Eventually, control returns to ISRJB1, the first batch program. ISRJB1 then either displays the Batch Selection panel (ISRJPB) with Job Step Generated, or processes it in non-display mode if display of the Batch Selection panel was bypassed. The Job Step Generated panel is similar in appearance to the Batch Selection Panel, except that the job statements can no longer be modified. From the Job Step Generated panel, you can select additional options, causing additional job steps to be generated.

Finally, ISRJB1 closes the temporary data set in which all the batch JCL was accumulated and submits it using the TSO SUBMIT command. The submission will be bypassed if either of these conditions occurs:

- No JCL was generated by the options.
- You entered CANCEL on the Batch Selection panel with Job Step Generated.

Variables that control batch processing

The Batch Selection panel, ISRJPA, includes two variables that control Batch processing. The variable RTNPNL contains the name of the panel that corresponds to the Batch Selection panel (for ISRJPA the corresponding panel is ISRJPB). The variable ZDCKO is associated with the Source Data Online field on the Batch Selection panel. If you enter YES in that field, the Batch option provides error

checking and verification of the input data sets. If NO is entered, no data set verification is performed. The NO option allows you to submit a job to be run at a later time if the data sets are not online.

If the Source Data Online field, variable ZDSCKO, is set to YES, the dialog variables required for batch option panels are the same as those for foreground processing. That is, variables PRJ1, LIB1, LIB2, LIB3, LIB4, TYP1, MEM, DSN, and ZSEL must be defined in either the)INIT,)BODY, or)PROC section of the panel displayed by ISRJB2.

If the Source Data Online, variable ZDSCKO, is set to NO, these variables are not required. However, if a data set name is not supplied to ISRJB2 in these variables, the output variables ZDSQMEM, ZDSQ, ZDSQ2, ZDSQ3, ZDSQ4, ZDS, ZDS2, ZDS3, ZDS4, ZMEM, and ZORG are blank when control is passed to the CLIST referenced in variable ZSEL in the option panel. See “Required option entry panel variables” on page 150.

Generated JCL

The job control language (JCL) statements generated by the Batch processing option are accumulated in a temporary data set named *userid.SPFTEMPn.CNTL* or *prefix.userid.SPFTEMPn.CNTL*, where *n* is the screen number. This data set contains the job cards generated by ISRJB1 and job steps generated by the option CLISTS. In all cases, file tailoring services are used to generate the JCL. If VIO is used, the generated JCL is in a VIO data set allocated to DDname ISPCTL1.

ISRJB1 generates up to four job statement lines from information that you supply in the Batch Selection panel, ISRJPA. A job statement line is not generated if the corresponding field on the panel is blank. An attempt is made to provide unique jobnames by using this algorithm:

1. The four lines entered in the selection panel are scanned for the first ‘//’ card.
2. If the string following the ‘//’ is equal to the TSO user ID, and if the user ID is followed by an alphabetic character or a numeric character, that character is automatically incremented each time a job is submitted.
3. If the string following the ‘//’ is not equal to the TSO user ID, the job name will not be automatically incremented each time a job is submitted. ISRJB1 increments and changes jobnames only if they begin with the user ID.

If you bypass the Batch Selection panel (for example, by selecting option 5.n from the ISPF Primary Option Menu), the job statement lines that would have been displayed on the selection panel are used as if you had not modified them.

The file skeleton associated with each option controls the JCL generated for that option. See “Batch (Option 5)” in the *z/OS ISPF User’s Guide Vol II* for a general description of skeleton formats. Each variable in the skeleton is replaced by its current value (the contents of the corresponding panel input field, as entered by you, or a previously entered value). Following variable substitution, each record in the skeleton is written to the temporary data set, which is eventually submitted to the job stream by the TSO SUBMIT command. Skeletons must be coded so that the maximum length of a record after substitution does not exceed 71 characters; otherwise, invalid JCL might be generated.

Variables that control option panel redisplay

After an option has been processed, the Batch Selection panel with Job Step Generated is normally displayed, thereby allowing you to add another job step to the one just generated. It is possible, however, to link options together

automatically by using the shared variable ZNEXTPN. The program ISRJB2 sets ZNEXTPN to blank. After the completion of a option CLIST, ISRJB2 references the variable again to determine the next panel to display. If you wish, for example, to display the linkage edit panel (ISRJP07) after processing the FORTRAN panel (ISRJP03), set ZNEXTPN to ISRJP07 either in the)PROC section of the FORTRAN panel or in the FORTRAN CLIST (ISRJC03), and place the variable in the shared pool. You can extend this type of panel linkage to any length you want.

Variable used by Batch CLISTS

In the distributed Batch option, all option panels select a CLIST that uses file tailoring services to generate the JCL job steps. (Only a CLIST or program can be selected from the option panel.) To obtain variables set from the panel and by program ISRJB2, the CLIST references the shared variable pool. The CLIST performs basic error checking on some of the variables associated with the panel fields. After generating the JCL, the CLIST returns to ISRJB2. If, because of some error condition, the CLIST does not generate a job step, a nonzero return code is returned to ISRJB2.

Batch skeletons

The skeleton library contains the JCL and file tailoring control statements that are used to generate the JCL for a particular Batch option. A primary skeleton is associated with each option. This skeleton embeds other skeletons based on input data set type. For option 1, for example, skeleton ISRJS01 is used. If the data set was defined in the ISPF library section of the panel, ISRJS01 embeds skeleton ISRJS01I for appropriate JCL. If an “other” partitioned data set were specified, skeleton ISRJS01P would be embedded. If an “other” sequential data set were specified, skeleton ISRJS01S would be embedded.

Batch modifications

Most of the Batch processing logic is in the option panels, CLISTS, and skeletons to make modifications as easy as possible. Before modifying existing options or adding new ones, you should study the distributed panels, CLISTS, and skeletons to understand the relationships among them.

ISPF does not attempt to diagnose all possible types of skeleton coding errors. Some types of errors are detected, and the appropriate error messages are displayed, but in many cases coding errors must be debugged by inspection of the generated JCL. To perform this inspection, enter the CANCEL command when the Batch Selection panel with Job Step Generated is displayed, and then browse the temporary data set that contains the generated JCL. (The temporary data set is closed, but not freed or erased, when the CANCEL command is specified.)

Note: This procedure cannot be used if the temporary CNTL data sets have been allocated to VIO because they have MVS-generated data set names.

Steps to add a new Batch primary option to PDF: The steps required to add a new PDF primary option that uses the Batch processing mechanism are listed here.

1. Add the new option (for example, '99') to the ISPF Primary Option Menu, panel name ISR@PRIM. In the translated value for option 99, use the PGM keyword to specify that program ISRJB1 is to receive control, and use the PARM keyword to pass the name of the Batch Selection panel. Specify the NOCHECK option to allow ISRJB1 to select subsequent panels. Set the ZTRAIL variable to the value remaining from the truncation function. (ZTRAIL is already set in panel ISR@PRIM, but you must set it yourself if you invoke ISRJB1 from some other selection panel.) For example:

```

)PROC
&ZSEL; = TRANS( TRUNC(&ZCMD,'.'
. . .

99,'PGM(ISRJB1) PARM(ZNEW99A) NOCHECK '
)
&ZTRAIL; = .TRAIL

```

2. Add a new Batch Selection panel (ZNEW99A in this example) to the panel library. Use panel ISRJPA as a model. For each option on the panel, use the PGM keyword to specify that program ISRJB2 is to receive control, and use the PARM keyword to pass the name of the option panel.
3. In the panel definition for ZNEW99A, set the variable RTNPNL to ZNEW99B (as an example) to specify the corresponding Batch Selection panel with Job Step Generated. Add new panel ZNEW99B to the panel library, using panel ISRJPB as a model.
4. Develop new option panels, CLISTs, and skeletons as described in "Steps to add a new Batch option to the PDF Batch Selection Panel."

Steps to add a new Batch option to the PDF Batch Selection Panel: The steps required to add a new option to the Batch Selection Panel and the panel showing Job Step Generated are listed here.

1. Add the new option (for example, '99') to panels (ISRJPA and ISRJPB). Use the PGM keyword to specify that program ISRJB2 is to receive control and use the PARM keyword to pass the name of the new option panel. For example:

```

)PROC
&ZSEL = TRANS(&ZCMD
. . .

99,'PGM(ISRJB2) PARM(ZNEW99 99)'

```

2. Add new option panel ZNEW99 to the panel library. Use one of the distributed option panels (for example, ISRJP01) as a model.
3. Develop a corresponding CLIST (referenced from panel ZNEW99 by the ZSEL variable) and skeleton (referenced from the CLIST by the file tailoring FTINCL service). Use the distributed CLISTs and skeletons (for example, ISRJC01 and ISRJS01) as models. Add the CLIST to a library accessible to ddname SYSPROC, and add the skeleton to the skeleton library.

You can also develop a new option that displays a lower-level selection panel, from which user selections invoke the Batch CLISTs.

For example:

```

)PROC
&ZSEL = TRANS (&ZCMD
1,'PGM(ISRJB2) PARM(ISRJP01)'
2,'PGM(ISPJB2) PARM(ISRJP02)'
. . .

9,'CMD(ZNEWCMD &ZCMD)'

```

In this example, the CLIST ZNEWCMD has been selected, and the parameter ZCMD (the option entered on the panel) has been passed to the CLIST. ZNEWCMD can then use the SELECT service to display a lower-level selection panel similar to panel ISRJPA, but without job statement information. When the options have been processed, the CLIST should end and return control to ISRJB1 to close the temporary data set and submit the job to TSO. If JCL was generated the invoked dialog (CLIST or PANEL) must end with a return code of 0. If no JCL was

generated the dialog must either end with a return code greater than 0 or set dialog variable ZADARC to a Y in either the ISPF SHARED or PROFILE pool.

Note: If the Source Data Online field, variable ZDSCKO, is set to YES, the dialog variables required for batch option panels are the same as those for foreground processing. That is, variables PRJ1, LIB1, LIB2, LIB3, LIB4, TYP1, MEM, DSN, and ZSEL must be defined in either the)INIT,)BODY, or)PROC section of the panel displayed by ISRJB2.

If the Source Data Online, variable ZDSCKO, is set to NO, these variables are not required. However, if a data set name is not supplied to ISRJB2 in these variables, the output variables ZDSQMEM, ZDSQ, ZDSQ2, ZDSQ3, ZDSQ4, ZDS, ZDS2, ZDS3, ZDS4, ZMEM, and ZORG are blank when control is passed to the CLIST referenced in variable ZSEL in the option panel.

Batch processing options considerations

The SISPLPA data set includes the ISRSCAN load module. It is not executed under TSO but is invoked from batch jobs submitted through the ISPF PDF batch processing option. The ISRSUPC and ISRLEMX load modules are executed in both foreground and batch.

To submit jobs through the ISPF batch processing option, the load modules ISRSCAN, ISRSUPC, and ISRLEMX must be available. If they are not in your LPA or link library, insert a STEPLIB DD statement for the library that contains them in each skeleton member ISRJSxxx and ISRSBJCL in the ISP.SISPLIB data set. Insert the statement following the EXEC PGM=ISRSCAN, EXEC PGM=ISRLEMX, or EXEC PGM=ISRSUPC statement, whichever is in the skeleton (see the comments in each of these members).

ISRSCAN and ISRLEMX programs

The ISPF-supplied Batch skeletons each generate one or more job steps. The first step executes either the ISRSCAN program or the ISRLEMX program. Both programs find the input member and copy it from the library hierarchy (up to four partitioned data sets) to a temporary data set for input to the processing program executed in the second step. The difference between them is that ISRSCAN copies only one member to the output data set, while ISRLEMX copies the primary member and expands any included members as part of the output data set. All members copied by ISRLEMX are unpacked in the output data set and ISRSCAN does not unpack the input while ISRLEMX does. The input to ISRSCAN must not be packed. ISRLEMX also creates a member parts list (see ISPF Options 4.12 and 5.12).

If your input is a sequential data set, ISRLEMX only copies the data to the output data set. **It unpacks the input but does not unpack any included members.**

The first step is essential for the operation of library hierarchies because the ISPF-supplied processing programs typically accept primary input only from fully qualified data sets (that is, from either a sequential data set or a single member of a single partitioned data set, not from concatenations of partitioned data sets).

Using ISRSCAN: The Batch job steps for using ISRSCAN are as follows:

```
/*ISRSCAN step
//SCANSTEP EXEC PGM=ISRSCAN,PARM='member name'
//STEPLIB DD DSN= (Library name if ISRSCAN is not in
your system library)
```

```
//IN      DD ... Input data set in which the source
          member is found.
//OUT     DD ... Sequential output data set.
/*
```

Return Codes: ISRSCAN sets one of these return codes in register 15:

```
0      Normal completion
8      One of these:
      • DDNAME OUT not found.
      • Error retrieving data set information for OUT data set.
      • OUT data set is a PDS without a member specified.
12     Member not found
16     Unable to open input DCB
20     I/O error on input data set
24     Unable to open output DCB
28     I/O error on output data set
```

Using ISRLEMX: ISRLEMX Batch job steps are shown here.

```
/*ISRLEMX step
//LEMXSTEP EXEC PGM=ISRLEMX,PARM='parm1,parm2,...,parm15'
//STEPLIB DD DSN= (Library name if ISRLEMX is not in your
                system library)
//ISRLCODE DD ... Input data set in which the source member(s)
                are found. Can be a concatenation of up to 8 data sets.
//ISRLEXPDD DD ... Sequential output data set for expansion.
//ISRLXREF DD ... Sequential output data set for mem prts lst.
//ISRLMSG DD SYSOUT=A /* program error messages print here */
```

- or -

```
//ISRLMSG DD DSN=&ZPREFIX;.&LID;.LMSG,UNIT=SYSDA,
            SPACE=(TRK,(1,1)),DISP=(MOD,CATLG),
            DCB=(RECFM=FBA,LRECL=133,BLKSIZE=3059)
/*
```

Return Codes: ISRLEMX sets one of these return codes in register 15:

```
0      Normal completion
n      Parameter n is 1-15 (too long)
16     Too many parameters
17     Too few parameters
20     Severe error in expand module—an error is printed in the ISRLMSG data
      set.
```

Note:

1. DDNAME ISRLEXPDD is needed if parameter 5 is either 'E' or blank. DDNAME ISRLXREF is needed if parameter 5 is 'L'. See this figure for additional information.
2. ISRLEMX reads data that is presented in a BSAM compatible form. If the SUBSYS parameter (or any parameter that will cause the UCB pointer in the TIOT to be 0) is used, PDF cannot verify that the input is on DASD. It is the responsibility of the user to ensure ISRLEMX will see the data in the correct form. If the data is not presented in a BSAM compatible form, results will be unpredictable.

The ISRLEMX parameter string contains up to 15 parameters, each separated from the next by commas. The parameters are:

Table 28. Parameters in the ISRLEM parameter string

Parameter	Length	Description
1	CHAR(3)	Language type of the input member to be processed: ASM - Assembler COB - COBOL FOR - FORTRAN PAS - Pascal PLI - PL/I SCR - Script
2	CHAR(8)	Member name of member to be expanded or of first member to be processed to create a member parts list.
3	CHAR(1)	'B' - The request is being run in batch 'F' - The request is being run in foreground
4	CHAR(1)	'Y' - Allocate a temporary sort data set if needed 'N' - Do not allocate a sort data set
5	CHAR(1)	'E' - Expand and unpack the specified member and all included members into one sequential data set 'L' - Create a member parts list starting with the specified member blank - Copy the specified input member to a temporary data set, unpacking the member but not expanding.
6	CHAR(1)	Number of concatenated input libraries that should be scanned to find the specified input number value can be 1-9
7	CHAR(20)	User trigger, a character string of maximum length 20 to be processed as an INCLUDE, COPY or IMBED statement when found in the member being processed. Enter a comma to skip this parameter if no user trigger is being used.
8	CHAR(2)	User trigger start column, specifies which column the user trigger listed here will start in the member being processed. Enter a comma to skip this parameter if no user trigger is being used.
9	CHAR(3)	Indicates the National language in use: ENU - English DEU - German (Deutsch) KAN - Japanese (Kanji) DES - Swiss German This is used to build the name of the literal load module that is loaded by member expansion. If the language is not English and the load fails, the English table is loaded.
10	CHAR(1)	Position of the month value in the date string; for example, <i>yy/mm/dd</i> (default '4')
11	CHAR(1)	Position of the day value in the date string; for example, <i>yy/mm/dd</i> (default '7')
12	CHAR(1)	Position of the year value in the date string; for example, <i>yy/mm/dd</i> (default '1')
13	CHAR(1)	Delimiter to use in the date string; for example, <i>yy/mm/dd</i> (default '/')
14	CHAR(8)	Unit name to be used for all temporary data sets used by ISRLEM. The unit name must be specified.

Table 28. Parameters in the ISRLEMX parameter string (continued)

Parameter	Length	Description
15	CHAR(4)	The number of blocks used when allocating the temporary sort data sets. These are allocated to ddnames ISRKLWKnn, where nn is 1 through 4. The default for this parameter is 0100. It can be increased for very large or complex expansions.

Note: You can specify the date notation in the national language format (for example, yy/mm/dd, mm/dd/yy, dd/mm/yy). Therefore, you must specify the index for each portion. Use any valid character to delimit the date string (for example, yy/mm/dd, dd.mm.yy). This delimiter is required.

Adding user-defined triggers

During installation time, you can add a user-defined trigger to the member expansion or member parts list functions, or to the foreground or batch options of PDF. The user defined trigger is interpreted as though it were an INCLUDE, COPY, or .im keyword.

Adding a user-defined trigger to the member expansion function: The user can define the member expansion function trigger by using up to 20 characters. The trigger must start in the user-defined start column and be followed by at least one blank. The next nonblank string is interpreted as the included member name. For more information about member expansion and triggers, see *z/OS ISPF User's Guide Vol II*.

Adding a user-defined trigger to the Foreground options: To define a user trigger for the PDF Foreground options, change the ISRLEMX SELECT statement in the CLIST for the appropriate option.

Change from:

```
ISPEXEC SELECT PGM(ISRLEMX) +
  PARM('XXX,&ZMEM,F,N,E,4, ,00,&ZFPRLANG,&ZFPRMMIX,+
    &ZFPRDDIX,&ZFPRYYIX,&ZFPRDLIM,&Z4UNIT')
```

To:

```
ISPEXEC SELECT PGM(ISRLEMX) +
  PARM('XXX,&ZMEM,F,N,E,4,trigger,nn,&ZFPRLANG,&ZFPRMMIX,+
    &ZFPRMMIX,&ZFPRDDIX,&ZFPRYYIX,&ZFPRDLIM,&Z4UNIT')
```

where *nn* is the trigger start column.

The CLIST names are as follows:

```
OPTION 4.1    ISRFC01
OPTION 4.2    ISRFC02
OPTION 4.3    ISRFC03
OPTION 4.5    ISRFC05
OPTION 4.6    ISRFC06
OPTION 4.9    ISRFC09
```

Adding a user-defined trigger to the Batch options: To define a user trigger for the PDF Batch options, change the ISRLEMX EXEC statement in the skeleton for the appropriate option.

Change from:

```
//EXPAND EXEC PGM=ISRLEMX,COND=(12,LE),  
// PARM=('XXX,&ZMEM,B,N,E,4, ,00,&ZJB2LANG,;  
// &ZJB2MMIX,&ZJB2DDIX,&ZJB2YYIX,&ZJB2DLIM,&Z5UNIT')
```

To:

```
//EXPAND EXEC PGM=ISRLEMX,COND=(12,LE),  
// PARM=('XXX,&ZMEM,B,N,E,4,trigger,nn,&ZJB2LANG,;  
// &ZJB2MMIX,&ZJB2DDIX,&ZJB2YYIX,&ZJB2DLIM,&Z5UNIT')
```

where *nn* is the trigger start column.

The skeleton names are as follows:

```
OPTION 5.1   ISRJS01I, ISRJS01J, ISRJS01P, ISRJS01S  
OPTION 5.2   ISRJS02I, ISRJS02J, ISRJS02P, ISRJS02S  
OPTION 5.3   ISRJS03I, ISRJS03J, ISRJS03P, ISRJS03S  
OPTION 5.5   ISRJS05I, ISRJS05J, ISRJS05P, ISRJS05S  
OPTION 5.6   ISRJS06I, ISRJS06J, ISRJS06P, ISRJS06S
```

Adding a user-defined trigger to the member parts list function: The user can define the trigger for the member parts list function by using up to 20 characters. The trigger must start in the user-defined start column and be followed by at least one blank. The next nonblank string is interpreted as the included member name.

To define the trigger, change two SET statements in the CLISTs ISRFC12 (Foreground) and ISRJC12 (Batch), as follows:

Change from:

```
SET &UT = &STR(&Z)  
SET &UTC = &STR(00)
```

To:

```
SET &UT = &STR(trigger)  
SET &UTC = &STR(nn)
```

where *nn* is the trigger start column.

Changing the size of the data set for the member parts list function: The member parts list function allocates a temporary data set for collecting cross-reference data. The default size of this data set is 100 blocks each of primary and secondary storage. To change this size, change the SSPACE variable in the panels ISRFP12 (foreground) and ISRJP12 (batch), as follows:

Change from:

```
)PROC  
&SSPACE = '0100'
```

To:

```
)PROC  
&SSPACE = 'nnnn'
```

where *nnnn* is the number of blocks to be allocated.

Customizing Browse and Edit

Customizing Browse and Edit describes how to provide customized Browse and Edit panels, and how to enable users to browse data that is stored in a Unicode format.

Providing customized Browse and Edit panels

Dialog developers can provide customized Browse or Edit data display panels for the dialogs they create. The name of the customized panel is passed as a parameter to the BROWSE or EDIT dialog service.

Note: Do not use the names ISREDDE, ISREDDE2, ISREDDE3, ISREDDE4, or ISREDDE5 as a panel name passed to the EDIT or VIEW services. When ISPF is using any of these panels, it can dynamically switch among any of these panels based on system configuration and edit profile settings.

Customized Browse panels must be patterned after the distributed panel ISRBROB (for Browse, as shown in Figure 87 on page 179). Customized Edit panels must be patterned after these panels:

- ISREFR01 - Edit without action bars or extended highlighting (as shown in Figure 88 on page 180)
- ISREFR02 - Edit with action bars and extended highlighting
- ISREFR03 - Edit with action bars and no extended highlighting
- ISREFR04 - Edit with extended highlighting but no action bars

The customized panel must include a Command field named ZCMD and a dynamic area named ZDATA. As shown in Figure 88 on page 180, this ZDATA dynamic area should be coded with an attribute that is defined with AREA(DYNAMIC). It is not acceptable to code this area with an attribute defined as AREA(SCRL). To enable extended highlighting, the customized edit panel must have a shadow variable called ZSHADOW and must have the attributes as defined in the attribute section of panel ISREFR04. Customized panels should meet the requirements for a movable Command line, so that the Command line can be displayed at the bottom of the screen at your request. See *z/OS ISPF Dialog Developer's Guide and Reference* for a discussion of these requirements.

Inclusion of a Scroll field is optional. The scroll fields in the distributed panels are named ZSCBR (for Browse) and ZSCED (for Edit). You can use these same names for scroll fields on customized panels. Inclusion of the (protected) variables that appear in the title line of the distributed panels is optional. If you want to display the volume of the data set, you can use variable ZDSVOL.

Because Edit and Browse translate non-displayable characters into blanks (for Edit) or a user-specified character (for Browse), hex codes that represent these characters cannot be placed in the data with the intent of using them as attribute characters. If you want to modify the Edit or Browse display, you must either use displayable characters, or redefine the existing Edit and Browse attributes. If you redefine an existing attribute, do not change the TYPE or FORMAT values of the attribute.

The HIDE EXCLUDED command uses reserved attribute characters to underscore the number field of the line preceding the excluded message line. As some customized Edit panels might already use these attribute characters, ISPF uses the dialog variable ZHIDEX to determine whether the attribute characters are available

and correctly defined in the Edit panel. An example of setting ZHIDEX and providing the reserved attribute bytes 13, 16, 17, and 1D is shown in Figure 88 on page 180.

If the HIDE command is used in an initial macro, then the macro must set the ISPF dialog variable ZHIDEX to a value of ?Y? and the Edit panel in use must contain the required attribute character definitions as previously described.

Note, even when the HIDE EXCLUDED command is enabled using the ZHIDEX variable, the number field of the line preceding the excluded message is only underscored on ISPF-supported terminals with the extended highlighting feature available.

```

```

Figure 87. Browse panel (ISRBROB)

The distributed panels have a dynamic area that automatically fills the available width and depth of the screen (after the first two lines). A customized panel can have a dynamic area that is fixed in width (in which case the WIDTH and EXPAND keywords should be omitted from the)BODY header statement), fixed in depth (in which case the EXTEND keyword should be omitted on the AREA statement in the)ATTR section), or fixed in both width and depth.

Note: If the dynamic area is less than the full width of the screen, the panel definition must include attribute bytes for protected fields on either side of the area.

See the description of dynamic areas in the *z/OS ISPF Dialog Developer's Guide and Reference*.

A customized panel can have additional text, input, or output fields outside the dynamic area. Any additional variable fields are transparent to the Browse and Edit programs. They can, however, be processed by the dialog that invoked Browse or Edit, or by edit macros provided by the dialog developer. Additional variable fields that appear on the panel should be refreshed (by using a REFRESH statement) in the)REINIT section of the panel definition. This ensures that the display screen is updated with the current contents of the variables each time the panel is displayed, which is after execution of each macro or built-in command, including SCROLL commands.

Any variables that are to be passed from the panel to an edit macro should be stored in the shared or profile pool by including a VPUT statement in the)PROC section of the panel definition. The macro must then issue a VGET to obtain them. The reason is that macros operate as nested dialogs, with a separate function pool from that of the dialog that invokes Edit.

The statements that appear in the)ATTR,)INIT,)REINIT, and)PROC sections of the distributed panels should be included in customized panels, with the possible exception of the EXTEND, WIDTH, and EXPAND keywords (discussed here) and the initialization of the scroll fields. Additional keywords can be added to the attribute definitions (for example, to produce different colors), but the same hexadecimal representation of the attribute bytes must be maintained, including the X'20' specified on the USERMOD keyword in the Edit panel.

The attribute keywords of the last attribute byte set before the dynamic area and of the attribute byte represented by X'01' should be the same for panel ISRBROB and any panels using it for an example.

Table 29 and Table 30 on page 182 list the ISPF-provided output-only variables you can use on Browse and Edit panels.

Table 29. Browse output-only variables

Variable	Description	Format/Length
ZCOLUMNS	First and last columns being displayed	CHAR 7
ZCSROFF	Cursor offset within cursor field	CHAR 4
ZCURSOR	Name of field where cursor is placed	CHAR 8
ZDADWD	Width of the dynamic area (ZDATA)	CHAR 4
ZDAMLN	Length of the dynamic area (ZDATA)	CHAR 4
ZDSN	Name of data set being displayed	CHAR 44
ZLEVEL	Version and mod level of member	CHAR 8

Table 29. Browse output-only variables (continued)

Variable	Description	Format/Length
ZLINES	Top line of the data display	CHAR 8
ZLVLINE	Last visible line of ZDATA after last interaction	CHAR 4
ZMEMB	Name of member being displayed	CHAR 8
ZTITLE	The title line DSN(MEMB) - VER.MOD	CHAR 65
ZWIDTH	Width of the panel	CHAR 4
ZDSVOL	Volume of the data set or first library in the concatenation	CHAR 6

Table 30. Edit output-only variables

Variable	Description	Format/Length
ZCL	Left column of the data display	CHAR 5
ZCR	Right column of the data display	CHAR 5
ZCSROFF	Cursor offset within cursor field	CHAR 4
ZCURSOR	Name of field where cursor is placed	CHAR 8
ZDADLN	Length of the dynamic area (ZDATA)	CHAR 4
ZDADWD	Width of the dynamic area (ZDATA)	CHAR 4
ZDSN	Name of data set being displayed	CHAR 44
ZLEVEL	Version and mod level of member	CHAR 8
ZLVLINE	Last visible line of ZDATA after last interaction	CHAR 4
ZMEMB	Name of member being displayed	CHAR 8
ZTITLE	The title line DSN(MEMB) -VER.MOD	CHAR 65
ZWIDTH	Width of the panel	CHAR 4
ZDSVOL	Volume of the data set or first library in the concatenation.	CHAR 6

Enabling Browse panels to display Unicode data

You can enable users to browse data that is stored in a Unicode format. To do this, MVS Conversion Services must first be set up for the appropriate conversions. See *z/OS Unicode Services User's Guide and Reference*.

Customizing member list panels

Dialog developers can also provide customized member list display panels for their dialogs. The name of the customized member list display panel is passed as a parameter to the LMMDISP service.

A customized member list panel should be modeled after the LMMDISP default member list panel, ISRML000.

Note: Panel ISRML000 is provided as both source code (written in Dialog Tag Language, or DTL) and as generated output. If you use this panel as a model for creating your own customized panel, be sure to copy the DTL source code for modification, as it is easier to modify than the generated output panel. The DTL source code can be found in one of the SISPGxxx libraries, where xxx is the designator for a specified language.

The customized panel must include a Command field named ZCMD and a dynamic area named ZDATA. In addition, for customized member list panels, the dynamic area must be 80 characters wide. The Scroll field is optional. The name of the Scroll field on member list panels is ZSCML. This same name can be used on a customized member list panel. Inclusion of the variables that output the data set name, relative row number, and total number of rows is optional. If you want to display the volume of the data set you can use variable ZDSVOL. Customized member list panels should also meet the requirements for a movable Command line. Figure 89 on page 184 shows an example of a customized member list panel that was generated by Dialog Tag Language code.

See the *z/OS ISPF Dialog Developer's Guide and Reference* for a discussion of these needs.

Figure 91. Customized member list panel (Part 3 of 3)

As with edit and browse customized panels, the distributed member list panels have a dynamic area that extends to fill the available depth of the screen. But, unlike edit and browse panels, (the dynamic area on a member list panel does not expand to fill the width of the screen), it must be 80 characters wide. The dynamic area can also be fixed in length by removing the EXTEND keyword from the)ATTR section of the panel definition.

See the description of dynamic areas in the *z/OS ISPF Dialog Developer's Guide and Reference*.

See "Customizing Browse and Edit" on page 178 for a more complete discussion on customizing panels.

Table 31 on page 187 lists the ISPF-provided output-only variables you can use on member list panels.

Table 31. Member list panel output-only variables

Variable	Description	Format/Length
ZDAZWD	Width of dynamic area (ZDATA)	CHAR 4
ZDAMLN	Length of dynamic area (ZDATA)	CHAR 4
ZDSN	First or only data set in concatenation	CHAR 44
ZMLCOLS	Member statistics column headings	CHAR 80
ZMLCR	Relative row number of top row	FIXED 4
ZMLTR	Total number of rows in member list	FIXED 4
ZDSVOL	Volume of the data set or first library in the concatenation.	CHAR 6

Customizing the z/OS UNIX directory list panel

Dialog developers can also provide a customized z/OS UNIX directory list display panel for their dialogs. The name of the customized directory list display panel is passed as a parameter to the DIRLIST service.

A customized directory list panel must be modeled after the DIRLIST default directory list panel, ISRUUDL0.

Note: Panel ISRUUDL0 is shipped as both source code (written in Dialog Tag Language, or DTL) and as generated output. If you use this panel as a model for creating your own customized panel, you have the option of modifying a copy of the DTL source code and using this to generate the customized panel. The DTL source code can be found in one of the SISPGxxx libraries, where xxx is the designator for a specified language.

The customized panel must include a Command field named ZCMD and a dynamic area named ZDATA which is used to display the column headings. ISPF uses the TBDISPL service to display the directory list and dynamically builds a model line in the value of variable ZULMODL. Therefore, the customized panel must specify variable ZULMODL as a variable model line. The panel is designed to use the available screen width and both the model line and column heading line are required to expand for the width of the screen. ISPF dynamically builds a list of ZVARs for the panel in the value of variable ZULZVARs.

For information on variable model lines refer to the description of the TBDISPL service in the *ISPF Services Guide*, and the section titled "Requirements for Model Section" in the *ISPF Dialog Developer's Guide and Reference*.

IBM Products option

Module ISRALTDI is used to determine if products are installed for the IBM Products Option (option 9). Products are considered to be installed if a specific panel for the product can be found in the panel library. If the panel is found, then ISPF will attempt to invoke it. No other checks are made to see if the products are correctly and completely installed or available.

For Information/System invocation, all parameters are allowed to default. To add parameters to the invocation, modify panel ISRDINFX by placing this statement immediately after the string PGM(BLGINIT):

```
PARM(your additional parameters)
```

To pass suboptions to the product panels, use the TRUNC and TRAIL functions with the ZALTTR variable before invoking program ISRALTDI. ZALTTR can hold up to 80 characters. Use this code:

```
&ZALTTR; = TRUNC(&ZCMD, '.')
&ZALTTR; = .TRAIL
&ZSEL; = TRANS(TRUNC*&ZCMD, '.')
```

The operation of ISRALTDI is:

1. Search the panel library for the primary panel.
2. If the primary panel exists, SELECT or DISPLAY the primary or alternate panel. If the primary panel does not exist, search the panel library for the secondary panel.
3. If the secondary panel exists, SELECT or DISPLAY the secondary or alternate panel. If the secondary panel does not exist, set an error message.

ISRALTDI is intended to be invoked from a selection panel. The parameter list follows:

```
SELECT PGM(ISRALTDI) PARM(
    Primary-panel
    , < Primary-application-id >
    , Secondary-panel
    , < Secondary-application id >
    , < Alternate-panel >
    , < Alternate-application-id >
) NOCHECK
```

After the last nonblank parameter, trailing commas are optional. The parameters are described here.

Primary-panel and secondary-panel are panel names and are required.

Primary- and secondary-application-id can be:

APPLICATION ID

0 to 4 character APPLID under which a panel is to be SELECTed.

- * DISPLAY this panel.
- + Use alternate panel.

Alternate-panel is an optional panel name.

Alternate APPLID can be:

APPLICATION ID

0 to 4 character APPLID under which a panel is to be SELECTed.

- * DISPLAY this panel.

Some examples of the parameter string for ISRALTDI follow:

- If PANEL1 exists, SELECT it with application ID 'AP'. Otherwise, DISPLAY panel 'NOTHERE'.
PANEL1,AP,NOTHERE,*
- If PANEL1 exists, DISPLAY it. Otherwise, DISPLAY panel 'NOTHERE'.
PANEL1,*,NOTHERE,*
- If PANEL1 exists, SELECT PANEL3 with application ID 'CSP'. Otherwise, SELECT panel 'UNAVAIL' with application ID 'ISR'.
PANEL1,+,UNAVAIL,ISR,PANEL3,CSP

- If PANEL1 exists, SELECT PANEL3 with application ID 'CSP'. Otherwise, SELECT panel 'UNAVAIL' with current APPLID.
PANEL1,+,UNAVAIL,,PANEL3,CSP
- If PANEL1 exists, SELECT PANEL1 with current application ID. Otherwise, SELECT panel 'UNAVAIL' with current APPLID.
PANEL1,,UNAVAIL

Part 2. Reference

Chapter 8. PDF installation-wide exits

PDF allows installations to satisfy unique processing needs by providing installation-wide exits at these points:

- Data set list and member list
- Data set allocation
- Print utility
- Compress request
- Data set name and member name change.

The sections that follow describe each of these installation-wide exits and list the parameters, return codes, and any error processing.

Note: All PDF exits should be AMODE(31). Consider making any exit routines that you write reusable, and preferably reentrant. If you write exits that are *not* reentrant, they cannot be put in the Link Pack Area (LPA) library. Non-reentrant exit routines placed in the LPA can cause abend errors.

Data set list filter exit

In the ISPF configuration table keyword file, this exit is set with keyword `DATA_SET_LIST_FILTER_PROGRAM_EXIT`.

The data set list filter exit is used by option 3.4 to allow the installation to determine what data set names appear in the data set list. The exit is called at two different points:

- First, with the `DSNAME LEVEL` and `VOLUME` specified on option 3.4 panel
- Second, for each data set whose name matches the `DSNAME LEVEL` and `VOLUME`.

If an exit routine is not provided, PDF uses the `dsname level` and `volume` specified on the panel and adds all data sets that match the data set name level and volume to the list.

PDF calls this exit routine using the standard conventions. The routine must be a program. All ISPF and system services are available to the routine.

See “Disable generic high-level qualifiers” on page 82 for an example of a data set list filter exit.

Analyze Dsname and Volume

Table 32. Details of the parameters used to analyze Dsname and Volume

Parameter	Type	Len	Description	Modifiable
CODE	FIXED	4	Code that indicates that this is the analyze dsname and volume call. Call=1.	No
DSNAME LEVEL	CHAR	44	Data set name level that was specified on the option 3.4 panel.	Yes
VOLUME	CHAR	6	Volume that was specified on the option 3.4 panel.	Yes

Analyze data set name

Table 33. Details of the parameters used to analyze the data set name

Parameter	Type	Len	Description	Modifiable
CODE	FIXED	4	Code that indicates that this is the analyze data set name call. Call=2	No
DSNAME LEVEL	CHAR	44	Data set name level that you specified on the option 3.4 panel.	No
VOLUME	CHAR	6	Volume that you specified on the option 3.4 panel.	No
DATA SET NAME	CHAR	44	Data set name that is to be added to the list.	No
VOLUME NAME	CHAR	6	Volume on which this data set resides.	No

Return codes

With the DSNAME LEVEL and VOLUME specified on option 3.4 panel.

- 0 The data set name and volume is used as entered on the panel.
- 4 Either the data set name or the volume has been modified by the exit and the modified data set name or volume is used.
- 8 A list is not displayed.

For each data set whose name matches the DSNAME LEVEL and VOLUME.

- 0 Data set name and volume is included in the list without any modification.
- 4 Data set name is not added to the list.
- 8 The list is stopped, no more items are added to the list.

Data set allocation exit

In the ISPF configuration table keyword file, this exit is set with keyword DATA_SET_ALLOCATION_PROGRAM_EXIT.

You can specify an installation-written exit routine to create, delete, allocate, and deallocate data sets instead of using those functions provided by PDF. However, allocations done by ISPF, the TSO ALLOCATE command, or TSO commands are not handled by the exit. If you use your own data set allocation exit routine, it must be a program. CLISTs are not allowed.

Exit parameters

PDF passes the SVC 99 parameter list/dynamic allocation request table as input to the exit routine. The information in the parameter list depends on the type of request being processed and is obtained from the user. Register 1 points to the parameter list.

PDF uses these parameters to communicate with the allocation exit:

SVC99 parmlist pointer

A pointer to the SVC99 parmlist/dynamic allocation request table.

User storage pointer

A pointer to a 120-byte area that can be used to add new or changed text units.

Path name pointer

A pointer to an area of storage containing the absolute path name of the z/OS UNIX file to be allocated. Set to zero if this is not a request to allocation a z/OS UNIX file.

Path name length

A fullword binary integer that is the length of the z/OS UNIX file path name. Set to zero if this is not a request to allocation a z/OS UNIX file.

In addition to these parameters, PDF allocates enough space for a total of 30 text unit pointers in the text unit pointer list. The unused pointers can be used in conjunction with the 120-byte user data area for adding or changing text units.

If the request is to *allocate* a data set, the parameter list contains the information in Table 34.

Table 34. Parameter list during allocation

Key	#Parms	Length	Parameter	Description	Exit may modify these parameters
0001	1	8	DDNAME	ddname to allocate data set to	No
0002	1	44	DSNAME	Data set name to allocate	No
0004	1	1	STATUS	Data set status	Yes
0005	1	1	NDISP	Normal data set disposition	Yes
0006	1	1	CDISP	Conditional data set disposition	Yes
0010	1	6	VLSER	Volume serial	No
0015	1	8	UNIT	unit name	No
0050	1	8	PASSW	Password for protected data set if a password was specified	No
0057	1	8	RTORG	Return data set organization	No
005D	1	6	RTVOL	Return volume serial from allocation	No
8017	1	1023 (max)	PATHNAME	Path name of the z/OS UNIX file to allocate. Pathname is of the form: <i>/dev/fdnnn</i> where <i>nnn</i> is the file descriptor number. The real path name can be obtained via the path name pointer and path name length parameters.	No
8018	1	4	PATHOPT	The file options for the z/OS UNIX file	No
801D	1	1	FILEORG	The organization of the z/OS UNIX file	No

If the request is to *concatenate* a data set, the parameter list contains the information in Table 35 on page 196.

Table 35. Parameter list during concatenation

Key	#Parms	Length	Parameter	Description	Exit may modify these parameters
0001	1	8	DDNAMEEx	List of ddnames corresponding to the data sets being concatenated	No
0004	0	0	PERMCC	Permanently concatenated attribute	No

If the request is to *create* a data set, the parameter list contains the information in Table 36.

Table 36. Create data set allocation parameter list

Key	#Parms	Length	Parameter	Description	Modifiable?
0001	1	8	DDNAME	ddname to allocate data set to	No
0002	1	44	DSNAME	Data set name to allocate	No
0004	1	1	STATUS	Data set status	Yes
0005	1	1	NDISP	Normal data set disposition	Yes
0006	1	1	CDISP	Conditional data set disposition	Yes
>0007	>1	>0	>TRKS	Space allocated in tracks or	>Yes
0008	1	0	CYLS	Space allocated in cylinders, or	Yes
0009	1	3	BLKS	Space allocated in blocks	Yes
000A	1	3	PSPACE	Primary space quantity	Yes
000B	1	3	SSPACE	Secondary space quantity	Yes
000C	1	3	DBLKS	Number of directory blocks	Yes
0010	1	6	VOLSER	Volume serial	Yes
0015	1	8	UNIT	Unit group (esoteric) name Device type Specific unit address	Yes
0020	1	1	PASPR	Data set is password protected: X'10' Data set cannot be read, changed, extended, or deleted. X'30' Data set can be read, but not changed, extended, or deleted.	Yes
>0022	>1	>5	>EXPDT	Expiration date - YYDDD or	>Yes
006D	1	7	EXPDTL	Expiration date - YYYYDDD or	Yes
0023	1	2	RETPD	Retention period	Yes
0030	1	2	BLKSZ	Block size	Yes
003C	1	2	DSORG	Data set organization	Yes
0042	1	2	LRECL	Logical record length	Yes
0049	1	1	RECFM	Record format	Yes
0050	1	8	PASSWORD	Data set password if specified	Yes
0052	0	0	PERM	Permanently allocated attribute	No
0057	1	2	RTORG	Return data set organization	No

Table 36. Create data set allocation parameter list (continued)

Key	#Parms	Length	Parameter	Description	Modifiable?
005D	1	6	RTVOL	Return volume serial from allocation	No
8004	1	8	STORCLAS	Storage class used to allocate the data set	Yes
8005	1	8	MGMTCLAS	Management class used to allocate the data set	Yes
8006	1	8	DATACLAS	Data class used to allocate the data set	Yes
8010	1	1	AVGREC	Unit of allocation in terms of average record size: X'80' Bytes X'40' Kilobytes X'20' Megabytes	Yes
8012	1	1	DSNTYPE	Data set name type used to allocate the data set: X'80' Library X'40' PDS X'10' HFS X'08' Extreq X'04' Extpref X'02' Basic X'01' Large	Yes

If the request is to *deallocate* a data set, the parameter list contains the information in Table 37.

Table 37. Parameter list during deallocation

Key	#Parms	Length	Parameter	Description	Exit may modify these parameters
0001	1	8	DDNAME	ddname to free	No
0007	0	0	UNALC	Unallocate option	No

If the request is to *delete* a data set, the parameter list contains the information in Table 38.

Table 38. Parameter list during deletion

Key	#Parms	Length	Parameter	Description	Exit may modify these parameters
0002	1	44	DSNAME	DSNAME to free	No
0007	0	0	UNALL	Unallocate option	No

If the request is to *delete* a data set, it is done through the MVS SCRATCH macro. This allows unexpired data sets to be deleted.

Return codes

- 0 No errors; the exit has issued the SVC 99.
- 4 No errors; PDF issues the SVC 99.
- 8 Error occurred; the exit has formatted a message.
- 20 Severe error from the exit. The exit formats a message and PDF displays it in an error box.

If the allocation exit issues the SVC 99 and requests PDF to evaluate the error, the exit should return the SVC 99 return code to PDF in register 15 with the high-order bit of the register turned on.

If PDF issued the SVC 99, it places (by way of a VPUT) these variables into the shared pool in character format:

Z99RC

Return code from SVC 99

Z99ERROR

SVC 99 error code

Z99INFO

SVC 99 information code.

Activity monitoring exits

In the ISPF configuration table keyword file, this exit is set with keyword `ACTIVITY_MONITORING_PROGRAM_EXIT`.

The activity monitoring exits provide monitoring information for these PDF functions:

- Primary commands invoked from BROWSE
- Primary commands invoked from EDIT
- Primary commands invoked from VIEW
- Edit macros invoked from EDIT
- Line commands invoked from EDIT
- Line commands invoked from VIEW
- Library/Data Set utility sub-functions
- Data Set List utility built-in line commands.

The activity monitoring exit routine is given control at the start and end of each command or function.

Exit parameters

PDF uses these parameters to communicate with the monitoring exit.

Table 39. Details of the parameters used to communicate with the monitoring exit

Parameter	Type	Len	Description	Modifiable
EXIT ID	FIXED	4	Numeric code for the exit point.	No
COMMAND/ SUB-FUNCTION ADDRESS	PTR	4	Storage location containing the command name or sub-function identifier.	No
COMMAND/ SUB-FUNCTION LENGTHS	FIXED	4	Length of the command name or sub-function identifier. The value ranges from 1-255.	No

Usage notes

- Activity monitoring exits are the same for VIEW as for EDIT. From within the VIEW function, the primary and line commands are monitored exactly like they are from EDIT.
- A single exit routine is allowed for all monitoring PDF exit points. The name of the module is placed into the ISPF configuration table when the product is installed.
- 31-bit addressing must be supported by the exit routine as it is given control in AMODE 31. ISPF/PDF does not restrict the RMODE of the exit, but RMODE ANY is recommended.
- Standard OS linkage conventions are used to branch to the exit routine that is defined.
- You can make PDF service calls from within the exit routine, with the exception of those services that could cause recursion (for example, calling the EDIT service for an EDIT primary command exit call).
- You cannot activate or deactivate the exit while an PDF session is in progress. You can make changes to the exit routine load module at any time, but because PDF loads the module only once at session initialization, the changes are not recognized until the next ISPF session.
- PDF does not provide data areas. You can use a predetermined ddname as a work area. The ISPF initialization exit could allocate and open a data set to this ddname. Each PDF exit could read and write to the data set as needed. The ISPF termination exit could close and free the data set.

Exit 1: BROWSE primary command start

This exit point marks the start of a valid BROWSE primary command. The exit routine is given control immediately before the function is performed.

Exit 2: BROWSE primary command end

This exit point marks the end of a valid BROWSE primary command. The exit routine is given control immediately after the command is performed. It can be used together with the BROWSE primary command start exit point for monitoring purposes.

Exit 3: EDIT primary command start

This exit point marks the start of a valid, user-entered EDIT primary command. The exit routine is given control immediately before the command is performed. All edit macro statements (such as ISREDIT SAVE) are processed as if they were primary commands. Individual edit macro statements executed from within the edit macro optionally invoke the exit routine. A field in the configuration table determines whether the activity monitoring exit is invoked at the start and stop of each edit macro command. If an alias has been defined for the command (via the DEFINE command of EDIT), and if the alias name is specified, the actual command that is invoked is passed to the exit.

Exit 4: EDIT primary command end

This exit point marks the end of a user-entered EDIT primary command. The exit routine is given control immediately after the command is performed. It can be used together with the EDIT primary command start exit point for monitoring purposes.

Exit 5: EDIT macro start

This exit point marks the start of a user-entered EDIT macro or an invalid EDIT primary command. The exit routine is given control immediately before the macro is invoked. Individual edit macro statements executed from within an edit macro optionally invoke the edit primary command exit routines (exits 3 and 4). Line commands processed by an edit macro optionally invoke the Edit line command exit routines (exits 7 and 8).

Exit 6: EDIT macro end

This exit point marks the end of a user-entered EDIT primary command. The exit routine is given command immediately after the macro is performed. It can be used together with the EDIT macro command start exit point for monitoring purposes.

Exit 7: EDIT line command start

This exit point marks the start of a valid user-entered EDIT line command. Line commands that are being processed by an edit macro optionally invoke the exit routine and indicate that it is a line command executed by an edit macro. The exit routine is given control immediately before the command is performed.

If multiple line commands are entered, the exit routine is given control once for each line command. A line command entered in block form (CC, for example) causes the exit to be called only once. Destination line commands (A,B,O) and defining line labels do not call the exit.

Exit 8: EDIT line command end

This exit point marks the end of an Edit line command. The exit routine is given control immediately after the command is performed.

If multiple line commands are entered, the exit routine is given control once for each line command. A line command entered in the block form (CC, for example) causes the exit to be called only once. Destination line commands (A, B, O) and defining line labels do not cause the exit to be called.

This exit point can be used together with the Edit line command start exit point for monitoring purposes.

Exit 9: Library/Data Set utility sub-function start

This exit point marks the start of a sub-function from either the Library (option 3.1) or Data Set (option 3.2) Utilities. These are the sub-function identifiers and their descriptions:

A	Allocate data set
C	Catalog data set
D	Delete data set
I	Data set information
M	Display member list
MB	Browse member
MD	Delete member
MP	Print member
MR	Rename member
P	Print entire data set

R	Rename data set
RU	Rename data set using ISPF option 3.2 (catalog is not updated)
S	Data set information (short)
U	Uncatalog data set
X	Print data set index listing
Z	Compress data set

The exit routine is given control immediately before the sub-function is performed.

If multiple line commands (member list) are entered, the exit routine is given control once for each sub-function.

Exit 10: Library/Data Set utility sub-function end

This exit point marks the end of a Library or Data Set utility sub-function. The exit routine is given control immediately after the sub-function is performed. It can be used together with the Library/Data Set utility sub-function start exit point for monitoring purposes.

Exit 11: Data Set List utility line command start

This exit point marks the start of a line command from the Data Set List (option 3.4) utility. These are the subfunction identifiers and their descriptions:

Table 40. Subfunction identifiers and descriptions for exit 11

Identifier	Description
B	Browse data set
C	Catalog data set
D	Delete data set
E	Edit data set
F	Free unused space
I	Data set information
M	Display member list
MB	Browse member
MD	Delete member
ME	Edit member
MI	Info member
MP	Print member
MR	Rename member
P	Print entire data set
R	Rename data set
S	Data set information (short)
U	Uncatalog data set
X	Print data set index listing
Z	Compress data set.

In addition to the one character command name, the name of the data set is provided for all commands that operate on entire data sets. For example, when an R is typed next to data set MY.TEST.DATA, the command pointed to by the command parameter is:

```
R 'MY.TEST.DATA'
```

Note that the data set name provided is the one shown in the data set list, even if the name has been changed by a data set name change exit.

For the M (member list) command, the command parameter includes the data set name. However, for commands executed within the member list, just the command code is given (such as MB for the B (browse) line command).

The exit routine is given control immediately before the command is performed.

If multiple line commands are entered, the exit routine is given control once for each line command. Only built-in commands cause the exit to be called.

Exit 12: Data Set List utility line command end

The exit routine is given control immediately after the command is performed.

If multiple line commands are entered, the exit routine is given control once for each line command. Only built-in commands cause the exit to be called.

This exit point is provided to mark the end of a Data Set List utility line command. It can be used together with the Data Set List utility line command start exit point for monitoring purposes.

Error processing

If a nonzero return code is returned from an exit call, a message is conditionally set.

Return codes

0 Normal Completion

Nonzero

Severe Error.

The ISPF Select Exit can be used by installations to monitor TSO commands and CLISTs issued from the Data Set List utility.

Data set list line command exit

In the ISPF configuration table keyword file, this exit is set with keyword DATA_SET_LIST_LINE_COMMAND_PROGRAM_EXIT.

The data set list line command exit allows installations to change or restrict the line commands entered in the Data Set List utility.

Exit parameters

ISPF uses these parameters to communicate with the line command exit routine.

Table 41. Details of the parameters used to communicate with the line command exit routine

Parameter	Type	Len	Description	Modifiable
LINE COMMAND	CHAR	255	A 255-line character field containing the data set list line command. The field is left-justified with trailing blanks.	Yes

Usage notes

- The name of the module is placed into the ISPF configuration table when the product is installed.
- 31-bit addressing must be supported by the exit routine as it is given control in AMODE 31. PDF does not restrict the RMODE of the exit, but RMODE ANY is recommended.
- Standard OS linkage conventions are used to branch to the exit routine that is defined.
- You can make PDF service calls from within the exit routine.
- You cannot activate or deactivate the exit while a PDF session is in progress. You can make changes to the exit routine load module at any time, but because PDF loads the module only once at session initialization, the changes are not recognized until the next ISPF session.
- On input to the exit, the 255-character field contains the line command (left justified) after ISPF substitutes the data set name. If you explicitly specify a slash character (/) in place of the data set name, the slash is replaced by the data set name before the exit receives the command. If you do not specify a slash, the data set name is appended to the end of the command that you enter. One or more spaces will precede the data set name in this case.
- The exit can change the command buffer, subject to these rules:
 - If the final command to be executed is not one of the ISPF built-in commands (E, C, V, and so on), then the buffer can be changed to anything. ISPF does no validation before sending the command to TSO.
 - If the final command to be executed *is* one of the built-in commands, the data set name cannot be changed.

Thus, user commands can be converted to built-in commands, built-in commands can be converted to user commands (like CLISTs), or the command string can be blanked out entirely to ignore the command.

- The Slash (/) command is considered a single command. Selections from the pop-up list are not reprocessed by the line command exit.
- Because the format of the data set list line command is free form, the exit should not have any dependencies on specific columns, or on specific numbers of blanks in the string.
- The intended interface for saving data across exit invocations is through standard ISPF methods (variables or tables).
- If the command buffer is changed, the exit must return a code of 4 in register 15 to notify ISPF.

If the exit name has been specified in the ISPF configuration table the exit is called before each line command is processed. The exit can analyze the line command and determine whether you should invoke the command as entered, as modified by the exit, or not at all.

If the exit modifies the line command, it is responsible for ensuring that the modified line command is valid.

Error processing

If a nonzero return code is returned from an exit call, a message is conditionally set.

Return codes

0	Use line command as specified by the user
4	Use line command as changed by the exit
8	Do not invoke this command
20	Severe error occurred.

Print utility exit

The Print utility exit receives control from ISPF in two distinct modes:

- Print utility exit for general printing (described here).
- Print utility exit on ISPF termination and LOG/LIST commands (see “Print utility exit on ISPF termination and LOG/LIST commands” on page 206).

In the ISPF configuration table keyword file, this exit is set with keywords PRINT_UTILILITY_PROGRAM_EXIT and PRINT_UTILILITY_COMMAND_EXIT.

The print utility exit lets you define your own print facility to replace or supplement PDF's print facilities. If you define a print routine for this exit, PDF calls that routine from options 3.6, 3.8, and all 4.x options. The print routine is also called on ISPF termination and for the LOG and LIST commands as described in “Print utility exit on ISPF termination and LOG/LIST commands” on page 206.

The print routine can:

- Define its own print facility or use the TSO/E Information Center Facility printer definitions. To indicate that you are using the TSO/E Information Center Facility printer definitions, set the PRINT_USING_ICF keyword in the ISPF configuration table to YES.
- Specify additional print options.
- Supply print parameters automatically.
- Censor print requests.

Exit parameters

PDF communicates with the installation-written print routine through dialog variables in the ISPF shared pool. PDF passes data set, job card, and print option information to the print routine that you supply on the PDF print panels. As a system programmer, you can modify those print panels so that the print routines receive more or less information.

If variable ZPRLGLST is not defined or does not have a value of LOG or LIST, then the variables shown in Table 42 on page 205 are available to the print exit routine. However, if variable ZPRLGLST has a value of LOG or LIST, then the variables shown in Table 43 on page 207 are available to the print exit routine.

Table 42. Variables available to the print exit routine.

Variable	Type	Len	Description	Modifiable
ZPRDSN	CHAR	44	Fully qualified data set name (no quotes) of the data set to be printed	No
ZPRMEM	CHAR	8	Member to be printed, if the data set is a partitioned data set and a member is defined	No
ZPRPMD	CHAR	5	Print mode - BATCH, LOCAL, or TSO/E ICF	Yes
ZPROPT	CHAR	1	Disposition of the data set as specified by the user - K (keep) or D (delete)	Yes
ZPRDSORG	CHAR	8	Organization of the data set - PO or PS	No
ZPRRECFM	CHAR	6	Record format of the data set	No
ZPRLRECL	CHAR	5	Logical record length of the data set	No
ZPRBLKSZ	CHAR	5	Physical block size of the data set	No
ZPRVOLSE	CHAR	6	Volume serial of the data set	No
ZPRPASS	CHAR	8	Data set password (if it is password protected)	No
ZPRSYSO	CHAR	80	Batch SYSOUT class as specified by the user	Yes
ZPRSYSOL	CHAR	80	Local SYSOUT class as specified by the user	Yes
ZPRLPRT	CHAR	8	Local printer ID as specified by the user	Yes
ZPRICFPL	CHAR	15	TSO/E Information Center Facility printer location as specified by the user	Yes
ZPRICFPF	CHAR	8	TSO/E Information Center Facility printer format as specified by the user	Yes
ZPRICFPT	CHAR	8	TSO/E Information Center Facility printer type as specified by the user	Yes
ZPRICFNC	CHAR	3	TSO/E Information Center Facility number of copies as specified by the user	Yes
ZPRICFEF	CHAR	1	TSO/E Information Center Facility enable font selection	Yes
ZPRJB1	CHAR	72	Print job card 1 as specified by the user	Yes
ZPRJB2	CHAR	72	Print job card 2 as specified by the user	Yes
ZPRJB3	CHAR	72	Print job card 3 as specified by the user	Yes
ZPRJB4	CHAR	72	Print job card 4 as specified by the user	Yes

Return codes

- 0 Successful termination of print routine. PDF does no further processing.
- 2 Successful termination of print routine. PDF submits any generated JCL.
- 4 Successful termination of print routine. PDF prints the data according to the information in the dialog variables located in the ISPF shared pool. If no message is waiting to be displayed, PDF issues a message.
- 20 Installation print routine failed. PDF keeps the data and, if the installation print exit has issued an ISPF SETMSG service request, ISPF displays the requested message.

Note: ISPF processes the data set based on the updated value of the ZPROPT variable for return codes 0, 2, or 4. This allows the exit to delete the data set or instruct ISPF to delete the data set. ZPROPT cannot be set to a value of 'D' for PDS or PDSE data sets.

Error processing

The installation-wide exit routine is responsible for handling all errors that occur while it is in control. The TSO/E Information Center Facility handles all error conditions while it is in control. In addition, PDF displays any error messages generated by the TSO/E Information Center Facility on the current print panel.

Print utility exit on ISPF termination and LOG/LIST commands

In the ISPF configuration table keyword file, this exit is set with keywords PRINT_UTILITY_PROGRAM_EXIT (if your exit is a program) and PRINT_UTILITY_COMMAND_EXIT (if your exit is a CLIST).

The print utility exit lets you define your own print facility to replace or supplement ISPF's print facilities. If you define a print routine for this exit, ISPF calls that routine upon ISPF termination and from ISPF's LOG and LIST commands. The print routine is also called from options 3.6, 3.8, and all 4.x options as described in "Print utility exit" on page 204. To define a print routine create your own JCL for batch jobs or your own local print routine such as PRINTDS. The exit parameters defined in Table 43 on page 207 that are marked with an asterisk (*) are system variables. They can be modified in the exit, but they are not saved in the system profile. The variables defined as not modifiable should not be modified.

Note: When calling the print utility exit upon ISPF termination and ISPF's LOG and LIST commands, the print log is turned off. The print utility operates without a log.

If the print utility exit is invoked, a new LOG or LIST is allocated if ISPF produces further LOG or LIST data.

The print routine can:

- Define its own print facility and submit the job.
- Specify additional print options.
- Supply print parameters automatically.
- Censor print requests.

Exit parameters

ISPF communicates with the installation-written print routine through dialog variables in the ISPF shared pool. PDF passes data set, job card, and print option information to the print routine that you supply on the ISPF LOG/LIST termination and command panels.

If variable ZPRLGLST has a value of LOG or LIST, then the variables shown in Table 43 on page 207 are available to the print exit routine. However, if variable ZPRLGLST is not available or blank, then the variables shown in Table 42 on page 205 are available to the print exit routine.

Table 43. Print exit routine variables

Variable	Type	Len	Description	Modifiable
ZPRLGLST	CHAR	4	Value is LOG if processing the LOG, LIST if processing the LIST.	No
ZPRLGDSN	CHAR	44	Fully qualified log data set name (no quotes) of the data set to print.	No
ZPRLSDSN	CHAR	44	Fully qualified list data set name (no quotes) of the data set to print.	No
ZPRLGPMD	CHAR	5	Log print mode, BATCH or LOCAL.	Yes
ZPRLSPMD	CHAR	5	List print mode, BATCH or LOCAL.	Yes
*ZPRLGOPT	CHAR	1	Disposition of the log data set as specified by the user D (delete)	Yes
*ZPRLSOPT	CHAR	1	Disposition of the list data set as specified by the user D (delete)	Yes
*ZPRECFM	CHAR	6	Record format of the list data set.	No
*ZPRLRECL	CHAR	5	Logical record length of the list data set.	No
*ZPRLGSYS	CHAR	15	Batch SYSOUT class for the log data set as specified by the user.	Yes
ZPRLGSYSL	CHAR	15	Local SYSOUT class for the log data set as specified by the user	Yes
*ZPRLSSYS	CHAR	15	Batch SYSOUT class for the list data set as specified by the user	Yes
ZPRLSSYL	CHAR	15	Local SYSOUT class for the list data set as specified by the user	Yes
*ZPRLGPRT	CHAR	17	Local printer ID for the log data set as specified by the user.	Yes
*ZPRLSPRT	CHAR	17	Local printer ID for the list data set as specified by the user.	Yes
*ZPRJB1	CHAR	72	Print job card 1 as specified by the user	Yes
*ZPRJB2	CHAR	72	Print job card 2 as specified by the user	Yes
*ZPRJB3	CHAR	72	Print job card 3 as specified by the user	Yes
*ZPRJB4	CHAR	72	Print job card 4 as specified by the user	Yes
ZPRMSGF	CHAR	1	Data set disposition message suppression. A value of 'S' stops ISPF setting a final disposition message.	Yes

Note: The user can only specify the disposition of the data set as D (delete). The exit can change the disposition of the data set to K (keep).

Return codes

When the print exit routine is invoked upon ISPF termination or ISPF LOG or LIST commands these return codes can occur.

0 Successful termination of print routine.

Batch Exit provides job card and other JCL needed to print the job. Exit submits the job.

Local Exit provides necessary information to print the job. Exit issues the print command.

ISPF issues a message on return from the print utility exit, indicating the return code from the exit.

- 2 Successful termination of the print routine.

Exit provides job card and JCL needed to print the job. ISPF submits the JCL contained in the file pointed to by the ZTEMPF variable.

ISPF issues a message on return from the print utility exit, indicating the return code from the exit.

- 4 Successful termination of the print routine.

Batch Exit may alter the modifiable variables and place them in ISPF's shared pool. ISPF submits the print job using the information in the dialog variables located in the ISPF shared pool.

Local Exit may alter the modifiable variables and place them in ISPF's shared pool. ISPF issues the PRINTDS command using the information in the dialog variables located in the ISPF shared pool.

ISPF issues a message on return from the print utility exit, indicating the return code from the exit.

Note:

ISPF processes the data set based on the updated value of the disposition variable (ZPRLGOPT or ZPRLSOPT) for return codes 0, 2, or 4. This allows the exit to either delete the data set itself, or instruct ISPF to delete the data set. ISPF does not delete pre-allocated LOG or LIST data sets.

For return codes 0, 2, and 4, ISPF issues a message regarding the disposition of the data set. The message is based on the dialog variables ZPRLGOPT, ZPRLSOPT, ZPRLGPRT, and ZPRLSPRT located in the ISPF shared pool. The exit can suppress this message by setting variable ZPRMSGF to a value of 'S'.

- 20 The print routine failed. ISPF keeps the data and displays an error message.

Error processing

The exit routine is responsible for handling all errors that occur while it is in control.

Compress request exit

In the ISPF configuration table keyword file, this exit is set with the keywords COMPRESS_UTILITY_PROGRAM_EXIT (if your exit is a program) and COMPRESS_UTILITY_CLIST_EXIT (if your exit is a CLIST).

Instead of using the IEBCOPY system utility interface that PDF provides, you can specify that PDF use an installation-written exit routine to handle requests to compress partitioned data sets under options 3.1, 3.4, and the LMCOMP service. When the compress exit gets control, the data set will have already been allocated and enqueued as exclusive. The exit will have to re-allocate the data set to a specific ddname. As part of termination processing, the exit must free the allocated ddname. The FREE operation must not be done by data set name. PDF allows the exit routine to:

- Use an alternate compression technique
- Provide backup before allowing normal PDF compression
- Selectively prevent compression.

PDF calls the exit routine with the SELECT service. The routine can be either a program or CLIST. All ISPF and system services are available.

Exit parameters

PDF communicates with the exit routine through variables in the shared pool. PDF considers these variables to be read-only and ignores any changes the exit routines make to the parameters. A VERASE is done at the end of the compress to delete the variables from all variable pools.

The variables available to the compress exit routine are:

Table 44. Details of the variables available to the compress exit routine

Variable	Type	Len	Description
ZCMPDSN	CHAR	44	Fully qualified data set name with no quotes
ZCMPVOL	CHAR	6	Volume serial
ZCMPPSWD	CHAR	8	Data set password
ZCMPORIG	CHAR	8	Origin of the call.
			LMCOMP The compress service (LMCOMP) called the exit routine.
			OPTION31 The compress exit routine is being called from option 3.1, the compress utility.
			OPTION34 The compress exit routine is being called from option 3.4, the data set list utility.

Return codes

0	Data set successfully compressed
2	PDF should compress the data set
4	Data set is not eligible for compression
8	Data set could not be allocated
12	Data set not cataloged
16	Error in exit; PDF should continue processing
17	LMCOMP recursion error
18	Unknown return code from exit
19	Error encountered invoking exit
20	Severe error; PDF should not continue processing
Other	PDF treats the error as return code 16.

Error processing

The exit routine is responsible for handling all errors that occur while it is in control. Failure to use correct allocation, serialization, and deallocation causes unpredictable results.

Data set name change exit

In the ISPF configuration table keyword file, this exit is set with keyword `DATA_SET_NAME_CHANGE_PROGRAM_EXIT`.

You can use the data set name change exit to change the name of the data set entered on the data entry panel. This allows PDF to process using the new data set name without the variables originally entered on the panel being changed. Anywhere the data set name is displayed, other than the data entry panel, can reflect either the original or the changed data set name. The data entry fields will not reflect any changes made to the data set name. If the exit is not specified, all data set names are used exactly as they are entered.

PDF calls this exit routine using the standard conventions. The exit is invoked for every data set specified on a data entry panel or in a PDF service call at the point in the PDF processing flow when the data set name is built from its component parts. This includes the library access services, EDIT and BROWSE services, and the PDF product dialogs themselves. The routine must be a program. All ISPF, PDF and system services are available to it.

If more than one ISPF library is specified on a data entry panel, the exit is invoked once for each library specified before each library is allocated. The libraries are not concatenated until each library is processed by the exit and allocated.

Exit parameters

PDF passes the data set name information as it was entered on the panel to the exit routine. Register 1 points to the parameter list.

PDF uses these parameters to communicate with the data set name change exit:

Table 45. Details of the parameters used to communicate with the data set name change exit

Variable	Type	Len	Description
PROJECT	CHAR	8	Project name as it was entered on the panel
GROUP	CHAR	8	Group name as it was entered on the panel
TYPE	CHAR	8	Type name as it was entered on the panel
MEMBER	CHAR	8	Member name as it was entered on the panel
OTHER DATA SET	CHAR	56	On input to the exit, the other data set name as entered on the panel. On output from the exit, blank or the data set name to be used. This can be used to replace an ISPF library.

Table 45. Details of the parameters used to communicate with the data set name change exit (continued)

Variable	Type	Len	Description
REASON	CHAR	8	Reason the data set is being allocated:
			<p>RECOVERY</p> <p>The data set is the edit recovery data set. The Other Data Set field contains the fully qualified data set name. The data set name change exit is not called for edit recovery data sets which are listed in the edit recovery table with an associated disposition of 'K'.</p> <p>TEMP</p> <p>The data set is a temporary PDF data set. This includes:</p> <ul style="list-style-type: none"> • The data set name specified on the member list SAVE command • The data set name specified on the data set list SAVE command • The data set used during the outlist utility processing (ISPF option 3.8, when using program ISRUOLP instead of CLIST ISRUOL). <p>blank</p> <ul style="list-style-type: none"> • Any data set entered on an PDF data entry panel • Data sets specified on the LMINIT service • Data sets specified on any service that does not need an LMINIT to have been previously performed.

Any of the parameters can be modified and are picked up by PDF with the exception of the Reason field, which is for the information of the exit only. Both an ISPF library (a PROJECT/GROUP/TYPE combination) and an OTHER DATA SET can be present in the parameter list. In this case, the OTHER DATA SET name supersedes the ISPF library name. If an ISPF library combination is specified as input to the exit and the exit wishes to create a new name that does not fit the ISPF library naming convention, the ISPF library name can be replaced by the exit filling in the Other Data Set field.

After the data set name has been changed by the exit, PDF does its normal data set processing, such as appending the user's prefix if an OTHER DATA SET name without quotes is returned by the exit. The changed data set name values are not saved in any variable pool, but are saved internally by PDF. The original input fields on the data entry panel are not changed, but any title line on a panel that contains a data set name can reflect either the original or the changed data set name.

Usage notes

1. Those data sets marked with a reason of TEMP can go through the exit more than once. The exit should not blindly add qualifiers to the TEMP data set names.
2. Any sequential data set that is used for output, such as being edited, the target of a Move/Copy (option 3.3), the source of an Edit MOVE command or the target of an Edit REPLACE command, or being reallocated by Edit after a space

ABEND (B37), is sent through the exit twice. In addition, if a member is being browsed via the Library utility browse line command (browse under option 3.1), the data set is sent through the exit twice.

3. Data sets that are allocated in a CLIST as well as a program or that have their data set names built in a CLIST or skeleton cannot be modified by the data set name exit unless the CLIST or skeleton has also been modified to change the data set name in the same way that the exit does. These data sets include:
 - The list data set name produced by the language processors in Foreground and Batch, and the term data sets in Batch.
 - The input and output data sets for SuperC. The CLISTs to be modified are ISRSFORG and ISRSSRCH.
 - The data set created by the Outlist utility (option 3.8) if CLIST ISRUOL is used rather than program ISRUOLP.
4. If the data set is being allocated for recovery, the data set name change exit should check the recovery table and generate a unique data set name.

Member list filter exit

In the ISPF configuration table keyword file, this exit is set with keyword MEMBER_LIST_FILTER_PROGRAM_EXIT.

The member list filter exit provides you with two capabilities:

1. You can dictate which members of a partitioned data set or concatenation of partitioned data sets are to be included in a member list when it is created.
2. You can specify which members of a member list are to be selected when the SELECT primary command is issued.

If a member list filter exit routine is not defined, PDF uses its default pattern matching conventions to determine which members are displayed, and which members are selected if the SELECT primary command is issued.

For each case in which the member list filter exit routine would be invoked, it is called first to allow verification or modification of the specified pattern (“Analyzing patterns with the member list filter exit”), and then once for each member in the data set that matches the pattern (“Analyzing member names with the member list filter exit” on page 213). The exit routine, through return codes, dictates which members are to be included in the member list, or selected if the SELECT primary command is issued.

PDF invokes the member list filter exit routine using standard linkage conventions. The exit routine must be a program.

From the exit routine, any of the PDF or ISPF services can be invoked. However, be careful when invoking services that generate a member list as part of their internal processing (LMMLIST, LMMDISP, LMMOVE, LMPROM, LMPRINT, and LMMSTATS). These invocations would result in a recursive call to the exit routine.

Analyzing patterns with the member list filter exit

Here are the exit parameters and return codes associated with analyzing patterns.

Exit parameters

PDF uses these parameters to communicate with the exit routine when it is invoked to verify/modify the pattern that you entered either on a member list entry panel, as a parameter to an PDF service, or with the SELECT primary command.

Table 46. Details of the parameters used to communicate with the member list filter exit when it is invoked to verify or modify a pattern

Parameter	Type	Len	Description	Modifiable
CODE	FIXED	4	Code that indicates that this is the analyze pattern call. Call=1.	No
PATTERN	CHAR	8	Pattern as entered by the user	Yes

Return codes

These return codes are expected from the member list filter exit routing to indicate the described conditions.

- 0 The pattern that you entered generates the member list.
- 4 The pattern is updated by the member list exit program and generates the member list.
- 8 The member list request or SELECT command request is canceled and a conditional SETMSG is issued.

Analyzing member names with the member list filter exit

Here are the exit parameters and return codes associated with analyzing member lists.

Exit parameters

PDF uses these parameters to communicate with the exit routine when the routine determines which members that matched the pattern are to be included in the member list, or which members are to be selected if a SELECT command was issued.

Table 47. Details of the parameters used to communicate with the member list filter exit when it is invoked to match members

Parameter	Type	Len	Description	Modifiable
CODE	FIXED	4	Code indicating that this is the analyze member name call. Call=2.	No
MEMNAME	CHAR	8	Member name.	No

Return codes

These return codes are expected from the member list filter exit program to indicate the described conditions.

- 0 Include this member in the member list.
- 4 Do not include this member in the member list.
- 8 The list is stopped; no more items are added to the list.

Member list built-in line command exit

In the ISPF configuration table keyword file, this exit is set with keywords MEMBER_LIST_LINE_COMMAND_PROGRAM_EXIT and MEMBER_LIST_LINE_COMMAND_COMMAND_EXIT.

The member list line command exit enables installations to change or restrict the behavior of the built-in line commands entered in a PDF member list. This exit is invoked for single-character member list built-in line commands invoked from ISPF option 3.1, ISPF option 3.4, and the ISPF Workplace (option 11).

This exit can be used to modify the behavior of built-in line commands. For example, when the E (edit) command is entered next to a member, the exit might examine the contents of the member and invoke a program other than the ISPF editor to process that member. If the exit then determines that the ISPF editor does not need to be invoked, it must return a return code of 8.

Exit parameters

PDF uses these parameters to communicate with the line command exit routine. These parameters are passed as a single 65-character string. A single blank is placed between parameters.

Table 48. Details of the parameters used to communicate with the line command exit routine

Parameter	Type	Len	Description	Modifiable
LINE COMMAND	CHAR	1	A 1-character field containing the data set list line command.	No
DATA SET NAME AND MEMBER	CHAR	56	A 56-character field containing data set name and member against which the line command is run. The format of this field is: 'DATA.SET.NAME(MEMBER)'. The field is left-justified with trailing blanks.	No
VOLUME SERIAL	CHAR	6	A 6-character field containing the volume on which the data set specified in DATA SET NAME AND MEMBER can be found.	No

Usage notes

- The name of the module is placed into the ISPF configuration table when the product is installed.
- 31-bit addressing must be supported by the exit routine as it is given control in AMODE 31. PDF does not restrict the RMODE of the exit, but RMODE ANY is recommended.
- For the program version of the exit, standard OS linkage conventions are used to branch to the exit routine that is defined.
- For the command version of the exit, the parameters are passed as operands.
- You can make PDF service calls from within the exit routine.
- You cannot activate or deactivate the exit while a PDF session is in progress. You can make changes to the exit routine load module at any time, but because PDF loads the module only once at session initialization, the changes are not recognized until the next ISPF session.

- If the exit name has been specified in the ISPF configuration table and the member list was generated from ISPF option 3.1, 3.4, or 11, the exit is called before each built-in line command is processed. The exit can analyze the line command and determine whether you should invoke the command as entered, or not at all.

Error processing

If a nonzero return code is returned from an exit call, a message is conditionally set.

Return codes

- 0 Use line command as specified by the user
- 8 Do not invoke this built-in command
- 20 Severe error occurred.

Chapter 9. ISPF Configuration Table keywords and values

ISPF Configuration Table keywords and values explains the keywords in the ISPF Configuration Table and their allowable and default values.

PDF exits

These fields specify the name of the program or command exit to be invoked at each exit point. COMMAND exits can be either CLIST or REXX. Exit names can have a maximum length of 8 characters. If both a program exit and a command exit are specified for the same exit point, the program exit is used.

DATA_SET_ALLOCATION_PROGRAM_EXIT

The program to be invoked as the data set allocation exit. This should be the name of a load module in your standard MVS search sequence.

PRINT_UTILITY_PROGRAM_EXIT

The program to be invoked as the print utility exit. This should be the name of a load module in your standard MVS search sequence.

PRINT_UTILITY_COMMAND_EXIT

The command to be invoked as the print utility exit. This should be the name of a member in your SYSPROC or SYSEXEC allocation.

COMPRESS_UTILITY_PROGRAM_EXIT

The program to be invoked as the compress utility exit. This should be the name of a load module in your standard MVS search sequence.

COMPRESS_UTILITY_CLIST_EXIT

The command to be invoked as the compress utility exit. This should be the name of a member in your SYSPROC or SYSEXEC allocation.

DATA_SET_LIST_FILTER_PROGRAM_EXIT

The program to be invoked as the data set list filter exit. This should be the name of a load module in your standard MVS search sequence.

MEMBER_LIST_FILTER_PROGRAM_EXIT

The program to be invoked as the member list filter exit. This should be the name of a load module in your standard MVS search sequence.

DATA_SET_NAME_CHANGE_PROGRAM_EXIT

The program to be invoked as the data set name change exit. This should be the name of a load module in your standard MVS search sequence.

DATA_SET_LIST_LINE_COMMAND_PROGRAM_EXIT

The program to be invoked as the data set list line command exit. This should be the name of a load module in your standard MVS search sequence.

ACTIVITY_MONITORING_PROGRAM_EXIT

The program to be invoked as the activity monitoring exit. This should be the name of a load module in your standard MVS search sequence.

MEMBER_LIST_LINE_COMMAND_PROGRAM_EXIT

The program to be invoked as the member list line command exit. This should be the name of a load module in your standard MVS search sequence.

MEMBER_LIST_LINE_COMMAND_COMMAND_EXIT

The command to be invoked as the member list line command exit. This should be the name of a member in your SYSPROC or SYSEXEC allocation.

Data set allocation settings

PDF_DEFAULT_UNIT

The unit name used by PDF when allocating work data sets. This value is used any time PDF needs to allocate a new data set on behalf of the user with the exception of option 3.2, edit recovery and ISPF work, control, and list data sets (ISPWRKx, ISPCTLx, and ISPLSTx). These new data sets may be temporary or permanent depending on the option of PDF being used.

For improved performance it is recommended that the VIO=YES option be added to the UNITNAME macro for the unit you specify in this field, but a VIO-only unit name is not recommended. Several of the ISPF options (including the Move/Copy utility and Outlist utility) will not function with VIO data sets.

The default is SYSALLDA.

ALLOWED_ALLOCATION_UNITS

This field controls which unit names are eligible to a user when the user is creating a data set through option 3.2. Valid values are:

ANY Any unit may be used

UADS Indicates the UNIT parameter in the users UADS entry should control the unit used

unit-name

Indicates that specific unit should be used

The default is ANY.

ALLOCATE_BEFORE_UNCATALOG

Indicates whether data sets to be uncataloged should first be allocated to accommodate those security packages the process during allocation. Valid values are YES or NO.

The default is NO.

VERIFY_EXPIRATION_DATE

Should expiration dates entered in option 3.2 when creating a data set be validated to ensure they are not in the past. Valid values are YES or NO.

The default is YES.

VOLUME_OF_MIGRATED_DATA_SETS

The volume name that indicates a data set is migrated.

The default is MIGRAT.

COMMAND_TO_DELETE_MIGRATED_DATA_SETS

The command that should be invoked when the D line command is used in option 3.4 to delete a migrated data set.

The default is HDELETE.

Outlist data set specifications

OUTLIST_RECORD_LENGTH

Record length of the temporary data set used by the Outlist utility.

The default is 133.

OUTLIST_BLOCK_SIZE

Block Size of the temporary data set used by the Outlist utility. Block size should be an even multiple of the record length unless a zero is specified for system determined block size.

The default is 13566.

OUTLIST_PRIMARY_QUANTITY

Primary number of tracks to be allocated for the Outlist Utility.

The default is 200.

OUTLIST_SECONDARY_QUANTITY

Secondary number of tracks to be allocated for the Outlist Utility.

The default is 100.

SuperC data set specifications

SUPERC_LIST_DATA_SET_BLOCK_SIZE

The block size for the SuperC listing data set. The list data set is a record format FBA, record length 133 data set. The block size should be an even multiple of 133 unless 0 is specified for system determined block size.

The default is 0.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

SUPERC_UPDATE_DATA_SET_BLOCK_SIZE

The block size for the SuperC update data set. The update data set is a record format FB, record length 80 data set. The block size should be an even multiple of 80 unless 0 is specified for system determined block size.

The default is 0.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

SUPERC_PROFILE_DATA_SET_BLOCK_SIZE

The block size for the SuperC profile data set. The profile data set is a record format FB, record length 80 data set. The block size should be an even multiple of 80 unless 0 is specified for system determined block size.

The default is 0.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

SUPERC_STATEMENTS_DATA_SET_BLOCK_SIZE

The block size for the SuperC statements data set. The statements data set is a record format FB, record length 80 data set. The block size should be an even multiple of 80 unless 0 is specified for system determined block size.

The default is 0.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

USE_SUPER_C_PROGRAM_INTERFACE

Should SuperC be invoked directly from ISPF rather than invoked via clists ISRSFORG OR ISRSSRCH. Specifying YES in this field will improve the performance of the SuperC interface.

The default is YES.

SUPER_C_LISTING_PRIMARY_QUANTITY

Primary number of blocks for the SuperC Listing data set.

The default is 50.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

SUPER_C_LISTING_SECONDARY_QUANTITY

Secondary number of blocks for the SuperC Listing data set.

The default is 100.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

SUPER_C_UPDATE_PRIMARY_QUANTITY

Primary number of blocks for the SuperC Update data set.

The default is 15.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

SUPER_C_UPDATE_SECONDARY_QUANTITY

Secondary number of blocks for the SuperC Update data set.

The default is 30.

This field is only used when the USE_SUPER_C_PROGRAM_INTERFACE field is set to YES.

LMF

FAIL_ON_LMF_LOCK

The default is YES.

Edit recovery data set specifications

EDIT_RECOVERY_BLOCK_SIZE

The block size for the edit recovery data set. This data set is a record format U, record length 0 data set. System determined block size is not supported for this field.

The default is 13680, the minimum allowed value is 3120.

EDIT_RECOVERY_PRIMARY_QUANTITY

The primary number of blocks that should be allocated for the edit recovery data set.

The default is 40.

EDIT_RECOVERY_SECONDARY_QUANTITY

The secondary number of blocks that should be allocated for the edit recovery data set.

The default is 200.

Move/Copy settings

MAXIMUM_GOOD_IEBCOPY_RETURN_CODE

Indicates the maximum return code from IEBCOPY that will allow Move/Copy processing to continue. Any return code higher than this value will be considered an error.

The default is 0.

USE_IEBCOPY_COPY_OR_COPYMOD_OPTION

Should ISPF use COPY or COPYMOD when invoking IEBCOPY to process load modules. Valid values are:

- 1 Use COPY if the target library block size is the same or greater than the source library block size, COPYMOD if the target block size is smaller.
- 2 Use COPY if the target library block size and source library block size are the same, COPYMOD if they are different.
- 3 Always use COPYMOD.

The default is 2.

WHEN_TO_USE_IEBCOPY

When should ISPF use IEBCOPY instead of a read/write loop to process load modules. Valid values are:

- 0 Only use IEBCOPY when processing a PDSE, or when copying from a larger block size to a smaller block size and COPYMOD was requested (see USE_IEBCOPY_COPY_OR_COPYMOD_OPTION).
- 1 Always use IEBCOPY for load modules.
- 2 Only use IEBCOPY for PDSEs.

The default is 0.

ALLOW_DATA_SET_CREATION_FOR_MOVE_COPY

If the target data set for Move/Copy does not exist, should the data set be created for the user. The user can specify either that the data set be created with the same characteristics as the original, or can specify the characteristics for the new data set. Valid values are YES and NO.

The default is YES.

DSLISRT removable media interface settings

The keywords DSLISRT_RM_ENABLED, DSLISRT_RM_COMMAND, and DSLISRT_RM_APPLID define an external interface to DFSMSrmm or an equivalent product. This can be used to allow the Data Set List utility (ISPF Option 3.4) to process selected line commands for data sets stored on tape or some other removable media.

The Data Set List utility handles return codes from the removable media interface command as follows:

- 0 or 4 Normal completion. Data Set List utility continues processing.
- 8 Error. Data Set List utility stops processing. Any further line commands are

not processed. No error message is issued, allowing the tape/removable media interface to issue an error message via the ISPF SETMSG service.

12 Error. Data Set List utility issues an error message and stops processing. Any further line commands are not processed.

Other Severe Error. Data Set List utility stops processing. Any further line commands are not processed. If the command was not found, message ISPD223 is issued, otherwise message ISRU671 is issued.

The command specified by `DSLISRTM_COMMAND` should set the return code to 12 for any line commands that are not supported by the interface.

DSLISRTM_ENABLED

Controls whether support is enabled in ISPF option 3.4 to call the removable media interface for these line commands: I, S, D, R, C, M, P, X, CO, MO. Valid values are YES and NO.

The default is NO.

DSLISRTM_COMMAND

Specifies a command name, including parameters, to be invoked using the ISPF SELECT CMD service. The command name can be up to 45 characters in length, and may contain 2 special characters:

- ? Is replaced with the option 3.4 line command. Two consecutive '?' characters will be replaced with a single '?' and no substitution of the line command will be performed. If '?' is not included within the command, the line command is automatically appended as a parameter to the end of the command.
- / Is replaced with the data set name (ZDLDSN) and the first volume (ZDLVOL), separated by a space. Two consecutive '/' characters will be replaced with a single '/' and no substitution of the data set name and first volume will be performed. Where the '/' is not included within the command, both the data set name and first volume will be automatically appended as a parameters to the end of the command. If a '%' character is specified before the command, the ISPF SELECT CMD service will bypass any attempt to load the command as a load module.

The default value for command is `%EDGRPD34`, which is equivalent to `%EDGRPD34 ? /`.

Here are some examples. The examples demonstrate different ways of specifying the `DSLISRTM_COMMAND` parameter:

```
tapecmd ? /
```

```
tapecmd OPT(?) /
```

```
tapecmd OPT(?) DSV(/) ALTLIB(YES)
```

DSLISRTM_APPLID

The syntax for the `DSLISRTM_APPLID` keyword is:

```
DSLISRTM_APPLID = applid | NONE
```

Where *applid* is the application ID used to invoke the tape interface command defined by `DSLISRTM_COMMAND`. *Applid* is a 1-character to 4-character name. If *applid* is set to NONE, no application ID will be used. Where the *applid* is specified, the `PASSLIB` parameter will also be included on the ISPF SELECT CMD service.

The default is EDG.

Edit-related settings

MAXIMUM_EDIT_PROFILES

The maximum number of ISPF Edit profiles. If the number of profiles exceeds this number the least recently used unlocked profile is deleted from the profile table. The value must be between 1 and 255.

The default is 25.

SCLM_WARNING_LEVEL

Indicates the level of SCLM checking that should be done when SCLM-controlled members are processed outside SCLM. Valid values are:

NONE

No checking is done. SCLM-controlled members may be edited and processed outside SCLM.

WARN

If an SCLM-controlled member is processed by Edit or Reset Statistics, a message is displayed to warn the user that the SCLM accounting data will be invalidated by the pending request.

ERROR

When Edit of an SCLM member is attempted, an error message is displayed and the edit is denied.

The default is WARN.

UNDO_STORAGE_SIZE

The maximum amount of kilobytes of storage available to the edit UNDO command to be used for keeping a history of edit changes. A minimum value of 1024 (1024 KB) is recommended. If this value is 0 then UNDO will be available from the edit recovery data set only. If the field is not 0 but is less than 128, a value of 128 will be used. This value will be rounded down to the nearest multiple of 64 (64 KB).

The default is 0.

Note: Use of storage for saving the record of changes provides better response time for individual users, but may have a slight detrimental effect on overall system performance.

ALLOW_EDIT_HIGHLIGHTING

Should ISPF Edit highlighting be available to all users and applications. Valid values are YES or NO. A value of NO disables Edit highlighting for all applications, a value of YES enables Edit highlighting for any dialog that uses a panel enabled for highlighting.

The default is YES.

DEFAULT_EDIT_DISPLAY

This field determines how the editor appears when it is invoked via ISPF either interactively, or via an Edit service call that does not specify a user edit panel. It controls the availability of action bars and edit highlighting. Valid values are:

0 No actions bars should be displayed, and Edit highlighting should not be available.

- 1 Actions bars should be displayed, but Edit highlighting should not be available.
- 2 No actions bars should be displayed, but Edit highlighting should be available.
- 3 Actions bars should be displayed, and Edit highlighting should be available.

The default is 3.

MAXIMUM_STORAGE_ALLOWED_FOR_EDIT

The maximum number of kilobytes of storage that the editor can use when initially reading in data. If the initial read of the data requires more storage than this value, browse will be substituted instead. To allow edit to use as much storage as is available, set the value to 0.

The default is 0.

ENABLE_ASSEMBLER_CONTINUATION_ERRORS

Enable the use of reverse video pink to highlight Assembler continuations which start before column 16. Set this value to NO if your site uses a different start column for Assembler continuation (via the ICTL Assembler instruction) or if assembler highlighting is used for data other than Assembler programs (such as SCLM architecture definitions).

The default is YES.

WARN_ON_TRUNCATION_OF_TRAILING_BLANKS

Should a warning message be displayed if a user edits variable data (record format = V) with one or more records that ends in a blank. The editor will truncate these blanks when the edit data is saved unless the editor is told to preserve the blanks.

Blanks will be preserved if:

- The "Preserve VB record length" field on the Edit Entry panel is selected.
- The PRESERVE keyword is specified on the EDIT service invocation.
- The PRESERVE ON Edit command is entered.

The default is YES.

SITE_WIDE_INITIAL_MACRO

Site-wide Edit initial macro. The macro specified here will be run before any user-specified macros. This can allow you to alter or disallow edit sessions. You may want to use a macro that does a PROFILE RESET to force all new profiles to use the settings in this configuration table.

The default is NONE (no macro).

TEXT_FLOW_TERMINATORS

What characters should cause the edit text flow function (line command TF, edit macro command TFLOW) to stop processing. These characters generally indicate a new paragraph or section of a document.

The default characters are:

.:&<

EDIT_CUT_DEFAULT

Valid values are REPLACE and APPEND. Selecting REPLACE means that the cut information replaces whatever information is already in the clipboard. Selecting APPEND means that cut information is added at the end of existing information in the clipboard.

The default is REPLACE.

EDIT_PASTE_DEFAULT

Valid values are KEEP and DELETE. Selecting KEEP means that the information remains in the clipboard even after pasting it into a separate file. Selecting DELETE means that the information is deleted from the clipboard after it has been pasted into a separate file.

The default is KEEP.

ALLOW_DATA_SET_CREATION_FOR_CREATE_REPLACE

If the target data set for the Edit CREATE or REPLACE command does not exist, should the data set be created for the user. The user can specify either that the data set be created with the same characteristics as the original, or can specify the characteristics for the new data set. Valid values are YES and NO.

The default is YES.

FORCE_ISRE776_FOR_RCHANGE

Ensures that when RCHANGE is issued from a PF key, it does not try to process input from the command line. In this case RCHANGE will treat anything that you type on the command line as an invalid parameter and will return an error message ISRE776.

This keyword sets a site default for the EDITSET option "Force ISRE776 if RCHANGE passed arguments". Valid values are YES and NO.

The default is NO.

FORCE_PRESERVE_VB_RECORD_LENGTH

Forces the users' Preserve VB Record Length setting in Edit to be the value selected in the PRESERVE_VB_RECORD_LENGTH field. Valid values are YES and NO.

The default is NO.

PRESERVE_VB_RECORD_LENGTH

The Preserve VB Record Length option in Edit will be selected. This option will cause the editor to save trailing blanks for variable-length files. Valid values are YES and NO.

The default is NO.

MAXIMUM_NUMBER_OF_EDIT_CLIPBOARDS

The maximum number of Edit clipboards allowed. Edit clipboards are used by the Edit CUT and PASTE commands and are kept in data spaces that last the life of the TSO session. Data spaces are allocated by the CUT command and released by the PASTE command, and are paged out when not in use. This can be a number between 1 and 11.

The default is 11.

MAXIMUM_EDIT_CLIPBOARD_SIZE

The maximum size for the Edit clipboards, in 4K increments. A value of 1 would mean 4 kilobytes. A value of 0 indicates that the IBM default data space size (239 4K blocks) of the value set through IEFUSI should be used.

The default is 0.

VSAM_EDIT_ENABLED

Is editing of VSAM data set enabled on the system. ISPF Edit will invoke

the command in the VSAM_EDIT_COMMAND field for any VSAM data sets specified unless restricted (see VSAM_RESTRICTED_EDIT_DATASET). Valid values are YES and NO.

The default is NO.

VSAM_EDIT_COMMAND

The command to be invoked when a VSAM data set is specified to ISPF Edit. A slash (/) may be used to specify the data set name specified. The maximum length is 50 characters.

The default is **FMNMAIN DSE /**

VSAM_EDIT_LIMITED

Should users be restricted from editing certain VSAM data sets? If this field is set to YES, the VSAM_RESTRICTED_EDIT_DATASET field must be used to specify the restricted data sets. Valid values are YES and NO.

The default is NO.

VSAM_BROWSE_ENABLED

Is browsing of VSAM data set enabled on the system. ISPF Browse will invoke the command in the VSAM_BROWSE_COMMAND field for any VSAM data sets specified unless restricted (see VSAM_RESTRICTED_BROWSE_DATASET). Valid values are YES and NO.

The default is NO.

VSAM_BROWSE_COMMAND

The command to be invoked when a VSAM data set is specified to ISPF Browse. A slash (/) may be used to specify the data set name specified. The maximum length is 50 characters.

The default is **FMNMAIN DSB /**

VSAM_VIEW_ENABLED

Is viewing of VSAM data set enabled on the system. ISPF View will invoke the command in the VSAM_VIEW_COMMAND field for any VSAM data sets specified unless restricted (see VSAM_RESTRICTED_VIEW_DATASET). Valid values are YES and NO.

The default is NO.

VSAM_VIEW_COMMAND

The command to be invoked when a VSAM data set is specified to ISPF View. A slash (/) may be used to specify the data set name specified. The maximum length is 50 characters.

The default is **FMNMAIN DSB /**

Edit site-wide profile customizations

These fields set the defaults for new Edit Profiles created by any user. For information about the values for each field, refer to the *z/OS ISPF Edit and Edit Macros*. These processing rules apply:

- Some items in this section of the ISPF Configuration table can be *forced*. The default for all of the FORCE fields is NO. To force users to use the value specified, change the FORCE field value to YES. If a user then attempts to change one of the forced settings from within the editor an error message is displayed.

- If the user has a ZDEFAULT Edit profile or if a ZEDFAULT profile exists in the ISPTLIB concatenation, then these settings have no effect *except* for those options that are forced.
- If a user has no ZDEFAULT profile and no ZEDFAULT profile exists in ISPTLIB these settings are used to create all new profiles. They have no effect on existing profiles.
- The ZDEFAULT profile is no longer automatically created the first time a user enters the editor, as it was in releases of ISPF before OS/390 Release 5.0. Profiles used with previous versions might contain a ZDEFAULT profile, and it is honored. Users can also specifically create a ZEDFAULT profile so that they can establish their own defaults.

STATS

Control whether the editor maintains ISPF statistics for PDS members.
Valid values are ON and OFF.

The default is ON.

FORCE_STATS

Force the specified value.

The default is NO.

STATS_EXT_ENABLED

Allows you to use STATS EXT command, extended stats option on reset member statistics panels, and LM services EXT option to cause extended statistics to be created.

The default is NO.

STATS_EXT

Control whether the editor maintains ISPF statistics for PDS members.
Valid values are ON and OFF.

The default is OFF.

FORCE_STATS_EXT

Force the specified value.

The default is NO.

RECOVERY

Determines whether the editor maintains its recovery file to keep track of the edit session, making it possible for users to recover from system failures. Valid values are ON and OFF.

The default is OFF.

FORCE_RECOVERY

Force the specified value.

The default is NO.

RECOVERY_WARNING_MESSAGE

Determines whether the editor should warn users when they enter an edit session with RECOVERY set OFF. Valid values are WARN and NOWARN.

The default is WARN.

FORCE_RECOVERY_WARNING_MESSAGE

Force the specified value.

The default is NO.

SETUNDO

Determines whether the UNDO command will be available in Edit. Valid values are ON and OFF.

The default is ON.

FORCE_SETUNDO

Force the specified value.

The default is NO.

PACK Determines whether the editor will save data in packed or unpacked format. Valid values are ON and OFF.

The default is OFF.

FORCE_PACK

Force the specified value.

The default is NO.

IMACRO

Specifies the sitewide initial macro to be run for all users.

The default is NONE (no macro).

FORCE_IMACRO

Force the specified value.

The default is NO.

CAPS Determines whether the editor automatically rolls text to uppercase. Valid values are ON and OFF.

The default is OFF.

NOTE Determines whether the editor displays ==NOTE== lines when the Edit MODEL command is used. Valid values are ON and OFF.

The default is ON.

HEX Determines whether the edit data is displayed in hex mode.

- ON
- OFF
- VERT
- DATA

The default is OFF.

NULLS

Determines whether trailing spaces on edit data are written to the screen as nulls or blanks.

- STD
- ALL
- OFF

The default is STD.

DISPLAY_SEQUENCE_NUMBERS

Determines whether the editor will maintain sequence numbers. Valid values are ON and OFF.

The default is ON.

COBOL_NUMBERS

Determines whether the sequence numbers should be maintained in COBOL format (in columns 1-6). Valid values are ON and OFF.

The default is OFF.

STANDARD_NUMBERS

Determines whether the sequence numbers should be maintained in standard format (in columns 1-8 for variable data, the last 8 columns for fixed data). Valid values are ON and OFF.

The default is ON.

AUTONUM

Determines whether the editor automatically renumbers edit data. Valid values are ON and OFF.

The default is OFF.

AUTOLIST

Determines whether the editor writes the edit data to the ISPF LIST data set when a user ends an edit session in which data has been changed or saved. Valid values are ON and OFF.

The default is OFF.

PROFILE

Determines whether an edit profile can be deleted if it is the least recently used profile. Specify LOCK to prevent profiles from being deleted. Valid values are LOCK and UNLOCK.

The default is UNLOCK.

AUTOSAVE

Determines whether the editor automatically saves changes when the END command is entered. Valid values are ON and OFF.

The default is ON.

AUTOSAVE_PROMPT

Determines whether the editor prompts the user to have the data changes saved if AUTOSAVE is OFF and the END command is entered. Valid values are PROMPT and NOPROMPT.

The default is PROMPT.

HILITE

Determines whether the editor uses color to highlight the data being edited. Valid values are ON and OFF.

The default is OFF.

HILITE_DOLOGIC

Determines whether editor highlighting should use color to match DO/END statements. Valid values are ON and OFF.

The default is OFF.

HILITE_IFLOGIC

Determines whether editor highlighting should use color to match IF/ELSE statements. Valid values are ON and OFF.

The default is OFF.

HILITE_PAREN

Determines whether editor highlighting should use color to match open and close parentheses. Valid values are ON and OFF.

The default is OFF.

HILITE_FIND

Determines whether editor highlighting should use color to highlight the target of the FIND command. Valid values are ON and OFF.

The default is ON.

HILITE_CURSOR

Determines whether editor highlighting should use color to highlight current cursor location. Valid values are ON and OFF.

The default is ON.

HILITE_LANGUAGE

The default language to be used by edit highlighting. Valid values are:

- 1 Automatic language determination
- 2 Assembler
- 3 PL/I
- 4 COBOL
- 5 Pascal
- 6 C
- 7 BookMaster[®]
- 8 Rexx
- 9 ISPF Panel language
- 10 ISPF Skeleton language
- 11 JCL
- 12 ISPF Dialog Tag Language (DTL)
- 13 Other (CLIST, etc.)
- 14 Default (no highlighting)
- 15 PL/X
- 16 IDL
- 17 SuperC Listing
- 18 HTML
- 19 XML

The default is 1.

HILITE_MARGIN_C

Determines the left and right margins to be used by edit highlighting when processing C statements. Values are specified in the form (*left-margin, right-margin*). Although the IBM C/C++ compiler supports left and right margins in the range 1 to 32760, ISPF only supports highlighting data sets up to a record length of 255. Therefore, the *left-margin* must be between 1 and 254 and the *right-margin* must be between 1 and 255.

You can specify (*,*) to use the default margins defined for the language. The default *left-margin* is 1. The default *right-margin* is the lesser of 255 and the last input column. The last input column is 8 less than the record length when the data set has fixed records and is in standard number mode; otherwise it is the same as the record length.

HILITE_MARGIN_PLI

Determines the left and right margins to be used by edit highlighting when processing PL/I statements. Values are specified in the form (*left-margin, right-margin*). *left-margin* must be between 1 and 100. *right-margin* must be between 1 and 200.

You can specify (*,*) to use the default margins defined for the language. The default *left-margin* is 2. The default *right-margin* is the lesser of 200 and the last input column. The last input column is 8 less than the record

length when the data set has fixed records and is in standard number mode; otherwise it is the same as the record length.

HILITE_MARGIN_PLX

Determines the left and right margins to be used by edit highlighting when processing PL/X statements. Values are specified in the form (*left-margin,right-margin*). *left-margin* must be between 1 and 65. *right-margin* must be between 15 and 80.

You can specify (*,*) to use the default margins defined for the language. The default *left-margin* is 2. The default *right-margin* is the lesser of 80 and the last input column. The last input column is 8 less than the record length when the data set has fixed records and is in standard number mode; otherwise it is the same as the record length.

ISPF site-wide profile customizations

ISPF site-wide defaults are not enabled until the VERSION_LEVEL_OF_SITEWIDE_DEFAULTS field is modified.

The RESET fields mean that ISPF resets the site-wide defaults for each user. This is done once each time the VERSION_LEVEL_OF_SITEWIDE_DEFAULTS field is incremented. Users can change the values of their fields after the incrementation has caused the reset.

VERSION_LEVEL_OF_SITEWIDE_DEFAULTS

This field indicates the modification level of the current site-wide defaults values. This field is set to 43000 initially by ISPF and will not be changed with new versions of ISPF. Each time you modify any of the sitewide defaults, increment this value by 1. For example, the first time you change any defaults you should set this field to 43001. This value is then saved in the ISPF system profile table.

When ISPF is initialized it checks the value saved in the system profile against the value in this field. If the value of this field is greater than that in the system profile, ISPF will use the values specified here. You must increment this value every time you modify a default or it will not be picked up by ISPF.

TAB_TO_POINT_AND_SHOOT

Enable tabbing to point and shoot fields. Valid values are YES and NO.

The default is NO.

RESET_TAB_TO_POINT_AND_SHOOT

Reset the value specified here.

The default is NO.

TAB_TO_ACTION_BARS

Enable tabbing to action bars. Valid values are YES and NO.

The default is YES.

RESET_TAB_TO_ACTION_BARS

Reset the value specified here.

The default is NO.

USE_SESSION_MANAGER

Value is used to set system variable ZSESS and is used to initialize system variable ZSM. Valid values are YES and NO.

The default is NO.

RESET_USE_SESSION_MANAGER

Reset the value of system variable ZSM to the value of the USE_SESSION_MANAGER keyword.

JUMP_FROM_LEADER_DOTS

Enable the ISPF jump command (for example, =2) from fields with leader dots. Valid values are YES and NO.

The default is YES.

RESET_JUMP_FROM_LEADER_DOTS

Reset the value specified here.

The default is NO.

SHOW_SPLIT_LINE

Should ISPF show the split line when a user is running in split screen mode. Valid values are YES and NO.

The default is YES.

RESET_SHOW_SPLIT_LINE

Reset the value specified here.

The default is NO.

LONG_MESSAGES_IN_POPUP

Should ISPF long messages always be shown in pop-up windows, or only when they are longer than 78 characters. Valid values are YES and NO.

The default is YES.

RESET_LONG_MESSAGES_IN_POPUP

Reset the value specified here.

The default is NO.

EDIT_PRINTDS_COMMAND

Should the user be allowed to modify the PRINTDS command generated by ISPF before its submission. Valid values are YES and NO.

The default is NO.

RESET_EDIT_PRINTDS_COMMAND

Reset the value specified here.

The default is NO.

RESTORE_TEST_TRACE_OPTIONS

Should the original TEST and TRACE options specified on ISPF invocation be restored when a user exits from Dialog Test. Dialog test will set TEST mode on. Valid values are YES and NO.

The default is YES.

RESET_RESTORE_TEST_TRACE_OPTIONS

Reset the value specified here.

The default is NO.

DISPLAY_PANELS_IN_CUA_MODE

Should ISPF panels be displayed in CUA mode. Valid values are YES and NO.

The default is YES.

RESET_DISPLAY_PANELS_IN_CUA_MODE

Reset the value specified here.

The default is NO.

LOG_DATA_SET_DISPOSITION

The default disposition for the ISPF Log data set. Valid defaults are:

- 1 Process option not set
- 2 Print and delete
- 3 Delete without printing
- 4 Keep
- 5 Keep and allocate a new log

The default is 1, process option not set.

Note: When manually editing the configuration table the valid options are:
NONE

- Process option not set
- J Print and delete
- D Delete without printing
- K Keep
- R Keep and allocate a new log data set

The default is NONE, process option not set.

RESET_LOG_DATA_SET_DISPOSITION

Reset the value specified here. The default is NO.

LIST_DATA_SET_DISPOSITION

The default disposition for the ISPF List data set. Valid defaults are:

- 1 Process option not set
- 2 Print and delete
- 3 Delete without printing
- 4 Keep
- 5 Keep and allocate a new list

The default is 1, process option not set.

Note: When manually editing the configuration table the valid options are:
NONE

- Process option not set
- J Print and delete
- D Delete without printing
- K Keep
- R Keep and allocate a new list data set

The default is NONE, process option not set.

RESET_LIST_DATA_SET_DISPOSITION

Reset the value specified here.

The default is NO.

COMMAND_LINE_PLACEMENT

Placement of the ISPF command line. Valid values are:

BOTTOM

Float the command line to the bottom of the panel.

ASIS Leave command line as coded on the panel.

The default is BOTTOM.

RESET_COMMAND_LINE_PLACEMENT

Reset the value specified here. The default is NO.

USE_KEYLISTS

Specifies whether ISPF uses Keylists for pfkey definitions. Valid values are YES and NO.

The default is YES.

RESET_USE_KEYLISTS

Reset the value specified here.

The default is NO.

SHOW_PFKEYS

Specifies whether ISPF will display the current PFKEY settings. Valid values are ON and OFF.

The default is ON.

RESET_SHOW_PFKEYS

Reset the value specified here.

The default is NO.

SCROLL_MEMBER_LIST

Specifies if ISPF should scroll to the first member selected in the member list after processing or disable the member list from automatic scrolling and instead place the cursor in front of the last member selected.

The default is YES.

RESET_SCROLL_MEMBER_LIST

Reset the value specified here.

The default is NO.

SCROLL_DEFAULT

Select the default scroll value. The valid settings are:

CSR When scrolling forward, move the line that currently contains the cursor to the first data line. When scrolling backward, move the line that currently contains the cursor to the last data line.

DATA Scroll by a full page minus one line when scrolling up or down, or by a full page minus one column when scrolling left or right.

HALF Half a screenful of data.

MAX Scroll to the top, bottom, left, or right margin.

PAGE One screenful of data.

The default is PAGE.

SCROLL_MIN

Select the minimum scroll value allowed. This can be a 1 to 7 digit number.

The default is 0.

SCROLL_MAX

Select the maximum scroll value allowed. This can be a 1 to 7 digit number.

The default is 9999.

RESET_SCROLL_VALUE

Force an update of ISPSPROF from the configuration table values at ISPF initialization.

The default is NO.

DISPLAY_EMPTY_MEMBER_LIST

Controls whether an empty member list is displayed.

The default is NO.

DISPLAY_EMPTY_MEMBER_LIST_PATTERN

If the DISPLAY_EMPTY_MEMBER_LIST option is set, this field controls whether an empty list that results from a nonmatching pattern will be displayed.

The default is NO.

DISPLAY_EMPTY_MEMBER_LIST_FUNCTION

Whether empty member list options apply to non-edit functions such as View and Browse.

The default is YES.

RESET_EMPTY_MEMBER_LIST_OPTIONS

Reset the values specified in the DISPLAY_EMPTY_MEMBER_LIST fields.

The default is NO.

STATUS_AREA_DEFAULT

Select the default status area value. The valid settings are:

- SES** Session
- FUN** Function Keys
- CAL** Calendar
- USE** User status
- UPS** User Point and Shoot
- OFF** None

The default is SESSION.

LIST_DATA_SET_RECORDS_PER_BLOCK

The number of records per block for the ISPF List data set. This value must be in the range 0 to 32760. A value of 0 will result in an ISPF list data set being allocated using a system-determined block size.

The default is 26.

LOG_DATA_SET_BLOCK_SIZE

The block size of the ISPF Log data set. This value must be in the range 0 to 32760. A value of 0 will result in an ISPF log data set being allocated using a system-determined block size.

The default is 129.

LOG_DATA_SET_RECORD_LENGTH

The record length of the ISPF Log data set.

The default is 125.

BLOCK_SIZE_FOR_TEMPORARY_CNTL_DATA_SETS

The block size for ISPF temporary control (CNTL) data sets. This value

must be in the range 0 to 32760. A value of 0 will result in the data sets being allocated using a system-determined block size.

The default is 800.

RECORD_LENGTH_FOR_TEMPORARY_CNTL_DATA_SETS

The record length for ISPF temporary control (CNTL) data sets.

The default is 80.

BLOCK_SIZE_FOR_TEMPORARY_LIST_DATA_SETS

The block size for ISPF temporary list data sets. This value must be in the range 0 to 32760. A value of 0 will result in the data sets being allocated using a system-determined block size.

The default is 3146.

RECORD_LENGTH_FOR_TEMPORARY_LIST_DATA_SETS

The record length for ISPF temporary list data sets.

The default is 121.

BLOCK_SIZE_FOR_TEMPORARY_WORK_DATA_SETS

The block size for ISPF temporary work data sets. This value must be in the range 0 to 32760. A value of 0 will result in the data sets being allocated using a system-determined block size.

The default is 2560.

RECORD_LENGTH_FOR_TEMPORARY_WORK_DATA_SETS

The record length for ISPF temporary work data sets.

The default is 256.

ISPCTL0_BLOCK_SIZE

The block size for ISPCTL0 temporary control (CNTL) data set. This value must be in the range 0 to 32760.

The default is 800.

ISPCTL0_RECORD_LENGTH

The record length for the ISPCTL0 temporary control (CNTL) data set.

The default is 80.

ISPCTL0_PRIMARY_QUANTITY

Primary number of blocks to be allocated for the ISPCTL0 temporary control (CNTL) data set.

The default is 10.

ISPCTL0_SECONDARY_QUANTITY

Secondary number of blocks to be allocated for the ISPCTL0 temporary control (CNTL) data set.

The default is 100.

ISPCTL_PRIMARY_QUANTITY

Primary number of blocks to be allocated for file tailoring CNTL data sets.

The default is 10.

ISPCTL_SECONDARY_QUANTITY

Secondary number of blocks to be allocated for file tailoring CNTL data sets.

The default is 100.

ISPLST_PRIMARY_QUANTITY

Primary number of blocks to be allocated for ISPF temporary list data sets.
The default is 10.

ISPLST_SECONDARY_QUANTITY

Secondary number of blocks to be allocated for ISPF temporary list data sets.
The default is 100.

ISPWRK_PRIMARY_QUANTITY

Primary number of blocks to be allocated for the file tailoring WORK data sets.
The default is 10.

ISPWRK_SECONDARY_QUANTITY

Secondary number of blocks to be allocated for the File Tailoring WORK data sets.
The default is 100.

USE_PDFCUNIT_FOR_TEMP_ISPF_DATA_SETS

Indicates whether to use the PDFCUNIT value for the units field when allocating ISPF temporary data sets. Valid values are YES and NO.
The default is NO.

ISPF_TEMPORARY_DATA_SET_QUALIFIER

An additional qualifier that will be appended to the ISPF log, list, and temporary control data set names. The qualifier will come after the ISPF assigned prefix, but before the suffix area. If Exit 16 is active, this qualifier will be part of the 26-byte prefix area passed to the exit. If the configuration table field `USE_ADDITIONAL_QUAL_FOR_PDF_DATA_SETS` is set to YES, the qualifier is also appended to the default names of data sets created by PDF utilities.

The qualifier can be either:

1. A valid data set qualifier, comprising 1 to 8 alphanumeric characters, the first being alphabetic (not numeric)
2. A string containing 1 or more system symbolic variables.

The string may be up to 32 characters in length, but when resolved it will be truncated to 8 characters. Truncation errors are ignored.

Other characters may be included between the symbolic variables, providing they are alphanumeric characters and the first character is nonnumeric. The use of any of the date and time symbols requires an alphabetic character before the symbol name to ensure that the qualifier is valid. If the resulting qualifier is invalid, it is ignored without an error message being issued.

Examples:

```
&SYSNAME.  
SYS&SYSNAME(1:4).
```

See the *z/OS MVS Initialization and Tuning Reference* for details on valid system symbols.

The default is `ISP&SEQ.` where ISPF Profile Sharing is enabled, otherwise the default is `NONE` (no qualifier).

PROFILE_SHARING

Enable the ISPF Profile Sharing facility. Valid values are YES and NO. The default is NO.

PROFILE_ENQLOCK_WAIT

The time in milliseconds that ISPF is to wait when it is unable to obtain an enqueue for an ISPF profile member. The value is an integer from 0 to 9999. The default is 1000 milliseconds (1 second). A value of 0 results in no wait being issued.

PROFILE_ENQLOCK_RETRY_COUNT

The number of attempts to retry the enqueue request when ISPF is unable to obtain the enqueue for an ISPF profile member. The value is an integer from 0 to 99. The default value is 1. A value of 0 results in no further attempt to obtain a failed enqueue.

PROFILE_ENQLOCK_PROMPT

Enable the prompt for further action when ISPF is unable to obtain the enqueue for an ISPF profile member. Valid values are YES and NO. The default is YES. When ISPF is running in a background environment or a value of NO is specified and ISPF is unable to obtain the enqueue for an ISPF profile member, the enqueue request is failed. When a value of YES is specified and ISPF is unable to obtain the enqueue for an ISPF profile member, a pop-up window is displayed giving you the option to either retry or fail the enqueue request.

PROFILE_SYSPROF_CONFLICT

The initial action to be taken when the ISPF system profile member, ISPSPROF, has been updated after it was read from disk. Valid values are:

PROMPT

Prompts you to either KEEP or DISCARD the changes to the ISPF system profile from the current ISPF session. You can also disable the prompt so that the same action is taken for further changes to the ISPF system profile during the current ISPF session.

KEEP Updates the System profile with changes from the current session. Other updates to the ISPF system profile made on other systems may be lost.

DISCARD

Updates made to the ISPF system profile during the current session are discarded.

The default is KEEP.

PROFILE_ISPPROF_CONFLICT

The initial action to be taken when the ISPF profile member, normally ISPPROF, has been updated after it was read from disk. Valid values are:

PROMPT

Prompts you to either KEEP or DISCARD the changes to the ISPF system profile from the current ISPF session. You can also disable the prompt so that the same action is taken for further changes to the ISPF system profile during the current ISPF session.

KEEP Updates the profile with changes from the current session. Other updates to the ISPF profile made on other systems may be lost.

DISCARD

Updates made to the ISPF profile during the current session are discarded.

The default is KEEP.

PROFILE_APPPROF_CONFLICT

The initial action to be taken when an ISPF application profile member has been updated after it was read from disk. Valid values are:

PROMPT

Prompts you to either KEEP or DISCARD the changes to the ISPF system profile from the current ISPF session. You can also disable the prompt so that the same action is taken for further changes to the ISPF system profile during the current ISPF session.

KEEP Updates the Application profile with changes from the current session. Other updates to the ISPF application profile made on other systems may be lost.

DISCARD

Updates made to the ISPF application profile during the current session are discarded.

The default is KEEP.

PROFILE_REFLIST_CONFLICT

The initial action to be taken when an ISPF reference list member, ISRLLIST, ISRPLIST, or ISRSLIST, has been updated after it was read from disk. Valid values are:

PROMPT

Prompts you to either KEEP or DISCARD the changes to the ISPF system profile from the current ISPF session. You can also disable the prompt so that the same action is taken for further changes to the ISPF system profile during the current ISPF session.

KEEP Updates the reference list with changes from the current session. Other updates to the ISPF reference list made on other systems may be lost.

DISCARD

Updates made to the ISPF reference list during the current session are discarded.

The default is KEEP.

PROFILE_EDIT_CONFLICT

The initial action to be taken when an ISPF edit profile, *xxxxEDRT*, has been updated after it was read from disk. Valid values are:

PROMPT

Prompts you to either KEEP or DISCARD the changes to the ISPF system profile from the current ISPF session. You can also disable the prompt so that the same action is taken for further changes to the ISPF system profile during the current ISPF session.

KEEP Updates the edit profile with changes from the current session. Other updates to the ISPF edit profile made on other systems may be lost.

DISCARD

Updates made to the ISPF edit profile during the current session are discarded.

The default is KEEP.

PROFILE_BATCH_CONFLICT

The action to be taken when ISPF is executing in a background environment and any profile has been updated after it was read from disk. Valid values are:

KEEP Updates the profile member with changes from the current session. Other updates to the ISPF profile member made on other systems may be lost.

DISCARD

Updates made to the ISPF profile member during the current session are discarded. The default is DISCARD.

PROFILE_OTHER_CONFLICT

The initial action to be taken when any other ISPF table in the ISPF ISPF profile data set has been updated after it was read from disk. Valid values are:

PROMPT

Prompts you to either KEEP or DISCARD the changes to the ISPF system profile from the current ISPF session. You can also disable the prompt so that the same action is taken for further changes to the ISPF system profile during the current ISPF session.

KEEP Updates the ISPF table with changes from the current session. Other updates to the ISPF table made on other systems may be lost.

DISCARD

Updates made to the ISPF table during the current session are discarded.

The default is KEEP.

Any conflicts that occur during ISPF termination where PROMPT is specified and the ISPF display services are no longer available are converted to the default action.

RESET_PROFILE_SHARING_SETTINGS

Option to specify that all the Profile Sharing settings are to be reset to the ISPF Configuration defined values. Valid values are YES and NO. The default is NO.

PDSE_RESERVE_PROCESSING

Option to specify whether ISPF issues a RESERVE to serialize access to PDSE. Valid values are OFF and ON. The default value is ON. See Appendix A, "ISPF enqueue processing for data integrity," on page 325 for further information.

ISPF_INIT_COMMAND_TABLE_ENTRY

Identifies a command table entry to be invoked when the value of VERSION_LEVEL_OF_SITEWIDE_DEFAULTS has been changed. One possible use for this could be to reset the value of the ISPF ZSTART profile variable. Note that neither ZSTART nor any other start option is processed when this command table entry is invoked. Therefore the invoked function should process ZSTART or other option. ZSTART, or the option, is appended to any other parameters that may be passed via this keyword. The command table entry name plus all arguments is truncated if the length exceeds 255 bytes.

PRINTDS_DEST_OR_WRITER_OPTION

PRINTDS option, valid values are:

DEST Indicates a local printer ID is being used.

WRITER

Indicates an external writer name is being used.

The default is DEST.

LOCAL_PRINTDS_OPTIONS

Parameters appended to the PRINTDS command when a local print is done. No verification of these fields is done. The maximum length of this value is 128 characters. To disable printing through PRINTDS, specify a value of DISABLE.

The default is NONUM.

USE_ALTERNATE_DIALOG_TEST_PANEL

Select alternate dialog test panels ISPYFP, ISPYFPA, or ISPYFPB. Panel ISPYFPA is formatted with the most frequently used fields at the top of the panel. Panel ISPYFPB is similar to panel ISPYFPA, but it has a selection field that allows the user to select a function: panel, command, program, or request. Unlike the panels ISPYFP or ISPYFPA, on panel ISPYFPB the panel, command, program, or request fields can all contain values. Valid options are:

- 1 ISPYFP panel
- 2 ISPYFPA panel
- 3 ISPYFPB panel

The default is 1.

USE_ADDITIONAL_QUAL_FOR_PDF_DATA_SETS

An additional qualifier is included in the default data set name for data sets generated by PDF utilities. The data sets affected by this setting are:

- Listing and update data sets produced by the SuperC and Srchfor utilities.
- Listing data sets produced by the data set list and member list SRCHFOR commands.
- Trace data sets generated by the ISPVCALL, ISPDPTRC, and ISPFTTRC commands.
- Data set created by the table utility EXPORT and FEXPORT commands.

The value specified for the ISPF_TEMPORARY_DATA_SET_QUALIFIER field is used as the additional qualifier which is included at the start of the default suffix for these data set names.

Valid values are YES and NO. The default is NO.

Default CUA color settings

These fields in the ISPF Configuration table define the color and highlighting for each of the CUA panel elements. The setting for each element consists of a 3-character numeric field, with each position meaning:

Position 1 — COLOR

- 1 Blue
- 2 Red
- 3 Pink
- 4 Green
- 5 Turquoise
- 6 Yellow
- 7 White

Position 2 — INTENSITY

- 0 Low
- 2 High

Position 3 — HILITE

- 0 None
- 1 Blink
- 2 Reverse Video
- 4 Underscore

ISPF site-wide defaults are not enabled until the VERSION_LEVEL_OF_SITEWIDE_DEFAULTS field is modified. See “ISPF site-wide profile customizations” on page 231 for more details. If you select any RESET fields here, you *must* increment the value in the VERSION_LEVEL_OF_SITEWIDE_DEFAULTS.

The RESET fields here mean that ISPF resets the site-wide defaults for each user. This is done once each time the VERSION_LEVEL_OF_SITEWIDE_DEFAULTS field is incremented. Users can change the values of their fields after the incrementation has caused the reset.

ACTION_BAR_SELECTED_CHOICE

Default is 600 (yellow, low intensity, no highlighting).

RESET_ACTION_BAR_SELECTED_CHOICE

Reset the value specified here.

The default is NO.

ACTION_BAR_SEPARATOR_LINE

Default is 100 (Blue, low intensity, no highlighting).

RESET_ACTION_BAR_SEPARATOR_LINE

Reset the value specified here.

The default is NO.

ACTION_BAR_UNSELECTED_CHOICE

Default is 720 (White, high intensity, no highlighting).

RESET_ACTION_BAR_UNSELECTED_CHOICE

Reset the value specified here.

The default is NO.

ACTION_MESSAGE_TEXT

Default is 220 (Red, high intensity, no highlighting).

RESET_ACTION_MESSAGE_TEXT

Reset the value specified here.

The default is NO.

CAUTION_TEXT

Default is 620 (Yellow, high intensity, no highlighting).

RESET_CAUTION_TEXT

Reset the value specified here.

The default is NO.

CHOICE_ENTRY_FIELD

Default is 504 (Turquoise, low intensity, underscored)

RESET_CHOICE_ENTRY_FIELD

Reset the value specified here.

The default is NO.

COLUMN_HEADING

Default is 120 (Blue, high intensity, no highlighting).

RESET_COLUMN_HEADING

Reset the value specified here.

The default is NO.

DESCRIPTIVE_TEXT

Default is 400 (Green, low intensity, no highlighting).

RESET_DESCRIPTIVE_TEXT

Reset the value specified here.

The default is NO.

EMPHASIZED_TEXT

Default is 520 (Turquoise, high intensity, no highlighting).

RESET_EMPHASIZED_TEXT

Reset the value specified here.

The default is NO.

ERROR_EMPHASIS

Default is 622 (Yellow, high intensity, reverse video)

RESET_ERROR_EMPHASIS

Reset the value specified here.

The default is NO.

FIELD_PROMPT

Default is 400 (Green, low intensity, no highlighting).

RESET_FIELD_PROMPT

Reset the value specified here.

The default is NO.

FUNCTION_KEYS

Default is 100 (Blue, low intensity, no highlighting).

RESET_FUNCTION_KEYS

Reset the value specified here.

The default is NO.

INFORMATIONAL_MESSAGE_TEXT

Default is 720 (White, high intensity, no highlighting).

RESET_INFORMATIONAL_MESSAGE_TEXT

Reset the value specified here.

The default is NO.

LIST_ENTRY_FIELD

Default is 504 (Turquoise, low intensity, underscored)

RESET_LIST_ENTRY_FIELD

Reset the value specified here.

The default is NO.

LIST_ITEM_DESCRIPTION

Default is 400 (Green, low intensity, no highlighting).

RESET_LIST_ITEM_DESCRIPTION

Reset the value specified here.

The default is NO.

LIST_ITEM

Default is 700 (White, low intensity, no highlighting).

RESET_LIST_ITEM

Reset the value specified here.

The default is NO.

NORMAL_ENTRY_FIELD

Default is 504 (Turquoise, low intensity, underscored)

RESET_NORMAL_ENTRY_FIELD

Reset the value specified here.

The default is NO.

NORMAL_TEXT

Default is 400 (Green, low intensity, no highlighting).

RESET_NORMAL_TEXT

Reset the value specified here.

The default is NO.

PANEL_ID

Default is 100 (Blue, low intensity, no highlighting).

RESET_PANEL_ID

Reset the value specified here.

The default is NO.

PANEL_INFORMATION

Default is 400 (Green, low intensity, no highlighting).

RESET_PANEL_INFORMATION

Reset the value specified here.

The default is NO.

PANEL_TITLE

Default is 100 (Blue, low intensity, no highlighting).

RESET_PANEL_TITLE

Reset the value specified here.

The default is NO.

POINT_AND_SHOOT

Default is 520 (Turquoise, high intensity, no highlighting).

RESET_POINT_AND_SHOOT

Reset the value specified here.

The default is NO.

PULLDOWN_AVAILABLE_CHOICE

Default is 700 (White, low intensity, no highlighting).

RESET_PULLDOWN_AVAILABLE_CHOICE

Reset the value specified here.

The default is NO.

PULLDOWN_UNAVAILABLE_CHOICE

Default is 100 (Blue, low intensity, no highlighting).

RESET_PULLDOWN_UNAVAILABLE_CHOICE

Reset the value specified here.

The default is NO.

REFERENCE_PHRASE

Default is 720 (White, high intensity, no highlighting).

RESET_REFERENCE_PHRASE

Reset the value specified here.

The default is NO.

SCROLL_INFORMATION

Default is 720 (White, high intensity, no highlighting).

RESET_SCROLL_INFORMATION

Reset the value specified here.

The default is NO.

SELECTION_AVAILABLE_CHOICE

Default is 700 (White, low intensity, no highlighting).

RESET_SELECTION_AVAILABLE_CHOICE

Reset the value specified here.

The default is NO.

SELECTION_UNAVAILABLE_CHOICE

Default is 100 (Blue, low intensity, no highlighting).

RESET_SELECTION_UNAVAILABLE_CHOICE

Reset the value specified here.

The default is NO.

VARIABLE_OUTPUT_INFORMATION

Default is 500 (Turquoise, low intensity, no highlighting).

RESET_VARIABLE_OUTPUT_INFORMATION

Reset the value specified here.

The default is NO.

WARNING_MESSAGE_TEST

Default is 620 (Yellow, high intensity, no highlighting).

RESET_WARNING_MESSAGE_TEST

Reset the value specified here.

The default is NO.

WARNING_MESSAGE

Default is 220 (Red, high intensity, no highlighting).

RESET_WARNING_MESSAGE

Reset the value specified here.

The default is NO.

WORKAREA_SEPARATOR_LINE

Default is 100 (Blue, low intensity, no highlighting).

RESET_WORKAREA_SEPARATOR_LINE

Reset the value specified here.

The default is NO.

Miscellaneous settings

MONITOR_EDIT_MACRO_COMMANDS

Should the ISPF Activity Monitoring Exit be invoked for ISREDIT commands invoked from an ISPF Edit Macro. Valid values are YES and NO.

The default is NO.

ALLOW_SUBMIT_FROM_BROWSE

Should users be allowed to issue the SUBMIT command from with a Browse session. Valid values are YES and NO.

The default is YES.

ALLOW_SUBMIT_FROM_VIEW

Should users be allowed to issue the SUBMIT command from with a View session. Valid values are YES and NO.

The default is YES.

WARN_ON_RENAME_TO_GDG_NAME

Should a warning panel be displayed when a user attempts to rename a data set to a new name that matches the naming convention of a GDG generation. The renamed data set may become a valid generation if it matches the naming convention of an existing GDG data set. If that new generation causes the LIMIT parameter value specified when the GDG was defined to be exceeded, the system will take action based on the SCRATCH/NOSCRATCH and EMPTY/NOEMPTY parameters that were specified when the GDG was defined. This action may result in one or all of the existing generations being deleted or uncataloged. Valid values are YES and NO.

The default is YES.

DEFAULT_EDIT/BROWSE/VIEW_MEMBER_LIST

Should option 3.4 (Data Set List utility) use the enhanced member list for the Edit, Browse and View actions. Performance is improved if the traditional member list ID used, but capability is improved using the enhanced member list. Valid values are YES and NO.

The default is YES.

IS_VIEW_SUPPORTED

Should users be allowed to use the View function from option 1 or only the Browse function. Because it is based on ISPF Edit, View can impact system resource utilization. Valid values are YES and NO.

The default is YES.

USE_ALTERNATE_PANEL_ISRTSOA

Should alternate ISPF Command Shell panel ISRTSOA be used in place of panel ISRTSO. ISRTSOA contains both an ISPF command line and a TSO command line, ISRTSO contains only one input field for both ISPF and TSO commands. Valid values are YES and NO.

The default is NO.

PRINT_USING_ICF

Indicates whether foreground print requests should be processed using an ICF printer definition. Valid values are YES and NO.

The default is NO.

DISALLOW_WILDCARDS_IN_HLQ

Indicates whether wildcards (* or %) are allowed in the high-level qualifier for data set list. Valid values are YES and NO.

The default is NO.

MAXIMUM_NUMBER_OF_SPLIT_SCREEN

Maximum number of separate logical screens a user can have active. The maximum value for this field is 32, and minimum value is 4.

The default is 8.

APPLID_FOR_USER_COMMAND_TABLE

The application ID for 1 to 3 user command tables. The application ID must be 1 to 4 alphanumeric or special characters, with the first character being either alphabetic or a special character. The application ID values can be specified in either of the formats:

User to specify a single application ID.

(usr1) or (usr1,usr2) or (usr1,usr2,usr3)

to specify 1 to 3 application IDs.

The default value is NONE (no user command tables).

In addition, a special format can be used to obtain the application ID from the current system name (ISPF dialog variable ZSYSID). The special format is:

***, *m, or *m:n.**

As the system name can be up to 8 characters, *m* and *n* are the start and end positions within the system name used to determine the application ID for the user command tables. The values for *m* and *n* must be in the range 1 to 8, where *m* is less than or equal to *n* and the difference in their values is no more than 3.

The default value for *m* is 1. The default value for *n* is *m*+3, to a maximum value of 8.

Compatibility Issue:

For compatibility of the ISPF configuration options with previous releases, do not specify any of the special formats (*, *m, or *m:n) as either the first user or site application ID.

APPLID_FOR_SITE_COMMAND_TABLE

The application ID for 1 to 3 site command tables. The application ID must be 1 to 4 alphanumeric or special characters, with the first character being either alphabetic or a special character. The application ID values can be specified in either of the formats:

Site to specify a single application ID.

(sit1) or (sit1,sit2) or (sit1,sit2,sit3)

to specify 1 to 3 application IDs.

The default value is NONE (No site-wide command tables).

In addition, a special format can be used to obtain the application ID from the current system name (ISPF dialog variable ZSYSID). The special format is:

*, *m, or *m:n.

As the system name can be up to 8 characters, *m* and *n* are the start and end positions within the system name used to determine the application ID for the site command tables. The values for *m* and *n* must be in the range 1 to 8, where *m* is less than or equal to *n* and the difference in their values is no more than 3.

The default value for *m* is 1. The default value for *n* is *m*+3, to a maximum value of 8.

Compatibility Issue:

For compatibility of the ISPF configuration options with previous releases, do not specify any of the special formats (*, *m, or *m:n) as either the first user or site application ID.

SITE_COMMAND_TABLE_SEARCH_ORDER

Determines whether the site-wide command tables are searched before or after the default ISP command table. Valid values are AFTER and BEFORE.

The default is BEFORE.

Depending on this setting, the search order will be:

Table 49. Search order details

Search Order = BEFORE

1. Application
2. USER (1 to 3)
3. SITE (1 to 3)
4. System

Search Order = AFTER

1. Application
2. USER (1 to 3)
3. System
4. SITE (1 to 3)

YEAR_2000_SLIDING_RULE

The cutoff value used by ISPF to determine whether a 2-character year date specified to ISPF should be considered a 19xx or 20xx date. Values less than or equal to this date will be considered 20xx, values greater will be considered 19xx. Value can be an absolute number or a number preceded by a minus sign to indicate the cutoff should be the specified number of years before the current year. For example, specifying 72 indicates that any 2-character year less than or equal to 72 should be considered 20xx, anything greater should be 19xx. Specifying -40 (assuming the current year is 1999) will yield a cutoff value of 59.

The default is 65.

SHOW_ENQ_DISPLAYS

Used to indicate that users should not be able to see who has existing data set ENQs when they press the help key or when they use the ISRDDN utility.

The default is blank.

DEFAULT_SESSION_LANGUAGE

Selects the language to use as the default language for ISPF. The value chosen will be the language used by ISPF if no language is specified on invocation. Valid values are:

1. English
2. Uppercase English

3. German
4. Swiss German
5. Japanese

The default is 1 (English).

PATHNAME_SUBSTITUTION_CHARACTER

This field defines the character which can be used to represent the full path name of a selected file. This character shows the position of the file name when it is specified as an argument in a z/OS UNIX command, TSO command, CLIST, or REXX exec. The substitution character can be used with commands that are invoked through the z/OS UNIX Directory List utility (ISPF option 3.17).

The default character is ! (exclamation point).

NUMBER_OF_ROWS_FOR_TBADD

The number of rows to be used in calculating the amount of storage required when a TBADD service is invoked. The value can be an integer from 1 to 1000.

The default is 1.

RETRIEVE_COMMAND_STACK_SIZE

The size, in bytes, of the command stack that RETRIEVE command uses. ISPF uses the command stack to hold commands (stripped of leading and trailing blanks) and some ISPF internal information. A stack of 512 bytes holds approximately 20 commands with a length of 10 characters each. The value can be an integer from 312 to 4096.

The default is 512.

ENABLE_ISPF_EXITS

Indicates whether exit routines are available:

- YES** Indicates that installation-written routines are provided or planned, and that the ISPEXITS load module is to be loaded at ISPF initialization. If you plan to use exit routines but those routines have not been written, you can code YES for this field, causing the IBM-provided defaults module, ISPEXITS, to be loaded. Later, you can replace ISPEXITS without having to repeat this part of the installation process.
- NO** Indicates that exit routines are not provided or planned, and that ISPEXITS is not to be loaded, reducing startup time.

The default is NO.

ENABLE_XTIOT

Indicates whether ISPF can process data sets dynamically allocated with an XTIOT and whether ISPF itself requests an XTIOT via dynamic allocation:

- YES** XTIOT capability is requested. ISPF checks whether NON_VSAM_XTIOT support has been activated before enabling XTIOT support fully. For an explanation of this keyword in the DEVSUPxx member of parmlib, see Chapter 18, "Using BSAM, BPAM, and QSAM support for XTIOT, uncaptured UCBs, and DSAB above the 16 MB line" in *z/OS DFSMS Using the New Functions*.

The ISRDDN utility indicates whether an allocation uses XTIOT and disables line command input if XTIOT support is disabled.

NO XTIOT data sets cannot be processed.

The default is NO.

VSAM data set restrictions

VSAM_RESTRICTED_EDIT_DATASET

The names of the data sets that are restricted from use in Edit. Wildcards may be used in the data set name (as in option 3.4) to specify sets of restricted data sets.

The default is NONE (all data sets allowed).

VSAM_RESTRICTED_BROWSE_DATASET

The names of the data sets that are restricted from use in Browse. Wildcards may be used in the data set name (as in option 3.4) to specify sets of restricted data sets.

The default is NONE (all data sets allowed).

VSAM_RESTRICTED_VIEW_DATASET

The names of the data sets that are restricted from use in View. Wildcards may be used in the data set name (as in option 3.4) to specify sets of restricted data sets.

The default is NONE (all data sets allowed).

ISPSPROF general values

ISPF site-wide defaults are not enabled until the VERSION_LEVEL_OF_SITETWIDE_DEFAULTS field is modified. See “ISPF site-wide profile customizations” on page 231 for more details. If you select any RESET fields here, you *must* increment the value in the VERSION_LEVEL_OF_SITETWIDE_DEFAULTS.

The RESET fields here mean that ISPF resets the site-wide defaults for each user. This is done once each time the VERSION_LEVEL_OF_SITETWIDE_DEFAULTS field is incremented. Users can change the values of their fields after the incrementation has caused the reset.

LOG/LIST_JOB_CARD1

First job card for log/list.

The default is NONE (blank).

LOG/LIST_JOB_CARD2

Second job card for log/list.

The default is NONE (blank).

LOG/LIST_JOB_CARD3

Third job card for log/list.

The default is NONE (blank).

LOG/LIST_JOB_CARD4

Fourth job card for log/list.

The default is NONE (blank).

LOG_DATA_SET_UNIQUE_CHARACTER

This unique character is used as the default only when a first-time user profile is created.

The default is 1.

LOG_SYSOUT_CLASS

Log data set sysout class.

The default is NONE (blank).

RESET_LOG_SYSOUT_CLASS

Reset the Log data set sysout class.

The default is NO.

LOCAL_LOG_SYSOUT_CLASS

Local log data set sysout class.

The default is NONE (blank).

RESET_LOCAL_LOG_SYSOUT_CLASS

Reset the Local log data set sysout class.

The default is NO.

LOG_DISPLAY_REQUIRED

Log panel display required on termination. Valid values are YES or NO.

The default is NO.

LOG_KEPT

The log data set is to be kept. Valid values are YES or NO.

The default is NO.

LOG_LINES_PER_PAGE

The number of log lines per page.

The default is 60.

LOG_MESSAGE_ID

The log message ID. Valid values are YES or NO.

The default is NO.

LOG_LOCAL_PRINTER_ID

The local printer ID (CHAR(17)) for the log.

The default is NONE (blank).

RESET_LOG_LOCAL_PRINTER_ID

Reset the log local printer ID for the log.

The default is NO.

LOG_PAGES_PRIMARY_QUANTITY

The primary quantity of log pages.

The default is 10. Set to zero to prevent allocation of the LOG data set.

LOG_PAGES_SECONDARY_QUANTITY

The secondary quantity of log pages.

The default is 10.

LIST_DATA_SET_UNIQUE_CHARACTER

This unique character is used as the default only when a first-time user profile is created.

The default is 1.

LIST_SYSOUT_CLASS

List data set sysout class.

The default is NONE (blank).

RESET_LIST_SYSOUT_CLASS

Reset the List data set sysout class.

The default is NO.

LOCAL_LIST_SYSOUT_CLASS

Local list data set sysout class.

The default is NONE (blank).

RESET_LOCAL_LIST_SYSOUT_CLASS

Reset Local list data set sysout class.

The default is NO.

LIST_DISPLAY_REQUIRED

List panel display required on termination. Valid values are YES or NO.

The default is NO.

LIST_KEPT

The list data set is to be kept. Valid values are YES or NO.

The default is NO.

LIST_LINES_PER_PAGE

The number of list lines per page.

The default is 60.

LIST_LINE_LENGTH

The line length of the list data set.

The default is 120.

LIST_LOCAL_PRINTER_ID

The local printer ID (CHAR(17)) for the list.

The default is NONE (blank).

RESET_LIST_LOCAL_PRINTER_ID

Reset the list local printer ID for the list. Valid values are YES or NO.

The default is NO.

LIST_RECORD_FORMAT

The record format for the list.

The default is FBA.

LIST_LOGICAL_RECORD_LENGTH

The logical record length for the list.

The default is 121.

RESET_LIST_LRECL_AND_RECFCM

Reset the LIST_LOGICAL_RECORD_LENGTH and LIST_RECORD_FORMAT.

The default is NO.

LIST_PAGES_PRIMARY_QUANTITY

The primary quantity of list pages.

The default is 100. Set to zero to prevent allocation of the LIST data set.

LIST_PAGES_SECONDARY_QUANTITY

The secondary quantity of list pages.

The default is 200.

UNIQUE_JOB_CHARACTER

The unique job character.

The default is NONE (blank).

SCREEN_FORMAT

The screen format. The screen format you choose depends on the type of terminal you are using or the type of terminal your emulator is emulating. These formats are available:

DATA Format based on data width (only 3278 model 5 terminal)

STD Format 24 lines by 80 characters

MAX Format 27 lines by 132 characters

PART Format using hardware partitions (only 3290 terminal)

The default is STD.

TERMINAL_TYPE

The terminal type depends on the type of terminal you are using or the type of terminal your emulator is emulating.

The default is 3278.

FAMILY_PRINTER

The printer type of the destination device. Two (2) is the only valid value and represents a QUEUED printer.

DEVICE_NAME

The device name is the destination of printed output. On MVS, this is the VTAM[®] node name for the printer and is installation-dependent.

The default is NONE.

RESET_DEVICE_NAME

Reset the device name specified.

The default is NO.

ASPECT_RATIO

Allows the user to preserve the Graphics Aspect Ratio for a "true" picture (0) or to preserve the positional relationship between the graphics and alphanumerics (1).

The default is zero (0).

PAD_CHARACTER

The character entered here will be used to fill input fields on a panel. It must be different than the command delimiter and it cannot be a-z, A-Z, 0-9 or /, except N and B can be used to indicate nulls and blanks respectively.

The default is B.

DELIMITER

The character entered here will be used to separate multiple commands entered on a command line. Alphabetic and alphanumeric characters as well as = (equal sign) and . (period) are not valid.

The default is ; (semicolon).

RETRIEVE_MINIMUM_LENGTH

The minimum number of characters ISPF should save in the retrieve stack. Valid values are 1 through 99.

The default is 1.

RETRIEVE_CURSOR_POSITION

Cursor position relative to the retrieved command. Valid values are:

- 1 Place cursor at the beginning of the string.
- 2 Place cursor at the end of the string.

The default is 1.

ENABLE_DUMP

Enable a dump for a subtask ABEND when not in ISPF TEST mode. Valid values are ON and OFF.

The default is OFF.

TERMTRAC_DD_NAME

The terminal tracing (TERMTRAC) ddname.

The default is ISPSNAP.

RESET_TERMTRAC_DD_NAME

Reset the TERMTRAC ddname specified. Valid values are YES and NO.

The default is NO.

ENVIRON_TERMTRAC_VALUE

Enable terminal tracing. Valid values are ON, OFF and ERROR.

The default is OFF.

PFKEY_PREFIX

Select pfkey prefix. Valid values are YES and NO.

The default is YES.

FKA_SETTING

Current state of the function key form. Valid values are LONG, SHORT and OFF (no display).

The default is LONG.

NUMBER_OF_PFKEYS

Number of function keys. Valid values are 12 or 24.

The default is 12.

CHARACTER_SET_LOAD_MODULE

Character set load module name.

The default is ISP3278.

RESET_CHARACTER_SET_LOAD_MODULE

Reset the character set load module.

The default is NO.

FRAME_COLOR

The color for window frames. Valid values are:

- 1 Blue
- 2 Red
- 3 Pink

- 4 Green
- 5 Turquoise
- 6 Yellow
- 7 White

The default is 6 (Yellow).

FRAME_INTENSITY

The intensity for window frames. Valid values are 0 (Low) and 2 (High).

The default is 2 (High).

TPUT_BUFFER_BLOCKSIZE

The TPUT buffer block size can range from 512 to 32767. If defined as 0, ISPF will use its own calculations to determine the TPUT buffer size. If defined within the range 512 to 32767, ISPF will use the defined value as the buffer block size.

The default is 0.

GLOBAL_COLORS

Determines the colors that are displayed while running ISPF in host mode. The string is a 7 digit number, each digit specifying the color to be substituted for another host color. The order of the digits in the string, and the number that represents each color is:

- 1. Blue
- 2. Red
- 3. Pink
- 4. Green
- 5. Turquoise
- 6. Yellow
- 7. White

For example, to substitute blue for green and accept all other default colors, specify the number for blue (1) in the position for green (fourth position): 1231567.

The default is 1234567.

GUI_GLOBAL_COLORS

The global colors supported by the workstation. In GUI mode you can map each of the 7 host colors to one of the 16 workstation colors. The value is specified as a string of seven 2-digit values mapping the workstation color to the host color. The order of the host colors is the same as for the GLOBAL_COLORS keyword. The 16 workstation colors are:

- 0 Black
- 1 Dark Blue
- 2 Dark Green
- 3 Dark Cyan
- 4 Dark Red
- 5 Dark Magenta
- 6 Brown
- 7 Light Gray
- 8 Dark Gray
- 9 Light Blue
- 10 Light Green
- 11 Light Cyan
- 12 Light Red
- 13 Light Magenta
- 14 Yellow

15 White

The default value is 01041302030600. Each 2-digit pair corresponds to a workstation color, in a host color position. The 01 in the first position tells the workstation to display the color Dark Blue wherever the host displays the color Blue. The default sequence maps the colors as:

Host color

Workstation color

Blue Dark Blue

Red Dark Red

Pink Light Magenta

Green Dark Green

Turquoise
Dark Cyan

Yellow
Brown

White Black

HOST_COLORS

Select host colors for panel fields when on the workstation. Valid values are ON (selected) or OFF (not selected).

The default is OFF (not selected).

Note: HOST_COLORS and PC_COLORS are mutually exclusive. If one is selected, DO NOT select the other.

PC_COLORS

Select personal computer colors for panel fields when on the workstation. Valid values are ON (selected) or OFF (not selected).

The default is OFF (not selected).

Note: HOST_COLORS and PC_COLORS are mutually exclusive. If one is selected, DO NOT select the other.

DEFAULT_MESSAGE_ID

Select to display the message identifier. The valid values are OFF or ON, the default is OFF.

DEFAULT_PANEL_ID¹

Select to display the panel identifier. The valid values are OFF or ON, the default is OFF.

DEFAULT_SCREEN_NAME¹

Select to display the screen name. The valid values are OFF or ON.

The default is OFF.

DEFAULT_SYSTEM_NAME¹

Select to display the system name. The valid values are OFF or ON.

The default is OFF.

DEFAULT_USERID_DISP¹

Select to display the user identifier. The valid values are OFF or ON.

The default is OFF.

DEFAULT_PRIMARY_PANEL

Enter a panel name for the default primary panel.

The default is ISP@MSTR.

DEFAULT_LIBDEF_PROCESSING_OPTION

Enter the default option for processing LIBDEF requests. The valid values are COND, UNCOND, STACK, or STKADD.

The default is UNCOND.

ENABLE_EURO_SYMBOL

Enable the Euro currency symbol. Valid values are YES or NO.

The default is NO.

RESET_ENABLE_EURO_SYMBOL

Reset enable the Euro currency symbol field.

The default is NO.

DATE_FORMAT_ZDATEFD

The date format using the national language convention for the day, month, year and the national language separator. If the value is DEFAULT ISPF will use the value defined in the ISPF Literal Load Module.

The default is DEFAULT.

DATE_FORMAT_ZDATEF

The date format using the characters DD for day, MM for month, and YY for year and the national language separator. The order of year month and day may change. If the value is DEFAULT, ISPF uses the value defined in the ISPF Literal Load Module.

The default is DEFAULT.

DEFAULT_TIME_SEPARATOR

The separator used in the time of day format. For example, the colon (:) in hh:mm:ss. If the value is D, ISPF uses the value defined in the ISPF Literal Load Module.

The default is the D.

Note:

1. These options control a shared 17-byte information area that overlays any panel display. For a description and references to the system commands that also affect this area, see "Understanding ISPF panels" in *ISPF User's Guide Volume 1*.

ISPSPROF workstation defaults**GUI_APPC_ADDRESS**

The workstation's APPC network name in fully qualified LU name format or in symbolic destination name format.

The default is NONE.

GUI_APPC_ADDRESS2

The workstation's APPC network name in fully qualified LU name format or in symbolic destination name format.

The default is NONE.

GUI_APPC_ADDRESS3

The workstation's APPC network name in fully qualified LU name format or in symbolic destination name format.

The default is NONE.

GUI_APPC_ADDRESS4

The workstation's APPC network name in fully qualified LU name format or in symbolic destination name format.

The default is NONE.

GUI_APPC_ADDRESS5

The workstation's APPC network name in fully qualified LU name format or in symbolic destination name format.

The default is NONE.

GUI_CLOSE_WINDOW

The command to be processed when a GUI window is closed. Valid values are:

- 1 CANCEL
- 2 END
- 3 EXIT
- 4 RETURN

The default value is 1 (CANCEL).

GUI_DISPLAY_ENTER_KEY

If YES the enter key button will be displayed at the bottom of GUI panels. Valid values are YES or NO.

The default is YES.

GUI_WINDOW_FRAME

Select the type of GUI window frame. Valid values are:

1 Standard

a GUI window frame that can be resized and has max/min buttons

2 Fixed

a GUI window frame that has max/min buttons, but cannot be resized

3 Dialog

a GUI window frame that cannot be resized and does not have max/min buttons

The default is 1.

GUI_NETWORK

Select the network protocol to be used for the GUI session. Valid values are:

1 TCP/IP

Transmission Control Protocol/Internet Protocol

2 APPC

Advanced Program-to-Program Communication

3 ISPDTPRF file

This option tells ISPF to look for the file allocated to DD ISPDTPRF. ISPF will search this file and use the network protocol and address specified for your userid.

The default is 1.

GUI_SWITCH

A connection to the workstation will be established and subsequent panels will be displayed in GUI mode after the ENTER key is pressed. Valid values are:

- 1 GUI display
- 2 Non-GUI display

The default is 1, GUI display.

SAVE_GUI_VALUES

Save the values entered on ISPF Settings Initiate the Workstation Connection panel in the system profile. Valid values are YES or NO.

The default value is YES.

GUI_TCP_ADDRESS

The TCP/IP address of the workstation in which the GUI display or connection should be made. The TCP/IP address can be in dotted decimal format or in domain name format.

The default is NONE.

GUI_TCP_ADDRESS2

The TCP/IP address of the workstation in which the GUI display or connection should be made. The TCP/IP address can be in dotted decimal format or in domain name format.

The default is NONE.

GUI_TCP_ADDRESS3

The TCP/IP address of the workstation in which the GUI display or connection should be made. The TCP/IP address can be in dotted decimal format or in domain name format.

The default is NONE.

GUI_TCP_ADDRESS4

The TCP/IP address of the workstation in which the GUI display or connection should be made. The TCP/IP address can be in dotted decimal format or in domain name format.

The default is NONE.

GUI_TCP_ADDRESS5

The TCP/IP address of the workstation in which the GUI display or connection should be made. The TCP/IP address can be in dotted decimal format or in domain name format.

The default is NONE.

GUI_TITLE

The GUI title is the default value to be used for the title bar. If the GUI title is blank the title bar will be set to the userid from where the dialog was initiated.

The default is NONE (blank).

GUI_ACCELERATOR_SUPPORT

When running in GUI mode and Accelerator Support is YES, any accelerator keys that are defined for the pulldown menus will be appended to the pulldown choice text and the accelerator keys will be functional. Valid values are YES or NO.

The default is YES.

HOST_CODE_PAGE and HOST_CHARACTER_SET

Both the Code Page (CP) and the Character Set (CS) must be specified in order to be used. If specified they are used in translating the data from

host to workstation. If the code page and character set are specified as 0000, values from the terminal query will be used. If your terminal/emulator does not support code pages, the CODEPAGE and CHARSET parameter values on ISPSTART will be used. The default will be English (U.S.) if these ISPSTART parameters are not specified.

The default is 0000 for both.

For more information about code pages and character sets refer to the *z/OS ISPF Dialog Developer's Guide and Reference*.

RESET_HOST_CODE_PAGE

Reset the host code page value.

The default is NO.

RESET_HOST_CHARACTER_SET

Reset the host character set value.

The default is NO.

GUI_DEFAULT_BACKGROUND_COLOR

Allows you to specify the background color for the display of GUI panels. The valid values are: 1 (Dialog) and 2 (Standard).

The default is 1.

GUI_DOWNLOAD_IMAGES

When running in GUI mode and Download Images is YES, ISPF will attempt to download images from the host libraries defined to ddname ISPILIB. When Download Images is NO, ISPF will not download images from the host. Valid values are YES or NO.

The default is YES.

GUI_MAKEPATH_FOR_IMAGES

When running in GUI mode and Make Path for Images is YES and the image path you have specified does not exist, ISPF will attempt to create the path. Valid values are YES or NO.

The default is NO.

CONTINUE_3270_AFTER_LOSS_OF_WS_CONNECTION

If the "3270 Mode after losing workstation connection" setting is selected,

the ISPF session continues in the 3270 emulator session rather than abend with code 989 is the workstation connection is lost while running in GUI mode. Valid values are YES and NO.

The default is YES.

ISPSPROF workstation download defaults

WSA_DOWNLOAD_OPTION

Workstation agent download option. The valid values are:

- 1 Download now
- 2 Do not download
- 3 Cease warnings

The default is 1.

WSA_DOWN_LEVEL_WARNING

Warn when a user's workstation agent is at an earlier level than the host's version. Valid values are YES and NO.

The default is YES.(issue a warning).

WSA_DOWNLOAD_FTP_ADDRESS

The IP address of the workstation agent FTP server.

The default is NONE.

BROWSE_FTP_ERRORS

Browse FTP output only if an error occurs in workstation agent download. Valid values are YES or NO.

The default is YES.

CREATE_DIRECTORY_ON_WSA_DOWNLOAD

Create a directory on the workstation agent download. Valid values are YES or NO.

The default is NO.

WSA_DOWNLOAD_DIRECTORY

The directory to copy the file to on a workstation agent download.

The default is NONE (blank).

WSA_DOWNLOAD_METHOD

There are three methods for downloading the workstation agent, and four values that can be placed in this keyword:

- 1 Download using FTP
- 2 Download using ISPF/Client
- 3 Download manually

NONE

Not using the Workstation Agent

The default is NONE.

WSA_DOWNLOAD_DATASET

The data set to copy the file from on the workstation agent download. The host data set that contains the workstation agent install programs.

The default is 'ISP.SISPGUI'.

RESET_WSA_DOWNLOAD_DATASET

Reset the workstation agent download data set.

The default is NO.

WSA_DOWNLOAD_PLATFORM

The workstation agent runs on different workstation platforms. Indicate which platform you are using. Valid values are:

NONE

Workstation agent not being used

1 Windows 2000/NT

2 Reserved

3 AIX®

4 Solaris

5 HP UX

The default is NONE.

WSA_DOWNLOAD_FTP_USER

The name of the workstation agent download FTP user.

The default is NONE.

Chapter 10. Exits

This section lists the exit macros and installation-wide exits.

Exit macros

You define the ISPF installation-wide exits and installation-written exit routines you want to use by placing entries in the exit definition table, ISPXDT. ISPXDT consists of two sections:

Exit entry definitions

Defines the installation-wide exits and their associated exit routines

Exit data area definitions

Defines the data areas that are used by the exit routines and their size specifications

The ISPMXED, ISPMXLST, ISPMXDEF, ISPMEPT, and ISPMXEND macros define the exit entry definition section of the table, and the ISPMXDD and ISPMDAD macros define the exit data area definitions.

ISPMXED

Defines the start or the end of the exit entry definition section.

ISPMXLST

Defines the installation-wide exits where you provide exit routines.

where:

epcode The numeric code for a user exit provided by ISPF. The list of codes must be enclosed in parentheses, and must be in ascending order. See Table 25 on page 121 for a list of the numeric codes.

ISPMXDEF

Begins the definition of exit routines for a particular user exit.

where:

epcode The numeric code for an exit point provided by ISPF. You must include this code as an operand for the ISPMXLST macro in order for the user exit to be defined. See Table 25 on page 121 for a list of the numeric codes.

ISPMEPT

Identifies an exit routine to call at a particular user exit.

▶▶—ISPMEPT—*entryname*—, *data-area-name*—▶▶

where:

entryname

Identifies the entry point of the exit routine. This is usually a CSECT name.

data-area-name

Identifies the name of the data area the exit routine uses. The name can be up to 8 characters long. If you list the data area on an ISPMEPT macro, you must define it using the ISPMDDAD macro. If you do not specify a data area on the ISPMEPT macro, ISPF does not provide a data area for the exit routine being defined.

Note: Do not use 'NULLAREA' as a *data-area-name*.

ISPMXEND

Ends the definition of routines for a particular user exit. This macro explicitly ends the ISPMXDEF macro and must be included.

▶▶—ISPMXEND—▶▶

ISPMXDD

Indicates the start or the end of the data-area definition section of ISPXDT. Even if an exit routine does not require a data area, you must code the ISPMXDD START and ISPMXDD END macros.

▶▶—ISPMXDD—START
END—▶▶

ISPMDDAD

Defines a data area and its size. The data area can be used by one or more exit routines.

▶▶—ISPMDDAD—*data-area-name*, *size*—▶▶

where:

data-area-name

Identifies the name of the data area an exit routine uses. The name can be up to 8 characters long.

size

Specifies, in bytes, the size of the data area. If the size is not a multiple of eight, ISPF rounds it up to the next multiple of eight.

Exit 1: ISPF session initialization exit

The ISPF session initialization exit provides accounting and monitoring capabilities. ISPF gives control to the exit routine after successfully opening all required data sets, determining session language, and before the first logical screen is started.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters.

Flags 4 bytes of bit flags defined as follows:

- 0 1 = TEST option specified
- 1 1 = TESTX option specified
- 2 1 = TRACE option specified
- 3 1 = TRACEX option specified
- 4-31 Reserved.

CPPL Pointer to the address of the TSO command processor parameter list (CPPL) that was passed to ISPF.

Lang An 8-character field that contains the name of the national language for this ISPF session. The value is left-justified and padded with blanks.

Return codes

No return codes are acknowledged at this user exit. When this user exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 2: ISPF session termination exit

This user exit also provides accounting and monitoring capabilities. ISPF invokes routines at this exit after the last logical screen terminates and just before ISPF terminates.

If the ISPF main task terminates abnormally, routines at this user exit are not invoked. You can create an ESTAE exit in the ISPF initialization exit if you want to detect abnormal product termination. However, this applies only to product abnormal termination and not to abends of the logical screen task.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters.

ISPF Return Code:

A fullword binary number that contains the value of ZISPFRC as set by the application on the ISPSTART command or by ISPF. See the *z/OS ISPF Dialog Developer's Guide and Reference* for return codes set by ISPF. Any change made to this parameter by the exit routine is ignored.

Return codes

No return codes are acknowledged at this user exit. ISPF termination continues upon return from the exit routine.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 3: SELECT service start exit

In addition to providing information you can use to monitor ISPF, this user exit lets you restrict access to applications selected through ISPF. ISPF invokes the exit routines when the SELECT service is invoked. The SELECT service is invoked by:

- ISPSTART command
- SPLIT command (not when already in split-screen mode)
- SPLIT NEW command
- START command
- ISPSTRT program interface
- Selection menu entry
- Command table entry
- SELECT dialog service

The exit routines are given control after the SELECT request has been parsed and syntax checking is complete.

Changes you make to the Screen name are **not** reflected in the SCRNAME value passed in this exit.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes the exit routines make to these parameters.

Flags 4 bytes of bit flags defined as follows:

- | | |
|-----|----------------------------------------------------------------------------------------------------------------------------|
| 0 | 1 = PGM keyword specified |
| 1 | 1 = CMD keyword specified |
| 2 | 1 = PANEL keyword specified |
| 3-4 | Reserved |
| 5 | 1 = ADDPOP keyword specified |
| 6 | 1 = BARRIER keyword specified |
| 7 | 1 = NEST keyword specified |
| 8 | 1 = NEWAPPL keyword specified |
| 9 | 1 = NEWPOOL or NEWAPPL keyword specified |
| 10 | 1 = PASSLIB keyword specified |
| 11 | 1 = Lang (CREX) keyword specified |
| 12 | 1 = Lang (APL) keyword specified |
| 13 | 1 = MODE(FSCR) specified |
| 14 | 1 = MODE(LINE) specified |
| 15 | Reserved |
| 16 | 1 = PARM value passed to the exit was truncated to 258 bytes, which include a halfword length field and 256 bytes of data. |
| 17 | 1 = SUSPEND specified |
| 18 | 1 = LOGO keyword specified |

19-31 Reserved.

elemname

An 8-character field that contains the name of the element (PGM, CMD, or PANEL) to be selected.

APPLID

A 4-character field that contains the current application ID. If NEWAPPL was specified on the SELECT request, this field contains the new APPLID as specified. If APPLID field is blank, the previously specified application ID is implied. The value is left justified and padded with blanks.

PARM Input parameters being passed to a program dialog in the same format as when passed to the program; single character string preceded by a halfword containing its length (the length value does not include itself). FLAGS bit 16 is set when this parameter represents a truncated PARM value. The Length field is not affected by truncation.

logoname

An 8-character field that contains the name of the LOGO panel if it was specified.

Screen name

Screen name as set by the SCRNAME command and shown by the SCRNAME ON function.

Return codes

- 0 Normal completion; ISPF continues processing.
- 8 Authorization failure; The SELECT request is not processed. Instead, ISPF issues a line mode message stating that the user exit indicated an authorization failure and terminates the select service, but allows the active application to continue.
- 16 Authorization failure; the SELECT request is not processed. Instead, ISPF issues a message indicating that the user exit indicated an authorization failure and terminates the SELECT service processing with a severe error (RC=20).
- Other** ISPF treats the error as severe and issues a message indicating that the exit routine returned an incorrect return code.

Exit 4: select service end exit

You can use this user exit to mark the end of a program, command, or menu invoked through any of the SELECT services, with or without the SELECT service start exit.

Changes you make to the screen name are not reflected in the SCRNAME value passed in this exit.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes the exit routines make to the parameters.

Flags 4 bytes of bit flags defined as follows:

- 0 1 = PGM keyword specified

- 1 1 = CMD keyword specified
- 2 1 = PANEL keyword specified
- 3-4 Reserved
- 5 1 = ADDPOP keyword specified
- 6 1 = BARRIER keyword specified
- 7 1 = NEST keyword specified
- 8 1 = new application being invoked
- 9 1 = new shared pool is to be created
- 10 1 = PASSLIB keyword specified
- 11 1 = Lang (CREX) keyword specified
- 12 1 = APL keyword specified
- 13 1 = MODE(FSCR) specified
- 14 1 = MODE(LINE) specified
- 15-16 Reserved
- 17 1 = SUSPEND specified
- 18 1 = LOGO keyword specified
- 19-31 Reserved.

Note: If no parameters were passed, the flag bytes will be zero.

elemname

An 8-character field that contains the name of the element (PGM, CMD, or PANEL) to be selected. In case of CMD, if the element is a CLIST prefixed with %, the % symbol is removed from the elemname.

APPLID

A 4-character field that contains the application ID of the element that just terminated.

STATS

Two contiguous fullwords containing:

Total "think time" in hundredths of a second for this SELECT level only. "Think time" means all of the time intervals between the time when ISPF unlocked the keyboard for input and the time when input was received by ISPF. If there are other SELECTs nested within this one, their statistics are given at the corresponding select end exits, but not included here.

The number of times the screen was read by ISPF in this SELECT level.

logoname

An 8-character field that contains the name of the LOGO panel if it was specified.

Screen name

Screen name as set by the SCRNAME command and shown by the SCRNAME ON function.

Return codes

No return codes are acknowledged at this user exit. ISPF termination continues upon return from the exit routine.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 5: TSO command start exit

You can use this user exit to monitor and restrict commands invoked through ISPF. In addition, you can also use the user exit to allow TSO commands newly added to the system to be invoked from within ISPF without updating the ISPF TSO command table (ISPTCM). If the invoked command is not an implicit CLIST (not prefixed by %), the TCM is searched. This exit is called immediately after searching the TCM. For implicit CLISTS, the exit is called before attaching the exec processor.

Note: This user exit will not be invoked for TSO commands issued from REXX execs.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters:

cmdname

An 8-character field that contains the name of the command that was invoked. The name is left-justified within the field and padded with blanks.

If the command is a CLIST, this field contains the CLIST name. The CLIST name will not include the % prefix if one was used.

user flags

1 or more bytes of installation data as defined when ISPTCM is generated. See “Customizing the ISPF TSO command table (ISPTCM)” on page 114 for more information.

TCM flags

The flag byte in ISPTCM that ISPF uses to determine what processing should be done for the command. If the current command is not in ISPTCM, the default flag byte is provided. The exit routine can change this value and ISPF uses the value if it receives a return code of 4. See “Customizing the ISPF TSO command table (ISPTCM)” on page 114 and “ISPTCM usage notes” on page 117 for information about TCM flags.

CPPL The address of the TSO command processor parameter list (CPPL) that was passed to ISPF.

When the command is an implicit CLIST (prefixed by %), the TCM is not searched. In those cases, the user flags and TCM flags parameters will be binary zeros.

Return codes

- 0 Normal completion; ISPF continues processing.
- 4 The exit routine has changed the value of the TCM flag byte. In this case, ISPF uses the value of the flag to process the command. However, changes to the TCM flag bit indicating whether the command should be logged are ignored.

- 16** Authorization failure. The exit routine indicated that this command should not be attached. ISPF issues an error message indicating that the exit routine rejected the command and returns to the caller.
- Other** ISPF treats the error as severe and issues a message indicating that the exit routine returned an incorrect return code.

Exit 6: TSO command end exit

You can use this user exit to monitor TSO commands invoked from within ISPF. This exit is called after the attached command completes (or if attach fails).

Note: This user exit will not be invoked for TSO commands issued from REXX execs.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes made to these parameters.

cmdname

An 8-character field that contains the name of the command to be attached. The name is left-justified within the field.

CLIST name

An 8-character field that contains the name of the CLIST if the command was a CLIST. In that case, cmdname is 'EXEC'. If the command is not a CLIST, this field is the same as cmdname.

user flags

1 or more bytes of installation data as defined when ISPTCM is generated. See “Customizing the ISPF TSO command table (ISPTCM)” on page 114 for more information.

TCM flags

The flag byte in ISPTCM that ISPF uses to determine what processing should be done for the command. If the current command is not in ISPTCM, the default flag byte is provided.

CPPL The address of the TSO command processor parameter list (CPPL) that was passed to ISPF.

When the command is an implicit CLIST (prefixed by %), the TCM is not searched. In those cases, the user flags and TCM flags parameters will be binary zeros.

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 7: LIBDEF service exit

This user exit lets you restrict the use of the LIBDEF service. ISPF passes control to the exit routines at this user exit after determining that a syntactically valid call has been made and before allocating and opening the alternate library.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes the exit routines make to the parameters.

libtype

An 8-character field that contains the library type as specified on the LIBDEF request. The value is left-justified and padded with blanks.

Flags 4 bytes of bit flags defined as follows:

- 0 1 = DATASET keyword specified
- 1 1 = LIBRARY keyword specified
- 2 1 = EXCLDATA keyword specified
- 3 1 = EXCLLIBR keyword specified
- 4 1 = COND request
- 5 1 = STACK request. If bit 4 and 5 are both 0, an UNCOND request was done
- 6 1 = STKADD request. Valid if bit 0 equals 1
- 7-31 Reserved

dsname#

A fullword binary number indicating the number of elements in the lengths and names arrays that follow. The number will not exceed 15.

lengths

An array of fullwords indicating the lengths of the corresponding elements of the names array. The maximum length of a dsname is 44. If a libname is provided using the LIBRARY or EXCLLIBR keyword, the length will be eight.

names An array containing the data set names or library name as specified in the ID parameter of the LIBDEF service. Data set names are fully qualified without quotes. Each element can be up to 44 characters long and those names less than 44 characters are padded on the right with blanks.

Return codes

- 0 Normal completion; ISPF continues processing.
- 16 Authorization failure. ISPF issues a message indicating an authorization failure has occurred and LIBDEF terminates with a severe error.
- Other** LIBDEF treats return codes other than 0 or 16 as a severe error and returns a code of 20 to the caller.

Exit 8: RESERVE exit

This user exit lets you use your own method for serializing resources in addition to the RESERVE done by ISPF. See Appendix A, “ISPF enqueue processing for data integrity,” on page 325 for information about ISPF’s use of ENQ and RESERVE. ISPF gives control to the exit routine before it does the RESERVE. If your serialization mechanism cannot acquire the resource, or if the exit routine returns a code greater than 0, ISPF does not attempt to get it.

The RESERVE exit is still called if Configuration table keyword PDSE_RESERVE_PROCESSING is set to OFF.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes made to these parameters.

qname

An 8-character field that contains the queue name against which the RESERVE is done. (ISPF uses a qname of 'SPFEDIT'.)

rname The 44-character resource name (data set name) that is reserved.

ucbaddr

A fullword field containing the address of the unit control block (UCB) for the reserved device.

Flags 4 bytes of bit flags defined as follows:

- 0 1 = Exclusive reserve requested. 0 = Shared reserve requested. (ISPF always requests exclusive use of the resource at RESERVE.)
- 1 1 = A RESERVE or ENQ will be done on qname 'SYSIEWLP' (the linkage editor qname).
- 2 1 = The resource being reserved is a partitioned data set.
- 3 1 = The resource being reserved is a sequential data set.
- 4 1 = The resource being reserved is a PDSE.
- 5 1 = PDSE_RESERVE_PROCESSING setting. On by default
- 6-31 Reserved.

Note: The exit routine should not use the same (qname, rname) combination (in a RESERVE macro call) that ISPF uses. If that happens, an abend occurs when ISPF attempts to do its own RESERVE.

Return codes

- 0 Normal completion; ISPF does its own RESERVE and continues processing.
- 16 Resource not available. ISPF issues a message showing that the exit routine indicated the resource is not available. This results in a failure of the service requesting the RESERVE.
- Other** ISPF treats other return codes similar to a return code of 16 and issues a message indicating that the exit routine returned an incorrect return code.

Exit 9: RELEASE exit

Use this user exit to release any resources acquired at the RESERVE user exit. ISPF relies on task termination to release any resources reserved by the abending logical screen task. This user exit does not get control in the case of abnormal termination of the logical screen.

If your serialization mechanism is such that task termination will not release the reserved resources, an exit routine is provided at the logical screen end user exit to clean up any unreleased resources for that task.

The RESERVE done by ISPF is released before the exit routine is given control.

The RELEASE exit is still called if Configuration table keyword PDSE_RESERVE_PROCESSING is set to OFF.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes made to these parameters.

qname

An 8-character field that contains the queue name against which the RESERVE is done. (ISPF uses a qname of 'SPFEDIT'.)

rname The 44-character resource name (data set name) that is reserved.

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 10: logical screen start exit

You can use this user exit to gather accounting and monitoring information for each ISPF logical screen. The exit routine is given control just before the logical screen task is attached.

Exit parameters

This user exit uses only the standard exit parameters described in “Exit parameter list” on page 126, which includes the logical screen identifier (screenid).

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 11: logical screen end exit

This user exit, which is similar to the logical screen start user exit, lets you gather accounting and monitoring information for each ISPF logical screen. It gives you control for both normal and abnormal termination of a logical screen. You can use it to perform necessary cleanup required as a result of exits being bypassed because of abnormal termination. Specifically, these end user exits cannot gain control because of a logical screen abend even though the corresponding start installation exits did get control:

- SELECT service end exit
- RELEASE exit
- ISPF service end exit.

Note: The TSO command end exit gets control for both normal and abnormal termination of attached commands.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters:

Flags 4 bytes of bit flags defined as follows:

0 0 = Normal termination 1 = Abnormal termination.

1-31 Reserved

Next logical screen

An 8-character field that identifies the next active ISPF logical screen. In the case of exiting ISPF, the next logical screen ID will be 0.

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 12: ISPF service start exit

The ISPF exit for the service start lets you monitor all external ISPF service requests. Exit routines at this user exit are notified of all service requests (including PDF services) made through the ISPLINK or ISPEXEC interfaces. The exit routines are not notified for ISPF internal service requests (those that do not use the ISPLINK or ISPEXEC interfaces.)

After initial verification of parameters and syntax, ISPF calls the exit routines at this user exit before the requested service is performed.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes the routines make to these parameters.

servname

An 8-character field containing the name of the ISPF service being invoked. The name is left-justified within the field.

Flags 4 bytes of bit flags defined as follows:

0 1 = ISPF service 0 = PDF service

1-31 Reserved.

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 13: ISPF service end exit

You can use this user exit to mark the termination of ISPF dialog services invoked through the ISPLINK or ISPEXEC interfaces.

If a severe error occurs causing a logical screen abend, ISPF does not give control to the exit routines at this user exit. You can also stack exit routines at the logical screen end user exit to ensure that service termination is correctly recorded.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters. ISPF ignores any changes the exit routines make to the parameters.

servname

An 8-character field containing the name of the ISPF or PDF service being invoked. The name is left-justified within the field.

Flags 4 bytes of bit flags defined as follows:

0 1 = ISPF service 0 = PDF service

1-31 Reserved.

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 14: SWAP exit

Using this user exit, you can indicate a change of the active logical screen. Together with the logical screen start and end user exits, it allows resource use to be monitored for each ISPF logical screen.

ISPF calls the exit routines at this user exit just after the logical screen to be given control is activated. In addition, ISPF calls the exit routines if the SPLIT command is entered when the screen is already split.

Exit parameters

This user exit uses only the standard exit parameters described in “Exit parameter list” on page 126, which includes the logical screen identifier (screenid). The screen ID identifies the logical screen activated as a result of the SWAP command.

Return codes

No return codes are acknowledged at this user exit. When this exit returns to ISPF, normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Exit 15: DISPLAY service exit

This user exit is provided for installation tailoring purposes. This allows you to selectively replace ISPF, PDF, or other ISPF-based panels with your own versions of the panels. You can control the amount of information presented to your users based on their experience with the panels. The exit routines can change a number of parameters at this user exit.

ISPF calls the exit routines at this user exit before the display of all the panels (as a result of internal or external display requests) except for the display of severe error or abend panels or display requests where a panel ID is not specified. This includes displays caused by the DISPLAY, TBDISPL, EDIT, SELECT, and BROWSE services.

Changes you make to the Screen name are **not** reflected in the SCRNAME value passed in this exit.

Exit parameters

In addition to the standard exit parameters described in "Exit parameter list" on page 126, the exit routines at this user exit receive these parameters.

panel-id

An 8-character field that contains the name of the panel to be displayed. If the display request did not specify a panel-id (indicating that the previously displayed panel is to be redisplayed), the exit routine is not invoked.

This parameter can be changed. If the parameter is changed, the name of the panel in the field must be left-justified.

message-id

An 8-character field that contains the message-id to be displayed on the panel, as specified on the display request. Messages displayed as a result of the SETMSG service are not identified in this field. If a message-id is not specified, the parameter contains blanks.

This parameter can be changed. If the parameter is changed, the message-id in the field must be left-justified.

cursor-field

An 8-character field that contains the field name on which the cursor is to be positioned. This field contains blanks if the cursor-field is not explicitly specified (the cursor is placed by defaults).

This parameter can be changed. If the parameter is changed, the field name must be left-justified.

cursor-offset

A fullword binary number that contains the offset within the cursor-field where the cursor is to be positioned. If not explicitly specified on the display request, this parameter has a value of zero.

This parameter can be changed.

table-name

An 8-character field that contains the name of the table to be displayed if the display request is a result of the TBDISPL service. Otherwise, the field contains blanks.

This parameter *cannot* be changed.

Flags 4 bytes of bit flags defined as follows:

- 0 1 = Non-display mode is active; the panel is processed but not displayed.
- 1 1 = COMMAND option was specified on the DISPLAY request.
- 2-31 Reserved.

message-field

An 8-character field that contains the name of the panel field the message pop-up window is to be positioned adjacent to. This field contains blanks if the MSGLOC parameter is not specified.

This parameter can be changed by the exit routine.

Screen name

Screen name as set by the SCRNAME command and shown by the SCRNAME ON function.

Return codes

- 0 Normal completion; ISPF continues processing.
- 4 The exit routine changed one or more of the parameters. ISPF continues processing using the changed parameter values.
- Other** ISPF treats the error as severe and issues a message indicating that the exit routine issued an incorrect return code.

Note: Panel functions, such as RESP, that are coded in the panel)INIT section are not processed before the exit is entered. This could prevent a display although non-display is not indicated by the exit 15 parameter.

Exit 16: log, list, trace, and temporary data set allocation exit

This user exit lets you maintain your own data set naming conventions. ISPF calls the routines at this user exit before allocating the log, list, or temporary control data sets. As a result, you can provide a prefix for the name of the data set to be allocated. However, if the data set has been preallocated, ISPF does not use this prefix.

The exit routine can provide a prefix up to 26 characters long. A zero length prefix is flagged as an error. ISPF reserves the remaining 18 characters of the data set name for its own use.

ISPF builds the names of the log, list, and temporary control data sets according to these rules:

1. If a data set prefix is specified in the TSO user profile table (UPT) and it is different from the user ID, the data set name is of the form:
 u_{pt}pf_x.userid.ISPF-specific-suffix
2. If a prefix is not specified in the UPT or if it is the same as the TSO user ID, the data set name is:
 userid.ISPF-specific-suffix
3. If a user ID is not available (executing ISPF in BATCH), ISPF recommends that the TSO PROFILE command be used to place the user ID in the UPT prefix field. In that case, the data set name has the this form:
 u_{pt}pf_x.ISPF-specific-suffix

Note that UPTPFIX is assumed to be the user ID in this case.

If you provide an exit routine at this user exit, ISPF allows the data set names to be of the form:

Exit-provided-prefix.ISPF-specific-suffix

The 18 characters reserved by ISPF begin with the period separator.

Because the user ID is also passed to the exit routine as part of the prefix, the exit routine is responsible for maintaining unique data set names.

Exit parameters

In addition to the standard exit parameters described in “Exit parameter list” on page 126, the exit routines at this user exit receive these parameters.

prefix-len

A fullword binary number that identifies the length of the prefix field. On entry to the exit routine, it is the length of the prefix including the UPT prefix, the user ID or both. On return to ISPF, it should contain the length of the prefix provided by the exit routine.

The value of this parameter must be in the range 1 to 26, inclusive.

prefix A 26-character field that contains the data set name prefix used by ISPF. On entry to the exit routine, it contains the UPT prefix, the user ID, or both left-justified within the field.

On return to ISPF, it can contain any prefix (up to 26 characters) chosen by the exit. ISPF does not do any validity checking of the specified prefix. This prefix must be left-justified. If an incorrect prefix is provided, allocation of the data set fails.

suffix-type

A fullword of bit flags indicating the type of data set that ISPF allocates:

- 0 1 = List data set
- 1 1 = Log data set
- 2 1 = Temporary listing data set
- 3 1 = Temporary control data set
- 4 1 = Temporary work data set
- 5 1 = ISPVCALL trace data set
- 6 1 = ISPDPTRC trace data set
- 7 1 = ISPFTTRC trace data set
- 8-31 Reserved.

suffix-len

A fullword binary number containing the length of the value within the suffix field. ISPF ignores any changes the exit routine makes to this field.

suffix An 18-character field containing the name of the data set name suffix that ISPF uses. ISPF ignores any changes the exit routine makes to this field.

Return codes

No return codes are acknowledged. Upon return to ISPF, the data set name is generated using the prefix provided by the exit routine (if any) and normal processing continues.

Note: For multiple exit routines, return codes still affect the processing flow.

Chapter 11. PDF translation tables

PDF translation tables perform many functions for PDF. Each section describes one particular use.

Translation table for valid data set name characters

The translation table for valid data set name characters (Table 50) specifies which characters are allowed in a data set name, as follows:

- Valid characters are represented with X'00'
- Invalid characters are represented with X'FF'.

Table 50. Example of translation table for valid data set characters

Table	Hexadecimal Code	Position
TTVDSN	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFF000000000000'	(X'78' to X'7F')
	DC X'FF00000000000000'	(X'80' to X'87')
	...	
	DC X'0000FFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'0000000000000000'	(X'F0' to X'F7')
	DC X'0000FFFFFFFFFFFF'	(X'F8' to X'FF')

Translation table for invalid data set name characters

The translation table for invalid data set name characters (Table 51) specifies which characters are not allowed in a data set name, as follows:

- Valid characters are represented by their EBCDIC hexadecimal code
- Invalid characters are represented with X'00'.

Table 51. Example of translation table for invalid data set name characters

Table	Hexadecimal Code	Position
TTIDSN	DC X'0000000000000000'	(X'00' to X'07')
	DC X'0000000000000000'	(X'08' to X'0F')
	DC X'0000000000000000'	(X'10' to X'17')
	...	
	DC X'00007A7B7C000000'	(X'78' to X'7F')
	DC X'0081828384858687'	(X'80' to X'87')
	...	
	DC X'E8E9000000000000'	(X'E8' to X'EF')
	DC X'F1F2F3F4F5F6F700'	(X'F0' to X'F7')
	DC X'F8F9000000000000'	(X'F8' to X'FF')

Translation table for hexadecimal characters

The translation table for hexadecimal characters (Table 52 on page 284) specifies the valid hexadecimal characters as follows:

- Valid characters are represented with X'00'
- Invalid characters are represented with X'FF'.

Table 52. Example of translation table for hexadecimal characters

Table	Hexadecimal Code	Position
TTHex	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFFFFFFFFFFFF'	(X'78' to X'7F')
	DC X'FF000000000000FF'	(X'80' to X'87')
	...	
	DC X'FFFFFFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'0000000000000000'	(X'F0' to X'F7')
	DC X'0000FFFFFFFFFFFF'	(X'F8' to X'FF')

Translation table for numeric characters

The translation table for numeric characters (Table 53) specifies the valid numeric characters as follows:

- Valid characters are represented with X'00'.
- Invalid characters are represented with X'FF'.

Table 53. Example of translation table for numeric characters

Table	Hexadecimal Code	Position
TTNUM	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFFFFFFFFFFFF'	(X'78' to X'7F')
	DC X'FFFFFFFFFFFFFFFF'	(X'80' to X'87')
	...	
	DC X'FFFFFFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'0000000000000000'	(X'F0' to X'F7')
	DC X'0000FFFFFFFFFFFF'	(X'F8' to X'FF')

Translation table for alphanumeric characters

The translation table for alphanumeric characters (Table 54) specifies the valid alphanumeric characters as follows:

- Valid characters are represented with X'00'.
- Invalid characters are represented with X'FF'.

Table 54. Example of translation table for alphanumeric characters

Table	Hexadecimal Code	Position
TTALN	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFFF0000FFFFFF'	(X'78' to X'7F')
	DC X'FF00000000000000'	(X'80' to X'87')
	...	
	DC X'0000FFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'0000000000000000'	(X'F0' to X'F7')
	DC X'0000FFFFFFFFFFFF'	(X'F8' to X'FF')

Translation table for edit terminal output characters

The translation table for edit terminal output characters (Table 55) is used to translate invalid edit display characters to an attribute byte as follows:

- Valid characters are represented by their EBCDIC value
- Invalid characters are represented with X'15'.

Table 55. Example of translation table for edit terminal output character

Table	Hexadecimal Code	Position
TTETO	DC X'1515151515151515'	(X'00' to X'07')

	DC X'F8F9151515151515'	(X'F8' to X'FF')

Translation table for generic string characters

The translation table for generic string characters (Table 56) is used to assign a mask value to a character representing a subset of characters. The characters are defined in the Generic String Special Character (GSS) table, Table 57 on page 286.

Table 56. Example of translation table for generic string characters

Table	Hexadecimal Code (Mask Value)	Code Mask Offset
TTGSC	DC X'00'	X'00' Any character
	DC X'01'	X'01' Invalid characters
	DC X'02'	X'02' Special characters
	DC X'04'	X'03' APL/TEXT Special
	DC X'08'	X'04' APL/TEXT Alpha
	DC X'10'	X'05' Lower alpha
	DC X'20'	X'06' Upper alpha
	DC X'40'	X'07' Numeric
	DC X'80'	X'08' User defined character set
	DC X'FF'	X'09' (RESERVED)
	DC X'30'	X'0A' Alpha
	DC X'7F'	X'0B' Nonblank
	DC X'FF'	X'0C' (RESERVED)
	DC X'FF'	X'0D' (RESERVED)
	DC X'FF'	X'0E' (RESERVED)
	DC X'FF'	X'0F' (RESERVED)
	DC X'40'	X'10' Not numeric
	DC X'20'	X'11' Not upper
	DC X'10'	X'12' Not lower
	DC X'30'	X'13' Not alpha
	DC X'FF'	X'14' (RESERVED)
	DC X'FF'	X'15' (RESERVED)
	DC X'FF'	X'16' (RESERVED)

Translation table for generic string special characters

The translation table for generic string special characters (Table 57 on page 286) is used to assign a code of X'01' to X'16' to generic string special characters according to the generic string character (GSC) table (Table 56) as follows:

- Numbers and letters translate to their EBCDIC hexadecimal codes.

- Other valid characters, that is, characters used to represent a character subset for Edit and Browse picture strings, are represented by the offset from the generic string character table corresponding to the subset they represent. In Table 57, (X'7B') has a value of '07' because '07' is the offset in the generic string character table for the subset of numeric characters, which the # is used to represent.
- Characters that are invalid in a generic string are represented with X'FF'.

Table 57. Example of translation table for generic string special characters

Table	Hexadecimal Code	Position
TTGSS	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFF070AFF00FF'	(X'78' to X'7F')
	DC X'FF81828384858687'	(X'80' to X'87')
	...	
	DC X'E8E9FFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'F0F1F2F3F4F5F6F7'	(X'F0' to X'F7')
	DC X'F8F9FFFFFFFFFFFF'	(X'F8' to X'FF')

Usage notes for the GSC and GSS tables

The generic string special (GSS) table is used to determine if a character is valid in a picture string and, if so, what offset into the generic string character (GSC) table describes its subset. The mask value from the GSC table is used to determine which characters satisfy the subset. Each character in the text being scanned is represented in the generic string master (GSM) table by a hexadecimal code that indicates which subsets that character belongs to (see "Creating ISPF terminal translation tables" on page 94). The hexadecimal code in the GSM is ANDed with the mask value from the GSC. Any nonzero result is considered a match.

In Table 57, a # ('7B') has a value in the GSS of '07'. At offset '07' in the GSC (actually the eighth entry in the GSC, the first being offset '00'), the mask value is a X'40'. This means any character that is a member of the numeric subset, when ANDed with a X'40', will produce a nonzero result.

Translation table for uppercase characters

The translation table for uppercase characters (Table 58) translates data as follows:

- Lowercase alphabetic characters translate to uppercase
- All other characters translate to themselves.

Table 58. Example of translation table for uppercase characters

Table	Hexadecimal Code	Position
TTUPP	DC X'0001020304050607'	(X'00' to X'07')
	DC X'08090A0B0C0D0E0F'	(X'08' to X'0F')
	DC X'1011121314151617'	(X'10' to X'17')
	...	
	DC X'78797A7B7C7D7E7F'	(X'78' to X'7F')
	DC X'80C1C2C3C4C5C6C7'	(X'80' to X'87')
	...	
	DC X'E8E9EAEBCEDDEEEF'	(X'E8' to X'EF')
	DC X'F0F1F2F3F4F5F6F7'	(X'F0' to X'F7')
	DC X'F8F9FAFBFCFDFEFF'	(X'F8' to X'FF')

Translation table for lowercase characters

The translation table for lowercase characters (Table 59) translates data as follows:

- Uppercase alphabetic characters translate to lowercase
- All other characters translate to themselves.

Table 59. Example of translation table for lowercase characters

Table	Hexadecimal Code	Position
TTLOW	DC X'0001020304050607'	(X'00' to X'07')
	DC X'08090A0B0C0D0E0F'	(X'08' to X'0F')
	DC X'1011121314151617'	(X'10' to X'17')
	...	
	DC X'78797A7B7C7D7E7F'	(X'78' to X'7F')
	DC X'8081828384858687'	(X'80' to X'87')
	...	
	DC X'A8A9EAEBCEDDEEEF'	(X'E8' to X'EF')
	DC X'F0F1F2F3F4F5F6F7'	(X'F0' to X'F7')
	DC X'F8F9FAFBFCFDFEFF'	(X'F8' to X'FF')

Modifying the GSM to use the user character subset

The generic string master (GSM) translation table (Table 60) and its related tables can be modified to add an additional character subset to be used in Edit picture string processing for the FIND and CHANGE commands. The GSM table is found in the ISPF translation tables, member ISPOWNTT in ISP.SISPSAMP.

Generic string master translation table

The positions in the generic string master translation table (Table 60) are filled in as follows:

- X'00' Blank character
- X'01' Invalid character
- X'02' Special character
- X'04' APL/TEXT special characters (only for APL and TEXT keyboards)
- X'08' APL/TEXT alphabetic characters (only for APL and TEXT keyboards)
- X'10' Lowercase alphabetic character
- X'20' Uppercase alphabetic character
- X'40' Numeric character
- X'80' User character subset.

Table 60. Example of Generic String Master translation table

Table	Hexadecimal Code	Position
TTGSM	DC X'0101010101010101'	(X'00' to X'07')
	DC X'0101010101010101'	(X'08' to X'0F')
	DC X'0101010101010101'	(X'10' to X'17')
	...	
	DC X'0102020202020202'	(X'78' to X'7F')
	DC X'0110101010101010'	(X'80' to X'87')
	...	
	DC X'2020010101010101'	(X'E8' to X'EF')
	DC X'4040404040404040'	(X'F0' to X'F7')
	DC X'4040010101010101'	(X'F8' to X'FF')

To modify the GSM table to use a user character subset, follow these steps:

1. Choose a character to represent your subset. For example, Edit uses an @ to stand for alphabetic.

2. Modify the entry in the generic string special character (GSS) table that corresponds to the character you want to use so that it has a value of X'08'. This indicates where in the generic string character (GSC) table the mask for your character is located. The GSC does not need to be changed. It is initially set for user character sets.
3. Modify the GSM entries of those characters you want to include in your special character set so the high order bit is on.

For example:

If you want to define a character set of special attribute characters consisting of hexadecimal codes X'10' through X'17', and you want to use a ("") as the picture string identifier for them, you would:

1. Modify the entry for X'4F' in the GSS table so it has a value of X'08' as shown in Table 61. Compare to Table 57 on page 286.

Table 61. Example of translation table for modified Generic String Special Characters

Table	Hexadecimal Code	Position
TTGSS	DC X'FFFFFFFFFFFFFFFF'	(X'00' to X'07')
	DC X'FFFFFFFFFFFFFFFF'	(X'08' to X'0F')
	DC X'FFFFFFFFFFFFFFFF'	(X'10' to X'17')
	...	
	DC X'FFFFFFF0105FFFF08'	(X'78' to X'7F')
	DC X'FFFFFFFFFFFFFFFF'	(X'80' to X'87')
	...	
	DC X'E8E9FFFFFFFFFFFF'	(X'E8' to X'EF')
	DC X'F0F1F2F3F4F5F6F7'	(X'F0' to X'F7')
	DC X'F8F9FFFFFFFFFFFF'	(X'F8' to X'FF')

2. Modify the GSM entries for hexadecimal codes X'10' through X'17' to turn the high order bit on as shown in Table 62. Compare to Table 60 on page 287.

Table 62. Example of modified Generic String Master translation table

Table	Hexadecimal Code	Position
TTGSM	DC X'0101010101010101'	(X'00' to X'07')
	DC X'0101010101010101'	(X'08' to X'0F')
	DC X'8181818181818181'	(X'10' to X'17')
	...	
	DC X'0102020202020202'	(X'78' to X'7F')
	DC X'0110101010101010'	(X'80' to X'87')
	...	
	DC X'2020010101010101'	(X'E8' to X'EF')
	DC X'4040404040404040'	(X'F0' to X'F7')
	DC X'4040010101010101'	(X'F8' to X'FF')

You could locate the special attribute bytes by issuing the edit command FIND P"". If you do not want these bytes to be found under any other picture string, set the hexadecimal value to X'80'. These characters can be included in multiple character sets by setting the appropriate bits to on, according to the GSM table.

ISPF and PDF terminal translation table relationship

The terminal translation table relationship for ISPF and PDF is shown in Table 63.

Table 63. ISPF terminal translation table relationship

ISPF	PDF
ISP3277 ISP3277A ISP3277K ISP3278	ISR3277 ISR3277A ISR3277K ISR3278
ISP3278A ISP3278C ISP3278K ISP3278T	ISR3278A ISR3278C ISR3278K ISR3278T
NEW32TBL	ISR32TBL

The delivered ISPF terminal table names start with the prefix "ISP". ISPF does not require that user-defined terminal table names begin with the prefix "ISP"; however, PDF terminal names require the "ISR" prefix. PDF searches for the load module beginning with the fourth position of the actual table name and prefixes it with "ISR".

Chapter 12. Dialog development model listings

This topic lists all of the models included with PDF. The table shows the external model name, any qualifiers, a short description, and the internal member name in the SKELS library provided with PDF. See *z/OS ISPF Edit and Edit Macros* for more information about adding or changing a model.

WSDISCON	Workstation disconnect	ISREMF4

Message format

Table 68. Message format

Model Name	Description	Member Name
MSG	Message member selection	ISREMMSG

Panel formats and statements

Table 69. Panel formats and statements

Model Name	Qualifier	Description	Member Name
Panel formats			
ACTION		Panel with action bar	ISREMMF6
ENTRY		Data entry panel	ISREMMF1
HELPSCR		Help panel with scrollable area	ISREMMF8
MULTIPLE	SELECT2	Double-column selection panel	ISREMSE1
MULTIPLE	ENTRY2	Double-column entry panel	ISREMSE2
SCROLL		Panel with scrollable area	ISREMMF7
SELECTION		Choice panel	ISREMMF3
SELECTION	CUA	Choice panel	ISREMMF9
TBDISPL		Table display table	ISREMMF4
TUTORIAL		Help panel	ISREMMF5
Panel statements			
ABC		Action bar	ISREMMSE

Table 69. Panel formats and statements (continued)

Model Name	Qualifier	Description	Member Name
AREA		AREA section header	ISREMMPI
AREA	DYNAMIC	Dynamic area attribute	ISREMMMA1
AREA	GRAPHIC	Graphic area attribute	ISREMMMA2
AREA	SCRL	Scrollable area attribute	ISREMMMA3
ASSIGN	SIMPLE	Simple assignment statement	ISREMAS1
ASSIGN	TRANS	Trans assignment statement	ISREMAS2
ASSIGN	TRUNC	Trunc assignment statement	ISREMAS3
ASSIGN	TRANSTRU	Nested translate truncate statement	ISREMAS4
ASSIGN	PFKEY	Function key built-in function	ISREMAS5
ASSIGN	LVLIN	Last visible line built-in function	ISREMAS6
ATTR		Attribute section header	ISREMMMS2
ATTRIB		New attribute character definition	ISREMMMS3
ATTRIBA		New attrib char definition for area	ISREMMMSB
BODY		Body section header	ISREMMMS4
CCSID		CCSID section header	ISREMMMPA
CONTROL	CURSOR	Control first cursor placement	ISREMCN1
CONTROL	HELP	Establish a tutorial panel	ISREMCN2
CONTROL	MSG	Identify message to be displayed	ISREMCN3
CONTROL	RESP	Show user response to panel	ISREMCN4
CONTROL	TRAIL	Contain remainder from TRUNC function	ISREMCN5
CONTROL	ALARM	Shows the alarm is to be sounded	ISREMCN6
CONTROL	ATTR	Override field attr by field name	ISREMCN7
CONTROL	ATTRCHAR	Override field attr by character	ISREMCN8
CONTROL	AUTOSEL	Control table display row selection	ISREMCN9
CONTROL	CSRPOS	Shows position of cursor in field	ISREMCNA
CONTROL	CSRROW	Row where cursor is positioned	ISREMCNB
CONTROL	PFKEY	Function key pressed by user	ISREMCND
CONTROL	ZVARS	Define names of placeholder fields	ISREMCNC
CUAATTR		CUA attributes	ISREMMMSJ
END		END section header	ISREMMPP
GROUPBOX		TYPE(GRPBOX) attribute	ISREMMMA4
HELP		HELP section	ISREMMPPM
IF		IF statement	ISREMMMS6
INIT		INIT section header	ISREMMPPJ
KEYLIST		Keylist specification	ISREMMMSF
LIST		LIST section	ISREMMPO
MODEL		Model section header	ISREMMMS7
PANEXIT		Panel language exit	ISREMMMSD
PDC		Action bar pull-down	ISREMMMSH

Table 69. Panel formats and statements (continued)

Model Name	Qualifier	Description	Member Name
PNTS		Point-and-shoot section	ISREMMPN
PROC		PROC section header	ISREMMPL
REFRESH		Retrieve variables before redisplay	ISREMMSA
REINIT		REINIT section header	ISREMMPK
SC	ATTR	TYPE(SC) attribute	ISREMMA5
VEDIT		Validate available	ISREMMSI
VERIFY	ALPHA	Alphabetic or special characters	ISREMVE1
VERIFY	ALPHAB	Alphabetic characters	ISREMVEE
VERIFY	BIT	Binary characters	ISREMVE2
VERIFY	DSNAME	TSO data set name	ISREMVE3
VERIFY	DSNAMEF	TSO data set name with filters	ISREMVEL
VERIFY	DSNAMEFEM	TSO data set name with filter member name only	ISREMVEO
VERIFY	DSNAMEPQ	TSO data set name' (adds missing end parenthesis and quote)	ISREMVEEx
VERIFY	DSNAMEQ	TSO data set name' (adds missing end quote)	ISREMVEJ
VERIFY	ENUM	Extended numeric	ISREMOVED
VERIFY	FILEID	CMS file ID	ISREMVE4
VERIFY	IPADDR4	IP Version 4 address	ISREMVEV
VERIFY	HEX	Hexadecimal characters	ISREMVE5
VERIFY	IDATE	International date	ISREMVEP
VERIFY	INCLUDE	Specify list of types	ISREMVEF
VERIFY	ITIME	International time	ISREMVET
VERIFY	JDATE	Julian date	ISREMVER
VERIFY	JSTD	Julian standard date	ISREMVES
VERIFY	LEN	Length of data stored in variable	ISREMVEC
VERIFY	LIST	List of valid values	ISREMVE6
VERIFY	LISTV	Specify list of values	ISREMVEG
VERIFY	LISTVX	Specify list of excluded values	ISREMVEI
VERIFY	LISTX	Specify list of excluded values	ISREMVEH
VERIFY	NAME	Data set member name	ISREMVE7
VERIFY	NAMEF	Data set member name with filters	ISREMVEM
VERIFY	NONBLANK	Verify nonblank field	ISREMVE8
VERIFY	NUM	Numeric characters	ISREMVE9
VERIFY	PICT	Mixed characters matching picture	ISREMVEA
VERIFY	PICTCN	Constants and mixed characters matching picture	ISREMVEK
VERIFY	RANGE	Numeric value within specified limits	ISREMVEB
VERIFY	STDDATE	Standard date	ISREMVEQ
VERIFY	STDTIME	Standard time	ISREMVEU

Table 69. Panel formats and statements (continued)

Model Name	Qualifier	Description	Member Name
VGET		Variable get statement	ISREMMSC
VPUT		Variable put statement	ISREMMS9

Chapter 13. Programming interface macros for customers

This topic describes the macros ISPF and SCLM provide as programming interfaces.

Attention: Do not use any ISPF macros other than those described in this topic as programming interfaces.

DM component general-use programming macros

ISPCCSID	ISPMXDEF
ISPMADAD	ISPMXED
ISPMEPT	ISPMXEND
ISPMTCM	ISPMXLST
ISPMXDD	ISPDSTAT

See Chapter 5, “Customizing DM,” on page 87 for further information about DM component macros.

SCLM general-use programming macros

FLMABEG	FLMGROUP
FLMAEND	FLMINCLS
FLMAGRP	FLMLANGL
FLMALLOC	FLMSYSLB
FLMALTC	FLMTRNSL
FLMATVER	FLMTSEXT
FLMCNTRL	FLMTYPE
FLMCPYLB	

See the SCLM Macros chapter in *z/OS ISPF Software Configuration and Library Manager Guide and Reference* for more information.

Chapter 14. ISPF data set descriptions

These figures list the target and distribution libraries (data sets) used by ISPF, and their contents.

Table 79. Target data set descriptions

Library	Description
SISPALIB	APL2 workspace library
SISPCLIB	CLIST library
SISPEXEC	REXX exec library

Part 3. Appendixes

Appendix A. ISPF enqueue processing for data integrity

Note: The enqueue processing performed by ISPF as described in this topic does not apply (that is, ISPF takes no action) when the data set is being accessed with the VSAM utility.

This topic describes the enqueue processing ISPF performs to maintain the integrity of data sets, PDS members, member queues, workstation files, and the SCLM VSAM database.

RESERVE processing for partitioned data set extended

ISPF uses RESERVE to protect data sets residing on a shared volume. However, PDSEs are designed to be shared in a sysplex, so Configuration Table keyword PDSE_RESERVE_PROCESSING can be used to disable the use of RESERVE.

Assuming a PDSE is being processed and ISPF services are used to access the PDSE then:

PDSE_RESERVE_PROCESSING=ON (default)

RESERVE issued prior to STOW and released afterwards. LMOPEN with ENQ(SHRW) issues a RESERVE at LMOPEN and OPTION(OUTPUT). If batch job issues RESERVE before an interactive user, then the interactive user waits on SAVE until the batch dialog releases the RESERVE. Another batch job will also wait. See the description of LMCLOSE in

PDSE_RESERVE_PROCESSING=OFF

No RESERVE is issued. DFSMS preserves the integrity of the PDSE. Interactive users and batch jobs can access the PDSE simultaneously. ISPF dialogs continue to use Member name enqueue to serialize access to individual members. In environments where there may be more than one Configuration Table, the dialog that issues a RESERVE will only wait for another dialog that also issues RESERVE. See SC26-7410 DFSMS Using Data Sets 3.8.9.3.3 Choosing Volumes for PDSEs in a Sysplex.

Serializing with non-ISPF TSO and BATCH

ISPF relies on MVS allocation to serialize access to resources with concurrent batch or non-ISPF TSO users. ISPF uses dynamic allocation and allocates partitioned data sets with DISP=SHR before any ISPF generated ENQUEUE. To ensure integrity when batch or TSO users are not using ISPF services, if you are updating a data set, you must allocate the data set with DISP=OLD.

Note: ISPF's allocation with DISP=SHR causes MVS allocation to issue a shared ENQUEUE on Qname SYSDSN as follows:

```
ENQ SYSDSN,dsname,S,44,SYSTEM
```

Non-ISPF TSO and Batch allocation with DISP=OLD causes MVS allocation to issue an exclusive ENQUEUE on Qname SYSDSN as follows:

```
ENQ SYSDSN,dsname,E,44,SYSTEM
```

ISPF also issues ENQ, DEQ, and RESERVE macro instructions to serialize access to resources among multiple ISPF users. It is possible for the LMMOVE service or option 3.3 Move function to be used such that each of 2 users is holding a

RESERVE (therefore an exclusive ENQ is held) that is being waited on by the other user. This occurs when the user 1 is moving from data set A to data set B, while at the same time, user 2 is moving from data set B to data set A. Each user holds a reserve on the output data set for the move and is requesting a reserve on the input for purposes of deleting the moved member. If this situation occurs, cancel one user off TSO, log back on, and reissue the move request.

ISPF data set integrity enqueue

To allow you to update a data set on DASD (EDIT's SAVE, PDF option 3 COPY/MOVE/DELETE/RENAME, TBSAVE, and so on), ISPF issues this macro to protect the entire partitioned data set:

```
RESERVE SPFEDIT,dsname,E,44,SYSTEMS
```

Also, when writing to a data set on a DASD (COPY/MOVE) that has a RECFM of 'U', ISPF serializes with the linkage editor using this macro to protect the entire partitioned data set:

On a shared volume:

```
RESERVE SYSIEWLP,dsname,E,44,SYSTEMS
```

On a volume that is not shared:

```
ENQ SYSIEWLP,dsname,E,44,SYSTEM
```

Attention: Do not install SPF and ISPF on the same system. There is a danger of destroying PDSs that are being updated by SPF and ISPF at the same time because SPF uses a different Qname (SPFDSN) than ISPF.

Member name enqueue

To restrict concurrent use of a member of a partitioned data set, while still allowing ISPF users to use different members of the same data set (PDF EDIT, Table Processing, File Tailoring), ISPF issues this ENQ macro for the member:

```
ENQ SPFEDIT,rname,E,52,SYSTEMS
```

where

rname the data set name, length of 44, padded with blanks, followed by the member name, length of 8, padded with blanks

z/OS UNIX file Enqueue

To restrict concurrent use of a z/OS UNIX file, ISPF edit issues this ENQ macro for the file:

```
ENQ SPFEDIT,rname,E,12,SYSTEMS (z/OS UNIX in sysplex; 0extSysplexActv = '1'b)
```

or

```
ENQ SPFEDIT,rname,E,12,SYSTEM (z/OS UNIX not in sysplex)
```

where

rname Is 12 bytes in length, made up of three 4-byte values:

- A binary integer, which is the inode number of the file.
- A binary integer, which is the device number of the file.
- Four flag bytes (0-3).

Bit 2 (of bits 0-7) of byte 3 is the Sysplex indicator. It can have one of these values:

1	z/OS UNIX is in a sysplex (OextSysplexActv is set ON).
0	z/OS UNIX is not in a sysplex (OextSysplexActv is set OFF).

This enqueue is compatible with the enqueue issued by the z/OS UNIX OEDIT command.

ISPF GUI TSO line mode message queue enqueue

Running ISPF GUI with TSO line mode support (that is, displaying TSO line mode and tputs/tgets in the ISPF/TSO window) requires a messaging queue for each user (TSO address space). This is used to coordinate the incoming TSO line mode and TPUT/TGET messages so that they will be synchronized correctly. Thus, ISPF issues this enqueue before placing messages on or retrieving messages from this message queue:

```
ENQ SYSZDTSK,rname,E,38,SYSTEMS
```

where

rname 'ISPF/TSO_WINDOW_SERIALIZATION' followed by a 64 bit unique ID for the TSO address space

Note: In addition to issuing this enqueue while running in GUI mode, this enqueue on SYSZDTSK is issued from the ISPF SVC 93 exit ISPSC93X when processing a cross-memory message even if the user is not running in GUI mode. This is because at the point the enqueue must be issued, the exit is not running in the user's address space and therefore does not know if the user is running in ISPF GUI mode.

Workstation file name enqueue

To restrict the concurrent use of a workstation file through ISPF's distributed editing or FILEXFER service, ISPF issues this ENQ macro for the workstation file:

```
ENQ SPFEDIT,wsname,E,255,SYSTEMS
```

where

wsname

The workstation address (IP:*tcpip-address* or LU:*appc-address*), padded with blanks to 68 characters, followed by the workstation file name identifier, padded with blanks to 187 characters. The entire string is padded to 255 characters with blanks.

SCLM VSAM enqueue

To restrict the concurrent use of the SCLM VSAM data base, ISPF issues this ENQ macro for the VSAM data set:

```
ENQ SLMVSAM,vsam-dsn,E,44,SYSTEMS
```

where

vsam-dsn

The VSAM data set name, padded to 44 characters with blanks.

Appendix B. Accessibility

Accessible publications for this product are offered through the z/OS Information Center, which is available at www.ibm.com/systems/z/os/zos/bkserv/.

If you experience difficulty with the accessibility of any z/OS information, please send a detailed message to mhvrcfs@us.ibm.com or to the following mailing address:

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
USA

Accessibility features

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size.

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to *z/OS TSO/E Primer*, *z/OS TSO/E User's Guide*, and *z/OS ISPF User's Guide Vol I* for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users accessing the z/OS Information Center using a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line, because they can be considered as a single compound syntax element.

Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that your screen reader is set to read out punctuation. All the syntax elements that have the same dotted decimal number (for example, all the syntax elements that have the number 3.1) are mutually

exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, you know that your syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a syntax element with dotted decimal number 3 is followed by a series of syntax elements with dotted decimal number 3.1, all the syntax elements numbered 3.1 are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add information about the syntax elements. Occasionally, these words and symbols might occur at the beginning of the element itself. For ease of identification, if the word or symbol is a part of the syntax element, it is preceded by the backslash (\) character. The * symbol can be used next to a dotted decimal number to indicate that the syntax element repeats. For example, syntax element *FILE with dotted decimal number 3 is given the format 3 * FILE. Format 3* FILE indicates that syntax element FILE repeats. Format 3* * FILE indicates that syntax element * FILE repeats.

Characters such as commas, which are used to separate a string of syntax elements, are shown in the syntax just before the items they separate. These characters can appear on the same line as each item, or on a separate line with the same dotted decimal number as the relevant items. The line can also show another symbol giving information about the syntax elements. For example, the lines 5.1*, 5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the LASTRUN and DELETE syntax elements, the elements must be separated by a comma. If no separator is given, assume that you use a blank to separate each syntax element.

If a syntax element is preceded by the % symbol, this indicates a reference that is defined elsewhere. The string following the % symbol is the name of a syntax fragment rather than a literal. For example, the line 2.1 %OP1 means that you should refer to separate syntax fragment OP1.

The following words and symbols are used next to the dotted decimal numbers:

- ? means an optional syntax element. A dotted decimal number followed by the ? symbol indicates that all the syntax elements with a corresponding dotted decimal number, and any subordinate syntax elements, are optional. If there is only one syntax element with a dotted decimal number, the ? symbol is displayed on the same line as the syntax element, (for example 5? NOTIFY). If there is more than one syntax element with a dotted decimal number, the ? symbol is displayed on a line by itself, followed by the syntax elements that are optional. For example, if you hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you know that syntax elements NOTIFY and UPDATE are optional; that is, you can choose one or none of them. The ? symbol is equivalent to a bypass line in a railroad diagram.
- ! means a default syntax element. A dotted decimal number followed by the ! symbol and a syntax element indicates that the syntax element is the default option for all syntax elements that share the same dotted decimal number. Only one of the syntax elements that share the same dotted decimal number can specify a ! symbol. For example, if you hear the lines 2? FILE, 2.1! (KEEP), and 2.1 (DELETE), you know that (KEEP) is the default option for the FILE keyword. In this example, if you include the FILE keyword but do not specify an option, default option KEEP will be applied. A default option also applies to the next higher dotted decimal number. In this example, if the FILE keyword is omitted, default FILE(KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1!

(KEEP), and 2.1.1 (DELETE), the default option KEEP only applies to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

- * means a syntax element that can be repeated 0 or more times. A dotted decimal number followed by the * symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3*, 3 HOST, and 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

Note:

1. If a dotted decimal number has an asterisk (*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
 2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you could write HOST STATE, but you could not write HOST HOST.
 3. The * symbol is equivalent to a loop-back line in a railroad syntax diagram.
- + means a syntax element that must be included one or more times. A dotted decimal number followed by the + symbol indicates that this syntax element must be included one or more times; that is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the * symbol, the + symbol can only repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the * symbol, is equivalent to a loop-back line in a railroad syntax diagram.

Notices

COPYRIGHT LICENSE:

This information might contain sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted

for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: IBM Lifecycle Support for z/OS (<http://www.ibm.com/software/support/systemsz/lifecycle/>)
- For information about currently-supported IBM hardware, contact your IBM representative.

Programming Interface Information

This publication primarily documents information that is NOT intended to be used as Programming Interfaces of ISPF.

This publication also documents intended Programming Interfaces that allow the customer to write programs to obtain the services of ISPF. This information is identified where it occurs, either by an introductory statement to a chapter or section or by the following marking:

```
+-----Programming Interface information-----+
```

```

Trademarks

IBM, the IBM logo, and [ibm.com](http://www.ibm.com)[®] are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Web at www.ibm.com/legal/copytrade.shtml (<http://www.ibm.com/legal/copytrade.shtml>).

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Windows and Windows NT are trademarks of Microsoft Corporation in the United States, other countries, or both.
