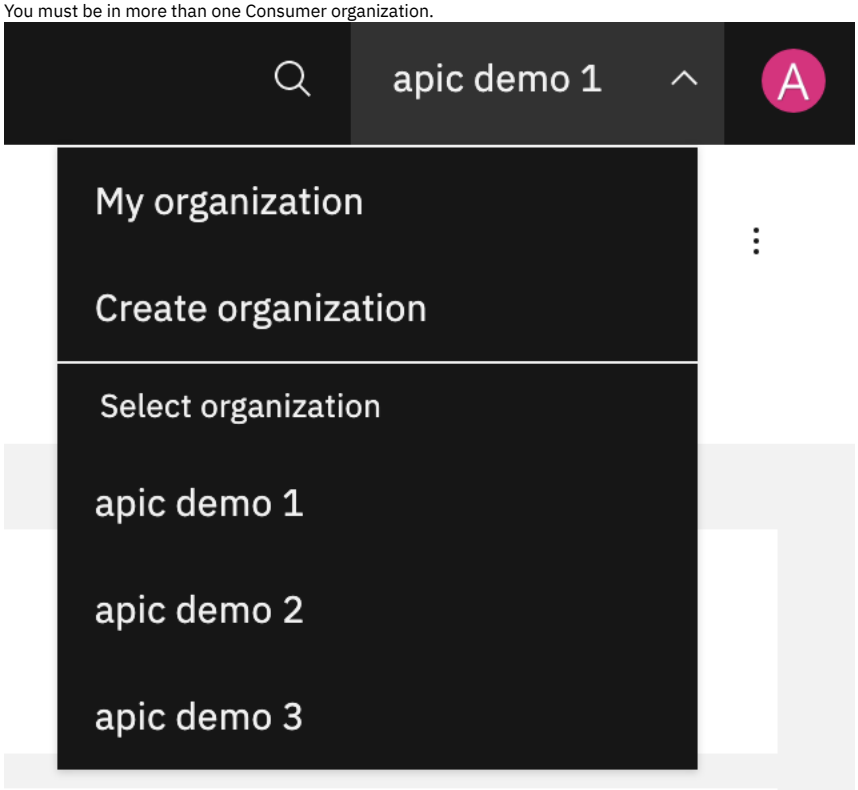
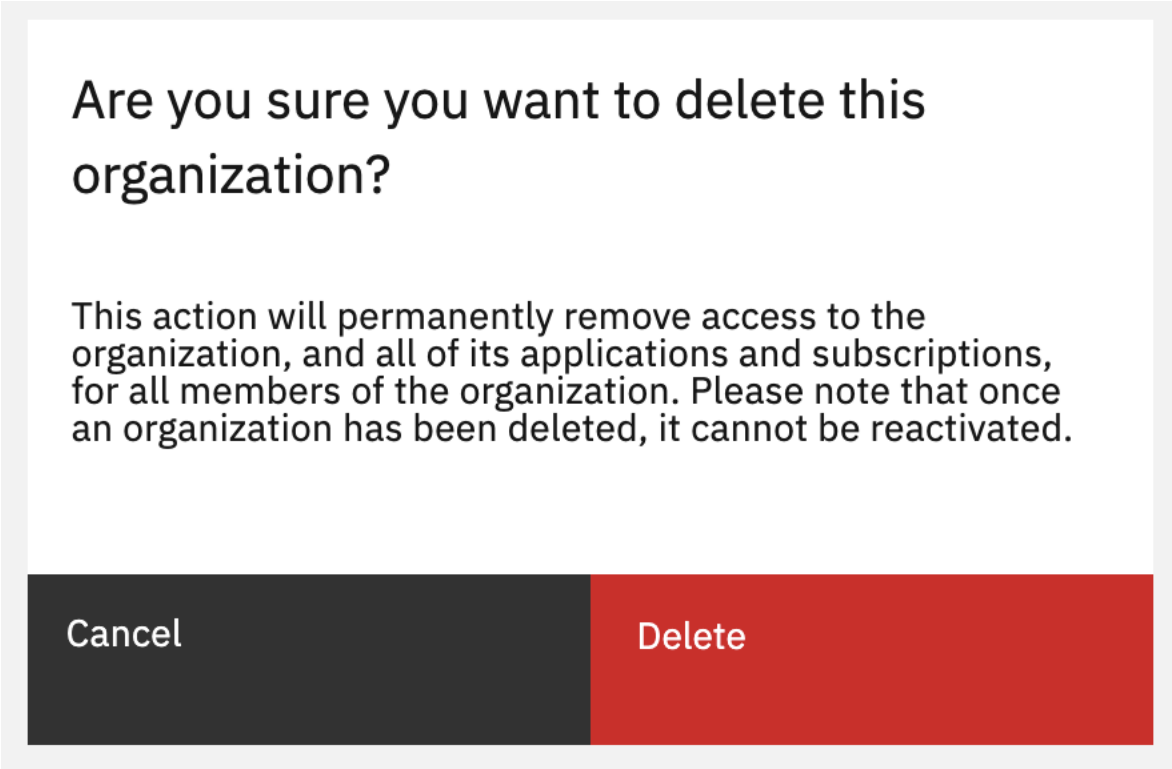
1. Click your Organization name in the Developer Portal home page, and select the organization that you want to delete by using the drop-down arrow.
   You must be in more than one Consumer organization.



2. Click your Organization name in the Developer Portal home page, and select My organization.
3. Click the options icon, ⋮ and select Delete organization.



4. Click Delete.

Results

You permanently deleted a Consumer organization in the Developer Portal.

User accounts, passwords, and support in the Developer Portal

You can change general elements such as user accounts and passwords in the Developer Portal.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **`A user already exists with this email address`**.
To learn about general user features of the Developer Portal, see the following topics:

- **Creating a new developer account**
  You can create new developer accounts, and their associated Consumer organizations, in the Developer Portal.
- **Changing your account settings**
  You can edit your user account settings in the Developer Portal, such as changing your name, password, time zone, and language settings.
- **Deleting your developer account**
  You can delete your account in the Developer Portal.

Creating a new developer account

You can create new developer accounts, and their associated Consumer organizations, in the Developer Portal.

Before you begin

You need to provide an email address to create a new account. That email address must be a valid email address, and the domain that is used is required to have a valid MX record that is determined by DNS. You can disable the security module that checks that the email domain has a DNS record.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Extend > Disable module.
4. In the search bar enter **`Check DNS`**, then select the Check DNS module and click Disable.
5. Click Disable to confirm that you want to disable the module.

About this task

In order to use the Developer Portal, you must have a developer account, and be a member of at least one Consumer organization. When you create a developer account, a Consumer organization is created at the same time. You can be an owner, and a member of, multiple Consumer organizations. For more information about Consumer organizations, see Consumer organizations in the Developer Portal.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **`A user already exists with this email address`**.

Procedure

1. From the Developer Portal home page, click Create account.
2. Populate the available fields with the details of the developer account and Consumer organization that you want to create.
3. Click Sign up.
   The email address that you provided for the new developer account is sent an email that contains an activation link for the new developer account. Use this link to activate your new account.

Changing your account settings

You can edit your user account settings in the Developer Portal, such as changing your name, password, time zone, and language settings.

About this task

You can edit various details about your user account, for example, change your password, update your code snippet language, change your time zone, select your preferred site language, and select an avatar.

Procedure

1. Click your user name in the Developer Portal home page, and click My account.
2. To update your password, click Change Password, and update the fields as required.
3. To update other elements of your account, such as your name, time zone, and language, click Edit and update the fields as required.
4. Click Save to save your changes.

Deleting your developer account

You can delete your account in the Developer Portal.

Before you begin

You must be the owner of the developer account that you want to delete, and you must not own more than one Consumer organization. If you do own more than one Consumer organization, you must either change the ownership of those organizations, or delete them, before you can delete your account. If you own only one Consumer organization, when you delete your account the Consumer organization is deleted at the same time as your account.

About this task

When you delete your account, any Consumer organizations that you own must also be deleted or transferred to new owners. If there are other members in a Consumer organization that you delete, these members will no longer have access to that organization, or any of its applications and subscriptions. Consider carefully the impact on any members of your Consumer organizations before you delete your account. For more information, see Deleting a Consumer organization.

Important: When an organization has been deleted, it cannot be reactivated. You might want to consider changing the ownership of your Consumer organizations before you delete your account. For more information, see Changing the ownership of a Consumer organization.

Procedure

1. Click your user name in the Developer Portal home page, and select My account.
2. Click the Edit tab.
3. Click Delete account.
4. Click Delete to confirm deletion of the account.
   This action deletes your developer account and, if you own a Consumer organization, this organization is also deleted.

Results

You successfully deleted your developer account in the Developer Portal.

Configuring the Developer Portal site

Customize the look and feel of your Developer Portal site, and brand it for your organization.

In IBM® API Connect Version 10 the Developer Portal is based on the open source Drupal 10 content management system, and consequently it is almost infinitely customizable. What an individual user is able to configure, depends on the role the user has been assigned, and the associated permissions of that role. A user can be assigned one of four Developer Portal roles:

Authenticated user
: An authenticated user is, typically, an application developer, and can perform all of the actions that are described in the Using the Developer Portal section.

Forum Moderator, Content Author, or Administrator
: In addition to performing all of the tasks that an Authenticated user role can, a Forum Moderator, Content Author, or Administrator role have additional permissions related to configuring the Developer Portal site. For more information, see Working with roles in the Developer Portal.
Note: By default, the Developer Portal administration operations are available only if you have Administrator access.

Before you start to configure your Developer Portal site, you should familiarize yourself with the various concepts and terminology that is referenced throughout the Developer Portal. See Concepts in the Developer Portal.

When you are ready to start configuring your Developer Portal site, see Getting started configuring the Developer Portal site for a quick start guide on customization. There is also a tutorial that you can follow that takes you through an example customization scenario; see Tutorial: Creating a custom theme for the Developer Portal.

If you are migrating from Version 5 to Version 10, see Migrating your Developer Portal from Version 5 to Version 10 for guidance about how to transfer any specific customizations, such as custom modules and themes, from the Drupal 7 baseline to the Drupal 10 baseline.

In addition to the previous options, Developer Portal configuration operations are described in detail in the following sections:

Appearance
: Control and configure the general appearance of your Developer Portal site by setting and configuring a default theme.
Important: Editing API Connect themes, modules, or Drupal core on the filesystem is not permitted or supported. For more information, see Creating a sub-theme and Extend.

Content
: Control multiple content entities in the Developer Portal, including the customization and restriction of specific content.

Structure
: Control the layout of the Developer Portal, such as configuring the front page, adding and changing blocks, and displaying Products and APIs in categories.

Configuration
: As an administrator, you can control multiple aspects of the Developer Portal configuration, including managing security and general configuration tasks.

People
: You can manage and customize the user experience in the Developer Portal, by altering permissions and assigning roles to specific users.

Forums
: Create and control forums in the Developer Portal.

Reports
: You can view reports about the general configuration and status of your Developer Portal site.

Extend
: You can extend the Developer Portal by creating and installing custom modules, or installing additional Drupal contributed modules.

Concepts in the Developer Portal

The Developer Portal is built on Drupal 10, an open source content management technology. A good understanding of Drupal concepts and terminology enhances your ability to work with the Developer Portal.

In Drupal, most content on the website is treated as variations on the concept of a **node**. Node types, such as static pages, blog posts, and news items, are all stored in the same way. The navigation structure of the site is designed separately by editing **menus**, **views**, and **blocks**. Finally, the **theme** of the system controls the overall appearance of the site to visitors. Access to these depends on the permissions that your role possesses. These are explained more fully in the following sections.

Nodes

A node is a set of individual related content such as a page, a poll, an article, a forum topic, or a blog post. For example, when you create a blog post, and define the body text, you also define its title, content, author link, creation date, and taxonomy . Some of these elements are shown by the theme layer when the node is displayed, and some elements are metadata that control where and when the node is displayed at all. Each set of content in a Developer Portal site is a node. You can apply new features or changes to all content of a single node type.

Fields

A field is somewhere that you can add extra metadata to a node. The following types of data are examples of fields:

- Title
- Body
- Comment body
- Tags
- Image

You can create different types of fields, and they can be defined at the content-type level for content items and comments, at the vocabulary level for taxonomy terms, and at the site level for user accounts. Field types are defined by modules, and managed by the Field module. In addition, other modules might enable fields to be defined for their data.

Content types

A content type is a predefined collection of fields. Content types define the default fields that content editors use to add content in a Developer Portal site, and help structure the authoring and developing of content. Content types can be displayed in the Developer Portal. You can control which content types, and the order and format that they are displayed, in the Developer Portal.

Themes

You can use themes to control the overall appearance of your Developer Portal site. You can modify the appearance of the theme in following ways:

1. Extend the code of an existing theme.
2. Identify and use a theme that is provided by the Drupal community or a third-party website, and modify the theme settings.
3. Create a complete custom theme from scratch.

However, you cannot directly edit the API Connect theme as editing is not supported. Any edited versions of these files are overwritten when a fix pack or iFix is installed. So, the way to create a custom theme is to create a custom subtheme of the standard API Connect theme that the Developer Portal uses by default. A subtheme inherits all of the settings of its parent theme, apart from the settings that are overridden. For more information, see Creating a sub-theme.

Most themes use the Twig template engine for PHP.

Regions

The specific areas of a Developer Portal site in which content can be placed. Regions are customized and styled in the theme.

Blocks

Blocks are boxes of content that can be displayed in regions on your Developer Portal page. Blocks can be made available to your Developer Portal site by enabling specific modules. After a block is created, its appearance can be modified. You can also define which Developer Portal page or pages blocks appear on. Some modules can provide multiple blocks when they are enabled, while other modules might not define new blocks. For more information, see Adding and changing the blocks displayed on Developer Portal pages.

Modules

Modules are similar to the concept of plug-ins, in that they extend the core functions of the Developer Portal site. A set of modules is implemented by default with the Drupal core, and there are extra modules that can be enabled to extend the default functions. You can find and add more modules to your Developer Portal site from the internet. For more information, see Extend.

Views

You can use views to manipulate the content that is displayed on a page, block, and other visual elements in the Developer Portal site. Views can be used along with content types to format the appearance of your site to your specification. For more information, see Using the Views module in the Developer Portal.

Pages

Pages are used by the features that can modify the appearance of the Developer Portal to customize the appearance of your Developer Portal site. Pages can be customized to be as specific as you require, and can be configured to satisfy the context of the situation that they are used in.

Users

After you log in to the Developer Portal site, you have a user record in the Developer Portal database. User ID 1 is always reserved for the administrator account. Regardless of whether other user accounts are using remote authentication such as LDAP, the administrator account is always a local account to enable administration of the Developer Portal site. For more information, see People.

Roles

A role is a collection of permissions that define the actions that a user can do in the Developer Portal site. Users can be given one or more roles. By default, a user that is logged in to the Developer Portal is in the Authenticated role. Other roles that can be assigned to a user include:

- Administrator
- Forum Moderator
- Content Author

You can also create new custom roles. For more information, see Working with roles in the Developer Portal.

Permissions

Permissions define the actions that a user can or cannot do in a Developer Portal site. Permissions are additive. If a permission that enables a user to do an action is not assigned, the user cannot do the action. If a user has multiple roles, and any of them contain a specific permission, the user is able to do that action. There are also permissions that have security implications, and you are recommended to assign those permissions to trusted roles. For more information, see Controlling access to Developer Portal content.

Templates

Template files define how the output of a particular component can look. They are formatted as Twig template files. The following are examples of where you can use templates:

- html.html.twig - the template for Developer Portal HTML pages
- page.html.twig - the body of Developer Portal HTML page
- node.html.twig - the template for all of the content nodes
- comment.html.twig - the template for all of the comment nodes
- search-result.html.twig - the template for search results
- node--product.html.twig - the template for nodes that use the Product content type
- node--product--teaser.html.twig - the template for the previews for the Product content type

For more information about overriding templates in the Developer Portal, see Applying a modified content type template.

Getting started configuring the Developer Portal site

A quick start guide to the main tasks involved in configuring the Developer Portal to your brand or theme.

The Developer Portal is based on the open source Drupal 10 content management software, and consequently is almost completely customizable. The following sections take you through the most common tasks to get started with branding the Developer Portal to your organizational requirements, including links to the related topics in the main table of contents. Many more customizing options are described in the main table of contents, and the best way of finding help with a specific customization in this content, is to use the documentation search bar.
Important:
All of the customizations that are detailed in this topic are preserved when you update to new versions of API Connect. Drupal updates, as well as new functionality, defect fixes, and security updates, are made available through API Connect update packages as determined by IBM. These update packages can be applied by upgrading your deployment; see the upgrade instructions for your platform in Installing and maintaining your IBM API Connect cloud. To find out what update packages are available, select your product on IBM Fix Central.

Directly editing any API Connect themes, modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when an update package is installed. Customizations must be done by using the proper mechanisms as described in this topic, such as custom modules and themes, and not by directly editing the source.

For more information about the API Connect support policy, see IBM® API Connect Support Lifecycle Policy.

- Create a custom theme
- Changing the page layout
- Changing the front page
- Advanced theme development
- Custom modules
- Hiding the admin login form
- What to do next - exploring the main configuration content

Create a custom theme

If you want your Developer Portal to have your corporate branding and style, you need to create a custom theme. Themes are composed primarily of Cascading Style Sheets (CSS) files, although they can include much more; see Advanced theme development.

Directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed. The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. A sub-theme inherits the parent theme's resources, and this means that your custom sub-theme CSS file needs to contain only the changes or overrides that you want to make from the default theme. The CSS file can contain as little or as many updates as you like.

For more information, see Creating a sub-theme. You can also follow a tutorial that takes you through how to use the theme generator, customize a theme, and install a custom theme; see Tutorial: Creating a custom theme for the Developer Portal.

While experience with Drupal is beneficial, the only skill you really need to create a sub-theme is CSS.

Changing the page layout

While the theme defines *regions* of the page, such as a footer, or sidebar first, the page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure > Block layout options on the Developer Portal administrator dashboard. You can then further limit those blocks to show only on specific pages, or show on all pages except certain ones, to show only for certain roles, or for certain languages, and more.

For information about how to configure the page layout, see Adding and changing the blocks displayed on Developer Portal pages.

Changing the page layout is done entirely in the Developer Portal UI as an Administrator.

Changing the front page

The front page is a special case and does not use the blocks system that is mentioned previously. Instead, you configure it from the Structure > Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see Configuring the front page.

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: Changing the front page banner block.
- Display featured API Products by creating a featured content block: Changing the front page Featured Content block.
- Create custom blocks with your own HTML content: Adding and changing the blocks displayed on Developer Portal pages.
- Set up the social block to include your organization Twitter feed: Integrating X or BlueSky data into the social block.
- Add a carousel to the front page to display a series of images: Implementing an image carousel.

Again, changing the front page is done entirely in the Developer Portal UI as an Administrator.

Advanced theme development

The DOM structure for specific blocks and parts of the page is controlled by templates. These templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see Applying a modified content type template.

Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

If you're developing custom templates, knowledge of Twig templating language, Drupal, HTML, and CSS is recommended.

Custom modules

If you need to modify the functional behavior of the Developer Portal, then you can create a custom module to do so. Drupal has an extensible programmatic API that is built around a system of *hooks*. By using these hooks in your custom modules you can change what happens when, for example, forms are displayed, forms are submitted, or make extra variables available to custom templates, and other options.

For more information on writing custom modules, see Extend. You can also follow a tutorial that includes using a custom module, see Tutorial: Adding validation to a field on the sign-up form.

Custom modules are written in PHP, and so Drupal experience and PHP knowledge are very beneficial.

Hiding the admin login form

If your Developer Portal is public facing, you might want to hide the admin registry as an option on the login form. You can do this simply from the administrator dashboard, by clicking Configuration > System > IBM API Developer Portal, and selecting Hide the admin registry on the login form. For more information, see Hiding the admin registry on the login form.

What to do next - exploring the main configuration content

There are an almost infinite number of configuration options available to you on the Developer Portal. Explore the following sections to find out more:

- Appearance - control general appearance elements, and learn how to create a custom theme.
- Content - add, configure, and control content elements, such as meta tags, custom pages, custom content types, and adding content to an API or Product.
- Structure - control how the content in your Portal is displayed, for example configuring the front page, changing block display, and using the Views module.
- Configuration - configure content moderation, perform general configuration tasks, and manage Developer Portal security.
- People - create and customize site configuration roles, control access to sites and to content, and create internal Consumer organizations to allow customization of specific API properties.
- Forums - create and control forums.
- Reports - list of available reports about the general configuration and status of your site.
- Extend - introduction to and instructions for creating custom modules, including information about developing in PHP, and how to use hooks in custom modules.
- Developer Portal tutorials - guided examples taking you through the simple and the more complex areas of configuration.

Appearance

Control and configure the general appearance of your Developer Portal site by setting and configuring a default theme.

To learn how to control the appearance of your Developer Portal site, use the following topic links.

- **Controlling general appearance elements in the Developer Portal**
  You can control general appearance aspects of the Developer Portal.
- **Adding custom JavaScript to a custom theme**
  To increase customization of the Developer Portal, you can add custom JavaScript to custom themes that you install.
- **Applying a modified content type template**
  You can apply a modified content type template to override a default content type template in the Developer Portal. For example, you can override the product content type template to change its layout.
- **Creating a sub-theme**
  Create a custom theme for your Developer Portal site by generating and configuring a sub-theme. A sub-theme is a theme that inherits all the resources of a specified parent theme. You can then override specific resources to configure your required customizations.
- **Installing additional themes**
  You can install additional themes in the Developer Portal.
- **Deleting themes**
  You can delete a theme from your Developer Portal site.

Controlling general appearance elements in the Developer Portal

You can control general appearance aspects of the Developer Portal.

To learn how to control general aspects of the Developer Portal appearance, use the following topic links:

- **Changing the shortcut icon**
  You can change the shortcut icon, or favicon, in the Developer Portal.
- **Changing the site email address**
  You can change the site email address in the Developer Portal.
- **Changing the site logo**
  You can change the site logo for your Developer Portal.
- **Changing the site name or site slogan**
  You can change the site name, or the site slogan, for your Developer Portal.
- **Changing the visibility of site branding**
  You can toggle the visibility of your site branding elements for your Developer Portal.

Changing the shortcut icon

You can change the shortcut icon, or favicon, in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The shortcut icon, or favicon, is displayed in the address bar or bookmarks of most browsers. Drupal provides a default favicon, the water drop logo, but if you want to make your Developer Portal stand out, you should provide your own.
The default Drupal favicon is 32 pixels high by 32 pixels wide. As a favicon is displayed only in the address bar and favorites (bookmarks) list, any favicon that you create should be similarly small.

Procedure

To change the shortcut icon, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Appearance in the administrator dashboard.
3. Click Settings for the default theme.
4. Click Favicon in the Override Global Settings section.
5. Deselect the Use the favicon supplied by the theme check box.
6. Provide a path to a custom icon on the server by entering it in the Path to custom icon field. Alternatively, you can browse for, and upload, a favicon image under the Upload favicon image subheading.
7. Click Save configuration.
   Note: If the changes don't appear immediately in your browser, clear your browser's cache and reload the page. If you've bookmarked the site, you may need to delete the bookmark and then create it again, so the new favicon is used.

Results

You have changed the favicon for the site.

Changing the site email address

You can change the site email address in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To change the site email address, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.

3. Under the System heading, click Basic site settings.
4. In the SITE DETAILS section, enter the new site email address in the Email address field.
5. Click Save configuration.

Results

You changed the email address for the site.

Changing the site logo

You can change the site logo for your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To change the site logo, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Appearance in the administrator dashboard.
3. Click Settings for the default theme.
4. Click Logo image in the Override Global Settings section.
5. Deselect the Use the logo supplied by the theme check box.
6. Provide a path to your custom logo by completing the Path to custom logo field. Alternatively, you can browse and upload a logo image under the Upload logo image subheading.
7. Click Save configuration.
   Note: If the changes don't appear immediately in your browser, clear your browser's cache and reload the page.

Results

You changed the site logo for your Developer Portal. How the site logo is used depends on the settings for your theme.

Changing the site name or site slogan

You can change the site name, or the site slogan, for your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The site name is used to identify the site and can be displayed in browsers. You can also set a site slogan for your theme.

Procedure

To change the site name or site slogan, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration > System > Basic site settings in the administrator dashboard.
3. In the SITE DETAILS section, enter the new site name in the Site name field, or enter a new slogan in the Slogan field.
4. Click Save configuration.

Results

The site name or site slogan is updated. How the site name and the site slogan are used depends on the settings for your site theme. For more information, see Changing the visibility of site branding.

Changing the visibility of site branding

You can toggle the visibility of your site branding elements for your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The site branding block includes the site logo, name, and slogan. You can choose which of these branding elements you want to be displayed in this block.

Procedure

To change the visibility of your site branding elements, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Block layout in the administrator dashboard.
3. Find the Site branding block in the Navigation section, and click Configure.
4. In the TOGGLE BRANDING ELEMENTS section, use the check boxes to select which branding elements you want to be visible.
5. Click Save block to save your changes.

Results

You changed the visibility of your site branding elements. How these elements are used depends on the settings for your theme.

Adding custom JavaScript to a custom theme

To increase customization of the Developer Portal, you can add custom JavaScript to custom themes that you install.

Procedure

1. Add your JavaScript file to your theme. For example, in a sub-directory named js and the file `myfilename.js`.
2. Add the JavaScript file to your theme, by editing your {custom_theme}.libraries.yml file and adding in the JavaScript file.
   An example of the JavaScript file:

   ```
   myfile:
     js:
       js/myfilename.js: {}
   ```

3. Add the following code to your theme's .info.yml file:

   ```
   libraries:
   - {custom_theme}/myfile
   ```

   Note: You must replace `{custom_theme}` with your theme name. Also, both files must reference `myfile`.
4. Zip up the directory and upload it to your portal site. For more information, see Installing additional themes.

Applying a modified content type template

You can apply a modified content type template to override a default content type template in the Developer Portal. For example, you can override the product content type template to change its layout.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must also have a custom sub-theme, and a copy of an existing template that you want to update. For information about how to create a sub-theme, see Creating a sub-theme.

To obtain a copy of an existing template, you can download a copy from the following locations on GitHub:

- https://github.com/ibm-apiconnect/devportal/tree/master/ibm_apim/templates
- https://github.com/ibm-apiconnect/devportal/tree/master/apic_api/templates
- https://github.com/ibm-apiconnect/devportal/tree/master/apic_app/templates
- https://github.com/ibm-apiconnect/devportal/tree/master/product/templates
- https://github.com/ibm-apiconnect/devportal/tree/master/consumerorg/templates

Note that you must copy the template to your sub-theme, and then modify the content. Do not modify the content that is stored on GitHub.

About this task

You can override the Developer Portal core templates by creating a custom sub-theme, and then adding your modified templates to the sub-theme folder. A sub-theme inherits all of the settings of its parent theme, apart from the settings that are overridden, such as by applying modified templates. After you have applied a modified

content types template, these changes take precedence over the default content types template. The Developer Portal templates are formatted as Twig template files. The following levels are examples of where you can use templates:

- html.html.twig - the template for Developer Portal HTML pages
- page.html.twig - the body of Developer Portal HTML page
- node.html.twig - the template for all of the content nodes
- comment.html.twig - the template for all of the comment nodes
- search-result.html.twig - the template for search results
- node--product.html.twig - the template for nodes that use the Product content type
- node--product--teaser.html.twig - the template for the previews for the Product content type

For more information about Twig templates, see Working with Twig templates and Debugging Twig templates on the Drupal documentation website.
Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

Important:
Directly editing any API Connect theme files is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

Procedure

To override a default content type template:

1. Apply the modifications that you require to the default template that you obtained.
   Warning: Although the ability to override templates is supported, if you override a template they are your responsibility. Templates can be from multiple sources and compatibility with an earlier version is not ensured. You must check the templates in the latest API Connect release to check whether you need to make equivalent changes to your overrides to maintain functional equivalence.
2. Create a directory in your custom sub-theme, and name it templates.
3. Add your modified template to the templates directory.
   Note: The modified template file name must be identical to the original name of the template file that it is overriding.
4. Log in to the Developer Portal UI as an administrator.
5. If the administrator dashboard is not displayed, click Manage to display it.
6. Install your custom sub-theme onto the Developer Portal by clicking Appearance > Install new theme on the administrator dashboard.
7. Click Choose file, select your sub-theme, and then click Install.
8. Click Install newly added theme, find your new theme in the list of Uninstalled themes, and click Install and set as default to set your new custom sub-theme as the default theme for your site.
   Your new theme, which contains the modified template file, is now set as the default theme, and is listed in the Installed themes section.

Results

You successfully modified and applied a template to override a default content type template in the Developer Portal.

Creating a sub-theme

Create a custom theme for your Developer Portal site by generating and configuring a sub-theme. A sub-theme is a theme that inherits all the resources of a specified parent theme. You can then override specific resources to configure your required customizations.

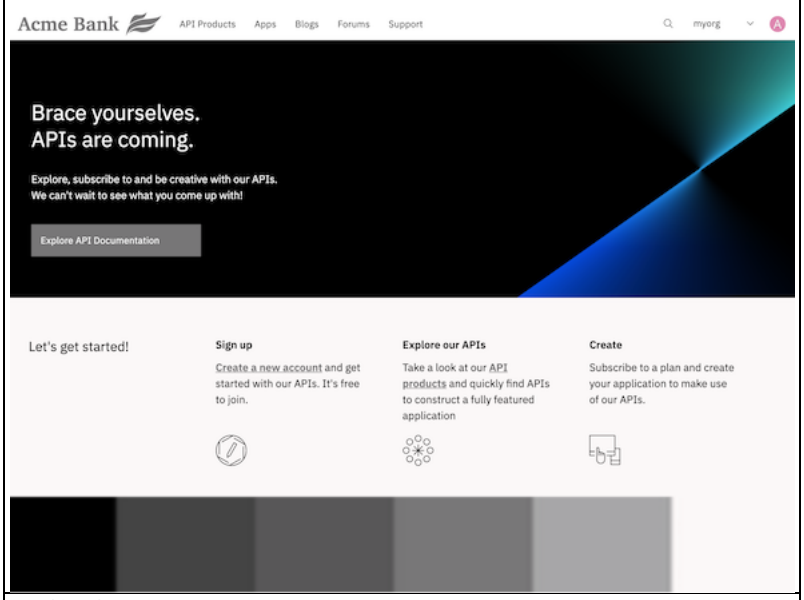
Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

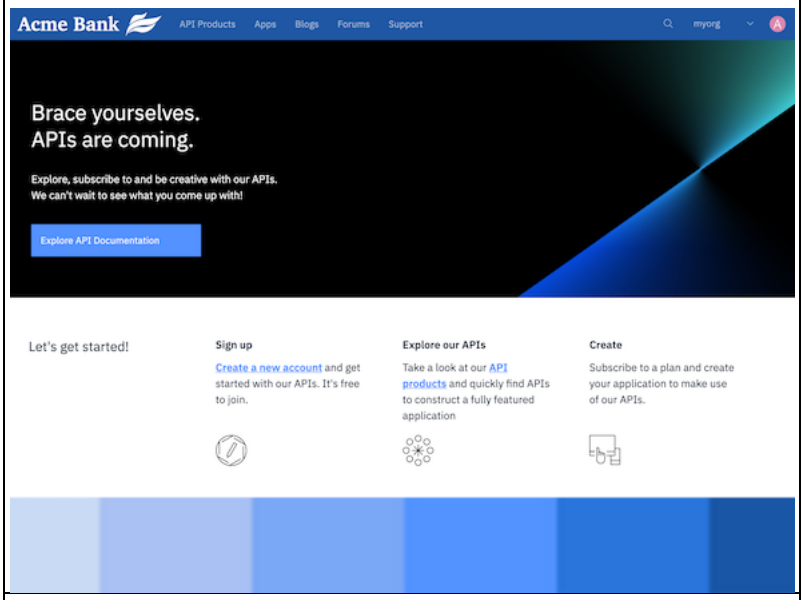
About this task

Directly editing the API Connect theme isn't permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed. So, the way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. You can also create a sub-theme that is based on one of the following color templates:

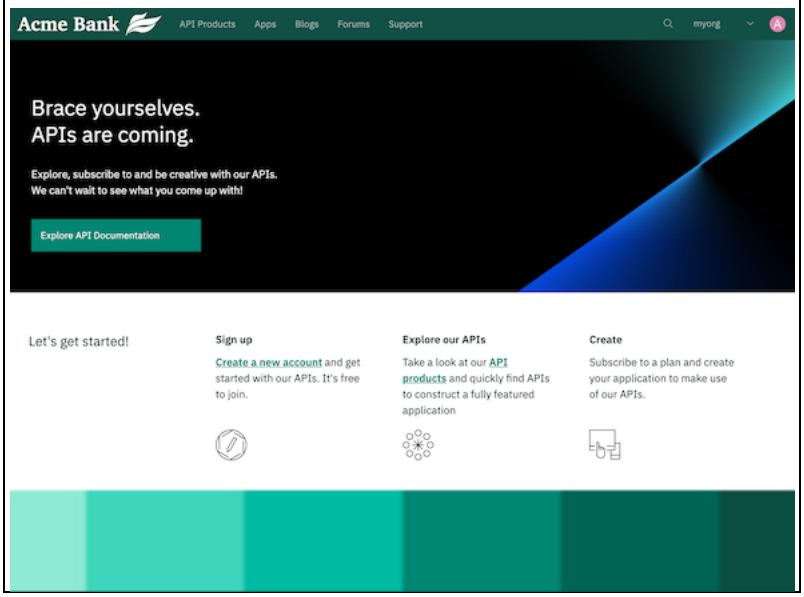
Business Mono



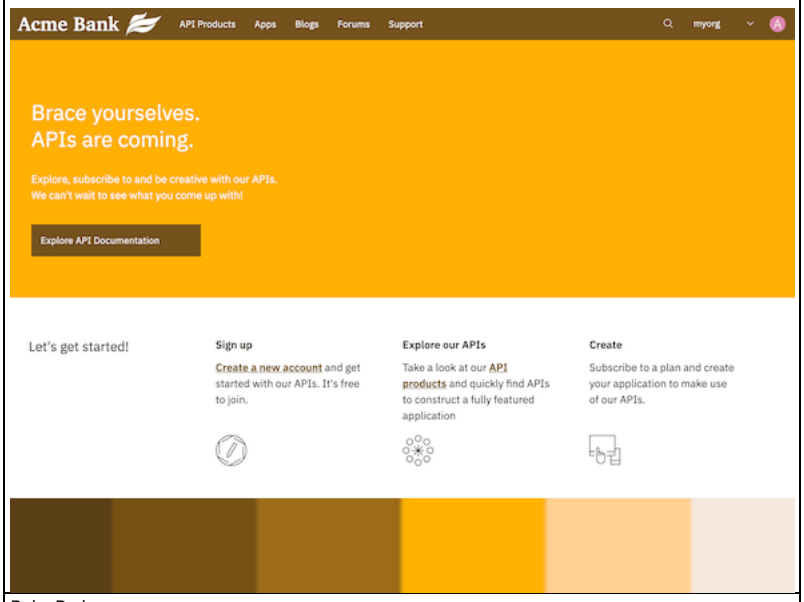
Sapphire Blue



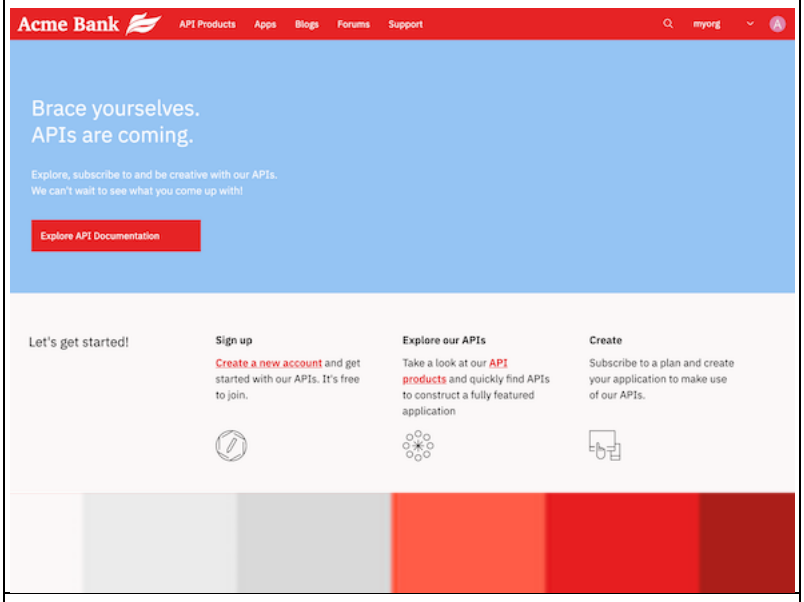
Emerald Green



Golden Brown



Ruby Red



Selecting a color template provides you with a base theme that you can build on more easily to produce your required site branding and styling.
Create a sub-theme by using the theme generator in the Developer Portal UI, customize the appearance as required, and then upload the compressed file back onto the site.

Important:

- You're not permitted to include any IBM® API Connect code within any custom themes that you create. Also, directly editing any API Connect themes on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom themes is supported, IBM API Connect do not provide support in their development or modification.

For a guided example on creating a sub-theme, see Tutorial: Creating a custom theme for the Developer Portal. In this example, you create a sub-theme, and then customize the styling by editing the overrides.css file.

Procedure

1. On the administrator dashboard, click Appearance > Generate sub-theme.
   The Generate sub-theme page is displayed.
2. Enter a Sub-theme name, and select the Sub-theme type that you would like to use. The name can contain only lowercase characters a - z, and numerals 1 - 9.
   - CSS - Cascading Style Sheets; the language that is used to describe how to display the HTML elements in the theme.
   - SCSS - Sass CSS; a superset of CSS. SCSS contains all the features of CSS, but is extended to include the features of Sass as well. However, SCSS must be compiled into CSS before it can be installed and used in the Developer Portal.
3. Select the template to base your sub-theme on:
   - Default - the standard connect_theme that the Developer Portal is based on.
   - Business Mono - a black and white color theme.
   - Sapphire Blue - a blue color theme.

- Emerald Green - a green color theme.
- Golden Brown - a brown color theme.
- Ruby Red - a red color theme.

4. Click Generate.
   Your sub-theme is available to download from the Generate sub-theme page.
5. Click your new sub-theme and save it to your preferred location.
6. Extract the resources from the sub-theme file, and then edit the specific resources to configure the customizations that you require.
   Define your theme by creating metadata in the *your_theme_name*.info.yml file. You can then customize the appearance of your theme by configuring the overrides.css file. For detailed information about how to customize themes, see Theming Drupal.
7. After you have completed your customizations, compress the sub-theme resources back into the .zip file.
   Note that the following file extensions are also supported: tar, tgz, gz, and bz2.
8. Install your new sub-theme onto the Developer Portal by clicking Appearance > Install new theme.
9. Click Choose file, select your sub-theme, and then click Install.
10. Click Install newly added theme, find your new theme in the list of Uninstalled themes, and click Install and set as default to set your new custom sub-theme as the default theme for your site.
    Your new theme is now set as the default theme, and is listed in the Installed themes section.

Results

You created and installed a new sub-theme for your Developer Portal site.

What to do next

You can edit the display settings for your new theme, by clicking Settings next to your theme.

Installing additional themes

You can install additional themes in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To install additional themes, complete the following steps:

1. Click Appearance in the administrator dashboard.
2. Click + Add new theme.
3. You can enter a path to the theme in the Install from a URL field. Alternatively, you can upload a theme under the Upload a module or theme archive to install heading.
4. Click Install.
5. Click Enable newly added themes.
6. Click Enable and set default for the theme that you want to be displayed in the Developer Portal.
   Your theme is displayed in the Developer Portal when you navigate to the home page.

Deleting themes

You can delete a theme from your Developer Portal site.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

If you have a custom theme which is disabled, you can remove it from the Developer Portal. Deleting a theme is useful if you have identified a theme that you do not want to use again.

Procedure

1. Click Appearance from the administrator dashboard.
2. Identify the custom theme that you want to delete, and ensure that it is disabled.
3. Click Delete against the theme.
   The theme is now deleted from your Developer Portal site.

Results

You deleted a disabled theme in the Developer Portal.

Content

Control multiple content entities in the Developer Portal, including the customization and restriction of specific content.

A *content entity* is an item of content data, which can consist of text, HTML markup, images, attached files, and other data that is intended to be displayed to site visitors. Content entities can be defined by the core software or by modules. Content entities are grouped into *entity types*, which have different purposes and are displayed in different ways on the site. Most entity types are also divided into *entity sub-types*, which are divisions within an entity type to allow for smaller variations in how the entities are used and displayed.

The Developer Portal site contains the following content entity types:

- API
- Application
- Article
- Basic page
- Blog post
- Book page
- Consumer Organization
- FAQ
- Forum Topic
- Product

Within content entity items the data is stored in individual *fields*, each of which holds one type of data, such as formatted or plain text, images or other files, or dates. Field types can be defined by the core software or by modules.

Fields can be added by an administrator on content entity sub-types, so that all the entity items of a given entity sub-type have the same collection of fields available. When you create or edit entity items, you are specifying the values for the fields on the entity item.

To learn how to configure the content entities of your Developer Portal site, use the following topic links.

- **Adding content elements in the Developer Portal**
  You can add content elements in the Developer Portal.
- **Configuring and restricting content in the Developer Portal**
  You can configure and restrict certain content elements in the Developer Portal.
- **Turning content on or off in the Developer Portal**
  You can turn certain content elements on or off in the Developer Portal

Adding content elements in the Developer Portal

You can add content elements in the Developer Portal.

Note: You can export and import entities from the Developer Portal UI. When you're editing a content entity type in the UI, you can click Export in the side navigation bar. To create an export entity container and export that entity, including any required embedded entities, click Export entity. Or, if you have an existing export entity container, you can select the required container, and click Add to the export. You can also view and manage all of your export entities by clicking Content > Content synchronizer > Exports, and all of your import entities by clicking Content > Content synchronizer > Imports.
To learn how to add various content elements in the Developer Portal, use the following topic links:

- **Adding and configuring meta tags**
  You can customize the Developer Portal by adding and configuring meta tags.
- **Adding custom pages**
  You can create custom pages within the Developer Portal. You can add a basic page for static content, or an article for news content.
- **Integrating X or BlueSky data into the social block**
  You can retrieve and integrate data from an X (formerly known as Twitter) or BlueSky account of interest and display it into a social block in a Developer Portal site.
- **Adding content in multiple languages**
  You can create content in multiple languages in the Developer Portal.
- **Adding custom pages to APIs and Products**
  After you create a custom page in the Developer Portal, you can add a link to the new page to any APIs and Products that exist in the Developer Portal.
- **Adding new frequently asked questions**
  You can add new FAQs to the Developer Portal.
- **Applying an image to an API or Product**
  You can apply an image to an API or a Product in the Developer Portal.
- **Attaching a documentation file to APIs**
  You can attach a file to APIs in the Developer Portal, and display them as documentation attachments. You can attach multiple files to APIs.
- **Configuring blogs**
  You can post new blog entries in the Developer Portal, and configure them to suit your requirements. You can also turn blogs off.
- **Configuring the taxonomy menu block**
  To display your tag hierarchy in the Developer Portal, you must configure the taxonomy menu block.

- **Customizing the URL alias for a specific API or Product page**
  You can customize the URL of an API or Product page from the default alias that they are assigned.
- **Embedding multimedia in site content**
  You can embed multimedia elements in site content in the Developer Portal.
- **Linking from one piece of site content to another**
  You can link from one piece of site content to another in the Developer Portal.
- **Linking to social media sites**
  You can link to social media sites from the Developer Portal. You can configure where and how these links are displayed and which sites you want to link to.
- **Managing tags in the Developer Portal**
  These instructions show you how to add new tags to your taxonomy, and how to manage the tag hierarchy in the Developer Portal. You can use tags to classify your Developer Portal content.
- **Posting a poll**
  You can post a poll in the Developer Portal.
- **Adding images to site content**
  You can add .jpg, .png and .gif images to your site content in the Developer Portal.

Adding and configuring meta tags

You can customize the Developer Portal by adding and configuring meta tags.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Meta tags provide preview information that is displayed for a link to a website. The preview information can include images, descriptions, tags, and links. Meta tags are used when you link to external website, for example Facebook, Twitter, and Slack.

You can see which entities have the meta tag form available on their respective edit pages by default, and can be configured, Configuration > Search and metadata > Metatags > Settings:

- CONTENT
  - API
  - APPLICATION
  - ARTICLE
  - BLOG POST
  - BOOK PAGE
  - CONSUMER ORGANIZATION
  - FAQ
  - FORUM TOPIC
  - BASIC PAGE
  - PRODUCT
- TAXONOMY TERM
  - FORUMS
  - TAGS
- USER
  - USER

Procedure

1. In the administrator dashboard, click Extend > Update, then click List.
2. Enter `meta tag` in the Filter list field.
3. Select the check boxes for the Meta tags you want to enable, click Enable.

- **Disabling external search engine indexing**
  If you do not want your Developer Portal site content to be indexed by external search engines, then you can disable the indexing.

Disabling external search engine indexing

If you do not want your Developer Portal site content to be indexed by external search engines, then you can disable the indexing.

Before you begin

You must have administrator or content author access to complete this task.

About this task

By disabling the external search indexing, you can increase the confidentiality of your content and restrict its exposure.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the SEARCH AND METADATA section, click Metatag.
4. Click Edit for the GLOBAL type.
5. Expand the ADVANCED section and, in the Robots section, select Prevents search engines from indexing this page.
6. Click Save.

Results

You have disabled external search engine indexing.

Adding custom pages

You can create custom pages within the Developer Portal. You can add a basic page for static content, or an article for news content.

Before you begin

You must have administrator or content author access to complete this task.

About this task

Use basic pages for your static content, such as an "About us" page. Typically, a basic page is used for static content that can be linked into the main navigation bar, although this is not a requirement. Use articles for time-sensitive content, like news, press releases, or blog posts.

Procedure

To add custom pages, complete the following steps.

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Content.
4. Click +Add content, then click either Basic page or Article, depending on the type of content you want to display.
5. Enter a page title, select the language, and enter the content.
6. Specify the remaining page options as required.
   If you want your new page to be linked to from a menu, you must complete the Menu settings section.
7. Optional: Click Edit summary and specify a summary page description.
8. Click Save to publish the new page immediately. If you don't want to publish the new page immediately, ensure that you deselect Published before saving.

Results

You added a new custom page to the Developer Portal. You can edit the page after it is created by clicking Edit for the custom page.

Integrating X or BlueSky data into the social block

You can retrieve and integrate data from an X (formerly known as Twitter) or BlueSky account of interest and display it into a social block in a Developer Portal site.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must have an X App for the X account of interest. The X App contains information that is used to configure the social block. For information on creating X Apps, see https://apps.twitter.com/. To configure social block for BlueSky, you must have an BlueSky account that contains the application password for the social block. For more information, see https://bsky.app/settings/app-passwords.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the WEB SERVICES section, click IBM Social Block settings.
4. Using the information from your X App or BlueSky, enter keys in the corresponding fields based on the platform:

   X platform
   : Consumer Key, Consumer Secret, Access Token, and Token Secret.

   BlueSky platform
   : Username and App password.

5. Click Save configuration.
   X or BlueSky data from an X or BlueSky account of interest has been integrated with the Developer Portal, and is displayed on the social block of the site.

- **Editing the social block**
  After you have integrated Twitter or BlueSky data into the Developer Portal social block, you can edit the content, appearance, and functionality of the social block.

Editing the social block

After you have integrated Twitter or BlueSky data into the Developer Portal social block, you can edit the content, appearance, and functionality of the social block.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must have Twitter or BlueSky data integrated into the Developer Portal social block. For more information, see Integrating X or BlueSky data into the social block.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Structure > Pages.
3. Click Edit next to the Welcome page (or next to the page that contains the social block that you want to edit).
4. From the Variants navigation tree, select Panels > Content, and click Edit next to the Social Block.
   The Edit block window is displayed.
5. Edit the social block by configuring any of the following options:

   Title
   : Update the title as required.

   Number of tiles to display
   : Configure the number of tiles that you want to display on the social block by entering a number in the Number of tiles to display field. The default number of tiles that are displayed on the social block is 9, and there is a limit of 100 tiles.

   FORUM
   : Use the check boxes to specify the forum topics that you want to display.

   Get tweets from
   : From the Get tweets from drop-down list, select whether you want to display Twitter or BlueSky data from users or a search term.

   Twitter search parameter
   : Enter the Twitter search parameter.

   BlueSky search parameter
   : Enter the BlueSky search parameter.

   Types of tweets to display
   : Select the types of tweets that you want to display from the drop-down list. You can select to display tweets, or tweets and replies.

6. After you have configured the social block, click Update block.
   Your social block is configured, and the configurations are implemented when you return to the home page.

Adding content in multiple languages

You can create content in multiple languages in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

About this task

You can provide custom pages in multiple languages to your APIs and Products to improve your customer experience and understanding. By default, multiple languages are enabled in the Developer Portal.

Note: In API Designer, translations for APIs and products must be done within a document. For more information, see Using `x-ibm-languages` to create multilingual API and Product documentation.

Procedure

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Content.
4. If you are creating a new page to be translated, click +Add content.
   a. Click Basic page, then select type, for example `Basic page`.
   b. Enter a title for your custom page in the Title field.
   c. Enter your information in the Body field.
   d. Click Save.

e. Click Translate.
f. Click Add for the language you want to translate.
g. Provide the language content.
h. Click Save (this translation).

5. If you are translating an existing page, find the page that you want to update in the list.
   a. Click Translate from the drop-down list for the page.
   b. Click Add for the language you want to translate.
   c. Provide the language content.
   d. Click Save (this translation).

Results

You successfully created a translated version of your content.

Adding custom pages to APIs and Products

After you create a custom page in the Developer Portal, you can add a link to the new page to any APIs and Products that exist in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

You must have an API or Product to add the custom page to.

About this task

You can add custom pages to your APIs and Products to provide further information on their use and value.

For example, you can create a custom documentation page on the implementation of an API in a specific circumstance, and add this custom documentation page to the API.

Procedure

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Content, then click +Add content.
4. Click Basic page.
   The Create Basic page window is displayed.
5. Enter a title for your custom page in the Title field.
6. Enter your information of interest in the Body field.
7. If you want to add the custom page to a specific Product, enter the Product name in the Link to one or more specific Products field. As you type into this field, a list of available Products is displayed for you to select. You can add more Products by clicking Add another item. If you want to add the custom page to all Products, select the Link to all Products check box.
8. If you want to add the custom page to a specific API, select the APIs tab, and then enter the API name in the Link to one or more specific APIs field. As you type into this field, a list of available APIs is displayed for you to select. You can add more APIs by clicking Add another item. If you want to add the custom page to all APIs, select the Link to all APIs check box.
9. Optional: Configure the additional settings of the custom page to your specification.
10. Click Save.

Results

Your custom page is created and linked to the APIs or Products that you have specified. You can edit the page after it is created, and update the APIs and Products that it is linked to, by clicking Edit for the custom page.

Adding new frequently asked questions

You can add new FAQs to the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

About this task

To add new FAQs, you create a new FAQ node and add questions and answers to that node. Each FAQ node represents an FAQ topic, and each topic can contain multiple questions and answers.

Procedure

To add new FAQs, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content in the administrator dashboard.
4. Click +Add content.
5. Click FAQ.
   The Create FAQ page displays.
6. Provide a Title for the new FAQ topic.
7. Enter the question in the Question field, and enter the answer in the Answer field.
8. Optional: If you have more content for this FAQ topic, click Add another item and complete the Question and Answer fields. Repeat this step as required.
9. Click Save to save your new FAQ topic.
   Your new FAQ topic is displayed in the Support section of the Developer Portal.

Results

You successfully added new FAQs to the Developer Portal.

What to do next

You can edit the current content of FAQs by clicking Content in the administrator dashboard, finding the FAQ content that you want to edit, and clicking Edit against that FAQ.

Applying an image to an API or Product

You can apply an image to an API or a Product in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To add an image to an API or Product, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click Edit next to the API or Product that you want to edit.
4. Under the Image heading, click Choose File to select an image.
5. Click Save and keep published, to publish the updated content,or select Save and unpublish if you want to publish the updated content later.
   You have added a new picture to the selected API or Product.

Attaching a documentation file to APIs

You can attach a file to APIs in the Developer Portal, and display them as documentation attachments. You can attach multiple files to APIs.

Before you begin

You must have administrator or content author access to complete this task.

About this task

You can attach only one file at a time. The default file upload size limit applies to the files that you want to attach, and you can attach up to 10 files to an API by default.
Note: You can change the default limit for the number of files that you want to attach.
An administrator can configure the types of file that are uploaded, and the number of files that a user can upload.

The following file types can be uploaded:

- txt doc pdf
- xls ppt pptx
- docx xlsx rtf
- odt ods odp md json
- yaml tgz tar zip

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click Edit next to the API you want to attach the file to.
4. In the Documentation section, click Browse and identify the file that you want to upload, then click Open.
5. Click Upload, then click Save.
6. Optional: Clear the Display checkbox for the file if you want to upload and attach the file to the API, but not show it in the Developer Portal.
7. Optional: Enter a description for your file in the Description field. This description can be used as the label of the link to the file.

8. Optional: If you uploaded multiple files, you can use the drag handle next to the file name to rearrange them.

Results

You successfully attached a documentation file to your API.

Configuring blogs

You can post new blog entries in the Developer Portal, and configure them to suit your requirements. You can also turn blogs off.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To post a new blog entry, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
- Click Content in the administrator dashboard.
- Click Add content.
- Click Blog post.
- Fill in the Title and Body fields.
- Click Save and keep published, to publish the updated content,or select Save and unpublish if you want to publish the updated content later.
  You have posted a new blog entry.

To configure a blog post, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
- Click Content in the administrator dashboard.
- Click Edit next to the blog post that you want to configure.
- You can configure the selected blog from this view.
- Click Save and keep published, to publish the updated content,or select Save and unpublish if you want to publish the updated content later.
  You have configured the selected blog post.

Configuring the taxonomy menu block

To display your tag hierarchy in the Developer Portal, you must configure the taxonomy menu block.

Before you begin

You must have administrator or content author access to complete this task.

About this task

Along with controlling how your tag hierarchy is displayed through configuring your taxonomy menu block, you can configure options for the taxonomy tree. The following options can be configured for your taxonomy menu block:

- Vocabulary
- Parent option
- Depth
- Node options and content
- Region settings
- Visibility settings

Important: The taxonomy block will appear after configuration only if there are tags for it to display.

Procedure

1. In the Administrator dashboard, click Structure > Blocks.
2. Click configure for the Taxonomy Menu Block (Tags) block.
3. Configure the options that are available for your taxonomy menu block.
4. When you have configured your taxonomy menu block, click Save block.
   You have configured your taxonomy menu block, and your tag hierarchy is displayed based on your configurations.

Customizing the URL alias for a specific API or Product page

You can customize the URL of an API or Product page from the default alias that they are assigned.

Before you begin

You must have administrator or content author access to complete this task.

About this task

Creating a custom URL, or path, alias is useful if you want to make the URL relevant to the API or Product page.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Content.
3. Identify the API or Product page that you want to customize the URL alias for, and click Edit.
4. In the Path Alias text field, enter the custom URL alias that you want to assign your API or Product page.
   Note: All Path Alias must be unique, and can contain only the following characters: [A-Za-z0-9_-.].
5. Click Save to publish the updated content.

Results

You have applied a custom URL alias for your specified API or Product page, and it is displayed in the URL of your browser when the API or Product page is selected. Depending on whether it is added to an API or a Product page, the application of the Path Alias differs. For example, if you add `my_new_path_alias`, you will have:

- `<my_site_url>/api/my_new_path_alias` for an API
- `<my_site_url>/product/my_new_path_alias` for a Product

Embedding multimedia in site content

You can embed multimedia elements in site content in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To embed multimedia in site content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Under the TITLE heading, click the title of the required content.
4. Click the Edit tab.
5. Use the Insert Media Embed icon in the in the WYSIWYG editor to embed multimedia in the content.
   Note: The Insert Media Embed icon is available only if you have selected Full HTML mode.
6. Click Save and keep published to publish the new page immediately, or select Save and unpublish if you want to publish the page later.
   You have embedded multimedia in the selected site content.

Linking from one piece of site content to another

You can link from one piece of site content to another in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To link from one piece of site content to another, complete the following steps:

1. Click Content in the administrator dashboard.
2. Under the TITLE heading, click the title of the required content.
3. Select the Edit tab.
4. Use the Link to content icon in the WYSIWYG editor.
5. Click Save.
   You have linked the selected site content to another site content element.

Linking to social media sites

You can link to social media sites from the Developer Portal. You can configure where and how these links are displayed and which sites you want to link to.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. Click Structure in the administrator dashboard.
2. Click Blocks.
3. Under the Disabled heading, locate the Follow site block.
4. Select the location for your social media block from the drop-down list for Follow Site in the REGION column.
   The Follow Site block will appear under the heading that corresponds to the region you selected in the REGION drop-down list.
5. Required: Click Save blocks before you begin configuring your new block.
6. Click configure for the Follow Site block.
7. In the Block title field, type the name of your block.
8. Under the Default block title heading, select one of the following leading text options for your block using the radio buttons for each option:
   - "Follow *your.portal.site* on"
   - "Follow me on"
   - "Follow us on"
9. Use the User pages check box to decide whether you want your block to display on your user's profile pages.
10. Use the Alignment and Icon Style drop-down lists to adjust the appearance of your block.
11. Click Save block.
12. Click Configuration in the administrator dashboard.
13. Under the WEB SERVICES heading, click Follow.
14. Type the URL under the URL heading for each of the social media sites you want your users to access. The following is an example of a link to the @ibmapiconnect twitter handle:

    ```
    https://twitter.com/ibmapiconnect
    ```

15. Click Submit.

Managing tags in the Developer Portal

These instructions show you how to add new tags to your taxonomy, and how to manage the tag hierarchy in the Developer Portal. You can use tags to classify your Developer Portal content.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To manage your tags, complete the following steps

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Taxonomy > Tags in the administrator dashboard.
   The List window for Tags is displayed.
3. You can add new terms, delete, and reorganize terms from this view.
   a. To add a new term, click Add term, define the new term, then click Save.
   b. To delete a term, select Delete from the OPERATIONS menu next to the term that you want to delete. Then click Delete to confirm.
   c. To reorganize terms, ensure that the row weights are hidden by clicking Hide row weights if necessary, then use the drag-and-drop handles to manage the tag hierarchy. Terms can be dragged to organize a parent grouping hierarchy. Then click Save.

- **Tagging APIs based on their lifecycle phase**
  In the Developer Portal, you can have APIs automatically tagged with their lifecycle phase; realized, identified, or specified.

Related tasks

- Editing tags for a specific item

Tagging APIs based on their lifecycle phase

In the Developer Portal, you can have APIs automatically tagged with their lifecycle phase; realized, identified, or specified.

Before you begin

You must have administrator or content author access to complete this task.

About this task

APIs are tagged in the API Manager with a lifecycle phase as follows:

- Realized (default) - The API is in the implementation phase.
- Identified - The API is in the early conceptual phase and is neither fully designed nor implemented.
- Specified - The API has been fully designed and passed an internal milestone, but has not yet been implemented.

You can configure the Developer Portal to tag APIs with their lifecycle phase automatically.

Procedure

Tagging APIs with their phase is disabled by default. To enable the function:

1. On the administrator dashboard, click Configuration > System > IBM API Developer Portal.
2. Select Automatically tag APIs with their phase, and then click Save configuration to automatically tag APIs with their lifecycle phase.

What to do next

You can manage the tag hierarchy of your APIs. For more information, see Managing tags in the Developer Portal.

Posting a poll

You can post a poll in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To post a poll, complete the following steps:

1. Click Content in the administrator dashboard.
2. Click Add content.
3. Click Poll.
4. Enter the poll question in the Poll question field.
5. Under the Choice heading, add answers to the available fields as choices.
6. From the Poll duration drop-down menu, select a time limit for the poll.
7. Click Save.
   You have posted a poll.

What to do next

See Editing sample content to learn how to add a links to your poll to sample content.

Adding images to site content

You can add .jpg, .png and .gif images to your site content in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To upload images for use in site content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Under the TITLE heading, click the title of the required content.
4. Click the EDIT tab.
5. Use the Image icon in the in the WYSIWYG editor to add an image.
6. Click Save and keep published to publish the new page immediately, or select Save and unpublish if you want to publish the page later.

Configuring and restricting content in the Developer Portal

You can configure and restrict certain content elements in the Developer Portal.

To learn how to configure and restrict content in the Developer Portal, use the following topic links:

- **Creating content types**
  Content types define default fields for editors to add content on your Developer Portal site and are the building blocks for authoring content. You can control which content types are available
- **Configuring documentation upload limitations**
  You can attach documentation to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded documentation.
- **Configuring image upload limitations**
  You can attach an image file to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded image files.
- **Configuring the appearance of ratings in the Developer Portal**
  You can configure the appearance of ratings in the Developer Portal.
- **Customizing the privacy policy statement**
  You can define and customize a privacy policy statement that sets out the privacy conditions of your Developer Portal site. The privacy policy can be linked to from the cookie compliance banner.
- **Customizing the terms of use statement**
  You can define and customize a terms of use statement that sets out the terms and conditions that your users must accept to use your Developer Portal site.
- **Editing a site comment**
  You can edit site comments in the Developer Portal.
- **Editing sample content**
  You can edit sample content, such as basic pages, in the Developer Portal.
- **Editing tags for a specific item**
  You can edit tags for a specific item in the Developer Portal.

Creating content types

Content types define default fields for editors to add content on your Developer Portal site and are the building blocks for authoring content. You can control which content types are available

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

After you create your content type, it is added to the following list of default content types that are present in the Developer Portal:

- API
- Application
- Article
- Basic page
- Blog post
- Book page
- Consumer organization
- Forum topic
- Product

The content type that you create, and the default content types, can be edited and configured further to your specifications.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. Click +Add content type.
5. Enter a name for your content type in the Name field.
6. Optional: Enter the text that you want to appear on the Add new content page, in the Description field.
7. Enter a title field label for your content type in the Title field label field.
8. Optional: Configure any of the following options for your content type:
   - Submission form settings
   - Publishing options
   - Language settings
   - Display settings
   - Menu settings
9. After you have configured your content type to your specifications, click Save and manage fields.
   You have created a new content type.

What to do next

You can add fields to your new content type; see Adding fields to content types.

- **Adding fields to content types**
  Fields can be added to content types in the Developer Portal for customization, and to add functionality.

Adding fields to content types

Fields can be added to content types in the Developer Portal for customization, and to add functionality.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can specify the type of data that a field can store, and the form element to edit the data with. The type of form element that is available is dependent on the type of data that your field stores.

Note: You can specify the number of values that a field can store, including an unlimited amount. You can configure the value after the field is created. Reducing the number of values that can be stored after the field is created might lead to data loss.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types, and identify the content type that you want to add a field to.
4. Click Manage fields for the content type, then click Add field.
5. Select a field type or select an existing field to reuse, then enter a label for your field in the Label field.
   The label that you specify for your field is displayed in the UI.
6. Optional: If you want to edit the machine name that is automatically created based on your label, click Edit and enter the new name.
   You cannot change the machine name after the field is created.
7. Click Save and continue.
8. Modify the field type specific settings as required, then click Save field settings.
   You have added a field to your content type.

Configuring documentation upload limitations

You can attach documentation to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded documentation.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The set of configurable limitations that you can place on uploading documentation is different to the set of limitations that you can place on uploading images.

The file size limit that is applied when you upload documentation is also different to the limit that is applied when you upload images.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structurein the administrator dashboard.
3. Click Content types.
4. For the API content type, click Manage fields.
5. For the Documentation field, click Edit.
6. Configure the type of files that are allowed to be uploaded in the Allowed file extensions field.
7. Enter the file size upload limit in the Maximum upload size field.
   The default size is 10MB, while the maximum upload size possible is 64MB.
8. Click Save settings.
   You have configured the documentation upload limitations.

Configuring image upload limitations

You can attach an image file to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded image files.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structurein the administrator dashboard.
3. Click Content types.
4. For the API content type, click Manage fields.
5. For the Image field, click Edit.
6. Configure the type of image files that are allowed to be uploaded in the Allowed file extensions field.
7. Specify the maximum and minimum allowed image sizes in the Maximum image resolution and Minimum image resolution fields.
8. Enter the file size upload limit in the Maximum upload size field.
   The default size is 2MB, while the maximum upload size possible is 64MB.
9. Click Save settings.
   You have configured the image upload limitations.

Configuring the appearance of ratings in the Developer Portal

You can configure the appearance of ratings in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can configure the appearance of ratings for only the following content types in the Developer Portal:

- APIs
- Applications
- Products

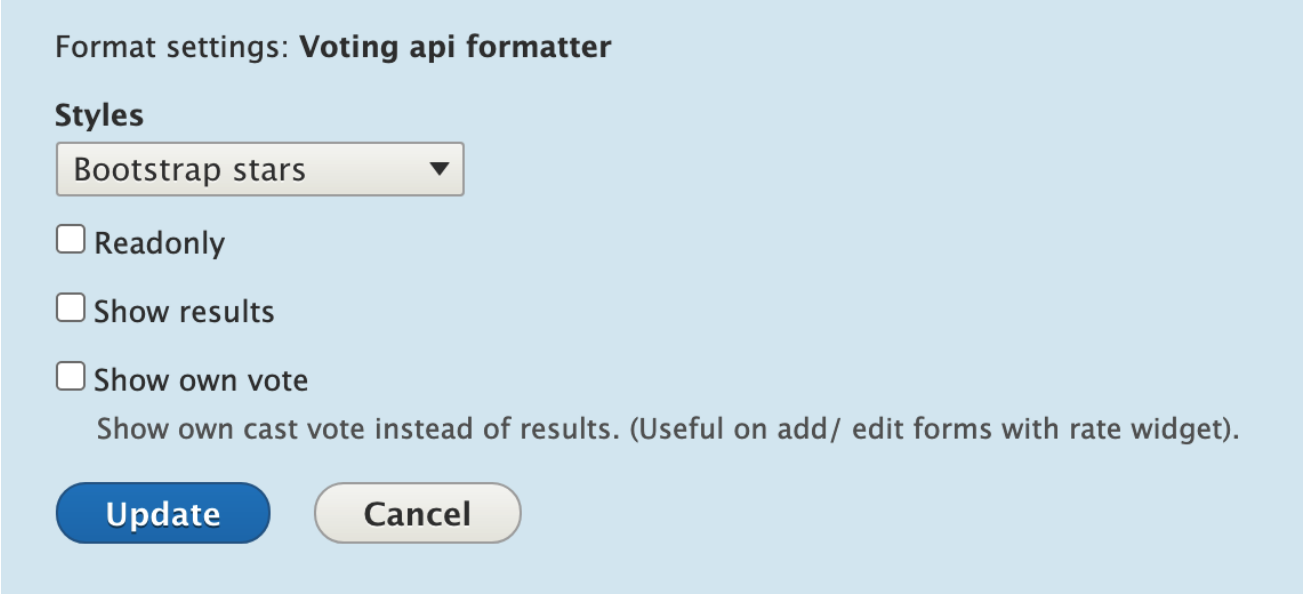
Note: The Applications and Products content types rating functionality is set to hidden by default.

Procedure

These following steps describe how to customize the rating on a selected API, Application, or Product. To ensure that the configured rating is also displayed in the list view of APIs, Applications, or Products, then you must repeat these steps on the Teaser tab in the Manage Display window:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. Select Manage display from the list in OPERATIONS column, next to the required content type.

5. Click the Settings icon , then select the style you require, then click Update.



6. Click Save. You have configured the appearance of the ratings feature for the required content type.

Customizing the privacy policy statement

You can define and customize a privacy policy statement that sets out the privacy conditions of your Developer Portal site. The privacy policy can be linked to from the cookie compliance banner.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To define or customize a privacy policy, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content, then enter `privacy` into the title search filter, and click Filter.
   The Privacy Policy content item is displayed in the list of content.
4. Click Edit next to the Privacy Policy content item.
5. Update the content as required. For example, you can complete the following tasks:
   a. Edit the text of the privacy policy statement.
   b. Set the display settings.
   c. Link the content to Products and APIs.
   d. Enter an explanation of the changes that have been made to the privacy policy since the last version.
6. Click Save to save your changes.

Results

The privacy policy statement is successfully updated.

What to do next

You can set your cookie compliance banner to link to your updated privacy policy. For more information, see Enabling a cookie compliance banner.

Related tasks

- Enabling a cookie compliance banner
- Customizing the terms of use statement

Customizing the terms of use statement

You can define and customize a terms of use statement that sets out the terms and conditions that your users must accept to use your Developer Portal site.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To define or customize a terms of use statement, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content, then enter `terms` into the title search filter, and click Filter.
   The Terms of use content item is displayed in the list of content.
4. Click Edit next to the Terms of use content item.
5. Update the content as required. For example, you can complete the following tasks:
   a. Edit the text of the terms of use statement.
   b. Set the display settings.
   c. Link the content to Products and APIs.
   d. Enter an explanation of the changes that have been made to the terms of use since the last version.
6. Click Save to save your changes.

Results

The terms of use statement is successfully updated.

What to do next

You can force new users to accept the terms and conditions on the Developer Portal. For more information, see Forcing new users to accept terms and conditions.

Related tasks

- Enabling a cookie compliance banner
- Customizing the privacy policy statement

Editing a site comment

You can edit site comments in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To edit a site comment, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click the Comments tab.
4. In the OPERATIONS column, click Edit alongside the comment that you want to edit.
5. Edit the content of the comment as required.
6. Click Save.
   You have edited the selected comment.

Editing sample content

You can edit sample content, such as basic pages, in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To edit sample content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the OPERATIONS column, click Edit alongside the content item that you want to edit.
4. Edit the sample content of the selected element as required.
5. Click Save and keep published, to publish the updated content,or select Save and unpublish if you want to publish the updated content later.

Editing tags for a specific item

You can edit tags for a specific item in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

You must have some tags that are available to apply to your content; see Managing tags in the Developer Portal.

Procedure

To edit tags for a specific item, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the list of content items, click Edit alongside the content item that you want to update.
4. In the Tags section, select the required tag.
5. To add another tag, click Add another item, then select the required tag.
6. If you want to publish the updated content, ensure the Published check box is selected. Deselect the check box if you want to publish the updated content later.
7. Click Save.

Related tasks

Turning content on or off in the Developer Portal

You can turn certain content elements on or off in the Developer Portal

To learn how to turn content on or off in the Developer Portal, use the following topic links:

- **Deleting a site comment**
  You can delete site comments in the Developer Portal.
- **Deleting blocks**
  You can delete blocks in the Developer Portal.
- **Disabling blogs**
  You can disable blogs on your Developer Portal.
- **Deleting forums from the front page**
  You can delete the help information on forums from the front page of your Developer Portal.
- **Turning comments for specific content types on or off in the Developer Portal**
  You can turn the comments for specific content types on or off in the Developer Portal.
- **Turning comments off for an individual item**
  You can turn off comments for individual items within a content type.
- **Turning off ratings for specific content types in the Developer Portal**
  You can turn off ratings for specific content types in the Developer Portal by hiding the ratings field.
- **Turning the ability to tag specific content types off in the Developer Portal**
  You can turn the ability to tag specific content types on or off in the Developer Portal.

Deleting a site comment

You can delete site comments in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To delete a site comment, complete the following steps

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click the Comments tab.

4. From the UPDATE OPTIONS list, select Delete the selected comments.
5. Select the comments that you want to delete, then click Update.
   The confirmation screen displays.
6. Click Delete comments.
   You have deleted the selected comments.

Deleting blocks

You can delete blocks in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Pages.
4. In the OPERATIONS column, find the welcome page row and select Edit from the drop-down list.
5. Expand Panels, then click Content.
6. In the OPERATIONS column, find the block that you want to delete and select Delete for the drop-down list
7. Click Delete to confirm, then click Update and save.

Disabling blogs

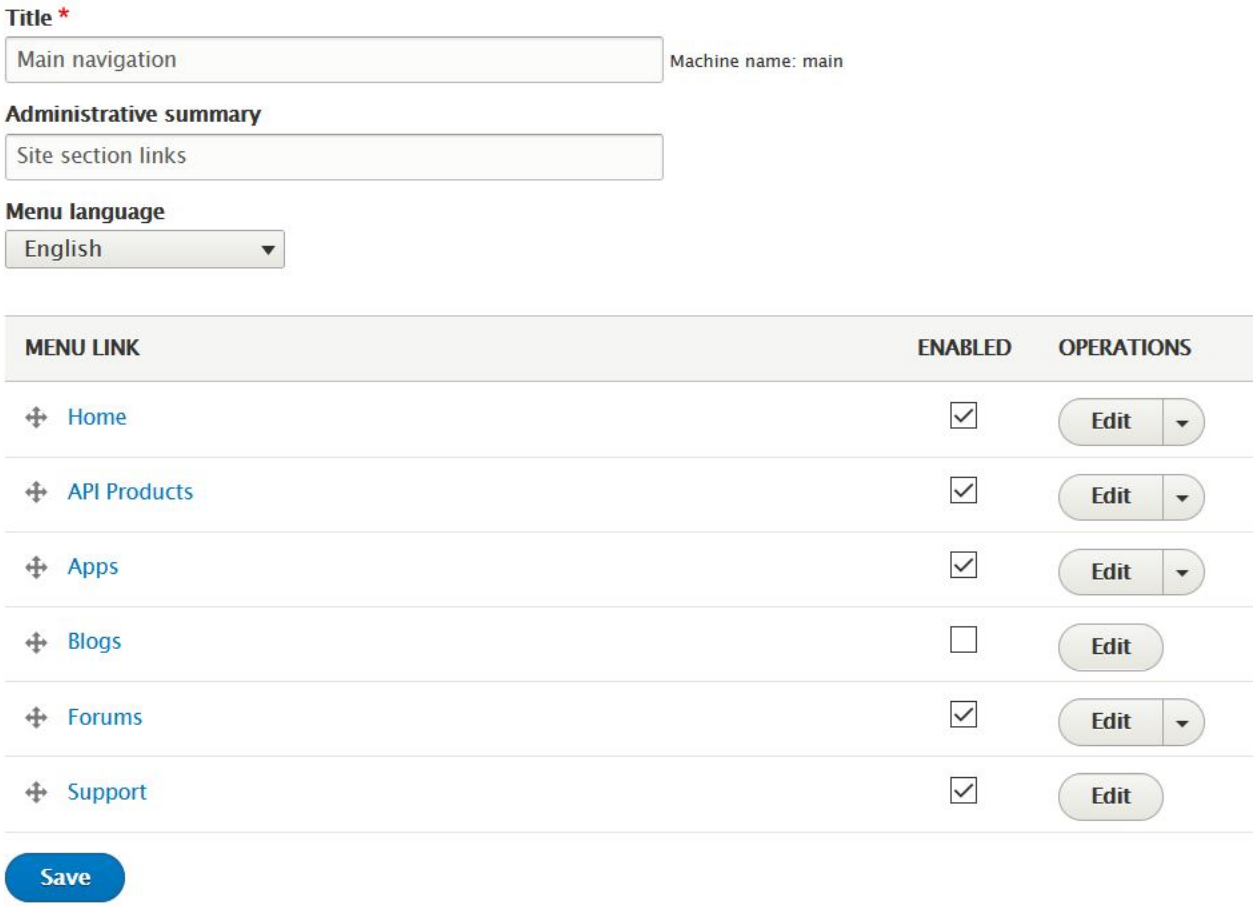
You can disable blogs on your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Before any changes are made, **`Blogs`** show as an option on the front page like this:

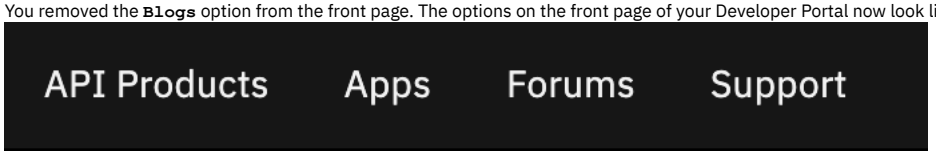
Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Menus from the administrator dashboard.
3. In the OPERATIONS column, click Edit menu for **`Main navigation`**.
4. Clear Enabled for the **`Blogs Menu link`**, then click Save.



Results

You removed the **Blogs** option from the front page. The options on the front page of your Developer Portal now look like this:

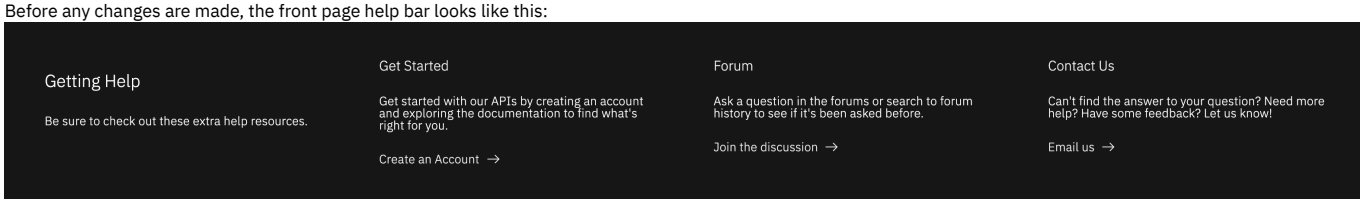


Deleting forums from the front page

You can delete the help information on forums from the front page of your Developer Portal.

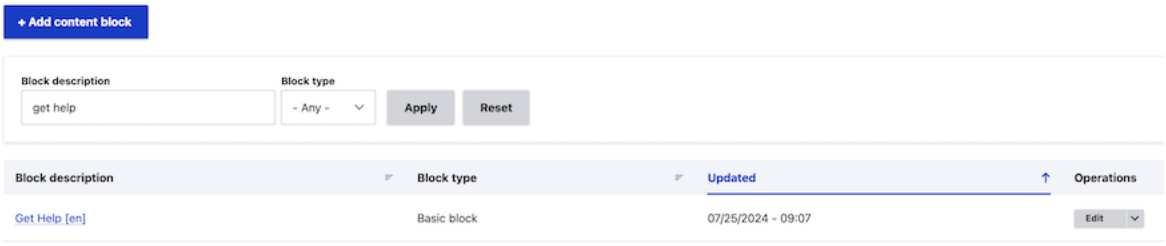
Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Before any changes are made, the front page help bar looks like this:



Procedure

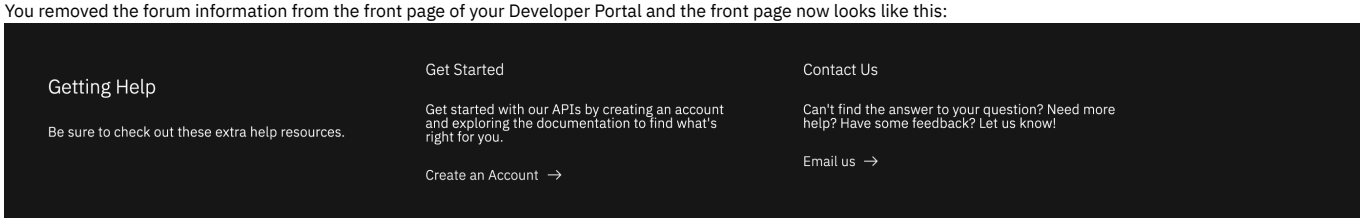
1. Click Blocks and enter `Get help` in the Block description field.
2. Click Apply.



3. In the Operations column, click Edit.
4. In the **Body** section, delete the forum information, then click Save.

Results

You removed the forum information from the front page of your Developer Portal and the front page now looks like this:



Turning comments for specific content types on or off in the Developer Portal

You can turn the comments for specific content types on or off in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To turn comments for specific content types on or off in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. In the OPERATIONS column, click Manage fields for the required content type.
5. In the OPERATIONS column, click Edit for the Comments field.
   Note:
   - If there is no Comments field, you can enable commenting for the selected content type by adding one as follows:
     - Click Add field.
     - From the Add a new field list, select Comments.
     - Enter a field label, then click Save and continue.
     - Select the required comment type, then click Save field settings.
   - You can completely disable commenting for the selected content type, and permanently remove all current comments, by selecting Delete.
6. Select the required option in the DEFAULT VALUE section.
   a. To allow commenting, select Open.
   b. To keep existing comments but disallow further commenting, select Closed.
   c. To hide all comments, select Hidden.
7. When done, click Save settings.

Turning comments off for an individual item

You can turn off comments for individual items within a content type.

Before you begin

Users with edit permission for the selected content type can perform this task.

Procedure

To turn off comments for a single item, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.

2. Click Content in the administrator dashboard.
3. In the OPERATIONS column, click Edit for the required content item.
4. Click Comment settings in the side pane.
5. Select Closed to turn comments off for the selected item.
6. Click Save.

Turning off ratings for specific content types in the Developer Portal

You can turn off ratings for specific content types in the Developer Portal by hiding the ratings field.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To turn off ratings for specific content types in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. In the OPERATIONS column for the required content type, select Manage fields from the drop-down list.
5. Click on the Manage form display tab. In the FIELD list, select Rating and drag and drop it into the Disabled section, then click Save.
6. Click on the Manage display tab. Content items are displayed by using different view modes, such as Default, Card, and Teaser, and these modes are shown at the beginning of the Manage display page. For each view mode that is applicable to the content type you're editing, click the mode, and in the FIELD list select Rating, and drag and drop it into the Disabled section.
7. Click Save.

Turning the ability to tag specific content types off in the Developer Portal

You can turn the ability to tag specific content types on or off in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To turn the ability to tag specific content types on or off in the Developer Portal, complete the following steps:

1. Click Structure in the administrator dashboard.
2. Click Content types.
3. Click Manage fields next to the required content type.
4. From the Tags field, click Edit.
5. Click Delete, then confirm the Delete as the action cannot be undone.
   You have turned the ability to tag specific content types off.

Structure

Control the layout of the Developer Portal, such as configuring the front page, adding and changing blocks, and displaying Products and APIs in categories.

To learn how to control the layout of the content on your Developer Portal site, use the following topic links.

- **Configuring the front page**
  You can configure the Developer Portal front page.
- **Adding a menu**
  You can add a menu to the Developer Portal, and define the items that are included in the menu.
- **Adding and changing the blocks displayed on Developer Portal pages**
  You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages.
- **Changing the front page banner block**
  You can change the front page banner content and image that is displayed on the home page when a user first logs in to the Developer Portal.
- **Changing the front page Featured Content block**
  You can display featured Products or APIs on the front page of your Developer Portal by configuring the Featured Content block.
- **Changing the case studies content block on the front page**
  Configure the case studies content block on your Developer Portal as required.

- **Changing the items in the main menu**
  You can change the items in the main menu that is displayed on all pages in the Developer Portal.
- **Changing the ratings display**
  You can change the appearance of the content ratings in the Developer Portal.
- **Displaying APIs and Products in categories**
  You can create taxonomies in the Developer Portal, which dictate the categorization of APIs and Products, and how they are displayed. The taxonomies that you define can be used by API developers to categorize APIs and Products in YAML files.
- **Implementing an image carousel**
  You can customize your Developer Portal home page to display images in a carousel. The image carousel provides your Developer Portal home page with a continuous slide show that is customized to your specifications.
- **Making your application's image public**
  You might want to display your application's image in an oauth authentication page to reassure customers that they are authenticating the correct application in the Developer Portal. That authentication uses a URL to the image that is stored on the Developer Portal. However, by default, those images are private unless you are logged in, which doesn't work if you want to display it in an oauth page. The solution is for the admin to change the `application_image` field to use public instead of private.
- **Providing navigation by tag hierarchy**
  You can provide the ability for users in the Developer Portal to navigate by using tag hierarchy.
- **Using the Views module in the Developer Portal**
  By using the Views module, you can fetch content from your Developer Portal site, and present it to users in different formats such as lists, graphs, and tables.

Configuring the front page

You can configure the Developer Portal front page.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Create a customized welcome page for your users. Note that blocks that are placed on the front page of the Developer Portal are visible to all users, regardless of whether the blocks have access restrictions placed on them. The visibility of blocks to all users also extends to the Featured Content block.

Procedure

To configure the front page, complete the following steps:

1. Click Structure, then click Pages.
2. Alongside the welcome entry, click Edit.
3. Use the options provided to configure the front page.
   Here you can edit the page information, access, and configuration of the welcome page.
4. Click Update and save to save your changes.

What to do next

You can create a custom page. For more information, see Creating custom pages.

- **Disabling blogs**
  You can disable blogs on your Developer Portal.
- **Deleting forums from the front page**
  You can delete the help information on forums from the front page of your Developer Portal.

Related tasks

- Changing the front page banner block
- Changing the front page Featured Content block

Disabling blogs

You can disable blogs on your Developer Portal.

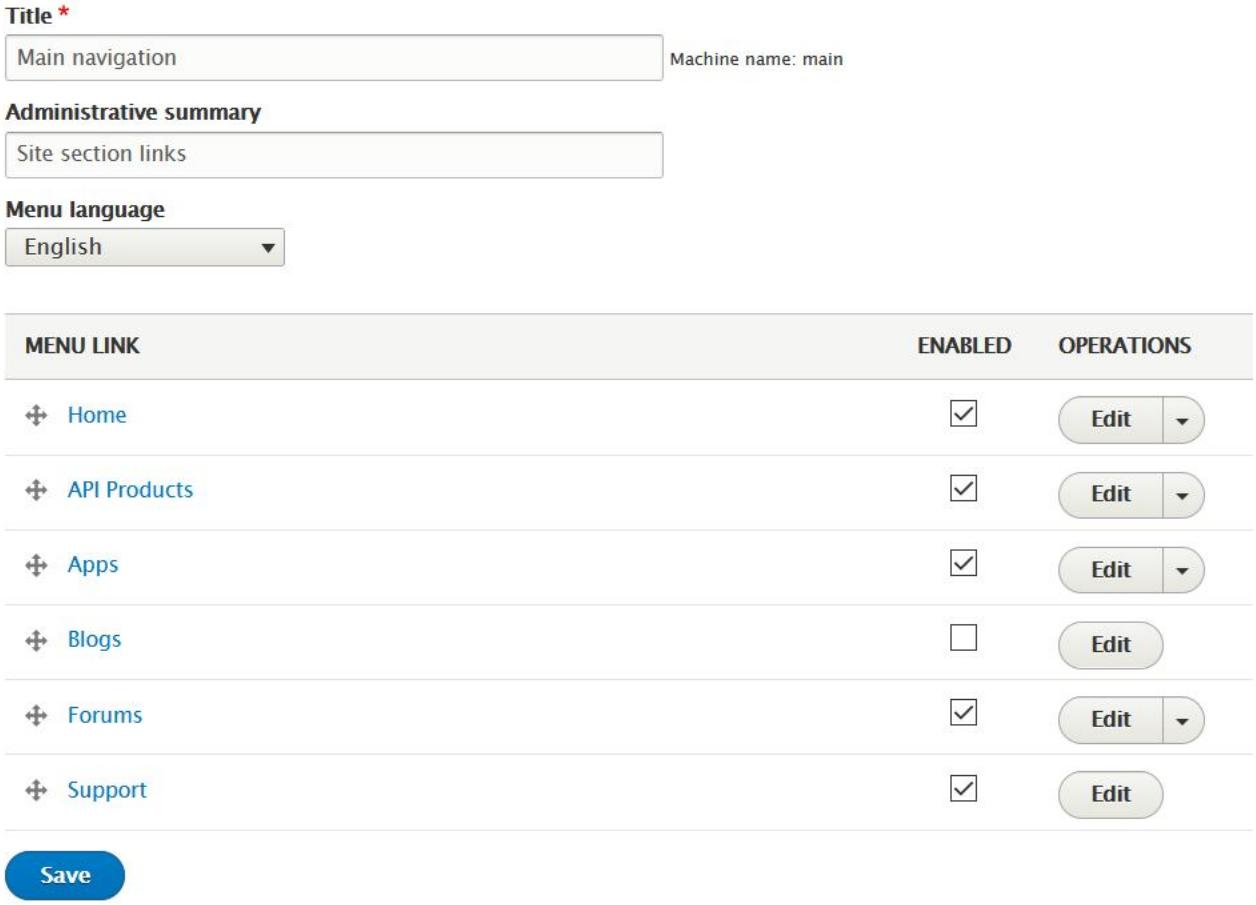
Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Before any changes are made, **Blogs** show as an option on the front page like this:

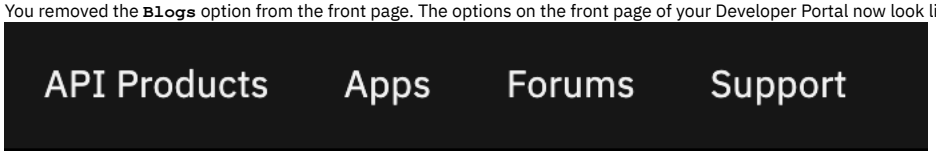
Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Menus from the administrator dashboard.
3. In the OPERATIONS column, click Edit menu for **Main navigation**.
4. Clear Enabled for the **Blogs Menu link**, then click Save.



Results

You removed the **Blogs** option from the front page. The options on the front page of your Developer Portal now look like this:



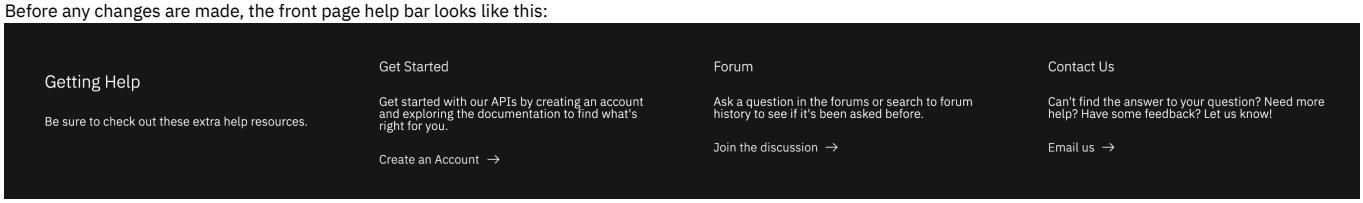
Deleting forums from the front page

You can delete the help information on forums from the front page of your Developer Portal.

Before you begin

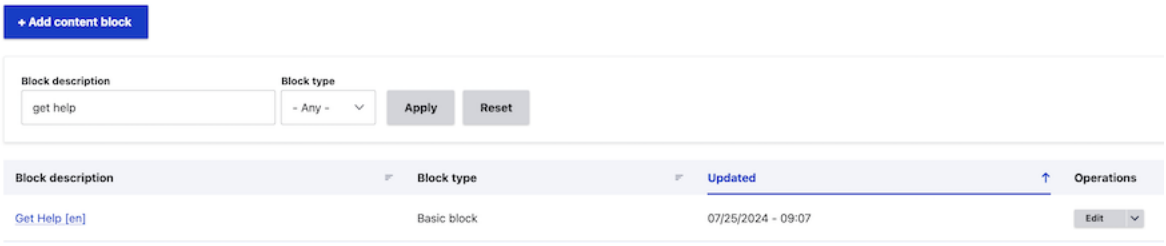
You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Before any changes are made, the front page help bar looks like this:



Procedure

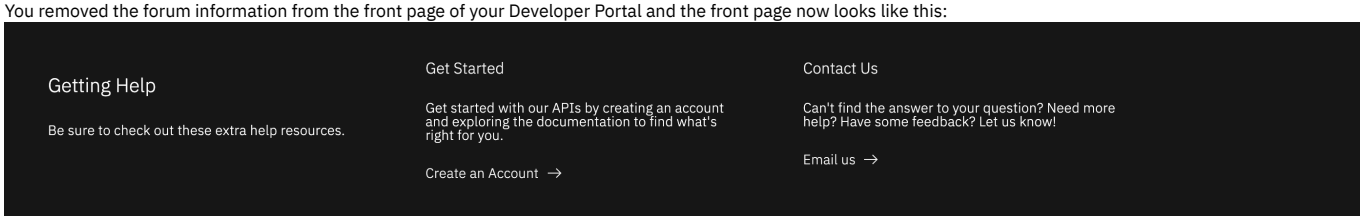
1. Click Blocks and enter `Get help` in the Block description field.
2. Click Apply.



3. In the Operations column, click Edit.
4. In the **Body** section, delete the forum information, then click Save.

Results

You removed the forum information from the front page of your Developer Portal and the front page now looks like this:



Adding a menu

You can add a menu to the Developer Portal, and define the items that are included in the menu.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To add a menu, complete the following steps:

1. Click Structure > Menus.
2. Click Add menu, provide a title, and an optional summary and menu language, and click Save.
3. To add items to your menu, click Add link, and configure the menu link details that you require.
4. Click Save to save your changes.
   A new block for your menu is created automatically, and your menu is now in the **Menus** list.

What to do next

You can use block configuration options to control which pages your menu is displayed on, and where it is positioned. You can use your menu with, or instead of, other menus available within the site. For more information, see Changing the blocks displayed on Developer Portal pages.

You can also update an existing menu, or change your menu. For more information, see Changing the items in the main menu.

Adding and changing the blocks displayed on Developer Portal pages

You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Blocks are boxes of content that are rendered into an area, or region, of a page. The content can be custom HTML, Github Markdown, or plain text, and you can specify the appearance, size, position, and also configure which pages a block appears on by editing its visibility settings. You can also modify an existing block to change its appearance, size, position, and visibility.

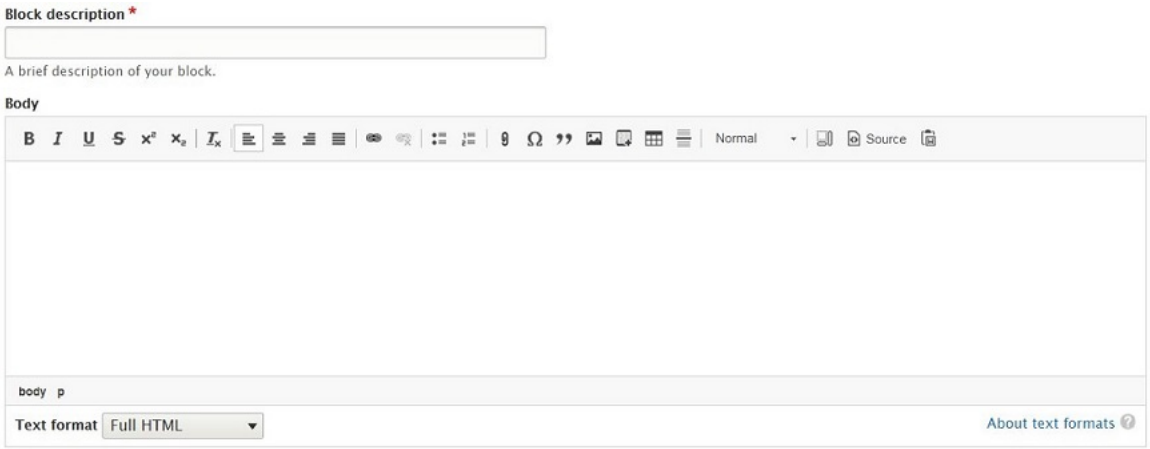
- Add a new block
- Edit the content of an existing block
- Modify the layout or visibility of an existing block

Procedure

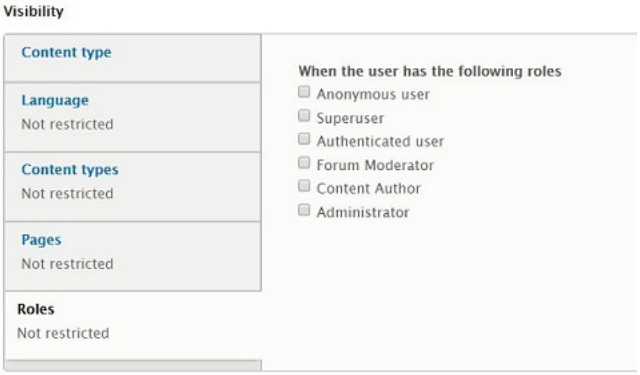
To add a new basic block, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure, then click Block layout.
   All of the blocks that are in the system are displayed by theme. From the Block layout page you can assign blocks to a region, and control the order of the blocks within the region. Blocks are positioned on a per-theme basis, so if you enable more than one theme on your site, you can place blocks differently for each theme.
3. Click Place block > Add custom block.
   The Add custom block page is displayed.
4. Complete the Block description field.
5. Enter the content that you require for your block into the Body section.
   You can set the text format to Full HTML, Basic HTML, Restricted HTML, or Github Markdown. You can use the edit icons in the Body section to configure your content. Click the Source icon

   to enter code source, such as HTML.



6. Click Save.
   The new custom block is saved and the Configure block page is displayed.
7. Complete the block Title field.
8. In the Visibility section, specify how you want the block to be displayed.
   You can specify the content types, configure the language settings, restrict the block to show only on pages that display specific content types, set which pages the block is displayed on, and restrict which user roles the block is visible to.



9. In the Region section, select the region where the block should be displayed.
10. Click Save block.
    The new custom block is added to your Developer Portal site.

To edit the content of an existing block, from the Block layout page complete the following steps.

11. Click the Custom block library tab (or select Structure > Block layout > Custom block library from the administrator dashboard).

12. Click Edit alongside the required block.
13. Change the block description and body content as required.
14. Click Save to save your changes.

To modify the layout or visibility settings of an existing block, from the Block layout page complete the following steps.

15. To change the region in which a block is positioned, select the required Region from the drop-down list next to the required block.
16. To change the vertical sort-order of a block within a region, drag the block to the required position.
17. To edit the visibility settings of an existing block, click Configure from the Operations drop-down menu next to the required block.
18. To enable or disable an existing block, select Enable or Disable from the Operations drop-down menu next to the required block.
19. Click Save blocks to save your changes.

Changing the front page banner block

You can change the front page banner content and image that is displayed on the home page when a user first logs in to the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

About this task

You can change the front page banner by editing the Welcome Banner block in the custom block library.

Procedure

To change the front page banner block, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Blocks and enter `welcome` in the **`Block description`** field.
3. Click Edit against the Welcome Banner block entry.
   The Edit Basic block Welcome Banner page is displayed.
4. Edit the Body section with the content and image that you require.
   You can set the text format to Full HTML, Basic HTML, Restricted HTML, or Github Markdown. You can use the edit icons in the Body section to configure your content. Click the Source icon

   to view and edit the code source, such as HTML.
5. Configure the language and translation settings as required.
6. Click Save to save your changes.

Results

You successfully updated the front page banner block.

Related tasks

- Configuring the front page
- Adding and changing the blocks displayed on Developer Portal pages

Changing the front page Featured Content block

You can display featured Products or APIs on the front page of your Developer Portal by configuring the Featured Content block.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

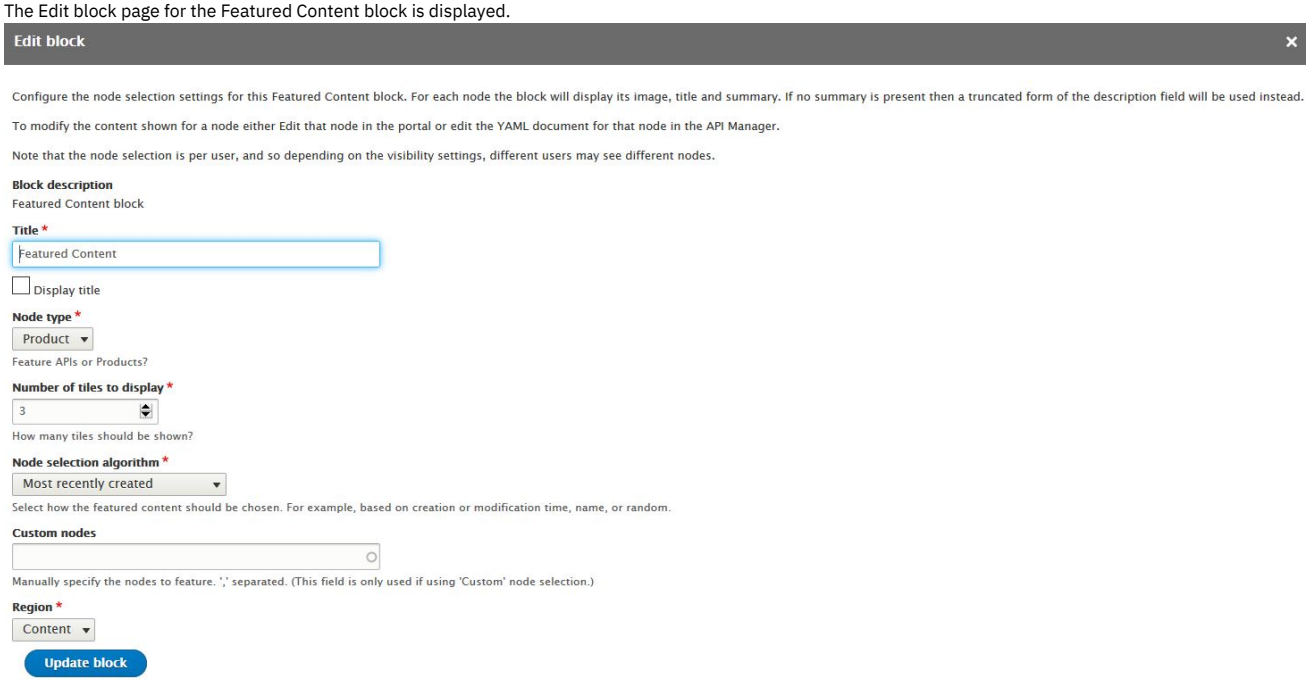
About this task

You can configure the Featured Content block on the front page of your Developer Portal. By default this block displays a list of the most recently created Products, but you can configure the block to display Products or APIs, and select how the featured content is chosen.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Pages.
4. Click Edit against the welcome page.
   The edit menu for the Welcome page is displayed.

5. Select Panels > Content from the navigation column, and then click Edit against the Featured Content block.
   The Edit block page for the Featured Content block is displayed.



6. Configure the Feature Content block as required.
   You can choose to display the title or not, select whether to use Products or APIs, for your node type. You can choose how many tiles to display, and select which algorithm is used to select the node. If you start typing in the **`Custom nodes`** field, you can choose from the options you are given.
7. Click Update block, then Update and save, to save your changes.

Results

You successfully configured the Featured Content block on the front page of your Developer Portal.

Changing the case studies content block on the front page

Configure the case studies content block on your Developer Portal as required.

Before you begin

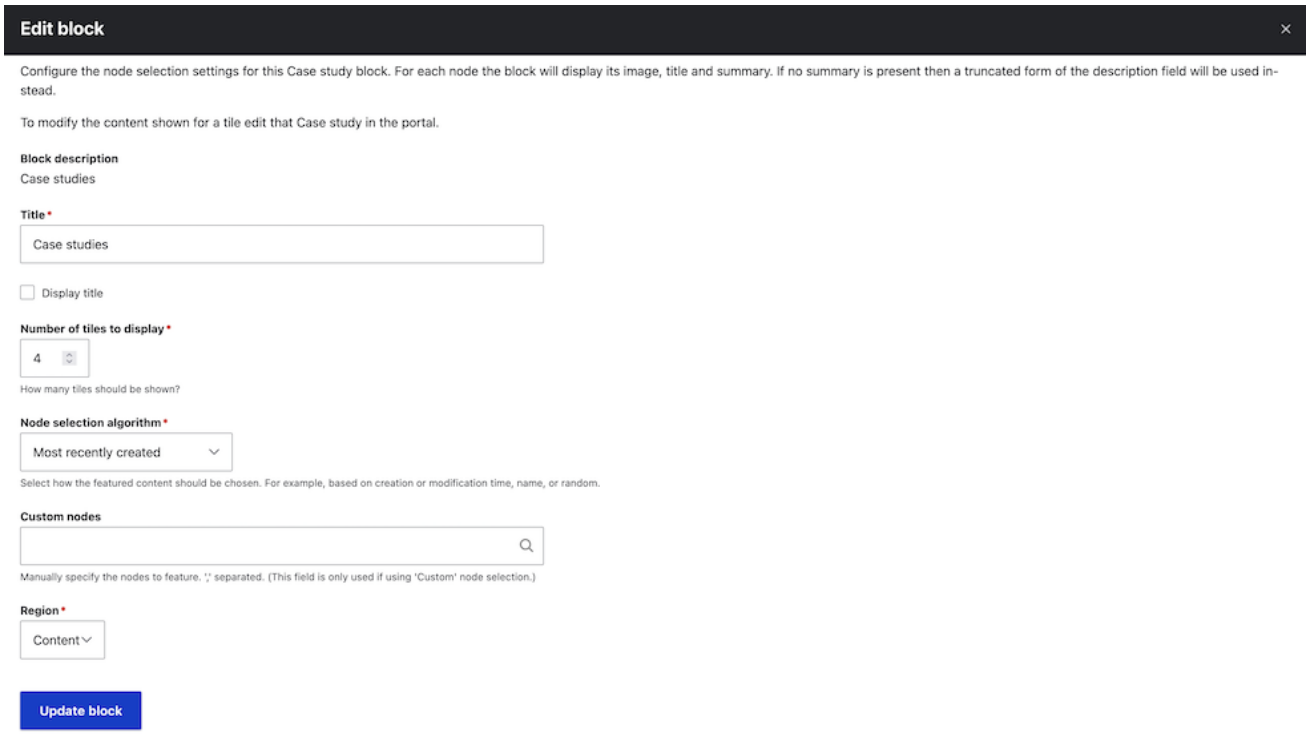
You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can configure the **`Case studies`** content block on the front page of your Developer Portal. By default this block displays a list of the most recently created case studies, but you can configure the block to display the case studies based on a different algorithm. You can also configure the numbers of tiles to display and the visibility of the content block title.

Procedure

1. Log in to the Developer Portal as an administrator.
2. Click Structure > Pages.
3. Click Edit against Welcome.
   The edit menu for the Welcome page is displayed.
4. Select Panels > Content from the navigation column, and then click Edit against the Case studies block.
   The Edit block page for the Case studies block is displayed.



5. Configure the case studies block as required.
   You can choose to whether to display the title, how many tiles to display, and select which algorithm is used to select the node. If you start typing in the **`Custom nodes`** field, you can choose from the options you are given.
6. Click Update block.
7. Click Update and save to save your changes.

Results

You successfully configured the case studies Content block on the front page of your Developer Portal.

Changing the items in the main menu

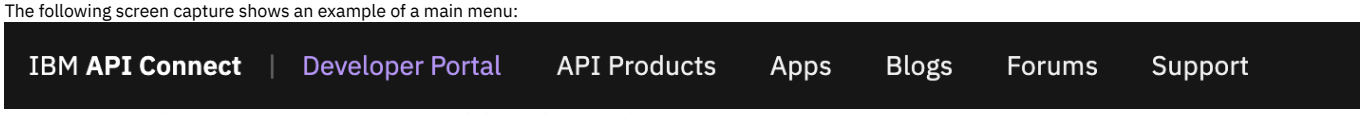
You can change the items in the main menu that is displayed on all pages in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The following screen capture shows an example of a main menu:

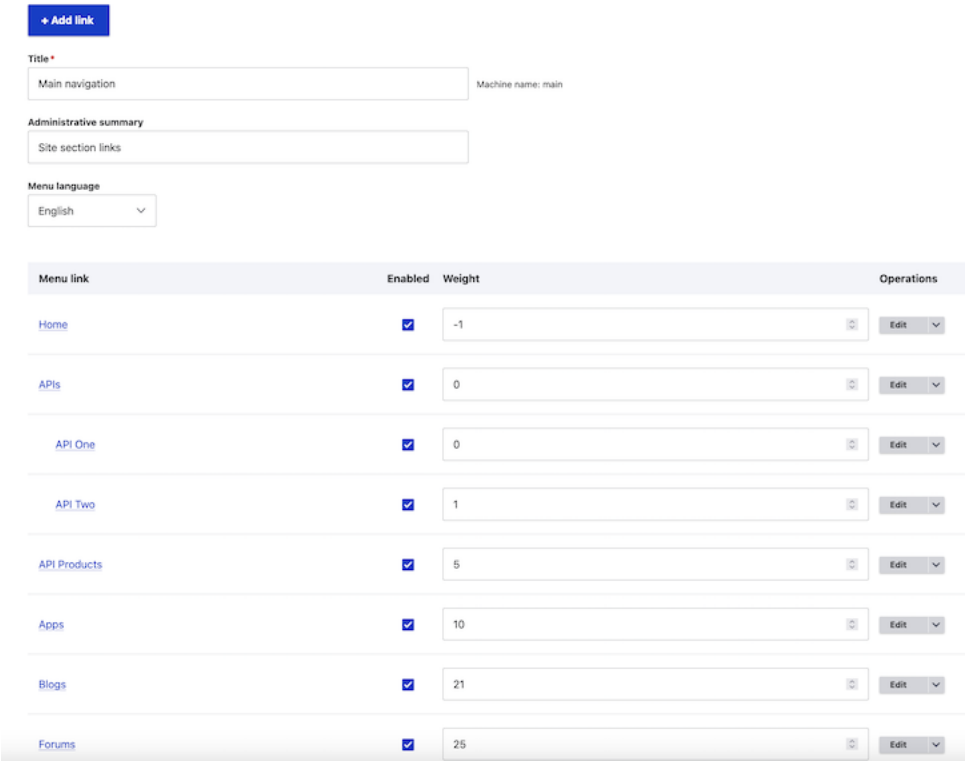


However, you can add new menu items, remove items, and change the item order.

Procedure

To change the items in the main menu, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. Click Structure > Menus. Find the **`Main navigation`** title and click Edit menu.



3. Use the configuration settings on the Edit menu main navigation page to change the menu items as required.
4. Click Save to save your changes.

Changing the ratings display

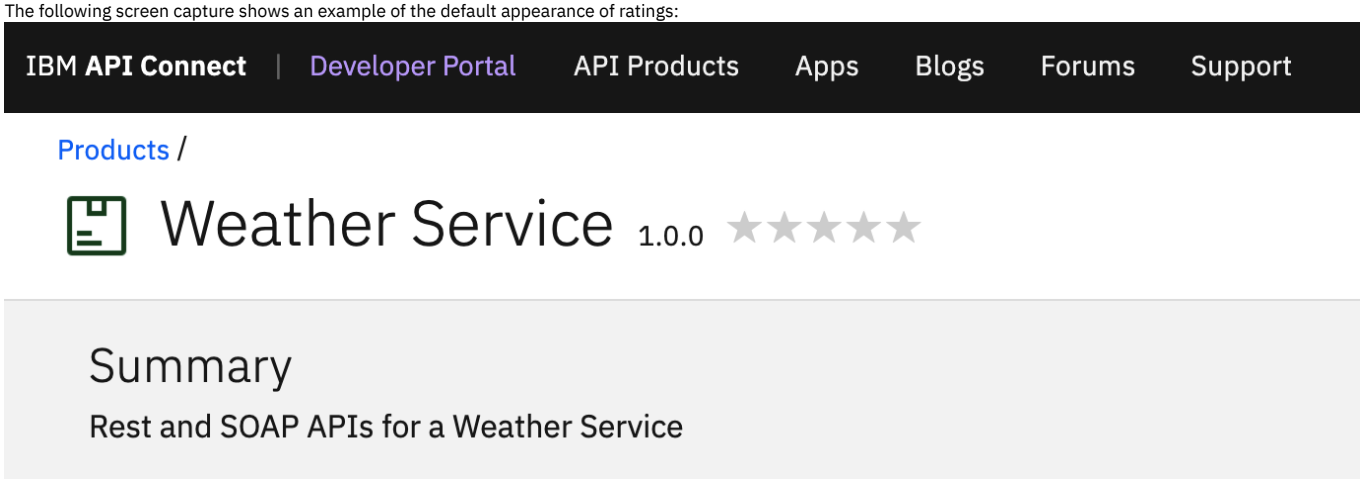
You can change the appearance of the content ratings in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The following screen capture shows an example of the default appearance of ratings:

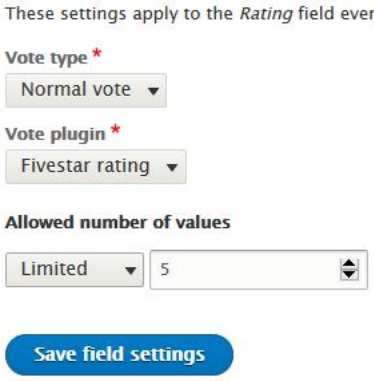


You can change this display if you want to.

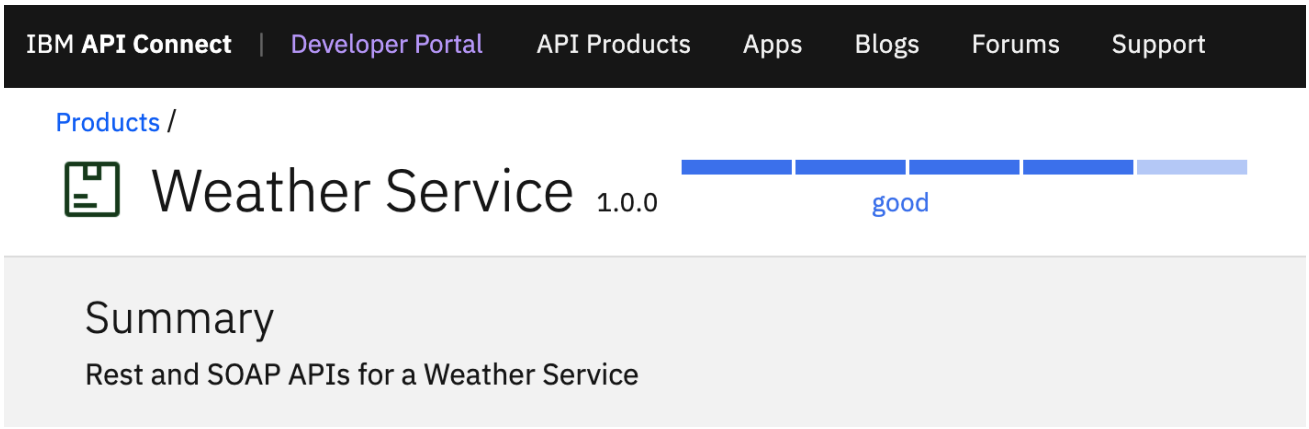
Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Content types.

4. Click the Manage fields drop-down against the content type you want to change, for example **`Product`**.
5. Click Edit on the **`Rating`** row. Then, select the Field settings tab.



6. Change the style settings as required and click Save field settings.
   Here is an example of an alternative Ratings style:



Results

You successfully changed the ratings display for a content type in your Developer Portal.
Note: There are different view modes, and the settings would need to be changed for each view mode for each content type.

Displaying APIs and Products in categories

You can create taxonomies in the Developer Portal, which dictate the categorization of APIs and Products, and how they are displayed. The taxonomies that you define can be used by API developers to categorize APIs and Products in YAML files.

You might want to create taxonomies to control which set of APIs and products can and cannot be used in the Developer Portal.

By default, all taxonomies must be created in the Developer Portal. For more information, see Managing tags in the Developer Portal.

After you create your taxonomies for your APIs and Products, API developers can assign content to those taxonomies manually in the Developer Portal, or by using categories in YAML files.

However, if you create categories for your APIs and Products in the API Designer or API Manager UI, you can have your APIs and Products that are displayed in those categories in the Developer Portal. For more information about how to create categories for your APIs and Products in the API Designer or API Manager UI, see Organizing your Products into categories. For information about how to have your APIs and Products that are displayed in those categories in the Developer Portal, see Enabling dynamic category creation.

You can add more Developer Portal taxonomies to the categories that are defined in the API Designer or API Manager UI.

You can also provide the ability for users in the Developer Portal to navigate by using tag hierarchy. For more information, see Providing navigation by tag hierarchy.

- **Enabling dynamic category creation**
  You can display APIs and Products in pre-defined categories in the Developer Portal. You can define the categories that the APIs and Products are displayed in, in the API Designer or API Manager UI.

Enabling dynamic category creation

You can display APIs and Products in pre-defined categories in the Developer Portal. You can define the categories that the APIs and Products are displayed in, in the API Designer or API Manager UI.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Your APIs and Products must be categorized in the API Designer or API Manager UI, and they must be published. For more information, see Organizing your APIs into categories and Organizing your Products into categories.

About this task

By organizing your APIs and Products into categories, you can provide a hierarchical display for your APIs and Products in the Developer Portal.
Note: Organizing APIs and Products into a hierarchical view in the API Manager UI is different from tagging in the Developer Portal.
The categories that are defined in the API Designer or API Manager UI can be overridden by creating taxonomies in the Developer Portal. For more information, see Displaying APIs and Products in categories.

Procedure

1. To enable the Developer Portal to display the categories for your APIs and Products:
   a. On the administrator dashboard, click Configuration > System > IBM API Developer Portal.
   b. In the Categories section, select the Create taxonomies for categories if they do not already exist check box.
   c. Click Save configuration.
2. To enable the Developer Portal to display the change to the categories you made in step 1, you must republish your APIs and products.

Results

You enabled the Developer Portal to display the categories that you defined for your APIs and Products. You can see the categories that you defined, including the number of APIs and Products that are in each category, by selecting your APIs and Products in the Developer Portal.

Implementing an image carousel

You can customize your Developer Portal home page to display images in a carousel. The image carousel provides your Developer Portal home page with a continuous slide show that is customized to your specifications.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

By implementing an image carousel, you can replace the default welcome banner or any previously set images.

Procedure

1. Create a content type of Image for your carousel.
   a. Click Structure > Content types > Add content type.
   b. Enter the name of your content type in the Name field.
      For example, *Slide show picture*.
   c. Optional: Specify the description of your content type in the Description field.
      For example, *A picture to display in the slideshow*.
   d. Click Save and manage fields for your newly created content type.
   e. Click Add field.
   f. Select Image for Add a new field, and enter a label for your field.
      For example, *slide image*.
   g. Click Save and continue.
      The Field settings page for your new field is displayed.
   h. In the DEFAULT IMAGE section, click Choose file to assign the image that you want as your default image for your slide show if no other images are found.
   i. Optional: Complete the Alternative text and Title fields.
   j. Click Save field settings.
   k. In the Manage fields tab for your newly created content type of *Slide show picture*, delete the `Body` field by clicking Delete on the OPERATIONS drop-down menu. Click Delete again to confirm.
2. Upload the images that you want to appear in your carousel.
   a. Click Content > Add content, then click the content type that you added in step 1.
   b. Enter a title for your image in the Title field.
      For example, if you had an image of a lighthouse, you can label the content as *Lighthouse*.
   c. Click Choose file under Slide image and select an image for your slide show. Complete the Alternative text field with some text to use when the image cannot be loaded.
   d. Click Save.
   e. Repeat sub-steps 2.a to 2.d until you are satisfied with the content of the slides for your carousel.
3. Create a view for your carousel.
   a. Click Structure > Views > Add new view.
   b. Complete View name.

For example, Slide show.
c. Select the Create a block check box in the BLOCK SETTINGS section.
d. Select Slick Carousel for the display format.
e. Enter the number of slides you have for your carousel in the Items per block field, then click Save and edit.
The Edit page for your slide show view is displayed.
f. Click the title of the view and enter `<none>` into the text field. Click Apply.
g. In the FIELDS section click Add, select the check box for slide image, and click Add and configure fields.
h. Ensure the check box for Create a label is not selected, and click Apply.
i. In the FIELDS section, click Content: Title > Remove.
j. In the FORMAT section, click Settings for Slick Carousel, and then set Skin Main to Default.
k. Scroll down to the CAPTION FIELDS section, and select the Content: slide image and Override main optionset check boxes.
l. In the OVERRIDABLE OPTIONS section, select the Autoplay, Dots, and Draggable check boxes.
m. Click Apply.
n. In the FILTER CRITERIA section, click Content: Published > Remove.
o. Click Save to save the Slide show view.

4. Configure your home page to host the carousel.
a. Click Structure, then click Pages.
b. Click edit for the welcome page, then click content in the Panels section.
c. To remove the current welcome banner, click the down-arrow under the OPERATIONS column for the Welcome Banner, and select Delete. Click Delete again to confirm.
d. To add your carousel, click Add new block and select the slide show view you created in step 3. Deselect Display title and click Add block.
e. Click Update and save.

Results

Your Developer Portal front page now has a slide show carousel.

Making your application's image public

You might want to display your application's image in an oauth authentication page to reassure customers that they are authenticating the correct application in the Developer Portal. That authentication uses a URL to the image that is stored on the Developer Portal. However, by default, those images are private unless you are logged in, which doesn't work if you want to display it in an oauth page. The solution is for the admin to change the **`application_image`** field to use public instead of private.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Content types > Application > Manage fields
4. Navigate to the Image label, then in the **`Edit`** drop down, select **`storage settings`**.
5. Click **`Public files`** for **`Upload destination`**.
6. Click **`Save field settings`**.

Providing navigation by tag hierarchy

You can provide the ability for users in the Developer Portal to navigate by using tag hierarchy.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The Categories block provides the ability to navigate by tag hierarchy. The Categories block is disabled by default, so you need to enable the block and then configure it to your requirements.

Procedure

To provide navigation by tag hierarchy, complete the following steps:

1. Click Extend, in the filter box enter `Hierarchical Taxonomy Menu`.
2. Select **`Hierarchical Taxonomy Menu`**, then click Enable.
3. Click Structure > Block layout.
All of the blocks in the connect_theme are displayed.

4. Scroll to the region that you want to add the block to, for example Collapse right, click Place block.
5. Find the **`Hierarchical Taxonomy Menu`** block in the list and click Place block.
6. Complete any configuration tasks that you require for the **`Collapse right`** block, including selecting the correct taxonomy to use and indicating what pages to display the block on.
7. Click Save block to save your changes.
   You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages. For more information, see Adding and changing the blocks displayed on Developer Portal pages.

Related tasks

- Editing tags for a specific item

Using the Views module in the Developer Portal

By using the Views module, you can fetch content from your Developer Portal site, and present it to users in different formats such as lists, graphs, and tables.

The Views module is a powerful SQL query builder that can access almost all the information in your Developer Portal site database and display it in any format.

There are many uses cases for views, but the following list shows some of the common ones:

- You want to display some of the content differently, such as Products, APIs, and applications.
- You want to display a block with the five most recent posts of some kind.
- You want to change the way that articles are displayed.
- You want to provide an unread forum posts list.
- You want to provide a monthly archive of posts.

For information about how to create a view in the Developer Portal, see the following topic. You can also follow a tutorial about creating a custom sort order view; see Tutorial: Using a custom weighting sort order on the product list page.

- **Creating views in the Developer Portal**
  You can create new views in the Developer Portal, such as content lists of Products, APIs, and applications, by using the Views module.
- **Configuring the search results view in the Developer Portal**
  You can configure the way that the search results are displayed in the Developer Portal.
- **Configuring the default number of items in a view list in the Developer Portal**
  You can configure the default number of items that are displayed in a view list in the Developer Portal.

Creating views in the Developer Portal

You can create new views in the Developer Portal, such as content lists of Products, APIs, and applications, by using the Views module.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Creating views in the Developer Portal enables you to control the presentation of specific content for users. For more information about views, see Using the Views module in the Developer Portal.

Procedure

To create a view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Structure > Views > Add new view.
   The Add view page is displayed.
4. Complete the View name and, optionally, the Description.
5. Complete the VIEW SETTINGS section with details of what you want your view to show, and how you want it to be sorted.
   For example, to create a view of APIs that are sorted by title, select Show `Content`, of type `API`, and sorted by `Title`.
6. Select whether to Create a page, Create a block, or both, for your view.
   A page is a full-screen page in the Developer Portal. Whereas a block would be a site block that you can then place on whatever pages you want to show a smaller view of the content, for example the 10 newest APIs.
7. Complete the options that you require for your view. For example, the display format, the number of items per page or block, whether to include a pager, whether to create a menu link, and whether to include an RSS feed.
8. Click Save and edit.
   Your new view opens in the Edit tab.
9. Refine your view further.

Here you can further modify the display of your view or add new displays. More options include formatting of the view, what fields to include in a table or grid format, filtering and sorting criteria, add header or footer details, as well as advanced options around contextual filters, relationships, and behavior when there are no results to display. The Edit tab also includes a preview area, so you can check your view before publishing.

10. Click Save to make your changes permanent.
    When saved, your new view is visible in the Structure > Views pane.

Results

You created a new view in the Developer Portal.

Configuring the search results view in the Developer Portal

You can configure the way that the search results are displayed in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

In the Developer Portal, the search results are displayed as a view, and so you can control the presentation of this search content. For more information about views, see Using the Views module in the Developer Portal.

Procedure

To configure the search results view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Structure > Views.
   The list of views is displayed.
4. Find the Search content view in the list, and click Edit.
5. Edit the Search content view settings as required.
   Here you can modify the display of the view or add new displays. For example, you can configure the formatting of the view, the filtering and sorting criteria, add header or footer details, as well as more advanced options around contextual filters, relationships, and behavior when there are no results to display. There is also a preview area so you can check the view before publishing.
6. Click Save to make your changes permanent.

Results

You updated the view of the search results in the Developer Portal.

What to do next

You can configure the search index and server that are used to generate the search results. For more information, see Configuring search indexes and servers.

- Drupal Views module

Configuring the default number of items in a view list in the Developer Portal

You can configure the default number of items that are displayed in a view list in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

In the Developer Portal, you can manage how many items in a list are shown for each page on a view. For more information about views, see Using the Views module in the Developer Portal.

Procedure

To configure the search results view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Structure > Views.
   The list of views is displayed.
4. In the list, find the view name that you want to update, for example, Products, then click Edit.
5. Click Pager.
6. Select Display a specified number of items, click Apply.
7. Set the Items per page as required, click Apply.
8. Click Save to make your changes permanent.

Results

You updated the default number of items in a view of the search results in the Developer Portal.

What to do next

The Views module is a powerful SQL query builder that can access almost all the information in your Developer Portal site database and display it in any format. For more information, see Using the Views module in the Developer Portal.

Configuration

As an administrator, you can control multiple aspects of the Developer Portal configuration, including managing security and general configuration tasks.

To learn how to configure specific aspects of your Developer Portal site, use the following section links.

- **Configuring content moderation**
  By configuring content moderation, you can configure a review and approval process for content types in the Developer Portal. You can specify which roles can perform which actions by assigning them the appropriate permissions.
- **General configuration tasks**
  You can perform general configuration tasks in the Developer Portal as an administrator.
- **Managing Developer Portal security**
  You can manage multiple security elements in the Developer Portal.

Configuring content moderation

By configuring content moderation, you can configure a review and approval process for content types in the Developer Portal. You can specify which roles can perform which actions by assigning them the appropriate permissions.

Before you begin

An example use case for configuring content moderation would be for a professional documentation writer to review an APIs documentation before it is published on the Developer Portal. They might, for example, notify the API Developer of typographical errors, suggest improvements to operation descriptions, or attach an image file. Edits might then be made before the documentation was republished to the API and then published to the Developer Portal.

You must have a Developer Portal enabled, and you must have administrator access to complete this task.

About this task

By using content moderation, you can configure the workflow of your Developer Portal site so that you can moderate content types, such as APIs and Products. However, you cannot moderate Consumer organizations or applications.

Procedure

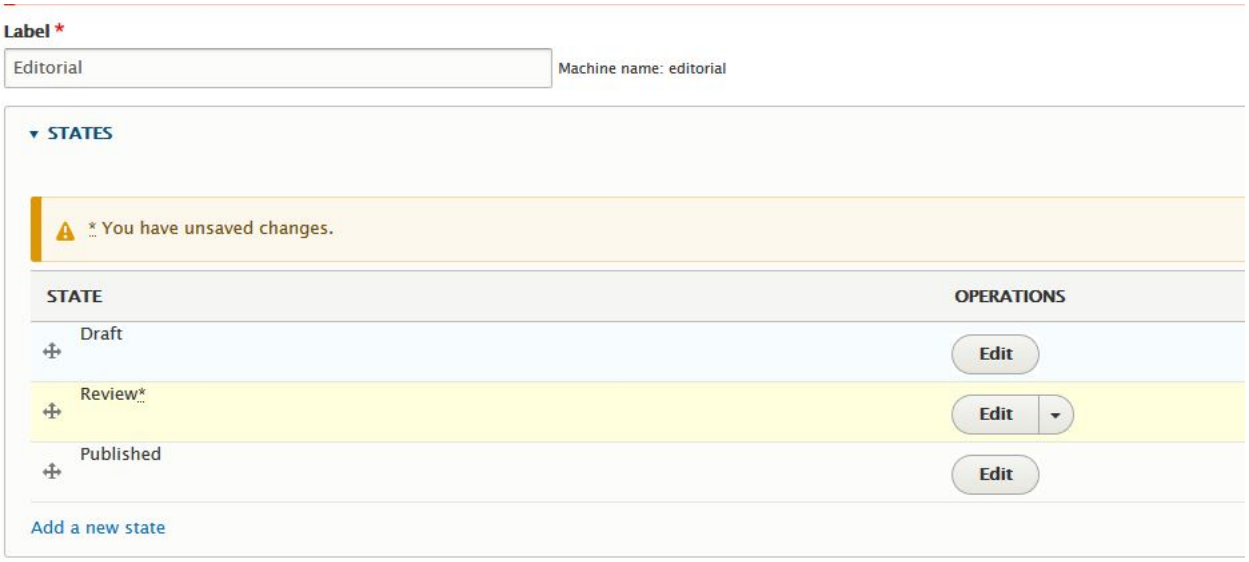
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Enable the required modules:
   a. On the administrator dashboard, click Extend.
   b. In the search bar enter **`workflows`**, then select the Workflows module and click Enable.
   c. In the search bar enter **`content moderation`**, then select the Content Moderation module and click Enable.
4. Navigate to Configuration > Workflow > Workflows
5. Check that **`Editorial`** is listed as a workflow. If it isn't listed:
   a. Click **`+ Add workflow`**.

b. Enter **`Editorial`** as the label.
c. Select the workflow type **`Content moderation`**.
d. Click **`Save`**.

6. Set up the workflow:
   a. Click **`Edit`** on the **`Editorial`** workflow.
   b. Click the **`Add a new state`** link.

   c. Enter the value **`Review`** in the **`State label`** field, leave the **`Published`** and **`Default revision`** check boxes cleared then click Save.

   d. Drag the **`review`** state to between the **`Draft`** and **`Published`** states then click 'Save'. If the drag handles are not visible, then click the **`Hide row weights`** link in the **`STATES`** section to make them appear.



e. Click the **Add a new transition** link.
f. Enter the value **Review** in the **Transition Label** field, tick the **Draft** check box in the **From** section and click **Review** in the **To** section then click Save.
g. Drag the **Review** transition to between the **Create New Draft** and **Publish** transitions, then click Save.
h. Click the **Edit** operation on the **Create New Draft** transition.
i. In the **From** check box list, untick **Published** and tick **Review** then click Save.
j. Click the **Edit** operation on the **Publish** transition.
k. In the **From** check box list, untick **Draft** and tick **Review** then click Save.
l. Click **Select** for the **Content types** item in the **THIS WORKFLOW APPLIES TO** section.
m. Select the **Product** content type then click Save.

7. Set up the permission schema for the workflow:
   a. Click People > Roles > Add a new role.
   b. In the **Role Name** field, enter the value **Editor** then click Save.
   c. Drag the **Editor** role to between the **Content Author** and **Administrator** roles then click Save.
   d. Click the Permissions tab and scroll down to the **Content Moderation** permission section.
   e. For the EDITOR role, select all the permissions in the **Content Moderation** section.
   f. For the CONTENT AUTHOR role, select the permissions **Editorial workflow: Use Create New Draft transition**, **View any unpublished content**, and **View the latest version** then click Save permissions.
   g. Ensure that the EDITOR and CONTENT AUTHOR roles have the permission **Use the administration toolbar**.
8. Assign the permissions to users in the portal. If you do not already have some registered users in your portal, create a new consumer organization and invite two new users to it.
   a. Click People.
   b. Tick the check box next to one of the users in the list, but not the admin user, then from the **Action** drop-down select **Add the Content Author role to the selected user(s)** then click **Apply to selected items**.
   c. Tick the check box next to another one of the users in the list, but not the admin user, then from the **Action** drop-down select **Add the Editor role to the selected user(s)** then click **Apply to selected items**.

Results

You successfully configured content moderation on your Developer Portal. You can now use the API manager user interface to publish a product to the portal, and transition the product from draft to review state.

- **Editing, reviewing, and publishing moderated content**
  If you have published content from API Manager UI to your Developer Portal or created content within the Developer Portal, you can edit and review the content through the Moderated content page before you publish it in the Developer Portal.

Editing, reviewing, and publishing moderated content

If you have published content from API Manager UI to your Developer Portal or created content within the Developer Portal, you can edit and review the content through the Moderated content page before you publish it in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must have content that is published to the Developer Portal from the API Manager UI.

Your role must have the necessary permissions that enable you to perform the tasks. For more information on assigning the necessary tasks, see Configuring content moderation.

About this task

In addition to editing content through the content moderation page, you can specify whether the content needs further review, or even publish the content if you have the permission.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. On the administrator dashboard, click Content.
4. Click the Moderated content tab.
5. If you have the necessary permissions to edit your content type, for example, you are a **`Content author`**:
   a. Click the Title of the content type that you want to edit, then click the Edit.
   b. Edit your content to your specification, then click Save.
   You are redirected to the **`View`** tab.
   c. When you have finished editing your content type on the **`edit`** tab, ensure that the **`Review`** state is selected from the **`Change to`** drop down, then click Save.
6. If you have the necessary permissions to review and publish your content type, for example, you are a **`Reviewer`**:
   a. On the administrator dashboard, click Content.
   The content page is displayed listing all content.
   b. Click the Moderated content tab.
   c. Click the Title of the content type that you want to review.
   d. Optional: If the content that you are reviewing requires editing, click Edit, apply the changes to your content type, then click Save.
   You are redirected to the View tab.

Results

You edited, reviewed, and published your draft content type.

General configuration tasks

You can perform general configuration tasks in the Developer Portal as an administrator.

To learn how to configure specific aspects of your Developer Portal site, use the following topic links.

- **Adding a page load progress indicator**
  You can extend your Developer Portal site by adding a page load progress indicator. This option might be useful on servers that have a slow connection to the API Manager, or for customers that are using OIDC and have slow response times from their OIDC provider.
- **Adding custom fields to user records**
  You can add custom fields to user records in the Developer Portal.
- **Checking the site status report**
  You can check the site status report in the Developer Portal.
- **Clearing the server caches**
  You can clear the server caches from within the Developer Portal.
- **Configuring a proxy**
  You can configure the proxy settings in your Developer Portal.
- **Configuring the visibility of analytics in the Developer Portal**
  How to configure the visibility of API consumer analytics in the Developer Portal.
- **Configuring the API details visibility for non-authenticated users**
  You can configure the API details visibility settings in the Developer Portal to limit non-authenticated users from viewing API details published in a product.
- **Configuring API product recommendations**
  Enable the **`API product recommendations`** setting in the Developer Portal to display product recommendations to the API product consumers.
- **Configuring force users logout settings**
  You can configure the force user logout settings in your Developer Portal to forcefully log out the logged in users..
- **Adding a case study**
  The Community managers and API product owners can use the case study module in the Developer Portal to promote and highlight their published API products.
- **Adding a news article**
  Use the news module in the Developer Portal to manage and display the content in the article.
- **Configuring Stripe in the Developer Portal**
  You can offer free use of your Product Plans to your API consumers, or you can offer Products with paid Plans. To enable API consumers to subscribe to Products with paid Plans, you must first configure the Stripe payment method in your Developer Portal.
- **Configuring cron to run scheduled tasks**
  You can configure cron to run scheduled tasks in the Developer Portal.
- **Configuring search indexes and servers**
  You can configure search indexes and servers in the Developer Portal by using the Search API module.
- **Configuring the date and time**
  You can configure the date and time in the Developer Portal.
- **Configuring the notifications event log settings**
  You can configure the settings of the notifications event log for the activity feed on your Developer Portal.
- **Configuring the application settings**
  You can configure the application settings in the Developer Portal to limit or allow credential access to the consumer organization members.

- **Configuring the site default timezone**
  You can configure the site default timezone in the Developer Portal.
- **Configuring the site error handling**
  You can configure the site error handling in the Developer Portal.
- **Configuring which buttons are displayed in the WYSIWYG rich text editor**
  You can configure which buttons are displayed in the WYSIWYG rich text editor in the Developer Portal.
- **Configuring which languages are available**
  You can configure which languages are available in the Developer Portal.
- **Customizing user account settings**
  You can customize the user account options that are displayed to users when they register and use the Developer Portal.
- **Disabling languages**
  You can extend your Developer Portal site by managing which languages are available for use on the site.
- **Disabling test tool restrictions**
  The default OAuth provider contains security mechanisms that prevent the ability to obtain authorization tokens in the Developer Portal test tool when you use Implicit or Authorization Code grant types. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option.
- **Enabling a cookie compliance banner**
  You can add a cookie compliance banner to your Developer Portal site by configuring the EU Cookie Compliance module.
- **Enabling code languages for code snippets**
  You can specify the languages that code snippets for APIs can be displayed in.
- **Enabling code snippets for SOAP APIs**
  By default, code snippets are only shown for REST APIs. You can enable code snippets for SOAP APIs.
- **Forcing new users to accept terms and conditions**
  You can extend your Developer Portal site by forcing new users to accept the terms and conditions before they are able to create accounts.
- **Hiding the admin registry on the login form**
  You can hide the admin registry as an option on the login form. The use case for this option might be a public facing Developer Portal where you want to remove the admin access from customer view.
- **Hiding the certificate in the header for APIs secured with mutual TLS**
  You can hide the certificate in the header for APIs secured with mutual TLS. By default, the **`x-client-certificate`** header is shown in an API when mutual TLS is configured. You can choose to turn off this option in your Developer Portal.
- **Importing and exporting taxonomies**
  You can import and export taxonomies in the Developer Portal.
- **Removing keys beginning with x-ibm from Open API document download**
  You can remove keys that begin with x-ibm from the Open API document download in the Developer Portal.
- **Restricting access by IP address**
  You can restrict access to a role or a user by IP address in the Developer Portal.
- **Restricting or preventing access from search engines**
  You can restrict or prevent access to your Developer Portal from search engines. You might want to control the access if you have a development or test site.
- **Toggling the site in and out of maintenance mode**
  You can put the Developer Portal site into maintenance mode for short periods of time. During maintenance mode, only an administrator is able to access the site, and all other users who enter the site URL get a maintenance message set by the administrator.
- **Viewing available updates**
  You can view available updates in the Developer Portal.

Adding a page load progress indicator

You can extend your Developer Portal site by adding a page load progress indicator. This option might be useful on servers that have a slow connection to the API Manager, or for customers that are using OIDC and have slow response times from their OIDC provider.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected check box. The disabled modules are displayed without a selected check box.
3. Enter `page_load_progress` into the search filter.
   The **`Page Load Progress`** content item is displayed in the list of content.
4. By default, the **`Page Load Progress`** module is enabled. However, if not, select the check box and click Enable.
   You have now enabled the default settings for the **`Page Load Progress`** module.
5. To change the default settings for the module, navigate to Configuration > User interface > Page Load Progress.
6. Decide which settings you want to change, for example, **`Time to wait before locking the screen`**, and click Save.
   Note: Changing the settings does not apply to the OIDC buttons. If it is enabled, the OIDC buttons use the page load process indicator, but do not allow any configuration.
7. To enable the permissions, navigate to People > Permissions.
8. Scroll down to **`Page Load Progress`**, check the boxes for anonymous and authenticated for **`Use Page Load Progress`**.

9. Click Save permissions.

Results

You successfully enabled the **`Page Load Progress`**. Now, the page loading spinner is automatically added to the login and register forms for OIDC buttons.

What to do next

You can customize the appearance of the modal page and spinner in CSS in a custom theme.

Adding custom fields to user records

You can add custom fields to user records in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Any data that is added to a custom field for user records will remain in the Developer Portal database.

Procedure

1. In the administrator dashboard, click Configuration > People > Account settings.
2. Click the MANAGE FIELDS tab.
3. Click Add field.
4. Specify the type of data that your field can store by selecting the type from the Add a new field list.
5. Enter a label for your field in the Label field.
6. Optional: If you want to edit the machine name that is automatically created based on your label, click Edit and enter the new name.
7. Click Save and continue.
8. Configure any additional values for the new field then click Save field settings.
   You have added a custom field to your user record.

What to do next

You can configure the contents of your custom field depending on what type of data you specified it could store.

Checking the site status report

You can check the site status report in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To check the site status report, complete the following steps:

1. Click Reports in the administrator dashboard.
2. Click Status report.
3. You can review information relating to the site status report from this view.

Clearing the server caches

You can clear the server caches from within the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.

Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. In the administrator dashboard, click Configuration, then in the Development section, click Performance.
2. Click Clear all caches.
   You have cleared the server caches, and a message will be displayed stating: `Caches cleared`.

Configuring a proxy

You can configure the proxy settings in your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

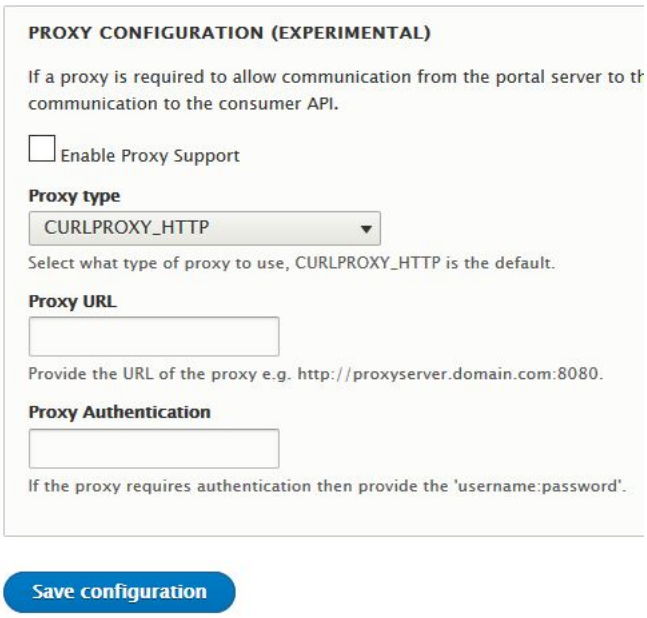
About this task

The Developer Portal communicates with the management server by way of the consumer and product APIs. For a Developer Portal that is deployed externally to the management server zone, and does not have access to the consumer and product APIs, a proxy can be used.

Procedure

To configure a proxy to use for communicating with management server APIs, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > System > IBM API Connect in the administrator dashboard.
4. To configure a proxy, select **`Enable Proxy Support`**, and make the required changes.



5. When your changes are complete, click Save configuration.

Results

You successfully configured a proxy on your Developer Portal.

Configuring the visibility of analytics in the Developer Portal

How to configure the visibility of API consumer analytics in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Restriction:

- If the Catalog that is associated with this Developer Portal has two or more gateway services enabled then, for analytics data to be available, the gateway services must all be associated with the **same** analytics service. If the set of associated analytics services for the gateway services includes two or more different analytics services then the Developer Portal does **not** display analytics data. An analytics service is associated with a gateway service in the Cloud Manager user interface; see Associating an analytics service with a gateway service.
- If the visualizations in your dashboard views display no data, show data only for a time period in the past, or the Dashboard tab does not show up, a possible reason might be that access to analytics data within API Connect has been switched off. Contact your API provider for confirmation.

About this task

What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings.

Procedure

- To configure the visibility of the API consumer analytics in Developer Portal, complete the following steps:
  1. If the administrator dashboard is not displayed, click Manage to display it.
  2. Click Configuration in the administrator dashboard.
  3. Under the System heading, click IBM API Developer Portal.
  4. Under the Configuration section, clear the Display Analytics checkbox to remove all the analytics links from the portal site. By default, the Display Analytics checkbox is selected and the analytics section is visible in the portal site.
  5. Click Save configuration to save the changes.
     You have configured the visibility of analytics in the Developer Portal.
- To configure the visibility of the API analytics charts, complete the following steps:
  1. If the administrator dashboard is not displayed, click Manage to display it.
  2. Click Configuration in the administrator dashboard.
  3. Under the System heading, click IBM API Developer Portal Consumer Analytics.
  4. From the list of Metrics and charts, clear the checkboxes corresponding to the charts that you want to remove from the analytics section in the portal site. By default, all the charts that are displayed under the metrics and charts section are visible in the analytics section.
  5. Click Save configuration to save the changes.
     You have configured the visibility of Metrics and charts in the analytics section.

Configuring the API details visibility for non-authenticated users

You can configure the API details visibility settings in the Developer Portal to limit non-authenticated users from viewing API details published in a product.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

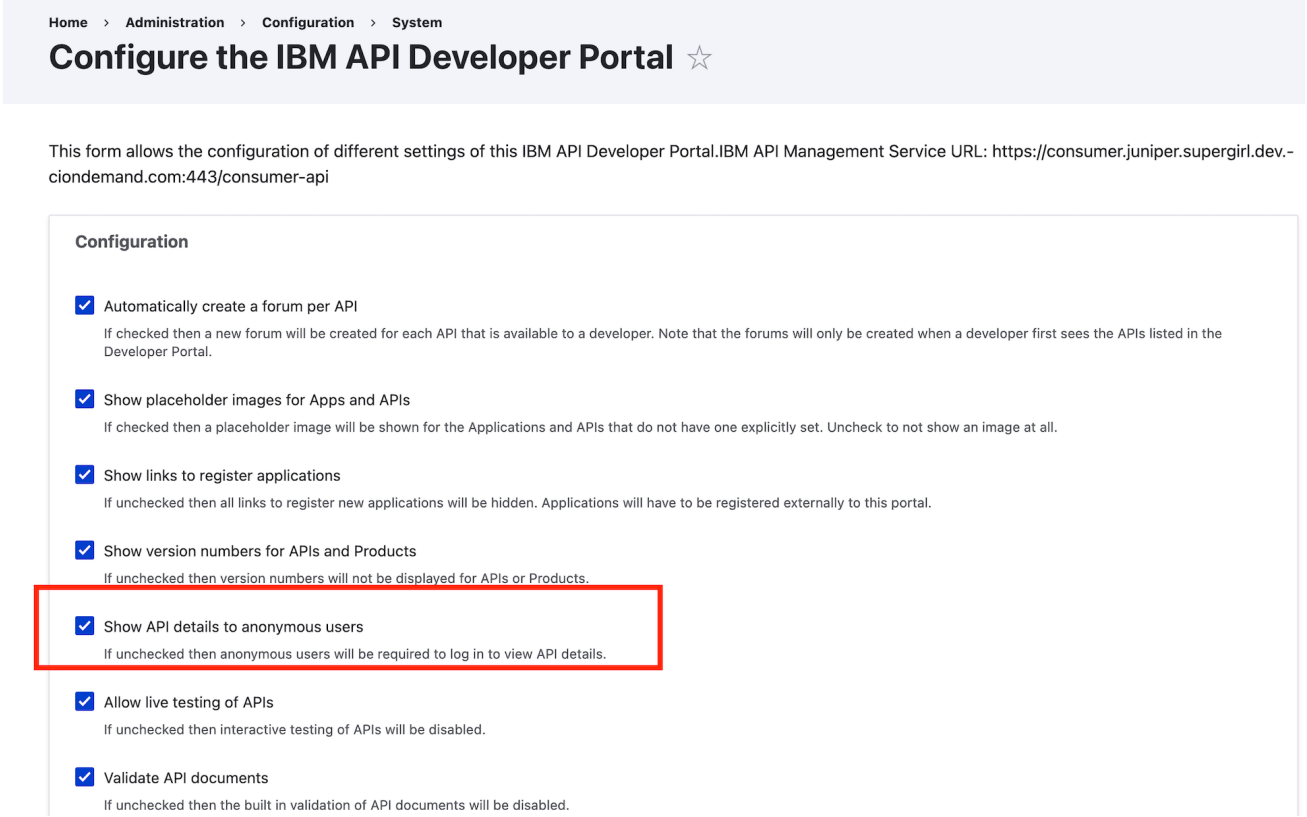
You can configure the **`Show API details to anonymous users`** setting in the Developer Portal to limit the visibility of API details to non-authenticated users. If you enable this setting, the non-authenticated users can see only the following basic API details:

- Name
- Description
- Icon
- Version number
- **Rating** (if configured; for more details, see Changing the ratings display)

The non-authenticated users can view these details on the API tiles that are displayed on individual API Product pages, API list view, or from the search results. To view more API details published in a product, the users must log in to the Developer Portal.

Procedure

1. Log in to your Developer Portal as an administrator.
2. Click Configuration > System > IBM API Developer Portal.
3. Scroll down to **`Show API details to anonymous users`**. By default, the configuration option is selected and both the authenticated and non-authenticated users can view all the API details if the respective API product is viewable.



Clear the Show API details to anonymous users checkbox to allow only the authenticated users to view more API details such as endpoints, protocols, type, and security features.

4. Click Save configuration to save the changes.
   When a non-authenticated user clicks on an API tile to view more details, the Developer Portal login page is displayed directing the user to log in to proceed further.

Results

You successfully configured the API details visibility setting for non-authenticated users on your Developer Portal.

Configuring API product recommendations

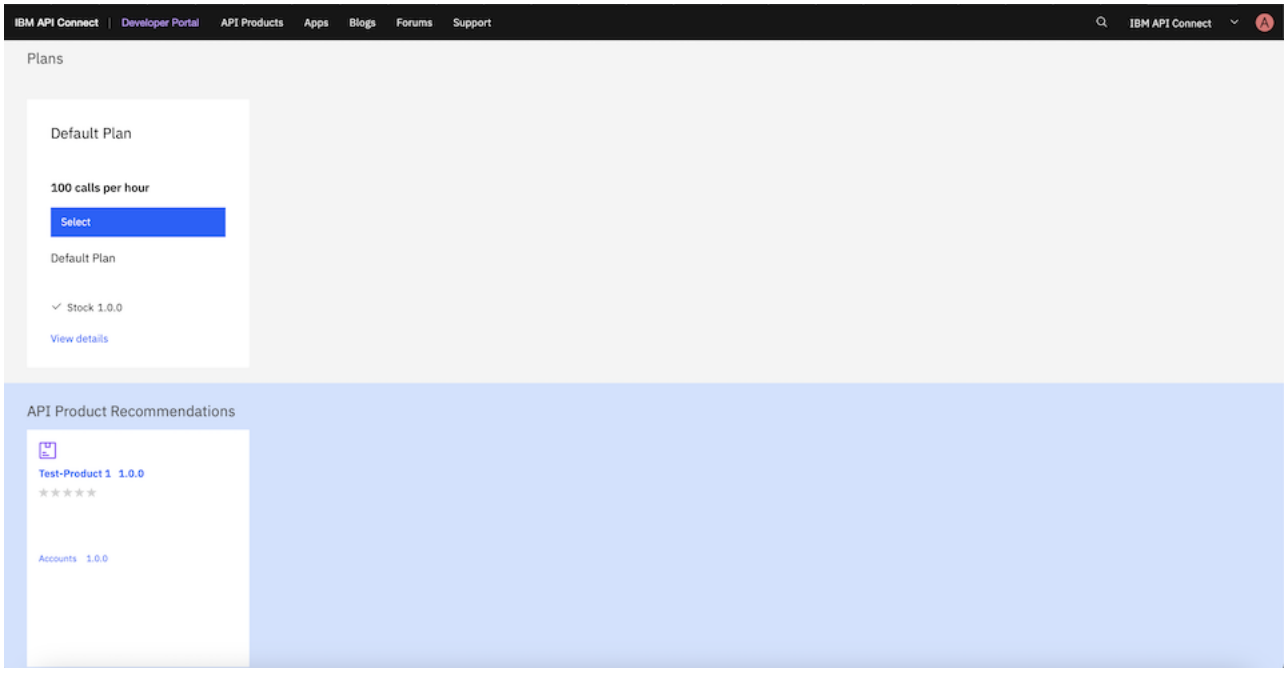
Enable the **`API product recommendations`** setting in the Developer Portal to display product recommendations to the API product consumers.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this topic

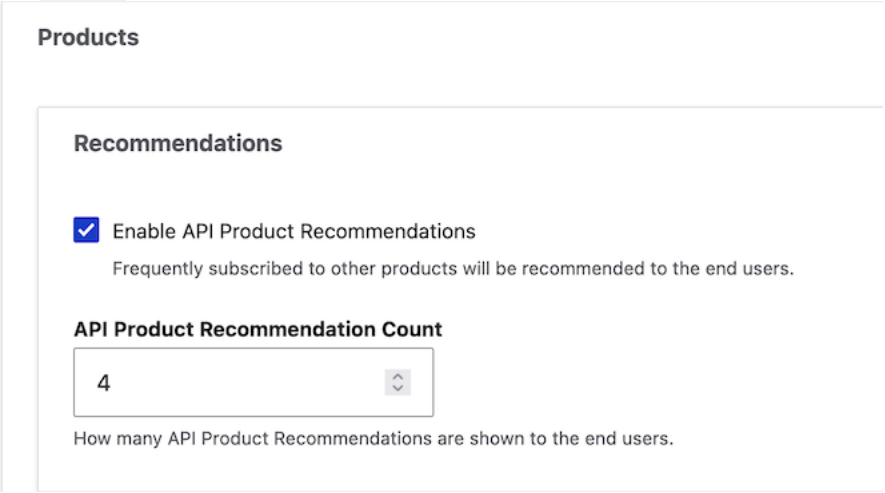
You can enable the **`API product recommendations`** setting in your Developer Portal site to display the **`API product recommendations`** block on the API Products page and the Summary tab for the Subscription wizard. This block suggests API products to the consumers based on their current subscription plan and browsing history.



Enable API product recommendations

Complete the following steps to enable the **`API product recommendations`** setting in the Developer Portal:

1. Log in to the Developer Portal as an administrator.
2. Click Configuration > System > IBM API Developer Portal.
3. In the **`Products`** section, select the Enable API Product Recommendations checkbox.

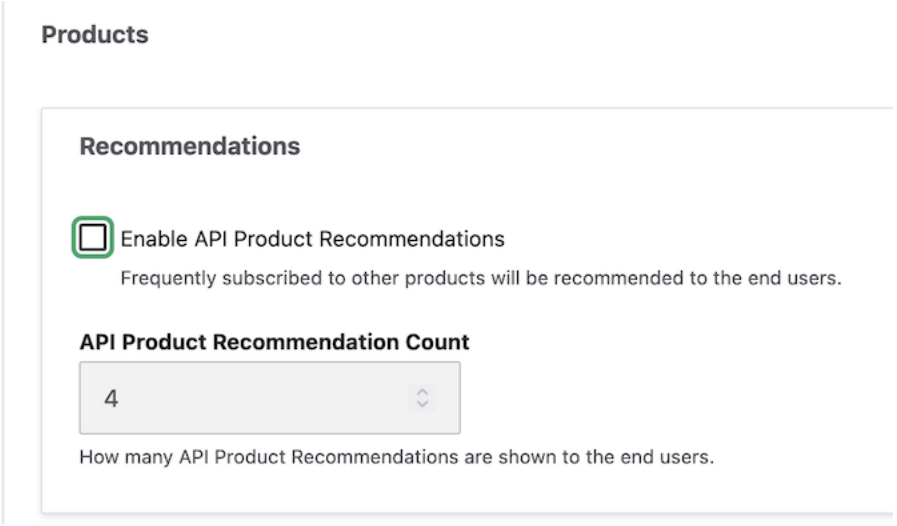


4. From the API product count recommendation count box, select a `value` based on the number of recommendations that you want to display to the user.
5. Click Save configuration to save the changes. The API Products page and the Summary tab of the subscription wizard on the Developer Portal displays the API product recommendations block.

Disable API product recommendations

Complete the following steps to disable the **`API product recommendations`** setting in the Developer Portal:

1. Repeat steps 1 and 2.
2. In the **`Products`** section, clear the Enable API Product Recommendations checkbox.



3. Click Save configuration to save the changes. The API product recommendations block is removed from the API Products page and the Summary tab of the subscription wizard on the Developer Portal.

Note:

- The **`API product recommendations`** setting is enabled by default in the Developer Portal.
- The API product recommendations block is displayed on the API Products page and the Summary tab for the Subscription wizard of the Developer Portal only if you satisfy the following conditions:
  - The API product must have at least one subscription.
  - The application that is subscribed to the API product must be subscribed to at least one another API product.

You successfully configured the API product recommendations settings in the Developer Portal.

Configuring force users logout settings

You can configure the force user logout settings in your Developer Portal to forcefully log out the logged in users..

Before you begin

You must have administrator access to the Developer Portal to complete this task.

About this task

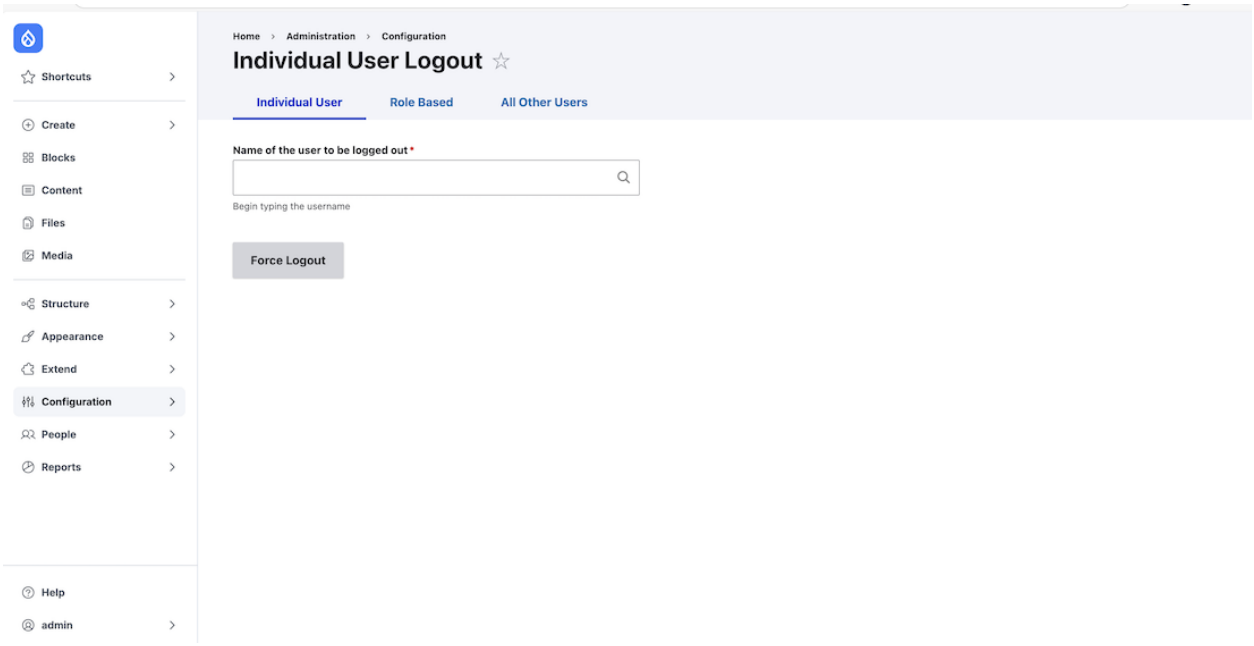
The Developer Portal Admins can forcefully log out the logged in portal users using the **`force_users_logout`** module.
Note: The **`force_users_logout`** module is enabled by default
The **`force_users_logout`** module allows admin to log out an individual user based on the **`username`** and **`role`**. The admin can also log out all the non-admin users.
When the admin forcefully logs out a user, the other logged out users are not notified.

Procedure

To configure the force users logout settings, complete the following steps:

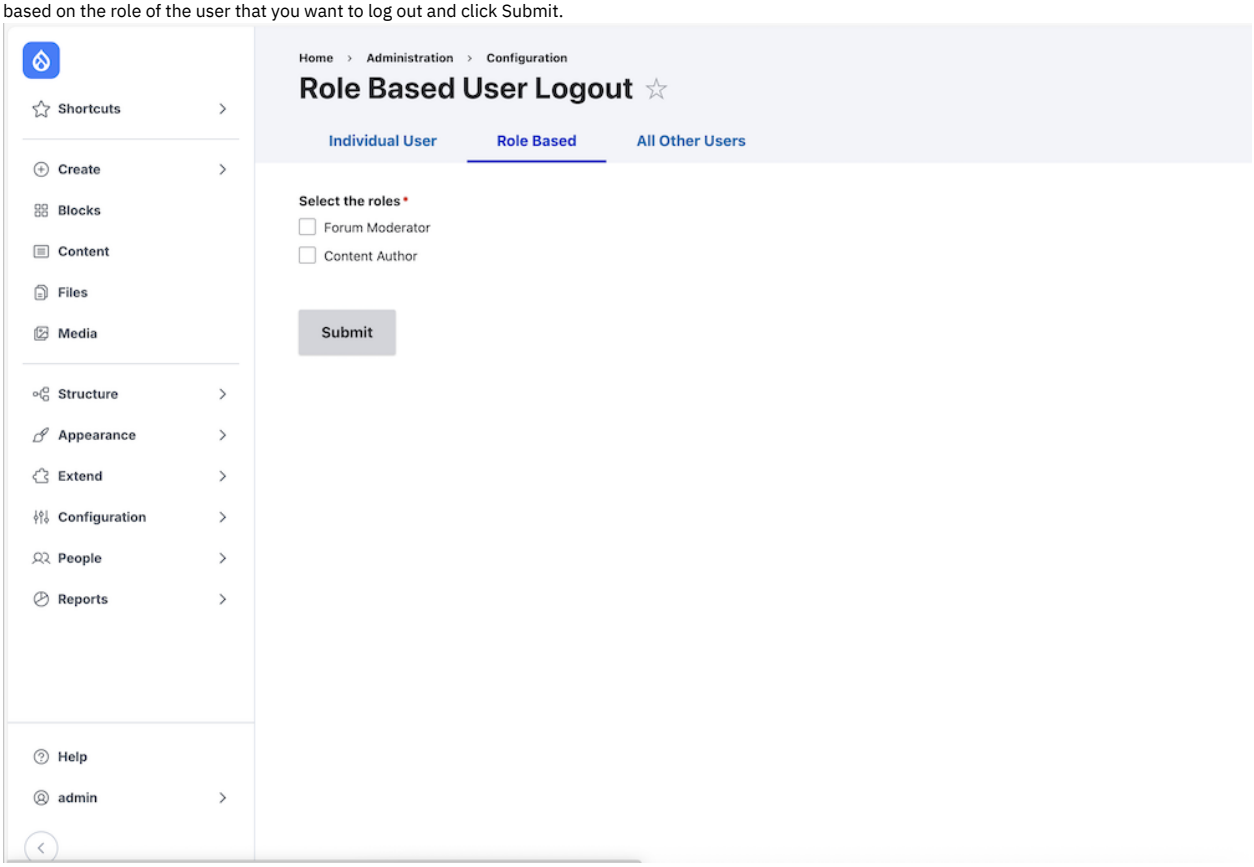
1. Log in to the Developer Portal as an administrator.
2. Click Configuration > Development > Force users logout settings.
3. On the user logout page, select the tab based on the users you want to log out:

   Individual user
   : Select this tab if you want to log out the users based on the username. In the name of the user to be logged out field, enter the `username` of the user that you want to log out and click Force logout.



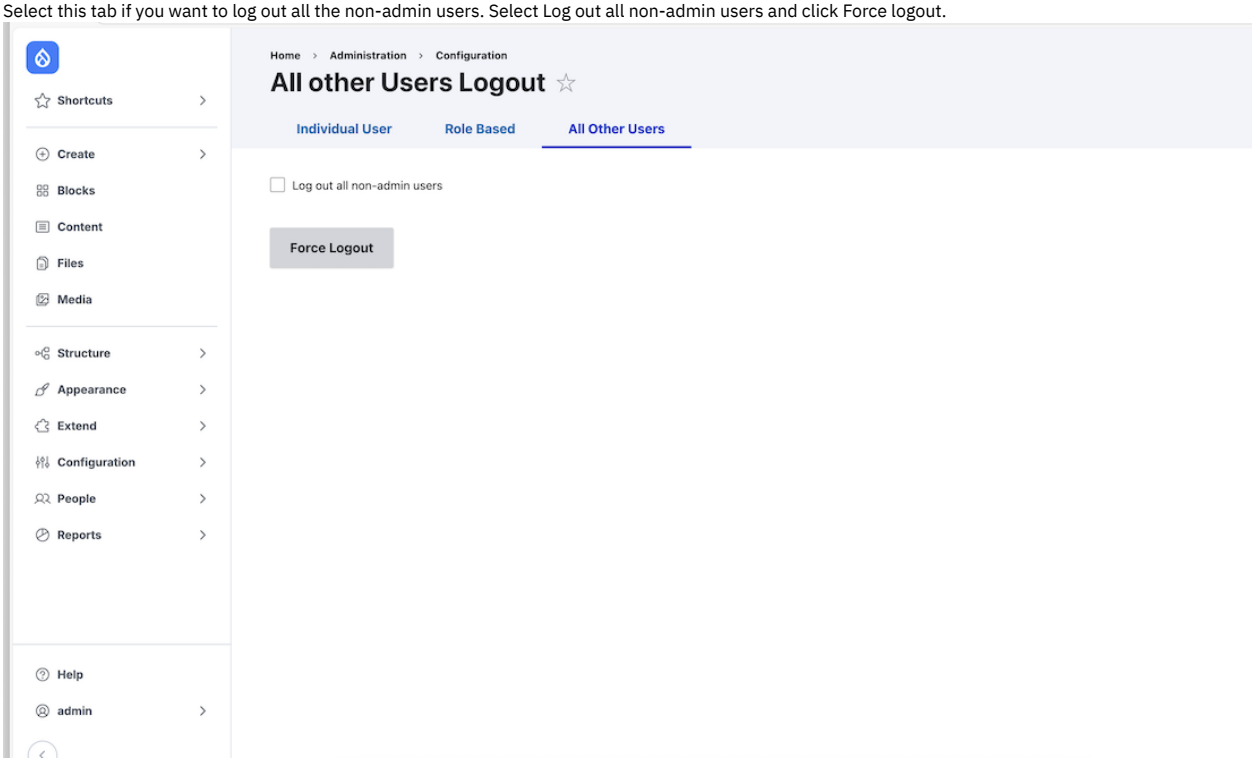
Role based

Select this tab if you want to log out the users based on the role. Under Select the roles, select either one or both Forum moderator and Content author based on the role of the user that you want to log out and click Submit.



All other users

Select this tab if you want to log out all the non-admin users. Select Log out all non-admin users and click Force logout.



4. When your changes are complete, click Save configuration.

Results

You successfully logged out the logged in Developer Portal users. A success message appears on the Developer Portal admin dashboard after the users are successfully logged out. If the users are not logged out, an error message is displayed on the Developer Portal admin dashboard.

Adding a case study

The Community managers and API product owners can use the case study module in the Developer Portal to promote and highlight their published API products.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The case study module offers valuable context and practical examples to highlight how the APIs published in their Developer Portal addresses real-world business challenges. The module also highlights the success stories of the users who have integrated these API products into their application.

Create a case study

Complete the following steps to create a new case study:

1. On the Admin dashboard, click Create > Case study.
2. On the Create case study page, provide the following details:
   a. In the **`Title`** field, provide a `title` for the case study.
   b. From the Language list, select an option. By default, English is selected.
   c. Click Browse to browse and select an image for the new case study and provide an alternative text for the image.
   d. In the Summary field, enter a `description` for the case study. This information is displayed on the case study tile.
   e. In the Body field, enter the main **`html`** body for the case study. This information is displayed on the case study page.
   f. Under Associated API products, start typing the name of your API product in the text box and you can choose from the options that are displayed.
   g. To associate more API products with the case study, click Add another item and repeat step (f).
3. Click Save.
   The new case study tile is displayed on the Developer Portal home page under **`Case studies`**. The tile displays the following details:
   - Case study tile
   - Case study summary
   - Case study image

   To configure the case study module in the Developer Portal, see Configure the case study module.
   Note: The case study module is enabled by default in the Developer Portal.

To change the front page of the case studies content block, see Changing the case studies content block on the front page.

What you did in this task

You created a case study and the Developer Portal home page now displays the case studies content block. Click the case study tile to view the case study page that displays all the associated API products. Click a product tile to view the corresponding product details page. The following actions are available on both the case study and API product pages:

- View
- Edit
- Delete
- Revisions
- Translate

- **Configure the case study module**
  Use the case study module in the Developer Portal to promote and highlight published API products.

Configure the case study module

Use the case study module in the Developer Portal to promote and highlight published API products.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can enable or disable the case study module in the Developer Portal. You can create a new case study only if the module is enabled. For more information, see Adding a case study.
Note: The case study module is enabled by default in the Developer Portal.
Complete the following steps to enable the case study module in the Developer Portal:

1. On the Admin dashboard, click Extend > Extend.
2. In the **Filter** field, enter `case study`. The case study module is displayed under IBM API Developer Portal.
3. Select the Case study checkbox and click Enable.

Complete the following steps to disable the case study module in the Developer Portal:

1. On the Admin dashboard, click Extend > Extend > Disable module.
2. In the **Filter** field, enter `case study`. The case study module is displayed.
3. Select the Case study checkbox and click Disable.
4. The Confirm disable page displays the list of configurations that will be deleted if the module is disabled. Click Disable to confirm the action.
   Warning: When a **Case study** module is disabled, all the case study content associated with the module is permanently deleted and cannot be restored

What you did in this task

You configured the case study module in the Developer Portal.

Adding a news article

Use the news module in the Developer Portal to manage and display the content in the article.

Before you begin

You must have administrator access to the Developer Portal to complete this task.

About this task

You can enable or disable the news article module in the Developer Portal.
Note: The news article module is enabled by default in the Developer Portal.
For more information about configuring the news article module in the Developer Portal, see Configuring the news article module.

Complete the following steps to create a new news article in the Developer Portal:

1. On the Admin dashboard, click Create > Article.
2. On the Create article page, enter the following details:
   a. In the **Title** field, enter the `title` for the news article.
   b. From the Language list, select an option. By default, English language is selected.
   c. Click Choose file to browse and select an image for the news article. Provide an alternative text for the image.
   d. In the **Summary** field, enter a `description` for the news article.

e. In the **Body** field, enter the `main html` body for the news article. The article page displays this information.

3. Click Save.
   The Developer Portal home page displays the new news article tile under News. The tile displays the following information about the news article:
   - Title
   - Summary
   - Image

What you did in this task

You created a new news article module in the Developer Portal. The news article content block is now displayed on the Developer Portal. Click the news article tile to view the news article content page. You can perform the following actions on the news article page:

- View
- Edit
- Delete
- Translate
- Revisions

- **Configure the news module**
  Use the news module in the Developer Portal to promote publishing of articles.

Configure the news module

Use the news module in the Developer Portal to promote publishing of articles.

Before you begin

You must have administrator access to the Developer Portal to complete this task.

About this task

You can enable or disable the news article module in the Developer Portal.
Note: The news article module is enabled by default in the Developer Portal.
You can create a news article even if the module is disabled. However, the news article tile is displayed under the News section on the Developer Portal home page only if the news article module is enabled. For more information, see Adding a news article.

Complete the following steps to enable the news article module in the Developer Portal:

1. On the Admin dashboard, click Extend > Extend.
2. In the **Filter** field, enter `News`. The news module is displayed under IBM API Developer Portal.
3. Select the News checkbox and click Enable.

Complete the following steps to disable the news article module in the Developer Portal:

1. On the Admin dashboard, click Extend > Extend > Disable module.
2. In the **Filter** field, enter `news`. The news module is displayed.
3. Select the News checkbox and click Disable.
4. The Confirm disable page displays the list of configurations that will be deleted if the module is disabled. Click Disable to confirm the action.

What you did in this task

You configured the news module in the Developer Portal.

Configuring Stripe in the Developer Portal

You can offer free use of your Product Plans to your API consumers, or you can offer Products with paid Plans. To enable API consumers to subscribe to Products with paid Plans, you must first configure the Stripe payment method in your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
To use Stripe as your credit card processing vendor, you must have port 443 open to HTTPS communication between the Stripe API and your Developer Portal management and the Management cluster servers. See Firewall requirements on Kubernetes and Firewall requirements on VMware for more information about this requirement.

The billing microservice must be enabled on your management system by your system administrator. See Configuring monetization on VMware and Configuring monetization on Kubernetes for more information.

Billing integration support must be configured in the API Manager. For more information, see Monetizing your Products.

About this task

API Connect includes a subscription billing feature that allows API providers to define pricing Plans in their API Products, and monetize their API offerings. If a Product contains a pricing Plan, API consumers must enter their payment information into the Developer Portal before they can subscribe to that Plan.

API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product Plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system.

Support is provided for Stripe in the Developer Portal, but before API consumers can enter their payment information, you need to configure the Stripe billing support in every Developer Portal where you will offer paid Plans. After this support is configured, API consumers can provide their payment information, and then subscribe to the paid Plans. Complete the following instructions to enable the APIC Monetization Stripe Integration module, and then configure your Stripe API credentials.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected checkbox. The disabled modules are displayed without a selected checkbox.
3. Enter `stripe` into the search filter.
   The **`ibm_stripe_payment_method`** module called APIC Monetization Stripe Integration is displayed in the list of contents.
4. Select APIC Monetization Stripe Integration and click Enable.
   The default settings for the **`ibm_stripe_payment_method`** module are now enabled.
5. In the administrator dashboard, click Configuration > System > IBM API Developer Portal Billing.
   The IBM API Developer Portal Billing Settings page is displayed.
6. Change the drop-down option to be the newly enabled APIC Monetization Stripe Integration (ibm_stripe_payment_method) as the module to use to create payment methods for the Stripe billing provider. Click Save configuration.
7. In the administrator dashboard, click Configuration > System > IBM APIC Stripe Integration, and enter your Stripe API credentials. These credentials must match the Stripe API credentials for the billing integration resource that is attached to the Catalog for this Developer Portal.
   Refer to your Stripe dashboard to get your publishable key and secret key; see https://dashboard.stripe.com/apikeys.
   Note: Each Stripe account comes with two sets of API keys, one for testing, and one for production. Each set of API keys has a distinct namespace for Stripe objects. Test API keys cannot see objects created by production API keys, and vice versa. You cannot switch the API keys of one of your billing integrations with the keys from another account, or swap your test and production keys over, as that would prevent API Connect from resolving the Stripe objects that were created by using the old keys. If you want to use your Stripe test keys, you must create a separate Catalog for testing, and not add your Stripe test keys to production Catalogs.
8. Click Save integration.

Results

You successfully configured the Stripe payment method in the Developer Portal. API consumers can now add a payment method to their consumer organization, so that they can subscribe to Products with paid Plans.

What to do next

After both the Catalog and the Developer Portal are configured, you can create Products with pricing Plans. See Defining a Product with billing integration for more information.

Configuring cron to run scheduled tasks

You can configure cron to run scheduled tasks in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure cron to run scheduled tasks, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the SYSTEM heading, click Cron.
3. Use the drop-down list for the module you want to configure and select Edit.
4. From the Run cron every drop-down menu, select the frequency of cron runs for this module.
5. Click Save.
   You have configured cron to run scheduled tasks.

Configuring search indexes and servers

You can configure search indexes and servers in the Developer Portal by using the Search API module.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The Search API module provides a generic framework for search capabilities within the Developer Portal, and you can customize the default database server and content index setup that is provided. By default, the search in the Developer Portal runs over the entire OpenAPI and WSDL documentation. It is not possible to restrict the search to specific sections of an Open API or WSDL document. The search can be configured to include any custom fields that were added to the Developer Portal, but it does not include any attached files.
The search results page is a view in the Developer Portal, and so it can also be configured. For more information, see Configuring the search results view in the Developer Portal.

Procedure

To configure the default database server and content index settings, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > Search and metadata > Search API in the administrator dashboard.
4. To configure the server settings, click Edit against the Database Server and make the required changes. For example:
   - Server name; the displayed name for the server.
   - Description; a description of the server.
   - CONFIGURE DATABASE BACKEND; the minimum number of characters a word must consist of to be indexed, and whether to search on parts of a word. However, wildcard searching can make searches on large sites very slow.
   - AUTOCOMPLETE SETTINGS; how suggestions are computed when autocompletion is used.
5. To configure the index settings, click Edit against the Default content index and make the required changes. For example:
   - Index name; the displayed name for the index.
   - Data sources; the data sources of the items to be stored in the index.
   - CONFIGURE THE DATASOURCE; for each data source, set which bundles of content should be indexed, and in which languages.
   - Server; the server that the index should use.
   - Description; a description for the index.
   - INDEX OPTIONS; whether the index is read only, whether to index new or updated items immediately, and setting how many items to index when indexing items during a cron run.
6. When your changes are complete, click Save.
   The View page of the updated default database server or default content index is displayed.

Results

You successfully configured the search indexes and servers in the Developer Portal.

What to do next

You can configure how searches are displayed by editing the Search content view. For more information, see Configuring the search results view in the Developer Portal.

- Search API module

Configuring the date and time

You can configure the date and time in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure the date and time, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.

2. Click Configuration in the administrator dashboard.
3. Under the Region and language heading, click Date and time formats.
4. Click Edit for the format you want to change.
5. Change the settings of the format then click Save format.
   You have configured the date and time.

Configuring the notifications event log settings

You can configure the settings of the notifications event log for the activity feed on your Developer Portal.

About this task

The Developer Portal includes an activity feed that shows Consumer organization users the details of events that occur on the organization, such as application creation, subscriptions, and so on. You can view these details under Notifications for each application and organization.

The default number of days that events are kept for is 30. You can edit this setting in the IBM APIC Notifications Settings page of your Developer Portal, as described in the following instructions.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > System > IBM APIC Notifications Settings.
   The IBM APIC Activity Feed Settings page is displayed.
4. Enter the required number of days to keep events for in the Retention Days field.
5. Click Save configuration.

Configuring the application settings

You can configure the application settings in the Developer Portal to limit or allow credential access to the consumer organization members.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

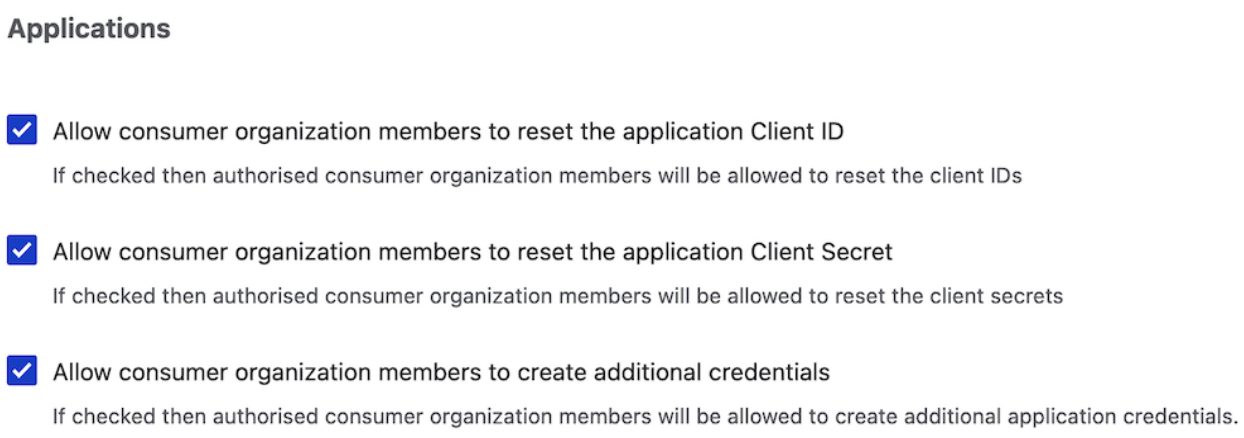
About this task

You can configure the application settings in the Developer Portal to limit or allow the following credential access to the consumer organization members:

- Reset the application client ID.
- Reset the application client secret.
- Add more credentials.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > System > IBM API Connect in the administrator dashboard.
4. Scroll down to **`Applications`**. By default, all the configuration options are selected.



The consumer organization members can see the following credential options on the respective Applications page under the Subscriptions tab:

- Add
- Edit
- Reset Credentials
- Reset API Secret

For more information, see Managing applications.

5. Clear one or more checkboxes based on the options you want to remove from the application credentials.
   Note: If you clear all the checkboxes, the consumer organization members can only see the Edit option on the Applications page under the Subscriptions tab.
6. Click Save configuration to save the changes.

Results

You successfully configured the application credential settings on your Developer Portal.

Configuring the site default timezone

You can configure the site default timezone in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure which languages are available, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the REGIONAL AND LANGUAGE heading, click Regional settings.
3. From the Default Time Zone drop-down menu, select the default time zone.
4. Click Save configuration.
   You have configured the default time zone.

Configuring the site error handling

You can configure the site error handling in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure the site error handling, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the DEVELOPMENT heading, click Logging and errors.
3. You can review and configure all information relating to site error handling from this view.
   Note: On a production system, set Logging and errors to **`none`**, to avoid any security issues.
4. Click Save configuration.
   You have configured the site error handling.

Configuring which buttons are displayed in the WYSIWYG rich text editor

You can configure which buttons are displayed in the WYSIWYG rich text editor in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure which buttons are displayed in the WYSIWYG rich text editor, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration > Content authoring > Text formats and editors.
3. Click Configure for the Full HTML profile.
4. In the **TOOLBAR CONFIGURATION** section, edit the buttons that you want to expose.
5. Click Save configuration.
   You have configured the editor buttons that are displayed in the WYSIWYG rich text editor.

Configuring which languages are available

You can configure which languages are available in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure which languages are available, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the REGIONAL AND LANGUAGE heading, click Languages.
3. Under the DEFAULT heading, select the radio button for the language you want to set as default.
4. To add a new language, click +Add language. Use the drop-down menu to select the language you want to add.
5. Click Save configuration.
   You have configured the languages that are available.
6. You can also provide your own translations, for strings of the website that are not translated, from the User interface translation view, under Configuration > Regional and Language in the administrator dashboard.

Results

You have configured the available languages for the Developer Portal.
Note: Multilingual API and Product documentation can be created by using an **x-ibm-languages** extension directly in the OpenAPI definition. For more information, see Using **x-ibm-languages** to create multilingual API and Product documentation.

Customizing user account settings

You can customize the user account options that are displayed to users when they register and use the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can change what fields users of the Developer Portal see when they register to use the site, when they log in, and when they view their user account profile. For instance, you can change the field order display, hide fields, and add custom fields.
As an example, the Consumer organization field is a required entry field when a user creates an account on the Developer Portal. However, you can configure this field to be hidden, in which case the field is automatically completed with a default entry of **firstname lastname** of the new user instead.

Procedure

To customize the user account settings, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > People > Account settings in the administrator dashboard.
   The Account settings page is displayed.
4. From the Settings tab you can edit the following options:
   a. CONTACT SETTINGS; enable or disable the personal contact form for new users.
   b. PASSWORD RESET TIMEOUT; set the timeout in seconds for one-time login links. This setting applies only to the admin user of the Developer Portal.
   c. ANONYMOUS USERS; set the name to be used to indicate anonymous users.
   d. ADIMINISTRATOR ROLE; assign the administrator role that is automatically given new permissions whenever a new module is enabled. The default is Superuser.
      Note: The Superuser role has the highest level of permissions in the Developer Portal. This role bypasses all content access control, which means that users that have a Superuser role can see all of the site content. For more information, see Working with roles in the Developer Portal.
   e. LANGUAGE SETTINGS; enable or disable translation.
   f. REGISTRATION AND CANCELLATION; enable or disable the password strength indicator, and set the action to take when a user account is canceled.

g. Notification email address; set the email address to use as the from address for all account notifications.
h. Emails; edit the emails that are sent when an account is blocked or canceled, or when a new password is requested.
i. Click Save configuration to save your updates.

5. Click the Manage fields tab to customize the fields that are available for storing user data.
   Here you can edit the settings for current fields, delete fields, and add new fields. Remember to save any updates that you make.
6. Click the Manage form display tab to configure how the user forms are displayed.
   a. Click the Default form mode to configure how the form fields display when a user profile is being edited.
   b. Click the Register form mode to configure how the form fields display when a new user creates an account.
      For each user form mode you can edit the field settings, enable and disable fields, and drag the fields to change their display order. You can also manage the form modes.
      For example, to hide the Consumer organization field when a new user creates an account, click the Register form mode, and drag the Consumer organization into the Disabled section.
   c. Click Save to save your updates.
7. Click the Manage display tab to configure how fields are displayed on a user profile page.
   You can edit the field settings, enable and disable fields, and drag the fields to change their display order. You can also manage the display view modes. Remember to save any updates that you make.
8. Click the Translate account settings tab to configure the language options for the user account settings. Remember to save any updates that you make.

Results

You successfully customized the user account settings in the Developer Portal.

Disabling languages

You can extend your Developer Portal site by managing which languages are available for use on the site.

Before you begin

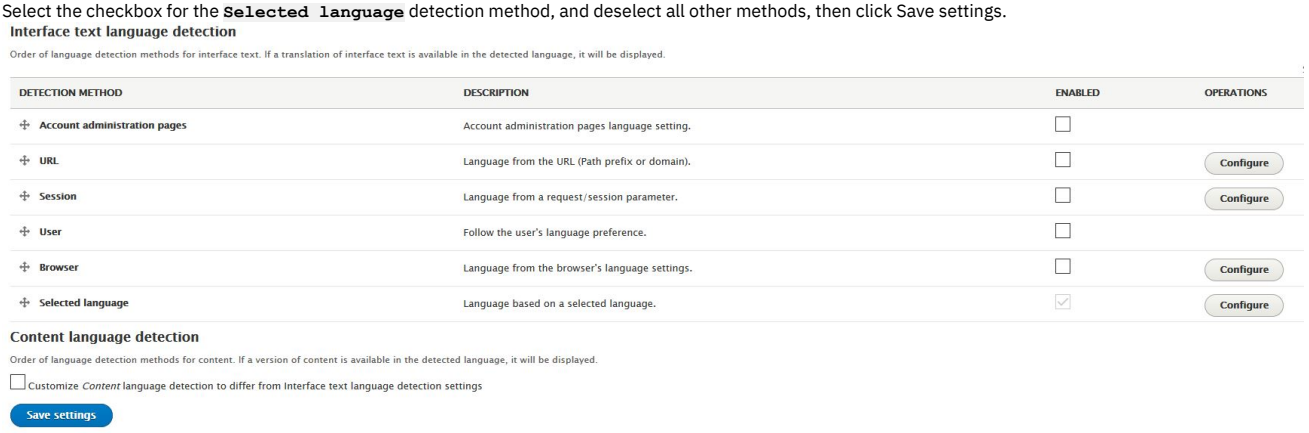
You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.

To disable all languages apart from English.

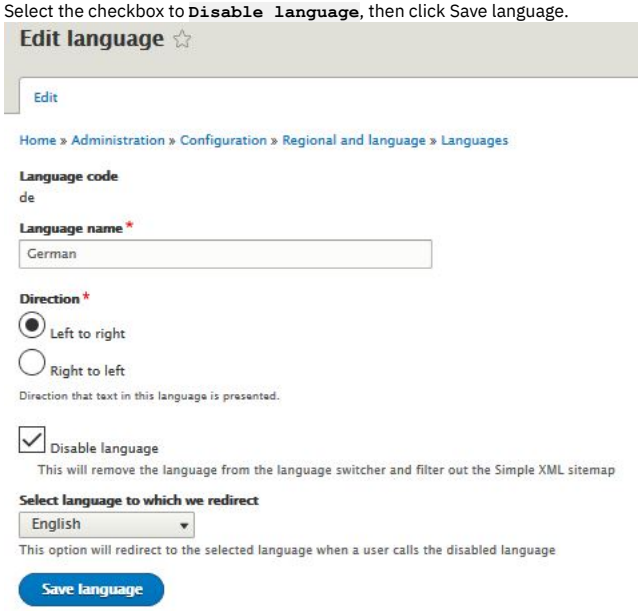
2. Navigate to Configuration > Regional and language > Languages > Detection and selection.
3. Select the checkbox for the **`Selected language`** detection method, and deselect all other methods, then click Save settings.



To disable one or more languages.

4. In the administrator dashboard, click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected checkbox. The disabled modules are displayed without a selected checkbox.
5. Enter `disable language` into the search filter.
   The Disable Language content item is displayed in the list of content.
6. Select the checkbox for the **`Disable Language`** module, and click Enable.
7. Navigate to Configuration > Regional and language > Languages > Detection and selection.
8. Select the checkbox to enable URL, and click Save settings.

9. Navigate to Configuration > Regional and language > Languages.
10. Click Edit on the language that you want to disable.
11. Select the checkbox to **`Disable language`**, then click Save language.



Results

You successfully disabled your chosen language.

Disabling test tool restrictions

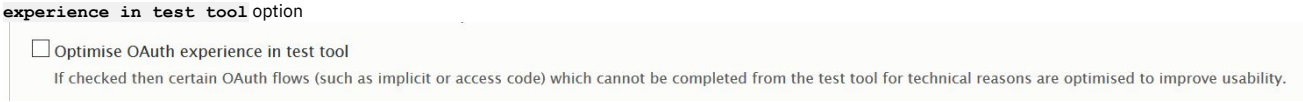
The default OAuth provider contains security mechanisms that prevent the ability to obtain authorization tokens in the Developer Portal test tool when you use Implicit or Authorization Code grant types. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Configuration > System > IBM API Connect.
3. In the **`CONFIGURATION`** section, deselect the **`Optimise OAuth experience in test tool`** option



4. Click Save configuration.

Results

You successfully disabled the **`Optimise OAuth experience in test tool`** option. You can now use the Developer Portal test tool to test an Implicit or Authorization Code grant type in an OAuth provider API, if your OAuth provider allows those actions to function correctly from the test tool.

What to do next

You can enable the **`Optimise OAuth experience in test tool`** option by repeating the task but selecting the option and then clicking Save configuration.

Enabling a cookie compliance banner

You can add a cookie compliance banner to your Developer Portal site by configuring the EU Cookie Compliance module.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The EU Cookie Compliance module provides a customizable pop-up notification that informs visitors to your site that cookies are being used. The notification enables your site visitors to find out more about cookies, and to decide not to browse the site if they disagree with using cookies. You can also provide a link from your cookie compliance banner to an internal or external privacy policy. For more information about configuring an internal privacy policy, see Customizing the privacy policy statement.
The EU Cookie Compliance module is enabled by default. The following instructions show you how to configure the notification.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > System > EU Cookie Compliance.
   The Settings tab of the EU Cookie Compliance page is displayed.
4. In the SETTINGS section select Enable banner, otherwise the notification does not display.
5. In the PRIVACY POLICY section, edit the Privacy policy link field to provide a link to your privacy policy or other page that explains cookies to your site visitors. The default link is `/privacy`, which links to the Privacy Policy content that is configured within the Developer Portal. For more information, see Customizing the privacy policy statement.
   External links should start with `http://` or `https://`. For example:

   ```
   https://example.com/privacy
   ```

6. Configure the remaining options as required. For example, you can change the wording, and edit the display size and color.
7. Click Save configuration to save your updates.

Results

You successfully enabled a cookie compliance banner on your Developer Portal site. New visitors to your site are now prompted to accept cookies.

Enabling code languages for code snippets

You can specify the languages that code snippets for APIs can be displayed in.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. On the administrator dashboard, click Configuration > System > IBM API Connect.
2. In the API Code Snippets section, select the check boxes for the languages that you want to make available for the code snippets to be displayed in.
3. Click Save configuration.
   The languages that you have enabled are displayed as options for your code snippets.

Enabling code snippets for SOAP APIs

By default, code snippets are only shown for REST APIs. You can enable code snippets for SOAP APIs.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Code snippets for SOAP APIs use raw HTTP, and do not use any SOAP libraries.

Procedure

1. On the administrator dashboard, click Configuration > System > IBM API Connect.
2. In the API Code Snippets section, select the Display code snippets for SOAP APIs as well as REST APIs check box.
3. Click Save configuration.
   The languages that you have enabled are displayed as options for your code snippets.

Forcing new users to accept terms and conditions

You can extend your Developer Portal site by forcing new users to accept the terms and conditions before they are able to create accounts.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Note: From IBM® API Connect Version 10.0.4.0, the **`Legal`** module is included in the list of core Developer Portal modules. The **`Terms of use`** module is still available in the Developer Portal, but the **`Legal`** module provides more configuration options.

About this task

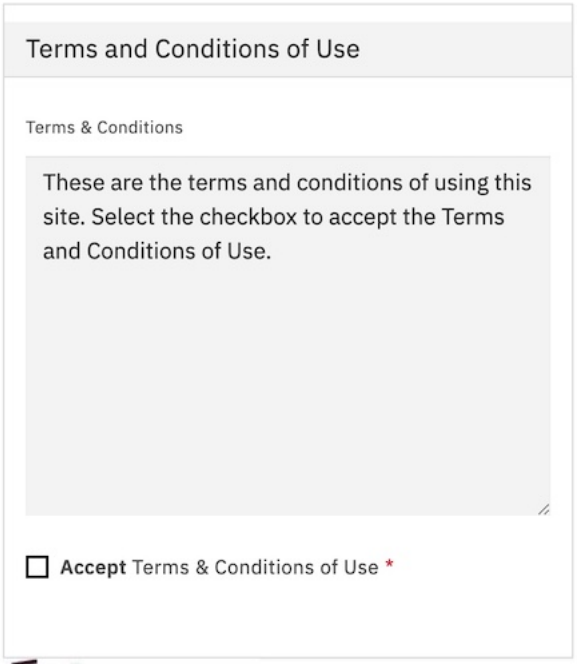
Use the following instructions to enable and configure the **`Legal`** module for your site terms and conditions.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected check box. The disabled modules are displayed without a selected check box.
3. Enter `legal` into the search filter.
   The Legal content item is displayed in the list of content.
4. Select the check box for the **`Legal`** module, and click Enable.
5. Navigate to Configuration > People > Legal.
6. Enter your Terms & Conditions statement, and select the Text format that you require.
7. Click Save configuration.

Results

You successfully enabled the **`Legal`** module. Now, when a user tries to create an account on your Developer Portal site, they must agree to the terms and conditions as a part of the registration.



What to do next

You can edit the terms and conditions page by navigating to Configuration > People > Legal, and making the changes that you require. You can disable the use of terms and conditions during site registration by deleting the terms and conditions content, and then disabling the **Legal** module.

If you prefer to use the **Terms of use** module, you can enable the module, and then navigate to Configuration > People > Terms of use, and select the page that contains your site terms and conditions, for example **Terms of use (1)**. For information about how to customize the statement, see Customizing the terms of use statement. The terms are displayed when you create an account and also from the link in the site footer. You can disable the use of terms and conditions during site registration by disabling the module.

- Drupal Legal module

Hiding the admin registry on the login form

You can hide the admin registry as an option on the login form. The use case for this option might be a public facing Developer Portal where you want to remove the admin access from customer view.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration > System > IBM API Developer Portal.
3. In the Configuration section, select the check box for **Hide the admin registry on the login form**.
4. Click Save configuration.
   The **Hide the admin registry on the login form** configuration is saved.

What to do next

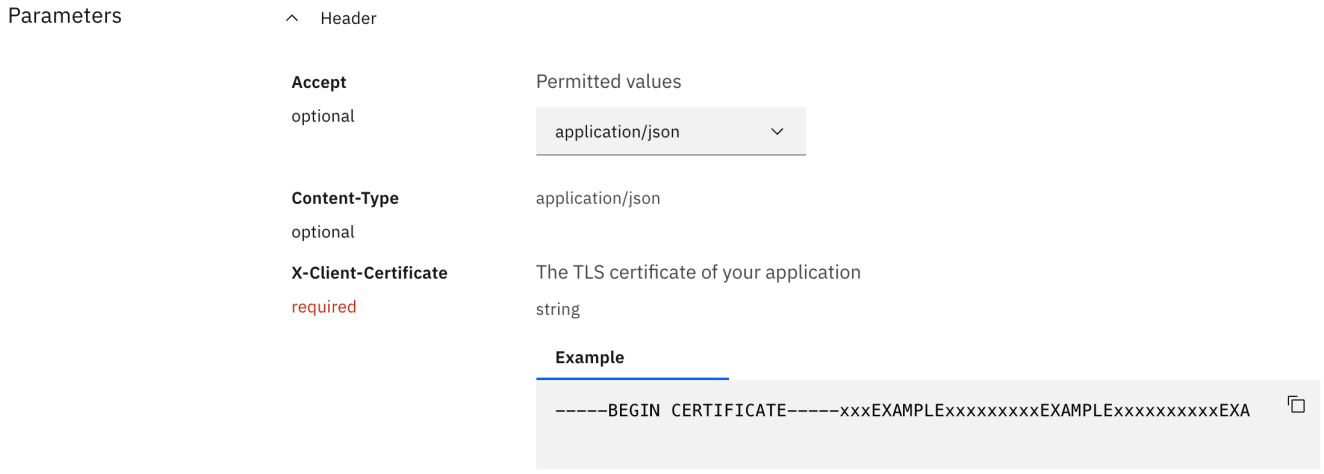
The admin registry is no longer shown on the login form. However, it is still accessible directly. The user can navigate to **<site_url>/user/login?registry_url=/admin**.

Hiding the certificate in the header for APIs secured with mutual TLS

You can hide the certificate in the header for APIs secured with mutual TLS. By default, the **x-client-certificate** header is shown in an API when mutual TLS is configured. You can choose to turn off this option in your Developer Portal.

Before you begin

The parameters for the example API showing the certificate.

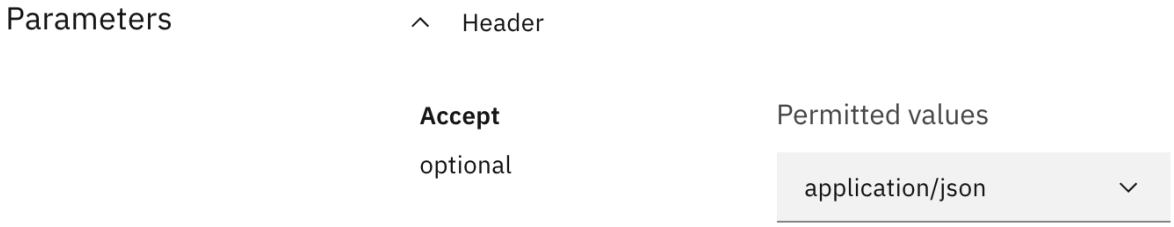


You must have administrator access to the Developer Portal to complete this task.

Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration > System > IBM API Developer Portal.
3. In the Configuration section, deselect the checkbox for **`Show certificate in header for APIs secured with mutual TLS.`**
4. Click Save configuration.
   The **`Show certificate in header for APIs secured with mutual TLS.`** configuration is saved.
   The parameters for the example API now not showing the certificate:



Importing and exporting taxonomies

You can import and export taxonomies in the Developer Portal.

Before you begin

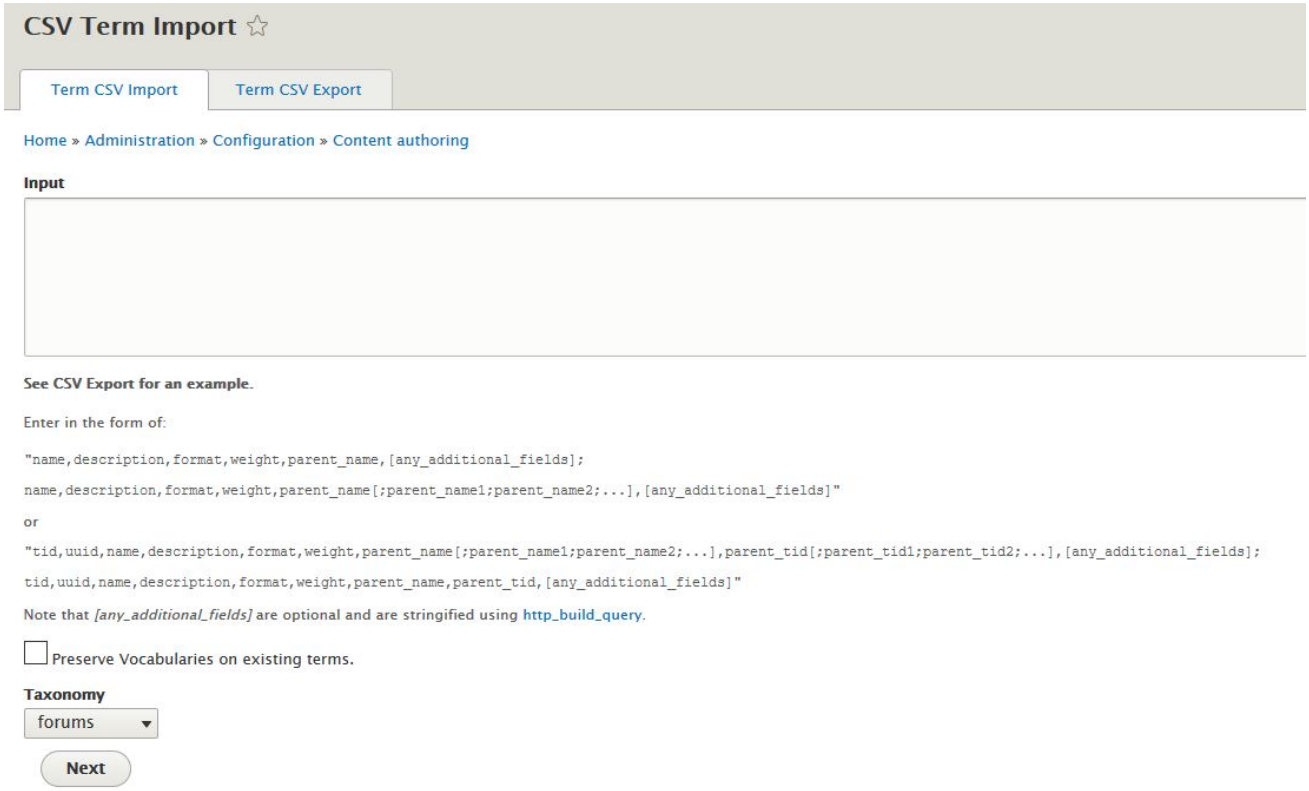
You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Configuration > Content authoring > Term CSV Export/Import.
4. Select Term CSV Import, or Term CSV Export.

For Term CSV Import

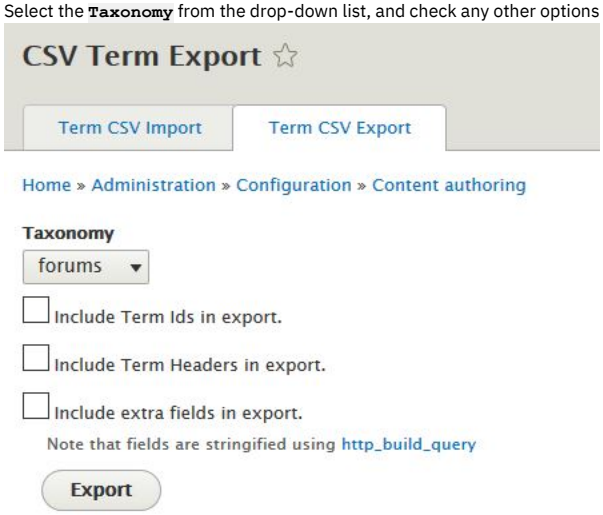
5. Enter your CSV input in the format given in the examples, and select the **`Taxonomy`** from the drop-down list.



6. Click Next.
7. Click Import.

For Term CSV Export

8. Select the **Taxonomy** from the drop-down list, and check any other options that you want.



9. Click Export.

Results

You successfully imported or exported a taxonomy.

Removing keys beginning with x-ibm from Open API document download

You can remove keys that begin with x-ibm from the Open API document download in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

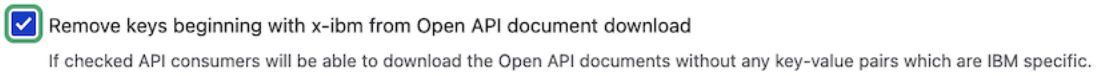
About this task

By removing keys that begin with x-ibm from the Open API document download, you can download the Open API documents without any key-value pairs that are IBM specific. Enabling this configuration setting removes the information about the API Management provider from the Open API document that is downloaded in the Developer Portal. The **file**, **filename**, and **url** keys are also automatically removed from the downloaded YAML file if the OpenAPI document includes the **x-ibm-schema** element with the type set to **graphQL**.
Warning: Removing keys that begins with x-ibm from the Open API document download also removes certain details from the downloaded API document. For example, the x-ibm-languages key that provides language support to the API will be removed from the downloaded API document after you enable this configuration.

Procedure

To remove keys that begin with x-ibm from the Open API document download in the Developer Portal, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > System > IBM API Developer Portal.
   The Configure the IBM API Developer Portal page is displayed.
4. Select the **Remove keys beginning with x-ibm from Open API document download** option.

5. Click Save configuration to save the changes.
   The keys beginning with x-ibm is removed from the JSON or YAML download of the Open API definition.

Restricting access by IP address

You can restrict access to a role or a user by IP address in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

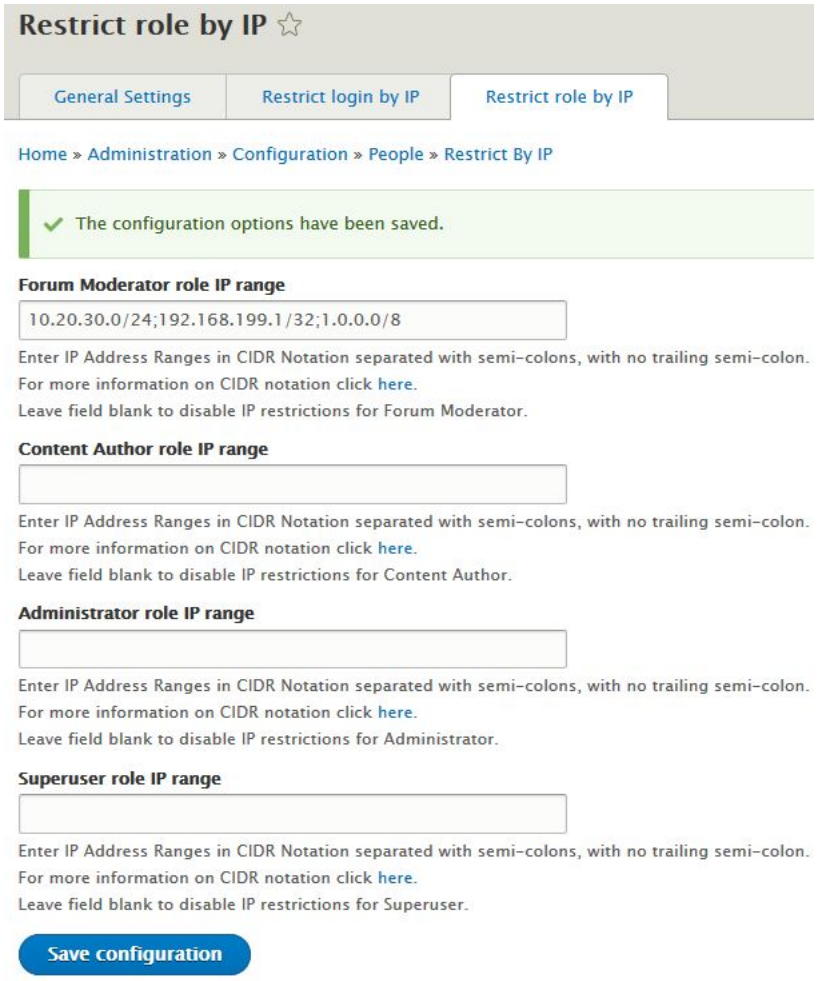
About this task

By restricting access to a role by IP address, that role is unavailable to users outside of the IP address ranges that you define. If a role restriction is triggered, the user's session is unaffected, but the restricted role is no longer available to the user. Role restriction affects only the availability of the restricted role to users. Role restrictions are available for all roles, except `anonymous user` and `authenticated user`.

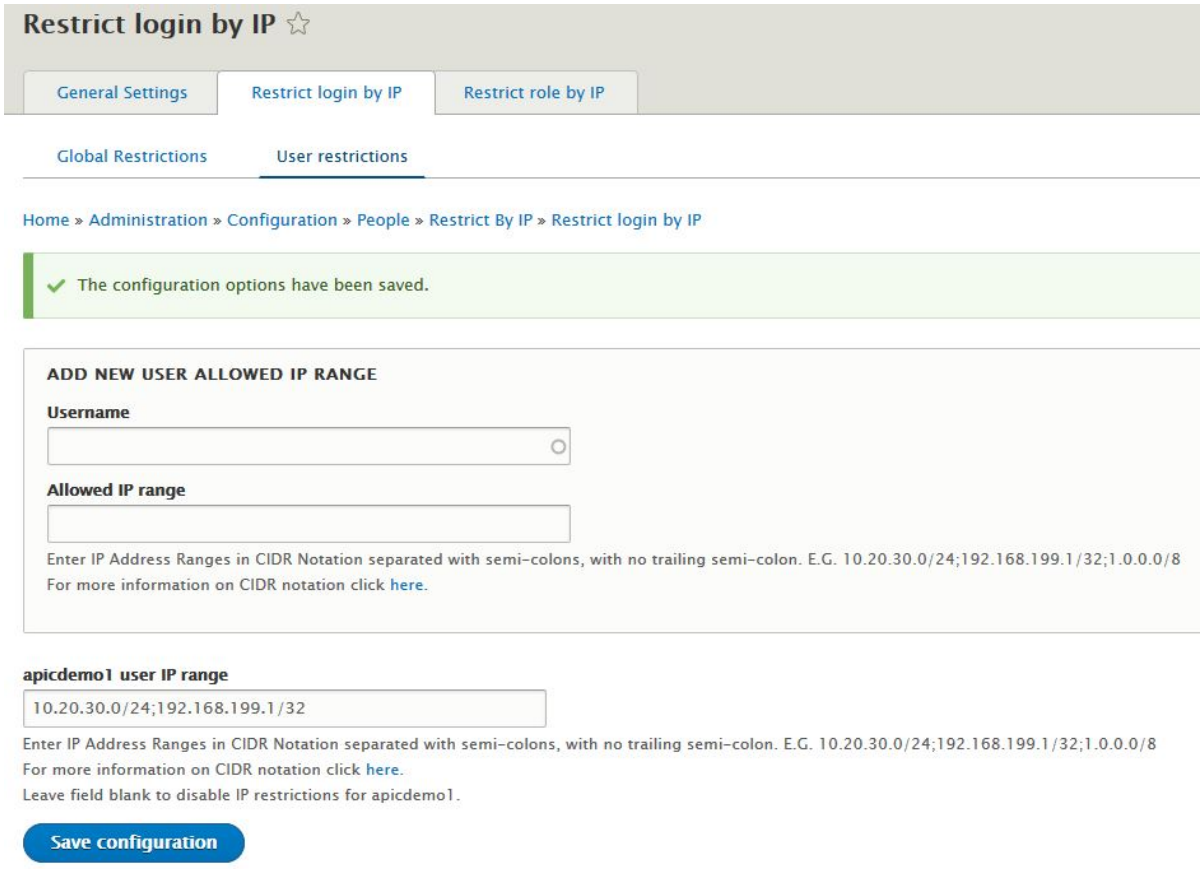
By restricting login access of a user by IP address, the user is unable to log in outside of the IP address ranges that you define. You can also specify global IP address ranges, which apply to all users. IP restrictions are checked on every page load. If a user restriction is triggered by an attempt at logging in being denied, then the user is logged out and sent to the 'error page' that is specified by the site administrator.
Note: IP address ranges must be entered in CIDR notation that is separated with semi-colons and no trailing semi-colon. For more information on CIDR notation, see CIDR format.

Procedure

1. In the Developer Portal, click Configuration > People > Restrict by IP, then click **Restrict log in by IP**.
2. On the **Global restrictions** tab, enter the address of the page to which the user is redirected to if they are not allowed to log in, in the Login denied error page.
3. Select one of the following options:
   - To restrict access to a role by IP address, complete the following steps:
     - Click Restrict role by IP.
     - Decide which role you want to restrict, the roles that you can restrict include Administrator, Content Author, and Forum Moderator.
     - Enter the IP address range (in CIDR notation) that you do not want to restrict log in for in the field for that role, for example, Forum Moderator role IP range.
     - Click Save configuration.



- To restrict login access of a user by IP address, complete the following steps:
  - Click Restrict login by IP, then click **`User restrictions`**.
  - In the **`ADD NEW USER ALLOWED IP RANGE`** section, enter a user name in the **`Username`** field.
  - Enter an IP address Range (in CIDR notation), that you do not want to restrict log in for in the **`Allowed IP range`** field.
  - Click Save configuration. Your new log in restriction can be seen after the **`ADD NEW USER ALLOWED IP RANGE`** section.



- To restrict login for all users, complete the following steps:
  - Click Restrict login by IP, then click **`Global restrictions tab`**.
  - Enter the global IP address ranges (in CIDR notation) in the Restrict global login to allowed IP range field.
  - Click Save configuration.

4. To remove an IP restriction, delete the value that is associated with the restriction, then click Save configuration.

Restricting or preventing access from search engines

You can restrict or prevent access to your Developer Portal from search engines. You might want to control the access if you have a development or test site.

Before you begin

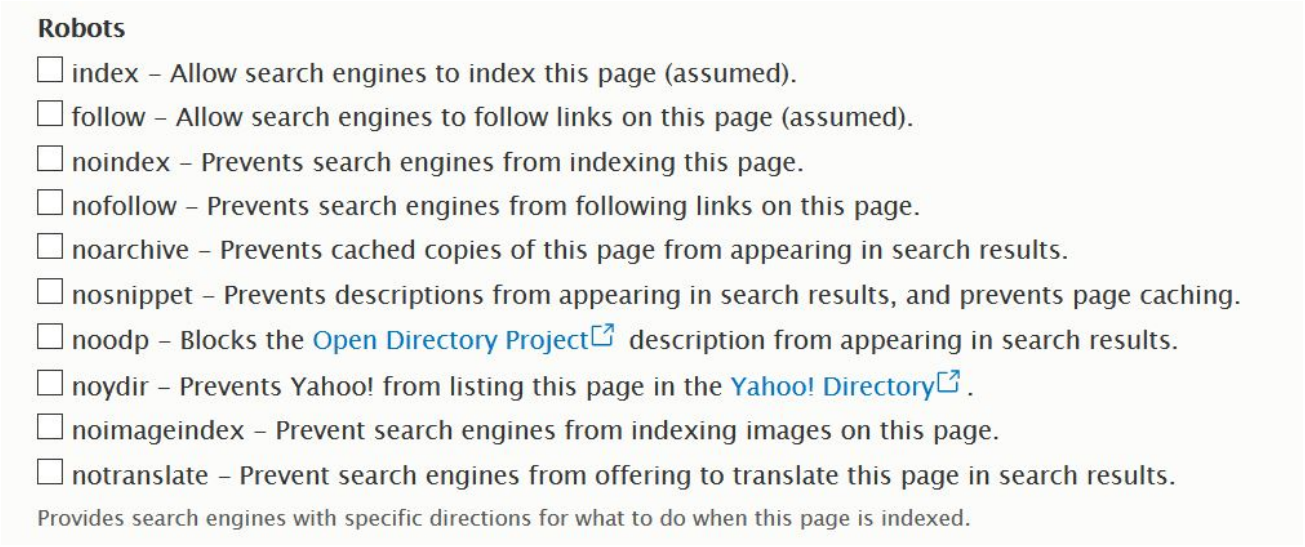
You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You might have a development or test Developer Portal site on the internet, but do not want them to be indexed by Google, or other search engines, making them visible to your customers. Google explicitly advises not to use **`robots.txt`** as a blocking mechanism. A correct solution is to control access by using Metatag.

Procedure

1. In the Developer Portal, click Configuration > Search and metadata > Metatag.
2. On the **`Global restrictions`** tab, click Edit.
3. In the Advanced section, select the meta tags that you want to use to restrict or prevent the access:



4. Click Save.

Toggling the site in and out of maintenance mode

You can put the Developer Portal site into maintenance mode for short periods of time. During maintenance mode, only an administrator is able to access the site, and all other users who enter the site URL get a maintenance message set by the administrator.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Important:

- Maintenance mode is designed for short-term site maintenance; it is not meant for long-term usage. While a site is in maintenance mode, the database is not updated with new content from API Manager. As soon as the maintenance tasks are finished, you must take the site out of maintenance mode.
- Do not log out of the Developer Portal while the site is in maintenance mode, as you will not be able to log back in to the UI. In this case, maintenance mode can be turned off only by using the toolkit CLI; see the following instructions for details.

Procedure

To put the site into maintenance mode, complete the following steps.

1. Click Configuration in the administrator dashboard.
2. Under the DEVELOPMENT heading, click Maintenance mode.
3. Select the Put site into maintenance mode checkbox.
4. Enter a site message, or leave the default site maintenance text.
   This message is what will be seen by users who visit the site while it is in maintenance mode.
5. Click Save configuration.
   Your site is now in maintenance mode.

To take the site out of maintenance mode, complete one of the following steps.

6. If you remained logged in to the site as the admin user during the maintenance period, you can use the Developer Portal UI to disable maintenance mode:
   a. Click Configuration in the administrator dashboard.
   b. Under the DEVELOPMENT heading, click Maintenance mode.
   c. Clear the Put site into maintenance mode checkbox .
      Your site is now available to users, and out of maintenance mode.
7. If you're no longer logged in to the site, you can use the toolkit CLI to disable maintenance mode:
   a. Log in to the toolkit CLI as a Provider org:

      ```
      apic login --server management_server --realm provider/identity_provider --username provider_username --password
      provider_password
      ```

      You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

      ```
      apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
      ```

      For example,

      ```
      apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
      total_results: 2
      results:
        - title: API Manager User Registry
          realm: provider/default-idp-2
      ```

```
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
For full details of the **apic login** command, see Logging in to a management server.

b. Run the following command to disable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --
state_key system.maintenance_mode  --input_format integer --state_value 0
```

Where:

- ***management_server*** is the endpoint URL of your management server (required).
- ***catalogid/name*** is the ID or name of the catalog that your site belongs to (required).
- ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to (required).
- **--state_key** is the name of the state key (required). Must be set to **system.maintenance_mode**.
- **--input_format** is the input format of the value of the state key. Must be set to **integer** for configuring the maintenance mode.
- **--state_value** is the value to assign to the state key (required). Set to **0** to disable maintenance mode.

For example, to disable maintenance mode for a Developer Portal in the **myOrg** organization, and in the **dev** catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key
system.maintenance_mode  --input_format integer --state_value 0
Successfully set state system.maintenance_mode to the value of 0.
```

Your site is now available to users, and out of maintenance mode.

What to do next

You can use the toolkit CLI to enable, and disable, maintenance mode. For more information, see the scenario How to enable and disable maintenance mode on your Developer Portal.

Viewing available updates

You can view available updates in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To view available updates, complete the following steps:

1. Click Reports in the administrator dashboard.
2. Click Available updates.
3. You can see what updates are available from this view. However, updates can be applied only by applying the latest available API Connect release; see Upgrading in a Kubernetes environment, or Upgrading in a VMware environment, for more information.

Managing Developer Portal security

You can manage multiple security elements in the Developer Portal.

- **Configuring CAPTCHA**
  You can add a CAPTCHA challenge to any of your Developer Portal pages to protect your site from spam.
- **Configuring reCAPTCHA**
  You can configure reCAPTCHA on your Developer Portal site to provide more protection from spam and abuse.
- **Configuring session timeout and limit**
  You can specify session timeout settings to control when a user is automatically logged out of the Developer Portal. You can also restrict the number of sessions a single user has available to them.
- **Configuring the timeout length for the password reset link**
  You can configure the timeout length for the one-time password reset link that is sent from the Developer Portal to the admin user account.

- **Configuring your site password policy**
  You can configure your site password policy to define the constraints that are applied to the passwords of your Developer Portal users.
- **Disabling CORS warnings**
  You can disable cross-origin resource sharing (CORS) warnings for unenforced APIs in the Developer Portal.
- **Disabling live testing of APIs**
  You can disable live testing of APIs in the Developer Portal to restrict exposure of an API.
- **How to enable penetration testing, and information about Developer Portal cookies**
  Many security features are available in the Developer Portal, but if you need to do a penetration test of your Developer Portal site, some of these features might block the scan that is required as part of the testing. This topic provides guidance on the security features that you might need to disable to allow penetration testing of your site, as well as information about Developer Portal cookies.
- **How to manage IP security in the Developer Portal**
  The Developer Portal offers the ability to perform various IP address security measures, such as adding and removing specific IP addresses from the banned IP address list, automatically banning client IP addresses by using the Drupal Perimeter Defence module, or managing login security by using flood control.
- **Managing banned IP addresses**
  You can ban specific IP addresses from accessing your Developer Portal site.
- **Using flood control for login security**
  You can configure login security for your Developer Portal by using flood control.
- **Login security**
  You can configure the login security for your Developer Portal at an IP and user level. You can also configure login security for Developer Portal contact forms.
- **Using the Security kit**
  You can improve the security of your website by configuring various options that are available in the Security Kit module, in the Developer Portal.
- **Using Honeypot for spam protection**
  Honeypot protection provides security mechanisms to protect your Developer Portal site from form submission by spam bots. If spam bot activity is detected, form submission is blocked.

Configuring CAPTCHA

You can add a CAPTCHA challenge to any of your Developer Portal pages to protect your site from spam.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The types of CAPTCHA challenges that are available include Image and Math based CAPTCHAs. Both types of CAPTCHA challenges are configurable in the CAPTCHA dialog box. By default, your Developer Portal site is configured with the Image based CAPTCHA challenge enabled.
You can also configure reCAPTCHA on your site. For more information, see Configuring reCAPTCHA.

Procedure

To configure CAPTCHAS, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click CAPTCHA module settings.
   The CAPTCHA settings window opens.
4. Use the CAPTCHA configuration options provided as required. For example, you can complete the following tasks:
   a. Specify the CAPTCHA challenge type.
   b. Specify which forms must include a CAPTCHA challenge.
   c. Add a description to the CAPTCHA.
   d. Enable CAPTCHA statistics.
5. Click Save configuration to save your changes.

Configuring reCAPTCHA

You can configure reCAPTCHA on your Developer Portal site to provide more protection from spam and abuse.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

reCAPTCHA is a CAPTCHA-like system that is designed to establish that a computer user is human. The types of reCAPTCHA that are available include Checkbox, Invisible, and Android.
Note: To use reCAPTCHA the administrator of your Developer Portal is required to sign up to Google's reCAPTCHA API, and your portal server must have internet access.

Procedure

To configure reCAPTCHA, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration > People > CAPTCHA module settings > reCAPTCHA in the administrator dashboard.
   The reCAPTCHA settings window opens.
3. In the GENERAL SETTINGS section, click register for reCAPTCHA.
   The Google registration site for reCAPTCHA is displayed.
4. Follow the instructions on Google to register your Developer Portal site, and obtain the Site key and Secret key.
5. Return to the reCAPTCHA settings window in the Developer Portal, and enter the Site key and Secret key that you obtained from Google into the GENERAL SETTINGS section.
6. Optional: Update the WIDGET SETTINGS section as required.
7. Click Save configuration to save your changes.
8. Click the CAPTCHA Settings tab, and in the FORM PROTECTION section change the Default challenge type to reCAPTCHA (from module reCAPTCHA).
9. Click Save configuration.

Results

The reCAPTCHA module is now enabled on your Developer Portal site.

Related tasks

- Configuring CAPTCHA

Configuring session timeout and limit

You can specify session timeout settings to control when a user is automatically logged out of the Developer Portal. You can also restrict the number of sessions a single user has available to them.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. To manage the automated logout settings, complete the following steps:
   a. Click Configuration in the administrator dashboard.
   b. In the PEOPLE section, click Automated logout settings.
   Note: You must check **`Enforce auto logout on admin pages`** for **`autologout`** to apply when navigating the admin areas of the site.

   c. Use the session timeout configuration options provided as required. For example, you can complete the following tasks:
      - Specify the length of inactivity time, in seconds, before a user is automatically logged out.
      - Specify session timeout values for individual user roles.
        Note: The default session timeout is 30 minutes.
      - Provide a redirection URL at logout.
      - Provide session expiry message texts.

   d. Click Save configuration to save your changes.
3. To restrict the number of sessions available to a user, complete the following steps:
   a. Click Configuration in the administrator dashboard.
   b. In the PEOPLE section, click Session limit.
   c. Specify the default maximum number of sessions for a user by entering the number into the Default maximum number of active sessions field.
   d. Select the required action from the When the session limit is exceeded options.
   e. From the Logged out message severity list, select the severity of the message that the user receives when they are logged out.
   f. Optionally, in the ROLE LIMITS section, specify separate session limits for each role.
   g. Click Save configuration to save your changes.

Configuring the timeout length for the password reset link

You can configure the timeout length for the one-time password reset link that is sent from the Developer Portal to the admin user account.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

By completing the steps in this task, you are configuring the timeout length for the one-time password reset link that is sent to the admin user account by the Developer Portal.
Note:

- Setting the password reset timeout length in the Developer Portal affects only the admin user account.
- You are not affecting the user activation or password reset links that are used by any other identification provider type in API Manager.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click Account settings.
   The Account settings window opens.
4. In the Account settings window, navigate to the PASSWORD RESET TIMEOUT section.
5. Enter your required value for the timeout in the Password Reset Timeout field.
   Note: The timeout value is specified in seconds, and is 86400 seconds by default.
6. Click Save configuration.
   You have configured the timeout length for the one-time link that is sent from the Developer Portal for the admin user account.

Configuring your site password policy

You can configure your site password policy to define the constraints that are applied to the passwords of your Developer Portal users.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Any passwords that are stored in the API Manager must comply with the API Manager password policy. You can configure your password policy to be the same as or stricter than the API Manager password policy.

Procedure

To configure your site password policy, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SECURITY section, click Password Policy.
   The Password Policies page opens.
4. In the OPERATIONS column for the default password policy, click Edit.
   Note: You can create a new password policy by clicking Add Policy; this allows you to apply different password policy settings to different roles. If you need only a single password policy, just configure the pre-supplied default policy.
5. Click Next.
   The Configure Constraints page opens.
6. Configure the password constraints as required.
   a. To configure a constraint, click Edit in the OPERATIONS column for the required constraint.
   b. To delete a constraint, select Delete in the OPERATIONS column.
   c. To add a constraint, select the required constraint type from the drop-down list, then click Configure Constraint Settings.
   d. When you are done, click Next.
      The Apply to Roles page opens.
7. Select the roles to which the password policy settings are to be applied. then click Finish.

Disabling CORS warnings

You can disable cross-origin resource sharing (CORS) warnings for unenforced APIs in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

By disabling the CORS warnings, users will not receive further warnings regarding the usage of unenforced APIs.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click IBM API Connect.
4. Ensure that the Display CORS warnings for unenforced APIs check box is cleared.
5. Click Save Configuration.
   You have disabled CORS warnings in the Developer Portal. To enable CORS warnings, repeat the steps and ensure that the Display CORS warnings for unenforced APIs check box is selected.

Disabling live testing of APIs

You can disable live testing of APIs in the Developer Portal to restrict exposure of an API.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click IBM API Connect.
4. Ensure that the Allow live testing of APIs check box is cleared.
5. Click Save configuration.
   You have disabled live testing of APIs. To enable live testing of APIs, repeat the steps and ensure that the Allow live testing of APIs check box is selected.

How to enable penetration testing, and information about Developer Portal cookies

Many security features are available in the Developer Portal, but if you need to do a penetration test of your Developer Portal site, some of these features might block the scan that is required as part of the testing. This topic provides guidance on the security features that you might need to disable to allow penetration testing of your site, as well as information about Developer Portal cookies.

Penetration testing, or pen testing, is the practice of testing a computer system, network, or web application for potential security vulnerabilities that an attacker might exploit. For certain elements of your pen testing, you might want to disable some of the security features that block scanning of the Developer Portal. The following sections describe the security features in the Developer Portal that you might need to disable. The actual requirements depend on your Developer Portal configuration, and on the type of pen testing that you are running. Note also the final section, which discusses testing for Distributed Denial of Service attacks.
Important:

- If you run a pen test, and you give the automated test tool the admin credentials, the tool submits all of the administration configuration forms as well, and this action is likely to break the Portal site configuration. Best practice is to use different credentials for the testing.
- If you disable security modules, and then run security scans, your Portal site configuration might be broken by the scanning process. Before running any security testing, ensure that you have a valid backup of your Portal site.
- If your Portal site configuration is broken by the security testing, then you must delete the Portal site from the API Manager Catalog settings and re-create it, or restore it from a backup.
  For information about restoring your site, see the appropriate topic for your environment:
  - Restoring the Developer Portal on Kubernetes and OpenShift
  - Restoring the Developer Portal on VMware
- Note that disabling of security modules makes it highly likely that you will find issues that are not actually vulnerabilities, because you have disabled the modules that are designed to protect against these vulnerabilities. Therefore, any issue that is found in these circumstances must be replicated in an environment without the security modules disabled, before contacting IBM Support.
- Do not use the **`Enforced`** mode of the **`Content Security Policy`**, this mode is not supported and can break core Developer Portal functionality such as API rendering and the content editor. The **`Content Security Policy`** must be in **`Report only`** mode.

Note: You might need to disable the **`Honeypot`** module to allow your penetration test to run. For more information, see Using Honeypot for spam protection.
This topic contains the following sections:

- CAPTCHA and reCAPTCHA verifications
- Drupal Perimeter Defense module
- Login Security module
- Developer Portal cookies
- Should I test the Developer Portal for vulnerability to Distributed Denial of Service attacks?

CAPTCHA and reCAPTCHA verifications

CAPTCHA and reCAPTCHA verifications are a type of challenge-response test that are used in web applications to check whether the user is human. By default, your Developer Portal site is configured with an Image based CAPTURE challenge enabled, but you can also configure a Math based CAPTCHA challenge, and Checkbox, Invisible, and Android reCAPTCHA challenges. If you need to disable these verifications before pen testing, see the following instructions.

To disable the CAPTCHA and reCAPTCHA verifications, you must disable the modules as follows:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Extend > Disable module.
4. Search through the list of modules, and select the check boxes next to the Image CAPTCHA and reCAPTCHA modules.
5. Click Disable, and click Disable again to confirm.
6. On the Disable tab, select the check box next to the CAPTCHA module, and click Disable. The display shows the forms that the CAPTCHA configuration is removed from.
7. Click Disable again to confirm. Note that the modules must be disabled in this order.

The CAPTCHA and reCAPTCHA modules are now disabled, and you can complete your pen testing. After pen testing, you can enable the modules again by clicking Extend on the administrator dashboard, selecting the check box for each module in the List tab, and clicking Enable.

Drupal Perimeter Defense module

The Drupal Perimeter Defense module (machine name: perimeter) immediately bans the IP addresses of those users that send suspicious requests to your site, so any pen testing scans would be blocked. This module is enabled by default on the Developer Portal. For more information about the module, see the Drupal documentation Drupal Perimeter Defense module.

If you need to disable the Drupal Perimeter Defense module before pen testing, see the following instructions:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Extend > Disable module.
4. Search through the list of modules, and select the check box next to the Drupal Perimeter Defense module.
5. Click Disable, and click Disable again to confirm.

The Drupal Perimeter Defense module is now disabled, and you can complete your pen testing. After pen testing, you can enable the module again by clicking Extend on the administrator dashboard, selecting the check box next to the Drupal Perimeter Defense module in the List tab, and clicking Enable.

Login Security module

The Login Security module (machine name: login_security) enables the site administrator to improve the security options in the login operation of your Developer Portal site. For example, controlling the number of invalid login attempts before blocking users, and denying access by IP address. This module is enabled by default on the Developer Portal. For more information about the module, see the Drupal documentation Login Security module.

If you need to disable these security options before pen testing, you need to manually modify the configuration of your security options according to your requirements. For example, you might need to change the number of login attempts that are allowed before a user or IP address is blocked. To configure the security options, see the following instructions:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Configuration > People > Login Security.
4. In the Login Security window, update the security options according to your requirements.
5. Click Save configuration to save your updates.

The Login Security options are now updated, and you can complete your pen testing. After pen testing, you can reconfigure your security options in the Login Security window.

Developer Portal cookies

Cookies are small text files that are placed on a computer by websites when they are visited. The Developer Portal uses cookie that remain on the computer for varying times. Some cookies expire at the end of each session, and some remain longer to enhance the user experience in the future.
Note: The cookie generated by Bigpipe does not have the **`httponly`** flag set. Thus, JavaScript can delete the cookie whenever required.
The list here explains the cookies that are used by the Developer Portal, and why they are used.
Note: Any load balancer that sits in front of the Developer Portal must be a transparent proxy that enables all cookies returned by the Developer Portal to pass through to the browser.

Drupal session identifier cookie
: This is the main cookie that all of the Developer Portal sites have, and it stores the session identification. The session cookie is named in the format SSESS*UUID*, where *UUID* is a randomly generated unique string of characters for that session, and this is the session token itself. The session cookie is always marked with the following flags as instructions to the browser client:

  - **`Secure`** - means that the cookie is sent only over a secure connection (that is, over TLS).
  - **`HttpOnly`** - means that the browser adds this cookie on outbound requests only, and not provide the value to client side javascript.

session_store.id cookie
: This cookie is used to store information on where a user is in the subscription flow, and any options that they selected, if they haven't yet signed in, so the Developer Portal can redirect them back there later. The session_store.id cookie is also marked with the **`Secure`** and **`HttpOnly`** flags, and it does not contain any confidential information.

Drupal.visitor.startSubscriptionWizard cookie
: This cookie is used to store information on where a user started in the subscription flow if they haven't yet signed in, so the Developer Portal can redirect them back there later. The Drupal.visitor.startSubscriptionWizard cookie is also marked with the **`Secure`** and **`HttpOnly`** flags, and it does not contain any confidential information.

portal_web cookie

This cookie is used to achieve session persistence, which it does by ensuring that web traffic between the user and the Developer Portal is correctly routed to the server. The portal_web cookie is used for both HTTP and HTTPS communications, so that routing is meaningful irrespective of the transfer protocol, and ensuring consistent behavior if the switching of protocols is required. The cookie contains only a hash of the pod that served the traffic to maintain session persistence, and does not contain any confidential information. The cookie is provided by the Portal ingress. This cookie is not marked as **`Secure`** or **`HttpOnly`**, as the Kubernetes ingress does not yet support these attributes.

Other cookies

In addition to the cookies listed previously, there are other (usually temporary) cookies that might be created depending on the configuration options of your Developer Portal site. For example, if the site uses OAuth for authentication, then during the OAuth token activation flow a JSON Web Token is sent to the browser. This token is stored in a cookie for a limited lifetime. This action is part of the normal function of an OAuth flow. As the creation of these other cookies depends on your particular Developer Portal configuration, we cannot provide a complete list of cookies here.

Should I test the Developer Portal for vulnerability to Distributed Denial of Service attacks?

When you run penetration testing, it's important to understand that individual systems are not responsible for (nor capable of dealing with) Distributed Denial of Service (DDoS) attacks. DDoS attacks are launched by huge numbers of external computers simultaneously, with a goal of using up all of the resources of a system, and thereby denying service to legitimate users. These kinds of attacks are usually defended against at the level of the network and edge gateways, and information about how to protect against them is out of the scope of this topic. Although the Developer Portal does have some capabilities, including the modules mentioned previously, for potentially mitigating some of the effects of a DDoS attack, do not rely on these capabilities as the first line of defense; rather they are designed to assist in dealing only with any elements of an attack that might have gotten through the outer network layers of protection.

How to manage IP security in the Developer Portal

The Developer Portal offers the ability to perform various IP address security measures, such as adding and removing specific IP addresses from the banned IP address list, automatically banning client IP addresses by using the Drupal Perimeter Defence module, or managing login security by using flood control.

See the following links for information about how to manage IP security in the Developer Portal:

- Enable and disable IP security
- Correctly passing through client IP addresses
- Managing banned IP addresses

Enable and disable IP security

The ability to enable or disable IP security related actions can be controlled at the Portal service level by using the Developer Portal CLI command **`ip-security-enabled`**. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. When IP security is disabled, all IP related security is switched off. For example, the perimeter module won't block client IP addresses when IP security is disabled. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. For more information, see Using the ip-security-enabled command.

Correctly passing through client IP addresses

In order to correctly use modules that make use of client IP banning, such as the Drupal Perimeter Defence module, you must ensure that any external load balancer that fronts the Portal cluster passes through the client IP address. This can be achieved by passing the client IP address through in an **`'x-forwarded-for'`** header, or by making use of the proxy protocol (provided both the load balancer and the ingress controller are compatible with the proxy protocol, and have the protocol enabled). Failure to correctly pass through the client IP address, results in the load balancer IP address being blocked when a client attempts to send a suspicious request to the portal.

If you are fronting the Portal cluster with an HAProxy setup acting as the load balancer, then you can make use of the proxy protocol by adding the **`send-proxy`** directive to the end of the Portal server declarations in the HAProxy configuration file, for example:

```
server portal0 portal_host:port check send-proxy
```

You must restart the HAProxy for the change to take effect. Note that if your load balancer IP address has already been blocked, you will need to remove the blocked IP address from the banned list by using the **`security`** command in theDeveloper Portal CLI, see Using the security command.

If you find your load balancers are being banned by Portal's IP Security modules, then you might need to configure your system's ingresses to send the **`'x-forwarded-for'`** headers. For instance, the default behavior of the **`nginx-ingress-controller`** is to ignore the inbound **`'x-forwarded-for'`** header and construct a new one. To configure the **`nginx-ingress-controller`** to pass through the inbound **`'x-forwarded-for'`** header you need to add the following to the **`nginx-ingress-controller`** config map:

```
data:
 compute-full-forwarded-for: "true"
 use-forwarded-headers: "true"
```

For more information about the Drupal Perimeter Defence module, see Drupal Perimeter Defense module.

Managing banned IP addresses

You can manage banned IP addresses for a particular site by using the administrator dashboard for a particular Developer Portal site. For more information, see Managing banned IP addresses.

- Managing banned IP addresses

Managing banned IP addresses

You can ban specific IP addresses from accessing your Developer Portal site.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To manage banned IP addresses, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click IP address bans.
   The IP address bans window opens.
4. You can complete the following tasks:
   a. To ban an IP address, enter the address in the IP address field, then click Add.
      The address is added to the BANNED IP ADDRESSES list.
   b. To remove an IP address from the banned list, click Delete alongside the required address.

   Note:
   - There is automatic login "flood" protection built into the Developer Portal. This feature means that an excess of login attempts from the same IP address in one hour will cause that IP to be temporarily banned. For more information, see Using flood control for login security.
   - You can also clear banned user/IP addresses by using the Developer Portal CLI command **`security:clear-bans`**. For more information, see Using the security command.

Using flood control for login security

You can configure login security for your Developer Portal by using flood control.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Navigate to Configuration > System > Flood Control.
3. Enter values in the following fields in the LOGIN SETTINGS section according to your requirements:
   - Failed IP login limit (min 1) - the number of failed login attempts from the same client IP.
   - Failed IP login window in seconds (0 = Off) - the time window, in seconds, for the number of failed login attempts from the same client IP.
   - Failed User login limit (min 1) - the number of failed login attempts from a user.
   - Failed User login window in seconds (0 = Off) - the time window, in seconds, for the number of failed login attempts from a user.
4. Enter values in the following fields in the CONTACT FORM section according to your requirements:
   - Emails sent limit - the number of emails that can be sent.
   - Emails sent window in seconds - the time window, in seconds, for the number of emails that can be sent.
5. Click Save configuration.

What to do next

To unblock a user, see Blocking and unblocking specific users. To unblock an IP address, see Managing banned IP addresses.

Login security

You can configure the login security for your Developer Portal at an IP and user level. You can also configure login security for Developer Portal contact forms.

Before you begin

Important: The Login Security module is being removed from future releases. It has been replaced by Flood Control. Existing users of the Login security module should configure Flood Control with the same limits and time windows as specified here. For more information, see Using flood control for login security.
You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click Login Security.
4. Enter values in the following fields in the GENERAL SETTINGS section according to your requirements:
   - Track time - the time window to check for security violations.
   - User - the number of login failures before blocking a user.
   - Soft host - the number of login failures before soft blocking a host. The host can still browse the site as an anonymous user.
   - Host - the number of login failures before hard blocking a host. The host cannot access the site at all.
   - Attack detection - the number of login failures before warning about an ongoing attack.
5. Select the check boxes that satisfy your notification requirements in the NOTIFICATION section:
   - Disable login failure error message
   - Notify the user about the number of remaining login attempts
   - Display last login timestamp
   - Display last access timestamp
6. Optional: Edit the EMAIL FOR ONGOING ATTACK DETECTION section.
7. Optional: Edit the EMAIL FOR BLOCKED ACCOUNT section.
8. Optional: You can edit the notification texts that are displayed by configuring the following options:
   - Failed login attempt
   - Banned host (soft IP ban)
   - Banned host (hard IP ban)
   - Blocked user by uid
9. After you have configured your login security options, click Save configuration.

What to do next

To unblock a user, see Blocking and unblocking specific users. To unblock an IP address, see Managing banned IP addresses.

Using the Security kit

You can improve the security of your website by configuring various options that are available in the Security Kit module, in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

The Security Kit module provides your website with various options to mitigate risks of common web application vulnerabilities like Cross-site Scripting, Cross-site Request Forgery and Clickjacking. It also has some options to improve your SSL/TLS security.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click Security Kit settings.
4. In the Security Kit module, configure the security settings for your website as required.
5. When you are done, click Save configuration.

Using Honeypot for spam protection

Honeypot protection provides security mechanisms to protect your Developer Portal site from form submission by spam bots. If spam bot activity is detected, form submission is blocked.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Honeypot protection provides the following security mechanisms:

- A hidden field, unseen by users, is added to the form. If a value has been entered in the field when the form is submitted then this indicates that the form was completed by a spam bot, and the submission is blocked. You can specify the name of the hidden field.
- If the form is submitted before a specified time has elapsed (five seconds by default), it is assumed that this is too short a time for a human to have completed the form, and the submission is blocked. You can specify the time length.

Honeypot protection is provided by the Honeypot module, which is enabled by default.
Note: If you want to carry out automated testing of your Developer Portal, you might need to disable the Honeypot module, because Honeyspot spam protection is designed specifically to block automated Developer Portal usage. For details on how to disable a module, see Disabling modules.

Procedure

To configure Honeypot for spam protection in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the CONTENT AUTHORING section, click Honeypot configuration.
4. Specify the forms that you want to protect with Honeypot.
    a. To enable Honeypot protection for all the forms on your Developer Portal site, select Protect all forms with Honeypot.
    b. To choose which forms you want to protect with Honeypot, clear the Protect all forms with Honeypot check box, then select the required forms in the HONEYPOT ENABLED FORMS section.

   By default, Honeypot protection is enabled for all user management forms and all comment forms.
5. To have details of all blocked form submissions written to the log file, select Log blocked form submissions.
6. In the Honeypot element name field, specify the name of the hidden form field.
   The default field name is url. You need to change the value if your form already has a field of the same name. For the most effective protection, use a generic field name; for example, email, homepage, or link.
7. In the Honeypot time limit field, specify the number of seconds that must elapse before it is assumed that a form is being submitted by a human rather than a spam bot. If the form is submitted before this time has elapsed then the submission is blocked.
   The default value is five seconds.
8. When done, click Save configuration.

People

You can manage and customize the user experience in the Developer Portal, by altering permissions and assigning roles to specific users.

To learn how to configure the user experience for your Developer Portal site, use the following section links.

- **Blocking and unblocking specific users**
  You can block and unblock specific users in the Developer Portal.
- **Controlling access to Developer Portal content**
  In IBM® API Connect, you can restrict access to content for Consumer organizations through an access content list. However, you can also assign permissions in the Developer Portal that override the access content list, and allow users to access and edit all of the content for Products, APIs, and Applications.
- **Creating a developer account to customize API properties**
  You can allow specific users in the Developer Portal to customize the properties for certain APIs, including APIs that are not viewable by the administrator, or other customizable features, by creating an internal Consumer organization.
- **Email Subscribers**
  As a site administrator, you can use the email subscribers wizard to send messages to your Developer Portal community.
- **How to style the Developer Portal emails**
  You can apply a theme to the HTML emails that are sent by the Developer Portal by using CSS and templating.
- **Working with roles in the Developer Portal**
  As a site administrator, you can create and customize site configuration roles in the Developer Portal.

Blocking and unblocking specific users

You can block and unblock specific users in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To block or unblock a specific user, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
   A list of users is displayed.
3. Select the check box next to the target user.
4. From the drop-down list under Action, select Block the selected user(s) or Unblock the selected user(s).
5. Click Apply to selected items.
   You have blocked or unblocked specific users from the Developer Portal.
   Note: If a user reports that they are unable to login, but they do not appear as blocked, then it might be that they have been blocked by Flood Control. To unblock such users, select Configuration > System > Flood unblock. You can configure your Flood Control settings; see Using flood control for login security for more information.

- Using flood control for login security

Controlling access to Developer Portal content

In IBM® API Connect, you can restrict access to content for Consumer organizations through an access content list. However, you can also assign permissions in the Developer Portal that override the access content list, and allow users to access and edit all of the content for Products, APIs, and Applications.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

A user with a Content Author role is a curator of content for the Developer Portal. A Content Author user can perform the following actions:

- Set taxonomies on the content
- Provide custom icons for content
- Upload additional documentation files
- Create documentation pages in the Developer Portal.

By default, Content Author users are assigned the following user permissions:

Edit any Product content
: The user can access and edit all of the Products available in the Catalog that the Developer Portal is associated with. The user can also access APIs that belong to those Products.

Edit any API content
: The user can access and edit all of the APIs that are available in the Catalog, but not the Products with which they are associated. (Note that this permission is a subset of Edit any Product content; as Content Author users are assigned both permissions they can access and edit all of the Products and the associated APIs that are available.)

The Edit any Application permission grants the user access to all of the Applications that are in the Developer Portal, but is not assigned to any user or role by default.
Note: There are security implications if you grant the Edit any Application permission, and it should be assigned only to trusted roles.
A user can configure, attach, and upload content if they are assigned the appropriate permissions.

Procedure

To check and assign permissions that grant users access to all content, proceed with one of the following options:

- Assign a user to the Content Author role. For more information, see Assigning users to a role.
- Create a custom role, to which you can add the relevant permissions and add users to your new custom role. For more information, see Creating a new role, Assigning permissions to a role, and Assigning users to a role.

Creating a developer account to customize API properties

You can allow specific users in the Developer Portal to customize the properties for certain APIs, including APIs that are not viewable by the administrator, or other customizable features, by creating an internal Consumer organization.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

Every user in the Developer Portal must be a member of a Consumer organization. To enable additional users to be editors of particular content in the Developer Portal, you can create an internal Consumer organization. You can then invite these additional editors to this organization, and assign them a specific role that grants certain editing permissions. For example, the following API properties can be customized by any member of the new Consumer organization that have been assigned the Administrator or Content Author role:

- Image uploading
- Tag assignment
- File attachment
- Custom field editing

Procedure

To create a new Consumer organization within the Developer Portal, complete the following steps:

1. Log in to the Developer Portal as an administrator or Content Author.
2. Click the arrow next to `your_organization_name` from the Developer Portal home page, and select Create organization.
3. In the Organization Title field, type the name of the organization that you want, then click Submit.

To invite the editor users to your new organization, complete the following steps:

4. Switch to your newly created organization by clicking the arrow next to `your_current_organization_name`, and select your new organization name from the list.
5. Click the arrow next to `your_new_organization_name` and select My organization.
   Your new organization page is displayed.
6. For each new user, click Invite, complete their Email details, and click Submit. Note that you can leave the default role of Developer selected and then change the role later, or you can select the Administrator role now. However, be aware that an administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps. You should be careful to ensure that only trusted users are given this access and level of control of your site. Each new user will receive an invitation email, and they need to click on the link in the email to activate their Developer Portal account.

To assign the required permissions to the users of your organization, you must log in as an administrator and complete the following steps:

7. Log in to the Developer Portal as an administrator.
8. If the administrator dashboard is not displayed, click Manage to display it.
9. Click People on the administrator dashboard.
10. Select the check box for the user, or users, to whom you want to give new permissions.
11. Under the Action heading, select the relevant role from the drop-down list.
    For example, selecting Add the Content Author role to the selected user(s) means they can edit images and content within the Developer Portal.
12. Click Apply to selected items to update the roles.

What to do next

If you want specific Products or APIs to be customized by the editor users, you must ensure that the relevant Products are visible to the internal Consumer organization that you have created. For more information on how to make a plan visible in API Manager, see Changing the availability of a Product.
Note that you can also create new roles and assign specific permissions to those roles. For more information, see Creating a new role and Assigning permissions to a role.

Email Subscribers

As a site administrator, you can use the email subscribers wizard to send messages to your Developer Portal community.

You can email all the subscribers of a specific API, plan, product, or all registered consumer organizations. For each consumer organization, you can select whether to email just the owner or all of the members. Each recipient receives an individual email.

You can use the wizard to specify context-specific tokens in the email subject and body. The tokens available and their replacement values depend on which flow is selected, for example, API, plan, product, or all.

- **Emailing all subscribers**
  As a site administrator, you can use the email `All users` wizard to email all the subscribers or a specified list of users of all the consumer organizations on your Developer Portal.
- **Emailing API subscribers**
  As a site administrator, you can use the email `API subscribers` wizard to send messages to all subscribers of all product plans that contain a one or more APIs on your Developer Portal.
- **Emailing plan subscribers**
  As a site administrator, you can use the email `Plan subscribers` wizard to send messages to all subscribers of a chosen plan that belongs to a specific product on your Developer Portal.

- **Emailing product subscribers**
  As a site administrator, you can use the email **Product subscribers** wizard to send messages to all subscribers of any plan for a one or more products in your Developer Portal.
- **Emailing consumer organizations**
  As a site administrator, you can use the email **Consumer organizations** wizard to email all or a specified list of users of a chosen Consumer organization on your Developer Portal.
- **Token reference**
  You can use the email subscribers wizard to specify context-specific tokens in the email subject and body. The tokens available and their replacement values depend on which flow is selected, for example, API, plan, product, or all.

Emailing all subscribers

As a site administrator, you can use the email **All users** wizard to email all the subscribers or a specified list of users of all the consumer organizations on your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can use the **All users** wizard to send messages to all consumer organizations. You can select whether to email just the owner, or all of the members of the consumer organizations. Each recipient receives an individual email.

Procedure

1. Navigate to People > Email subscribers.
2. Select **All users**, and click Save.
3. Select the role of the recipients that you want to send the email to, then click Next.
   - Owners - sends the email to the relevant consumer organization owners.
   - Members - sends the email to all members of the relevant consumer organizations.
4. Enter the content of the email, subject, and body, and set the Text Format of the email:
   - Basic HTML
   - Plain text
5. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see Token reference.
6. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
   - **Priority**: Set the priority of the email. Many email programs ignore a priority setting.
   - **Request receipt**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
   - **Additional headers**: Set any additional headers to be sent with the email.
7. Use the remaining check boxes to configure what messages are to be sent and how:
   - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
   - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.
   - Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.
8. Click Next.
9. Confirm that the email is ready to send, then click Next.
10. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
    If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
11. Click Finish.

Results

You successfully sent an email to all members, or all of the owners of each consumer organization on your Developer Portal.

Emailing API subscribers

As a site administrator, you can use the email **API subscribers** wizard to send messages to all subscribers of all product plans that contain a one or more APIs on your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.

Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can use the email **`API subscribers`** wizard to send messages to all subscribers of all product plans that contain a specific API in your Developer Portal community. For each consumer org, you can select whether to email just the owner or all members. Each recipient receives an individual email.

Procedure

1. Navigate to People > Email subscribers.
2. Select **`API subscribers`**, and click Save.
3. In the text box, enter the name of the API whose subscribers you want to email. If you start typing in the text box, you can choose from the options that you are given. Click Next.
4. Select the role of the recipients that you want to send the email to, then click Next.
   - Owners - sends the email to the relevant consumer organization owners.
   - Members - sends the email to all members of the relevant consumer organizations.
5. Enter the content of the email, subject, and body, and set the Text Format of the email:
   - Basic HTML
   - Plain text
6. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see Token reference.
7. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
   - **`Priority`**: Set the priority of the email. Many email programs ignore a priority setting.
   - **`Request receipt`**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
   - **`Additional headers`**: Set any additional headers to be sent with the email.
8. Use the remaining check boxes to configure what messages are to be sent and how:
   - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
   - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.
   - Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.
9. Click Next.
10. Confirm that the email is ready to send, then click Next.
11. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
    If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
12. Click Finish.

Results

You successfully sent an email to all members or all owners of each consumer org that contained a subscription to all product plans that contain the chosen API on your Developer Portal.

Emailing plan subscribers

As a site administrator, you can use the email **`Plan subscribers`** wizard to send messages to all subscribers of a chosen plan that belongs to a specific product on your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can use the email **`Plan subscribers`** wizard to send messages to all subscribers of a chosen plan that belongs to a specific product on your Developer Portal community. For each consumer org, you can select whether to email just the owner or all members. Each recipient receives an individual email.

Procedure

1. Navigate to People > Email subscribers.
2. Select **`Plan subscribers`**, and click Save.
3. In the text box, enter the name of the product whose subscribers you want to email. If you start typing in the text box, you can choose from the options that you are given. Click Next.
4. Select the name of the plan whose subscribers you want to email. Click Next.
5. Select the role of the recipients that you want to send the email to, then click Next.
   - Owners - sends the email to the relevant consumer organization owners.

- Members - sends the email to all members of the relevant consumer organizations.

6. Enter the content of the email, subject, and body, and set the Text Format of the email:
   - Basic HTML
   - Plain text
7. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see Token reference.
8. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
   - **`Priority`**: Set the priority of the email. Many email programs ignore a priority setting.
   - **`Request receipt`**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
   - **`Additional headers`**: Set any additional headers to be sent with the email.
9. Use the remaining check boxes to configure what messages are to be sent and how:
   - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
   - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.
   - Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.
10. Click Next.
11. Confirm that the email is ready to send, then click Next.
12. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
    If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
13. Click Finish.

Results

You successfully sent an email to all members or all owners of each consumer org that contained a subscription to the chosen plan within the chosen product, on your Developer Portal.

Emailing product subscribers

As a site administrator, you can use the email **`Product subscribers`** wizard to send messages to all subscribers of any plan for a one or more products in your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can use the email **`Product subscribers`** wizard to send messages to all subscribers of any plan for a specific product in your Developer Portal community. For each consumer org, you can select whether to email just the owner or all members. Each recipient receives an individual email.

Procedure

1. Navigate to People > Email subscribers.
2. Select **`Product subscribers`**, and click Save.
3. In the text box, enter the name of the product whose subscribers you want to email. If you start typing in the text box, you can choose from the options that you are given. Click Next.
4. Select the role of the recipients that you want to send the email to, then click Next.
   - Owners - sends the email to the relevant consumer organization owners.
   - Members - sends the email to all members of the relevant consumer organizations.
5. Enter the content of the email, subject, and body, and set the Text Format of the email:
   - Basic HTML
   - Plain text
6. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see Token reference.
7. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
   - **`Priority`**: Set the priority of the email. Many email programs ignore a priority setting.
   - **`Request receipt`**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
   - **`Additional headers`**: Set any additional headers to be sent with the email.
8. Use the remaining check boxes to configure what messages are to be sent and how:
   - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
   - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.

- Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.

9. Click Next.
10. Confirm that the email is ready to send, then click Next.
11. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
    If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
12. Click Finish.

Results

You successfully sent an email to all members or all owners of each consumer org that contained a subscription to any plan within the chosen product on your Developer Portal.

Emailing consumer organizations

As a site administrator, you can use the email **`Consumer organizations`** wizard to email all or a specified list of users of a chosen Consumer organization on your Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

You can use the **`Consumer organizations`** wizard to send messages to all the owners or members of the chosen consumer organizations. You can select whether to email just the owner, or all of the members of the consumer organizations. Each recipient receives an individual email.

Procedure

1. Navigate to People > Email subscribers.
2. Select **`Consumer organizations`**, and click Save.
3. In the text box, enter the name of the consumer organization. If you start typing in the text box, the list of available options are displayed. Select the required option and click Next.
4. Select the role of the recipients that you want to send the email to, then click Next.
   - Owners - sends the email to the relevant consumer organization owners.
   - Members - sends the email to all members of the relevant consumer organizations.
5. Enter the content of the email by providing necessary details in the Subject and Body fields.
6. Select one of the Text Format options:
   - **`Basic HTML`**
   - **`Plain text`**
7. Expand Replacements, and click Browse available tokens to view the tokens that you can add to the subject and body fields for replacement.
   You can select a token by either typing the token name directly, or by clicking in the subject or body field. You are then select the required option from the given a list of available tokens. For a reference list of tokens, see Token reference.
8. Expand Additional email options to configure any additional settings:
   - **`Priority`**: Set the priority of the email. Many email programs ignore a priority setting.
   - **`Request receipt`**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
   - **`Additional headers`**: Set any additional headers to be sent with the email.
9. Select one of the following checkboxes to configure what and how the messages must be sent:
   - **`Send the message directly by using the Batch API`**: This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
   - **`Send a copy of all messages to the copy recepient`**: This will send a copy of each email that is generated to the copy recipient. Because the email may contain context specific tokens, new email content is generated for each recipient with the correct token replacement. This option will send a copy of all generated emails to the copy recipient configured in the site settings.
   - **`Send a copy of the original message to the copy recipient`**: This option sends a single copy of the email to the copy recipient without the replacement of any tokens that may have been selected.
10. Click Next.
11. Confirm that the email is ready to send, then click Next.
12. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a Summary page that shows the total number of emails that were sent.
    If you chose to spool the delivery of the emails, you are redirected to the Summary page that shows the total number of emails that are spooled.
13. Click Next.
14. In the Summary page, enter a name in the text box to save the list.
15. Click Finish.

Results

You successfully sent an email to all members, or all of the owners of the consumer organizations on your Developer Portal.

Token reference

You can use the email subscribers wizard to specify context-specific tokens in the email subject and body. The tokens available and their replacement values depend on which flow is selected, for example, API, plan, product, or all.

Application Tokens

Tokens that are related to an individual Application.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Description	`[application:description]`	The description that is given to the application.	✓	✓	✓	
Enabled	`[application:enabled]`	The state that the application is in.	✓	✓	✓	
ID	`[application:id]`	The ID of the application.	✓	✓	✓	
Image URL	`[application:image_url]`	The URL of the image for the application.	✓	✓	✓	
Lifecycle State	`[application:lifecycle_state]`	The lifecycle state of the application.	✓	✓	✓	
Name	`[application:name]`	The name of the application.	✓	✓	✓	
Title	`[application:title]`	The title of the application.	✓	✓	✓	

Consumer Organization Tokens

Tokens that are related to the individual consumer organization.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
ID	`[consumer-org:id]`	The ID of the consumer organization.	✓	✓	✓	✓
Name	`[consumer-org:name]`	The name of the consumer organization.	✓	✓	✓	✓
Title	`[consumer-org:title]`	The title of the consumer organization.	✓	✓	✓	✓

Product Tokens

Tokens that are related to an individual product.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
APIs	`[product:apis]`	A comma separated list of APIs (name:version) within the product.	✓	✓	✓	
ID	`[product:id]`	The ID of the product.	✓	✓	✓	
Image URL	`[product:image_url]`	The URL of the image for the product.	✓	✓	✓	
Name	`[product:name]`	The name of the product.	✓	✓	✓	
Plans	`[product:plans]`	A comma separated list of plan names within the product.	✓	✓	✓	
State	`[product:state]`	The state of the product.	✓	✓	✓	
Title	`[product:title]`	The title of the product.	✓	✓	✓	

Plan Tokens

Tokens that are related to an individual product plan.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Approval required	`[product-plan:approval]`	Whether the plan requires approval or not.		✓		
Description	`[product-plan:description]`	The description of the plan.		✓		
Name	`[product-plan:name]`	The name of a given plan within the product.		✓		
Rate limits	`[product-plan:rate-limits]`	A comma separated list of rate limit name value pairs that the plan contains.		✓		
Title	`[product-plan:title]`	The title of the plan.		✓		

API Tokens

Tokens that are related to an individual API.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
ID	`[api:id]`	The ID of the API.			✓	
Image URL	`[api:image_url]`	The URL of the image for the API.			✓	

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Name	`[api:name]`	The name of the API.			✓	
OAI Version	`[api:oai_version]`	The OAI version of the API.			✓	
Protocol	`[api:protocol]`	The protocol of the API.			✓	
State	`[api:state]`	The current state the API is in.			✓	
Title	`[api:title]`	The title of the API.			✓	
Version	`[api:version]`	The version of the API.			✓	

User Tokens

Tokens that are related to the individual user account of the recipient.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Account Name	`[user:account-name]`	The login name of the user account.	✓	✓	✓	✓
Created	`[user:created]`	The date the user account was created.	✓	✓	✓>	✓
Display Name	`[user:display-name]`	The display name of the user account.	✓	✓	✓	✓
Email	`[user:mail]`	The email address of the user account.	✓	✓	✓	✓
First Name	`[user:first_name]`	The first name of the user.	✓	✓	✓	✓
Last Name	`[user:last_name]`	The last name of the user.	✓	✓	✓	✓
Roles	`[user:roles]`	The user roles associated with the user account.	✓	✓	✓	✓
State	`[user:apic_state]`	List (text) field.	✓	✓	✓	✓
User ID	`[user:uid]`	The unique ID of the user account.	✓	✓	✓	✓

Current User Tokens

Tokens that are related to the current user who is initiating the sending of the emails.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Account name	`[current-user:account-name]`	The login name of the user account.	✓	✓	✓	✓
Display name	`[current-user:display-name]`	The display name of the user account.	✓	✓	✓	✓
Email	`[current-user:mail]`	The email address of the user account.	✓	✓	✓	✓

Site Information Tokens

Tokens that are related to site-wide settings and other global configuration.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Email	`[site:mail]`	The administrative email address for the site.	✓	✓	✓	✓
Login page	`[site:login-url]`	The URL of the site's login page.	✓	✓	✓	✓
Name	`[site:name]`	The name of the site.	✓	✓	✓	✓
Slogan	`[site:slogan]`	The slogan of the site.	✓	✓	✓	✓
URL	`[site:url]`	The URL of the site's front page.	✓	✓	✓	✓
URL (brief)	`[site:url-brief]`	The URL of the site's front page without the protocol.	✓	✓	✓	✓

Current Date Tokens

Tokens that are related to the current date and time.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Custom format	`[current-date:custom:?]`	A date in a custom format. See the PHP documentation for details.	✓	✓	✓	✓
Fallback date format	`[current-date:fallback]`	A date in 'fallback' format. (Fri, 01/08/2021 - 14:19)	✓	✓	✓	✓
HTML Date	`[current-date:html_date]`	A date in 'html_date' format. (2021-01-08)	✓	✓	✓	✓
HTML Datetime	`[current-date:html_datetime]`	A date in 'html_datetime' format. (2021-01-08T14:19:19+0000)	✓	✓	✓	✓
HTML Month	`[current-date:html_month]`	A date in 'html_month' format. (2021-01)	✓	✓	✓	✓
HTML Time	`[current-date:html_time]`	A date in 'html_time' format. (14:19:19)	✓	✓	✓	✓

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
HTML Week	`[current-date:html_week]`	A date in 'html_week' format. (2021-W01)	✓	✓	✓	✓
HTML Year	`[current-date:html_year]`	A date in 'html_year' format. (2021)	✓	✓	✓	✓
HTML Yearless date	`[current-date:html_yearless_date]`	A date in 'html_yearless_date' format. (01-08)	✓	✓	✓	✓
Long format	`[current-date:long]`	A date in 'long' format. (Friday, January 8, 2021 - 14:19)	✓	✓	✓	✓
Medium format	`[current-date:medium]`	A date in 'medium' format. (Fri, 01/08/2021 - 14:19)	✓	✓	✓	✓
Raw timestamp	`[current-date:raw]`	A date in UNIX timestamp format (1610115559)	✓	✓	✓	✓
Short format	`[current-date:short]`	A date in 'short' format. (01/08/2021 - 14:19)	✓	✓	✓	✓
Time-since	`[current-date:since]`	A date in 'time-since' format. (6 minutes)	✓	✓	✓	✓

How to style the Developer Portal emails

You can apply a theme to the HTML emails that are sent by the Developer Portal by using CSS and templating.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must have a custom theme. For information about how to create a custom theme, see Creating a sub-theme.

About this task

You can apply custom styling to the HTML content of the emails that are sent by the Developer Portal, such as the emails that are sent by the Email subscribers wizard. The custom styling consists of two parts: editing a twig template and, optionally, also editing a CSS file in your custom theme. See the following instructions for details.
Note: These instructions apply only to emails that are sent by the Developer Portal. These instructions don't apply to the consumer invitation, activation, and password reset emails, as these emails are sent by the API Manager. For information about how to style API Manager emails, see Configuring notifications and Sending messages to consumer organization owners.

Procedure

1. Download the ibm-apic-mail-message.html.twig template from https://github.com/ibm-apiconnect/devportal/tree/master/ibm_apim/ibm_apic_mail/templates, and save it to your custom theme templates directory.
2. Edit the ibm-apic-mail-message.html.twig template to fit your custom theme.
   You can add styles directly into this twig template, or you can add them to the css/mail.css file in your custom theme, which will mean that they are automatically included in the HTML email content that is sent.

   If you are using an SCSS theme that has been generated by the Developer Portal theme generator, then you can put the custom SCSS mail styles into the mail-overrides.scss file. These styles will then be compiled into the mail.css file.

   Note: If you are using an older theme that was generated before API Connect Version 10.0.4.0, then the theme won't contain the mail theme support. However, you can workaround this by generating a new sub-theme with the same name, copying the overrides.css, or overrides.scss, as appropriate, logo.png, and *.theme files from the old theme into the new sub-theme, and then compress and install the new sub-theme as usual. (See Creating a sub-theme for details.)
3. Define a standard set of classes in the ibm-apic-mail-message.html.twig template that the Developer Portal administrators can use.
   The twig template lists the variables that can be used within it. The HTML **<body>** element is the actual content of the email message as defined within Drupal. For example, that content could be the information that's entered in the WYSIWYG editor of the Email subscribers wizard. Note that the HTML content in the WYSIWYG editor is more restricted for security reasons, for example, it's not possible to use inline styles in the HTML content in the editor. However, it is possible to use CSS class names, and then define the class in the mail.css file, which is then included in the emails. Therefore, it's recommended that you define a standard set of classes that the Developer Portal administrators can use when they're creating emails.

4. Optional: Add images to the ibm-apic-mail-message.html.twig template.
   Images can be used by adding a **** reference in the twig template. The **src** attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

   Note: The **logo** will be automatically set to the fully qualified URL for the site logo image.
5. Compress all of your sub-theme resources back into a .zip file, and install into the Developer Portal. See Installing additional themes for details.

What to do next

It is possible to have multiple email templates. For example for different modules, where one template could be used for the emails that are sent by the contact module, and another template for the emails that are sent by the Email subscribers wizard. This more advanced configuration can be done by using the module and key attributes, and is explained within the twig template itself. Essentially, you create a twig template that's called ibm-apic-mail-message.contact.html.twig, for example, to override the default template for only the contact module. Then the most specific template for a module is used by the Developer Portal, before falling back on the more general template.

Working with roles in the Developer Portal

As a site administrator, you can create and customize site configuration roles in the Developer Portal.

Rather than assigning individual permissions to each user, permissions are assigned to roles, and then roles are assigned to users. Using roles gives administrators greater control over permissions, and makes it easy to assign and remove roles when necessary.

Administrators can assign the following site configuration roles to users in the Developer Portal:

Superuser
: The Superuser role has the highest level of permissions in the Developer Portal, and is the role that is assigned by default to the admin user, in addition to the Administrator role, when they enable a Developer Portal site in the API Manager. This role bypasses all content access control, which means that users that have a Superuser role can see all of the site content. This level of access can lead to some unexpected behavior when they access content such as their Consumer organizations and their applications. Careful consideration should be given before you assign users to a Superuser role.

Administrator
: An Administrator can use the administrator dashboard to customize and configure the Developer Portal. An Administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps.

Content Author
: A Content Author is a curator of content for the Developer Portal. A Content Author can perform the following actions:

  - Set taxonomies on the content.
  - Provide custom icons for content.
  - Upload additional documentation files.
  - Create documentation pages in the Developer Portal.

Forum Moderator
: A Forum Moderator can moderate the content of a forum in the Developer Portal.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: `A user already exists with this email address`.
To learn how to create and customize roles in the Developer Portal, use the following topic links:

- **Creating administrator users for the Developer Portal**
  You can create additional administrator users for an Developer Portal.
- **Assigning users to a role**
  Assign users to one or more roles in the Developer Portal to enable role specific permissions.
- **Assigning permissions to a role**
  You can assign permissions to a new role in the Developer Portal, and update the permissions for current roles.
- **Creating a new role**
  You can create a new role within the Developer Portal.

Creating administrator users for the Developer Portal

You can create additional administrator users for an Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

After you enable a Developer Portal site in the API Manager, you are sent an email that contains a one-time log in link for the Developer Portal site Admin user. The Admin user can administer the Content Management System (CMS) capabilities of the Developer Portal. For more information about enabling a site, see Creating and configuring Catalogs.

However, you can also create additional administrative roles for users from within the Developer Portal by assigning the role to users that have access to the Developer Portal. A user with an Administrator role can use the administrator dashboard to customize and configure the Developer Portal. An Administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps. You should be careful to ensure that only trusted users are given this access and level of control of your site.

Procedure

To create additional administrative users, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the List tab.
4. Select the check boxes for the target users.
5. From the drop-down list under the Action heading, select Add the Administrator role to the selected user(s).
6. Click Apply to selected items.

Results

You have assigned the selected users to the Administrator role.
Note: For improved security and accountability, create named user accounts for all administrators. After assigning the Administrator role to these users and verifying their access, consider disabling the default Portal administrator account. This avoids shared credentials and ensures all actions are traceable.

Assigning users to a role

Assign users to one or more roles in the Developer Portal to enable role specific permissions.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To assign users to a role, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the List tab.
4. Select the check boxes for the target users.
5. From the drop-down list under the Action heading, select the role that you want to assign.
6. Click Apply to selected items.

Results

You have assigned the selected users to the required role.

Assigning permissions to a role

You can assign permissions to a new role in the Developer Portal, and update the permissions for current roles.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To assign or update permissions for a role, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the Permissions tab.
4. Assign a permission to a role, by selecting the check box in the relevant column for the permission that you want to assign.
5. Click Save permissions.

Results

You have assigned permissions to the target role.

Creating a new role

You can create a new role within the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To create a new role, complete the following steps:

1. Click People in the administrator dashboard.
2. Select the Roles tab.
3. Click Add role.
4. Enter a name for the new role in Role name, and click Save.
5. Your new role is displayed in the list of roles. You can drag any of the roles to re-order them. It's recommended to order roles from least permissive (for example, Anonymous user) to most permissive (for example, Administrator user). Users who aren't logged in have the Anonymous user role. Users who are logged in have the Authenticated user role, plus any other roles granted to their user account.

Results

You have created a new role in the Developer Portal.

What to do next

The new role is created with the same permissions as an Authenticated user role. You can click the Permissions tab and edit the permissions as required.

Forums

Create and control forums in the Developer Portal.

The Developer Portal lets you create threaded discussion boards, called forums, on your site. To learn how to configure forums, use the following topic links.

- **Creating a new forum**
  You can create a new forum in the Developer Portal.
- **Creating new forum containers**
  You can create new forum containers in the Developer Portal.
- **Configuring the creation of new forums for each API**
  You can choose whether or not to automatically create a new forum when an API is created in the Developer Portal.
- **Locking forum topics**
  You can lock forum topics in the Developer Portal.
- **Marking content in a forum as sticky**
  You can mark content in a forum as sticky in the Developer Portal.
- **Removing forum posts**
  You can remove forum posts in the Developer Portal.
- **Turning off forums in the Developer Portal**
  You can turn off forums in the Developer Portal by disabling the Forum module. This action prevents users from viewing, and contributing to, forums.

Creating a new forum

You can create a new forum in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To create a new forum, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Forums.
4. Click Add forum.
5. Fill in the Name and Description fields for the new forum.
6. From the Parent drop-down list, select the hierarchical position of the new forum.
7. Click Save. You have created a new forum.

Creating new forum containers

You can create new forum containers in the Developer Portal.

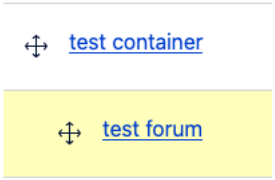
Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To create a new forum containers, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Forums.
4. Click + Add container.
5. Fill in the `Name` and `Description` fields for the new forum container.
6. Click Save. The newly created container is listed in the table.
7. Click + Add forum.
8. Fill in the `Name` and `Description` fields for the new forum container.
9. Click Save. The newly created forum is listed in the table.



10. Use the slider beside the forum to position it as a child to the container.
11. Click Save.

Results

You have created a new forum container.

Configuring the creation of new forums for each API

You can choose whether or not to automatically create a new forum when an API is created in the Developer Portal.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

To configure the creation of new forums for each API, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. Under the SYSTEM heading, click IBM API Developer Portal.
4. Select or clear the Automatically create a forum per API check box to turn the feature on or off.
5. Click Save configuration.
   You have configured the creation of new forums for each API.

Locking forum topics

You can lock forum topics in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To lock forum topics, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click Edit for the forum topic that you want to lock.
4. Click Comment settings. The view expands.

5. Select Closed .
6. Keeping the Published selected, click Save.
   You have disallowed any further replies and marked the topic as locked.

Marking content in a forum as sticky

You can mark content in a forum as sticky in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To mark content in a forum as sticky, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. From the Action drop-down menu, select Make content sticky.
4. Select the check boxes next to the forum topics that you want to make sticky.
5. Click Apply to selected items.
   You made the selected forum content sticky.

Removing forum posts

You can remove forum posts in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To remove forum posts, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. From the Action drop-down menu, select Delete content.
4. Select the check boxes next to the forum posts that you want to remove.
5. Click Apply to selected items.
   You removed the selected forum posts.

Turning off forums in the Developer Portal

You can turn off forums in the Developer Portal by disabling the Forum module. This action prevents users from viewing, and contributing to, forums.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

About this task

To turn off forums, you must first remove all Forums terms, and then you can disable the Forum module.

Procedure

To turn off forums, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Delete all Forums terms by completing the following steps:
   a. Click Structure > Taxonomy > Forums in the administrator dashboard.
      The list of Forums terms is displayed.
   b. For each item in the list of terms, select Delete from the drop-down list in the Operations column, and then click Delete again to confirm.
      All of the Forums terms are deleted.
3. Disable the Forum module by completing the following steps:
   a. Click Extend > Disable module in the administrator dashboard.

b. Select the Forum module, then click Disable.
c. The display then shows a list of forum configuration that will also be removed if the Forum module is disabled. Click Disable again to confirm that you agree to this removal.

4. Remove the Forums menu from the Developer Portal home page by completing the following steps:
   a. Click Structure > Menus > Main navigation.
   b. Click Edit menu in the Operations column.
      The Main navigation edit menu page lists all the menu options displayed on the Developer Portal home page.
   c. Clear the Enabled checkbox against Forums.
   d. Click Save to save the changes.

Results

You successfully turned off forums in the Developer Portal.
If you want, you can enable the Forum module again by clicking Extend, selecting the Forum module on the List tab, and clicking Enable.

Reports

You can view reports about the general configuration and status of your Developer Portal site.

Use the Reports section in the Developer Portal to view information about the following areas:

Available updates
: Status report about available updates for your installed modules and themes.

Node Type Count
: Status report about how much of each content type there is in your portal site, and whether it is published or not. It can also provide totals of how many users there are of each role.

Available translation updates
: Status report about available interface translations for your installed modules and themes.

Field list
: Overview of fields on all entity types.

Status report
: Short overview of your site's parameters, as well as any problems detected with your installation.

Views plugins
: Overview of the plugins that are used in all views.

Extend

You can extend the Developer Portal by creating and installing custom modules, or installing additional Drupal contributed modules.

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

Modules provide functionality to your site, and the *core modules* that are included in the standard Developer Portal installation, provide all of the basic functions that most sites need. However, some of the core modules are not enabled by default, so you might want to examine the module list under the Extend menu of your site, to see whether the functionality you require is available from a core module before starting to investigate custom and contributed modules. If you still require additional custom or contributed modules, consider the following topics to help you create and implement modules consistently.
Note: The Developer Portal contains a Rules framework for event based actions. Some of those actions and triggers might exhibit unexpected behavior. A workaround is to create a custom module instead, because the same events and actions are possible there.

Custom module development: an introduction to Drupal tools for PHP development

Some guidance about the Drupal tools and environment considerations when developing in PHP, to help when writing custom modules to extend your Developer Portal functionality.

The following sections provide an overview of the key automation tools and environment considerations for PHP development in the Developer Portal. For a complete list of Drupal tools, see Development tools overview on Drupal.org, however, note that you are not permitted to access the shell inside the Developer Portal containers. Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

Devel, Devel Generate Kint, and Webprofiler development modules

The Devel, Devel Generate Kint, and Webprofiler modules are all packaged within the Devel module. These modules provide the following development support:

- *Devel* - Helper functions for Drupal developers.
- *Devel Generate Kint* - Accelerate development of your site or module by quickly generating nodes, comments, terms, users, and more.
- *Kint* - Pretty print of variables with `kint($my_var)`.
- *Webprofiler* - Port of the Symfony WebProfiler Bundle as a Drupal module.

For more information, see Devel module on drupal.org, and Devel on drupalship.org.

Admin Toolbar module

The Admin Toolbar module improves the default Drupal Toolbar by transforming it into a drop-down menu, providing fast access to the administration pages. It also adds extra links to the Drupal icon on the admin toolbar to development tools such as flush all caches, run cron, and run updates.

For more information, see Admin toolbar module on drupal.org.

Examples for developers project

The Examples for Developers project aims to provide high-quality, well-documented API examples for a broad range of Drupal core functionality.

The project contains many modules that illustrate best practices for implementing Drupal core APIs. For example there are examples for Block, Cache, Config and Content Entity, Cron, Database API, Email, Events, Form API, Field, Field Permission, File, Hooks, Javascript, Node Type, Page, Pager, PHPUnit, Plugin Type, Queue, Simple Test, Stream Wrapper, Table Sort, Testing, and Tour.

For more information, see Examples for developers project on drupal.org.

Coding standards

The Drupal Coding Standards apply to code within Drupal and its contributed modules. For more information, see Coding standards on drupal.org.

- Drupal tools for developers

Custom module development: background and prerequisites

You can create custom modules in the Developer Portal to extend functionality. The following information provides a getting started developer guide to custom module development.

Custom modules are written in PHP, which is an open source server-side scripting language that is used for creating dynamic web pages. For general information on the Drupal tools for PHP development, see Custom module development: an introduction to Drupal tools for PHP development.

The following sections provide an overview of custom module development, with links to learn more about the required development languages and concepts. Creating custom modules affects the source of your Developer Portal site, so it is recommended that you gain Drupal experience and PHP knowledge before you start creating modules.

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

Object-Oriented Programming (OOP)

OOP is established as best practice for development, so ensure your knowledge of OOP is good. The PHP documentation on Classes and Objects is a good place to start. For a general overview of PHP best practices, see PHP The Right Way. The following resources are also helpful:

- Object-oriented programming (on Wikipedia)
- Object Oriented Programming with PHP (on phpro.org)
- Object-Oriented PHP for Beginners (on tutsplus.com)
- Object Oriented Programming in PHP (on tutorialspoint.com)

Drupal also uses some common design patterns, so you need to ensure you have a basic understanding of these. See the following pattern resources:

- The Factory Pattern (on phptherightway.com), and Late Static Bindings (on php.net)
- Software design pattern (on Wikipedia)
- Programming Foundations: Design Patterns (on lynda.com)

PHP namespaces

You must be familiar with the concept of namespaces in PHP. In most cases, the Drupal code is namespaced based on the module that code belongs to.

For example, the namespace for **`block.module`** is:

```
namespace Drupal\block;
```

When you create Drupal modules, it is important to consider that PHP has a global namespace, and that function names must be unique. You are recommended to prefix the name of any methods with the module name.

For example, if you have a module that is named **`custom_module`**, a **`create`** method within it is called **`custom_module_create()`**.

For more information about namespaces, see the following resources:

- Drupal namespace standards (on drupal.org)
- How to use PHP namespaces (on sitepoint.com)
- PHP Namespaces (on php.net)

Dependency injection

It is important that you have a baseline understanding of dependency injection. Drupal makes heavy use of this concept, so you will need this understanding to be able to access and make use of many of the core APIs.

To find out more about dependency injection, see Dependency Injection (on phptherightway.com), as well as the additional articles that are linked to on that page. See also Services and dependency injection in Drupal (on drupal.org).

Symfony

Symfony is a set of reusable PHP components and a PHP framework for web projects. Drupal borrows from this framework in order to reduce code duplication across various PHP projects. Much of the code that Drupal uses to handle routing, sessions, and the services container, amongst other things, is borrowed from Symfony.

To understand how Symfony works, see the Symfony Documentation on symfony.com.

Other useful resources

- Drupal API Annotations - list of the different annotation types that Drupal uses for plugin discovery, and to provide additional context/meta-data for the code that's being executed.
- Plugin API overview - overview about how plugins are used in Drupal.
- Tools are available for checking your custom modules, such as drupal_check on GitHub, which checks Drupal code for deprecations.

Custom module development: creating a module skeleton

You can extend your Developer Portal site by creating custom modules. The starting point for a new module is to create a module skeleton.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must also have experience in Drupal and PHP development. For more information, see Custom module development: an introduction to Drupal tools for PHP development and Custom module development: background and prerequisites.

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

About this task

Every custom module creation starts with creating an .info.yml file. This file, or module skeleton, is used to store the metadata about the custom theme. After the module skeleton is created, the module can be installed onto your site by using the Extend menu on the administrator dashboard of the Developer Portal UI. However, without any module specific code, your site won't be affected.
The following instructions guide you through creating a custom module skeleton. What to do next in your custom module creation depends on what you want your module to do. Options are shown at the end of this task.

Procedure

1. Choose a short name, also known as a machine name, for your custom module.
   The machine name is used in several files and functions in your module, as well as by Drupal core to programmatically refer to your module. The name must conform to the following rules:
   - It must start with a letter.
   - It must contain only lowercase letters and underscores. (Note that if uppercase letters are used in the name, Drupal won't recognize any hook implementations in your module.)
   - It must not contain any spaces.
   - It must be unique within your Developer Portal site.
   - It should not be any of the following reserved terms: `src`, `lib`, `vendor`, `assets`, `css`, `files`, `images`, `js`, `misc`, `templates`, `includes`, `fixtures`, `Drupal`.
2. Create a module folder in a location of your choice, for example, /modules/*module_name*.
   You don't have to name the folder the same name as your module machine name, however, you must remember to use the machine name programmatically within your module's code and filenames.
3. Create a *module_name*.info.yml file in your module folder.
   Where *module_name* is the short name, or machine name, that you chose in Step 1.
4. Insert the metadata for your custom module into the *module_name*.info.yml file as follows:

```
name: Example module name
description: Description of the module.
package: Custom

type: module
core: 8.x
core_version_requirement: '^8 || ^9'
version: 1.0

dependencies:
  - module_name

test_dependencies:
  - module_name

configure: example.settings

php: 7.1

hidden: true
```

   where
   - `name` (required) is the name of your module, and is the text that is shown on the module administration page in the Developer Portal UI.
   - `description` (optional) is a description of your module, and is the text that is shown on the module administration page in the Developer Portal UI.
   - `package` (optional) is a key that enables you to group similar modules together.
   - `type` (required) is the type of extension that you are creating, for example, a module, theme or profile. In this instance you are creating a module.
   - `core` (optional) specifies with which Drupal core version your module is compatible.
   - `core_version_requirement` (required) specifies which versions of Drupal your module is compatible with. This example specifies that the module is compatible with all versions of Drupal 8 and 9.
   - `version` (required) is the version number of your module. Note that `version` is not required if you are publishing your module on Drupal.org.
   - `dependencies` (optional) is a YAML list of any modules that your module depends on. They must be namespaced in the format `module_name`, where *module_name* is the module's machine name.
   - `test_dependencies` (optional) is list of any modules (in the same format as `dependencies`) that are needed to run certain automated tests for your module on Drupal's automated test runner (DrupalCI), but are not needed as module dependencies in general.
   - `configure` (optional), if your module offers a configuration form, specify the route to this form here.
   - `php` (optional) is the minimum PHP version that is required for your module. For the Developer Portal the minimum PHP version is 7.1.
   - `hidden` (optional) is an option that, if set, will hide your module from the Extend section of the administrator dashboard on the Developer Portal UI. This option might be useful if your module only contains tests, or if the module is meant as an example to other developers.
5. Save your *module_name*.info.yml.

Results

You successfully created your module skeleton.

Example

An example .info.yml file:

```
name: User field example
type: module
description: Developer Portal tutorial about a user field example
package: IBM API Connect Tutorials
core: 8.x
core_version_requirement: '^8 || ^9'
version: 8.x-0.0.1
dependencies:
  - ibm_apim
  - auth_apic
```

What to do next

You now need to create the appropriate content for your custom module, depending on what you want the module to do. For information about the various options, see Creating custom modules on Drupal.org. There is also a walkthrough example of creating a basic custom module that is available on Drupal.org, see: A "Hello World" custom page module.
Note: If you are defining URL paths in the routing file of your module, you must consider any potential implications of those paths, and avoid conflicts with other parts of the Developer Portal. For example, you are recommended not to prefix any paths with `ibm_apic`.
After you have created your custom module content, you need to package your custom module files up into a zip, tar, tgz, gz, or bz2 file. This file can then be installed onto your Developer Portal site by using the Extend menu on the administrator dashboard. For more information, see Installing custom modules.

Custom module development: using hooks

You can use hooks in custom modules to alter the behavior of Drupal core or other modules in your Developer Portal.

Custom modules enable you to extend the functionality of your Developer Portal site. For more information about how to create custom modules, see Custom module development: an introduction to Drupal tools for PHP development, and Custom module development: background and prerequisites.

Hooks are one of the ways that custom modules can use to interact with other modules and with Drupal core subsystems. The following sections provide an overview of hooks, and a list of the IBM® API Connect specific hooks.

Important:

- You are not permitted to include any IBM API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

About hooks

Hooks define functions that alter the behavior of Drupal core. So one way for custom modules to alter these functions, is to use hooks. Hooks are specially-named functions that a module defines (this is known as *implementing the hook*), these hooks are then discovered and called at specific times to alter or add to the base behavior or data (this is known as *invoking the hook*). Each hook has a name (for example: `hook_batch_alter()`), a defined set of parameters, and a defined return value. Your custom modules can implement hooks that are defined by Drupal core, by API Connect, or by other modules that they interact with. Your custom modules can also define their own hooks in order to let other modules interact with them. For more information, see Understanding Hooks on Drupal.org.

Note: If you write a hook implementation function, the function must not throw errors or exceptions, or use `alert` level log messages. Errors, exceptions, and `alert` level log messages can break all the processing in the parent code. For example, if you write a hook that calls an external server when an application is updated, the code needs to have error handling in place to handle the server not being found, or not returning the expected result. Otherwise, Drupal stops parsing the function and the application might not get updated correctly. It can cause webhook and snapshot parsing to abort leaving the portal in an inconsistent state.
For a list of all the hooks that are available on Drupal core, and how to implement them in your custom module, see Drupal API Hooks.

For a list of all the API Connect specific hooks, see the following section.

Using hooks in custom modules

To invoke a hook you need to add a function to your .module file in your custom module, and prefix the hook with your custom module name. For example, when using an API Connect hook in a custom module, you must replace the word `hook` in the hook name with the name of your custom module. For example:

`hook_apic_app_create`

should be referenced in your custom module as:

`moduleName_apic_app_create`

API Connect specific hooks

The following tables list the hooks that are specific to the API Connect Developer Portal. Each section contains a link to the .php file on the API Connect Developer Portal repository on GitHub for those hooks. This file contains examples of how you can use the hooks in your modules.

Hooks about Applications

The following table lists the hooks that relate to Applications in the Developer Portal. For examples of how to use Application hooks, see apic_app/apic_app.api.php on GitHub.

Table 1. Hooks about Applications

Hook name	Description
`hook_apic_app_create`	Triggered when an Application is created.
`hook_apic_app_update`	Triggered when an Application is updated.
`hook_apic_app_pre_delete`	Triggered when an Application is deleted, before the node deletion or cascade has happened.
`hook_apic_app_post_delete`	Triggered when an Application is deleted, after the node deletion or cascade has happened.
`hook_apic_app_promote`	Triggered when an Application is promoted.
`hook_apic_app_creds_create`	Triggered when a new set of credentials is created for an Application.
`hook_apic_app_creds_update`	Triggered when a set of credentials is updated for an Application.
`hook_apic_app_credential_post_delete`	Triggered after a set of credentials is deleted for an application, following the node deletion or cascade event.
`hook_apic_app_credential_pre_delete`	Triggered before a set of credentials is deleted for an application, before the node deletion or cascade happens.
`hook_apic_app_subscribe`	Triggered when a subscription is created.
`hook_apic_app_migrate`	Triggered when a subscription is migrated to a new Plan.
`hook_apic_app_unsubscribe`	Triggered when an Application is unsubscribed from a Plan.
`hook_apic_app_image_create`	Triggered when a custom Application image is created.
`hook_apic_app_image_delete`	Triggered when a custom Application image is deleted.
`hook_apic_app_clientid_reset`	Triggered when a credential client ID is reset.
`hook_apic_app_clientsecret_reset`	Triggered when a credential client secret is reset.
`hook_apic_app_modify_getplaceholderimage_alter`	Alter the Application placeholder image provided in \Drupal\apic_app\Application::getPlaceholderImage(). Can be used to define a specific placeholder image to use when the consumer has not uploaded their own custom image for their Application.
`hook_apic_app_modify_getimageforapp_alter`	Alter the Application placeholder image provided in \Drupal\apic_app\Application::getImageForApp(). Can be used to provide a full path to a specific image to use for an Application that overrides any custom image that might have been uploaded.
`hook_apic_app_modify_client_id_reset_alter`	Alter the client ID provided by API Manager when the ID is reset.
`hook_apic_app_modify_client_secret_reset_alter`	Alter the client secret provided by API Manager when the secret is reset.
`hook_apic_app_modify_create_alter`	Alter the credentials provided by API Manager when a new Application is created.
`hook_apic_app_modify_credentials_create_alter`	Alter the credentials provided by API Manager when new credentials are created.

Hooks about Consumer organizations

The following table lists the hooks that relate to Consumer organizations in the Developer Portal. For examples of how to use Consumer organization hooks, see consumerorg/consumerorg.api.php on GitHub.

Table 2. Hooks about Consumer organizations

Hook name	Description
`hook_consumerorg_create`	Triggered when a Consumer organization is created.
`hook_consumerorg_update`	Triggered when a Consumer organization is updated.
`hook_consumerorg_pre_delete`	Triggered when a Consumer organization is deleted, before the node deletion or cascade has happened.
`hook_consumerorg_post_delete`	Triggered when a Consumer organization is deleted, after the node deletion or cascade has happened.
`hook_consumerorg_payment_method_create_alter`	Triggered to allow modification of the payment method creation form.
`hook_consumerorg_myorg_tabs_alter`	Triggered to allow more tabs to be added to the **`my organization`** page.

Hooks about APIs

The following table lists the hooks that relate to APIs in the Developer Portal. For examples of how to use API hooks, see apic_api/apic_api.api.php on GitHub.

Table 3. Hooks about APIs

Hook name	Description
`hook_apic_api_create`	Triggered when an API is created.
`hook_apic_api_update`	Triggered when an API is updated.
`hook_apic_api_delete`	Triggered when an API is deleted.

Hooks about Products

The following table lists the hooks that relate to Products in the Developer Portal. For examples of how to use Product hooks, see product/product.api.php on GitHub.

Table 4. Hooks about Products

Hook name	Description
`hook_product_create`	Triggered when a Product is created.
`hook_product_update`	Triggered when a Product is updated.
`hook_product_delete`	Triggered when a Product is deleted.

Other IBM API Connect Hooks

The following table lists the hooks that can be for other uses.

Table 5. Other APIC Hooks

Hook name	Description
`hook_ibm_apim_subscription_wizard_summary_alter`	Triggered to allow modification of the summary page of the subscription wizard.

Related tasks

- Installing custom modules

Related information

- Creating custom modules

Installing custom modules

You can extend your Developer Portal site by installing custom modules that you created, and also installing contributed modules from the Drupal community.

Before you begin

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

About this task

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You can add extra functions to your site by installing new custom or contributed modules. For more information on creating custom modules, see Custom module development: background and prerequisites. Contributed modules are modules that are contributed by Drupal community members. To search for contributed modules, go to Drupal Download & Extend. You can install both types of modules into your Developer Portal site by using the following instructions.
Note: The following modules are unsupported and their installation is blocked in the Developer Portal:

- `advagg`
- `advagg_bundler`
- `advagg_css_minify`
- `advagg_ext_minify`
- `advagg_js_minify`
- `advagg_mod`
- `advagg_validator`
- `backup_migrate`
- `content_sync`
- `delete_all`
- `devel_themer`
- `domain`
- `email_tfa`
- `php`
- `simple_html_mail`
- `statistics`
- `swiftmailer`
- `tfa`
- `theme_editor`

Procedure

1. Click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The modules that are displayed with a selected checkbox are enabled, the modules that are displayed without a selected checkbox are not enabled.
2. Click + Install new module, and either complete the Install from a URL field, or click Choose file to upload a *filename*.tar.gz module file from your local computer.
3. Click Install.
   The Update manager confirms that the module was installed successfully.
4. Click Enable newly added modules to return to the List tab for the Extend page.
5. Find your newly added module in the list of modules, select its checkbox, and click Enable.
   Your newly added module is now enabled and available for you to use in the Developer Portal.

Deleting custom modules

You can delete custom modules from your Developer Portal if you want to remove them entirely from your site.

Before you begin

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

Note that any custom modules that you want to delete must be disabled first, including disabling any associated sub-modules. For more information, see Disabling modules. Any modules that are shipped with IBM API Connect cannot be deleted.

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Extend.
4. Click the Delete tab.
   The list of disabled custom modules that can be deleted is displayed. Note that any disabled modules that have sub-modules that are still enabled, are prevented from being disabled.
5. After you have found the module that you want to disable, select the check box next to the module, then click Delete.
6. At the confirmation dialogue, select Delete to delete the module completely from your site, or select Cancel to cancel the operation.

Results

You successfully deleted the module.

What to do next

To install a module, see Installing custom modules.

Disabling modules

You can disable an entire module in the Developer Portal if you want to improve performance, or remove functionality.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Note that the disable process removes all data related to a module.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed, some of which are enabled (displayed with a selected check box), and some of which are not enabled (where the check box is not selected).
4. Click the Disable tab.
   The list of modules that can be disabled is displayed. Note that any modules that are required by other enabled modules, are prevented from being disabled.
5. Either enter the name of the module that you want to disable in the Filter by name or description field, or scroll through the list of modules.
6. After you have identified the module that you want to disable, select the check box next to the module, then click Disable.
7. At the confirmation dialogue, select Disable to disable the module and remove any data that relates to it, or select Cancel to cancel the operation.

Results

You successfully disabled the module.

What to do next

To enable a module, return to the List tab, select the check box next to the module that you want to enable, and click Enable.
You can also delete custom modules completely from your Developer Portal site; see Deleting custom modules.

Using Developer Portal metadata on API Manager

For content created or updated after Version 10.0.1.0, the Developer Portal propagates more metadata to API Manager for **consumerorgs**, **users**, and **applications**.

This metadata might be values that the user provided by adding extra fields to content types, or added programmatically by using custom modules.

The benefit of this is that when you add custom fields to **consumerorgs**, **users**, and **applications**, this data is now also stored as metadata in API Manager. Storing this data allows the Developer Portal to correct or repopulate the custom fields from a webhook or a snapshot.

Related tasks

Using a custom module for payment method creation

You can offer free use of your products to your customers or you can configure your Developer Portal to bill your customers when they use your products. You can use a custom module to configure creation of payment methods.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
You must have configured billing support in API Manager.

Create your custom module. Your custom module needs to implement the `consumerorg_payment_method_create_alter` hook, so it needs to have a function like this:

```
my_custom_module_consumerorg_payment_method_create_alter(&$form, $integration, $billing) {
// do this payment function with $form
}
```

For more information, see Custom module development: background and prerequisites.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
   The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected checkbox. The disabled modules are displayed without a selected checkbox.
3. Click + Install new module, and either complete the Install from a URL field, or click Choose file to upload a *filename*.tar.gz module file from your local computer.
4. Click Install.
   The Update manager confirms that the module was installed successfully.
5. Click Enable newly added modules to return to the List tab for the Extend page.
6. Find your newly added module in the list of modules, select its checkbox, and click Enable.
   Your newly added module is now enabled and available for you to use in the Developer Portal.
7. In the administrator dashboard, click Configuration > System > IBM API Connect Billing Settings in the administrator dashboard.
8. Change the drop-down option to be your newly enabled module for your billing provider.

Results

You successfully enabled your payment method by using a custom module.

Managing the Developer Portal by using the toolkit CLI

You can perform operations on your Developer Portal by using the API Connect toolkit CLI.

- **Getting started with the Portal CLI commands**
  The toolkit CLI provides developer portal-specific commands for managing your portal servers and sites.
- **Developer Portal CLI commands**
  A summary of the commands that are supported in the Developer Portal CLI.
- **Scenarios that use the Portal CLI**
  Here are some scenarios of how you can use the Portal commands in the toolkit CLI to accomplish tasks that are more complex to complete, or not possible in the Developer Portal UI.

Getting started with the Portal CLI commands

The toolkit CLI provides developer portal-specific commands for managing your portal servers and sites.

Procedure

1. Install the toolkit: Setting up the API Connect toolkit
2. Log in to the Management server. Toolkit CLI Login.

```
apic login --server <management hostname/api base url> --username <username> --realm <realm>
```

Where:

- *<management hostname/api base url>* is the FQDN or base URL of your management API endpoints, for example: `mgmt.example.com` or `https://mgmt.example.com`.
- *<username>* is either the admin user or provider org owner, depending on whether you want to run cloud or provider organization scoped operations.
- *<realm>* is the user registry realm for the specified *<username>*. By default this is `admin/default-idp-1` for the admin user, and `provider/default-idp-2` for provider organization users.

Note: All portal CLI commands are either cloud admin or provider org scoped.

3. View the available toolkit portal commands by using `-m portaladmin -h`. Example:

```
apic -m portaladmin -h
...Usage:
  apic [flags]
  apic [command]

Available Flags:
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
  -h, --help                  Help for apic
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")

Available Commands:

  Creating applications and artifacts
     config                               Manage configuration variables

  Publishing to the cloud
     api                                  Api operations
     apic-config                          Apic Config operations
     application                          Application operations
     backups                              Backups operations
     consumer-org                         Consumer Org operations
     custom-module                        Custom Module operations
     custom-theme                         Custom Theme operations
     custom-translation                   Custom Translation operations
     custom-webserver-page                Custom Webserver Page operations
     drupal-config                        Drupal Config operations
     drupal-state                         Drupal State operations
     entity                               Entity operations
     factory-reset                        Factory Reset operations
     ip-security-enabled                  Ip Security Enabled operations
     modules                              Modules operations
     php-memory                           Php Memory operations
     platforms                            Platforms operations
     product                              Product operations
     security                             Security operations
     service-ip-allowlist                 Service Ip Allowlist operations
     site                                 Site operations
     site-config                          Site Config operations
     sites                                Sites operations
     themes                               Themes operations
     twig                                 Twig operations

  Other commands
     licenses                             Review the license for API Connect
     validate                             Validate an API or product definition
     version                              Get the APIConnect toolkit version

Additional help topics:

Use "apic [command] --help" for more information about a command.
```

4. To view command-specific help, run the command with `-h`:

```
apic -m portaladmin php-memory -h
Usage: apic php-memory:list [flags]

Php Memory operations

Flags:
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                         Help for list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

```
Type "apic [command] --help" for help on the following related commands:
      php-memory:list    List the PHP memory limit on the platform.
      php-memory:update  Set the PHP memory limit on the portal platform.

apic -m portaladmin php-memory:list -h
Usage: apic php-memory:list [flags]

List the PHP memory limit on the platform.

Lists the PHP memory_limit setting on the portal platform.

Flags:
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Developer Portal CLI commands

A summary of the commands that are supported in the Developer Portal CLI.

Authenticating

Use the **apic login** command to authenticate, and the **apic logout** command to remove your local authentication credentials. For more information, see Getting started with the Portal CLI commands.

Note: When you authenticate successfully, your credentials are stored, in plain text, in the file Linux .netrc or Windows _netrc. Therefore, you must set the file permissions in such a way that your credentials are not accessible by others.

Command summary

The following tables summarize **apic --mode portaladmin** commands.

Table 1. Summary of the **portaladmin** commands

Command	Description	Subcommands
apic api	Manage your **api**.	• **apic api:add-attachment** - Add an attachment for an API • **apic api:add-tag** - Add a tag for an API. • **apic api:get** - Get an API from a portal service. • **apic api:get-document** - Get a specific entire API document from the portal of the given organization and catalog. • **apic api:list** - List the APIs of the given organization and catalog. • **apic api:set-icon** - Set an icon for an API. For more information, see Using the api commands.
apic apic-config	Manage your **apic-config**.	• **apic apic-config:get** - Get the configuration of a site. For more information, see Using the apic-config commands.
apic application	Manage your **application**.	• **apic application:get** - Get an application from a portal service. • **apic application:list** - List the applications on a portal service. For more information, see Using the application commands.
apic backups	Manage your **backups**.	• **apic backups:list** - List the backups of a portal service. For more information, see Using the backups commands.
apic consumer-org	Manage your **apic consumer-org**.	• **apic consumer-org:get** - Get a consumer org from a portal service. • **apic consumer-org:list** - List the consumer orgs on a portal service. For more information, see Using the consumer-org commands.
apic content	Manage your **content** entity types.	• **content:create-export** - Create a task to export a .tgz file containing your site content entities. • **content:create-import** - Create a task to import an archive of your site content. • **content:delete-export** - Cancel any currently running **content:create-export** tasks, and delete any related artifacts. • **content:delete-import** - Cancel any currently running **content:create-import** tasks, and delete any related artifacts. • **content:get-export-status** - Return the status of a specific export task. • **content:get-export** - Stream the content of a specific export task to a .tgz file. • **content:get-import-status** - Return the status of a specific import task. • **apic content:list** - List all of the entities in your site for a given content entity type and, if required, bundle. • **apic content:list-type** - List the content entity types that are exportable from your site. For more information, see Using the content commands.

Command	Description	Subcommands
apic custom-module	Manage your **custom modules**.	• **apic custom-module:create-export** - Create an export of a **custom module**. • **apic custom-module:create-import** - Create an import of a **custom module**. • **apic custom-module:delete-export** - Delete an export of a **custom module**. • **apic custom-module:delete-import** - Delete an import of a **custom module**. • **apic custom-module:get-export** - Get an export of a **custom module**. • **apic custom-module:get-export-status** - Get the status of an export of a **custom module**. • **apic custom-module:get-import-status** - Get the status of an import of a **custom module**. For more information, see Using the custom-module commands.
apic custom-theme	Manage your **custom themes**.	• **apic custom-theme:create-export** - Create an export of a **custom theme**. • **apic custom-theme:create-import** - Create an import of a **custom theme**. • **apic custom-theme:delete-export** - Delete an export of a **custom theme**. • **apic custom-theme:delete-import** - Delete an import of a **custom theme**. • **apic custom-theme:get-export** - Get an export of a **custom theme**. • **apic custom-theme:get-export-status** - Get the status of an export of a **custom theme**. • **apic custom-theme:get-import-status** - Get the status of an import of a **custom theme**. For more information, see Using the custom-theme commands.
apic custom-translation	Manage your **custom translations**.	• **apic custom-translation:create-export** - Create a task to export a **custom translation**. • **apic custom-translation:create-import** - Create a task to import a **custom translation**. • **apic custom-translation:delete-export** - Cancel any ongoing or recently created export tasks. • **apic custom-translation:delete-import** - Cancel any ongoing or recently created import tasks. • **apic custom-translation:get-export** - Streams an export artifact of a **custom translation** back to the provided task ID. • **apic custom-translation:get-export-status** - Get the status of an export of a **custom translation**. • **apic custom-translation:get-import-status** - Get the status of an import of a **custom translation**. For more information, see Using the custom-translation commands.
apic custom-webserver-page	Manage your **custom-webserver-page** content.	• **apic custom-webserver-page:delete** - Delete a custom HTML web server error page. • **apic custom-webserver-page:get** - Get the content of a custom HTML web server error page. • **apic custom-webserver-page:set** - Set a custom HTML web server error page by using a valid HTML5 content file. For more information, see Using the custom-webserver-page commands.
apic drupal-config	Manage your **drupal-config**.	• **apic drupal-config:delete** - Delete a Drupal config object, or a specific config key. • **apic drupal-config:get** - Get all of the key values for a Drupal config object, or a specific config key value. • **apic drupal-config:list** - List the Drupal config names by prefix, or list all. • **apic drupal-config:set** - Set a new Drupal config key and value, or update an existing config key and value. For more information, see Using the drupal-config commands.
apic drupal-state	Manage your **drupal-state** keys and values.	• **apic drupal-state:delete** - Delete a specific Drupal state key and value. • **apic drupal-state:get** - Get a specific Drupal state key value. • **apic drupal-state:set** - Set a new Drupal state key and value, or update an existing state key value. For more information, see Using the drupal-state commands.
apic entity	Manage your **entity**.	• **apic entity:count** - A count of entities from a site. For more information, see Using the entity commands.

Command	Description	Subcommands
apic export-entity	Manage the export of your content entities.	• **export-entity:create** - Create a new export entity, which is the container for the entity content that you want to export. • **export-entity:add-content** - Adds content to an existing export entity. • **export-entity:get** - Returns a list of the content of a specific export entity. • **export-entity:remove-content** - Removes certain content from a specific export entity. • **export-entity:delete** - Deletes a specific export entity. • **export-entity:launch** - Launches an export entity polling task that creates a .tgz file of all of the entities that are contained in a specific export entity. Can be run with a **--no-poll** option, in which case the task doesn't return a .tgz file, but just returns the task ID. • **export-entity:get-launch-export** - Streams the content of a specific completed **export-entity:launch** task to a .tgz file. • **export-entity:delete-launch-export** - Cancels a currently running **export-entity:launch** task, and deletes any related artifacts. • **export-entity:get-launch-export-status** - Returns the status of a specific **export-entity:launch** task. • **export-entity:list** - Returns a list of all of the export entities within a specific Developer Portal. Each export entity contains a defined list of all of the entity content that will be exported if **export-entity:launch** is run. For more information, see Using the export-entity commands.
apic factory-reset	Perform a factory reset of your Developer Portal.	• **apic factory-reset:delete** - Perform a factory reset of your Developer Portal, deleting the portal service and all of its associated Developer Portal sites. Warning: The **factory-reset** command is irreversible. You must ensure that you have backups created before running this command. For more information, see Using the factory-reset command.
apic forums	Manage your **forums**.	• **apic forums:disable** - disables the Forum module for a given site. • **apic forums:enable** - enables the Forum module for a given site. For more information, see Using the forums commands.
apic ip-security-enabled	Manage your **IP security**.	• **apic ip-security-enabled:update** - Enable or disable the IP security at the portal service level. For more information, see Using the ip-security-enabled command.
apic maintenance	Manage your **maintenance** operations.	• **apic maintenance:disable** - Disable your **maintenance** operations. • **apic maintenance:enable** - Enable your **maintenance** operations. • **apic maintenance:rebuild_node_access** - Rebuild the node access table of your **maintenance** operations. • **apic maintenance:search_api_index_rebuild** - Rebuild and re-index the search API index of your **maintenance** operations. • **apic maintenance:search_api_index_status** - Print the search API index status of your **maintenance** operations. • **apic maintenance:status** - Get the current mode of your **maintenance** operations. For more information, see Using the maintenance commands.
apic memcache	Manage your **memcache** operations.	• **apic memcache:disable** - Disable the default caching store operations. This sets Drupal to use database as its cache. • **apic memcache:enable** - Enable the default caching store operations. This sets Drupal to use RAM as its cache. • **apic memcache:get** - Get the status of the **memcache enabled** operations. For more information, see Using the memcache commands.
apic modules	Manage your **modules**.	• **apic modules:delete** - Delete **modules**. • **apic modules:disable** - Disable **modules**. • **apic modules:enable** - Enable **modules**. • **apic modules:list** - Get a list of your **modules**. For more information, see Using the modules commands.
apic php-memory	Manage your **php-memory**.	• **apic php-memory:list** - List the PHP memory limit on the platform. • **apic php-memory:update** - Set the PHP memory limit on the portal platform. For more information, see Using the php-memory commands.
apic platforms	Manage your **platforms**.	• **apic platforms:list** - List the platforms of a portal service. For more information, see Using the platforms commands.
apic product	Manage your **product**.	• **apic product:add-attachment** - Add an attachment for the given product. • **apic product:add-tag** - Add a tag for the given product. • **apic product:get** - Get a product from a portal service. • **apic product:get-document** - Get a specific entire product document from the portal of the given organization and catalog. • **apic product:list** - List the products on a portal service. • **apic product:set-icon** - Set an icon image for the given product. For more information, see Using the product commands.
apic queue	View the tasks in a portal **queue**.	• **apic queue:get** - View the queued and locked platform related tasks for a specific Developer Portal site. • **apic queue:list** - View the queued and locked platform related tasks across all of the Developer Portal sites on a specific portal service. For more information, see Using the queue commands.

Command	Description	Subcommands
`apic role`	Manage your `role` operations.	• `apic role:create` - Create a new Drupal user role. • `apic role:delete` - Delete an unwanted Drupal user role. • `apic role:add-permission` - Add specific permissions to a Drupal user role. • `apic role:remove-permission` - Remove unwanted permissions from a Drupal user role. • `apic role:get` - Get the details of a Drupal user role as well as all the permissions granted to the specific role. • `apic role:list` - List all of the roles. You can filter the list based on the user role as well as the permission using the corresponding flags along with the `role:list` command. Use the `--filter_by_permission` flag to get the list of the roles that have the specified permission. Use the `--role` flag to get the list of permissions granted to the specified role. For more information, see Using the role commands.
`apic security`	Manage your `security`.	• `apic security:clear-bans` - Clear all of the banned user/IP addresses on a portal site. For more information, see Using the security command.
`apic service`	Manage your `service` operations.	• `apic service:list` - List the Portal service currently installed. For more information, see Using the service command.
`apic service-ip-allowlist`	Manage your `service-ip-allowlist`, which enables specific IP addresses to be exempt from being blocked by portal security checks.	• `apic service-ip-allowlist:add` - Add specific IP addresses to the `allowlist`. • `apic service-ip-allowlist:delete` - Delete all of the IP addresses from the `allowlist`. • `apic service-ip-allowlist:list` - List all of the IP addresses that are currently on the `allowlist`. • `apic service-ip-allowlist:remove` - Remove one or more specific IP addresses from the `allowlist`. For more information, see Using the service-ip-allowlist commands.
`apic site`	Manage your `site`.	• `site:cache-rebuild` - Rebuild the cache of a portal site. • `apic site:check` - Run a platform check against a portal site. • `apic site:state` - Obtain the current state of a portal site. • `apic site:login-link` - Get an admin login link for a specific portal site. • `site:create-export` - Create a task to export a .tgz archive file of your entire site configuration. • `site:create-import` - Create a task to import an archive of your entire site configuration. • `site:delete-export` - Cancel any currently running `site:create-export` tasks, and delete any related artifacts. • `site:delete-import` - Cancel any currently running `site:create-import` tasks, and delete any related artifacts. • `site:get-export-status` - Return the status of a specific export task. • `site:get-export` - Stream the content of a specific completed export task to a .tgz file. • `site:get-import-status` - Return the status of a specific import task. Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to. For more information, see Using the site commands.
`apic site-config`	Manage your `site-config`.	• `apic site-config:create-export` - Create an export of a `site config`. • `apic site-config:create-import` - Create an import of a `site config`. • `apic site-config:delete-export` - Delete an export of a `site config`. • `apic site-config:delete-import` - Delete an import of a `site config`. • `apic site-config:get-export` - Get an export of a `site config`. • `apic site-config:get-export-status` - Get the status of an export of a `site config`. • `apic site-config:get-import-status` - Get the status of an import of a `site config`. For more information, see Using the site-config commands.
`apic sites`	Manage your `sites`.	• `apic sites:check` - Run a platform check against all portal sites on a portal service. • `apic sites:list` - List the sites of a portal service. • `apic sites:reset-upgrade-attempts` - Reset the portal upgrade attempts. For more information, see Using the sites commands.
`apic themes`	Manage your `themes`.	• `apic themes:delete` - Delete `themes`. • `apic themes:disable` - Disable `themes`. • `apic themes:enable` - Enable `themes`. • `apic themes:list` - Get a list of your `themes`. • `apic themes:set-default` - Set the default theme of the portal. For more information, see Using the themes commands.
`apic twig`	Manage the `twig` debugging operations on a specific portal site.	• `apic twig:debug-enable` - Enable twig debugging for a portal site. • `apic twig:debug-disable` - Disable twig debugging for a portal site. • `apic twig:debug-status` - Get the current state of twig debugging for a specific site. For more information, see Using the twig commands.

Command	Description	Subcommands
`apic user`	Manage some Developer Portal `user` tasks.	• `apic user:add-role` - Add one or more roles to one or more specified user accounts. • `apic user:block` - Block one or more users. • `apic user:information` - Retrieve information about your users. • `apic user:remove-role` - Remove one or more roles from one or more specified user accounts. • `apic user:unblock` - Unblock one or more users. For more information, see Using the user commands.
`apic version`	Get the version of your API Connect toolkit.	• `apic version --mode portaladmin` - Get toolkit version.

- **Using the api commands**
  You can use the **api** commands to get and list the APIs on your Developer Portal service.
- **Using the apic-config commands**
  You can use the **apic-config** commands to get the apic config of your Developer Portal service.
- **Using the application commands**
  You can use the **application** commands to get and list the applications on your Developer Portal service.
- **Using the backups commands**
  You can use the **backups** commands to list the backups on your Developer Portal service.
- **Using the consumer-org commands**
  You can use the **consumer-org** commands to get and list the consumer orgs on your Developer Portal service.
- **Using the content commands**
  You can use the **content** commands to list, import, and export content from your Developer Portal site.
- **Using the custom-module commands**
  You can use the **custom-module** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.
- **Using the custom-theme commands**
  You can use the **custom-theme** commands to create export and import tasks, delete export and import tasks, get the status of an export or import task, and get an export artifact, on your Developer Portal service.
- **Using the custom-translation commands**
  You can use the **custom-translation** commands to create an import or export task that will import or export a .tgz of custom translations for a Developer Portal site. You can also delete the export and import tasks, get the status of an export or import task, and get a custom translation export artifact.
- **Using the custom-webserver-page commands**
  You can use the **custom-webserver-page** commands to customize the web server error pages on your Developer Portal service.
- **Using the drupal-config commands**
  You can use the **drupal-config** commands to list, get the values of, set values, create new, and delete the Drupal configuration objects on your Developer Portal service.
- **Using the drupal-state commands**
  You can use the **drupal-state** commands to store and retrieve information about the state of your Developer Portal system.
- **Using the entity commands**
  You can use the **entity** commands to get the entity count on your Developer Portal service.
- **Using the export-entity commands**
  You can use the **export-entity** commands to manage the export of content entities from your Developer Portal site.
- **Using the factory-reset command**
  You can use the **factory-reset** command to perform a factory reset of your Developer Portal, which will delete the portal service and all of its associated Developer Portal sites.
- **Using the forums commands**
  You can use the **forums** commands to disable or enable the forums on your Developer Portal service.
- **Using the ip-security-enabled command**
  You can use the **ip-security-enabled** commands to toggle IP security on your Developer Portal. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. Banned IP addresses can be cleared by using the `security:clear-bans` command. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. Note that IP security is enabled by default on the Developer Portal.
- **Using the maintenance commands**
  You can use the **maintenance** commands to manage the maintenance operations on your Developer Portal service.
- **Using the memcache commands**
  You can use the **memcache** commands to get, enable, and disable the default caching store operations on your Developer Portal service.
- **Using the modules commands**
  You can use the **modules** commands to list, enable, disable and delete the modules on your Developer Portal service.
- **Using the php-memory commands**
  You can use the **php-memory** commands to list or update the PHP memory limits on your Developer Portal.
- **Using the platforms commands**
  You can use the **platforms** commands to list the platforms on your Developer Portal service.
- **Using the product commands**
  You can use the **product** commands to get and list the products on your Developer Portal service.
- **Using the queue commands**
  You can use the **queue** commands to list the queued and locked platform tasks on your Developer Portal site.
- **Using the role commands**
  You can use the **role** commands to complete the full lifecycle of Drupal user roles. This includes creating and deleting of roles, as well as adding and removing permissions to the roles in your Developer Portal service.
- **Using the security command**
  You can use the **security** command to clear all of the banned user/IP addresses on a Developer Portal site.
- **Using the service command**
  You can use the **service** command to list the Developer Portal service from the Developer Portal database.
- **Using the service-ip-allowlist commands**
  You can use the **service-ip-allowlist** commands to add, remove, and list the IP addresses on your Developer Portal `allowlist`. IP addresses that are on the `allowlist` are exempt from being blocked by Developer Portal security checks, for example, load balancer and proxy IPs.

- **Using the site commands**
  You can use the **site** commands to check the site on your Developer Portal service, and to export and import an entire site configuration.
- **Using the site-config commands**
  You can use the **site-config** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.
- **Using the sites commands**
  You can use the **sites** commands to check and list the sites on your Developer Portal service. You can also reset the portal upgrade attempt counter.
- **Using the themes commands**
  You can use the **themes** commands to list, enable, disable, delete, and set the default themes on your Developer Portal service.
- **Using the twig commands**
  You can use the **twig** commands to enable, disable, and check the state of twig debugging on a specific site on your Developer Portal service.
- **Using the user commands**
  You can use the **user** commands to complete some Drupal user management tasks on your Developer Portal, such as adding and removing roles, blocking and unblocking users, and retrieving user information.

Using the api commands

You can use the **api** commands to get and list the APIs on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. List the APIs from a site.
   For example,

   ```
   apic --mode portaladmin api:list --org orgid/name --server management_server --catalog catalogid/name
   ```

   - *management_server* is the endpoint URL of the management server (required).
   - *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
   - *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
   - *format_type* is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.
3. Get an API from a site by using the *id* or *name:version*.
   For example,

   ```
   apic --mode portaladmin api:get --org orgid/name --server management_server --catalog catalogid/name id/name:version
   ```

   - *id/name:version* - The ID or name:version of a specific API (required). For example, `id-of-api-called-example-3` or `example:3.0.0`.
4. Get a specific entire API document from the portal of the provided organization and catalog by using the *id* or *name:version*.

   ```
   apic --mode portaladmin api:get-document --org orgid/name --server management_server --catalog catalogid/name --format
   format_type  id/name:version
   ```

   For example,

   ```
   apic --mode portaladmin api:get-document --org ibm --server management_server --catalog portal-test --format yaml  intuiz-
   api:1.0.0
   ```

5. Add an attachment for your API within your Developer Portal.
   For example,

   ```
   apic --mode portaladmin api:add-attachment -s management_server --org orgid/name --catalog catalogid/name --
   attachment_name attachment.txt --attachment_description "API documentation" mortgage-management-api:1.0.0 ./attachment.txt
   Loading File (Large files may take a while)...

   Attachment successfully added to api mortgage-management-api:1.0.0.
     This product now has 4 attachments.
   ```

   - *attachment_name* is the name given to the attachment when it is uploaded (required).
   - *attachment_description* is the description of the attachment that is displayed to the users.
6. Set an icon for your API within your Developer Portal.
   For example,

```
apic --mode portaladmin api:set-icon -s management_server --org orgid/name --catalog catalogid/name --icon_description
"API icon" mortgage-management-api:1.0.0 ./icon.png
Loading File (Large files may take a while)...

Icon successfully set for api mortgage-management-api:1.0.0
```

- *icon_description* is the icon description to be displayed to users and it is used as an alt text for the image (required).

7. Add a tag (Category) for your API within your Developer Portal.
   For example,

```
apic --mode portaladmin api:add-tag -s management_server --org orgid/name --catalog catalogid/name --tag_name
top_level_element/next_level_element/lower_level_element mortgage-management-api:1.0.0
Successfully set taxonomy tag top_level_element/next_level_element/lower_level_element
  for api mortgage-management-api:1.0.0
```

- tag_name is the tag name. For example, *top_level_element/next_level_element* (required).

Using the apic-config commands

You can use the **apic-config** commands to get the apic config of your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

   For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
   For full details of the **apic login** command, see Logging in to a management server.

2. Get the apic config of a site.
   For example,

```
apic --mode portaladmin apic-config:get --org orgid/name --server management_server --catalog name/id
```

Using the application commands

You can use the **application** commands to get and list the applications on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

   For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
   For full details of the **apic login** command, see Logging in to a management server.

2. List the applications on a site.
   For example,

```
apic --mode portaladmin application:list --org orgid/name --server management_server --catalog name/id
```

3. Get an application from a site by using application id.
   For example,

   ```
   apic --mode portaladmin application:get --org orgid/name --server management_server --catalog name/id id
   ```

Using the backups commands

You can use the **backups** commands to list the backups on your Developer Portal service.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Get the availability zone of the portal service's backups that you want to list:

   ```
   apic availability-zones --org orgid/name --server management_server
   ```

3. List all the portal services in that availability zone

   ```
   apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
   ```

4. Get the selected portal service's name

   ```
   apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
   ```

5. List the backups of the portal service

   ```
   apic --mode portaladmin backups:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
   ```

Using the consumer-org commands

You can use the **consumer-org** commands to get and list the consumer orgs on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. List the consumer orgs of a site.
   For example,

   ```
   apic --mode portaladmin consumer-org:list --org orgid/name --server management_server --catalog name/id
   ```

3. Get a consumer org from a site by using org id.

For example,

```
apic --mode portaladmin consumer-org:get --org orgid/name --server management_server --catalog name/id id
```

Using the content commands

You can use the **content** commands to list, import, and export content from your Developer Portal site.

About

The Developer Portal is based on the Drupal content management system. In Drupal, a content entity is an item of content data that is intended to be displayed to site users, such as text, images, and HTML markup. Content entities are grouped into entity types, and most of these entity types are also subdivided into entity subtypes, also known as bundles. The **content** commands enable you to list, import, and export either one type of content entity, or all of the content entity types, at a time. If you want to manage the export of assorted content entity types at the same time, you can use the **export-entity** commands; see Using the export-entity commands for more information.

Procedure

1. Log in as Provider org as seen in the following example.

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. List the content entity types that are exportable from your site by using the following `content:list-types` command. This command returns a list of all of the content entity types that are allowed to be exported from your site. If a type isn't listed in the return, that type is either blocked or isn't a content entity type.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:list-types
   ```

   Where:
   - *management_server* is the endpoint URL of the management server (required).
   - *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
   - *catalogid/name* is the ID or name of the catalog that the site belongs to (required).

   Each content entity type can have subtypes, which are known as bundles. These bundles can be used in the `content:list` command, when you want to list a particular bundle type of a content entity. In the following example, `page` is a bundle type of the content entity type `node`.

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog content:list-types
   block_content:
     - basic
   comment:
     - comment
     - comment_forum
   export_entity: {  }
   file: {  }
   import_entity: {  }
   media: {  }
   menu_link_content: {  }
   node:
     - article
     - blog_post
     - faq
     - forum
     - page
   shortcut:
     - default
   taxonomy_term:
     - forums
     - tags
   ```

3. List all of the entities in your site for a given content entity type and, if required, bundle by using the following `content:list` command.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:list --entity_type
   entity_type_name --bundle bundle_name
   ```

Where:

- ***entity_type_name*** is the type of content entity that you want to list (required). You can use the **content:list-types** command to find the list of available content entity types.
- ***bundle_name*** is the name of the bundle type that you want to list (optional).

The following example lists the content of the **page** bundle type for the **node** content entity. Included in the return is an **Entity ID** for each item in the content list.

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog content:list --entity_type node --
bundle page
-
  Title: 'Terms of use'
  Langcode: en
  'Entity ID': '1'
  Bundle: page
  UUID: 75fc430e-fc4d-47e3-bc5f-7f23063716ac
-
  Title: 'Privacy Policy'
  Langcode: en
  'Entity ID': '2'
  Bundle: page
  UUID: ddff300b-16fe-4d1e-be6f-ce7040131b68
```

4. Export your site content entities by using the following **content:create-export** command. This command creates an export task that returns a .tgz file containing the content entities. By default, the command polls the status of the task every 30 seconds until the task is finished, at which point the export file is returned. You can export a specific content entity type, or specific entities within an entity type, or you can generate a .tar file that contains all of the exportable content from your site. Note that exporting all of your site content can take a long time to complete.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:create-export --
   entity_type entity_type_name --entity_ids entity_ids
   ```

   Where:

   - ***entity_type_name*** is the type of content entity that you want to export (required). If you want to export all of the exportable content from your site, set this option to **all**.
   - ***entity_ids*** is a comma separated list of the entity IDs that you want to export (optional).
   - **--no-poll** is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the **content:get-export** command to return the export file.

   Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the commands **content:get_export_status** and **content:get-export** to get the status and, if the task has finished, an artifact.
   The following example creates an export task for the **Terms of use** and **Privacy Policy** entity IDs of the **node** content entity.

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog content:create-export --
   entity_type node --entity_ids 1,2
   201 CREATED - Task ID: 8h86b8utjtw51

   Response Code - 202:

   Message(s) -
   The status of this task is: RUNNING

   Response Code - 200:

   Message(s) -
   The status of this task is: FINISHED and the artifact can now be streamed

   Saving File (Large files may take a while)...
   Incoming project saved to content_createExport-20230627114023.tgz
   ```

   The command saves the export file to your running directory. The export .tgz file includes a root.json file that contains an index of all of the entities that are contained in the .tgz file, as well as a *content_entity_type*.json file for each content entity type exported. The *content_entity_type*.json file contains all of the information needed to be able to import those entities into a different Developer Portal site.
5. If you ran the **content:create-export** command with the **--no-poll** option, you can use the following commands to manage your content export.
   - **content:delete-export**
     Cancels any currently running **content:create-export** tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:delete-export --
     task_id task_id
     ```

     Where ***task_id*** is the ID of the export task on the queue.
   - **content:get-export**
     Streams the content of a specific completed export task to a .tgz file. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:get-export --
     task_id task_id
     ```

   - **content:get-export-status**
     Returns the status of a specific export task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:get-export-
     status --task_id task_id
     ```

6. Import your site content entities by using the **content:create-import** command. This command launches an import polling task that polls the status of the task every 30 seconds until the task is finished, at which point a summary of the import is returned. If the command is run with the **--no-poll** option, the task doesn't return the status of the task, but just returns the task ID.
   Important: Before you import any content, make sure that you backup the site that you're importing to, in case content gets overwritten that you weren't expecting.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:create-import
   export_file_name
   ```

   Where:

- ***export_file_name*** is the name of the export file that you want to import. You can import .tgz files that were created by using the **content:create-export** or **export-entity:launch** commands.
- **--no-poll** is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the **content:get-import-status** command to get the status of the task.

Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the command **content:get-import-status** to get the status of the task.
In the following example, the export file from Step 4 is imported into a different Developer Portal site on a different server:

```
apic --mode portaladmin --server my_management_server2 --org my_prod_org --catalog my_prod_catalog content:create-import
content_createExport-20230627114023.tgz
Loading File (Large files may take a while)...

201 CREATED - Task ID: zmaskh7oo6531tty

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 200:

Message(s) -
2023-10-18 13:36:18: CLI task (content:import) starting.
2023-10-18 13:36:29: [notice] [1/2] - [node.page:1] "Terms of use" - Updated
(https://my_management_server2/my_prod_catalog/tsandcs)
 [notice] [2/2] - [node.page:2] "Privacy Policy" - Updated (https://my_management_server2/my_prod_catalog/privacy)
2023-10-18 13:37:20: CLI task (content:import) completed successfully.
```

Depending on the content imported, the following three types of import can be shown in the import summary messages:

- **Overridden** - In this case a content entity existed with the same entity ID but not the same UUID, and there was also no reference to it in the synchronization table, so the entity was overridden. Care must be taken when importing entities across different sites until they are in sync with one another, as data can be lost. For example, say you have a blog post about APIs with an entity ID of **50** on a test site, and you wanted to import this post onto your production site. However, the production site already has a blog post with an entity ID of **50** that talks about policies, in which case that post would be overwritten by the blog post about APIs, and be given the imported UUID. The next time that entity ID of **50** is imported, the import type will be **Updated**, because the UUID is now the same.
- **Updated** - In this case the same content entity, with the same UUID, was found, so its contents were updated with the content from the import file.
- **Created** - In this case no content entity of this type was found, so a new entity was created, and it was populated with the data from the import file.

7. If you ran the **content:create-import** command with the **--no-poll** option, you can use the following commands to manage your content import.
   - **content:delete-import**
     Cancels any currently running **content:create-import** tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:delete-import --
     task_id task_id
     ```

     Where ***task_id*** is the ID of the import task on the queue.
   - **content:get-import-status**
     Returns the status of a specific import task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:get-import-
     status --task_id task_id
     ```

Related reference

- Using the export-entity commands

Using the custom-module commands

You can use the **custom-module** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
   ```

```
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Export your custom modules.
The **custom-module:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.
Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-module:get-export-status** and **custom-module:get-export** to get the status and potentially an artifact.

```
apic --mode portaladmin custom-module:create-export --catalog name/id --org orgid/name --server management_server
```

   - The module .tgz is saved to the directory in which you ran the command.
   - The saved .tgz has the format `custom_module_createExport-20200217134637.tgz`.
   - You can save your exports into your change control management system.

   For example,

```
apic --mode portaladmin custom-module:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your custom modules.
The **custom-module:create-import** command uses the supplied .tgz file to import the custom modules into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.
Note:
   - The higher level folders of the archive can contain only these characters, a-z and 0-9.
   - The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **custom-module:get-import-status** to get the status of the import.
   - If you import a custom module that already exists you overwrite the existing custom module.
   - The Drupal cache is rebuilt in the background after the task is complete. If you want to include the cache rebuild as part of the task, you must include the `--wait` flag.

```
apic --mode portaladmin custom-module:create-import --catalog name/id --org orgid/name --server management_server
/PATH/TO/theme/TGZ --wait
```

   Where `--wait` is an optional flag that makes the Drupal cache rebuild part of the task. Otherwise, the cache is rebuilt in the background after the task is finished.
   For example,

```
apic --mode portaladmin custom-module:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/custom_module_export_three.tgz
Loading File (Large files may take a while)...

201 CREATED - Task ID: qe91vremj903owve

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
2024-01-26 09:47:58: CLI task (custom_module:import) starting.
2024-01-26 09:48:01: Deleting existing custom module /var/aegir/platforms/devportal-10.x-10.99.99.99-20240125-
0920/sites/ibm.portal-ci-catalog-1.portal.ibm.com/modules/chosen
2024-01-26 09:48:02: Importing custom module chosen
2024-01-26 09:48:02: Deleting existing custom module /var/aegir/platforms/devportal-10.x-10.99.99.99-20240125-
0920/sites/ibm.portal-ci-catalog-1.portal.ibm.com/modules/google_tag
2024-01-26 09:48:02: Importing custom module google_tag
2024-01-26 09:48:02: Deleting existing custom module /var/aegir/platforms/devportal-10.x-10.99.99.99-20240125-
0920/sites/ibm.portal-ci-catalog-1.portal.ibm.com/modules/snowflakes
2024-01-26 09:48:02: Importing custom module snowflakes
2024-01-26 09:48:09: The Drupal cache will now be rebuilt. If you experience issues, please attempt to rebuild the cache
via CLI.
2024-01-26 09:48:10: CLI task (custom_module:import) completed successfully.
```

4. You can run the delete command to cancel any ongoing or recently created import or export tasks. Any temporarily created artifacts will be deleted from the portal filesystem. No custom modules are deleted.
   For example,

```
apic --mode portaladmin custom-module:delete-export --catalog name/id --org orgid/name --server management_server --format
json --task_id string

apic --mode portaladmin custom-module:delete-import --catalog name/id --org orgid/name --server management_server --format
json --task_id string
```

Using the custom-theme commands

You can use the **custom-theme** commands to create export and import tasks, delete export and import tasks, get the status of an export or import task, and get an export artifact, on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Export your custom themes.
   The **custom-theme:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.
   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-theme:get-export-status** and **custom-theme:get-export** to get the status and potentially an artifact.

   ```
   apic --mode portaladmin custom-theme:create-export --catalog name/id --org orgid/name --server management_server
   ```

   - The theme .tgz is saved to the directory in which you ran the command.
   - The saved .tgz has the format `custom_theme_createExport-20200217134637.tgz`.
   - You can save your exports into your change control management system.

   For example,

   ```
   apic --mode portaladmin custom-theme:create-export --catalog dev --org ibm --server api.stagingexample.com
   ```

3. Import your custom themes.
   The **custom-theme:create-import** command uses the supplied .tgz file to import the custom themes into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.
   Note:
   - The higher level folders of the archive can contain only these characters, a-z and 0-9.
   - The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **custom-theme:get-import-status** to get the status of the import.
   - If you import a custom theme that already exists you overwrite the existing custom theme.
   - The Drupal cache is rebuilt in the background after the task is complete. If you want to include the cache rebuild as part of the task, you must include the `--wait` flag.

   ```
   apic --mode portaladmin custom-theme:create-import --catalog name/id --org orgid/name --server management_server
   /PATH/TO/theme/TGZ --wait
   ```

   Where `--wait` is an optional flag that makes the Drupal cache rebuild part of the task. Otherwise, the cache is rebuilt in the background after the task is finished.
   For example,

   ```
   apic --mode portaladmin custom-theme:create-import --catalog prod --org ibm --server api.productionexample.com
   C:/users/example/desktop/custom_theme_export_three.tgz
   Loading File (Large files may take a while)...

   201 CREATED - Task ID: lpzqgmoyh4hps7uq

- Toolkit CLI reference documentation

Using the custom-translation commands

You can use the **custom-translation** commands to create an import or export task that will import or export a .tgz of custom translations for a Developer Portal site. You can also delete the export and import tasks, get the status of an export or import task, and get a custom translation export artifact.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

   For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Export your custom translations.
   The **custom-translation:create-export** command creates an export task against the portal of the specified `catalog` and `org`, to export an archive of the custom translations of the site. The command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back. The task ID is printed to the terminal.
   Note:
   - The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-translation:get-export-status** and **custom-translation:get-export** to get the status and potentially an artifact.
   - The translation .tgz archive is saved to the directory in which you ran the command.
   - The saved .tgz has the format `custom_translation_createExport-20210217134637.tgz`.
   - You can save your exports into your change control management system.

```
apic --mode portaladmin custom-translation:create-export --catalog catalogid/name --org orgid/name --server
management_server
```

   - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
   - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
   - `management_server` is the endpoint URL of the management server (required).
   - `--langcodes` is a comma separated list of the language codes, for example `es,zh-hans`. You can use this option to specify which custom translations to export.
   - `--no-poll` can be used to stop the command from polling the task, and just return the task ID.

   For example:

```
apic --mode portaladmin custom-translation:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your custom translations.
   The **custom-translation:create-import** command uses the supplied .tgz file to create a task to import the custom translations into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error. The task ID is printed to the terminal.
   Note:
   - The .tgz archive must contain only .po translation files, and nothing else.
   - The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **custom-translation:get-import-status** to get the status of the import.
   - If you import a custom translation that already exists, the existing custom translation is overwritten.

```
apic --mode portaladmin custom-translation:create-import --catalog catalogid/name --org orgid/name --server
management_server /PATH/TO/MODULE/TGZ
```

- `--no-poll` can be used to stop the command from polling the task, and just return the task ID.

For example:

```
apic --mode portaladmin custom-translation:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/custom_translation_createExport-20210217134637.tgz
```

4. You can run the delete command to cancel any ongoing or recently created import or export tasks. Any temporarily created artifacts will be deleted from the portal filesystem. No custom translations are deleted.
For example,

```
apic --mode portaladmin custom-translation:delete-export --catalog catalogid/name --org orgid/name --server
management_server --format json --task_id taskid
```

```
apic --mode portaladmin custom-translation:delete-import --catalog catalogid/name --org orgid/name --server
management_server --format json --task_id taskid
```

- *taskid* is the ID of the import or export task that was created on the queue (required).
- `--format` is the output format that can be seen if you run the command with debug. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

For example:

```
apic --mode portaladmin custom-translation:delete-import --catalog prod --org ibm --server api.productionexample.com  --
task_id 4hythbptta6z9lyx
```

Using the custom-webserver-page commands

You can use the **custom-webserver-page** commands to customize the web server error pages on your Developer Portal service.

The **custom-webserver-page** commands enable you to set, get, and delete custom HTML content for the web server error pages of index, 404, 40x, and 50x. You can embed base64 encoded images, such as .svg and .png, or inline .svg images in your content, but the maximum size of the content of each error page is 8 MB.
Note:

- The custom web server error pages that can be set by using the **custom-webserver-page** commands, are the pages that are returned when the URL of a specific portal site isn't used. For example, if your portal site was https://example.com/myorg/dev, but you went to https://example.com/myorg/deb, then this is when a custom 404 error page is returned. However, if the requested URL matches a portal site, then the web server will use the Drupal error handlers, and will respond according to the Drupal configuration.
- All custom content that you set must conform to the HTML5 specification. If you try to set custom content that doesn't conform to HTML5, it will fail with the following error message:

  ```
  Error: The supplied custom HTML failed validation.
  ```

- Setting and deleting custom web server pages can take several minutes to complete, depending on the size of the content.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Set a custom HTML web server error page on the Developer Portal. The maximum size of the page is 8 MB, and you must ensure that the content conforms to the HTML5 specification, or the **custom-webserver-page:set** command will fail with a validation error.

   ```
   apic --mode portaladmin custom-webserver-page:set --server management_server --portal_service_name portal --page_type
   page_type filename.html
   ```

   - *management_server* is the endpoint URL of the management server (required).
   - *portal* is the name of the portal service (required).
   - *page_type* is the type of web server error page that you want to run the command against (required). Valid values are `index`, `404`, `40x`, or `50x`.
   - *filename* is the name of the HTML file that contains the content for the custom web server error page.

   For example, the following screen capture shows a standard 404 web server response:

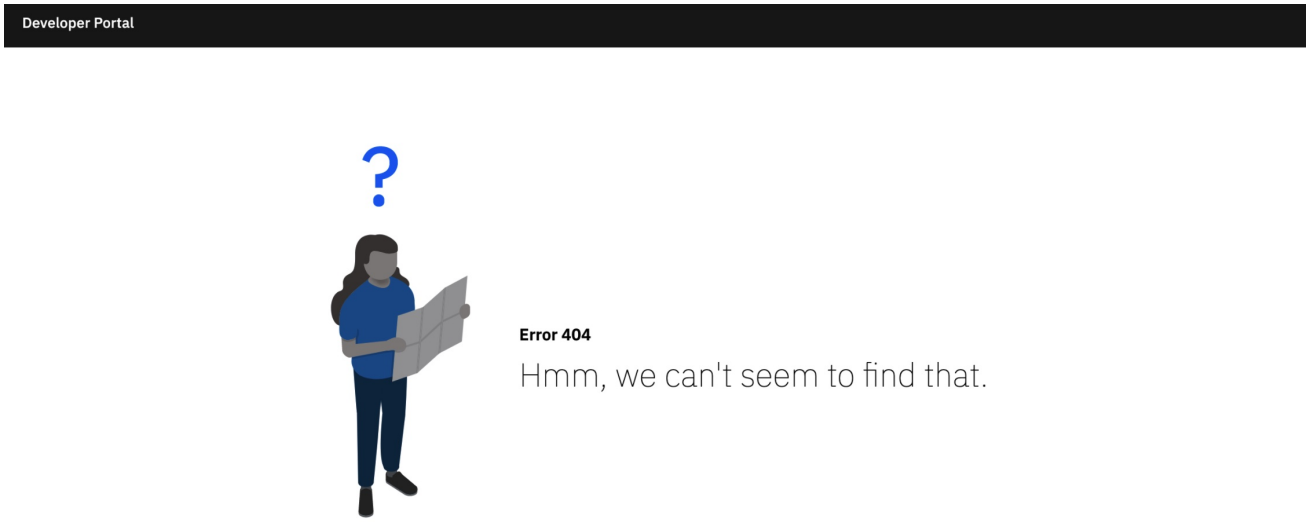
404 Not Found

Then the following **custom-webserver-page:set** command is run:

```
apic --mode portaladmin custom-webserver-page:set --server my.management.server.com --portal_service_name portal --
page_type 404 custom-404.html
Loading File (Large files may take a while)...

Successfully added the custom HTML content for page type 404.
```

The following custom 404 error page is now displayed:



3. Get the custom content of a specific page type and save it to a file named <page_type>-timestamp.html.

   ```
   apic --mode portaladmin custom-webserver-page:get --server management_server --portal_service_name portal --page_type
   page_type
   ```

   For example:

   ```
   apic --mode portaladmin custom-webserver-page:get --server my.management.server.com --portal_service_name portal --
   page_type 404
   Incoming project saved to 404-20211027121830.html
   ```

   If there is no custom content available for the page type, the following error is displayed:

   ```
   apic --mode portaladmin custom-webserver-page:get --server my.management.server.com --portal_service_name portal --
   page_type 50x
   Error: There is currently no custom HTML content for page type 50x.
   ```

4. Delete the custom content of a specific page type. If there is no custom content available for a page type, the error response defaults to the standard web server error page.

   ```
   apic --mode portaladmin custom-webserver-page:delete --server management_server --portal_service_name portal --page_type
   page_type
   ```

   For example:

   ```
   apic --mode portaladmin custom-webserver-page:delete --server my.management.server.com --portal_service_name portal --
   page_type 404
   The custom HTML content for page type 404 has been deleted.
   ```

Using the drupal-config commands

You can use the **drupal-config** commands to list, get the values of, set values, create new, and delete the Drupal configuration objects on your Developer Portal service.

For example, you can use the **drupal-config** commands to disable CSS and JS aggregation to help with twig debug, see Example.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
   ```

```
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
For full details of the **apic login** command, see Logging in to a management server.

2. List all of the available Drupal config for a site.

```
apic --mode portaladmin drupal-config:list --server management_server --catalog catalogid/name --org orgid/name --format
format_type
```

- ***management_server*** is the endpoint URL of the management server (required).
- ***catalogid/name*** is the ID or name of the catalog that the site belongs to (required).
- ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to (required).
- ***format_type*** is the output format. Can be **json**, **yaml**, **go-template=...**, **go-template-file=...**. Defaults to **yaml**.

For example:

```
apic --mode portaladmin drupal-config:list --server my.management.server.com --org ibm --catalog portal-test --format yaml
admin_toolbar_tools.settings:
  name: admin_toolbar_tools.settings
adminimal_admin_toolbar.settings:
  name: adminimal_admin_toolbar.settings
advagg.settings:
  name: advagg.settings
advagg_css_minify.settings:
  name: advagg_css_minify.settings
advagg_js_minify.settings:
  name: advagg_js_minify.settings
autologout.settings:
  name: autologout.settings
...
```

Note that the example has been reduced as the full response is very large.

3. List a specific Drupal config for a site.

```
apic --mode portaladmin drupal-config:list --server management_server --catalog catalogid/name --org orgid/name --prefix
config_prefix --format format_type
```

- ***config_prefix*** is the prefix of the Drupal config, for example **system**. If omitted, the command returns all config names in the system.

For example:

```
apic --mode portaladmin drupal-config:list --server my.management.server.com --org ibm --catalog portal-test --format yaml
--prefix system.theme
system.theme:
  name: system.theme
system.theme.global:
  name: system.theme.global
```

4. Update a Drupal config key value.

```
apic --mode portaladmin drupal-config:set -server management_server --catalog catalogid/name --org orgid/name  --
config_name config_name --config_key config_key --config_value config_value
```

- ***config_name*** is the name of the Drupal config object, for example **system.site** (required).
- ***config_key*** is the Drupal config key, for example **page.front** (required).
- ***config_value*** is the value to assign to the config key (required).

For example, to set the default theme to **claro**:

```
apic --mode portaladmin drupal-config:set --server my.management.server.com --org ibm --catalog portal-test --config_name
system.theme --config_key default --config_value claro
// Do you want to update default key in system.theme config?: yes.
```

5. Create a new Drupal config key and set the value.

```
apic --mode portaladmin drupal-config:set -server management_server --catalog catalogid/name --org orgid/name  --
config_name config_name --config_key new_config_key --config_value new_config_value
```

For example, to create a new config key and set the value in the **system.site** config object:

```
apic --mode portaladmin drupal-config:set --server my.management.server.com --org ibm --catalog portal-test --config_name
system.site --config_key new_key --config_value new_value
// new_key key does not exist in system.site config. Do you want to create a new config key?: yes.
```

6. Get all of the key values for a Drupal config object.

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name  --format
format_type --config_name config_name
```

For example, to find out what themes are available:

```
apic --mode portaladmin drupal-config:get --server my.management.server.com --org ibm --catalog portal-test --format json
--config_name system.theme
{
    "admin": "seven",
    "default": "claro",
    "_core": {
        "default_config_hash": "fOjer9hADYYnbCJVZMFZIIM1azTFWyg84ZkFDHfAbUg"
    },
    "defaultplus": "bartisk"
}
```

7. Get the value of a specific key for a Drupal config object.

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name  --format
format_type --config_name config_name --config_key config_key
```

   For example, to find out what the default theme is:

```
apic --mode portaladmin drupal-config:get --server my.management.server.com --org ibm --catalog portal-test --format json
--config_name system.theme --config_key default
{
    "system.theme:default": "claro"
}
```

8. Delete a Drupal config object, or a specific config key and its value.

```
apic --mode portaladmin drupal-config:delete --server management_server --catalog catalogid/name --org orgid/name  --
config_name config_name --config_key config_key
```

   - *config_key* is the Drupal config key, for example `page.front` (optional).

   For example, to delete the config key `new_key` and its value:

```
apic --mode portaladmin drupal-config:delete --server my.management.server.com --org ibm --catalog portal-test --
config_name system.site --config_key new_key
The config object/value was successfully deleted.
```

Example

The following scenario gives an example of how to turn off CSS and JS aggregation to help with twig debug. However, on a production system aggregation should be enabled for performance reasons.

1. Check the settings for performance, which include settings for CSS and JS aggregation:

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name --
config_name system.performance
```

2. Turn off CSS aggregation:

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --
config_name system.performance --config_key css.preprocess --config_value 0
```

3. Turn off JS aggregation:

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --
config_name system.performance --config_key js.preprocess --config_value 0
```

4. Then, rebuild the cache:

```
apic --mode portaladmin site:cache-rebuild  --server management_server --catalog catalogid/name --org orgid/name
```

When loading the site in a browser, you should now see CSS and JS aggregation is disabled when using development tools for site debug or customization.
Note:

- Disabling aggregation affects site performance, so if the site goes into production remember to turn aggregation back on again.
- Although the settings are shown as `true` or `false`, to set them by using the `drupal-config:set` command, you must apply a value of `1` for `true`, and `0` for `false`.

Using the drupal-state commands

You can use the **drupal-state** commands to store and retrieve information about the state of your Developer Portal system.

Information about the state of your Developer Portal system is stored in the Developer Portal database, and therefore this information is lost if the database is dropped, or the Developer Portal site is re-installed from configuration.

The **drupal-state** commands can be used to set, update, get, or delete a state key value. For example, you can use the **drupal-state** commands to enable and disable maintenance mode for your Developer Portal; for more information, see the scenario How to enable and disable maintenance mode on your Developer Portal.

Warning: Use the **drupal-state** command with caution. This command enables you to modify keys for your Developer Portal site state. Incorrect usage of this command can bring down your Developer Portal, and then require restoring it from a backup.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

   For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Create a new Drupal state key, or update an existing key, and set the value.

```
apic --mode portaladmin drupal-state:set -server management_server --catalog catalogid/name --org orgid/name  --
input_format input_format_type --state_key state_key_name --state_value state_value
```

Where:
- *`management_server`* is the endpoint URL of the management server (required).
- *`catalogid/name`* is the ID or name of the catalog that the site belongs to (required).
- *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
- *`input_format_type`* is the input format of the value for the state key. Can be `string`, `integer`, `float`, `boolean`, `json`, or `yaml`. Defaults to `auto`, which means that you can omit this parameter, and the toolkit CLI will decide which format to use.
- *`state_key_name`* is the name of the state key, for example `system.cron_last` (required).
- *`state_value`* is the value to assign to the state key (required).
- `--format` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

For example, to create a new key called `testKey`, and set the value to `123`:

```
apic --mode portaladmin drupal-state:set -s my.management.server.com -o myorg -c dev-catalog --input_format yaml --
state_key testKey --state_value 123
Successfully set state testKey to the value of 123
```

3. Get the value for a particular Drupal state key.

```
apic --mode portaladmin drupal-state:get --server management_server --catalog catalogid/name --org orgid/name  --format
format_type --state_key state_key_name
```

For example, to get the value of the state key `testKey`:

```
apic --mode portaladmin drupal-state:get -s my.management.server.com -c dev-catalog -o myorg --format yaml --state_key
testKey
testKey: 123
```

4. Delete a specific Drupal state key and its value.

```
apic --mode portaladmin drupal-state:delete --server management_server --catalog catalogid/name --org orgid/name --
state_key state_key_name
```

For example, to delete the state key `testKey` and its value:

```
apic --mode portaladmin drupal-state:delete -s my.management.server.com -c dev-catalog -o myorg --state_key testKey
The key/value was successfully deleted.
```

Related tasks

- Toggling the site in and out of maintenance mode

Using the entity commands

You can use the **entity** commands to get the entity count on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Get the entity count for a site.
For example,

```
apic --mode portaladmin entity:count --org orgid/name --server management_server --catalog name/id
```

Using the export-entity commands

You can use the **export-entity** commands to manage the export of content entities from your Developer Portal site.

About

The Developer Portal is based on the Drupal content management system. In Drupal, a content entity is an item of content data that is intended to be displayed to site users, such as text, images, and HTML markup. Content entities are grouped into entity types, and most of these entity types are also subdivided into entity subtypes, also known as bundles. The **export-entity** commands enable you to create a predefined list, called an export entity, of all of the content entities that you want to export. You can create multiple export entities, each one containing its own set of assorted entity types. Export entities persist, so you can add content and remove content as required.

If you want to export only one type of content entity, or all of the content entity types, at a time, you can use the **content** commands; see Using the content commands for more information. You also use these commands when you want to import your entity content.

Procedure

1. Log in as Provider org as seen in the following example.

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Create an export entity by using the following `export-entity:create` command. This command creates a container for the entity content that you want to export.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:create --
   export_entity_name "export_entity_name"
   ```

   Where:
   - *management_server* is the endpoint URL of the management server (required).
   - *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
   - *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
   - *export_entity_name* is the name of the export entity that you want to create. Note that this name is not a unique identifier.

   The command returns an ID for the newly created export entity. For example:

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:create --
   export_entity_name "Main Content"
   [notice] Created new export entity Main Content, id 5
   ```

   Make a separate note of the ID number that is returned, as you will need this ID for future commands.
3. List all of the export entities that are available for your site by using the following `export-entity:list` command.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:list
   ```

   The command returns a list of the available export entities, including their ID, and the date and time that they were created. For example:

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:list
   -
     id: '5'
     name: 'Main Content'
     created_time: '2023-09-12 15:05:04'
   ```

4. Add content to an export entity by using the following `export-entity:add-content` command.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:add-content --
   export_entity_id export_entity_id --entity_type entity_type_name --entity_ids entity_ids
   ```

   Where:
   - *export_entity_id* is the ID of the export entity (required).
   - *entity_type_name* is the type of content entity that you want to add to the export entity (required). You can use the `content:list-types` command to find out the type of content entities that are exportable from your site; see Using the content commands.

- ***entity_ids*** is a comma separated list of the entity IDs that you want to add to the export entity (optional). If you want to add all of the content entities for a particular entity type, you don't need to set any entity IDs.

The following example shows three different types of entity content being added to the export entity **5**:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type node --entity_ids 1,2
[notice] Successfully added entity type node - "1, 2" to export entity 5

apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type block_content --entity_ids 1,2
[notice] Successfully added entity type block_content - "1, 2" to export entity 5

apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type shortcut --entity_ids 1
[notice] Successfully added entity type shortcut - "1" to export entity 5
```

5. Delete content from an export entity by using the following **export-entity:remove-content** command.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:remove-content
--export_entity_id export_entity_id --entity_type entity_type_name --entity_ids entity_ids
```

Where:

- ***export_entity_id*** is the ID of the export entity (required).
- ***entity_type_name*** is the type of content entity that you want to remove (required).
- ***entity_ids*** is a comma separated list of the entity IDs that you want to remove (optional). If you want to remove all of the content entities for a particular entity type, you don't need to set any entity IDs.

For example, to remove entity ID **1** of the content entity type **shortcut** from the export entity **5**, you can run the following command:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:remove-content --
export_entity_id 5 --entity_type shortcut --entity_ids 1
[notice] Successfully removed entity type shortcut - "1" from export entity 5
```

6. View the content details of an export entity by using the following **export-entity:get** command. This command returns a list of all of the content entities in a specific export entity ID, and is the entity content that will be exported if the **export-entity:launch** command is run on that ID.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get --
export_entity_id export_entity_id
```

In the following example, export entity **5** contains four different content entities:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:get --
export_entity_id 5
- bundle: basic
  id: "1"
  title: No Apps Found [en]
  type: block_content
- bundle: page
  id: "1"
  title: Terms of use
  type: node
- bundle: basic
  id: "2"
  title: No Apis Found [en]
  type: block_content
- bundle: page
  id: "2"
  title: Privacy Policy
  type: node
```

7. Export your content entities by running the following **export-entity:launch** command. This command launches an export entity polling task that creates a .tgz file of all of the entities that are contained in a specific export entity. By default, the command polls the status of the task every 30 seconds until the task is finished, at which point the export file is returned. If the command is run with the **--no-poll** option, the task doesn't return a .tgz file, but just returns the task ID.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:launch --
export_entity_id export_entity_id
```

Where:

- **--no-poll** is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the **export-entity:get-export** command to return the export file.

Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the commands **export-entity:get_export_status** and **export-entity:get-export** to get the status and, if the task has finished, an artifact.
The **export-entity:launch** command can be run multiple times, and the content of the export entity updated as required by using the **export-entity:add-content** and **export-entity:remove-content** commands.

The following example exports the contents of export entity **5**:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:launch --
export_entity_id 5
201 CREATED - TASK ID: saleo5261k5a2y

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
```

```
Incoming project saved to export_entity_launchExport-20230912165
```

The command saves the export to your running directory. The export .tgz file includes a root.json file that contains an index of all of the entities that are contained in the .tgz file, as well as a *content_entity_type*.json file for each content entity type exported. The *content_entity_type*.json file contains all of the information needed to be able to import those entities into a different Developer Portal site.

8. If you ran the **export-entity:launch** command with the **--no-poll** option, you can use the following commands to manage your entity export.
   - **export-entity:delete-launch-export**
     Cancels any currently running **export-entity:launch** tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:delete-launch-export --task_id task_id
     ```

     Where ***task_id*** is the ID of the export task on the queue.
   - **export-entity:get-launch-export**
     Streams the content of a specific completed **export-entity:launch** task to a .tgz file. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get-launch-export --task_id task_id
     ```

   - **export-entity:get-launch-export-status**
     Returns the status of a specific **export-entity:launch** task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get-launch-export-status --task_id task_id
     ```

What to do next

You can import your export entity archive files by using the **content** commands; see Using the content commands for more information.

Related reference

- Using the content commands

Using the factory-reset command

You can use the **factory-reset** command to perform a factory reset of your Developer Portal, which will delete the portal service and all of its associated Developer Portal sites.

Warning: The **factory-reset** command is irreversible. You must ensure that you have backups created before running this command.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
   ```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.
   For full details of the **apic login** command, see Logging in to a management server.

2. Output a dry run status of a Developer Portal factory reset:

   ```
   apic --mode portaladmin factory-reset:delete --server management_server --portal_service_endpoint portal_endpoint
   ```

   - ***management_server*** is the endpoint URL of the management server.
   - ***portal_endpoint*** is the URL endpoint of the portal service.

   For example:

   ```
   apic --mode portaladmin factory-reset:delete --server api.stagingexample.com --portal_service_endpoint https://api.portal.mystack.com
   ```

3. Perform a factory reset of the Developer Portal, deleting the portal service and all of its associated Developer Portal sites:
   Warning: The **factory-reset** command is irreversible. You must ensure that you have backups created before running this command.

   ```
   apic --mode portaladmin factory-reset:delete --server management_server --portal_service_endpoint portal_endpoint --execute_reset true
   ```

   - **--execute_reset** must be set to **true** to trigger the Developer Portal reset.

   For example:

```
apic --mode portaladmin factory-reset:delete --server api.stagingexample.com --portal_service_endpoint
https://api.portal.mystack.com  --execute_reset true
```

Using the forums commands

You can use the **forums** commands to disable or enable the forums on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Disable the Forum module on your Developer Portal site.
   This command deletes all of the taxonomy terms in the forum vocabulary, and then disables the Forum module.

   ```
   apic --mode portaladmin forums:disable --org orgid/name --server management_server --catalog name/id
   ```

   - *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
   - *management_server* is the endpoint URL of the management server (required).
   - *name/id* is the ID or name of the catalog that the site belongs to (required).

   For example,

   ```
   apic --mode portaladmin forums:disable --org ibm --server api.stagingexample.com --catalog dev
   ```

3. Enable the Forum module on your Developer Portal site.

   ```
   apic --mode portaladmin forums:enable --org orgid/name --server management_server --catalog name/id
   ```

   For example,

   ```
   apic --mode portaladmin forums:enable --org ibm --server api.stagingexample.com --catalog dev
   ```

Using the ip-security-enabled command

You can use the **ip-security-enabled** commands to toggle IP security on your Developer Portal. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. Banned IP addresses can be cleared by using the `security:clear-bans` command. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. Note that IP security is enabled by default on the Developer Portal.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Enable IP security on the Developer Portal:

```
apic --mode portaladmin ip-security-enabled:update --server management_server --portal_service_name portal --enabled true
```

- *management_server* is the endpoint URL of the management server.
- *portal* is the name of the portal service.
- **--enabled** is set to **true** to enable IP security. Can be set to **false** to disable IP security.

For example:

```
apic --mode portaladmin ip-security-enabled:update --server my.management.server.com --portal_service_name
my_portal_service --enabled true
IP security has been successfully set to true
```

3. Disable IP security on the Developer Portal:

```
apic --mode portaladmin ip-security-enabled:update --server management_server --portal_service_name portal --enabled false
```

Using the maintenance commands

You can use the **maintenance** commands to manage the maintenance operations on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
For full details of the **apic login** command, see Logging in to a management server.

For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get the current mode of your maintenance operations.

```
apic --mode portaladmin --server management_server maintenance:status --org orgid/name --catalog catalogid/name
```

- *mode* is the toolkit operation mode.
- *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
- *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
- *management_server* is the endpoint URL of the management server (required).

For example,

```
apic --mode portaladmin --server api.stagingexample.com maintenance:status --org ibm --catalog api-connect-catalog-1
```

3. Enable the maintenance mode to make the Developer Portal site inaccessible to everyone apart from an administrator. All other users who enter the site URL will see a maintenance message set by the administrator.

```
apic --mode portaladmin --server management_server maintenance:enable --org orgid/name --catalog catalogid/name
```

4. Disable the maintenance mode to make the Developer Portal site accessible to everyone.

```
apic --mode portaladmin --server management_server maintenance:disable --org orgid/name --catalog catalogid/name
```

5. Rebuild the node access table to prevent users from accessing the nodes to which they do not have access permissions.

```
apic --mode portaladmin --server management_server maintenance:rebuild-node-access --org orgid/name --catalog
catalogid/name
```

6. Rebuild and reindex the search API index to increase the performance and storage space usage.

```
apic --mode portaladmin --server management_server maintenance:search-api-index-rebuild --org orgid/name --catalog
catalogid/name
```

7. Print the search API index status.

```
apic --mode portaladmin --server management_server maintenance:search-api-index-status --org orgid/name --catalog
catalogid/name
```

Using the memcache commands

You can use the **memcache** commands to get, enable, and disable the default caching store operations on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get the status of all the `memcache enabled` operations.

   ```
   apic --mode portaladmin --server management_server memcache:get --org orgid/name --catalog catalogid/name
   ```

   - *mode* is the toolkit operation mode.
   - *management_server* is the endpoint URL of the management server (required).
   - *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
   - *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).

   For example,

   ```
   apic --mode portaladmin --server api.stagingexample.com memcache:get --org ibm --catalog api-connect-catalog-1
   ```

3. Enable the default caching store operations. This will set Drupal to use the RAM as cache.

   ```
   apic --mode portaladmin --server management_server memcache:enable --org orgid/name --catalog catalogid/name
   ```

4. Disable the default caching store operations. This will set Drupal to use the database as cache.

   ```
   apic --mode portaladmin --server management_server memcache:disable --org orgid/name --catalog catalogid/name
   ```

Using the modules commands

You can use the **modules** commands to list, enable, disable and delete the modules on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. List the modules from a *packagename*.
   For example,

   ```
   apic --mode portaladmin modules:list --org orgid/name --server management_server --catalog name/id --package
   packagename1,packagename2
   ```

3. Enable the *modulename* module. You can upload this module by using the **custom-module:create-import** command. For more information, see Using the custom-module commands.
   For example,

```
apic --mode portaladmin modules:enable --org orgid/name --server management_server --catalog name/id --modules modulename
```

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `--package` enables you to filter by project packages. You can use multiple comma separated values.
- `--status` enables you to filter by extension status. Can be `enabled`, `disabled` and/or `'not installed'`. You can use multiple comma separated values.
- `--custom` enables you to filter your results to only the modules that you have installed on your Developer Portal site.

4. Disable the *modulename* module. If you disable a module, you must also disable all its dependencies.
   For example,

   ```
   apic --mode portaladmin modules:disable --org orgid/name --server management_server --catalog name/id --modules
   modulename,module_lib
   ```

5. Delete the *modulename* module. The module and all its dependencies must be disabled before you can delete them.
   For example,

   ```
   apic --mode portaladmin modules:delete --org orgid/name --server management_server --catalog name/id --modules modulename
   ```

Note that if you want to manage the Forum module, you can use the `forums` commands. For more information, see Using the forums commands.

Using the php-memory commands

You can use the **php-memory** commands to list or update the PHP memory limits on your Developer Portal.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Get the availability zone of the portal service's sites that you want to list:

   ```
   apic availability-zones --org orgid/name --server management_server
   ```

3. List all the portal services in that availability zone:

   ```
   apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
   ```

4. Get the selected portal service's name:

   ```
   apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-
   NAME
   ```

5. List the current PHP memory limits on the Developer Portal platform:

   ```
   apic --mode portaladmin php-memory:list --server management_server --portal_service_name PORTAL-SERVICE-NAME
   ```

   You receive output like this example:

   ```
   Current web memory is set to: 768M
   Current admin memory is set to: 768M
   ```

6. Update the current PHP memory limits on the Developer Portal platform:

   ```
   apic --mode portaladmin php-memory:update --server management_server --portal_service_name PORTAL-SERVICE-NAME --
   memory_value 1024
   ```

   You receive output like this example:

   ```
   Setting php memory limit to 1024M within the database
   Setting php memory limit to 1024M in /var/devportal/storenosync/php.ini
   Setting php memory limit to 1024M in /web/local/php_config/php.ini
   Done
   ```

Note: Consider the memory resource limits that are allocated to your Developer Portal pods before you set this value. Setting this value too high can result in the portal pods restarting because the containers request more memory than is allowed by Kubernetes. Setting the value too low can result in the internal portal processes failing because of lack of available memory.

Using the platforms commands

You can use the **platforms** commands to list the platforms on your Developer Portal service.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Get the availability zone of the portal service's platforms that you want to list:

   ```
   apic availability-zones --org orgid/name --server management_server
   ```

3. List all the portal services in that availability zone

   ```
   apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
   ```

4. Get the selected portal service's name

   ```
   apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
   ```

5. List the platforms of the portal service

   ```
   apic --mode portaladmin platforms:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
   ```

Using the product commands

You can use the **product** commands to get and list the products on your Developer Portal service.

1. Log in as Provider org as seen in the following example.

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get a list of products from a site.

   For example,

   ```
   apic --mode portaladmin product:list --org orgid/name --server management_server --catalog catalogid/name
   ```

   - `management_server` is the endpoint URL of the management server (required).
   - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
   - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
   - `format_type` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

3. Get a product from a site by using the *id* or *name:version*.

   For example,

   ```
   apic --mode portaladmin product:get --org orgid/name --server management_server --catalog catalogid/name id/name:version
   ```

   - *id/name:version* - The ID or name:version of a specific product (required). For example, `id-of-product-called-example-3` or `example:3.0.0`.
4. Get a specific entire product document from the portal of the provided organization and catalog by using the *id* or *name:version*.

   ```
   apic --mode portaladmin product:get-document --org orgid/name --server management_server --catalog catalogid/name --format
   format_type  id/name:version
   ```

   For example,

   ```
   apic --mode portaladmin product:get-document --org ibm --server my.management.server.com --catalog portal-test --format
   yaml  intuiz-product:1.0.0
   ```

5. Add an attachment for your product within your Developer Portal.

   For example,

   ```
   apic --mode portaladmin product:add-attachment -s management_server --org orgid/name --catalog catalogid/name --
   attachment_name attachment.txt --attachment_description "Product documentation" awesome-sleek-soft-chips-product:1.0.0
   ./attachment.txt
   Loading File (Large files may take a while)...

   Attachment successfully added to product awesome-sleek-soft-chips-product:1.0.0.
     This product now has 2 attachments.
   ```

   - *attachment_name* is the name given to the attachment when it is uploaded (required).
   - *attachment_description* is the description of the attachment that is displayed to the users.
6. Set an icon for your product within your Developer Portal.
   For example,

   ```
   apic --mode portaladmin product:set-icon -s management_server --org orgid/name --catalog catalogid/name --icon_description
   "product icon" awesome-sleek-soft-chips-product:1.0.0 ./icon.png
   Loading File (Large files may take a while)...

   Icon successfully set for product awesome-sleek-soft-chips-product:1.0.0
   ```

   - *icon_description* is the icon description to be displayed to users and it is used as an alt text for the image (required).
7. Add a tag (Category) for your product within your Developer Portal.
   For example,

   ```
   apic --mode portaladmin product:add-tag -s management_server--org orgid/name --catalog catalogid/name --tag_name
   top_level_element/next_level_element/lower_level_element awesome-sleek-soft-chips-product:1.0.0
   Successfully set taxonomy tag top_level_element/next_level_element/lower_level_element
     for product api-connect-cassin-llc-awesome-sleek-soft-chips-product:1.0.0
   ```

   - *tag_name* is the tag name. For example, *top_level_element/next_level_element* (required).

Using the queue commands

You can use the **queue** commands to list the queued and locked platform tasks on your Developer Portal site.

1. List the queued and locked platform tasks for a specific Developer Portal site, including Developer Portal creates, restores, upgrades, snapshots, and cron jobs. An empty response means that there are currently no queued tasks for this Developer Portal.
   a. Log in as Provider org as seen in the following example.

      ```
      apic login --server management_server --realm provider/identity_provider --username provider_username --password
      provider_password
      ```

      You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

      ```
      apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
      ```

      For example,

      ```
      apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
      total_results: 2
      results:
        - title: API Manager User Registry
          realm: provider/default-idp-2
        - title: Corporate LDAP user registry
          realm: provider/corporate-ldap
      ```

      The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
      For full details of the `apic login` command, see Logging in to a management server.

      For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

   b. Run the following **queue:get** command:

      ```
      apic --mode portaladmin queue:get --server management_server  --org orgid/name --catalog catalogid/name
      ```

      - *management_server* is the endpoint URL of the management server (required).

- ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to (required).
- ***catalogid/name*** is the ID or name of the catalog that the site belongs to (required).

2. List the queued and locked platform related tasks for all of the Developer Portal sites on a specific portal service, including Developer Portal creates, restores, upgrades, snapshots, and cron jobs. An empty response means that there are currently no queued tasks.
   a. Log in as Cloud manager:

      ```
      apic login --server management_server --realm admin/identity_provider --username cloud_username --password
      cloud_password
      ```

      You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

      ```
      apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
      ```

      For example:

      ```
      apic identity-providers:list --scope admin --server myserver.com --fields title,realm
      total_results: 2
      results:
        - title: Cloud Manager User Registry
          realm: admin/default-idp-1
        - title: Corporate LDAP user registry
          realm: admin/corporate-ldap
      ```

      The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.
   b. Run the following **queue:list** command:

      ```
      apic --mode portaladmin queue:list --server management_server  --portal_service_name  portal_service_name
      ```

      - ***portal_service_name*** is the name of the portal service (required).

Related information

- Toolkit CLI reference documentation

Using the role commands

You can use the **role** commands to complete the full lifecycle of Drupal user roles. This includes creating and deleting of roles, as well as adding and removing permissions to the roles in your Developer Portal service.

1. Log in as Provider org as seen in the following example.

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
   For full details of the **apic login** command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get the details of a specific Drupal user role and all of the permissions granted to the role.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:get role
   ```

   - ***mode*** is the toolkit operation mode.
   - ***management_server*** is the endpoint URL of the management server (required).
   - ***catalogid/name*** is the ID or name of the catalog that the site belongs to (required).
   - ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to (required).
   - ***role*** is the name or label of the Drupal user role (required).

   For example,

   ```
   apic --mode portaladmin -server management-platform-api --org ibm --catalog api-connect-catalog-1 role:get portal_cli_blog
   portal_cli_blog:
   label: 'Portal CLI Blog'
   perms:
   ```

```
  - 'access content'
  - 'access shortcuts'
```

The command returns the Drupal user role under the `portal_cli_blog` label as well as the permissions granted to the role.

3. List all of the Drupal user roles.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:list
```

List the Drupal user roles based on user permissions assigned to the role.

For example,

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:list --
filter_by_permission=role_permission
```

- `--filter_by_permission` flag is used to filter the list based on specific permission (optional).
- `role_permission` is the permissions granted to a specific role.

List the Drupal user roles based on a specific role.
For example,

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:list --role=role
```

- `--role` flag is used to filter the list based on specific role (optional).

4. Create a new Drupal user role.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:create --machine_name
machine_name --human_readable_name human_readable_name
```

Note: The command must include a *machine_name* and a *human_readable_name*.
- The *machine_name* is used by Drupal to refer to the role and must contain only lowercase letters, numbers, and underscores.
- The *human_readable_name* is displayed on the UI and can contain other characters such as spaces.

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:create --
machine_name "portal_cli_blog" --human_readable_name "Portal CLI Blog"
```

5. Delete an unwanted Drupal user role.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:delete role
```

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:delete
portal_cli_blog
```

If you try to delete a role that does not exist, you will get an error indicating that the specific user role doses not exist.
For example,

```
  - [error]  Unable to load the user_role: no_role
```

6. Add permissions to a Drupal user role using the `permissions` flag. You can add multiple permissions to a role using a comma separated list within a single command call.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:add-permission role --
permissions=role_permissions
```

- `role_permissions` is the permissions granted to a specific role (required).

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm  --catalog api-connect-catalog-1 role:add-permission
portal_cli_blog --permissions="access comments,access content,access shortcuts"
```

If you try to add permissions to a role that does not exist, you will get an error indicating that the permission is fake.
For example,

```
- [error]  Permission(s) not found: fake permission
```

7. Remove unwanted permissions from a Drupal user role using the `permissions` flag. You can delete multiple permissions from a role using a comma separated list within a single command call.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:remove-permission role -
-permissions=role_permissions
```

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:remove-permission
portal_cli_blog --permissions="access comments"
```

If you try to remove permissions from a role that does not exist, you will get an error indicating that the permission does not exist.
For example,

```
 - [error]  Permission(s) not found: perm not on role
```

Using the security command

You can use the **security** command to clear all of the banned user/IP addresses on a Developer Portal site.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Clear all of the user and IP addresses that are currently banned on a particular portal site:

```
apic --mode portaladmin security:clear-bans --server management_server --catalog catalogid/name --org orgid/name
```

- *management_server* is the endpoint URL of the management server.
- *catalogid/name* is the ID or name of the catalog that the site belongs to.
- *orgid/name* is the ID or name of the provider organization that the catalog belongs to.

For example:

```
apic --mode portaladmin security:clear-bans --server my.management.server.com --catalog portal-test --org ibm
[notice] All bans cleared.
```

Note: You can also manage banned IP addresses by using the Developer Portal UI. For more information, see Managing banned IP addresses.

Using the service command

You can use the **service** command to list the Developer Portal service from the Developer Portal database.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
For full details of the `apic login` command, see Logging in to a management server.

For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get the availability zone of the portal service's sites that you want to list.

```
apic availability-zones --org orgid/name --server management_server
```

- `apic service:list` - List the Portal service currently installed.
- `-s, --server` *mgmt_endpoint_url*. Use the value of the platform API endpoint URL for this entry.
- `--org` *orgid*
- `--catalog` *catalog id*.
- `--debug`. If you need debug information.

3. List the installed Developer Portal service.

```
apic --mode portaladmin service:list -s management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

Using the service-ip-allowlist commands

You can use the **service-ip-allowlist** commands to add, remove, and list the IP addresses on your Developer Portal `allowlist`. IP addresses that are on the `allowlist` are exempt from being blocked by Developer Portal security checks, for example, load balancer and proxy IPs.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Add one or more IP addresses to the `allowlist`:

   ```
   apic --mode portaladmin service-ip-allowlist:add --server management_server --portal_service_name portal --ips
   "list_of_ips"
   ```

   - *management_server* is the endpoint URL of the management server.
   - *portal* is the name of the portal service.
   - *list_of_ips* is a comma separated list of the IP addresses that you want to add to the `allowlist`.

   For example:

   ```
   apic --mode portaladmin service-ip-allowlist:add --server my.management.server.com --portal_service_name my_portal_service
   --ips "123.456.34.56,123.456.46.67"
   Successfully added IP: 123.456.34.56.
   Successfully added IP: 123.456.46.67.
   ```

3. Delete all of the IP addresses that are currently on the `allowlist`:

   ```
   apic --mode portaladmin service-ip-allowlist:delete --server management_server --portal_service_name portal
   ```

4. List all of the IP addresses that are currently on the `allowlist`:

   ```
   apic --mode portaladmin service-ip-allowlist:list --server management_server --portal_service_name portal
   ```

5. Remove one or more IP addresses from the `allowlist`:

   ```
   apic --mode portaladmin service-ip-allowlist:remove --server management_server --portal_service_name portal --ips
   "list_of_ips"
   ```

Using the site commands

You can use the **site** commands to check the site on your Developer Portal service, and to export and import an entire site configuration.

About

You can use the **site** commands to check the health of a portal site, rebuild the cache of a site, and display the login link for an admin account of a site. You can also use them to export the configuration settings for an entire Developer Portal site, and import those settings into another site. For example, you could use the export and import commands to replicate the configuration of a test site into a production site.
Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the **apic login** command, see Logging in to a management server.

For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Check the site on your portal service. This command checks the file system, database, and API Manager on your portal site, which might identify platform-related problems on your portal site.

```
apic --mode portaladmin site:check  --server management_server --catalog catalogid/name --org orgid/name --format
format_type
```

   - ***management_server*** is the endpoint URL of the management server (required).
   - ***catalogid/name*** is the ID or name of the catalog that the site belongs to (required).
   - ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to (required).
   - ***format_type*** is the output format. Can be **json**, **yaml**, **go-template=...**, **go-template-file=...**. Defaults to **yaml**.
3. Rebuild the cache of a specific portal site.

```
apic --mode portaladmin site:cache-rebuild  --server management_server --catalog catalogid/name --org orgid/name
```

   For example:

```
apic --mode portaladmin site:cache-rebuild --server management_server --org ibm --catalog portal-test
[success] Cache rebuild complete.
```

4. Display the state of a portal site associated with a particular organization and catalog. This command is useful as a general health check of the site.

```
apic --mode portaladmin site:state --server management_server --catalog catalogid/name --org orgid/name --format
format_type
```

```
apic --mode portaladmin site:state --server my.management.server.com --org ibm --catalog portal-test --format json
{
    "alias": "ibm.portal-test.my.management.server.com",
    "check_state": "OK: 200",
    "content_refresh_required": false,
    "known_to_apim": 1,
    "platform": "platform_devportal_9_x_10_99_99_99_20210922_2000",
    "snapshot_first_requested": "0000-00-00 00:00:00",
    "snapshots_failed_processing_since_last_success": 0,
    "snapshots_requested_since_last_received": 0,
    "state": "INSTALLED",
    "subscribed_to_webhooks": true,
    "url": "my.management.server.com/ibm/portal-test",
    "uuid": "cc0ad766-e372-4988-9d45-744eb8d381de.1cd9dc41-b08d-xyz"
}
```

5. Log in to your Developer Portal admin with a link. This command displays a one time login link for the admin account for your Developer Portal site that is specified by the catalog and organization.

```
 apic --mode portaladmin site:login-link  --server management_server --org ibm --catalog portal-test
sample output:
https://my.portal.server.com/ibm/portal-test/user/reset/1/12345678901/ABCde1f2gH3ijKL-
4M_NOPqrs5TU6VWxy7ZABCDEFg7h8/new/login
```

6. Export your entire site configuration by using the following **site:create-export** command. This command creates an export task that returns a .tgz file containing the site configuration. By default, the command polls the status of the task every 10 seconds until the task is finished, at which point the export file is returned. Note that exporting all of your site configuration can take a long time to complete.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:create-export
```

   Where:
   - **--no-poll** is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the **site:get-export** command to return the export file.

   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **site:get_export_status** and **site:get-export** to get the status and, if the task has finished, an artifact.
   For example:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog site:create-export
201 CREATED - Task ID: vfg6b8utjtw51

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to site_createExport-20231013154023.tgz
```

   The command saves the export file to your running directory. The export .tgz file includes a site-content.tgz file, and a site-config.tgz file. The export file will also include a site-custom-themes.tgz, or a site-custom-modules.tgz file, or both, depending on whether the site contains any custom themes or custom modules.

7. If you ran the `site:create-export` command with the `--no-poll` option, you can use the following commands to manage your site export.
   - `site:delete-export`
     Cancels any currently running `site:create-export` tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:delete-export --
     task_id task_id
     ```

     Where *`task_id`* is the ID of the export task on the queue.
   - `site:get-export`
     Streams the content of a specific completed export task to a .tgz file. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-export --
     task_id task_id
     ```

   - `site:get-export-status`
     Returns the status of a specific export task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-export-status -
     -task_id task_id
     ```

8. Import your site configuration by using the `site:create-import` command. This command launches an import polling task that polls the status of the task every 10 seconds until the task is finished, at which point a summary of the import is returned. If the command is run with the `--no-poll` option, the task doesn't return the status of the task, but just returns the task ID.
   Important:
   - If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.
   - The `site:create-import` command changes taxonomy term IDs. This can affect configurations that reference specific IDs. Since the IDs are not preserved as part of import or export, it is necessary to review and adjust these configurations after the import to ensure they work correctly.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:create-import
   export_file_name
   ```

   Where:
   - *`export_file_name`* is the name of the export file that you want to import. You can import .tgz files that were created by using the `site:create-export` command.
   - `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `site:get-import-status` command to get the status of the task.

   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command `site:get-import-status` to get the status of the task.
   In the following example, the export file from Step 6 is imported into a production Developer Portal site on a different server:

   ```
   apic --mode portaladmin --server my_management_server2 --org my_prod_org --catalog my_prod_catalog site:create-import
   site_createExport-20231013154023.tgz
   Loading File (Large files may take a while)...

   201 CREATED - Task ID: 1z8e9zthfkhwdxh2

   Response Code - 202:

   Message(s) -
   The status of this task is: QUEUED

   Response Code - 202:

   Message(s) -
   The status of this task is: RUNNING

   Response Code - 202:

   Message(s) -
   The status of this task is: RUNNING

   Response Code - 202:

2023-10-11 10:52:38: CLI task (site:import) completed successfully.
```

The message section provides detailed information about the import as the configuration is being imported.

9. If you ran the `site:create-import` command with the `--no-poll` option, you can use the following commands to manage your content import.
   - `site:delete-import`
     Cancels any currently running `site:create-import` tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:delete-import --task_id task_id
     ```

     Where *`task_id`* is the ID of the import task on the queue.
   - `site:get-import-status`
     Returns the status of a specific import task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-import-status --task_id task_id
     ```

Using the site-config commands

You can use the **site-config** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username cloud_username --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Export your site configs.
The **site-config:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.
Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **site-config:get-export-status** and **site-config:get-export** to get the status and potentially an artifact.

```
apic --mode portaladmin site-config:create-export --catalog name/id --org orgid/name --server management_server
```

   - The site config .tgz is saved to the directory in which you ran the command.
   - The saved .tgz has the format `site_config_createExport-20200217134637.tgz`.
   - You can save your exports into your change control management system.

   For example,

```
apic --mode portaladmin site-config:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your site configs.
The **site-config:create-import** command uses the supplied .tgz file to import the site configs into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.
Note: The higher level folders of the archive can contain only these characters, a-z and 0-9.
Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **site-config:get-import-status** to get the status of the import.

```
apic --mode portaladmin site-config:create-import --catalog name/id --org orgid/name --server management_server
/PATH/TO/SITE_CONFIG/TGZ
```

   For example,

```
apic --mode portaladmin site-config:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/site_config_createExport-20200217134637.tgz
```

4. You can run the delete command to cancel any ongoing or recently created import or export tasks. Any temporarily created artifacts will be deleted from the portal filesystem.
For example,

```
apic --mode portaladmin site-config:delete-export --catalog name/id --org orgid/name --server management_server --format
json --task_id string
```

```
apic --mode portaladmin site-config:delete-import --catalog name/id --org orgid/name --server management_server --format
json --task_id string
```

Using the sites commands

You can use the **sites** commands to check and list the sites on your Developer Portal service. You can also reset the portal upgrade attempt counter.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

   For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Get the availability zone of the portal service's sites that you want to list.

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone.

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name.

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-
NAME
```

5. Check the sites on your portal service. This command checks the file system, database, and API Manager on all your portal sites, which might identify platform-related problems on one or more of your portal sites.

   ```
   apic --mode portaladmin sites:check --server management_server --portal_service_name PORTAL-SERVICE-NAME --format yaml
   ```

6. List the sites of the portal service.

   ```
   apic --mode portaladmin sites:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
   ```

7. Reset the portal upgrade attempts. The following command resets the upgrade attempt counter within the portal, so that failed upgrades can be retried.

   ```
   apic --mode portaladmin sites:reset-upgrade-attempts --server management_server --portal_service_name PORTAL-SERVICE-NAME
   ```

Using the themes commands

You can use the **themes** commands to list, enable, disable, delete, and set the default themes on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. List the themes from a *packagename*.
   For example,

   ```
   apic --mode portaladmin themes:list --org orgid/name --server management_server --catalog catalogid/name --package
   packagename1,packagename2
   ```

   - `management_server` is the endpoint URL of the management server (required).
   - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
   - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
   - `--package` enables you to filter by project packages. You can use multiple comma separated values.
   - `--status` enables you to filter by extension status. Can be `_ enabled`, `disabled` and/or `'not installed'`. You can use multiple comma separated values.
   - `--custom` enables you to filter your results to only the themes that you have installed on your Developer Portal site.

3. Enable the *themename* theme. You can upload this theme by using the **custom-theme:create-import** command. For more information, see Using the custom-theme commands.
   For example,

   ```
   apic --mode portaladmin themes:enable --org orgid/name --server management_server --catalog catalogid/name --themes
   themename
   ```

   - `--themes` is the name of the theme, and can be multiple comma separated values (required).

4. Disable the *themename* theme.
   For example,

   ```
   apic --mode portaladmin themes:disable --org orgid/name --server management_server --catalog catalogid/name --themes
   themename,theme_lib
   ```

5. Delete the *themename* theme. The theme and all its dependencies must be disabled before you can delete them.
   For example,

   ```
   apic --mode portaladmin themes:delete --org orgid/name --server management_server --catalog catalogid/name --themes
   themename
   ```

6. Set the *themename* theme to be the default theme. The theme must exist and be enabled for it to be set as a default theme.
   For example,

   ```
   apic --mode portaladmin themes:set-default --org orgid/name --server management_server --catalog catalogid/name themename
   ```

   - *themename* is the name of the theme to set as default.

Using the twig commands

You can use the **twig** commands to enable, disable, and check the state of twig debugging on a specific site on your Developer Portal service.

Note: Twig debugging should not be left enabled on production sites, as it causes performance issues, and can affect the caching on the site.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Enable twig debugging for a portal site.

   ```
   apic --mode portaladmin twig:debug-enable --server management_server --org orgid/name --catalog catalogid/name
   ```

   - *`management_server`* is the endpoint URL of the management server (required).
   - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
   - *`catalogid/name`* is the ID or name of the catalog that the site belongs to (required).

   For example:

   ```
   apic --mode portaladmin twig:debug-enable --server my.management.server.com --org ibm --catalog portal-test
   Setting twig debug to true for site my.management.server.com/ibm/portal-test.
   Rebuilding cache for my.management.server.com/ibm/portal-test so twig debug changes can take affect.
   ```

3. Disable twig debugging for a portal site.

   ```
   apic --mode portaladmin twig:debug-disable --server management_server --org orgid/name --catalog catalogid/name
   ```

   For example:

   ```
   apic --mode portaladmin twig:debug-disable --server my.management.server.com --org ibm --catalog portal-test
   Setting twig debug to false for site my.management.server.com/ibm/portal-test.
   Rebuilding cache for my.management.server.com/ibm/portal-test so twig debug changes can take affect.
   ```

4. Get the current state of twig debugging for a specific site.

   ```
   apic --mode portaladmin twig:debug-status --server management_server --org orgid/name --catalog catalogid/name
   ```

   For example:

   ```
   apic --mode portaladmin twig:debug-status --server my.management.server.com --org ibm --catalog portal-test
   The current state of twig debugging is true for my.management.server.com/ibm/portal-test.
   ```

Using the user commands

You can use the **user** commands to complete some Drupal user management tasks on your Developer Portal, such as adding and removing roles, blocking and unblocking users, and retrieving user information.

About

In the Developer Portal, user management tasks can be completed by using the Developer Portal UI (see People), or by using the toolkit CLI as described in the following instructions. You can use these toolkit CLI commands to help you facilitate the user management process. For example, you could integrate these commands into your CI/CD processes, to find out information about inactive users that need to be notified of account deletion.

Procedure

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
   ```

   For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
For full details of the **apic login** command, see Logging in to a management server.

2. Retrieve information about your Developer Portal users by using the **user:information** command. Due to the large number of users that might exist in your Developer Portal site, this command includes a default pagination limit of 50 users, with an offset of 0, but these defaults can be changed by using the optional flags. You can also use the optional flags to filter what user information is returned.

```
apic --mode portaladmin user:information --server management_server --org orgid/name --catalog catalogid/name
```

Where:
- ***management_server*** is the endpoint URL of the management server (required).
- ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to (required).
- ***catalogid/name*** is the ID or name of the catalog that the site belongs to (required).

For example:

```
apic --mode portaladmin user:information --server my.management.server.com --org ibm --catalog portal-test
total: 2
offset: 0
limit: 2
users:
  - uid: '9'
    name: 'portal1'
    mail: 'corg-email+1@ibm.com'
    roles:
      - 'authenticated'
    status: 'active'
    apic_state: 'enabled'
    last_login: '01/11/2024 12:25:40'
    user_registry: '/consumer-api/user-registries/349aa966-a081-4f10-a104-084c353bd08e (portal-ci Catalog 1 Catalog User
Registry)'
    consumer_orgs:
      - '/consumer-api/orgs/d22714f4-89e0-48a2-b5a3-94e7f1043eaf (portal-ci Grant - Stokes - Practical Rustic Metal Chair
Consumer Organization)'
      - '/consumer-api/orgs/b6251379-5b43-433f-a64e-c93cdae6e085 (portal-ci Krajcik, Jacobson and Kihn - Tasty Sleek Metal
Mouse Consumer Organization)'
  - uid: '10'
    name: 'portal2'
    mail: 'corg-email+2@ibm.com'
    roles:
      - 'authenticated'
    status: 'active'
    apic_state: 'enabled'
    last_login: '01/01/1970 00:00:00'
    user_registry: '/consumer-api/user-registries/349aa966-a081-4f10-a104-084c353bd08e (portal-ci Catalog 1 Catalog User
Registry)'
    consumer_orgs:
      - '/consumer-api/orgs/d22714f4-89e0-48a2-b5a3-94e7f1043eaf (portal-ci Grant - Stokes - Practical Rustic Metal Chair
Consumer Organization)'
      - '/consumer-api/orgs/b6251379-5b43-433f-a64e-c93cdae6e085 (portal-ci Krajcik, Jacobson and Kihn - Tasty Sleek Metal
Mouse Consumer Organization)'
```

The following user information is returned by default:
- **uid**- The unique Drupal ID that identifies the user entity.
- **name** - The name of the user.
- **mail** - The email address of the user.
- **roles** - The current active Drupal user roles that the user has assigned to them.
- **status** - The Drupal status of the user. Valid values are **active** or **blocked**.
- **apic_state** - The current status of the user account. Valid values are:
  - **enabled** - The account is activated.
  - **pending** - The account is created, but not activated.
  - **pending_approval** - The account is created, but is waiting for approval before it can be activated.
- **last_login** - The last time the user logged into the Developer Portal UI. If the user hasn't logged into the UI since creating their account, the time defaults to **01/01/1970 00:00:00**, which is the start of UNIX time.
- **user_registry** - The user registry that the account is in. The entry contains both its unique identifier, and its human readable name.
- **consumer_orgs** - A list of the consumer organizations that the user is in. The list contains both the unique identifier, and the human readable name, of the organizations.

You can use the following optional command flags to filter what user information is returned, and control the pagination:
- **--apic-state** - A comma-separated list of the user account states (string).
- **--consumer-org** - A comma-separated list of consumer organization URLs (string). The users that are returned can be in one or more of the organizations listed, and you can find the consumer organization URLs by using the **consumer-org:list** command.
- **--format** - The output format of the return (string). Valid values are **json**, **yaml**, **octet-stream**, **go-template=*template_name***, or **go-template-file=*file_name***. Defaults to **yaml**.
- **--limit** - Limit the number of user results returned (int32). Default is 50 user results.
- **--login-after** - Filter the return to those users who last logged in after the provided date (string). The date must be in the format of **MM-DD-YYY** or **MM-DD-YY HH:MM:SS**.
- **--login-before** - Filter the return to those users who last logged in before the provided date (string). The date must be in the format of **MM-DD-YYY** or **MM-DD-YY HH:MM:SS**.
- **--mail** - A comma-separated list of user email addresses (string).

- `--names` - A comma-separated list of user names (string).
- `--offset` - Offset the user results that are returned (int32). For example, if there are 100 users in your Developer Portal site, and you want to return the user information for users 51 to 100, you can set the `--offset` option to `50`.
- `--role` - A comma-separated list of Drupal user roles (string).
- `--status` - The Drupal status of the user. Valid values are `'active'` or `'blocked'`.
- `--uid` - A comma-separated list of unique Drupal user IDs.

3. Add one or more roles to one or more specified user accounts. You must provide one or more of the email address, user name, or unique Drupal ID of the user accounts that you want to update.

```
apic --mode portaladmin user:add-role --server management_server --org orgid/name --catalog catalogid/name --role
role_name --names user_names
```

Where:
- *`role_name`* is a comma-separated list of the name of the Drupal user roles that you want to add (required). Note that the role must already exist in the Developer Portal.
- `--names` is a comma-separated list of user names.
- `--mail` is a comma-separated list of user email addresses.
- `--uid` is comma-separated list of unique Drupal IDs of users.

For example:

```
apic --mode portaladmin user:add-role --server my.management.server.com --org ibm --catalog portal-test --role
administrator --names portal1
[success] Added administrator role to portal1
```

4. Remove one or more roles from one or more specified user accounts. You must provide one or more of the email address, user name, or unique Drupal ID of the user accounts that you want to update.

```
apic --mode portaladmin user:remove-role --server management_server --org orgid/name --catalog catalogid/name --role
role_name --names user_names
```

Where:
- *`role_name`* is a comma-separated list of the name of the Drupal user roles that you want to remove (required).
- `--names` is a comma-separated list of user names.
- `--mail` is a comma-separated list of user email addresses.
- `--uid` is comma-separated list of unique Drupal IDs of users.

For example:

```
apic --mode portaladmin user:remove-role --server my.management.server.com --org ibm --catalog portal-test --role
administrator --names portal1
[success] Removed administrator role from portal1
```

5. Block one or more Developer Portal users. You must provide the names of the users that you want to block.

```
apic --mode portaladmin user:block --server management_server --org orgid/name --catalog catalogid/name --names user_names
```

Where:
- `--names` is a comma-separated list of user names.

For example:

```
apic --mode portaladmin user:block --server my.management.server.com --org ibm --catalog portal-test --names portal1
[success] Blocked user(s): portal1
```

When a blocked user tries to log in to their Developer Portal account, an error message is displayed indicating that they are unable to sign in.

6. Unblock one or more Developer Portal users. You must provide the names of the users that you want to unblock.

```
apic --mode portaladmin user:unblock --server management_server --org orgid/name --catalog catalogid/name --names
user_names
```

Where:
- `--names` is a comma-separated list of user names.

For example:

```
apic --mode portaladmin user:unblock --server my.management.server.com --org ibm --catalog portal-test --names portal1
[success] Unblocked user(s): portal1
```

Scenarios that use the Portal CLI

Here are some scenarios of how you can use the Portal commands in the toolkit CLI to accomplish tasks that are more complex to complete, or not possible in the Developer Portal UI.

- **Exporting and importing custom themes and site configuration**
  You can use the portal commands in the toolkit CLI to replicate changes from one Developer Portal instance to another. You might want to use these commands to copy your themes or a configuration change, from a staging environment to a production environment.
- **How to enable and disable maintenance mode on your Developer Portal**
  You can use the Portal commands in the toolkit CLI to enable and disable maintenance mode on your Developer Portal site.

Exporting and importing custom themes and site configuration

You can use the portal commands in the toolkit CLI to replicate changes from one Developer Portal instance to another. You might want to use these commands to copy your themes or a configuration change, from a staging environment to a production environment.

Before you begin

To complete this scenario, you must have a staging Developer Portal and a production Developer Portal enabled. You must have administrator access, and the permission **`settings:manage`**, to both to complete this scenario. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this scenario

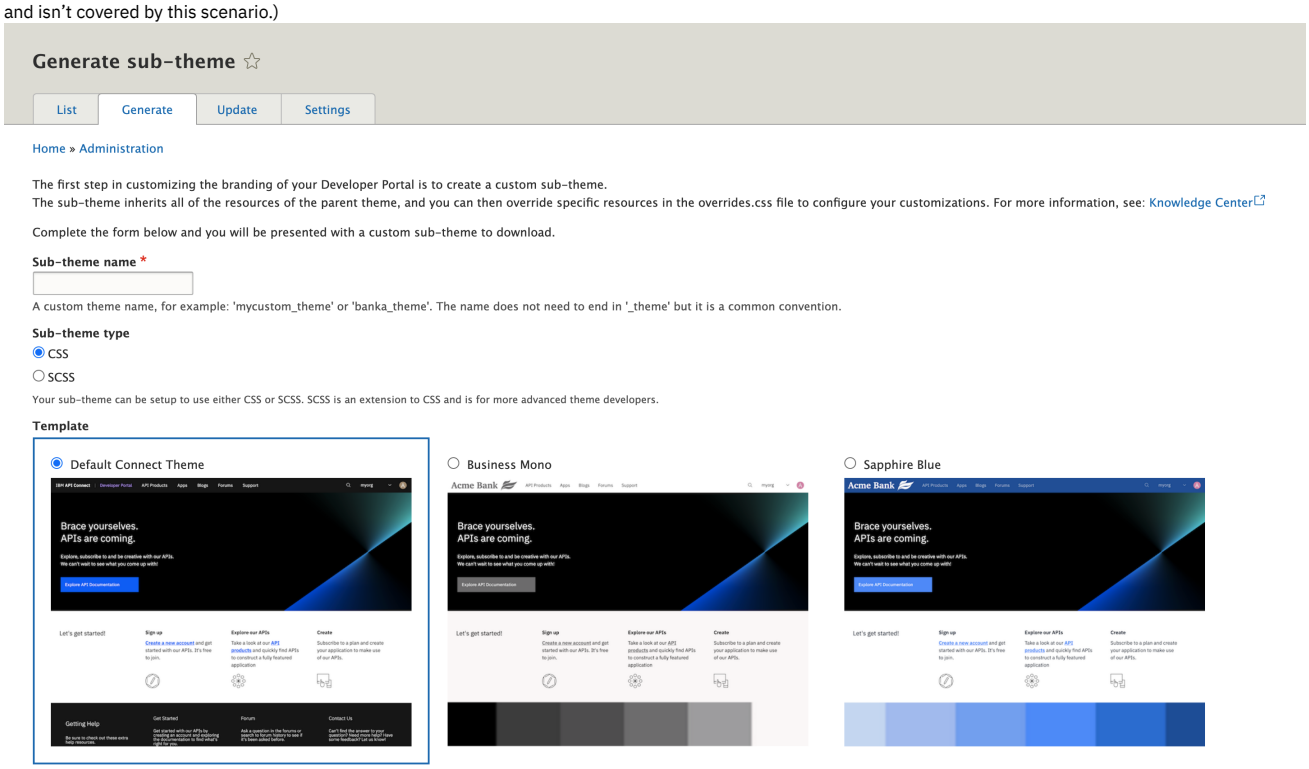
In this scenario, on your staging Developer Portal, you create a theme and make some configuration changes. Then, you use the toolkit CLI to replicate the changes on your production Developer Portal.

This scenario takes you through the following steps:

1. Create a custom theme on the staging Developer Portal.
2. Add a field to an application content type to change the **`site-config`** on the staging Developer Portal.
3. Use the **`cli`** to export the custom themes and **`site-config`** on the staging Developer Portal.
4. Use the **`cli`** to import the custom themes and **`site-config`** on the production Developer Portal.

Create a custom theme on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Appearance > Generate sub-theme. The **`Generate sub-theme`** window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this scenario.)



5. Select the Default template to base your **`sub-theme`** on. You can create a **`sub-theme`** based on a color template. However, for this scenario you use the default connect_theme template.
6. Click Generate.
7. Download the generated **`sub-theme`** to a location of your choice, and extract all the files from the .zip file.

On your computer, navigate to the files that you extracted. Find the overrides.css file in here banka_theme/banka_theme/css/overrides.css. You can now customize the overrides.css file.

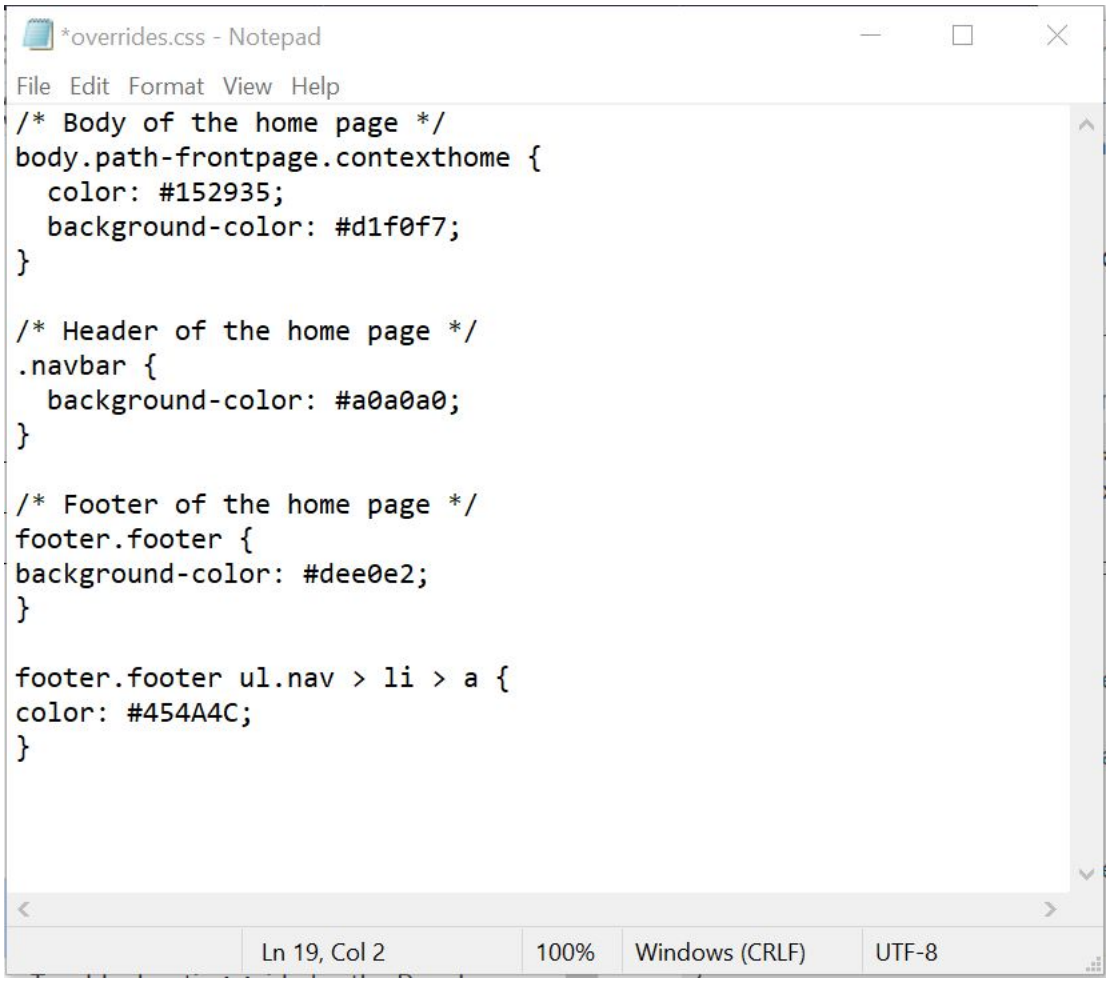
1. Open the overrides.css file in your chosen editor.
2. Customize your **`sub-theme`** by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}
```

```
/* Footer of the home page */
footer.footer {
background-color: #dee0e2;
}

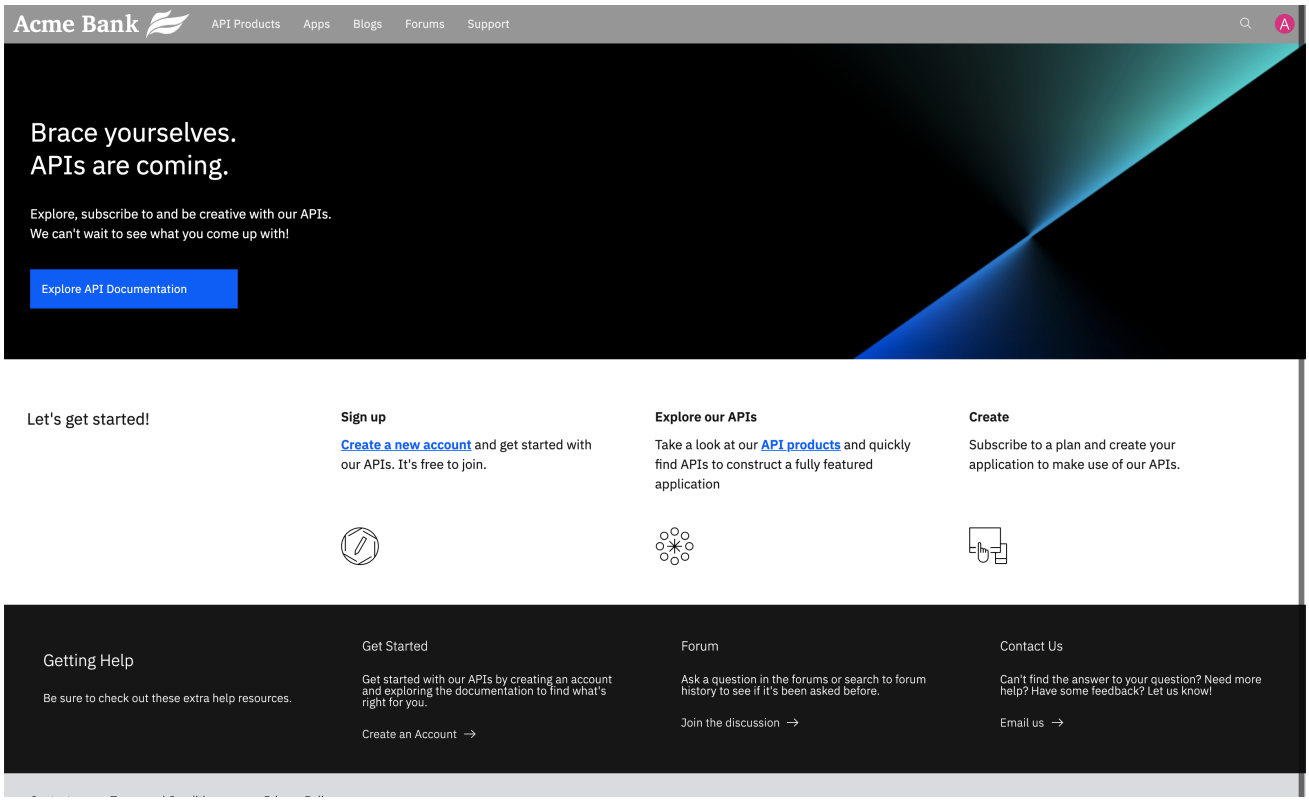
footer.footer ul.nav > li > a {
color: #454A4C;
}
```



3. Save the overrides.css file.

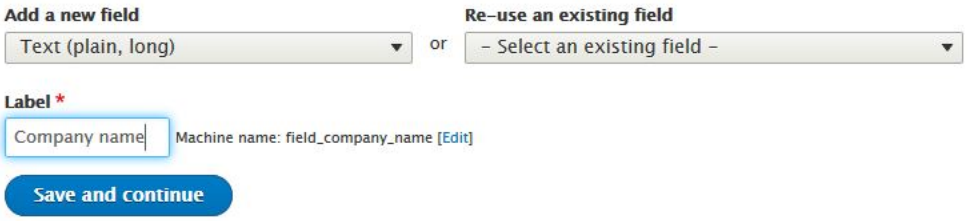
You can now install and enable your customized theme.

1. After you finish updating the overrides.css file, compress all the theme files back into the .zip **sub-theme** file that you downloaded originally.
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive to install click Browse, and navigate to your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of **Disabled themes**. Click Enable and set as default to set your new custom **sub-theme** as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.



Add a field to an application content type to change the `site-config` on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Application > Manage fields.
4. Click + Add field.
5. In **`Add a new field`**, select Text (plain, long). Enter `Company name` as the label title.



6. Click Save and continue.
7. Leave the **`Allowed number of values`** set to 1 and click Save field settings.
8. Click Save field settings. You can now see your new field.

Use the toolkit CLI to export the custom themes and `site-config` on the staging Developer Portal

1. Log in to the management server.

   `apic login --server` ***`management_server`*** **`--realm`** ***`realm`*** **`--username`** ***`org_username`*** **`--password`** ***`org_password`***

   For example,

   `apic login -s api.stagingexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123£`

   For more information about variable options, see Logging in to a management server.

2. Export your custom themes.
   The **custom-theme:create-export** command creates an export task against the portal of the specified **`catalog`** and **`org`**. The command then polls the status of the task until it has **`FINISHED`** and the artifacts are streamed back.
   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-theme:get-export-status** and **custom-theme:get-export** to get the status and potentially an artifact.

   `apic --mode portaladmin custom-theme:create-export --catalog` ***`name/id`*** **`--org`** ***`name/id`*** **`--server`** ***`management_server`***

- The theme .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `custom_theme_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin custom-theme:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Export your site config.
   The **site-config:create-export** command creates an export task against the portal of the specified `catalog` and `org`, the command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.

```
apic --mode portaladmin site-config:create-export --catalog name/id --org name/id --server management_server
```

- The site config .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `site_config_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin site-config:create-export --catalog dev --org ibm --server api.stagingexample.com
```

Use the toolkit CLI to import the custom themes and `site-config` on the production Developer Portal

1. Log in to the management server.

```
apic login --server management_server --realm realm --username org_username --password org_password
```

For example,

```
apic login -s api.productionexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123£
```

For more information about variable options, see Logging in to a management server.

2. Import your custom themes.
   The **custom-theme:create-import** command uses the supplied .tgz file to import the custom themes into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.
   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **custom-theme:get-import-status** to get the status of the import.

```
apic --mode portaladmin custom-theme:create-import --catalog name/id --org name/id --server management_server
/PATH/TO/THEME/TGZ
```

For example,

```
apic --mode portaladmin custom-theme:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/custom_theme_createExport-20200217134637.tgz
```

3. Import your site config.
   The **site-config:create-import** command uses the supplied .tgz file to import the site config into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.

```
apic --mode portaladmin site-config:create-import --catalog name/id --org name/id --server management_server
/PATH/TO/CONFIG/TGZ
```

For example,

```
apic --mode portaladmin site-config:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/site_config_createExport-20200217134637.tgz
```

What you did in this scenario

In this scenario, you created a theme and changed the configuration on your staging Developer Portal. Then, you used the toolkit CLI to replicate the changes on to your production Developer Portal.

You can now see the changes that you made on your production Developer Portal.

- **Exporting and importing custom themes and site configuration by using the Portal Admin API**
  The platform REST APIs for IBM® API Connect provide complete access to the capability of the platform. So, you can use the toolkit CLI to replicate changes from one Developer Portal instance to another. However, if the toolkit CLI was unavailable for some reason, you can use the Portal Admin API.

Exporting and importing custom themes and site configuration by using the Portal Admin API

The platform REST APIs for IBM® API Connect provide complete access to the capability of the platform. So, you can use the toolkit CLI to replicate changes from one Developer Portal instance to another. However, if the toolkit CLI was unavailable for some reason, you can use the Portal Admin API.

Before you begin

To complete this scenario, you must have a staging Developer Portal and a production Developer Portal enabled. You must have administrator access, or the permission `settings:manage`, to both to complete this scenario. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

Also, you must have downloaded and installed the toolkit. For more information, see Installing the toolkit.

About this scenario

In this scenario, you use the toolkit to obtain some authentication. Then, on your staging Developer Portal, you create a theme and make some configuration changes. Then, you use the Portal Admin API to replicate the changes on your production Developer Portal.

This scenario takes you through the following steps:

1. Obtaining the client ID and secret, and a bearer token.
2. Create a custom theme on the staging Developer Portal.
3. Add a field to an application content type to change the `site-config` on the staging Developer Portal.
4. Use the Portal Admin API to export the custom themes and `site-config` on the staging Developer Portal.
5. Use the Portal Admin API to import the custom themes and `site-config` on the production Developer Portal.

Obtaining the client ID and secret, and a bearer token.

From your toolkit:

1. Obtaining the client ID and secret.
   a. Obtain the list of administrator scoped providers to determine the correct realm to use:

      ```
      apic identity-providers:list --scope admin --server <management_server>
      ```

      For example,

      ```
      apic identity-providers:list --scope admin --server api.stagingexample.com
      ```

      Here is an example of some possible output:

      ```
      default-idp-1
      ```

   b. Run `apic login`, complete the details:

      ```
      apic login --server management_server --realm cloud_realm --username admin_username --password admin_password
      ```

      For example,

      ```
      apic login -s api.stagingexample.com --realm provider/default-idp-1 --username admin --password Qwerty123£
      ```

   c. Log in to cloud manager, and register an app. Make a new file locally and call it `app1.json`. Then, copy into it the following code snippet:

      ```
      {
        "name": "app1",
        "client_id": "app1id",
        "client_secret": "app1secret",
        "client_type": "toolkit"
      }
      ```

   d. Run the registration create command:

      ```
      apic registrations:create --server management_server app1.json
      ```

      For example,

      ```
      apic registrations:create --server api.stagingexample.com app1.json
      ```

      Here is an example of some possible output:

      ```
      app1    [state: enabled]   https://api.stagingexample.com/api/cloud/registrations/d2b7572f-3406-42a7-bdcc-
      85f177860df7
      ```

2. Now, you can get a bearer token from the provider org.
   a. To obtain a list of provider realms:

      ```
      apic identity-providers:list --scope provider --server management_server
      ```

      For example,

      ```
      apic identity-providers:list --scope provider --server api.stagingexample.com
      ```

      Here is an example of some possible output:

      ```
      default-idp-2
      ```

   b. Run `apic login`, complete the details:

      ```
      apic login --server management_server --realm provider_realm --username org_username --password org_password
      ```

      For example,

      ```
      apic login -s api.stagingexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123£
      ```

   c. Create an HTTP request to obtain an access token:

      ```
      curl -k -X POST -d '{"username": "org_username", "password": "org_password", "realm": "provider/default-idp-2",
      "client_id": "app_id", "client_secret": "app_secret", "grant_type": "password"}' -H 'Content-Type: application/json'
      -H 'Accept: application/json' https://management_server/api/token
      ```

      For example,

```
curl -k -X POST -d '{"username": "steve", "password": "T****8", "realm": "provider/default-idp-2", "client_id":
"app1id", "client_secret": "app1secret", "grant_type": "password"}' -H 'Content-Type: application/json' -H 'Accept:
application/json' https://api.stagingexample.com/api/token
```

Here is an example of some possible output:

```
{
    "access_token":
"eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCIsImtpZCI6IjBDQkI2Mjg5MkU4QUNFNEIzNDZCQzcyNDMxMUY0QzE4NTU2MUE4NjkifQ.eyJqdGkiOiJlN

a1-1EbqUB0sejwQoKvSYHMFwnh3K8Y97g21bdjkAcSwVOk02FpUMIIz4aeInYqwlUdzqww",
    "token_type": "Bearer",
    "expires_in": 28800
}
```

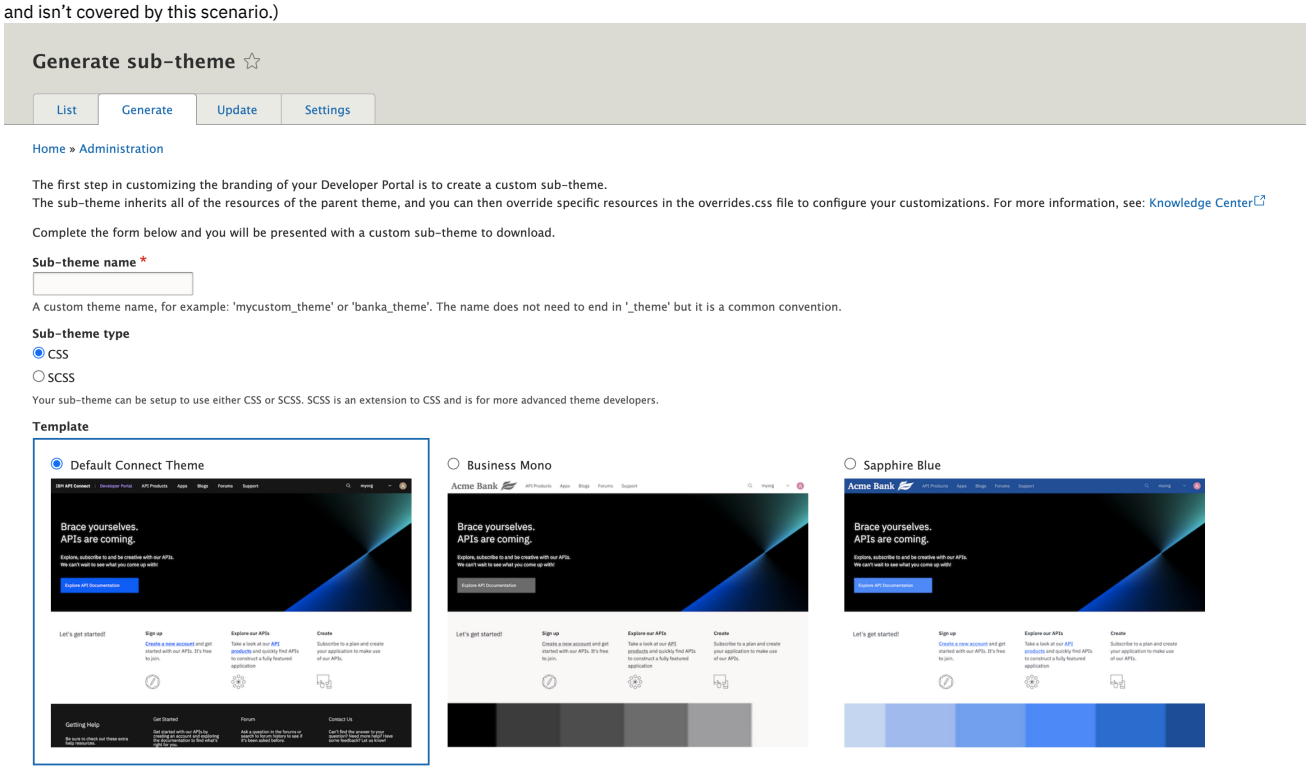
d. Save the token in a variable in your terminal:

```
TOKEN="<paste the access token that you obtained>"
```

You can now authenticate yourself when you invoke the toolkit CLI by using the REST API.

Create a custom theme on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Appearance > Generate sub-theme. The **Generate sub-theme** window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this scenario.)



5. Select the Default template to base your **sub-theme** on. You can create a **sub-theme** based on a color template. However, for this scenario you use the default connect_theme template.
6. Click Generate.
7. Download the generated **sub-theme** to a location of your choice, and extract all the files from the .zip file.

On your computer, navigate to the files that you extracted. Find the overrides.css file in here banka_theme/banka_theme/css/overrides.css. You can now customize the overrides.css file.

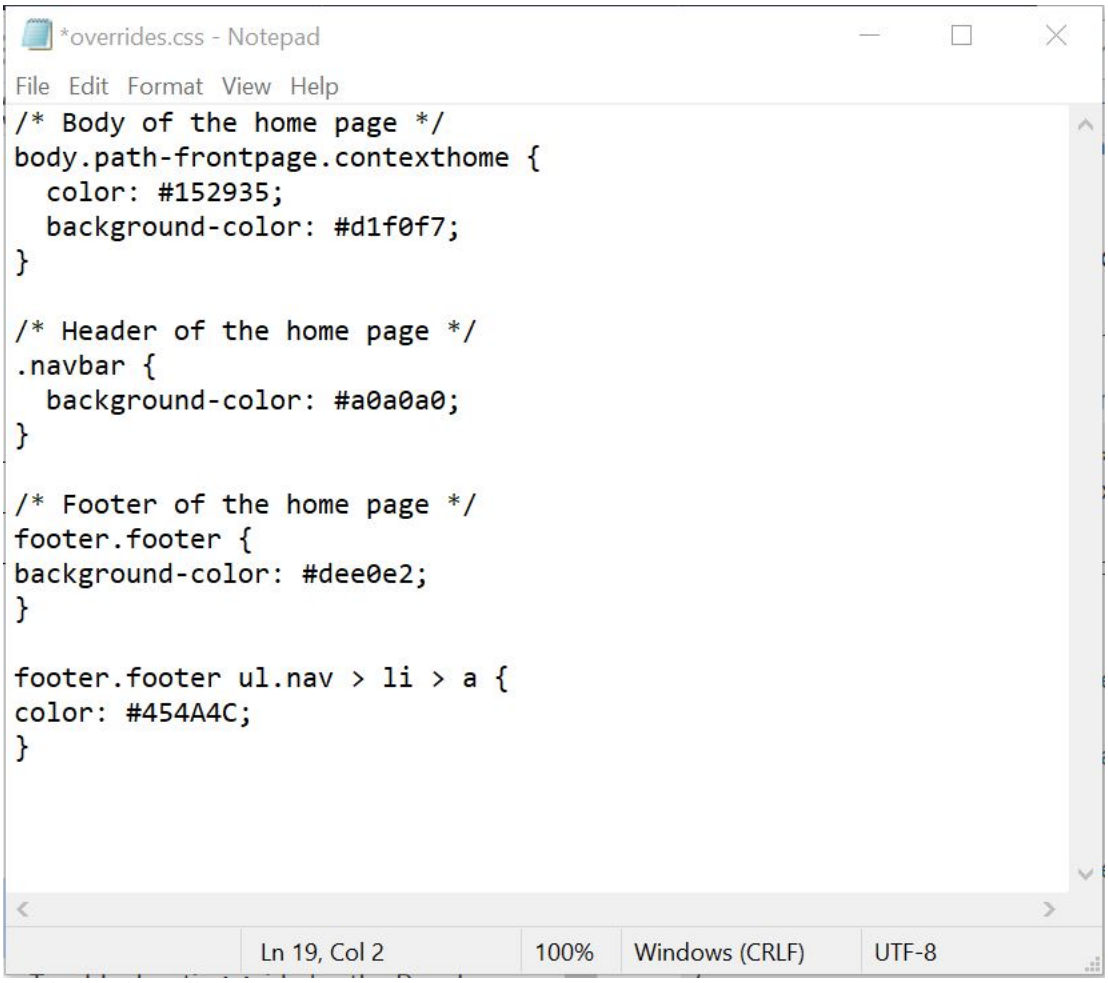
1. Open the overrides.css file in your chosen editor.
2. Customize your **sub-theme** by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
background-color: #dee0e2;
}

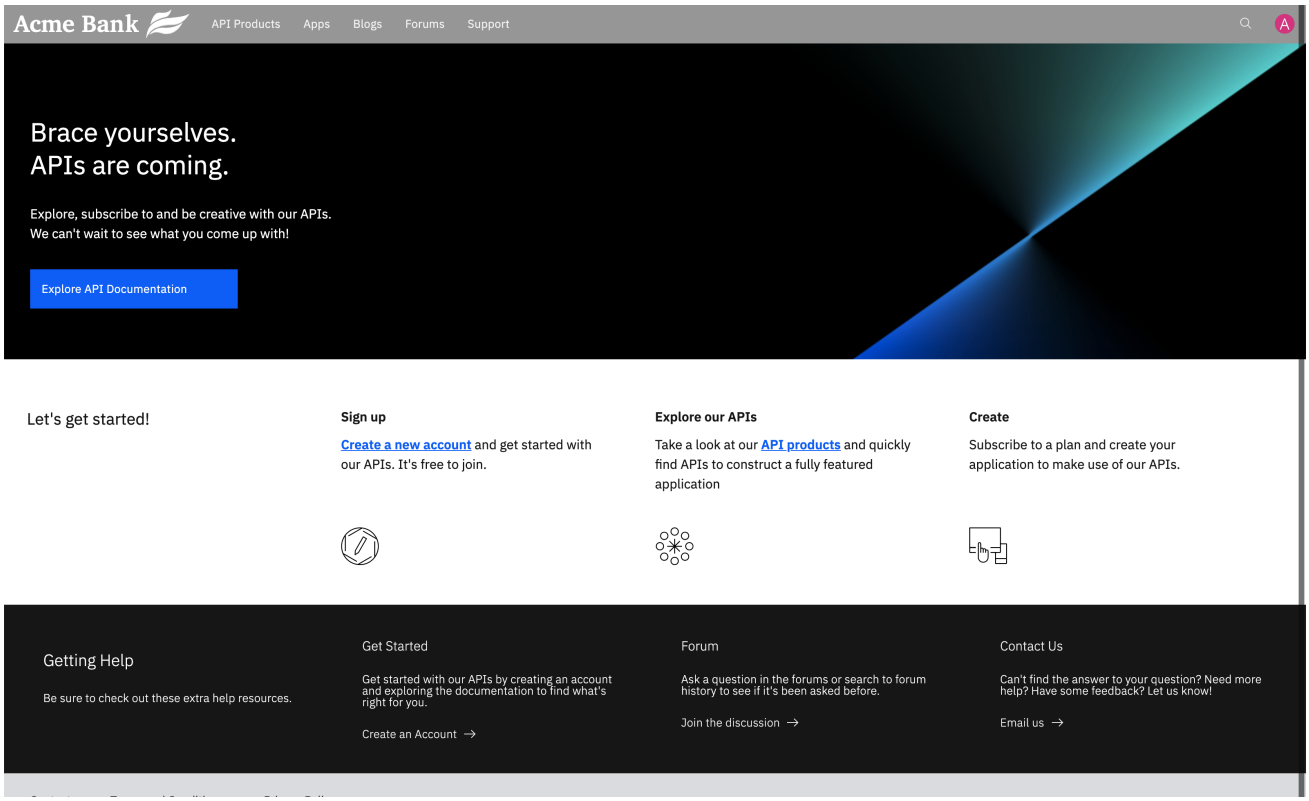
footer.footer ul.nav > li > a {
color: #454A4C;
}
```



3. Save the overrides.css file.

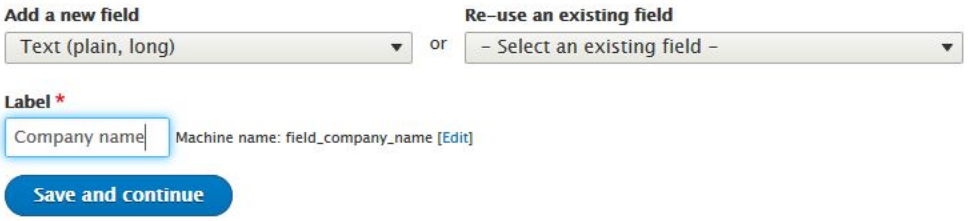
You can now install and enable your customized theme.

1. After you finish updating the overrides.css file, compress all the theme files back into the .zip **sub-theme** file that you downloaded originally.
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive to install click Browse, and navigate to your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of **Disabled themes**. Click Enable and set as default to set your new custom **sub-theme** as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.



Add a field to an application content type to change the `site-config` on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Application > Manage fields.
4. Click + Add field.
5. In **`Add a new field`**, select Text (plain, long). Enter `Company name` as the label title.



6. Click Save and continue.
7. Leave the **`Allowed number of values`** set to 1 and click Save field settings.
8. Click Save field settings. You can now see your new field.

Use the Portal Admin API to export the custom themes and `site-config` on the staging Developer Portal

1. Export your custom themes.
   a. Create the export job by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export'
```

   For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export'
```

   Here is an example of some possible output:

```
status: 201
message:
  stdout: >-
    /catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/f09602a2-a0e4-40dc-a82d-d1af326ad092/custom-
```

```
theme/export/85z2m39znojolv2s/status
  stderr: ''
errors: []
```

b. You can check the status of the export job by invoking the `/status` endpoint.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN"  -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export/85z2m39znojolv2s/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "The status of this task is: FINISHED and the artifact can now be streamed"
  },
  "errors": []
}
```

c. You can now download the custom theme file onto your machine.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export/<task_id>' -o <theme_name>
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export/85z2m39znojolv2s' -o mytheme.tgz
```

Note: When you use the `curl` commands to download files, if you do not specify an output with `-o`, it incorrectly prints the output as binary onto the terminal screen.

d. On Mac and Linux® machines, you can verify that you have a valid theme export `.tgz` file by invoking the tar `t --list` argument.

```
tar -tvf <theme_name>
```

For example,

```
tar -tvf mytheme.tgz
```

Here is an example of some possible output:

```
drwxrwsr-x  0 aegir  aegir       0  9 Jun 13:40 ./
drwxr-sr-x  0 aegir  aegir       0  9 Jun 13:40 emerald_theme_css/
-rw-r--r--  0 aegir  aegir       7  9 Jun 13:40 emerald_theme_css/emerald_theme_css.theme
-rw-r--r--  0 aegir  aegir   29224  9 Jun 13:40 emerald_theme_css/screenshot.png
-rw-r--r--  0 aegir  aegir     442  9 Jun 13:40 emerald_theme_css/composer.json
-rw-r--r--  0 aegir  aegir     599  9 Jun 13:40 emerald_theme_css/emerald_theme_css.info.yml
-rw-r--r--  0 aegir  aegir    1150  9 Jun 13:40 emerald_theme_css/favicon.ico
-rw-r--r--  0 aegir  aegir    5932  9 Jun 13:40 emerald_theme_css/logo.svg
-rw-r--r--  0 aegir  aegir      61  9 Jun 13:40 emerald_theme_css/emerald_theme_css.libraries.yml
drwxr-sr-x  0 aegir  aegir       0  9 Jun 13:40 emerald_theme_css/css/
-rw-r--r--  0 aegir  aegir   47249  9 Jun 13:40 emerald_theme_css/css/overrides.css
```

2. Export your site config.

a. Create the export job by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export'
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export'
```

Here is an example of some possible output:

```
{
    "status": 201,
    "message": {
        "stdout": "/catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/f09602a2-a0e4-40dc-a82d-
d1af326ad092/config/export/5cylgk55ciiwn190/status",
        "stderr": ""
    },
    "errors": []
}
```

b. You can check the status of the export job by invoking the `/status` endpoint.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export/5cylgk55ciiwn190/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "The status of this task is: FINISHED and the artifact can now be streamed"
  },
  "errors": []
}
```

c. You can now download the site-config file onto your machine.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export/<task_id>' -o <config_name>
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export/5cy1gk55ciiwn190' -o myconfig.tgz
```

Note: When you use the `curl` commands to download files, if you do not specify an output with `-o`, it incorrectly prints the output as binary onto the terminal screen.

d. On Mac and Linux machines, you can verify that you have a valid theme export `.tgz` file by invoking the tar `t --list` argument. The `head -n 10` option returns the first 10 lines of the result.

```
tar -tvf <config_name> | head -n 10
```

For example,

```
tar -tvf myconfig.tgz | head -n 10
```

Here is an example of some possible output, which should be a list of yaml files:

```
-rw-rw-r--  0 aegir  aegir 393 11 Jun 15:54 block.block.bartik_page_title.yml
-rw-rw-r--  0 aegir  aegir 577 11 Jun 15:54 filter.format.plain_text.yml
-rw-rw-r--  0 aegir  aegir 256 11 Jun 15:54 captcha.captcha_point.consumerorg_invite_user_form.yml
-rw-rw-r--  0 aegir  aegir 741 11 Jun 15:54 block.block.emerald_theme_css_account_menu.yml
-rw-rw-r--  0 aegir  aegir 488 11 Jun 15:54 field.field.node.application.apic_hostname.yml
-rw-rw-r--  0 aegir  aegir 460 11 Jun 15:54 field.storage.node.apic_catalog_id.yml
-rw-rw-r--  0 aegir  aegir 545 11 Jun 15:54 field.field.user.user.apic_user_registry_url.yml
-rw-rw-r--  0 aegir  aegir 427 11 Jun 15:54 language.content_settings.shortcut.default.yml
-rw-rw-r--  0 aegir  aegir 460 11 Jun 15:54 field.storage.node.api_soapversion.yml
-rw-rw-r--  0 aegir  aegir 148 11 Jun 15:54 captcha.captcha_point.node_product_form.yml
```

Use the Portal Admin API to import the custom themes and `site-config` on the production Developer Portal

Note: If you are importing your custom theme onto a new server, then before you continue, follow step 1 of this tutorial to obtain a new token to authenticate with your second server. If you are using the same server, and are importing the theme into a new catalog, then the current TOKEN remains valid for the rest of the steps.
Note: You must import the custom theme before you import the site config. This order is because the site config contains information about the default theme, and so your custom theme must exist on the portal when the site config is imported so that it can be set upon import.

1. Import your custom themes.
   a. On the production catalog, import the custom theme onto the production catalog `prod` by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' -H 'Content-Type:
application/octet-stream' 'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/import' --data-
binary @<path_to_theme_file>
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' -H 'Content-Type:
application/octet-stream' 'https://api.productionexample.com/portal/catalogs/ibm/prod/custom-theme/import' --data-
binary @/Users/steve/PortaladminCLI/mytheme.tgz
```

Here is an example of some possible output:

```
status: 201
message:
  stdout: >-
    /catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/56f3d4ca-8be2-48f7-8f91-3d654c2b91f2/custom-
theme/import/vtscpucj08i0hfo6/status
  stderr: ''
errors: []
```

   b. You can check the status of the import job by invoking the `/status` endpoint on this command:

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/import/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.productionexample.com/portal/catalogs/ibm/prod/custom-theme/import/vtscpucj08i0hfo6/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "2020-06-09 13:00:59: CLI task (custom_theme:import) starting.\n2020-06-09 13:00:59: Importing custom
theme emerald_theme_css\n2020-06-09 13:01:18: CLI task (custom_theme:import) completed successfully.",
    "stderr": ""
  },
```

```
  "errors": []
}
```

2. Import your site config.
   a. Import the existing site-config onto the production catalog `prod` by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' -H 'Content-Type:
application/octet-stream' 'https://<management_server>/portal/catalogs/<org>/<catalog>/config/import' --data-binary
@<path_to_config_import>
```

   For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' -H 'Content-Type:
application/octet-stream' 'https://api.productionexample.com/portal/catalogs/ibm/prod/config/import' --data-binary
@/Users/steve/PortaladminCLI/myconfig.tgz
```

   Here is an example of some possible output:

```
{
  "status": 201,
  "message": {
      "stdout": "/catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/56f3d4ca-8be2-48f7-8f91-
3d654c2b91f2/config/import/kzyozx4v5sfa8la5/status",
      "stderr": ""
  },
  "errors": []
}
```

   b. You can check the status of the config import job by invoking the `/status` endpoint:

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/import/<task_id>/status'
```

   For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.productionexample.com/portal/catalogs/ibm/prod/config/import/kzyozx4v5sfa8la5/status'
```

   Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
      "stdout": "2020-06-11 15:42:55: CLI task (site_config:import) starting.\n2020-06-11 15:43:29: CLI task
(site_config:import) completed successfully.",
      "stderr": ""
  },
  "errors": []
}
```

What you did in this scenario

In this scenario, you created a theme and changed the configuration on your staging Developer Portal. Then, you used the Portal Admin API to replicate the changes on to your production Developer Portal.

You can now see the changes that you made on your production Developer Portal.

How to enable and disable maintenance mode on your Developer Portal

You can use the Portal commands in the toolkit CLI to enable and disable maintenance mode on your Developer Portal site.

Before you begin

To complete this Portal CLI scenario, you must have a Developer Portal enabled. You must also have administrator access to this site, and the permission **`settings:manage`**, to complete this scenario. The tutorial Creating the Portal explains how to enable the portal if you haven't enabled it already.

For more information about using the toolkit CLI with the Developer Portal, see Getting started with the Portal CLI commands.

Important: Maintenance mode is designed for short-term site maintenance; it is not meant for long-term usage. While a site is in maintenance mode, the database is not updated with new content from API Manager.

About this scenario

In this scenario, you use the toolkit CLI to enable, and then disable, maintenance mode on your Developer Portal site.

The scenario takes you through the following steps:

1. Log in to the management server as a Provider organization by using the toolkit CLI
2. Use the toolkit CLI to enable maintenance mode
3. Use the toolkit CLI to disable maintenance mode

Log in to the management server as a Provider organization by using the toolkit CLI

- Log in to the toolkit CLI as a Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server platform_api_host_name --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

Use the toolkit CLI to enable maintenance mode

- Run the following command to enable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key
system.maintenance_mode  --input_format integer --state_value 1
```

Where:
  - *`management_server`* is the endpoint URL of your management server (required).
  - *`catalogid/name`* is the ID or name of the catalog that your site belongs to (required).
  - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
  - `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
  - `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
  - `--state_value` is the value to assign to the state key (required). Set to `1` to enable maintenance mode.

For example, to enable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key
system.maintenance_mode  --input_format integer --state_value 1
Successfully set state system.maintenance_mode to the value of 1.
```

The Developer Portal site is now inaccessible to everyone apart from an administrator. All other users who enter the site URL will see a maintenance message set by the administrator.

Use the toolkit CLI to disable maintenance mode

- Run the following command to disable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key
system.maintenance_mode  --input_format integer --state_value 0
```

Where:
  - *`management_server`* is the endpoint URL of your management server (required).
  - *`catalogid/name`* is the ID or name of the catalog that your site belongs to (required).
  - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
  - `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
  - `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
  - `--state_value` is the value to assign to the state key (required). Set to `0` to disable maintenance mode.

For example, to disable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key
system.maintenance_mode  --input_format integer --state_value 0
Successfully set state system.maintenance_mode to the value of 0.
```

Your Developer Portal site is now accessible to everyone again.

What you did in this scenario

In this scenario, you used the toolkit CLI to put your Developer Portal site into maintenance mode, and to turn maintenance mode off again.

- Toggling the site in and out of maintenance mode

Troubleshooting guide for the Developer Portal

Use this guide to help you diagnose and resolve Developer Portal issues in IBM® API Connect. For example, why is the Developer Portal not connecting to the Management server, why is my site not created, and why can't I log in?

About

The following sections provide advice about how to diagnose and resolve some common problems. This information can help you to identify whether a specific IBM API Connect Version 10 component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem.

Note: In the Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

1. Why is the Developer Portal not connecting to the Management server?
2. Why is my Developer Portal site not being created?
3. Why can't I register a user?
4. Why can't I login?
5. Why are changes to Products not appearing in the Developer Portal?
6. Why am I having problems with my Developer Portal user interface?
7. Why am I having problems with my Kubernetes system?
8. Why am I having problems with my Developer Portal backup?
9. Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?

Why is the Developer Portal not connecting to the Management server?

Problems with connecting to the Management server can be due to connectivity or TLS issues. You should check the following areas:

- Can the Management server actually reach the Developer Portal?
- Is SSL passthrough enabled or required on any load balancer that sits between the Management server and the Developer Portal? For more information, see JWT security on Kubernetes and OpenShift, JWT security on OVA.

If you need to open a Service Request, include the following information:

- The IBM API Connect MustGather Information.
- Details of the date and time that the connection attempts were made.

Why is my Developer Portal site not being created?

If you are having problems creating a site, you should take the following actions to help diagnose the issue:

1. Tail the nginx container log to confirm that the site create request reached the portal, for example:

   ```
   kubectl logs rb93d4fb118-apic-portal-nginx-7c7b464fb6-vvx5m
   ```

2. Look in the container log for a site create request, for example:

   ```
   POST /portal-service-configuration-create HTTP/1.1" 200
   ```

   a. If you don't find a site create request in the log, then the create request is not reaching the Developer Portal from the Management. Follow the instructions in Why is the Developer Portal not connecting to the Management server? to diagnose the connectivity issues.
   b. If a site create request is in the log, then further diagnostics can be found in the admin pod log, for example:

   ```
   kubectl logs -f rb93d4fb118-apic-portal-www-p4bhj -c admin
   ```

   Look in the admin pod log for messages that refer to `create_site`, as well as the name of the site.

Why can't I register a user?

If you are having problems registering a user, take the following actions to help diagnose the issue:

- The user registration links in the emails are only valid for 24 hours, so check that the system time is correctly configured across all of the pods.
- If emails aren't being received, check that the email server is correctly configured; see Configuring an email server for notifications. Also, if possible, check whether other emails such as publish approval alerts or password reset emails are being received.

If you need to open a Service Request, please take the following steps:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Re-create the issue, making a note of the time, the username, and any messages displayed on the screen.
4. Gather the web container log for the www pod, for example:

   ```
   kubectl logs portal-apic-portal-www-zhqxf web > web.log
   ```

5. Gather all of the Management server logs and the logs for the user registry type that is being used; see IBM API Connect MustGather Information for details.

Why can't I login?

If users are having problems with logging in to the Developer Portal, please take the following steps before opening a Service Request:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Recreate the issue, making a note of the time, the username, and any messages printed to the screen.
4. Gather the web container log for the www pod, for example:

```
kubectl logs portal-apic-portal-www-zhqxf web > web.log
```

5. Gather all of the Management server logs and the logs for the user registry type that is being used; see IBM API Connect MustGather Information for details.

Why are changes to Products not appearing in the Developer Portal?

To determine whether the problem is with the Portal server (either the nginx or the www pod), the Management server, or the network, please make the following diagnostic checks.

Portal nginx pod

1. Tail the nginx pod log on the Portal, for example:

   ```
   kubectl logs -f portal-apic-portal-nginx-866c977c4c-n9gbf
   ```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

   ```
   ...POST /event-create...
   ```

If the POST message appears in the nginx log, then the publish webhook that was sent from the Management server did arrive at the Portal. If there is an error message in place of a POST message, then the problem is likely to be with the nginx pod. If there is no message at all, then it's likely that the webhook from the Management server is not reaching the Portal and there is a network problem.

Portal www pod

1. Tail the www pod admin container log on the Portal, for example:

   ```
   kubectl logs -f portal-apic-portal-www-dtbzw -c admin
   ```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

   ```
   Received webhook event 'product_lifecycle' for catalog
   ```

If no such message appears, it suggests that the webhook is either not arriving at the Portal, or not getting beyond the nginx pod (see the previous section Portal nginx pod). Any errors that the admin container has in processing the webhook will be logged in the www pod admin container log.

Management server apim pod

1. Tail the apim pod log on the Management server, for example:

   ```
   kubectl logs -f apiconnect-apim-v2-86b464c4f5-4cx6r
   ```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if there any error messages.

Search for the word 'sending', you should see the message `webhook: sending successful` if the webhook is sent, or error messages indicating why if the webhook is not sent.

Why am I having problems with my Developer Portal user interface?

If you are having user interface (UI) problems, make the following checks:

- Try clearing the cache from your browser, try using private browsing, and try using different browsers - see whether there are any differences in behavior.
- Check your browser window size and screen resolution, and try increasing and decreasing the settings.
- Investigate the browser developer tools console and network tabs, as they might provide some diagnostic clues.
- Try clearing the Drupal caches from within the Developer Portal; see Clearing the server caches for details.

If you need to open a Service Request, along with the IBM API Connect MustGather Information logs, also include details of the time and date when the problem was reproduced. In addition, an export of the browser developer tools console and network output would be helpful.

Why am I having problems with my Kubernetes system?

Kubernetes provides a DNS server as one of the pods in the kube-system namespace (unless you have configured your Kubernetes setup differently), and sometimes this DNS server can silently fail. When the Portal www or db pods restart, they check that their own hostname and IP address is in the service that is defined for the pod. If the DNS server is down, this check fails. An indication that the DNS server is down is seeing the following log lines printed endlessly in the admin or db containers:

```
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-ready:
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-all:
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: Waiting for sleep in service all check. Pid(s) 352  Seconds
24
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:59: Finished waiting for sleep in service all check. Pid(s)
352  Seconds 29
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:28:01: WARNING 5: r4c09b98d02-apic-portal-admin-all doesn't
include this pod or r4c09b98d02-apic-portal-director does. Checking again in 5 seconds.
```

To fix this problem, delete the DNS pod in the kube-system namespace to force it to restart, for example:

```
kubectl -n kube-system delete pod kube-dns-b76db4f7f-n4lvt
```

Where *kube-dns-b76db4f7f-n4lvt* is the full name of the DNS pod.
Note: To find out the full name of the DNS pod in your Kubernetes system, run the following command:

```
kubectl -n kube-system get pods
```

This command will return data like the following example:

```
$ kubectl -n kube-system get pods
NAME READY STATUS RESTARTS AGE
default-http-backend-5bccfbdc8-mjnnb 1/1 Running 0 4d
etcd-minikube 1/1 Running 0 4d
kube-addon-manager-minikube 1/1 Running 0 4d
kube-apiserver-minikube 1/1 Running 0 4d
kube-controller-manager-minikube 1/1 Running 0 4d
kube-dns-6f4fd4bdf-7zslq 3/3 Running 0 4d
kube-proxy-mddmj 1/1 Running 0 4d
kube-registry-proxy-99qml 1/1 Running 0 4d
kube-registry-v0-zt8pv 1/1 Running 0 4d
kube-scheduler-minikube 1/1 Running 0 4d
kubernetes-dashboard-77d8b98585-dczcs 1/1 Running 0 4d
nginx-ingress-controller-57bcfc76d6-z775d 1/1 Running 0 4d
storage-provisioner 1/1 Running 0 4d
tiller-deploy-587df449fb-bpwhq 1/1 Running 0 4d
```

Why am I having problems with my Developer Portal backup?

If you attempt to back up your portal system or site:

```
apicup subsys exec <portal_subsystem> backup-system|backup-site|backup-all
```

You might encounter the following message:

```
curl: (6) Could not resolve host: apic-portal-apic-portal-director
```

This error is the result of a failure of the SFTP backup file transfer to the backup system, caused by missing authentication with the portal node. To correct this error, `ssh` from the backup system to the portal node, and accept the authentication key when prompted:

1. Enter the portal-www admin container, for example:

   ```
   kubectl exec -it WWW_POD_NAME -c admin bash
   ```

2. `ssh` to your backup server and accept any authentication prompts, for example:

   ```
   ssh BACKUP_SERVER_HOSTNAME
   ```

When you have successfully authenticated with your backup server, you can close the session. This action needs to be done only once. Portal backups can then run without any issues.

Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as drupal_check on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: rubyred
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for rubyred
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: site1.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their *.info.yml file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module

# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see Let Drupal know about your module with an .info.yml file on the drupal.org website.

If you have a backup of a site that you need to restore and are getting the version compatibility error, but the module or theme *.info.yml file cannot be changed easily, then you can modify the site backup.

To modify the site backup, extract the it, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:

1. `mkdir /tmp/backup`
2. `cd /tmp/backup`
3. `tar xfz path_to_backup.tar.gz`
4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct `core_version_requirement` setting.
5. `rm -f path_to_backup.tar.gz`
6. `tar cfz path_to_backup.tar.gz`
7. `cd /`
8. `rm -rf /tmp/backup`

Migrating your Developer Portal from Version 5 to Version 10

Guidance on how to migrate a Developer Portal site from IBM® API Connect Version 5, to IBM API Connect Version 10.

In IBM API Connect Version 10 the Developer Portal is based on the open source Drupal 9 content management software, which enables more advanced, flexible, and powerful customization capabilities. However, in IBM API Connect Version 5 the Developer Portal is based on Drupal 7. The migration tooling in Version 10 will create a new Developer Portal site, and migrate all of the associated APIs and Products, user information, and subscriptions over. However, customizations such as modules and themes cannot be automatically migrated, as the Drupal 9 baseline is very different to Drupal 7. For more information about upgrading from a Drupal 7 baseline to a Drupal 9 baseline, see Upgrading Drupal in the Drupal documentation.

The following sections take you through the migration process for the Developer Portal, and provide guidance on how to manually migrate any specific customizations to Drupal 9.

- Migration process for the Developer Portal
- Portal Delegated User Registries
- Custom themes
- Custom modules
- Custom Rules
- Custom content types and fields
- Advanced theme development
- Changing the page layout
- Changing the front page
- Features no longer available in the Developer Portal

Note: The ability to migrate is available only from IBM API Connect Version 5.0.8.7 onwards. If your deployment is at an earlier version, you must upgrade before migrating. See Upgrading your API Connect cloud for information about upgrading in Version 5. For more information about the supported versions for migration, see Migrating a Version 5 deployment.
Note: In Version 5, it was possible, though not recommended, to modify files on the Developer Portal server directly. For more information, see Developer Portal best practices for administrators. However, in Version 10, you should not make any system changes. Do not use the **kubectl exec** command to make changes inside the Developer Portal containers, and on OVA deployments do not make any modifications on the Developer Portal VM. Make any customizations on your Developer Portal by using the UI or CLI. Do not run a **kubectl exec** command on any Developer Portal containers unless asked to by IBM.

Migration process for the Developer Portal

The migration process for the Developer Portal migrates all of the following information to Version 10 for each site in your cluster:

- User information (if Portal Delegated User Registry is enabled, the process is slightly different; see Portal Delegated User Registries).
- Products and APIs.
- Consumer organizations.
- Applications.
- Subscriptions.

For information about the main migration process, see Migrating a Version 5 deployment.

Portal Delegated User Registries

In IBM API Connect Version 5, if Portal Delegated User Registry (PDUR) was selected for a Catalog, the user management was delegated from the management server to the Developer Portal. The site administrator within the Portal then performed the configuration of user registries, and the management server recorded that the delegation had taken place, and stored a record of the users that existed in the Catalog. However, the management service maintained no information about the configuration of the specific registries or how users mapped to them. In IBM API Connect Version 10, all user registry configuration takes place in the management server, and PDUR is no longer needed. Therefore, to migrate the PDUR user registries and users from v5 to v10, configuration information must be gathered from both the management server and the Portal node.

If your IBM API Connect Version 5 Developer Portal uses Portal Delegated User Registry (PDUR), you must first export the user information that is stored in the Version 5 Developer Portal local database. This user information can then be fed into the migration tooling so that the correct user registries can be created in the newer version of API Connect.

For more information about how to export the PDUR information from v5, see Exporting Portal Delegated User Registry user information. For more information about the migration process in v10, see Migration steps with PDUR.

Custom themes

If your Version 5 Developer Portal is using a custom theme, you'll need to create the custom theme again for the Drupal 9 baseline. Start by creating a sub-theme of the new Version 10 Developer Portal site by using the theme generator, and then manually customize the sub-theme to your specifications for Drupal 9 by using Cascading Style Sheets (CSS), or Sass CSS (SCSS). Note that using SCSS in your theme makes it far simpler to change colors. We've also added a color template theme generator, which means you can quickly generate a base color theme on which to build your customized site branding. For more information, see Creating a sub-theme.

Note, directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

Other useful resources:

- Tutorial: Creating a custom theme for the Developer Portal - takes you through how to use the theme generator, customize a theme, and install a custom theme.
- Changing the site logo - how to change your site logo.
- Changing the shortcut icon - how to change the shortcut icon (favicon).
- Creating sub-themes - Drupal documentation about creating a sub-themes.
- Theming differences between Drupal 6, 7 & 8 - Drupal documentation about theming differences.

Custom modules

If your Version 5 Developer Portal is using any custom modules, you will need to create these custom modules again for the Drupal 9 baseline. For more information on writing custom modules, see Extend.

Other useful resources:

- Creating custom modules - Drupal documentation about creating custom modules.
- Getting started creating custom modules - Drupal documentation giving background information and prerequisites needed for custom module development.
- Understanding hooks - Drupal documentations about hooks.
- Drupal API hooks - Drupal documentation about the hooks that are available.

Custom Rules

If your Version 5 Developer Portal is using any custom Rules, you will need to create them as custom modules for the Drupal 9 baseline. You cannot export the Drupal 7 Rules, and then import them into the Drupal 9 baseline, as the events and actions are implemented in a different way. For more information about custom modules, see the Custom modules section.

Custom content types and fields

If your Version 5 Developer Portal is using any custom content, you will need to create this content again for the Drupal 9 baseline.

For information about creating custom content types, see the following topics:

- Creating content types
- Adding fields to content types
- Adding custom fields to user records

Advanced theme development

If your Version 5 Developer Portal is using modified content type templates, you must create these templates again for the Drupal 9 baseline. In Drupal 9 the templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see Applying a modified content type template, and Creating a sub-theme. You can also follow a guided example of how to create a new theme, see Tutorial: Creating a custom theme for the Developer Portal.

Note:
Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect Version 10 releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

Changing the page layout

If your Version 5 Developer Portal is using a different page layout, you will need to create this layout again for the Drupal 9 baseline. The page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure > Block layout options on the Developer Portal administrator dashboard.

For information about how to configure the page layout, see Adding and changing the blocks displayed on Developer Portal pages.

Changing the front page

If your Version 5 Developer Portal is using a different front page, you will need to create this front page again for the Drupal 9 baseline. The front page is configured from the Structure > Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see Configuring the front page, and Adding custom pages.

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: Changing the front page banner block.
- Display featured API Products by creating a featured content block: Changing the front page Featured Content block.
- Create custom blocks with your own HTML content: Adding and changing the blocks displayed on Developer Portal pages.
- Set up the social block to include your organization Twitter feed: Integrating X or BlueSky data into the social block.

Features no longer available in the Developer Portal

The following features that are available in IBM API Connect Version 5, are not available in IBM API Connect Version 10:

- Security questions - these can now be created inside an OpenID Connect provider.
- Two-factor authentication - this can now be performed inside an OpenID Connect provider.
- Support tickets - no Drupal 9 equivalent module is currently available.

Upgrading your Developer Portal from Drupal 9 to Drupal 10

Information about the upgrade of the Developer Portal from Drupal 9 to Drupal 10.

The Developer Portal is based on the open source Drupal content management system. From API Connect 10.0.5.3, Drupal 9 is upgrading to Drupal 10, which also requires PHP 8.1. All existing Developer Portal sites will be upgraded to, and all new sites will be based on Drupal 10. Therefore, all modules and themes on your Developer Portal site must be compatible with Drupal 10 and PHP 8.1. The core modules and themes are automatically made compatible as part of the upgrade. However, if your Developer Portal sites contain any custom modules or themes, either written in-house or contributed by the Drupal community, it is your responsibility to ensure that they are Drupal 10 and PHP 8.1 compatible before the upgrade.

See the following topics for more detailed information about how to prepare your Developer Portal sites for the upgrade to Drupal 10.

- How to find your custom modules and themes on your Developer Portal.
- Prepare your Developer Portal for the update for Drupal 10.
- Upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant.

Upgrading from older versions of API Connect v10

If you are upgrading to 10.0.5.3 from 10.0.1.7 or earlier, or coming from 10.0.5.0 or earlier, your Developer Portal sites will first be upgraded to Drupal 9.5 and then to Drupal 10. This is because upgrading to Drupal 10 requires your site to be on at least Drupal 9.4.4.

Note that if you are in the category where a double upgrade occurs, your Developer Portal sites are going to take double the time to upgrade compared to your normal experience, because upgrading from Drupal 9 to Drupal 10 is a major upgrade. Therefore, when you are planning your maintenance window for upgrading to 10.0.5.3, you need to be aware of the extended time frame. To shorten your upgrade window, consider removing the Developer Portal sites that you do not need.

How to find your custom modules and themes on your Developer Portal

Guidance on how to find what custom modules and themes you installed on your Developer Portal.

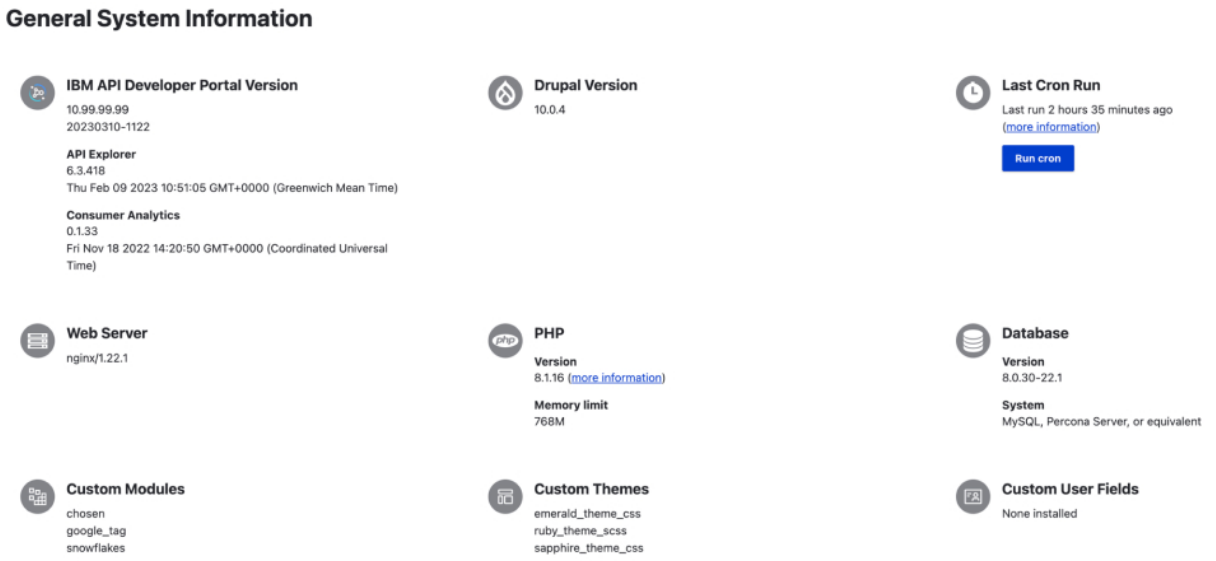
The Developer Portal within API Connect comes with built-in modules and themes that you can use to customize your site. You can extend your customizations by installing external custom modules and themes, or even ones written by yourself. If you are unsure which custom modules and themes are installed on your Developer Portal, you can use one of the following methods to find out.

1. Method 1. Developer Portal admin status report (recommended)
2. Method 2. Developer Portal toolkit CLI
3. Method 3. Developer Portal container

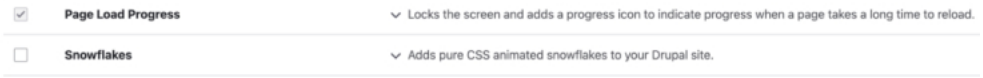
Method 1. Developer Portal admin status report (recommended)

1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Manage > Reports > Status report.

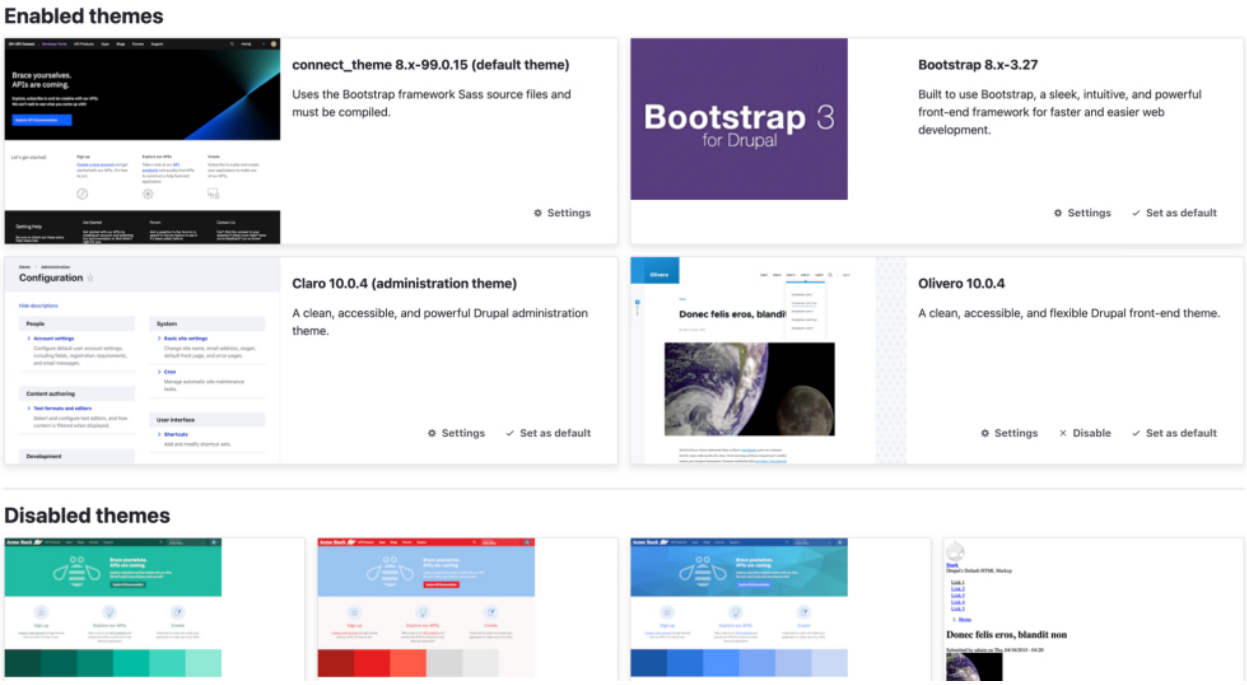
- The custom modules and themes are listed in the Custom Modules and Custom Themes sections at the end of the page.



4. Check which of your custom modules are enabled or disabled by clicking Manage > Extend.
   - The enabled modules are displayed with a selected checkbox, and the disabled ones are not selected as seen in the following example.



5. Check which of your custom themes are enabled or disabled by clicking Manage > Appearance.
   - Find your themes that are categorized into Enabled and Disabled sections.



Method 2. Developer Portal toolkit CLI

Use the **`custom-module:create-export`** and **`custom-theme:create-export`** commands to extract your custom modules and themes into a compressed file.

The compressed file includes a list of your custom modules and themes. For more information about using the Developer Portal toolkit CLI and all the other features it offers, see Overview of the Developer Portal command-line tool.

1. To list your modules, implement the following steps:
   a. Log in to the Developer Portal toolkit CLI as a provider organization.
   b. Run the following **`custom-module:create-export`** command against the Developer Portal.

```
apic custom-module:create-export --mode portaladmin [flags]
```

   c. Specify the appropriate **`org`** and **`catalog`** name.

For example,

```
❯ SERVER=myserver.ibm.com
❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
```

```
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into myserver.ibm.com successfully

❯ apic -s $SERVER -m portaladmin custom-module:create-export -o ibm -c api-connect-catalog-1
201 CREATED - Task ID: x8jupowmktkf8f2r

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to custom_module_createExport-20230322143819.tgz
```

After the command has run, extract your compressed export to see the modules inside. Or use **tar** directly as shown in the following example.

```
❯ tar --exclude='*/*' -tvf custom_module_createExport-20230322143819.tgz
drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 chosen/
drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 google_tag/
drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 snowflakes/
```

2. To check which one of your custom modules are enabled or disabled, implement the following steps:
   a. Run the following **modules:list** command to print the list of installed modules.

   ```
   apic modules:list --mode portaladmin [flags]
   ```

   b. Search for your custom modules from the result.
   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic -s $SERVER -m portaladmin modules:list -o ibm -c api-connect-catalog-1 --no-core
   .
   .
   .
   chosen:
     package: 'User interface'
     display_name: 'Chosen (chosen)'
     status: Disabled
     version: 3.0.5
   google_tag:
     package: Statistics
     display_name: 'Google Tag Manager (google_tag)'
     status: Enabled
     version: 8.x-1.6
   snowflakes:
     package: 'User interface'
     display_name: 'Snowflakes (snowflakes)'
     status: Enabled
     version: 2.0.1
   .
   .
   ```

3. To list your custom themes, implement the following steps:
   a. Log in to the Developer Portal toolkit CLI as a provider organization.
   b. Run the following **custom-theme:create-export** command against the Developer Portal.

   ```
   apic custom-theme:create-export --mode portaladmin [flags]
   ```

   c. Specify the appropriate **org** and **catalog** name.
   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
   Warning: Using default toolkit credentials.
   Enter your API Connect credentials
   Password?
   Logged into api.fyre-ci-136264-master.fyre.ibm.com successfully

   ❯ apic -s $SERVER -m portaladmin custom-theme:create-export -o ibm -c api-connect-catalog-1
   201 CREATED - Task ID: oh595vuywxsz3526

   Response Code - 202:

   Message(s) -
   The status of this task is: QUEUED

   Response Code - 200:

   Message(s) -
   The status of this task is: FINISHED and the artifact can now be streamed

   Saving File (Large files may take a while)...
   Incoming project saved to custom_theme_createExport-20230322143856.tgz
   ```

   After the command has run, extract your compressed export to see the themes inside. Or use **tar** to view the contents directly as shown in the following example.

```
❯ tar --exclude='*/*' -tvf custom_theme_createExport-20230322143856.tgz
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 emerald_theme_css/
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 ruby_theme_scss/
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 sapphire_theme_css/
```

4. To check which of your custom themes are enabled or disabled, implement the following steps:
   a. Run the following **themes:list** command to print the list of installed themes.

   ```
   apic themes:list --mode portaladmin [flags]
   ```

   b. Search for your custom themes from the result.
   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic -s $SERVER -m portaladmin themes:list -o ibm -c api-connect-catalog-1 --no-core
   bootstrap:
     package: Bootstrap
     display_name: 'Bootstrap (bootstrap)'
     status: Enabled
     version: 8.x-3.27
   .
   .
   .
   emerald_theme_css:
     package: Bootstrap
     display_name: 'emerald_theme_css (emerald_theme_css)'
     status: Disabled
     version: null
   ruby_theme_scss:
     package: Bootstrap
     display_name: 'ruby_theme_scss (ruby_theme_scss)'
     status: Disabled
     version: null
   sapphire_theme_css:
     package: Bootstrap
     display_name: 'sapphire_theme_css (sapphire_theme_css)'
     status: Disabled
     version: null
   ```

Method 3. Developer Portal container

If you are unable to access the Developer Portal settings or the Developer Portal toolkit CLI, check the Developer Portal container running within your Kubernetes or Red Hat OpenShift environment.

Note: You need access to the Developer Portal Kubernetes pods to be able to perform these steps.

1. Use **kubectl** or **oc** for Red Hat OpenShift environment to obtain a shell to the Developer Portal running container.

   Your Developer Portal sites are located within the **portal-www** pod in the **admin** container within the namespace that your Developer Portal subsystem is deployed to as seen in the following example.

   ```
   ❯ kubectl get pods -n apic | grep www
   portal-014179b4-www-0     2/2     Running     0          8d

   ❯ kubectl exec -n apic -it portal-014179b4-www-0 -c admin -- bash
   bash-4.4$
   ```

2. After you access the container, use the command **list_sites -a** to obtain the site alias for your Developer Portal. For example,

   ```
   bash-4.4$ list_sites -a
   daae4642-b1e2-4fd8-a5a7-77a68ed812ef.944dce4f-bbad-41ce-b166-aa2c9f8c4b17 => ibm.api-connect-catalog-1.portal.fyre-ci-
   136264-master.fyre.ibm.com (INSTALLED)
   daae4642-b1e2-4fd8-a5a7-77a68ed812ef.c560c004-852d-42c3-ae4e-797144a857af => ibm.api-connect-catalog-2.portal.fyre-ci-
   136264-master.fyre.ibm.com (INSTALLED)
   ```

   The Developer Portal **portal.fyre-ci-136264-master.fyre.ibm.com/ibm/api-connect-catalog-1** has the site alias **ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com**.

3. After you identify the Developer Portal that you want to look at, use the alias string within a **find** command to list your modules and themes, as shown in the following example.

   ```
   bash-4.4$ find /web/platforms/devportal*/sites/myserver.ibm.com/modules -mindepth 1 -maxdepth 1 -type d -exec basename {}
   \;
   chosen
   google_tag
   snowflake

   bash-4.4$ find /web/platforms/devportal*/sites/ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com/themes
   -mindepth 1 -maxdepth 1 -type d -exec basename {} \;
   emerald_theme_css
   ruby_theme_scss
   sapphire_theme_css
   ```

4. To check which of your custom modules and themes are enabled or disabled, implement the following sub-steps:
   a. Use the **drush** command-line tool within the container to print the list of installed modules and themes for your Developer Portal.
   b. Then, use the site alias that you obtained earlier to run the following **drush** command and find your custom modules and themes.

   ```
   bash-4.4$ drush @myserver.ibm.com pml --no-core
   Running: drush -y @daae4642-b1e2-4fd8-a5a7-77a68ed812ef-944dce4f-bbad-41ce-b166-aa2c9f8c4b17 pml --no-core
    ---------------------------------- ----------------------------------------------------------------------------------------
   - ---------- ----------------
     Package                          Name
   ```

```
Status     Version
 ---------------------------------- ----------------------------------------------------------------------------------------------------
- ---------- -----------------
  User                              Account Field Split (account_field_split)
Enabled
  Access control                    ACL (acl)
Enabled
  .
  .
  .
  User interface                    Chosen (chosen)
Disabled   3.0.5
  Statistics                        Google Tag Manager (google_tag)
Disabled   8.x-1.6
  User interface                    Snowflakes (snowflakes)
Disabled   2.0.1

  Bootstrap                         Bootstrap (bootstrap)
Enabled    8.x-3.27
  Bootstrap                         connect_theme (connect_theme)
Enabled    8.x-99.0.15
  Bootstrap                         emerald_theme_css (emerald_theme_css)
Disabled
  Bootstrap                         ruby_theme_scss (ruby_theme_scss)
Disabled
  Bootstrap                         sapphire_theme_css (sapphire_theme_css)
Disabled
```

Results

By using one of the three methods discussed in the topic, you managed to successfully list the custom modules and themes installed on your Developer Portal. This also allowed you to see which of these custom modules and themes are enabled or disabled.

1. Method 1. Developer Portal admin status report (recommended)
2. Method 2. Developer Portal toolkit CLI
3. Method 3. Developer Portal container

Next steps

Ensure that you keep your custom modules and themes up to date, and remove deprecated code within your own written custom modules and themes. If you are not using a custom module or theme, consider removing it. This helps mitigate problems when you want to migrate or upgrade your Developer Portal.

Prepare your Developer Portal for the update for Drupal 10

Guidance on how to prepare your Developer Portal site from Drupal 9 to Drupal 10.

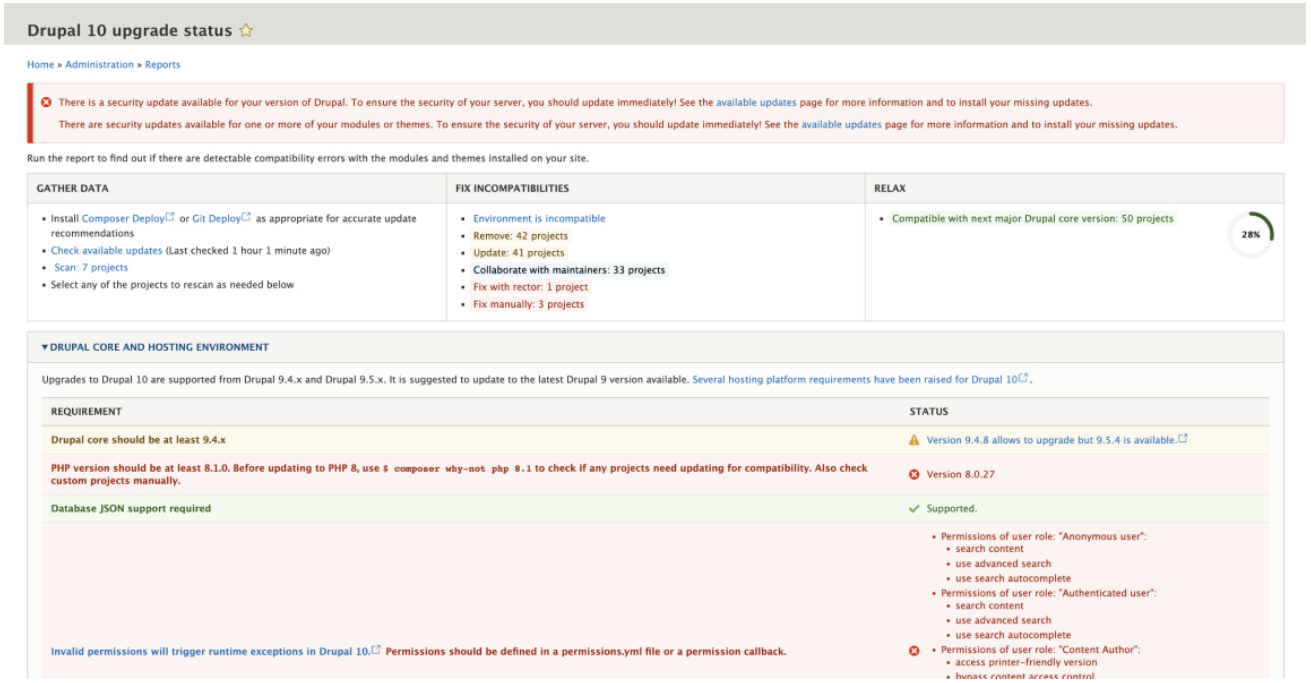
If your Developer Portal contains custom modules and themes that are written by yourself or downloaded from elsewhere, ensure that they are Drupal 10 compatible before you start the upgrade process. This action aims toward a seamless IBM® API Connect upgrade experience. To find more information about your modules and themes compatibility, download the Upgrade Status module available here.

Note: Before you start the upgrade, check the status of your modules and themes and if they are in use. Remove the ones that you do not use.
To learn more on how to prepare your Developer Portal for the Drupal 10 upgrade, check the following steps.

1. Installing the Upgrade Status module
2. Upgrading your module to be Drupal 10 compatible
3. Import your module into your Developer Portal
4. Verifying that your module is Drupal 10 compatible

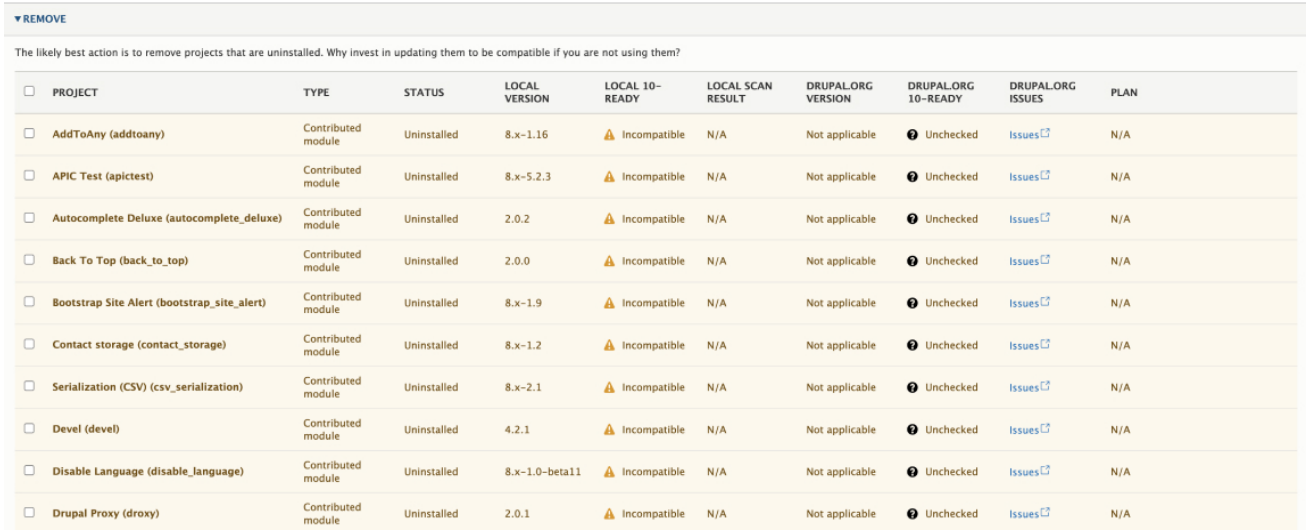
Installing the Upgrade Status module

1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Install the Upgrade Status module. For more information about how to install the Upgrade Status, see Installing custom modules.
4. When you finish your Upgrade Status installment, click Admin > Reports > Upgrade-status.

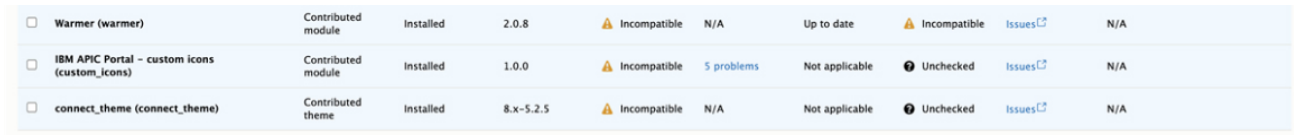


5. The DRUPAL CORE AND HOSTING ENVIRONMENT section can be ignored. This area is managed by IBM API Connect and gets resolved when you upgrade.
   Note: Your custom modules and themes must be PHP 8.1 compatible before you upgrade to Drupal 10, and you are responsible for doing the upgrade.
6. The list of projects further on the page are the ones that your Upgrade Status believes are not compatible with Drupal 10. These projects are categorized into sections, for example: REMOVE, UPDATE, COLLABORATE WITH MAINTAINERS.

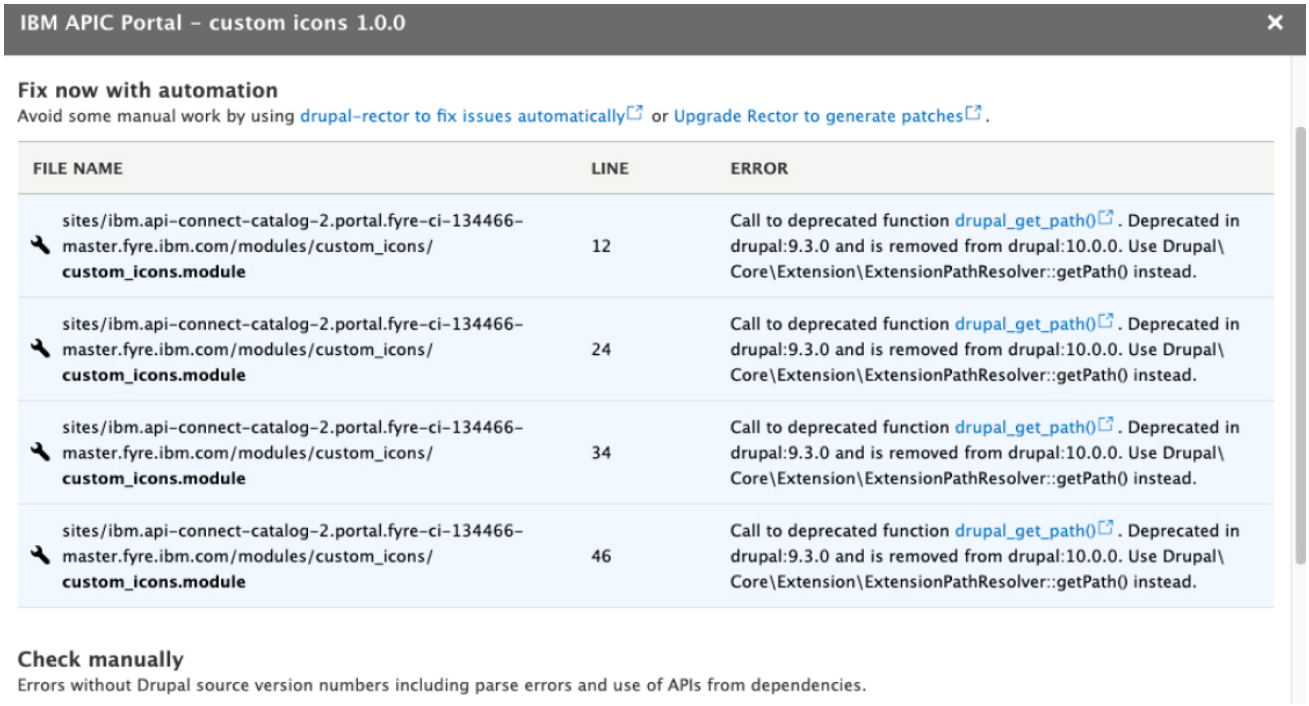
   When you upgrade IBM API Connect, the Drupal 10 compatibility is automatically given to the modules and themes that you have not created or installed manually.



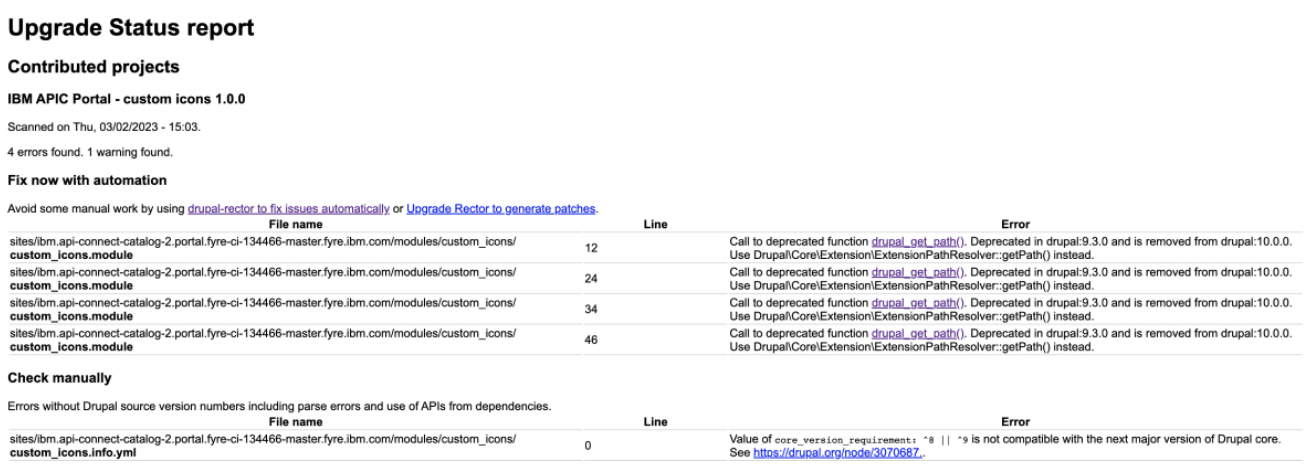
7. If you find your custom modules and themes there, you can scan them to reveal what changes are needed to make them Drupal 10 compatible. For instance, the following image demonstrates the process of scanning an installed custom module, named **`custom_icons`**.



8. Select your custom modules and themes and then click Scan selected. When completed, if your custom module or theme requires changes, you see a link on the row of them.
   Note: For Upgrade Status to identify all of the Drupal 10 compatibility issues in your custom modules and themes, you must have them enabled before scanning it.



9. Click export as HTML to see a clear view.



Upgrading your module to be Drupal 10 compatible

This module is an example of how you can read the report and fix your code to be compatible with Drupal 10.

1. The report shows that drupal_get_path() is deprecated, and the code must be changed to use the newer function **`getPath()`**. The following examples demonstrate the change to the newer extension type-specific version.

Before

```
 $name = preg_replace("/[^A-Za-z0-9]/", '', $returnValue);
  $returnValue = Url::fromUri('internal:/' . drupal_get_path('module', 'custom_icons') . '/images/' .
_custom_image_getRandomImageName($name))
    ->toString();
```

After

```
$name = preg_replace("/[^A-Za-z0-9]/", '', $returnValue);
  $iconPath = \Drupal::service('extension.list.module')->getPath('custom_icons');
  $returnValue = Url::fromUri('internal:/' . $iconPath . '/images/' . _custom_image_getRandomImageName($name))
    ->toString();
```

2. Add the new version into the **`info.yml`** file.
3. **`Drupal/Core/Extension/Extension List`** is still present in Drupal 8 and Drupal 9, so you can keep them, and add on support for Drupal 10.
4. Modify the version number when you make a new change to the module as seen in the following example.

Before

```
 name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^8 || ^9
```

```
version: 1.0.1
project: 'custom_icons'
dependencies:
  - ibm_apim

After

name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.2
project: 'custom_icons'
dependencies:
  - ibm_apim
```

Import your module into your Developer Portal

Import the module by using the Developer Portal Toolkit CLI. For more information about how to use the Developer Portal CLI, see Getting started with the Portal CLI commands.

For example,

```
❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into api.fyre-ci-134466-master.fyre.ibm.com successfully

❯ apic -s $SERVER -m portaladmin custom-module:create-import -o ibm -c api-connect-catalog-2 /tmp/custom_icons.zip
Loading File (Large files may take a while)...

201 CREATED - Task ID: wp5fhmm9l74pmkw1

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 200:

2023-02-27 14:39:38: CLI task (custom_module:import) starting.
2023-02-27 14:39:40: Deleting existing custom module /var/aegir/platforms/devportal-9.x-10.0.5.2-20230105-1720/sites/ibm.api-connect-catalog-2.portal.fyre-ci-134466-master.fyre.ibm.com/modules/custom_icons
2023-02-27 14:39:40: Importing custom module custom_icons
2023-02-27 14:40:25: CLI task (custom_module:import) completed successfully.
```

Alternatively, import your updated module by installing it again using the Developer Portal UI. For more information about how to install custom modules, see Installing custom modules.

Verifying that your module is Drupal 10 compatible

The updated module is now imported into the Developer Portal. Return to the Upgrade Status report page to rescan the module. When it becomes compatible with Drupal 10, it appears at the end of the page.

Workbench (workbench)	Contributed module	Installed	8.x-1.4	✓ Compatible	N/A	Up to date	✓ Compatible	Issues	N/A
IBM APIC Portal - custom icons (custom_icons)	Contributed module	Installed	1.0.0	✓ Compatible	No problems found	Not applicable	? Unchecked	Issues	N/A
Snowflakes (snowflakes)	Contributed module	Uninstalled	2.0.1	✓ Compatible	3 problems	Not applicable	? Unchecked	Issues	N/A

Results

You used the Upgrade Status module to identify and fix the Drupal 10 compatibility problems with your custom modules and themes. However, this process might not cover everything that you need to be ready for the upgrade to Drupal 10. Drupal 10 requires PHP 8.1, so you might need to change your custom modules and themes to support it. Remember to keep your custom modules and themes up to date, and to remove deprecated code within your own written custom modules and themes.

Upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant

Guidance on how to upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant.

The following sections provide examples of the most common updates that you might need to make. However, you must check the deprecation lists for Drupal and PHP to ensure that you cover all of the scenarios in your Developer Portal sites.

Notable changes the update brings

The following items are some of the key changes in Drupal 10.

- **`CKEditor4`** is removed and **`CKEditor5`** is now the default text editor.
- **`Claro`** is now the default theme for the Admin UI, which gives it a modern and refreshing look.
- Ensure that none of your custom modules depend on them as they will not be there after the upgrade.

  The following modules are uninstalled as they do not support Drupal 10:
  - ckeditor_media_embed
  - console
  - flood_unblock
  - message
  - message_notify
  - message_subscribe
  - video_embed_field
  - video_embed_html5
  - content_browser
  - entity_browser
  - entity_browser_enhanced
  - entity_embed
  - file_browser
  - editor_file
  - color
  - Unlimited_number
  - embed
  - ckeditor
  - quickedit
- The Drupal 10 upgrade comes with a major Symfony upgrade version. Drupal 9 used Symfony 4.4, and Drupal 10 now uses Symfony 6, so if you are using any Symfony ensure that they have not been deprecated. Symfony provides a guide at the following link https://symfony.com/doc/current/setup/upgrade_major.html.
- The default Drush version is now Drush 11. If you are writing Drush commands in your custom modules, you must ensure they are Drush 11 compatible. The following links provide examples on how you can achieve compatibility, https://www.specbee.com/blogs/writing-your-own-custom-drush-9-and-10-commands and https://www.drush.org/11.x/commands/.

PHP 8.1 deprecations

The following items are some of the key PHP 8.1 deprecations.

Passing null to non-nullable internal function parameters is deprecated
: There are multiple scenarios that require a fix with the possibility to pass a **`null`** to some PHP functions.
The following example is the most common PHP deprecation.
`Before:`

```
$redacted_url = $url;
if (strlen($redacted_url) > 0 && strpos($redacted_url, '/') !== 0) {
```

`After:`

```
$redacted_url = $url ?? '';
if (strlen($redacted_url) > 0 && strpos($redacted_url, '/') !== 0) {
```

Optional parameters specified before the required parameters
: Some functions in code have optional parameters before the required ones. However, in PHP 8.1, the required parameters come after the optional ones.

Improved type safety
: PHP 8.1 improves the type of safety, which can result in numerous warnings that might require changing functions and variable declarations.
The following example addresses the improved safety and the optional parameters before required parameters deprecations.
`Before:`

```
protected $id;

public function oldFunction($url = '', $data) {
  return $id;
}
```

`After:`

```

/**
 * Drupal entity ID
```

```
 *
 * @var string
 */
protected $id;

public function newFunction(someObject $data, string $url = ''): string {
  return $id;
}
```

Drupal 10 deprecations

The following items are some of the key PHP 8.1 deprecations.

Entity queries now require an `accessCheck`

If you have custom modules with entities, you must do an `accessCheck`. For more information about access checking, see https://www.drupal.org/node/3201242.
For example,
Before:

```
$query = \Drupal::entityQuery('node');
$query->condition('type', 'api');
$query->condition('status', 1);
$nids = $query->execute();
```

After:

```
$query = \Drupal::entityQuery('node');
$query->condition('type', 'api');
$query->condition('status', 1);
$nids = $query->accessCheck()->execute();
```

The `Once` function is removed from the jQuery library and added to its own core library

If you have any modules that use the `once`function in your JavaScript files, you need an update to pull in the new library. For more information about how to remove jQuery dependency, see https://www.drupal.org/node/3158256.
For more examples on how you might upgrade your code, see https://www.drupal.org/project/drupal/issues/3183149.
For example,
Before:

```
// ibm_apim.libraries.yml
validate_password:
  version: 1.x

// validate_password.js
(function($, Drupal, drupalSettings) {
  var $passwordInput = $(context).find('input.js-password-field').once('ibmApimValidatePassword');
})(jQuery, Drupal, drupalSettings);
```

After:

```
// ibm_apim.libraries.yml
validate_password:
  version: 1.x
  dependencies:
    - core/once

// validate_password.js
(function($, Drupal, drupalSettings, once) {
  var $passwordInput = $(once('ibmApimValidatePassword', context)).find('input.js-password-field');
})(jQuery, Drupal, drupalSettings, once);
```

The `app.root` and `site.path` services that are converted into container parameters

If you use the `app.root` and `site.path` services in your custom modules, you must ensure they are converted into container parameters.
For example,
Before:

```
 \Drupal::service('config.factory')
    ->getEditable('locale.settings')
    ->set('translation.use_source', 'local')
    ->set('translation.path', \Drupal::service('site.path') . '/translations')
    ->save();
```

After:

```
\Drupal::service('config.factory')
    ->getEditable('locale.settings')
    ->set('translation.use_source', 'local')
    ->set('translation.path', \Drupal::getContainer()->getParameter('site.path') . '/translations')
    ->save();
```

The parameters of some `Forms`are updated, so be aware if you are extending them.

If you are extending your `Forms`, note the parameters of some of them have changed. For more information about the updated parameters, see https://www.drupal.org/node/3251987.

Next steps

This topic covers the key upgrades you might need when upgrading your custom modules to be Drupal 10 and PHP 8.1 compliant. However, note that it is your responsibility to check the deprecation lists for Drupal and PHP to ensure that you cover all of the scenarios in your Developer Portal sites.

For more information about making your custom modules Drupal 10 and PHP 8.1 compliant, see the following links:

- Deprecation checking and correction tools.
- Deprecated modules and themes.
- List of APIs deprecated and now removed from Drupal 10.
- Whats new in PHP 8.1.
- Symfony Upgrade Guide.
- Drush 11 commands.

Upgrading your Developer Portal from Drupal 10 to Drupal 11

The Developer Portal is based on the open source Drupal content management system. From API Connect 10.0.8.3, Drupal 10 is upgrading to Drupal 11.

Starting with API Connect 10.0.8.3, all the existing Developer Portal sites are upgraded to Drupal 11, and all new sites that you create must be based on Drupal 11. Therefore, all modules and themes on your Developer Portal site is compatible with Drupal 11. The core modules and themes are automatically made compatible as part of the upgrade.
Note: If your Developer Portal sites contain any custom modules or themes, either written in-house or contributed by the Drupal community, it is your responsibility to ensure that they are Drupal 11 compatible before the upgrade.
For more information about how to prepare your Developer Portal sites for the upgrade to Drupal 11, see the following topics:

- How to find your custom modules and themes on your Developer Portal.
- Prepare your Developer Portal for the update for Drupal 11.
- Upgrade your custom modules to be Drupal 11 compliant.

Upgrading from older versions of API Connect 10.0.8.3

If you are upgrading to API Connect 10.0.8.3 from 10.0.8.0, your Developer Portal sites are first upgraded to Drupal 10.4 and then to Drupal 11. This is because upgrading to Drupal 11 requires your site to be on at least Drupal 10.3.
Note: If you are in the category where a double upgrade occurs, your Developer Portal sites are going to take double the time to upgrade compared to your normal experience. This time consumption occurs because the upgrade from Drupal 10 to Drupal 11 is a major upgrade. Therefore, when you are planning your maintenance window for upgrading your API Connect deployment to 10.0.8.3, you need to be aware of the extended time frame. To shorten your upgrade window, consider removing the Developer Portal sites that you do not need.

Further reading

For more information about upgrading the Developer Portal to Drupal 11, see the following links:

- Deprecation checking and correction tools.
- Deprecated modules and themes.
- List of APIs deprecated and now removed from Drupal 11.
- Symfony Upgrade Guide.
- Drush 13.6.0 commands.

  Guidance on how to find what custom modules and themes you installed on your Developer Portal.
- **Preparing to upgrade your Developer Portal to Drupal 11**
  Make all the custom modules and themes in your Developer Portal are Drupal 11 compatible before you start the upgrade process.
- **Upgrading to class-based hooks in Drupal 11**
  Starting with Drupal 11, you can define hooks as class-based attributes that align with modern PHP practices to improve the ease of maintenance.

Finding your custom modules and themes on your Developer Portal

Guidance on how to find what custom modules and themes you installed on your Developer Portal.

The Developer Portal within API Connect comes with built-in modules and themes that you can use to customize your site. You can extend your customizations by installing external custom modules and themes, or even ones written by yourself. If you are unsure which custom modules and themes are installed on your Developer Portal, you can use one of the following methods to find out.

1. Method 1. Developer Portal admin status report (recommended)
2. Method 2. Developer Portal toolkit CLI
3. Method 3. Developer Portal container

Results

By using one of the three methods discussed in the topic, you managed to successfully list the custom modules and themes that are installed on your Developer Portal. This also allowed you to see which of these custom modules and themes are enabled or disabled.

1. Method 1. Developer Portal admin status report (recommended)
2. Method 2. Developer Portal toolkit CLI
3. Method 3. Developer Portal container

Next steps

Make sure that you keep your custom modules and themes up to date, and remove deprecated code within your own written custom modules and themes. If you are not using a custom module or theme, consider removing it. This helps mitigate problems when you want to migrate or upgrade your Developer Portal.

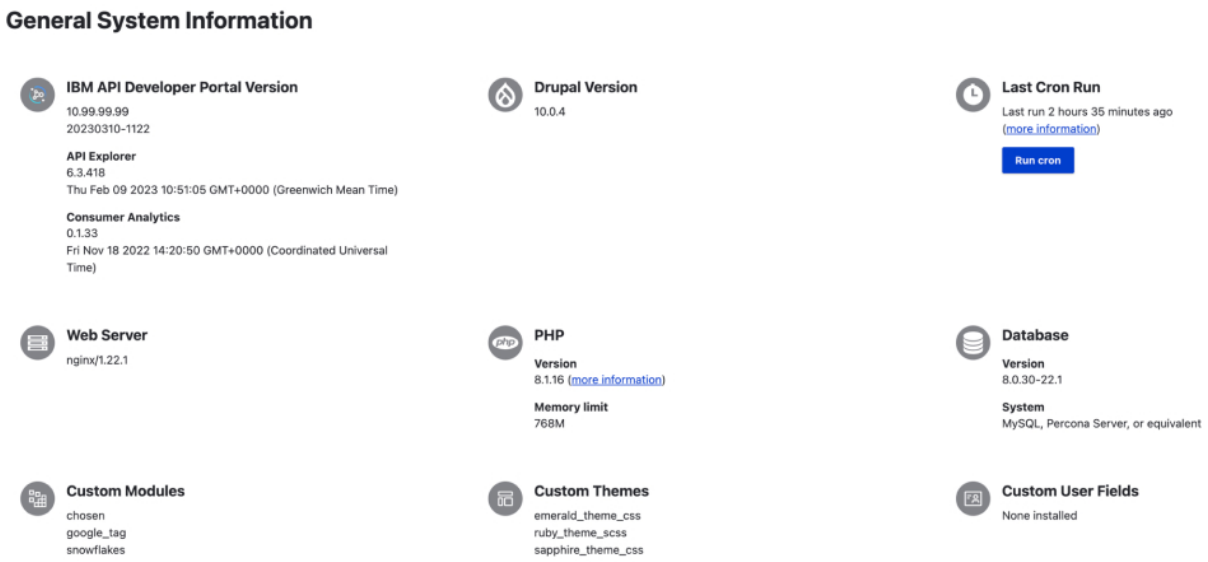
- **Method 1. Developer Portal admin status report (recommended)**
  Use the Developer Portal admin status report to quickly check which custom modules and themes are currently enabled or disabled in your portal. This helps administrators monitor and manage site functionality and appearance efficiently.
- **Method 2. Developer Portal toolkit CLI**
  Use the `custom-module:create-export` and `custom-theme:create-export` commands to extract your custom modules and themes into a compressed file.
- **Method 3. Developer Portal container**
  If you are unable to access the Developer Portal settings or the Developer Portal toolkit CLI, check the Developer Portal container running within your Kubernetes or Red Hat OpenShift environment.

Method 1. Developer Portal admin status report (recommended)

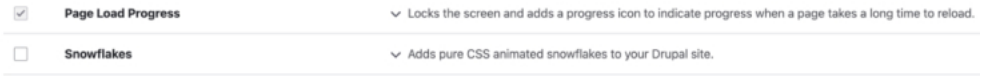
Use the Developer Portal admin status report to quickly check which custom modules and themes are currently enabled or disabled in your portal. This helps administrators monitor and manage site functionality and appearance efficiently.

Procedure

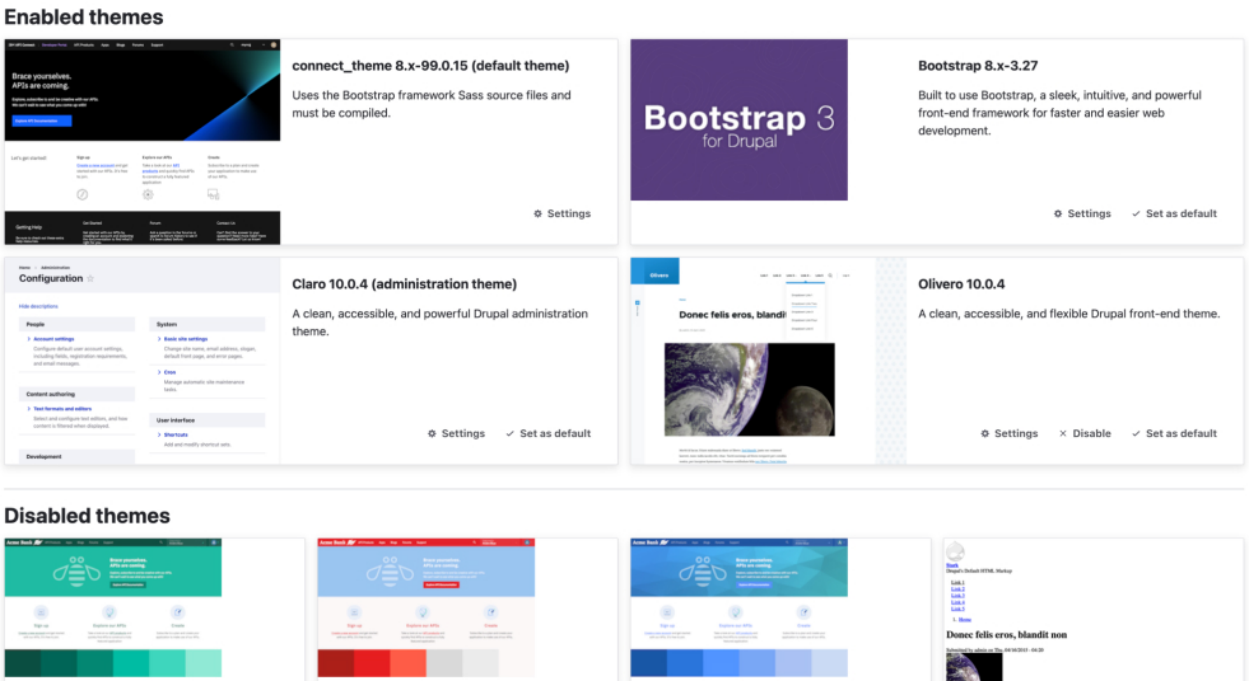
1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Manage > Reports > Status report.
   - The custom modules and themes are listed in the Custom Modules and Custom Themes sections at the end of the page.



4. Check which of your custom modules are enabled or disabled by clicking Manage > Extend.
   - The enabled modules are displayed with a selected checkbox, and the disabled ones are not selected as seen in the following example.



5. Check which of your custom themes are enabled or disabled by clicking Manage > Appearance.
   - Find your themes that are categorized into Enabled and Disabled sections.



Method 2. Developer Portal toolkit CLI

Use the **custom-module:create-export** and **custom-theme:create-export** commands to extract your custom modules and themes into a compressed file.

About this task

The compressed file includes a list of your custom modules and themes. For more information about using the Developer Portal toolkit CLI and all the other features it offers, see Overview of the Developer Portal command-line tool.

Procedure

1. To list your modules, implement the following steps:
   a. Log in to the Developer Portal toolkit CLI as a provider organization.
   b. Run the following **custom-module:create-export** command against the Developer Portal.

      ```
      apic custom-module:create-export --mode portaladmin [flags]
      ```

   c. Specify the appropriate **org** and **catalog** name.

   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
   Warning: Using default toolkit credentials.
   Enter your API Connect credentials
   Password?
   Logged into myserver.ibm.com successfully

   ❯ apic -s $SERVER -m portaladmin custom-module:create-export -o ibm -c api-connect-catalog-1
   201 CREATED - Task ID: x8jupowmktkf8f2r

   Response Code - 202:

   Message(s) -
   The status of this task is: QUEUED

   Response Code - 200:

   Message(s) -
   The status of this task is: FINISHED and the artifact can now be streamed

   Saving File (Large files may take a while)...
   Incoming project saved to custom_module_createExport-20230322143819.tgz
   ```

   After the command has run, extract your compressed export to see the modules inside. Or use **tar** directly as shown in the following example.

   ```
   ❯ tar --exclude='*/*' -tvf custom_module_createExport-20230322143819.tgz
   drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 chosen/
   drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 google_tag/
   drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 snowflakes/
   ```

2. To check which one of your custom modules are enabled or disabled, implement the following steps:
   a. Run the following **modules:list** command to print the list of installed modules.

```
apic modules:list --mode portaladmin [flags]
```

b. Search for your custom modules from the result.
For example,

```
❯ SERVER=myserver.ibm.com
❯ apic -s $SERVER -m portaladmin modules:list -o ibm -c api-connect-catalog-1 --no-core
.
.
.
chosen:
  package: 'User interface'
  display_name: 'Chosen (chosen)'
  status: Disabled
  version: 3.0.5
google_tag:
  package: Statistics
  display_name: 'Google Tag Manager (google_tag)'
  status: Enabled
  version: 8.x-1.6
snowflakes:
  package: 'User interface'
  display_name: 'Snowflakes (snowflakes)'
  status: Enabled
  version: 2.0.1
.
.
```

3. To list your custom themes, implement the following steps:
   a. Log in to the Developer Portal toolkit CLI as a provider organization.
   b. Run the following `custom-theme:create-export` command against the Developer Portal.

```
apic custom-theme:create-export --mode portaladmin [flags]
```

   c. Specify the appropriate `org` and `catalog` name.
   For example,

```
❯ SERVER=myserver.ibm.com
❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into api.fyre-ci-136264-master.fyre.ibm.com successfully

❯ apic -s $SERVER -m portaladmin custom-theme:create-export -o ibm -c api-connect-catalog-1
201 CREATED - Task ID: oh595vuywxsz3526

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to custom_theme_createExport-20230322143856.tgz
```

   Run the command and then extract your compressed export to see the themes inside. Or use `tar` to view the contents directly as shown in the following example.

```
❯ tar --exclude='*/*' -tvf custom_theme_createExport-20230322143856.tgz
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 emerald_theme_css/
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 ruby_theme_scss/
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 sapphire_theme_css/
```

4. To check that which of your custom themes are enabled or disabled, implement the following steps:
   a. Run the following `themes:list` command to print the list of installed themes.

```
apic themes:list --mode portaladmin [flags]
```

   b. Search for your custom themes from the result.
   For example,

```
❯ SERVER=myserver.ibm.com
❯ apic -s $SERVER -m portaladmin themes:list -o ibm -c api-connect-catalog-1 --no-core
bootstrap:
  package: Bootstrap
  display_name: 'Bootstrap (bootstrap)'
  status: Enabled
  version: 8.x-3.27
.
.
.
emerald_theme_css:
  package: Bootstrap
  display_name: 'emerald_theme_css (emerald_theme_css)'
  status: Disabled
  version: null
ruby_theme_scss:
  package: Bootstrap
  display_name: 'ruby_theme_scss (ruby_theme_scss)'
```

```
  status: Disabled
  version: null
sapphire_theme_css:
  package: Bootstrap
  display_name: 'sapphire_theme_css (sapphire_theme_css)'
  status: Disabled
  version: null
```

Method 3. Developer Portal container

If you are unable to access the Developer Portal settings or the Developer Portal toolkit CLI, check the Developer Portal container running within your Kubernetes or Red Hat OpenShift environment.

Before you begin

You need access to the Developer Portal Kubernetes pods to be able to perform these steps.

Procedure

1. To obtain a shell to the Developer Portal running container, use **kubectl** or **oc** for Red Hat OpenShift environment.
   Your Developer Portal sites are located within the **portal-www** pod in the **admin** container within the namespace that your Developer Portal subsystem is deployed to as seen in the following example.

   ```
   ❯ kubectl get pods -n apic | grep www
   portal-014179b4-www-0     2/2     Running     0          8d

   ❯ kubectl exec -n apic -it portal-014179b4-www-0 -c admin -- bash
   bash-4.4$
   ```

2. Run the command **list_sites -a** to obtain the site alias for your Developer Portal.

   ```
   bash-4.4$ list_sites -a
   daae4642-b1e2-4fd8-a5a7-77a68ed812ef.944dce4f-bbad-41ce-b166-aa2c9f8c4b17 => ibm.api-connect-catalog-1.portal.fyre-ci-
   136264-master.fyre.ibm.com (INSTALLED)
   daae4642-b1e2-4fd8-a5a7-77a68ed812ef.c560c004-852d-42c3-ae4e-797144a857af => ibm.api-connect-catalog-2.portal.fyre-ci-
   136264-master.fyre.ibm.com (INSTALLED)
   ```

   The Developer Portal **portal.fyre-ci-136264-master.fyre.ibm.com/ibm/api-connect-catalog-1** has the site alias **ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com**.

3. Identify the Developer Portal that you want to look at and then use the alias string within a **find** command to list your modules and themes, as shown in the following example.

   ```
   bash-4.4$ find /web/platforms/devportal*/sites/myserver.ibm.com/modules -mindepth 1 -maxdepth 1 -type d -exec basename {}
   \;
   chosen
   google_tag
   snowflake

   bash-4.4$ find /web/platforms/devportal*/sites/ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com/themes
   -mindepth 1 -maxdepth 1 -type d -exec basename {} \;
   emerald_theme_css
   ruby_theme_scss
   sapphire_theme_css
   ```

4. To check which of your custom modules and themes are enabled or disabled, implement the following substeps:
   a. Use the **drush** command line tool within the container to print the list of installed modules and themes for your Developer Portal.
   b. Then, use the site alias that you obtained earlier to run the following **drush** command and find your custom modules and themes.

   ```
   bash-4.4$ drush @myserver.ibm.com pml --no-core
   Running: drush -y @daae4642-b1e2-4fd8-a5a7-77a68ed812ef-944dce4f-bbad-41ce-b166-aa2c9f8c4b17 pml --no-core
    ---------------------------------- ----------------------------------------------------------------------------------------
   - ---------- -----------------
     Package                          Name
   Status     Version
    ---------------------------------- ----------------------------------------------------------------------------------------
   - ---------- -----------------
     User                             Account Field Split (account_field_split)
   Enabled
     Access control                   ACL (acl)
   Enabled
     .
     .
     .
     User interface                   Chosen (chosen)
   Disabled   3.0.5
     Statistics                       Google Tag Manager (google_tag)
   Disabled   8.x-1.6
     User interface                   Snowflakes (snowflakes)
   Disabled   2.0.1

     Bootstrap                        Bootstrap (bootstrap)
   Enabled    8.x-3.27
     Bootstrap                        connect_theme (connect_theme)
   Enabled    8.x-99.0.15
     Bootstrap                        emerald_theme_css (emerald_theme_css)
   Disabled
   ```

```
  Bootstrap                       ruby_theme_scss (ruby_theme_scss)
Disabled
  Bootstrap                       sapphire_theme_css (sapphire_theme_css)
Disabled
```

Preparing to upgrade your Developer Portal to Drupal 11

Make all the custom modules and themes in your Developer Portal are Drupal 11 compatible before you start the upgrade process.

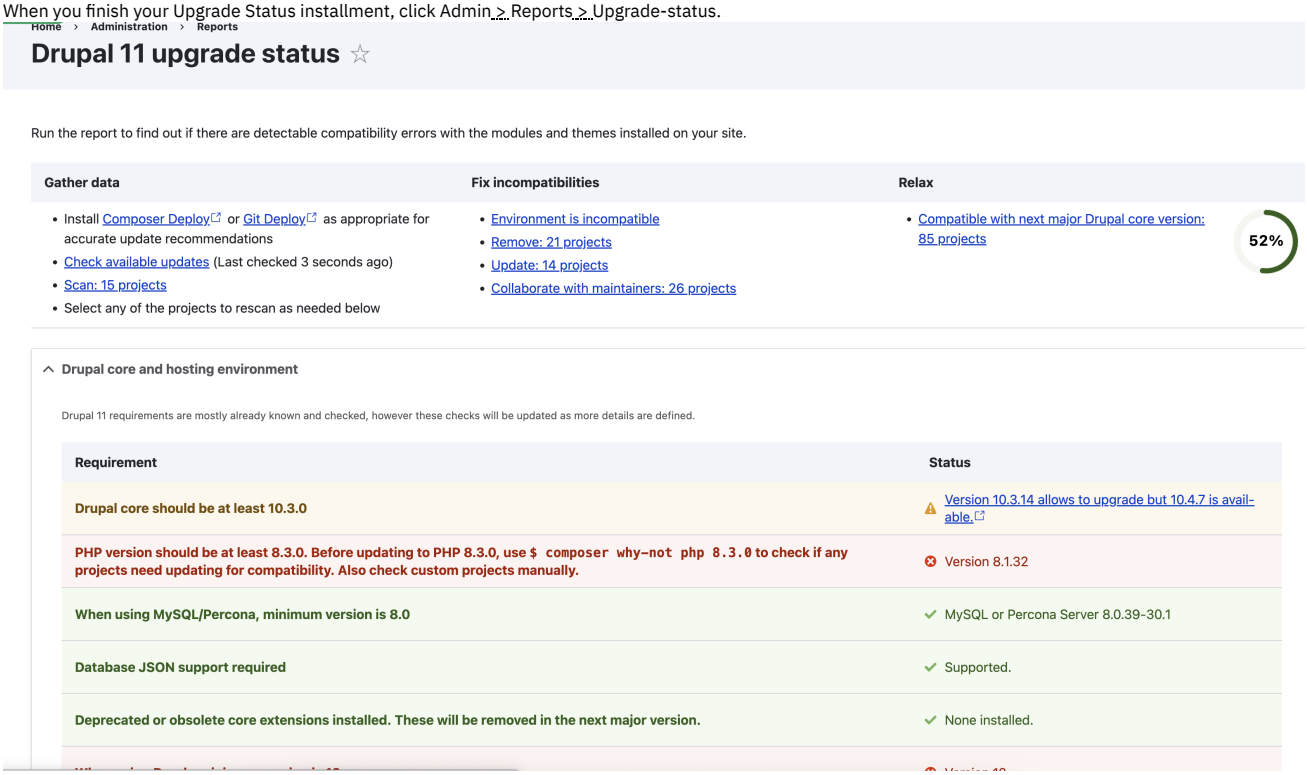
If your Developer Portal contains custom modules and themes that are written by yourself or downloaded from elsewhere, ensure that they are Drupal 11 compatible before you start the upgrade process. This action can help create a seamless IBM® API Connect upgrade experience. For more information about your modules and themes compatibility, download the **`Upgrade status`** module from Upgrade status in the Drupal documentation.

Note: Before you start the upgrade, check the status of your modules and themes and if they are in use. Remove the ones that you do not use.
For more information about how to prepare your Developer Portal for the Drupal 11 upgrade, see the following steps:

1. Installing the upgrade status module
2. Upgrading your module to be Drupal 11 compatible
3. Importing your module into your Developer Portal
4. Verifying that your module is Drupal 11 compatible

Installing the upgrade status module

1. Log in to your Developer Portal as the administrator.
2. Install the Upgrade Status module. For more information about how to install the Upgrade Status, see Installing custom modules.
3. When you finish your Upgrade Status installment, click Admin > Reports > Upgrade-status.



You can ignore the Drupal core and hosting environment section as this area is managed by IBM API Connect and gets resolved when the upgrade is complete.
Important: Your custom modules and themes must be PHP 8.3 compatible before you upgrade to Drupal 11, and you are responsible for doing the upgrade.
The list of projects that are displayed on the Drupal 11 upgrade status page are the ones that are not compatible with Drupal 11. The **`Upgrade status`** module categorizes these projects into different sections. For example, Remove, Update, Collaborate with maintainers.

Note: When you upgrade IBM API Connect, the Drupal 11 compatibility is automatically given to the modules and themes that you have not created or installed manually. For details, see the following screenshot.

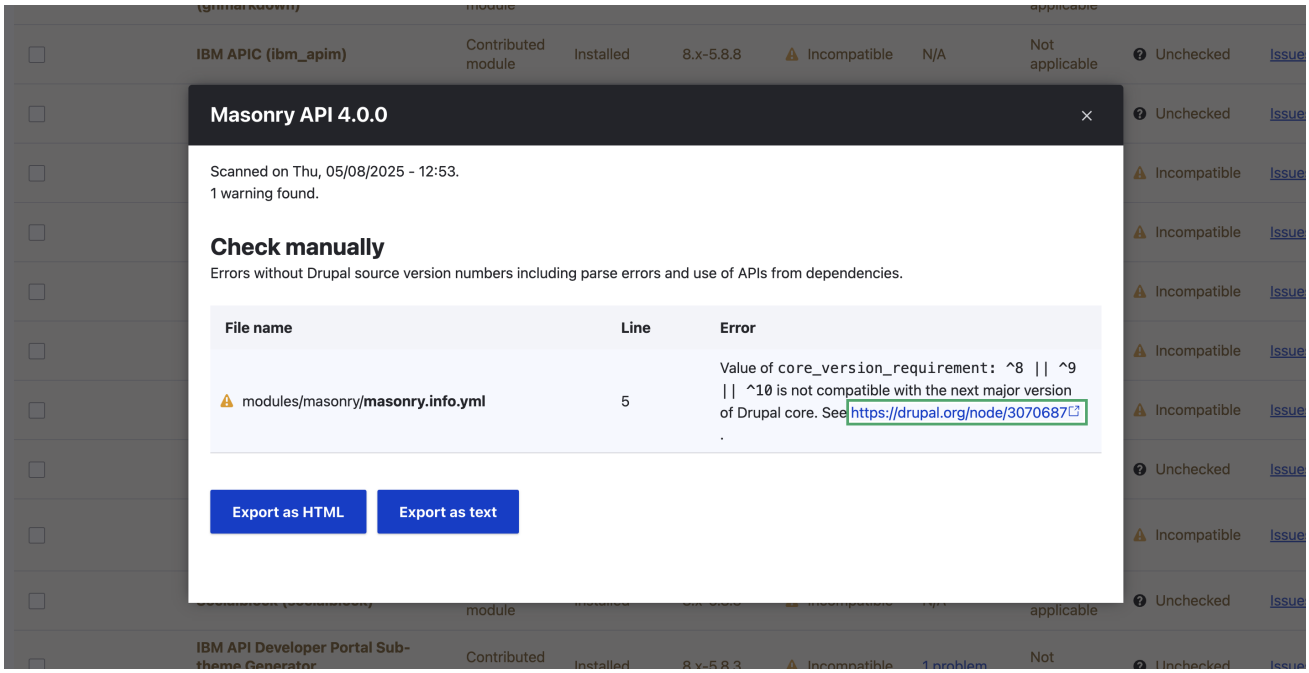
	Project	Type	Status	Local version	Local 11-ready	Local scan result	Drupal.org version	Drupal.org 11-ready	Drupal.org issues
	Account Field Split (account_field_split)	Contributed module	Installed	2.0.3	Incompatible	N/A	2.0.4	Compatible	Issues
	Blog (blog)	Contributed module	Installed	3.1.2	Incompatible	N/A	3.1.4	Compatible	Issues
	Clipboard.js (clipboardjs)	Contributed module	Installed	2.0.8	Incompatible	N/A	2.1.0-rc1	Compatible	Issues
	Contact Block (contact_block)	Contributed module	Installed	2.0.2	Incompatible	N/A	2.0.3	Compatible	Issues
	Client-side Hierarchical Select (cshs)	Contributed module	Installed	4.0.2	Incompatible	N/A	4.0.3	Compatible	Issues
	External Links (extlink)	Contributed module	Installed	8.x-1.7	Incompatible	N/A	2.0.4	Compatible	Issues
	FAQ Field (faqfield)	Contributed module	Installed	8.x-7.1	Incompatible	N/A	8.0.0	Compatible	Issues
	Flood control (flood_control)	Contributed module	Installed	2.3.4	Incompatible	N/A	3.0.0	Compatible	Issues
	Font Awesome (fontawesome)	Contributed module	Installed	8.x-2.26	Incompatible	N/A	3.0.0	Compatible	Issues
	Panels (panels)	Contributed module	Installed	8.x-4.8	Incompatible	N/A	8.x-4.9	Compatible	Issues
	Redirect 403 to User Login (r4032login)	Contributed module	Installed	2.2.2	Incompatible	N/A	2.2.3	Compatible	Issues
	RDF (rdf)	Contributed module	Installed	2.1.1	Incompatible	N/A	3.0.0-beta2	Compatible	Issues
	Views Bootstrap (views_bootstrap)	Contributed module	Installed	5.3.1	Incompatible	N/A	5.5.0-rc3	Compatible	Issues
	Views Taxonomy Term Name Depth (views_taxonomy_term_name_depth)	Contributed module	Installed	7.2.0	Incompatible	N/A	7.3.0	Compatible	Issues
	Rules (rules)	Contributed module	Installed	8.x-3.0-alpha9	Incompatible	9 problems	4.0.0	Compatible	Issues
	Bootstrap (bootstrap)	Contributed theme	Installed	8.x-3.32	Incompatible	N/A	5.0.2	Compatible	Issues

4. If you find your custom modules and themes on the Drupal 11 upgrade status page, select your custom modules and themes and then click Scan selected to reveal what changes are needed to make them Drupal 11 compatible. For details, see the following screenshot.

	Maintenance 200 (maintenance200)	Contributed module	Installed	8.x-2.1	Incompatible	N/A	Up to date	Incompatible	Issues
	Masonry API (masonry)	Contributed module	Installed	4.0.0	Incompatible	1 problem	Up to date	Incompatible	Issues
	Masonry Views (masonry_views)	Contributed module	Installed	4.0.0	Incompatible	N/A	Up to date	Incompatible	Issues

If your custom module or theme requires updates, you see a link to the corresponding themes or custom modules once the scan completed. For example, the following image demonstrates the process of scanning an installed custom module, named **`Masonry API`**.

Note: For the **`Upgrade status`** module to identify all the Drupal 11 compatibility issues in your custom modules and themes, you must enable the custom modules and themes before scanning it.



5. Click Export as HTML to get a clear view.

Upgrade Status report

Contributed projects

Masonry API 4.0.0

Scanned on Thu, 05/08/2025 - 12:53.

1 warning found.

Check manually

Errors without Drupal source version numbers including parse errors and use of APIs from dependencies.

File name	Line	Error
modules/masonry/**masonry.info.yml**	5	Value of `core_version_requirement: ^8 || ^9 || ^10` is not compatible with the next major version of Drupal core. See https://drupal.org/node/3070687.

6. Add the new version in the info.yml file and change the code for the deprecated functions to upgrade your module and make it compatible with Drupal 11.
7. When your module becomes compatible with Drupal 11, import your updated module by reinstalling it using the Developer Portal UI. For more information about how to install custom modules, see Installing custom modules.
8. Return to Upgrade status report page and rescan the module to verify that your module is Drupal 11 compatible.

Upgrading your module to be Drupal 11 compatible

This module is an example of how you can read the report and fix your code to make it compatible with Drupal 11.

1. Add the new version into the info.yml file. Keep Drupal/Core/Extension/Extension List as it is still present in Drupal 9 and Drupal 10, and add on support for Drupal 11.
   Note: If any custom modules use deprecated APIs that are not compatible with Drupal 11, it is your responsibility to make it compatible with Drupal 11.
2. When you make a change to the module, modify the version number as shown in the following example.

Before

```
 name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^9 || ^10
version: 1.0.1
project: 'custom_icons'
dependencies:
  - ibm_apim
```

After

```
name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^9 || ^10 || ^11
version: 1.0.2
project: 'custom_icons'
dependencies:
  - ibm_apim
```

Importing your module into your Developer Portal

Import the module by using Developer Portal Toolkit CLI. For more information about how to use the Developer Portal CLI, see Getting started with the Portal CLI commands.

For example,

```
❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into api.fyre-ci-134466-master.fyre.ibm.com successfully

❯ apic -s $SERVER -m portaladmin custom-module:create-import -o ibm -c api-connect-catalog-2 /tmp/custom_icons.zip
Loading File (Large files may take a while)...

201 CREATED - Task ID: wp5fhmm9l74pmkw1

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 202:

```

```
connect-catalog-2.portal.fyre-ci-134466-master.fyre.ibm.com/modules/custom_icons
2023-02-27 14:39:40: Importing custom module custom_icons
2023-02-27 14:40:25: CLI task (custom_module:import) completed successfully.
```

Alternatively, import your updated module by installing it again using the Developer Portal UI. For more information about how to install custom modules, see Installing custom modules.

Verifying that your module is Drupal 11 compatible

The updated module is now imported into the Developer Portal. Return to the Upgrade status report page to rescan the module. When it becomes compatible with Drupal 11, it appears at the end of the page.

Workbench (workbench)	Contributed module	Installed	8.x-1.4	✓ Compatible	N/A	Up to date	✓ Compatible	Issues	N/A
IBM APIC Portal – custom icons (custom_icons)	Contributed module	Installed	1.0.0	✓ Compatible	No problems found	Not applicable	? Unchecked	Issues	N/A
Snowflakes (snowflakes)	Contributed module	Uninstalled	2.0.1	✓ Compatible	3 problems	Not applicable	? Unchecked	Issues	N/A

Results

You used the **`Upgrade status`** module to identify and fix the Drupal 11 compatibility problems with your custom modules and themes. However, this process might not cover everything that you need to be ready for the upgrade to Drupal 11. Drupal 11 requires PHP 8.3, so you might need to change your custom modules and themes to support it.

Note: Remember to keep your custom modules and themes up to date, and to remove deprecated code within your own written custom modules and themes.

Upgrading to class-based hooks in Drupal 11

Starting with Drupal 11, you can define hooks as class-based attributes that align with modern PHP practices to improve the ease of maintenance.

Although the traditional procedural hooks that are defined as functions in the .module files still supports backward compatibility, use **`class-based`** syntax for Drupal 11. The suggested directory for defining hook classes is src/Hook/. For more information, see Drupal 11.1.0 release blog.

Important:

- Hooks are now annotated with the **`#[Hook]`** PHP attribute to indicate their role in the system.
- You cannot convert all hooks to class-based definitions. Some older or low-level hooks must remain as procedural functions.
- Before converting hooks, consult the official API documentation to ensure compatibility.

The following sections provide examples of the most common updates that you might need to make. However, you must check the deprecation lists for Drupal and PHP to ensure that you cover all the scenarios in your Developer Portal sites.

Notable changes the update brings

Some of the key changes in Drupal 11 include:

- The Drupal 11 upgrade comes with a major Symfony upgrade version. Drupal 10 used Symfony 6, and Drupal 11 now uses Symfony 7. If you are using any Symfony, ensure that they are not deprecated. For more information, see https://symfony.com/doc/current/setup/upgrade_major.html.
- The default Drush version is now Drush 13. If you are writing Drush commands in your custom modules, you must ensure that the commands are Drush 13 compatible.

Note:

- The custom modules and themes must be compatible with Drupal 11. For more information about finding the custom modules and themes on your Developer Portal, see How to find your custom modules and themes on your Developer Portal.
- It is your responsibility to check the deprecation lists for Drupal and PHP to ensure that you cover all scenarios in your Developer Portal sites.

For more information about making your custom modules compatible with Drupal 11, see the following links:

- Deprecation checking and correction tools.
- Deprecated modules and themes.
- List of APIs deprecated and now removed from Drupal 11.
- Symfony Upgrade Guide.
- Drush 13 commands.

Developer Portal tutorials

Tutorials for using the Developer Portal.

The following guided examples help you through some of the most common user scenarios in the Developer Portal, as well as some of the more complex areas.

Developer Portal tutorials by category
For API consumers Create an Application

Developer Portal tutorials by category
User authentication Adding a field to the sign up form Adding validation to a field on the sign up form Adding a field group to group fields in a content type
Getting started configuring the Developer Portal Creating the Portal Creating a private Portal site Customizing themes
Advanced customization Changing the front page Grouping products by category Adding a custom block to the front page Adding a custom block to a page other than the front page Using avatars Using image optimization Adding a Back to top button Creating a drop-down menu link Displaying blog posts on the front page Displaying tweets on the front page Changing the profile page to display firstname lastname, instead of username Using a custom weighting sort order on the product list page Configuring the RobotsTxt file Configuring the SecurityTxt file Synchronizing application credentials with an external server

Tutorial: Creating the Developer Portal

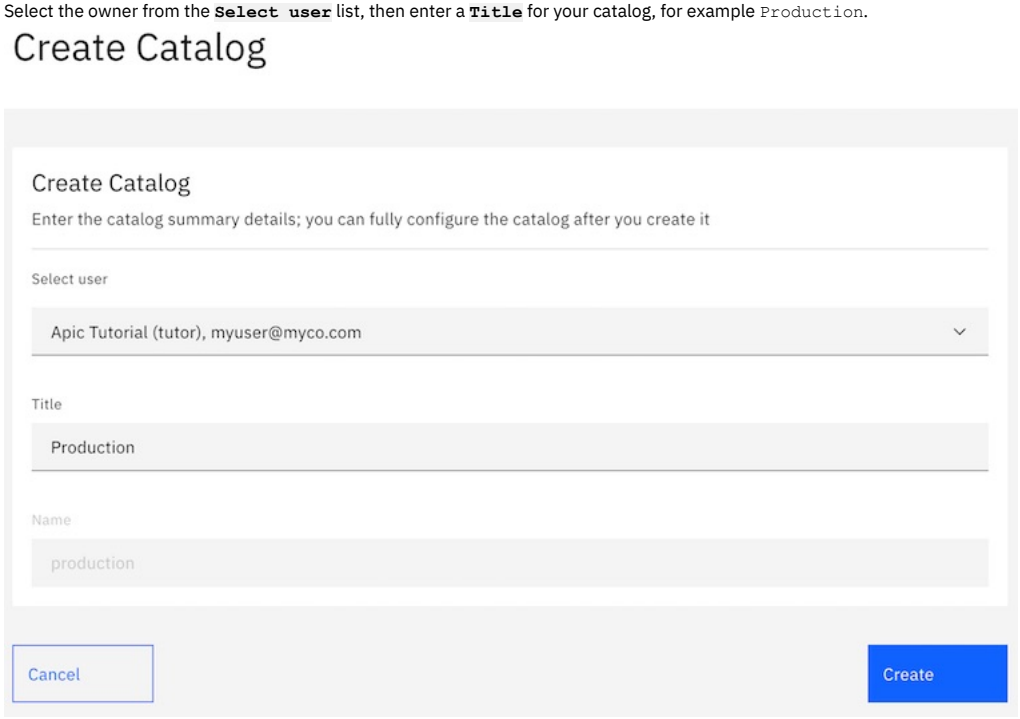
About this task

In this tutorial, you are going to complete the following lessons:

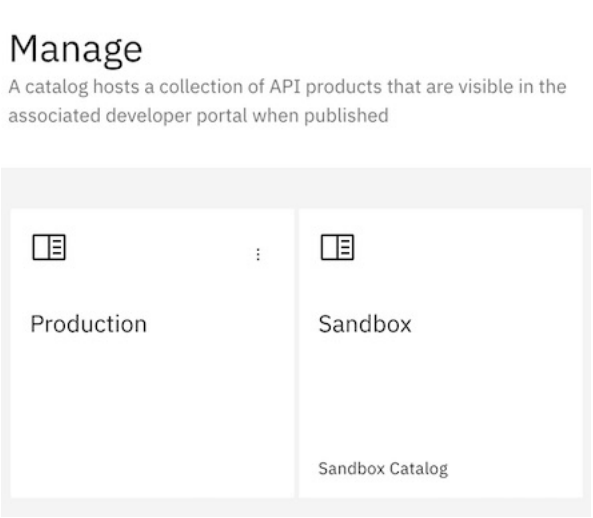
Enabling the Developer Portal through the API Manager

By proceeding with the following steps, you create an administrator account:

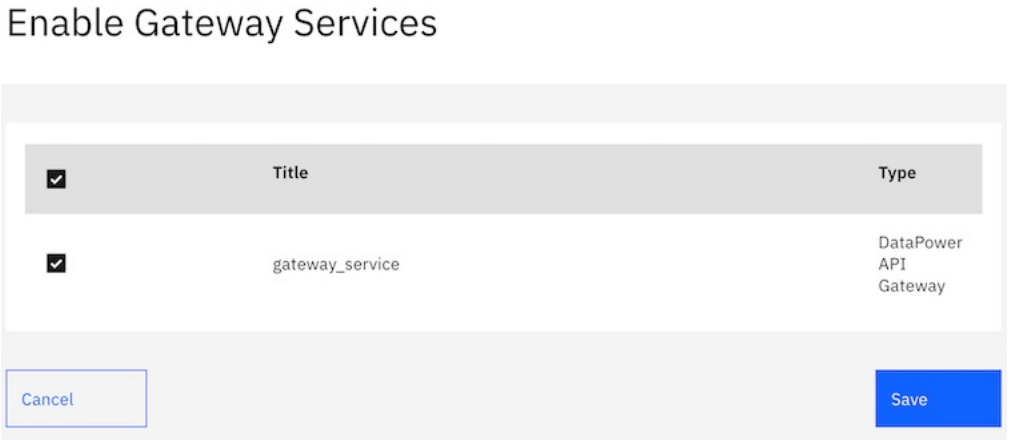
1. Log in to the API Manager
2. Click Manage, then click Add, and select Create catalog.
3. Select the owner from the **`Select user`** list, then enter a **`Title`** for your catalog, for example `Production`.



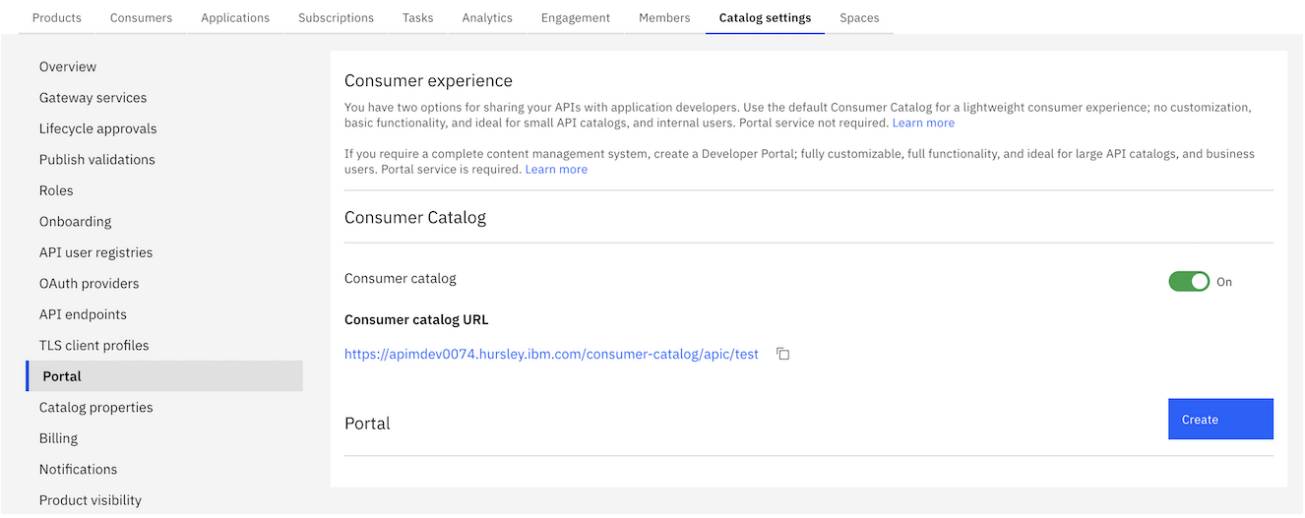
4. Click Create. The Manage page appears.



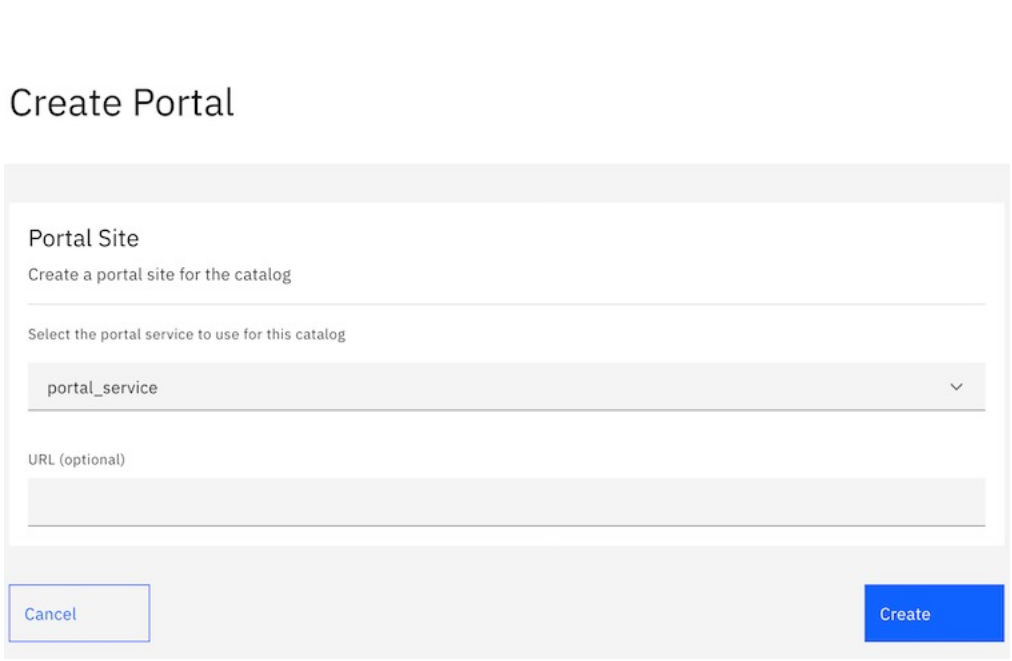
5. Click on the tile that corresponds to your new catalog, for example **`Production`**.
6. Click Catalog settings.
7. Click Gateway Services. If the message **`You currently don't have any gateway services`** is displayed, click Edit, select the configured gateway service, and click Save.



8. Click Portal.
9. Click Create.



10. Select a portal service to use. Click Create.



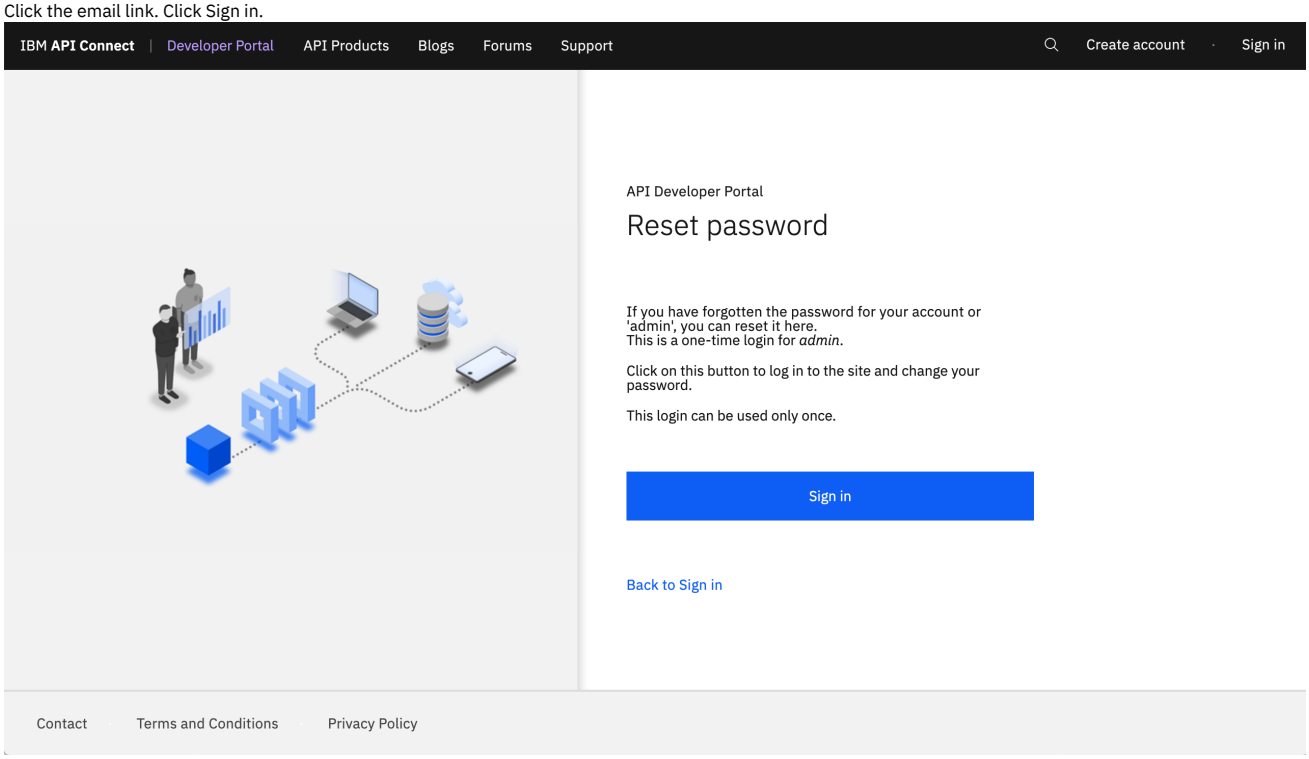
After a few minutes, you receive an email with a link to your Developer Portal site for that catalog. The link is a single use only link for the administrator account.

Administrator (admin),

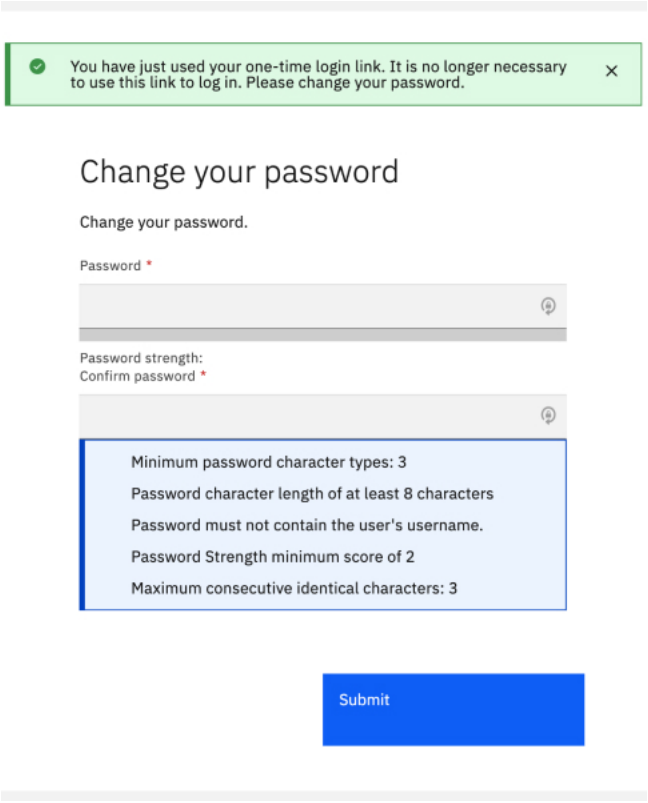
Your Developer Portal site has been created. You can log in as the 'admin' user by using the following one-time log in link. After you have logged in with the following link, you must change the password for the 'admin' user account immediately.

https://portal.apidemo.demo.ibm.com/tutorial/production/user/reset/1/1591727237/h26vxzf2e51UqqK7vf10LNbHiVEC5VQ_AZAoKCYH72C/new/login

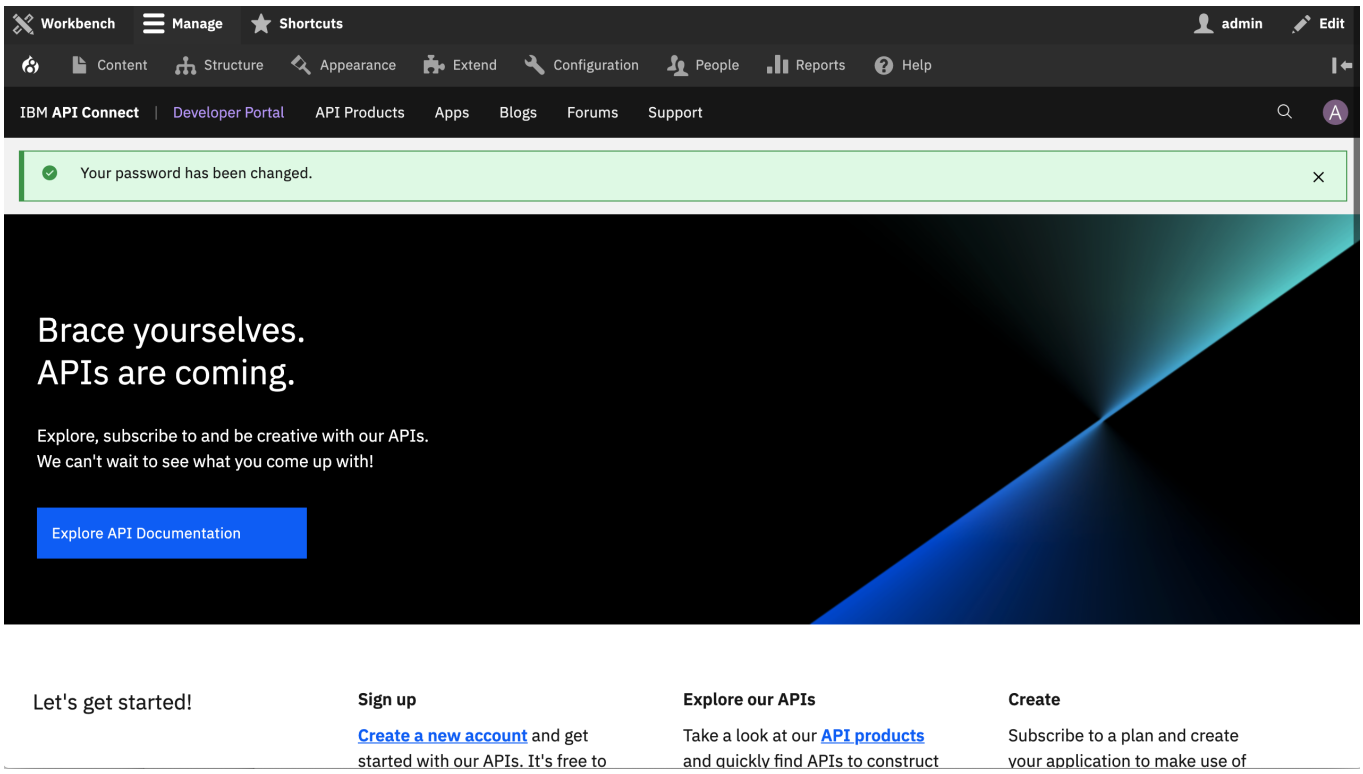
11. Click the email link. Click Sign in.



12. Change the password. Click Submit.



The portal site for the Production catalog is now active. The admin account cannot create applications or subscriptions. You must create a new account to complete those tasks.



What you did in this tutorial

In this tutorial, you completed the following activities:

- Enabled a Developer Portal site and created an administrator account.

Note: To ensure that your desired content is displayed, it is crucial to publish your product containing APIs to the appropriate catalog.

What to do next

- Create a Developer Account and Application

Related information

- Importing an API

Tutorial: Creating a private Developer Portal site

You can create a private version of the Developer Portal, so that authenticated users only can access content on the site. You might want to do this if you want to restrict public access to your content unless they are logged in.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you are going to restrict access for all the content to authenticated users only. This gives access to all users from **Content Author** to **Superuser**, as they are all required to authenticate to access their roles. You will then add the login form to the home page, so that public users will be able to view the public home page that contains the login form only.

This tutorial takes you through the following steps:

1. Export your configuration settings.
2. Restrict all permissions to authenticated users.
3. Restrict blocks to authenticated users.
4. Add login form to the home page.

Export your configuration settings

In case you make an error, or want to revert all of the changes made during this tutorial, you can back up your configuration settings to your machine before you make any changes.

The tutorial Exporting and importing custom themes and site configuration provides further details on how to export your configuration settings using the Developer Portal CLI.

Restrict all permissions to authenticated users

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to People > Permissions.
3. Clear all check boxes that are associated with **ANONYMOUS USER**.
4. Click **Save permissions** at the end of the page.

Restrict blocks to authenticated users

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Block layout.
3. Find the row that is labeled **Main menu** and click **Configure**.
4. Find the setting **Roles** under the category **Visibility**.
5. Check the box **Authenticated user**.
6. Click **Save block**.
7. Repeat from step 3 for the **Footer menu**.
8. Click **Save block**.

Add login form to the home page

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.
3. Click **Edit** on the **Welcome** page.
4. Navigate to Panels > Content.
5. Click **Add new block**.
6. Find and click **User login**, under the **FORMS** section.
7. Clear the **Display title** check box.
8. Click **Add block**.
9. Rearrange the new login block so that it is underneath the **Welcome Banner**.
10. Click **Update and save**.

What you did in this tutorial

On your Developer Portal, you restricted access for all the content to authenticated users only. Now when you access your home page as an unauthenticated user, you see that the login form appears underneath the welcome banner. Navigating to other URLs on the site presents an **unauthorized** page to appear.

When you log in, the login form disappears from the home page and you are able to access all of the pages that are visible to your role.

Tutorial: Creating Accounts and Applications on the Developer Portal

This tutorial shows you how to create a developer account and register an application on the Developer Portal.

Before you begin

You must have a Developer Portal installed, and created and published at least one API product.

If you do not have a Developer Portal available, complete the tutorial Creating a Developer Portal.

If you don't have an API product available, you can download one of the following APIs, and then import and activate it:

- If your Sandbox catalog uses a DataPower® Gateway (v5 compatible) (as one of the gateways, or as the only gateway), download the findbranch.txt file to your local filesystem. Rename this file `findbranch.yaml`.
- If your Sandbox catalog uses a DataPower API Gateway, download the findbranch_v6.txt file to your local filesystem. Rename this file `findbranch.yaml`.

For more information about importing an API, see Adding a REST API by importing an OpenAPI definition file.

About this task

In this tutorial you are going to complete the following lessons:

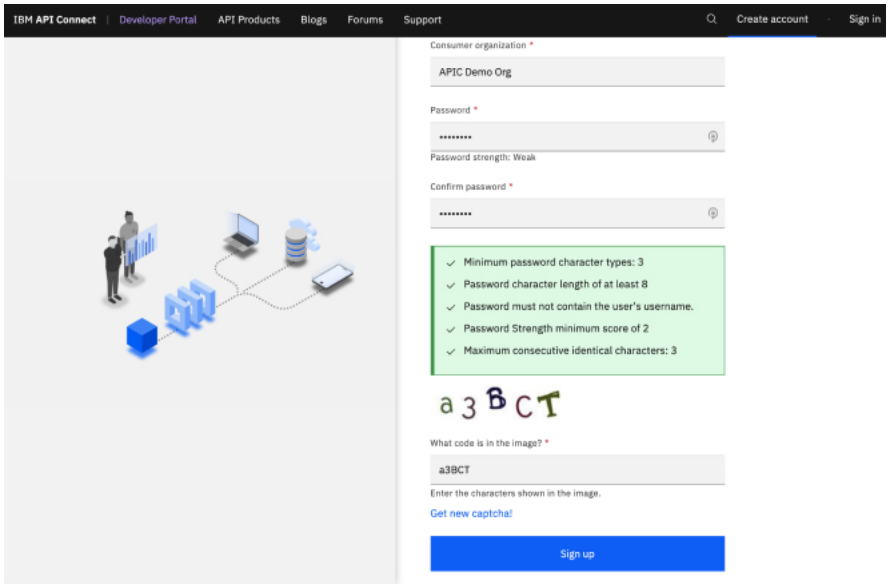
- Creating a developer account in the Developer Portal
- Creating a developer application in the Developer Portal
- Testing the Branches API in the Developer Portal

Note: The administrator account cannot create an App, or register to an App. To create or register to an App, you must have a developer account. A developer account that has been assigned administrator privileges can create and register Apps.

Creating a developer account in the Developer Portal

Take the following steps to create a developer account:

1. Follow the instructions provided on Creating a Developer Portal and open the Developer Portal.
2. Click Create account. If the Create account link is not visible, log out as Admin from the Developer Portal first, go to the home page of the Developer Portal, and click Create account.
   Note: Your email is used as your user name for the Developer Portal. The email address must be different from the address used for creating the administrator account.
3. Complete the sign up form. The email address you provide must be functional. Click Sign up. A confirmation message is sent to the email address provided in the form.

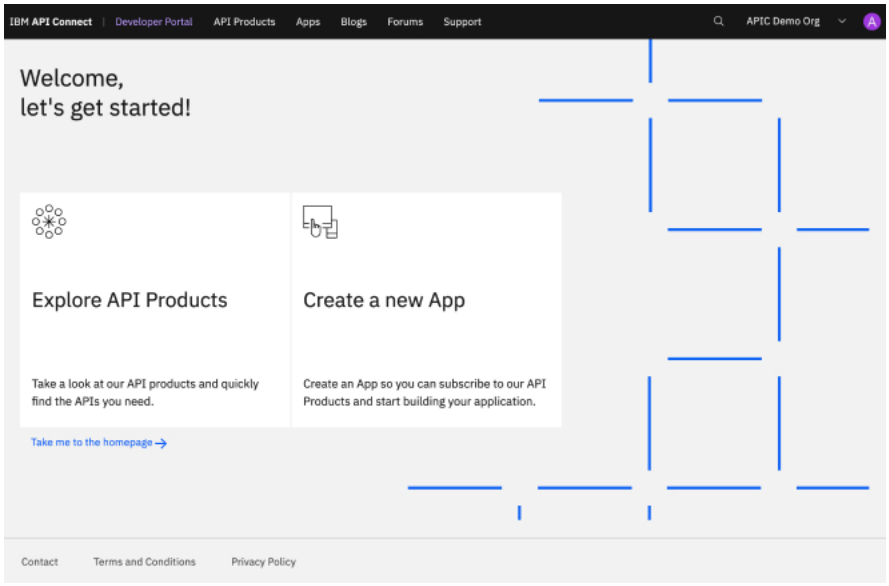


4. Click the account activation link in the confirmation email to activate your account.
5. To use the Developer Portal, click Sign in and sign in with the user credentials you specified.

Creating a Developer Portal Application

To create and register a new App:

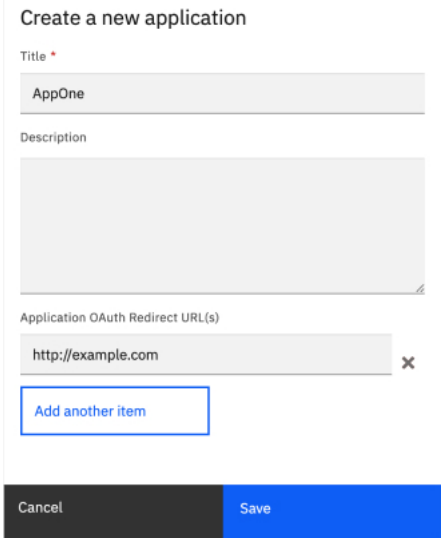
1. In the Developer Portal, click Create a new App.
   Note: You cannot register new applications if you are logged in as the administrator.



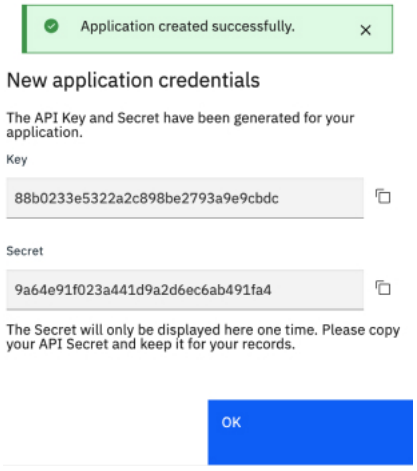
2. Enter the following values for the application that is being registered.

Table 1. Values for registering the application

Field Name	Value
Title	`AppOne`
Application OAuth Redirect URL(s)	`http://example.com`

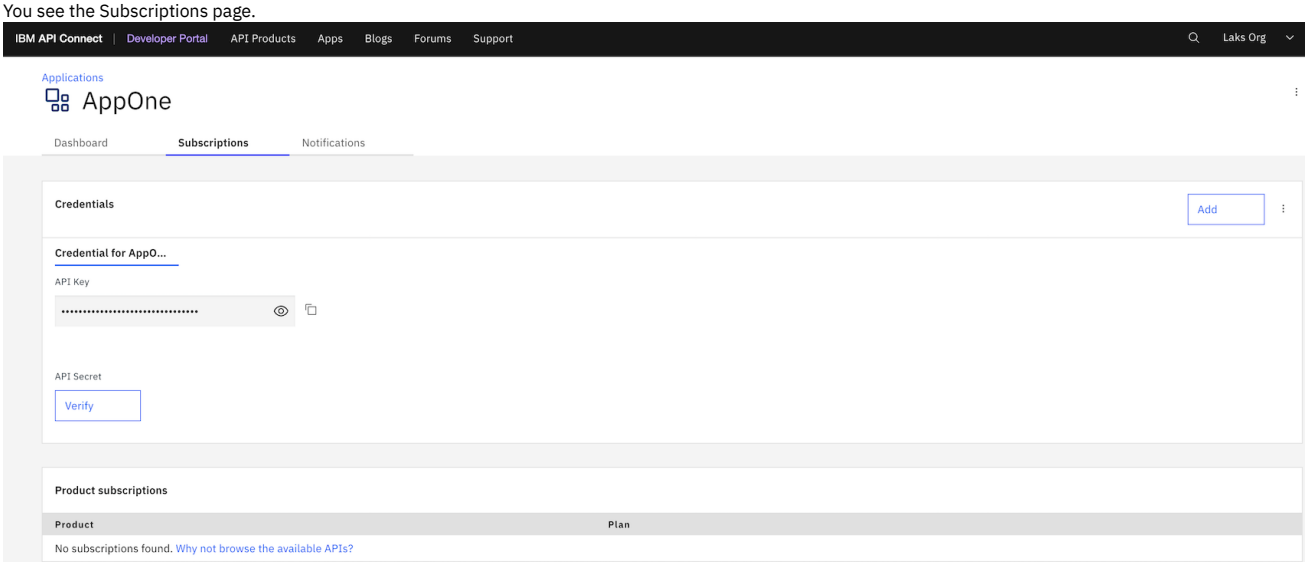


3. Click Save.
4. Copy the key and secret values for the new app. Click OK.



5. Click OK.

You see the Subscriptions page.



Subscribing to an API in the Developer Portal

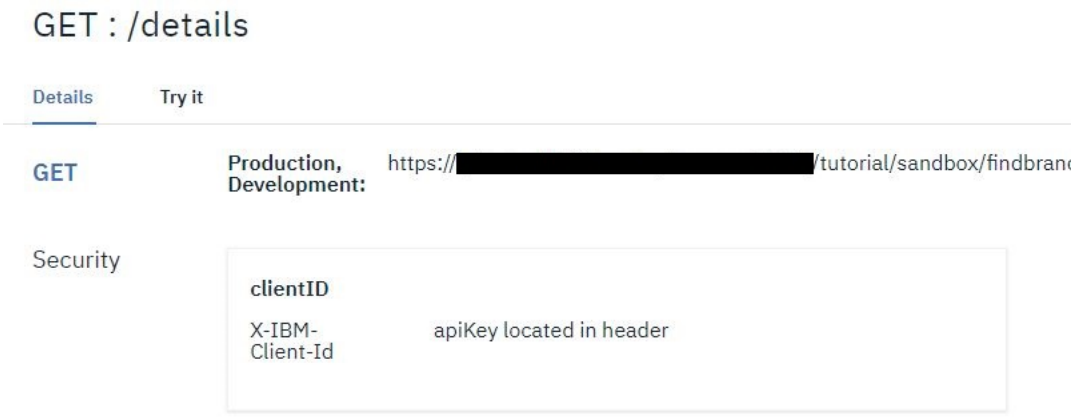
1. Click API Products.
2. In the Name field, enter `FindBranch` and click on the *product name* .
3. Under Plans, click Select.
4. Under the Application heading, click AppOne.
5. Under Subscribe, click Next to confirm the subscription.
6. Under Summary, click Done after confirming the subscription details.

To view the current subscription details of your application, perform the following steps:

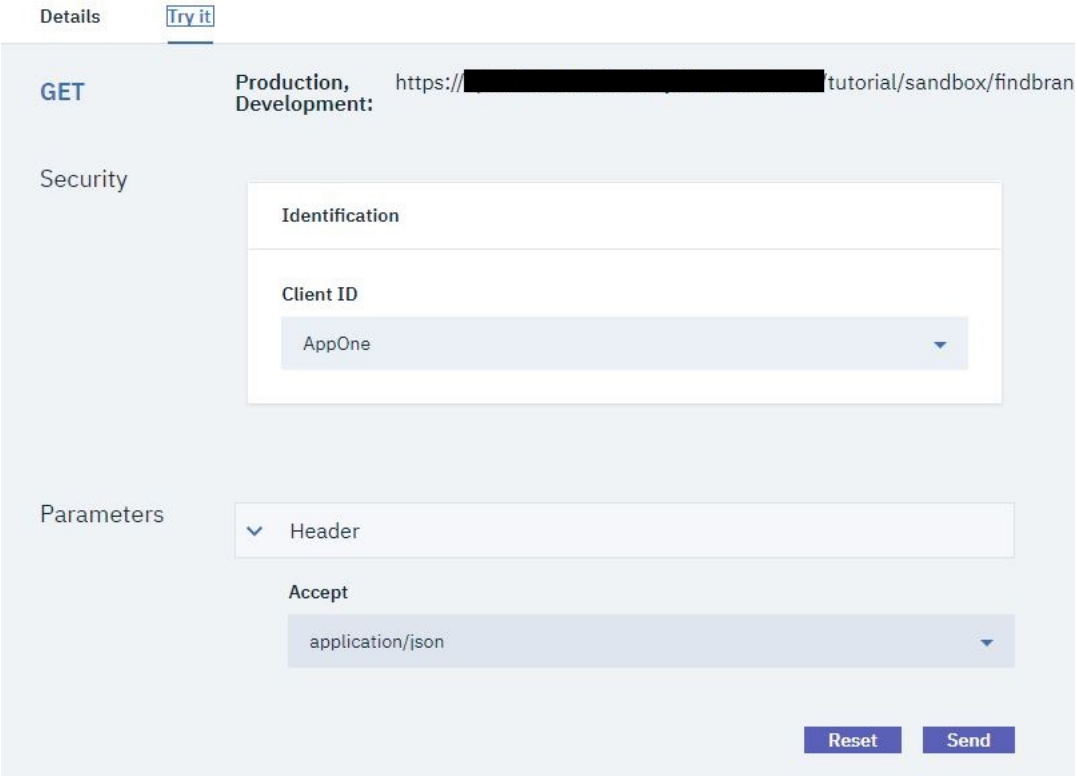
1. Under Apps, select AppOne.
2. Click Subscription.

Testing An API in the Developer Portal

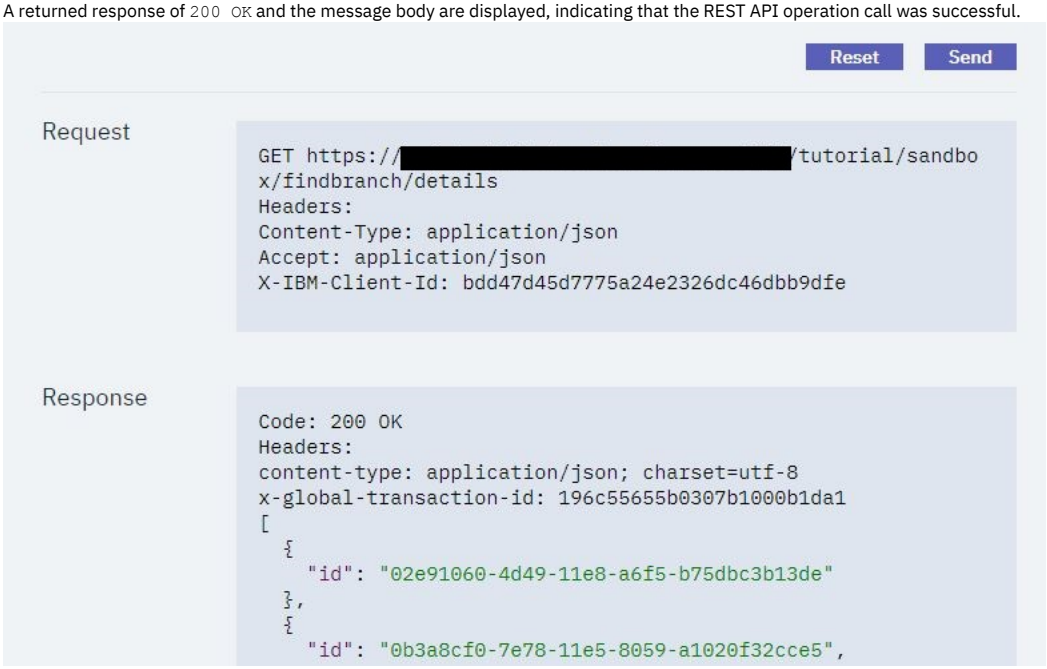
1. Click API Products in the Developer Portal dashboard.
2. Click a Product, such as FindBranch auto product , then select the FindBranch API from the list.
3. Click GET /details.



4. Click Try it.



5. Click Send.
   Note: If no response is received, navigate to the URL that is displayed at the beginning of the Try this operation section, in a new browser tab. Accept the security certificate, and then call the operation again.
6. A returned response of `200 OK` and the message body are displayed, indicating that the REST API operation call was successful.



What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a developer account in the Developer Portal.
- Created and registered a new App, and subscribed it to a Plan.
- Tested an API in the Developer Portal.

Tutorial: Creating a custom theme for the Developer Portal

Customize the appearance of your Developer Portal home page, by generating a sub-theme, configuring the overrides.css file, and installing the newly customized theme.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.
Important: You're not permitted to include any IBM® API Connect code within any custom themes that you create.

About this tutorial

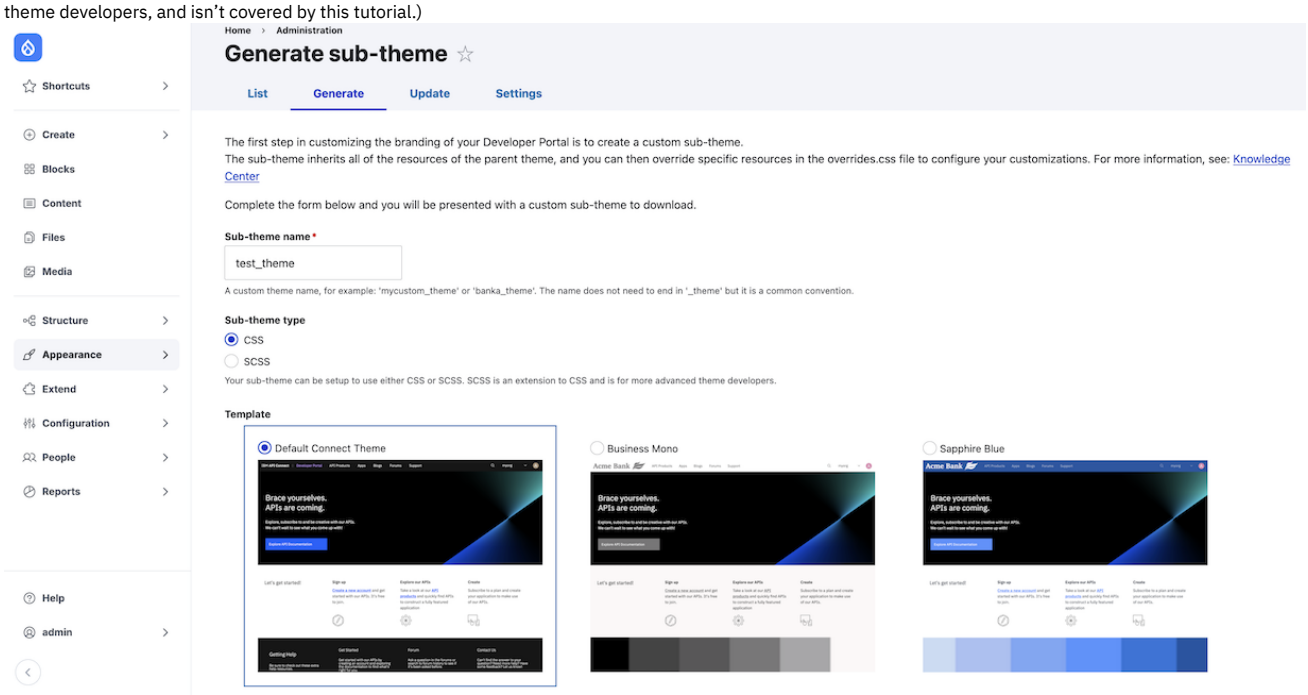
The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources to configure the required customizations.

This tutorial takes you through the following lessons:

1. Creating a sub-theme by using the theme generator.
2. Customizing the overrides.css file.
3. Installing and enabling your customized theme.

Creating a sub-theme

1. Log in to your Developer Portal as an administrator.
2. Click Appearance > Generate sub-theme. The Generate sub-theme window is displayed.
3. Under Generate tab, enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this tutorial.)



4. Select the Default template to base your `sub-theme` on. You can create a sub-theme based on a color template. However, for this tutorial you use the Default Connect Theme template.
5. Click Generate.
6. Download the generated sub-theme to a location of your choice, and extract all the files from the .zip file.
   Note: The generated sub-theme is available to download for 24 hours.

Customizing the overrides.css file

On your computer, navigate to the files that you extracted. Find the overrides.css file in here: <extract_folder>/css/overrides.css. You can now customize the overrides.css file.

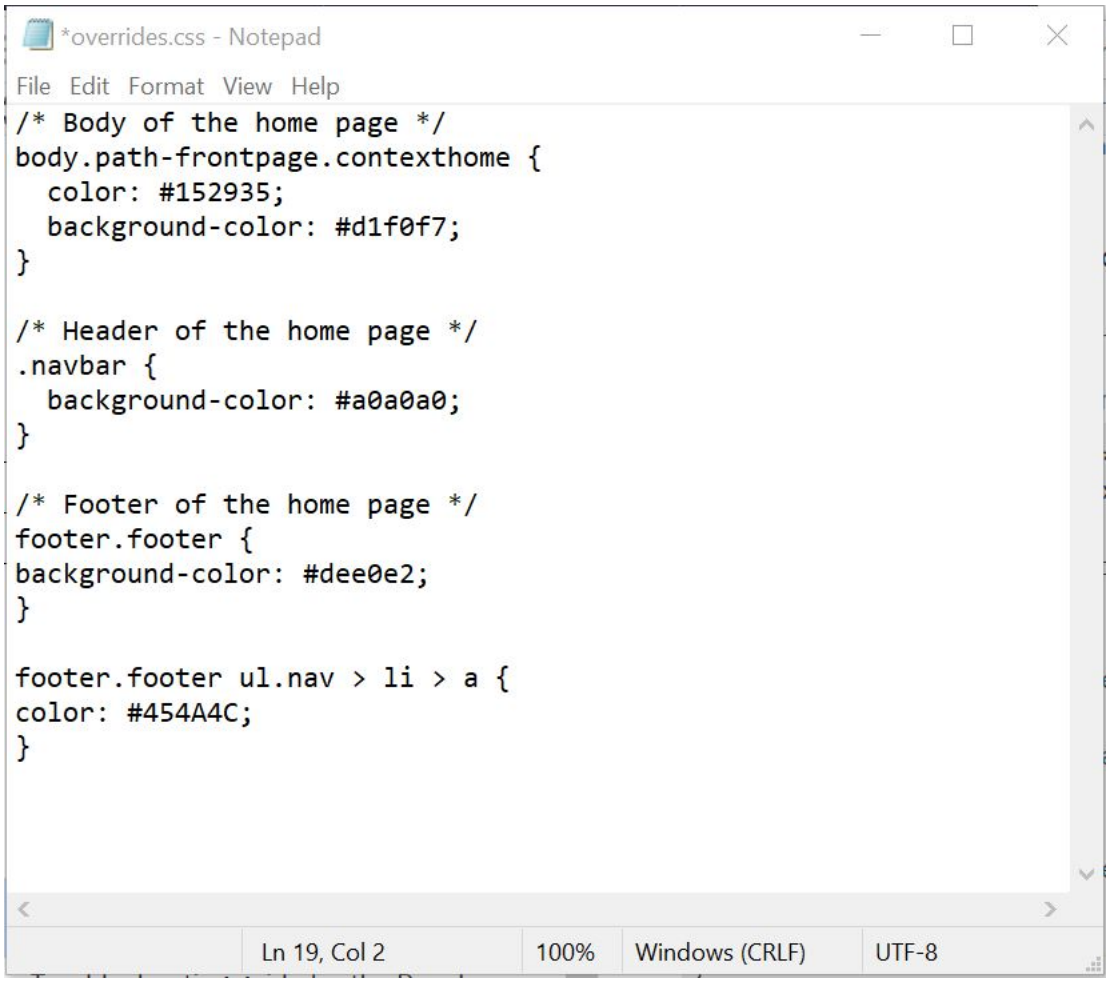
1. Open the overrides.css file in your chosen editor.
2. Customize your sub-theme by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
background-color: #dee0e2;
}
```

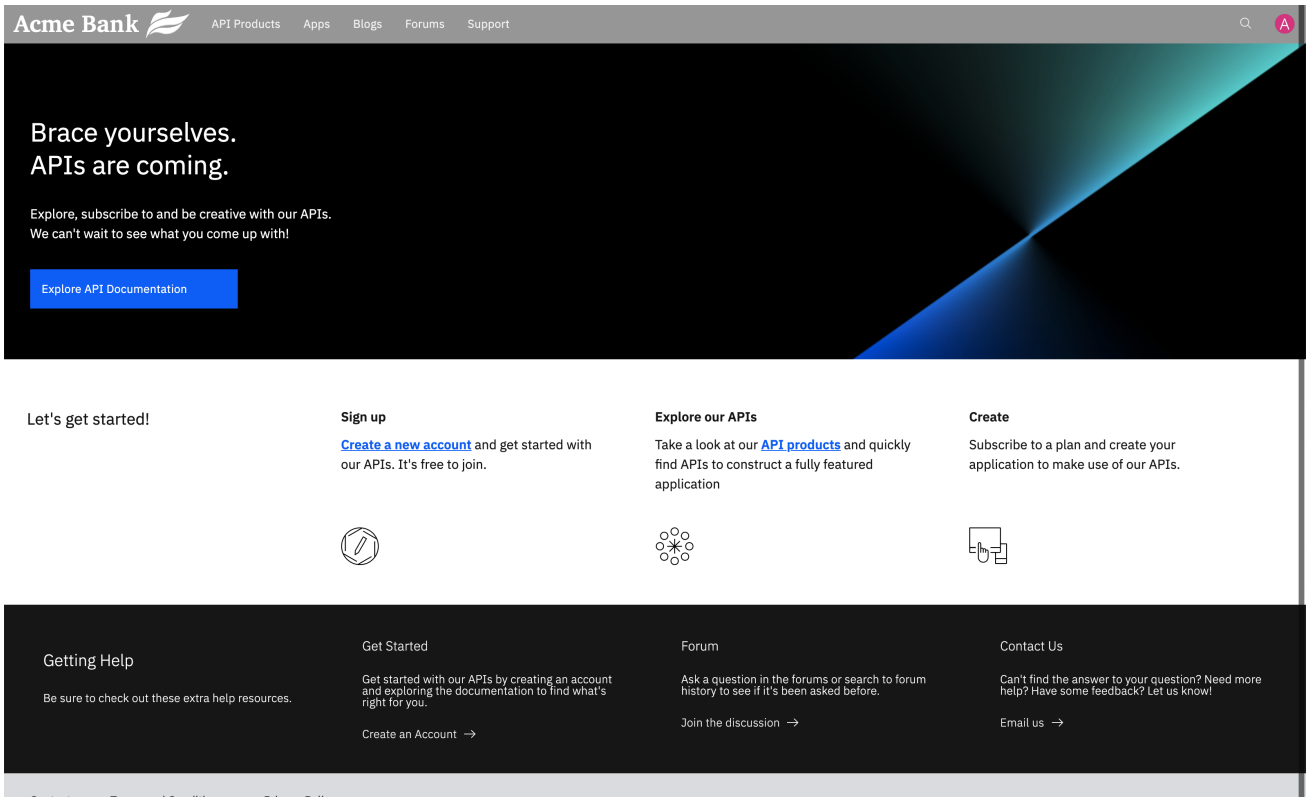
```
footer.footer ul.nav > li > a {
color: #454A4C;
}
```



3. Save the overrides.css file.

Installing and enabling your customized theme

1. After you have finished updating the overrides.css file, compress all the theme files back into the .zip sub-theme file that you downloaded originally.
   Note: You can also include your own custom logo and favicon in your theme files, and these are then included as part of your theme when it is installed. These files must use the naming convention logo.svg, and favicon.ico, respectively. You can also change your logo and favicon at a later time, see Changing the site logo and Changing the shortcut icon.
2. In the Developer Portal, click Appearance > + Add new theme. The **Add new theme** window is displayed.
3. In Upload a module or theme archive, click Browse, and navigate to your newly updated compressed theme file.
4. Click Continue to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of Disabled themes. Click Enable and set as default to set your new custom sub-theme as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.



What you did in this tutorial

In this tutorial, you completed the following tasks:

- Created a sub-theme of your Developer Portal site by using the theme generator.
- Configured some customized home page elements in the overrides.css file of your sub-theme.
- Uploaded and installed your customized theme in your Developer Portal site.
- Successfully customized the appearance of your Developer Portal home page.

Tutorial: Using avatars

You can use an avatar generator to better represent the branding of your site, and add a sense of community for your users, than the default name initial that is provided in the Developer Portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

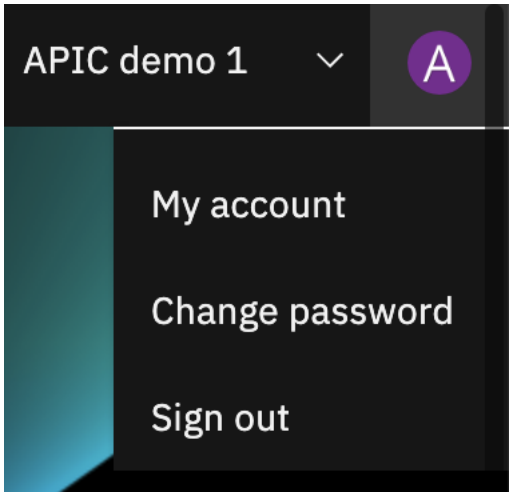
About this tutorial

In this task, you add the **Robohash** avatar generator to your Developer Portal site, and assign it as the primary avatar generator for all users.

This tutorial takes you through the following steps:

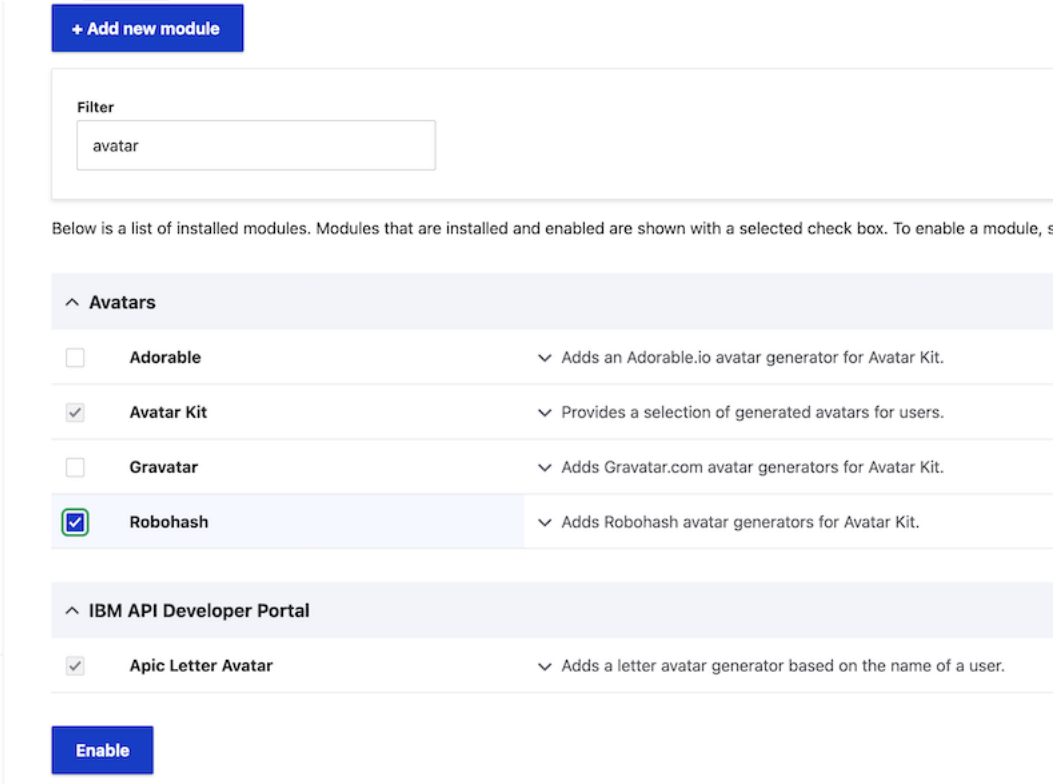
1. Enable the Robohash avatar generator.
2. Set Robohash as the preferred avatar generator for your site.
3. Configure the permissions for the Robohash avatar generator.

The avatar of the admin user displays like this before the block is added.



Enable the `Robohash` avatar generator

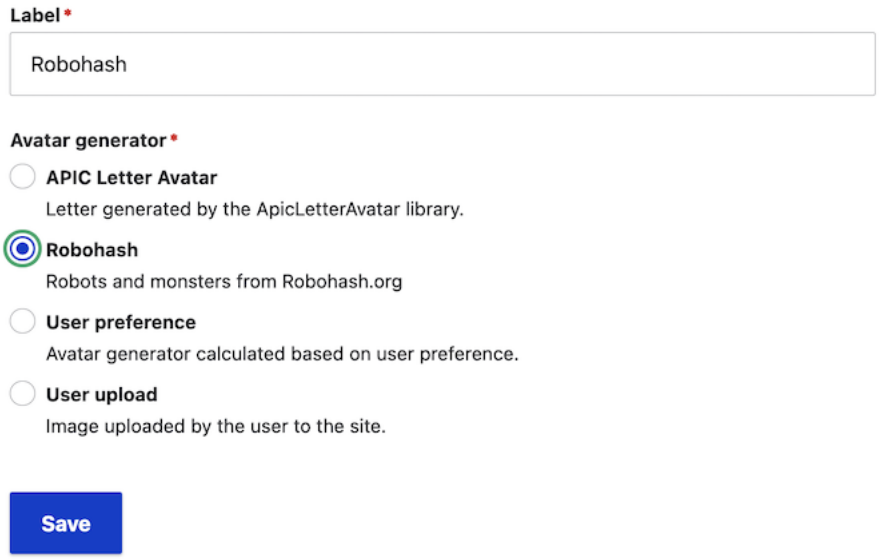
1. Log in to your Developer Portal as an administrator.
2. Click Extend > Extend.
3. In the Filter field, enter `avatar` to view the list of all the available avatar modules.
4. Select the **`Robohash`** checkbox and click Enable to enable the selected avatar module.



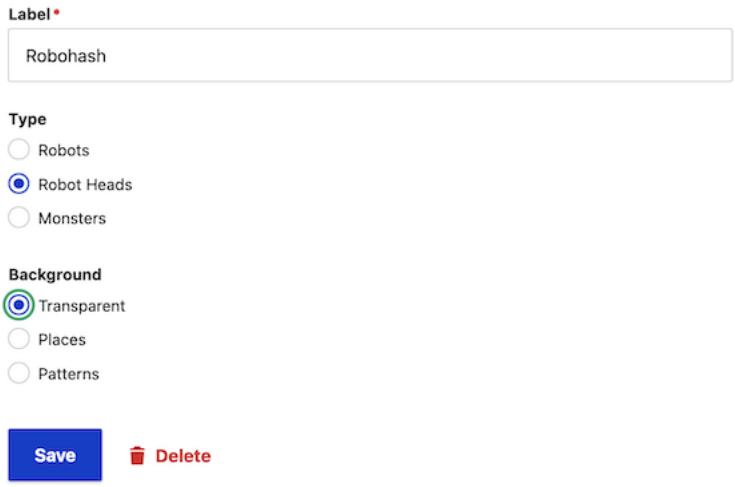
When the module is enabled, you receive a **`Module Robohash has been enabled`** message.

Set `Robohash` as the preferred avatar generator for your site

1. Navigate to Configuration > People > Avatar settings.
2. Click + Add avatar generator.
3. Enter `Robohash` as the label.
4. Select Robohash from the Avatar generator options.
5. Click Save.



6. The **`Edit avatar generator Robohash`** page opens. Select the following options:
   - **`Type: Robot Heads`**
   - **`Background: Transparent`**



7. Click Save.
8. The Avatar Kit settings page opens. Under the Avatar Generator column, drag **`Robohash`** to be first in the list, and select the **`Enabled`** checkbox.
9. Click Save configuration to save the changes.

You have now set **`Robohash`** as the preferred avatar generator for your site.

Configure the permissions for the `Robohash` avatar generator

The default setting for the **`Robohash`** avatar generator is to generate avatars for users with **`superuser`** access only. In this example, the permissions are changed so that all **`authenticated users`** can access **`Robohash`**.

1. Navigate to People > People and click the Permissions tab.
2. Find **`Use Robohash`** under the permission type **`Avatar Kit`** and select the Authenticated user checkbox to enable the avatar generator for all authenticated users.
   Note: Once you select the Authenticated user checkbox, all the checkboxes for this user type are automatically selected because all of those users have the same permissions as an authenticated user, or higher.

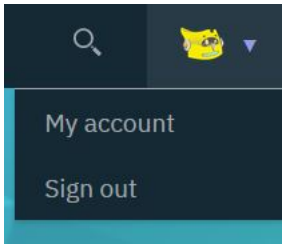
Permission	Anonymous user	Authenticated user	Forum Moderator	Content Author	Administrator	Superuser
Automated Logout						
Administer Autologout	☐	☐	☐	☐	☑	☑
Change own logout threshold	☐	☐	☐	☐	☑	☑
Avatar Kit						
Administer Avatar Kit *Warning: Give to trusted roles only; this permission has security implications.* Manage settings for Avatar Kit.	☐	☐	☐	☐	☑	☑
Use *APIC Letter Generator* User can select *APIC Letter Generator* avatar generator.	☐	☑	☑	☑	☑	☑
Use *Robohash* User can select *Robohash* avatar generator.	☐	☐	☐	☐	☐	☑
Use *User upload* User can select *User upload* avatar generator.	☐	☑	☑	☑	☑	☑

3. Click Save permissions to save the changes.

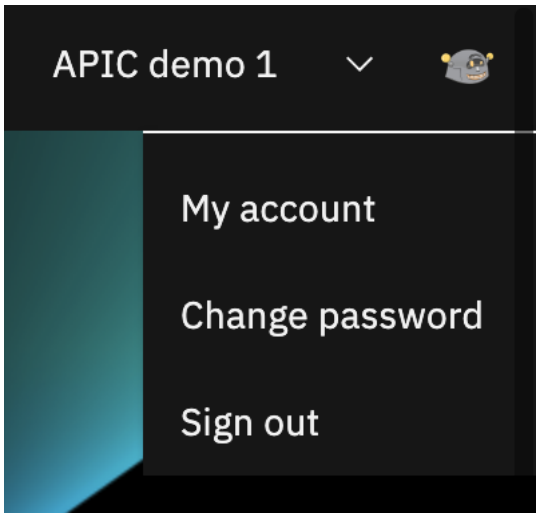
What you did in this tutorial

The avatars of all users now have the **robohash** avatar.

You can check that the avatar of the admin user has changed by looking at your site page.



You can check that the avatars of other users have changed by finding their published content and looking for their avatar. Or, you can navigate to Manage > People, click a user, and see their avatar on their profile page.



What to do next

You can disable the **robohash** avatar generator.

1. Navigating to Extend > Disable module.
2. Search for **avatar** in the filter text box.
3. Check **Robohash**, click Disable
4. Click Disable.

You can also disable the **robohash** avatar generator by clearing it within Configuration > People > Avatar settings, or, reducing its preference by dragging it to a different order in the list. Click Save configuration.

Tutorial: Using image optimization

You can use image optimization on your Developer Portal site to enhance the use of images.

Optimized images do not overload your website and significantly increase its performance compared to using the original images. Your customer satisfaction and brand reputation improve with fast-loading and trimmed visual assets. Automatic optimization can save time and effort on editing and content moderation.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

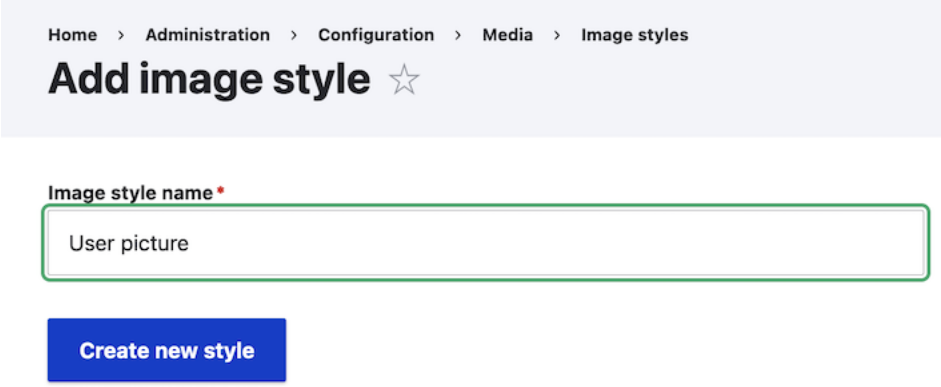
In this task, you create an image style that is called `User picture`, and give it a scale and crop effect. Then, use the `User picture` as the **`Picture`** field in the user account.

This tutorial takes you through the following steps:

1. Create the image style **`User picture`**.
2. Edit the image style **`User picture`**.
3. Assign **`User picture`** to the **`picture`** option in **`Account settings`**.

Create the image style `User picture`

1. Log in to your Developer Portal as an administrator.
2. Navigate to Configuration > Media > Image styles.
3. Click + Add image style.
4. Enter `User picture` in the **`Image style name`** field. Click Create new style

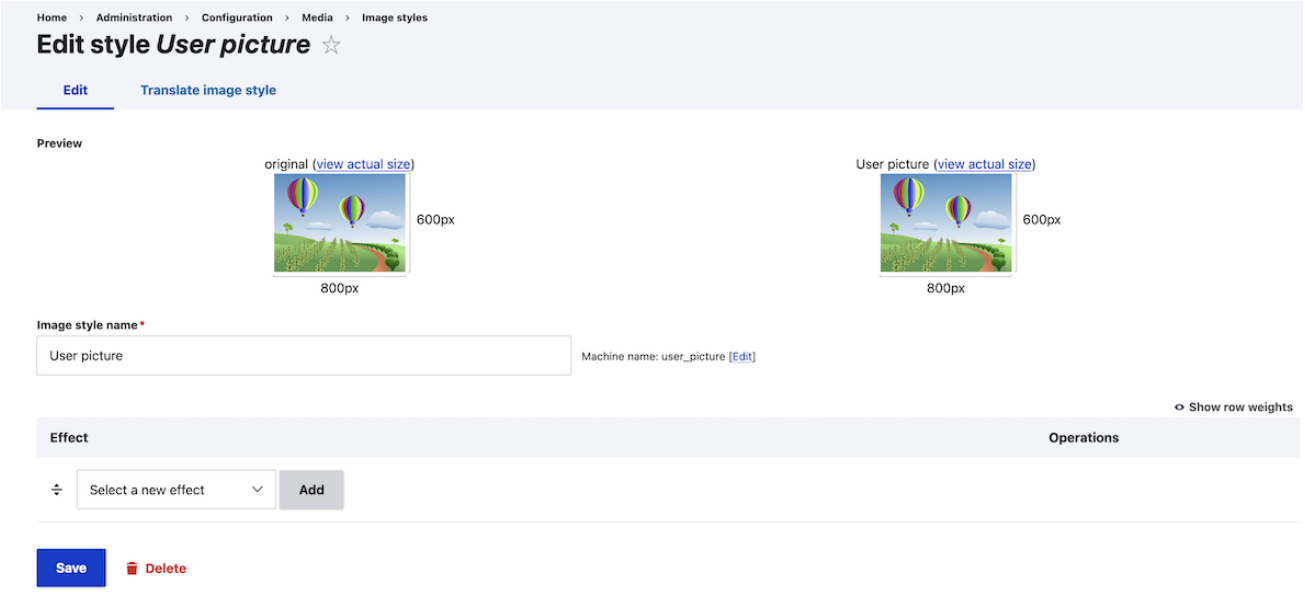


You created the image style **`User picture`**. You can edit the **`User picture`** as required. For more information, see Edit the image style User picture.

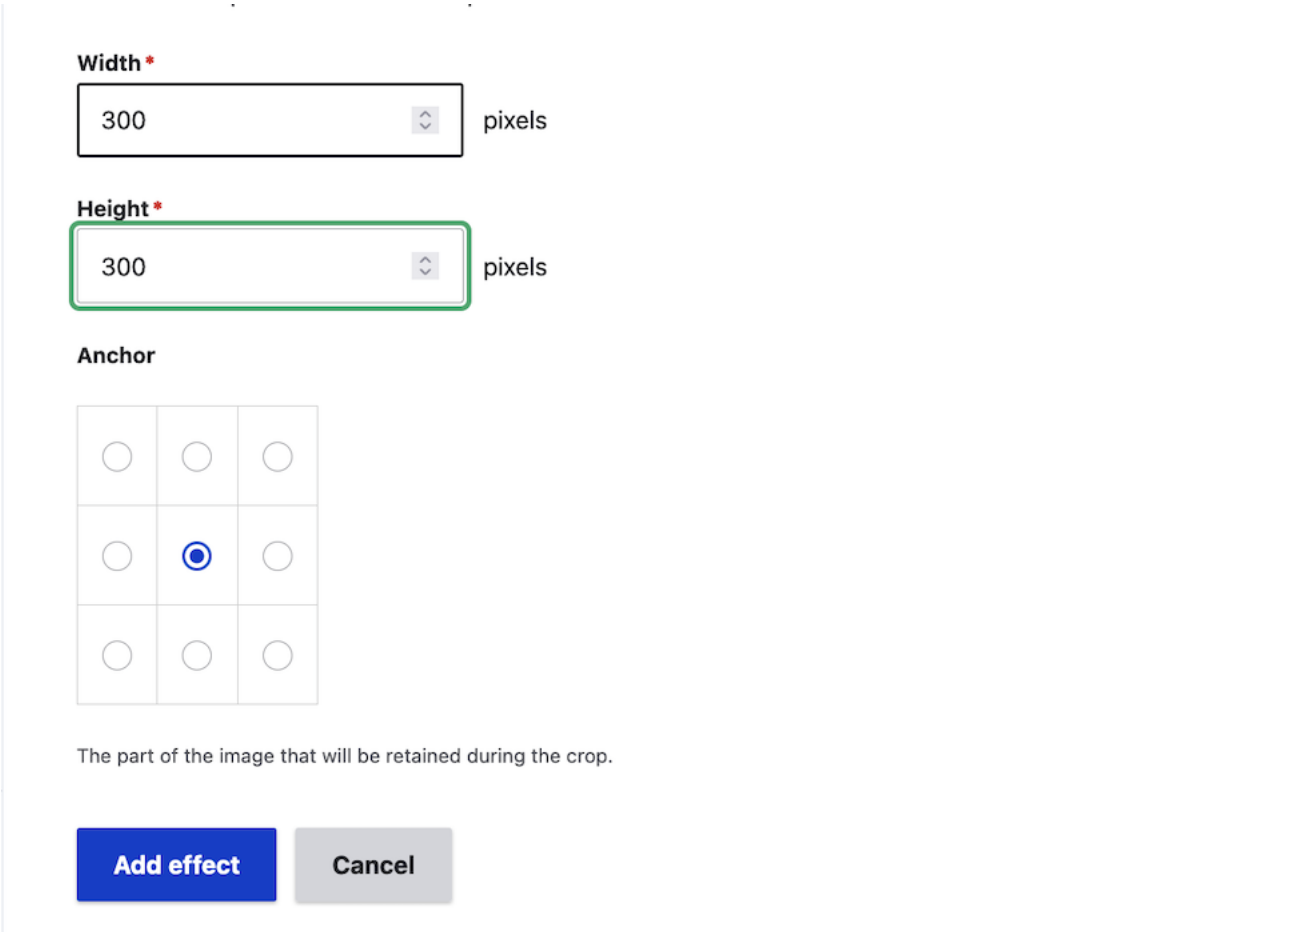
Edit the image style `User picture`

When you edit this style, you choose the width and height settings. Also, the part of the picture to retain during the crop, for example, the center.

1. Navigate to Configuration > Media > Image styles.
2. Click Edit on the **`User picture`** style name.



3. Under **`Effect`**, select **`Scale and crop`** from the list and click Add.
4. Enter `300` in the **`Width`** and **`Height`** boxes. Leave the **`Anchor`** as the middle setting.
5. Click Add effect.

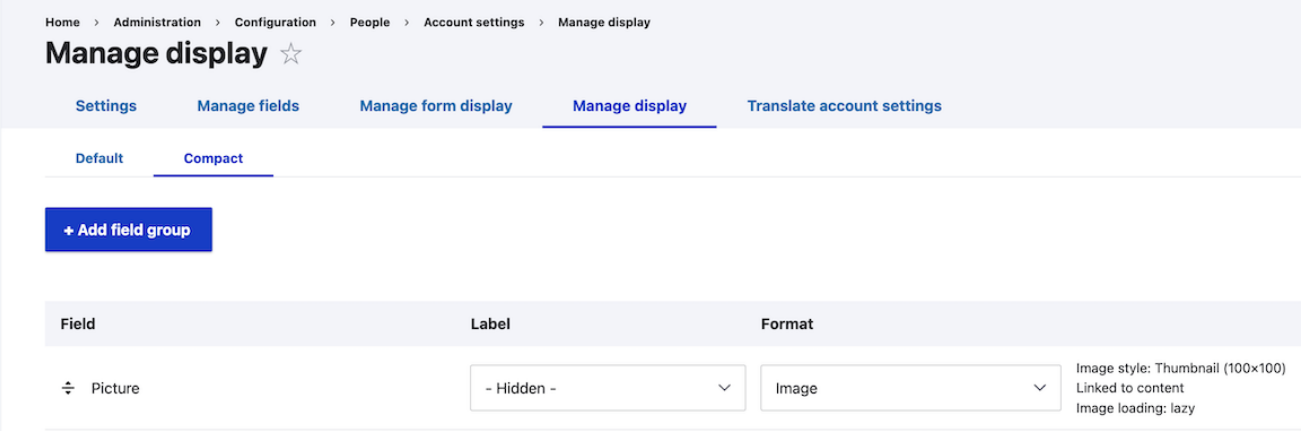


6. Click Save to save the changes.

You edited the image style **`User picture`**.

Assign `User picture` to the `picture` option in `Account settings`

1. Navigate to Configuration > People > Account settings and click the Manage display tab.
2. Click the Compact tab.



3. On the **`Picture`** row, click .
4. Select **`User picture`** from the **`Image style`** list.
5. Click Update
6. Click Save to save the changes .

You set the **`User picture`** image style for all accounts.

What you did in this tutorial

You changed your account settings so that if the user displays a picture it is within the limits of the image style **`User picture`**.

To check the picture used by a user, go to People, click a user, and see their picture on their profile page. Right-click the image, then click **`View image info`**, you can see that the dimensions are scaled.

Type:	JPEG Image
Size:	29.95 KB (30,667 bytes)
Dimensions:	620px × 413px (scaled to 240px × 160px)
Associated Text:	Profile picture for user apicdemo1

Tutorial: Adding a Back to top button

You might want to add a Back to top button, as a navigation enhancement to help your Developer Portal users get back to the top of the page that they are viewing, instead of scrolling.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

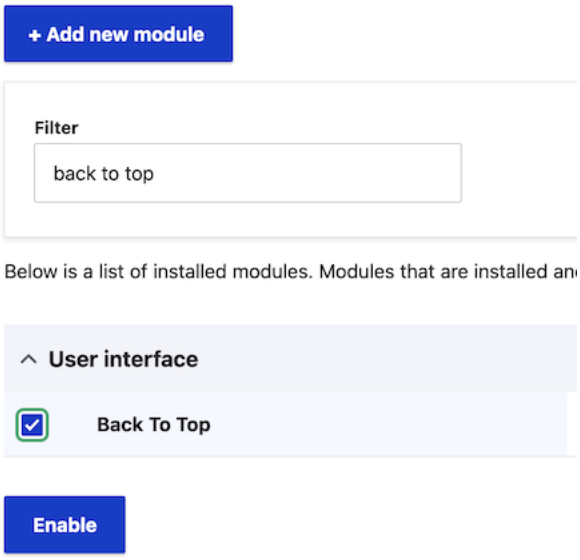
About this tutorial

In this tutorial, you add a Back to top button to your Developer Portal.

Enable the `Back to top` module

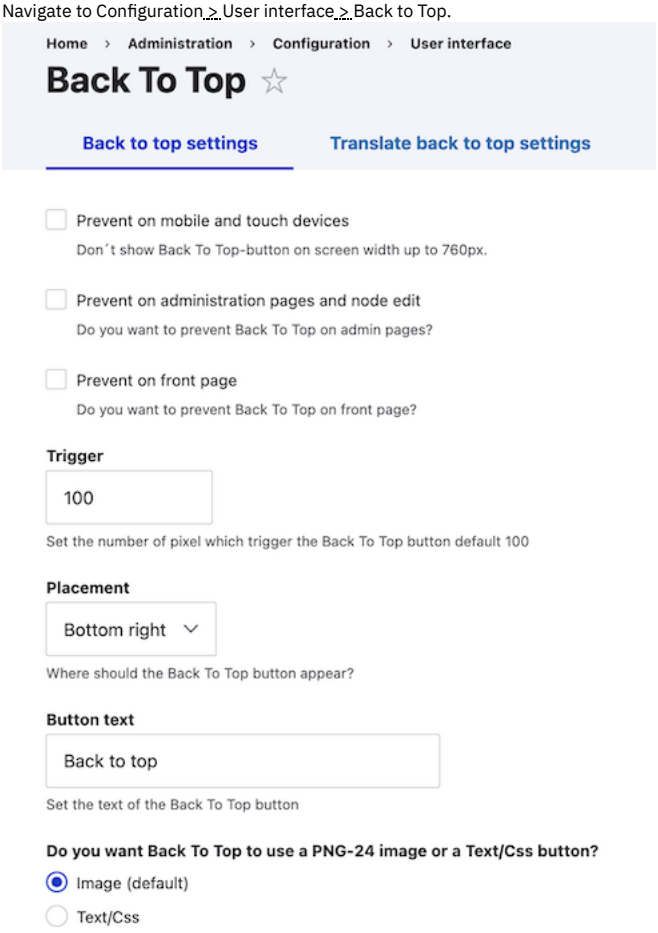
Before you begin, ensure that the **`Back to top`** module is installed and enabled:

1. Log in to your Developer Portal as an administrator.
2. Click Extend.
3. Enter `back to top` in the **`Filter`** field.
4. Under **`User interface`**, select the **`Back To Top`** checkbox and click Enable.



Configure the `Back to top` module

1. Navigate to Configuration > User interface > Back to Top.



2. Change any settings as required, or keep the default values.
3. Click Save configuration to save the changes.

You now have a Back to Top button.

What you did in this tutorial

You added a Back to Top button, as a navigation enhancement to help your users get back to the beginning of a page that they are viewing, instead of scrolling.

Tutorial: Creating a drop-down menu link

You can create and use drop-down menus, or nested menus, to enhance the use of your Developer Portal .

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

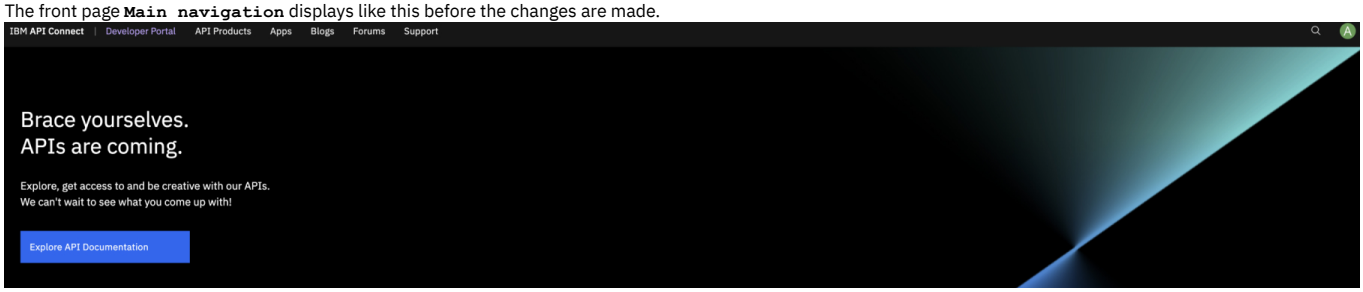
In this tutorial, you create a drop-down menu link on the **`Main navigation`** menu.

Note:
Although drop-down menu links can be created in the Developer Portal, the drop-down menu doesn't expand by default. To make the drop-down menu expand, you need to use the **`Superfish`** module.

This tutorial takes you through the following steps:

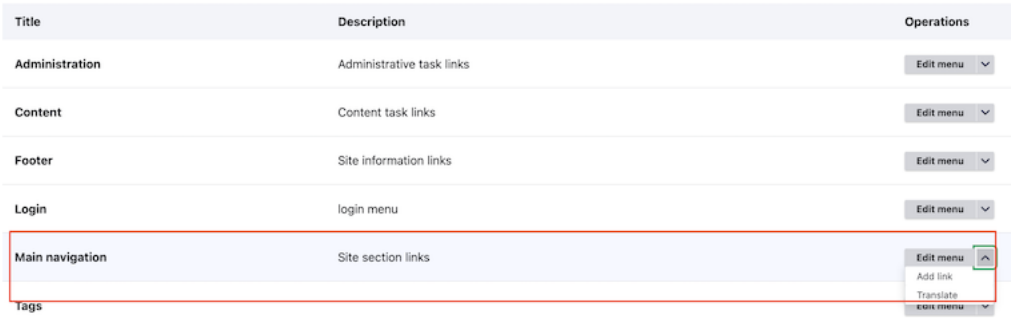
1. Add menu links to the main navigation menu.
2. Make the drop-down menu expand by using the Superfish module.

The front page **`Main navigation`** displays like this before the changes are made.

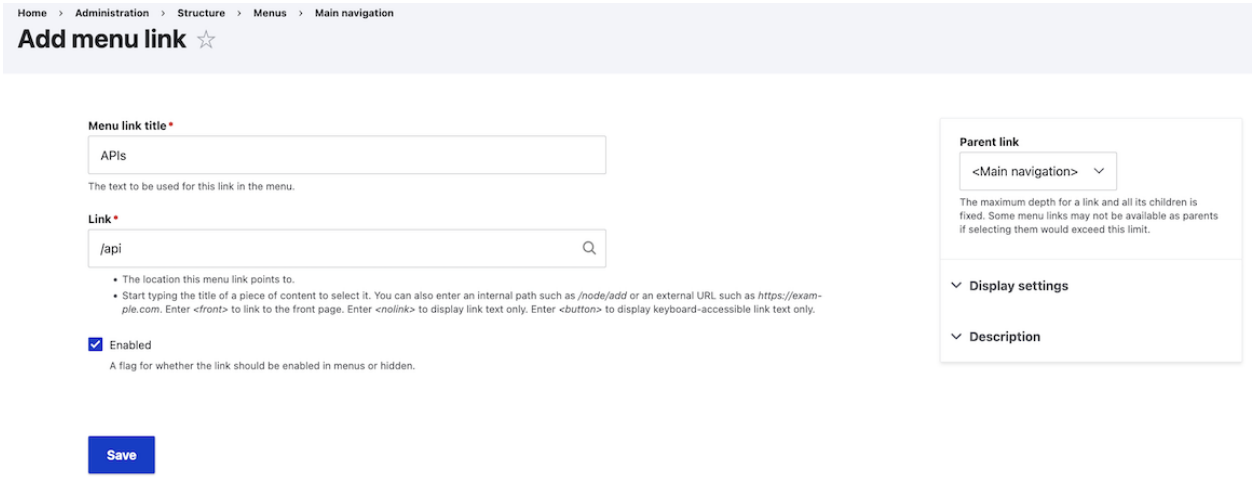


Add menu links to the main navigation menu

1. Log in to your Developer Portal as an administrator.
2. Navigate to Structure > Menus.
3. From the title list, find **`Main navigation`**. Click the arrow icon beside Edit menu and select Add link.

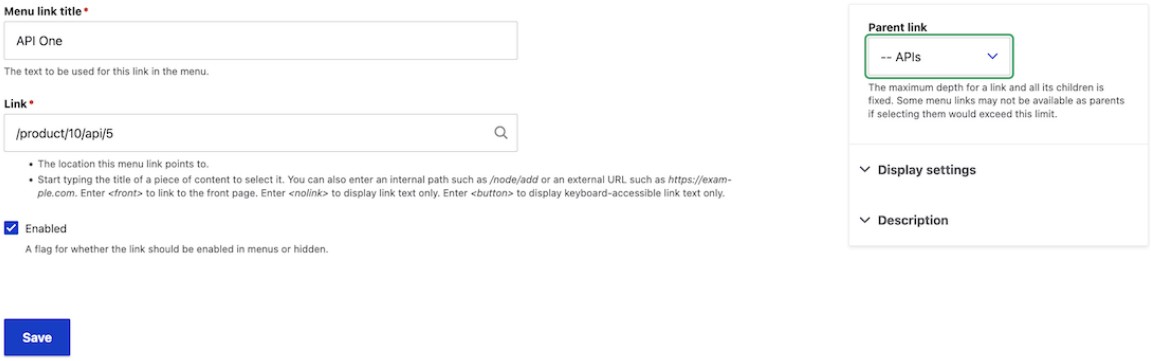


4. Complete the following steps to add a new menu link:
   a. In the **`Menu link title`** field, enter `APIs`.
   b. In the **`Link`** field, enter `/api`.
   c. Under Display settings, select the Show as expanded checkbox.
   d. Click Save to save the changes.

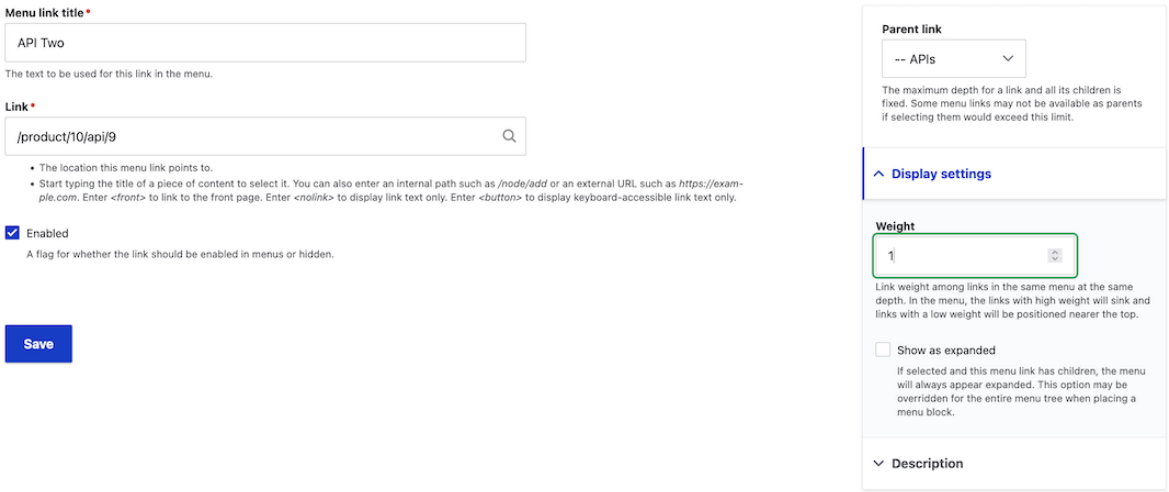


Important: Ensure Show as expanded checkbox is selected as this is the parent link for the submenu links.

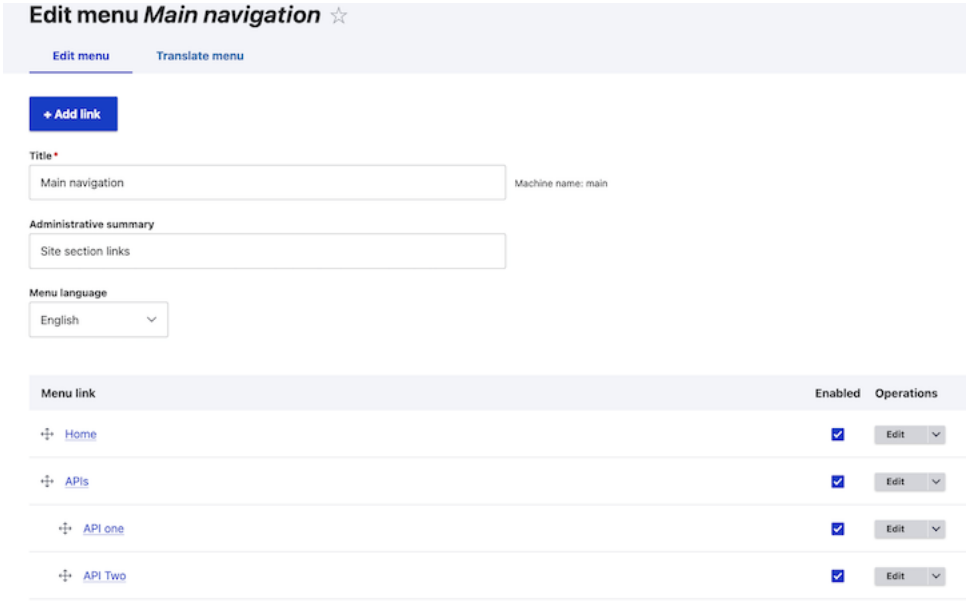
5. Complete the following steps to add another menu link to the main navigation menu:
    a. On the Edit menu Main navigation page, click +Add link.
    b. In the **`Menu link title`** field, enter `API One`.
    c. In the **`Link`** field, enter `/product/10/api/5`.
    d. Under Parent link, select -- APIs.
    e. Click Save to save the changes.



6. Complete the following steps to add another menu link to the main navigation menu:
    a. On the Edit menu Main navigation page, click +Add link.
    b. In the **`Menu link title`** field, enter `API Two`.
    c. In the **`Link`** field, enter `/product/10/api/9`.
    d. Under Parent link, select -- APIs.
    e. Under Display settings, select `1`in the Weight field.
    f. Click Save.



7. The hierarchy of the menu links now looks like this:

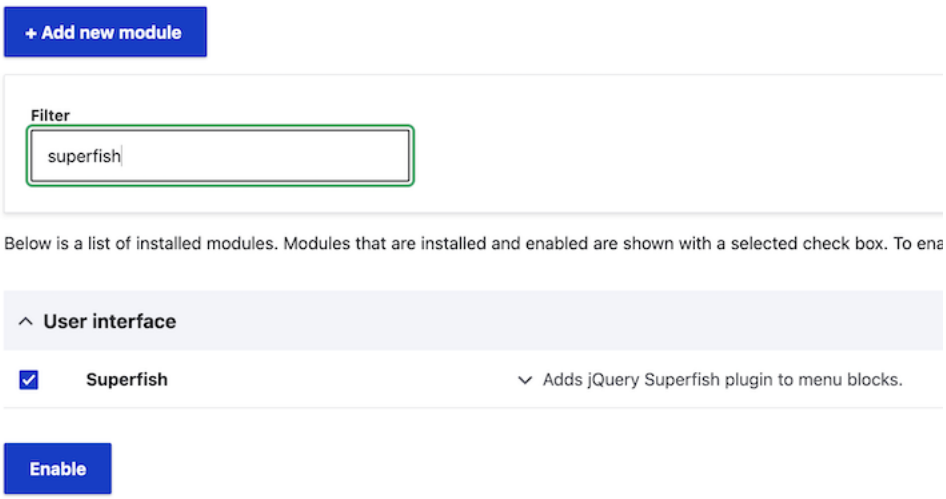


8. Navigate to the home page. The **`APIs`** menu link that you added to the main navigation menu does appear, but the submenus links don't expand when you hover over it.

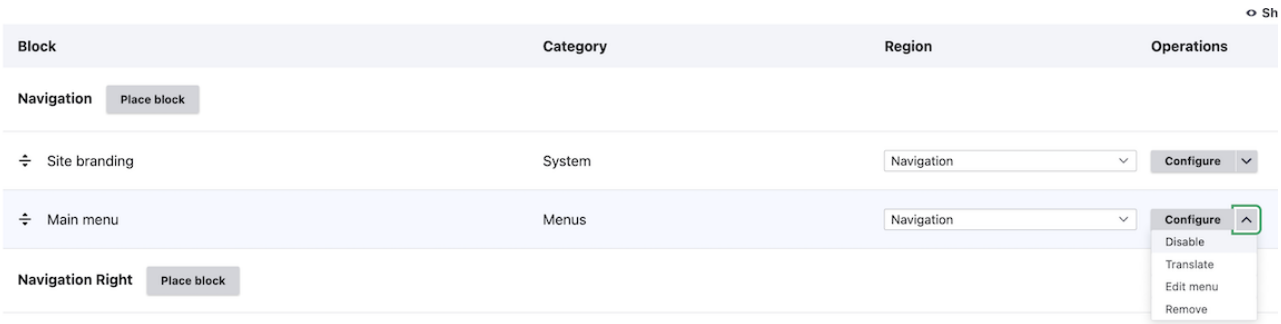
Make the drop-down menu expand by using the Superfish module

To make the drop-down menu expand when you hover over it, you need to use the **`Superfish`** module and configure the **`Block Layout`**.

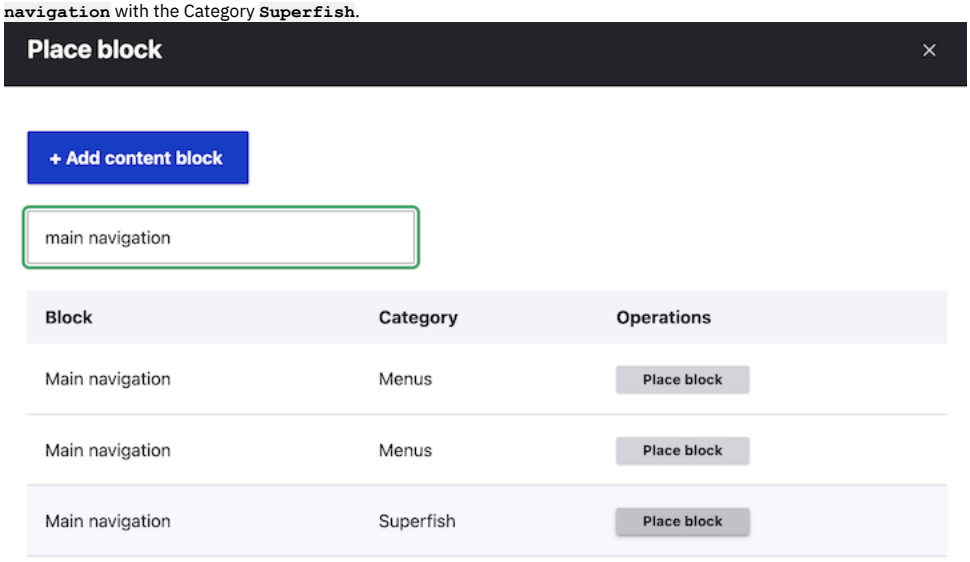
1. Navigate to Extend > Extend.
2. In the **`Filter`** field, enter `superfish` and select the **`Superfish`** checkbox.
3. Click Enable to enable the module.



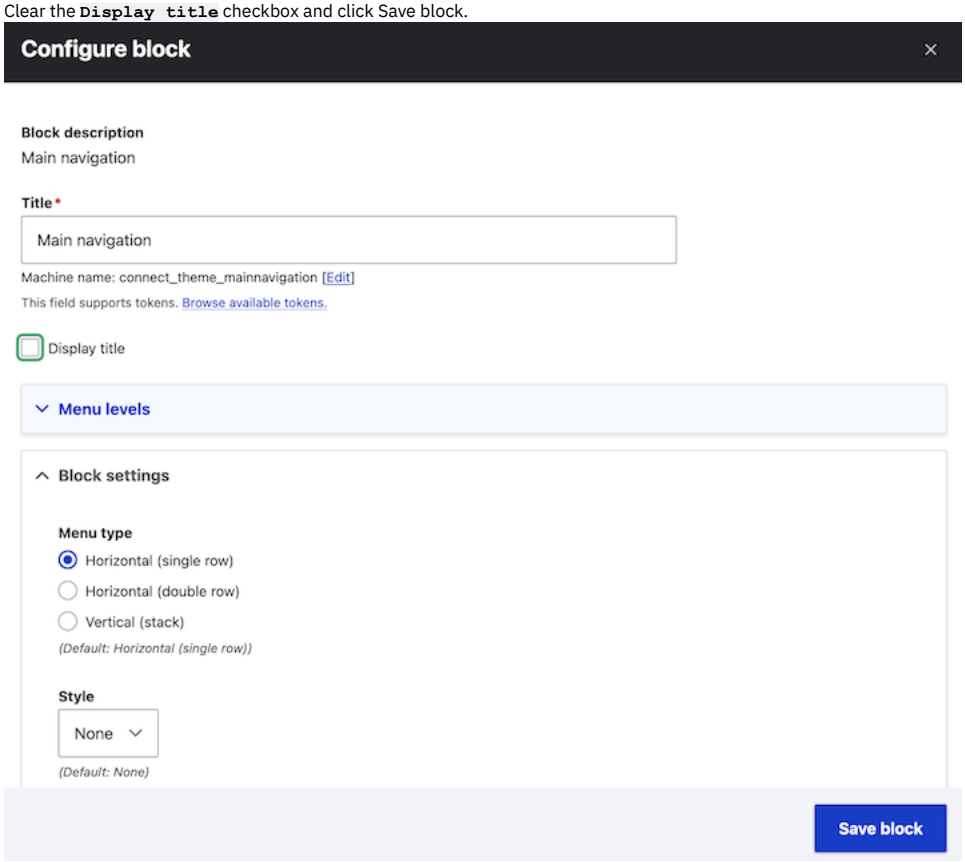
4. Navigate to Structure > Block layout.
5. Under Block, find **`Main menu`**, click the arrow icon beside Configure, and select Disable.



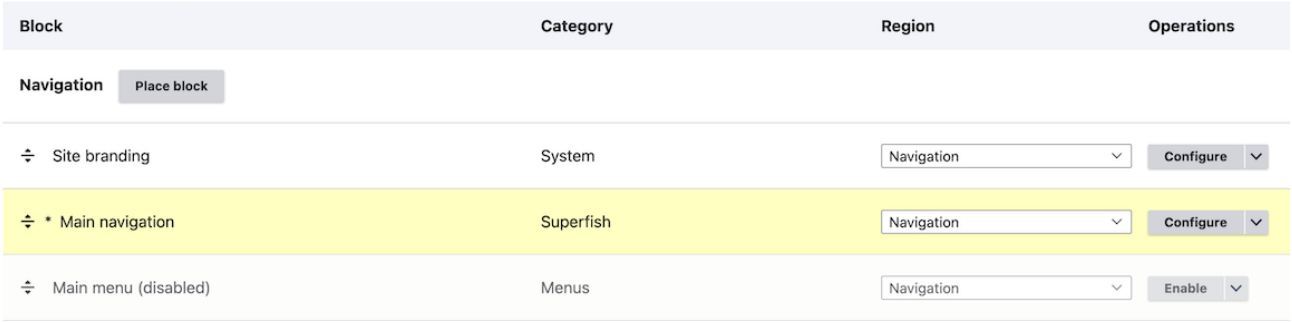
6. Click Place block for Navigation and search for `main navigation` in the box. The filtered results might show two or more options. Click Place block for the **`Main navigation`** with the Category **`Superfish`**.



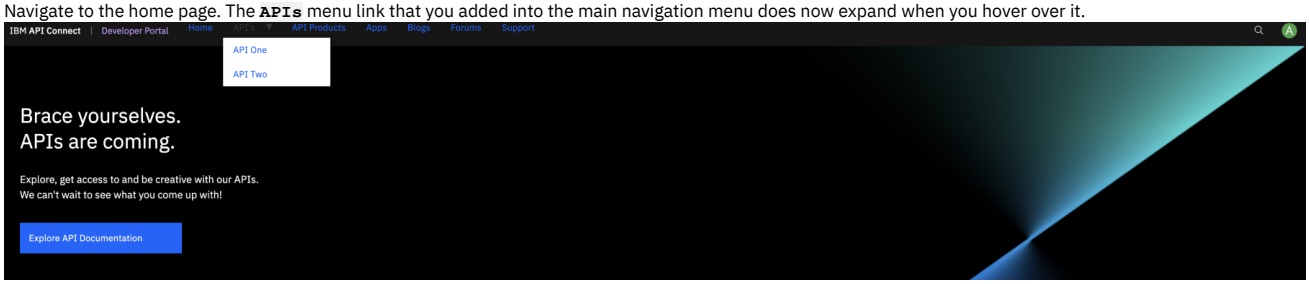
7. Clear the **`Display title`** checkbox and click Save block.



8. Drag **`Main navigation`** to be under **`Site branding`**.



9. Click Save blocks to save the changes.
10. Navigate to the home page. The **`APIs`** menu link that you added into the main navigation menu does now expand when you hover over it.



What you did in this tutorial

You created a drop-down menu link on the **`Main navigation`** menu.

What to do next

You can consider any other uses of the drop-down menu to enhance your users experience on your Developer Portal.

Tutorial: Displaying blog posts on the front page

You can customize the appearance of the front page of your Developer Portal to display recent blog posts. You might use the blog posts to provide your users with information, such as service availability or marketing campaigns.

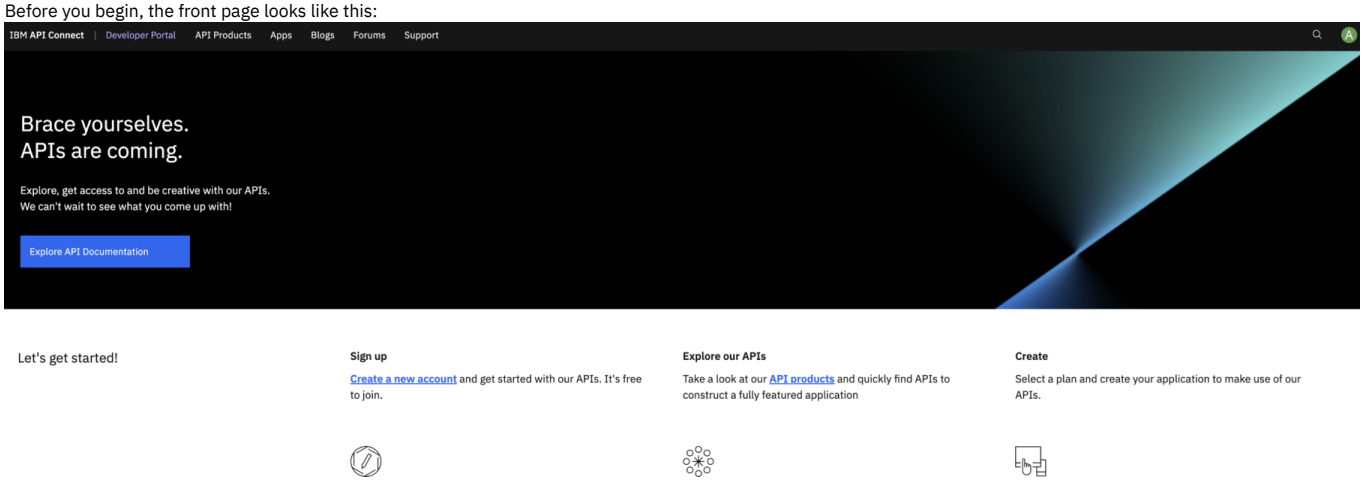
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create a view, customize that view to show blog posts, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:



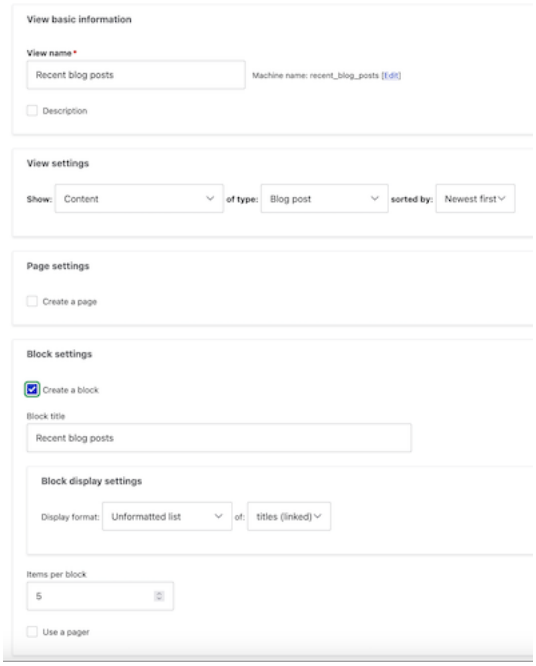
This tutorial takes you through the following steps:

1. Create a view.

2. Customize the view.
3. Embed the view on the front page of your Developer Portal.

Create a view

1. Log in to your Developer Portal as an administrator.
2. Navigate to Structure > Views.
3. Click +Add view.
4. In the **View name** field, enter a name for your view, for example Recent Blog posts.
5. Under **View settings**, select the options as follows:
   - Show - **Content**
   - of type - **Blog post**
   - sorted by - **Newest first**
6. Under Block settings, select the **Create a block** checkbox and choose the number of blog posts that you want to display.



7. Click Save and edit.

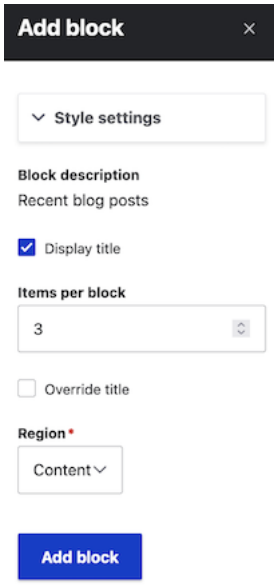
Customize the view

You are now on the page where you can edit your view.

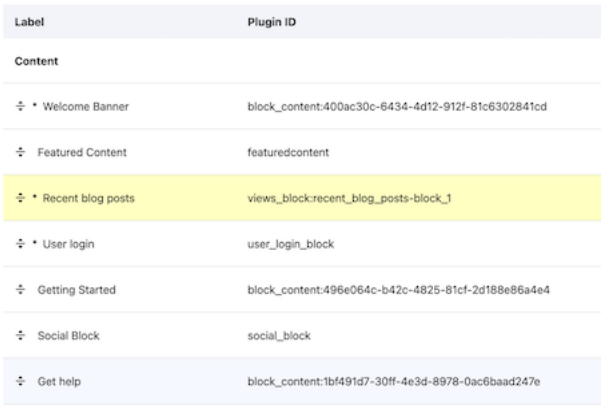
1. If you are not on the edit view page, navigate to Structure > Views, find the name of the view that you created, and click Edit.
2. In the **Format** section, click Unformatted list.
3. Select **Bootstrap List Group**, then click Apply.
4. Select Content: Title from the **Title field** list, then click Apply.
5. Click Save.

Embed the view on the front page of your Developer Portal

1. Navigate to Structure > Pages.
2. From the list of labels, find **welcome** and click Edit.
3. Navigate to Panels > Content.
4. Click Add new block.
5. Under **LISTS (VIEWS)**, select your new block.
6. Select the number of **Items per block**, then click Add block.



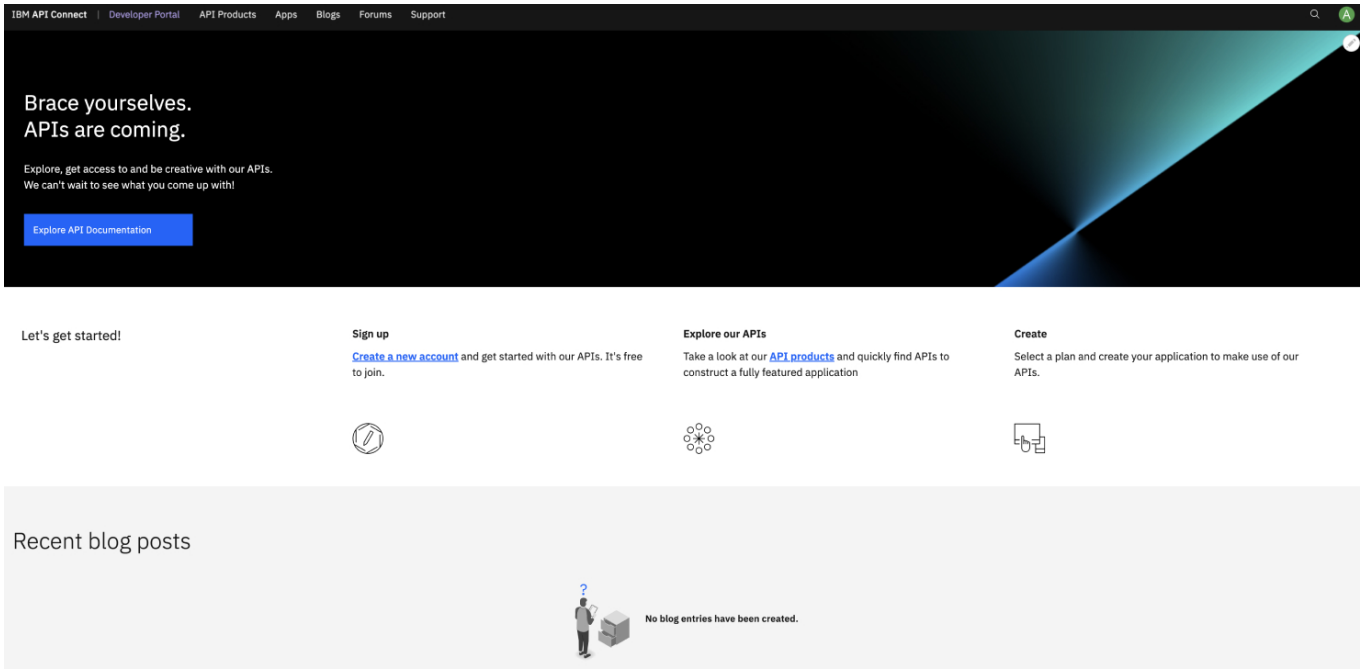
7. You can now rearrange the position of the blog post on the front page.



8. Click Update and save.

What you did in this tutorial

You can check that the view you created appears on the front page of your site page.



What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

Tutorial: Displaying tweets on the front page

You can customize the appearance of the front page of your Developer Portal to display recent tweets. You might use the tweets to provide your users with information, such as service availability or marketing campaigns.

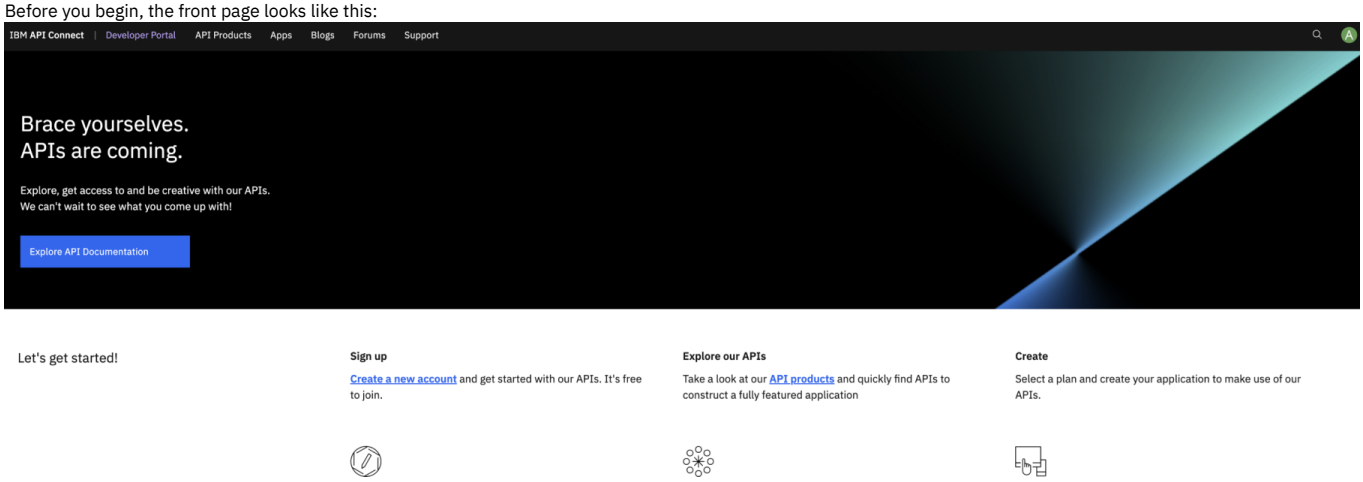
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create a view, customize that view to show tweets, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

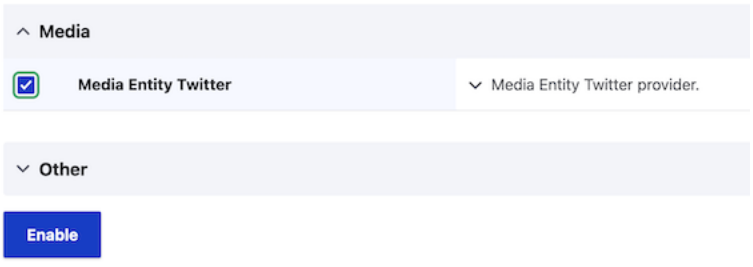


This tutorial takes you through the following steps:

1. Enable the Media entity Twitter module.
2. Create an entity called Twitter to store the tweets.
3. Add media items.
4. Create a carousel view.
5. Customize the carousel view.
6. Embed the carousel view on the front page of your Developer Portal.

Enable the `Media entity twitter` module

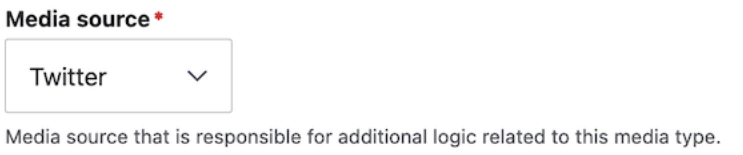
1. Log in to your Developer Portal as an administrator.
2. Click Extend > Extend, and enter `media` in the Filter field.
3. Under the Media section, find Media Entity Twitter and click Enable to enable the **`Media entity twitter`** module.



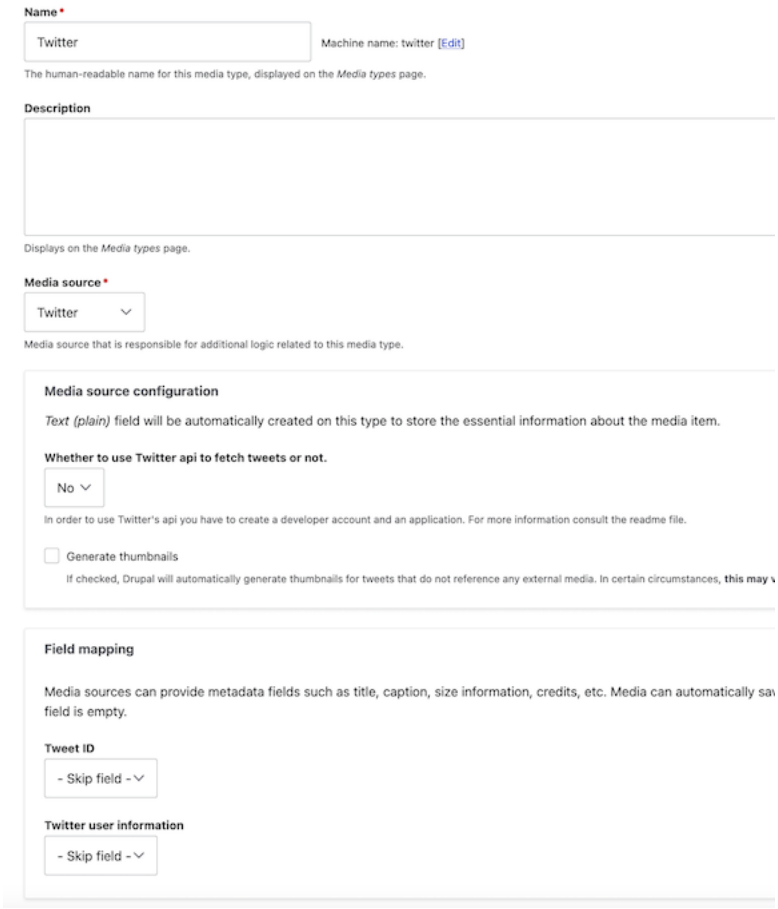
Create an entity called `Twitter` to store the tweets

1. Navigate to Structure > Media types.
2. Click +Add media type.
3. In the Name field, enter Twitter.

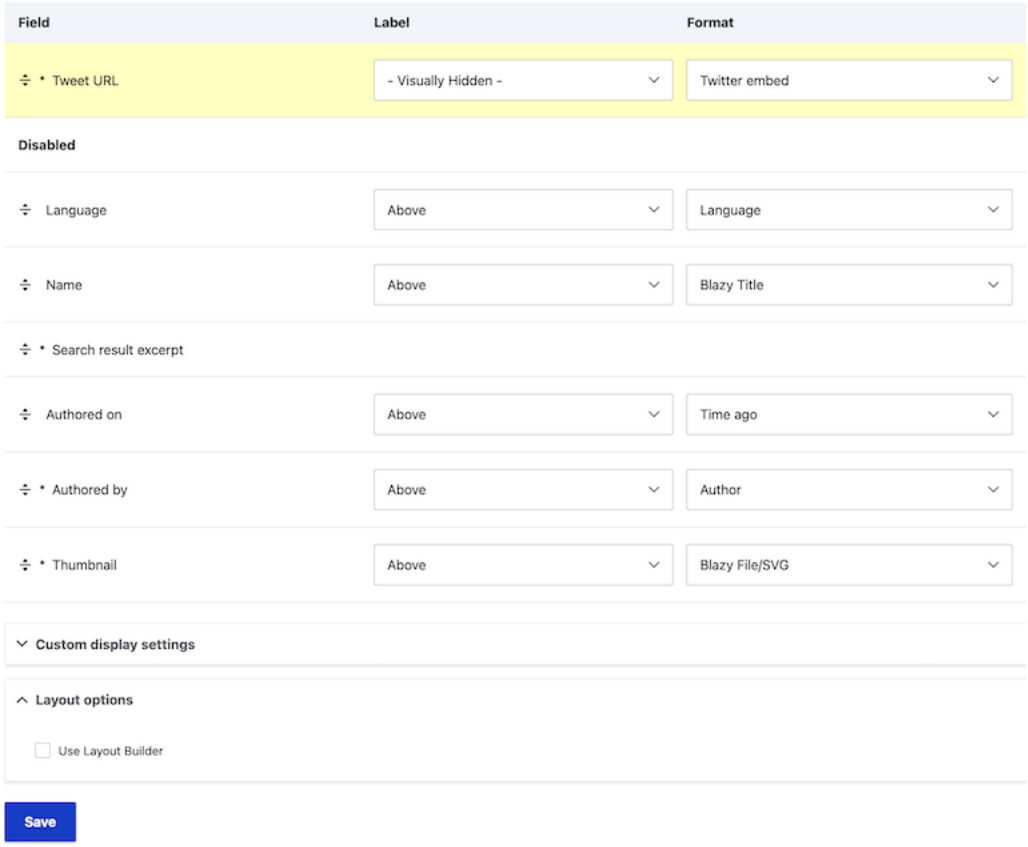
4. From the Media source list, select Twitter.



5. Under the Media source configuration section, ensure that **`Whether to use Twitter api to fetch tweets or not`** value is set to No.
6. Under the Field Mapping section, ensure that the **`Tweet ID`** and **`Twitter user information`** sections are set to - Skip field -.



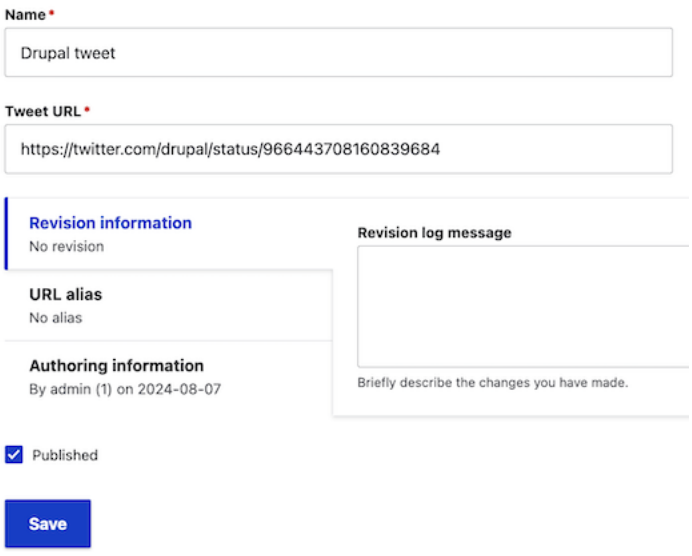
7. Click Save.
8. Select Manage Display from the list next to Edit for the new **`Twitter`** media type.
9. From the Format list of **`Tweet URL`**, select Twitter embed.
10. Ensure that the Authored on, Authored by, and Thumbnail fields are in the Disabled section.



11. Click Save.

Add media items

1. Click Media > +Add media > Twitter.
2. In the Name field, enter a name for the media, for example Drupal Tweet.
3. In the Tweet URL field, enter a URL, for example, `https://twitter.com/drupal/status/966443708160839684`.



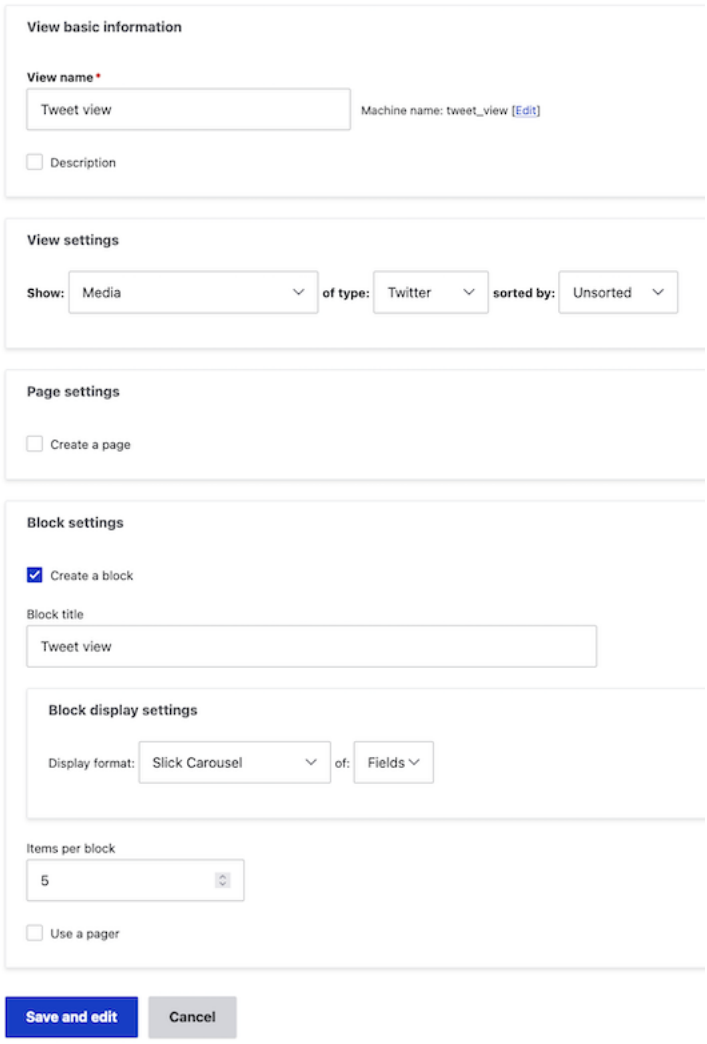
4. Click Save.
5. Repeat these steps to add more tweets, you need at least 2 to make a carousel view.

Create a carousel view

1. Navigate to Structure > Views.
2. Click +Add view.
3. In the View name field, enter a name for your view, for example Tweet view.
4. Under View Settings, select the options as follows:
   - **show**: Media

- **`of type`**: Twitter
- **`sorted by`**: Unsorted

5. In the Block Settings section, select the Create a block checkbox.
6. Ensure that the Display format is selected as Slick Carousel of fields.



7. Click Save and edit.

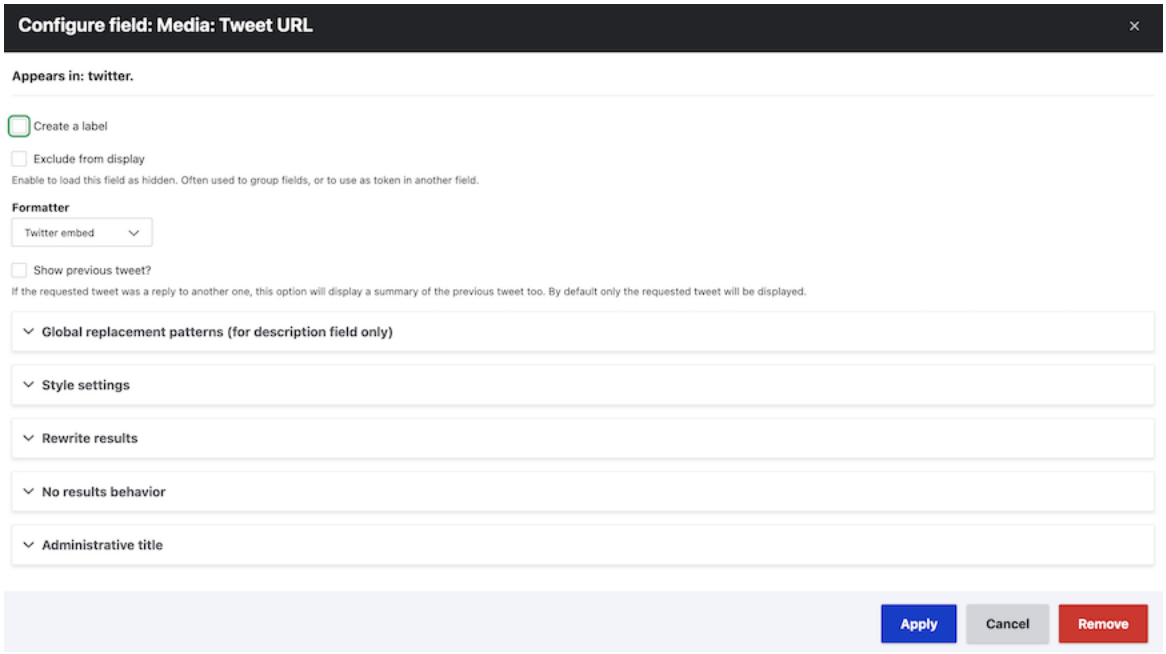
Customize the carousel view

You are now on the page where you can edit your view.

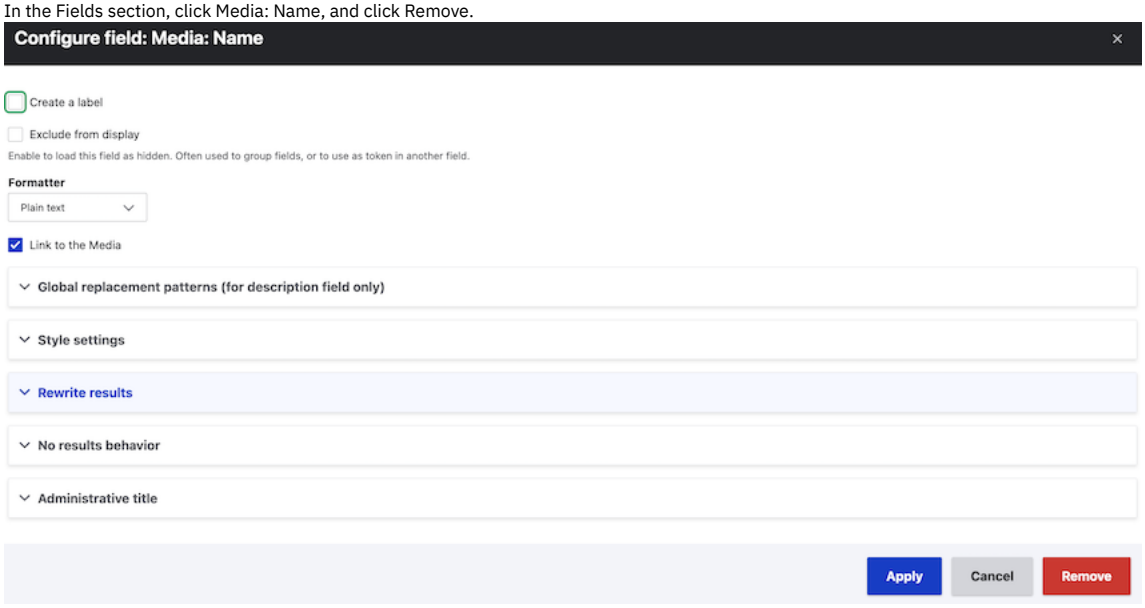
1. If you are not the edit view page, navigate to Structure > Views, find the name of the view that you created, and click Edit.
2. In the Title section, click Tweet view and enter <none> in the **`Title`** field, and click Apply.

3. In the Fields section, click Add and then search for tweet.
4. Select the check box for Tweet URL and click Add and configure fields.

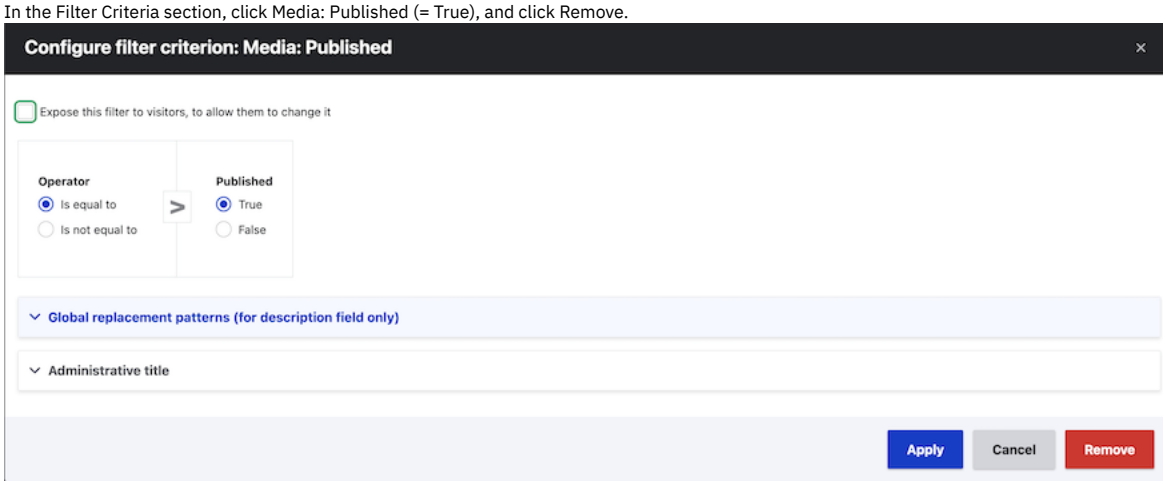
5. From Formatter, select Twitter embed and click Apply.



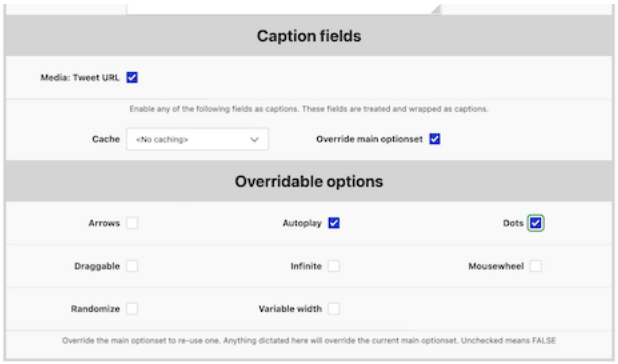
6. In the Fields section, click Media: Name, and click Remove.



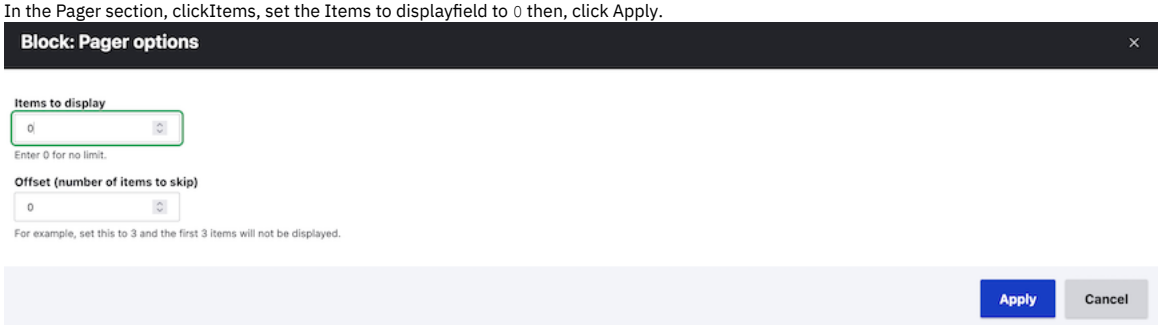
7. In the Filter Criteria section, click Media: Published (= True), and click Remove.



8. In the Format section, click Settings next to Slick Carousel.
9. From the Skin Main list, select Default.
10. In the Caption Fields section, select Media: Tweet URL and Override main optionset checkboxes.
11. In the Overridable Options section, select the Autoplay and Dots checkboxes, and click Apply.



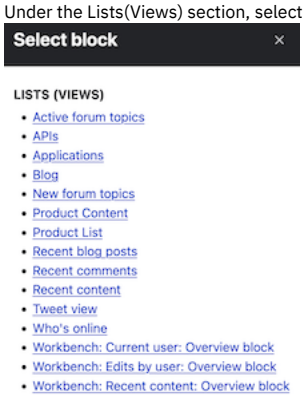
12. In the Pager section, clickItems, set the Items to displayfield to `0` then, click Apply.



13. Click Save.

Embed the view on the front page of your Developer Portal

1. Navigate to Structure > Pages.
2. Find the **`welcome`** label and click Edit.
3. In the Variants section, click Panels, then Content.
4. Click Add new block.
5. Under the Lists(Views) section, select your new block.



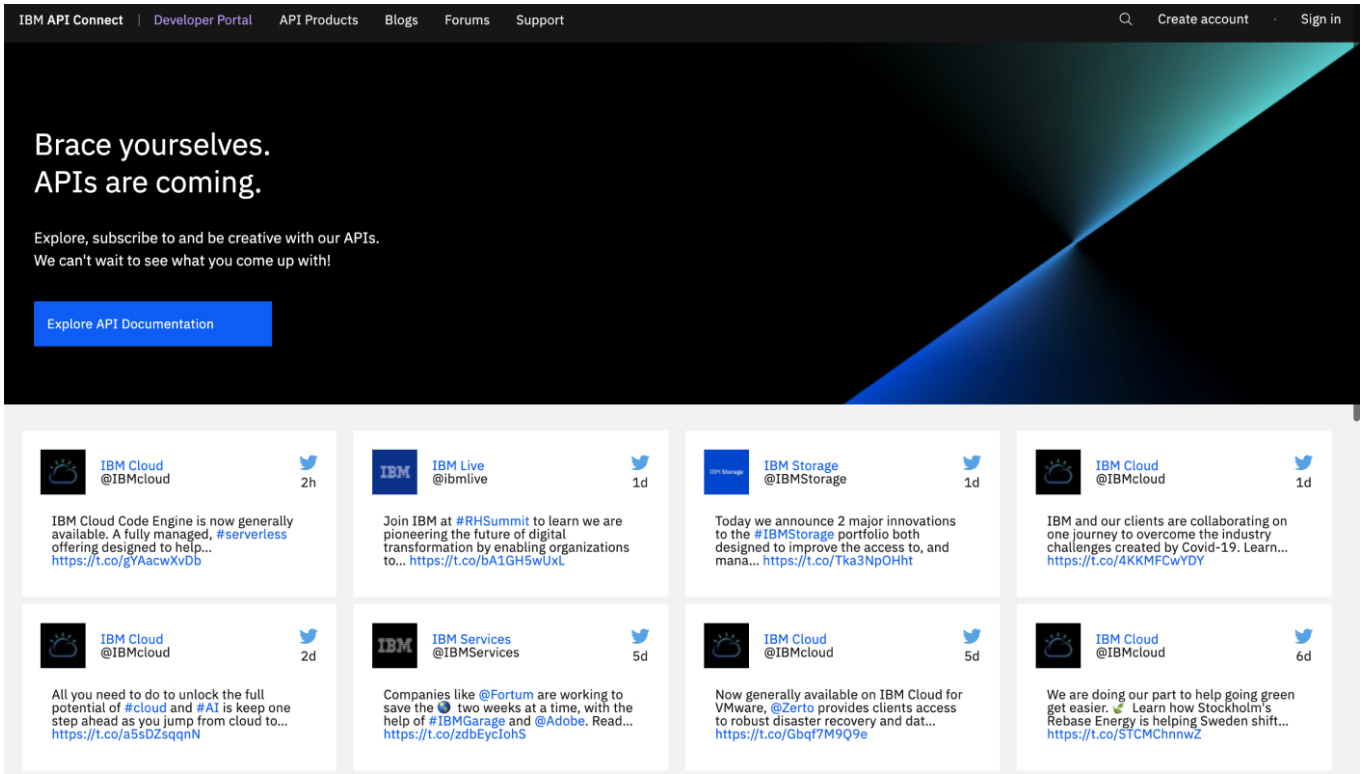
6. Clear the Display title checkbox and click Add block.
7. You can now rearrange the position of your tweet view on the front page.

Label	Plugin ID	Region	Operations
Content			
Welcome Banner	block_content:ae26695d-f6fc-4f0e-adda-5d575506bd23	Content	Edit
Featured Content	featuredcontent	Content	Edit
Recent blog posts	views_block:recent_blog_posts-block_1	Content	Edit
Tweet view	views_block:tweet_view-block_1	Content	Edit
Getting Started	block_content:9328e92b-6efe-40fc-971f-d8eb0171912b	Content	Edit
Social Block	social_block	Content	Edit
Get help	block_content:7958fc33-e61d-4c9a-ae61-9b47f02acec8	Content	Edit

8. Click Update and save.

What you did in this tutorial

You can check that the view you created appears on the front page of your site page.



What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

You can also integrate your Twitter data dynamically. For more information, see the links below.

Tutorial: Changing the front page of your Developer Portal

You can create and arrange content in your Developer Portal to provide a front page that aligns with your brand, and helps your users discover your APIs.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

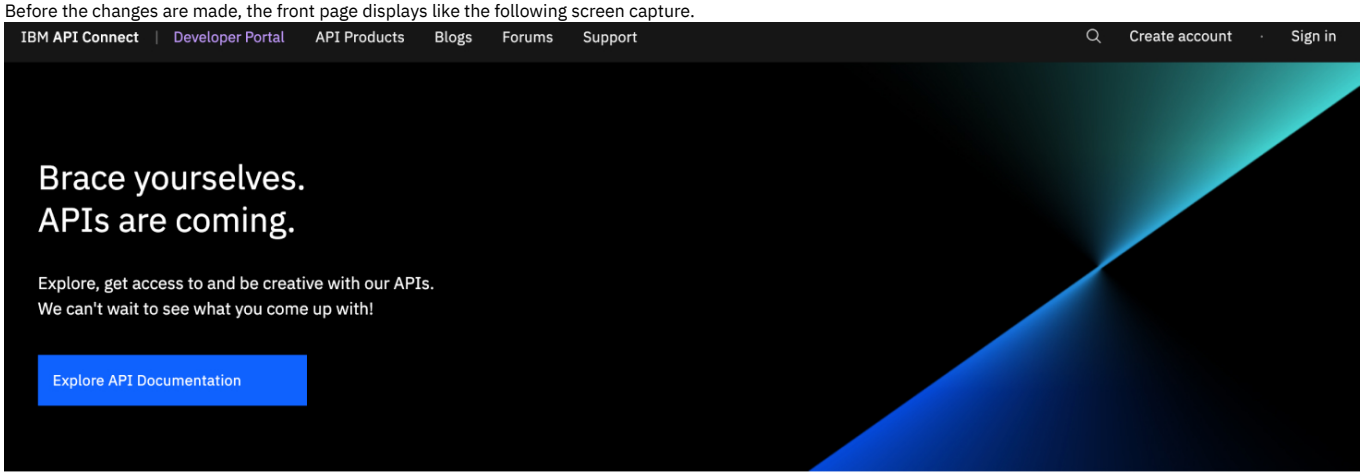
About this tutorial

In this tutorial, you create some content for a page, and then change the front page to be your new page.

This tutorial takes you through the following steps:

1. Creating some custom blocks.
2. Create and configure a page.
3. Adding the custom blocks to the page.
4. Changing the front page to be your new page.

Before the changes are made, the front page displays like the following screen capture.



Let's get started!

Sign up

Create a new account and get started with our APIs. It's free to join.

Explore our APIs

Take a look at our API products and quickly find APIs to construct a fully featured application

Create

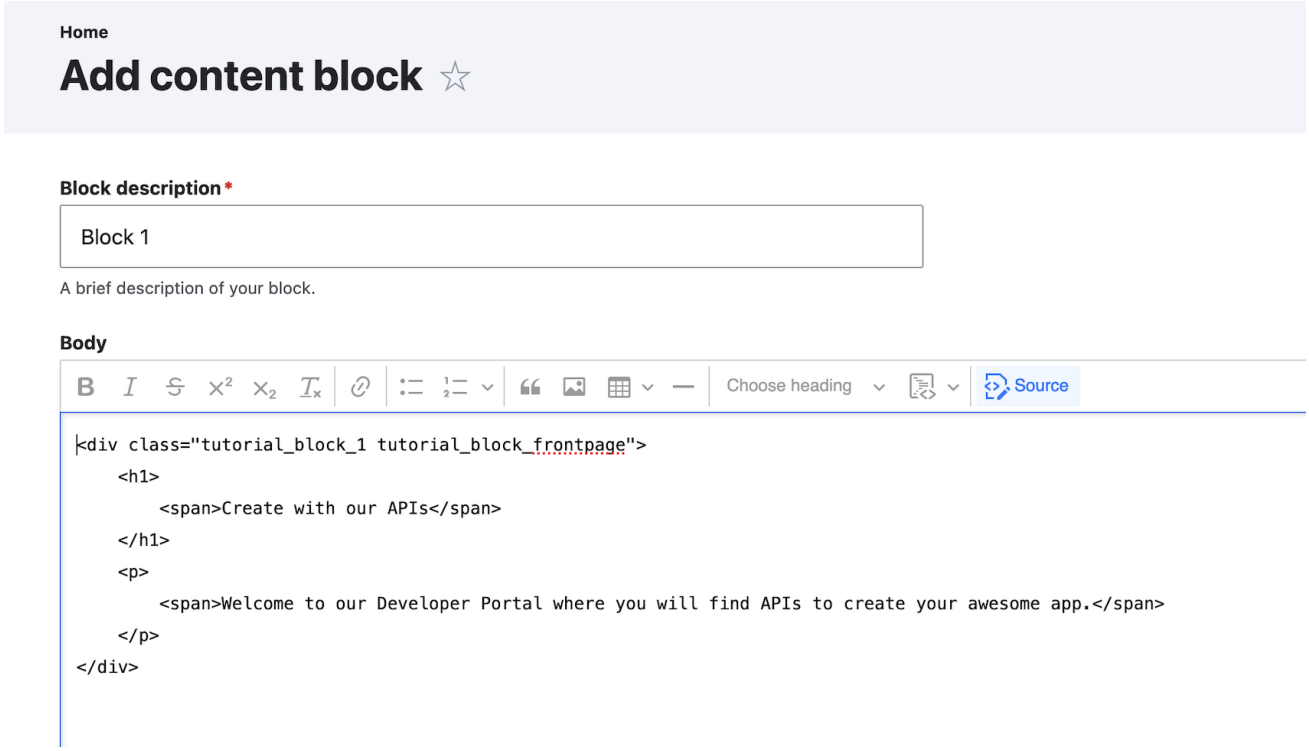
Select a plan and create your application to make use of our APIs.

Creating some custom blocks

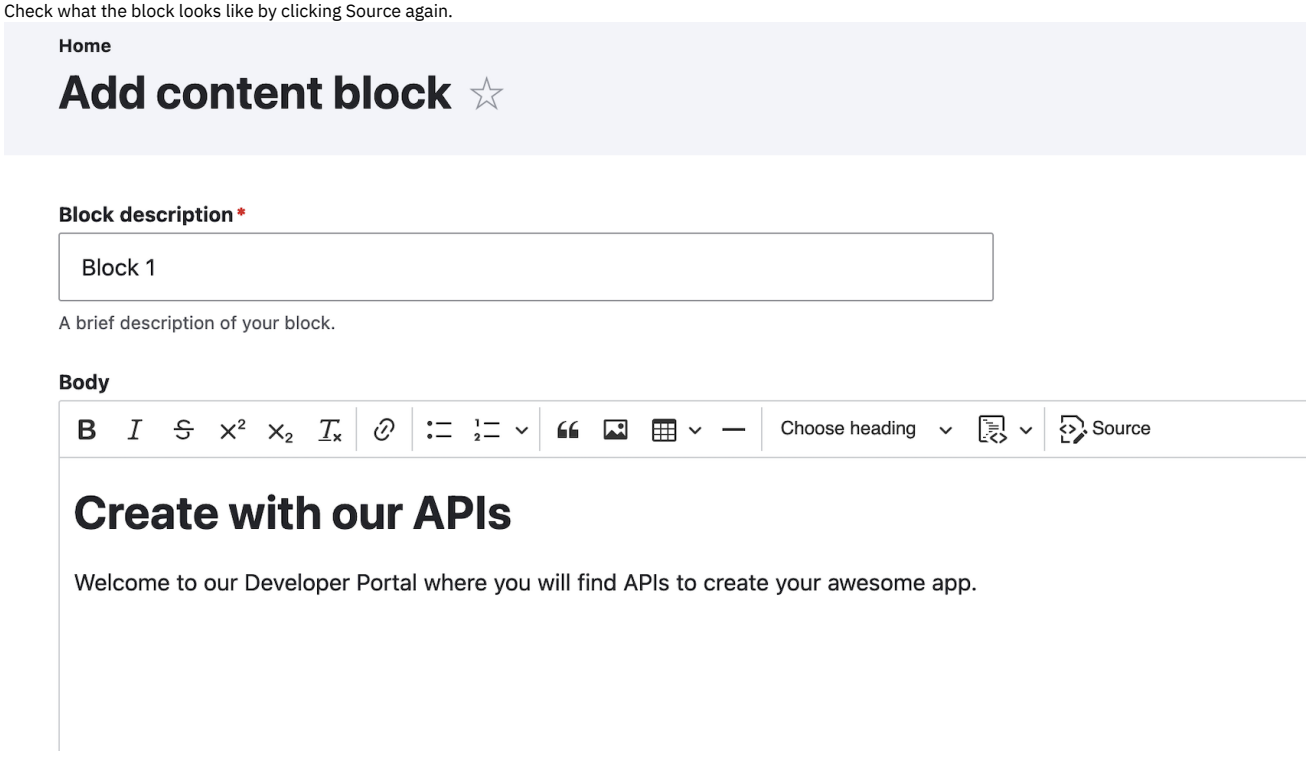
1. Log in to your Developer Portal as an administrator.
2. Click Blocks and then click +Add content block.
3. Enter `Block 1` in the Block description.
4. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>

<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```



5. Check what the block looks like by clicking Source again.



Note: This block uses no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see Tutorial: Creating a custom theme for the Developer Portal.

6. Click Save.
   You have created `Block 1`.

7. Repeat steps 3 to 7 to create `Block 2`, `Block 3`, and `Block 4`.
   a. Enter `Block 2` in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_2 tutorial_block_frontpage">
<p class="text-align-center">Explore and subscribe to our APIs.<br />
See what you come up with!</p>

<p class="text-align-center"> </p>

<div class="bannerButtonRow text-align-center"><a class="button cta-btns--white__btn"
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.8_com.ibm.apic.devportal.doc_product">Explore API
```

```
Documentation</a></div>
</div>
```

b. Enter `Block 3` in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_3">
<p class="text-align-center"><a
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.8_com.ibm.apic.devportal.doc_user_register">Create a
new account</a> and get started with our APIs. It's free to join.</p>
</div>
```

c. Enter `Block 4` in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="block-get-help">
<div class="get_help">
<div class="column col1">
<h3>Getting Help</h3>

<div>Be sure to check out these extra help resources.</div>
</div>

<div class="column col2">
<h4>Get Started</h4>

<div>Get started with our APIs by creating an account and exploring the documentation to find what's right for you.
</div>

</div>
</div>
</div>
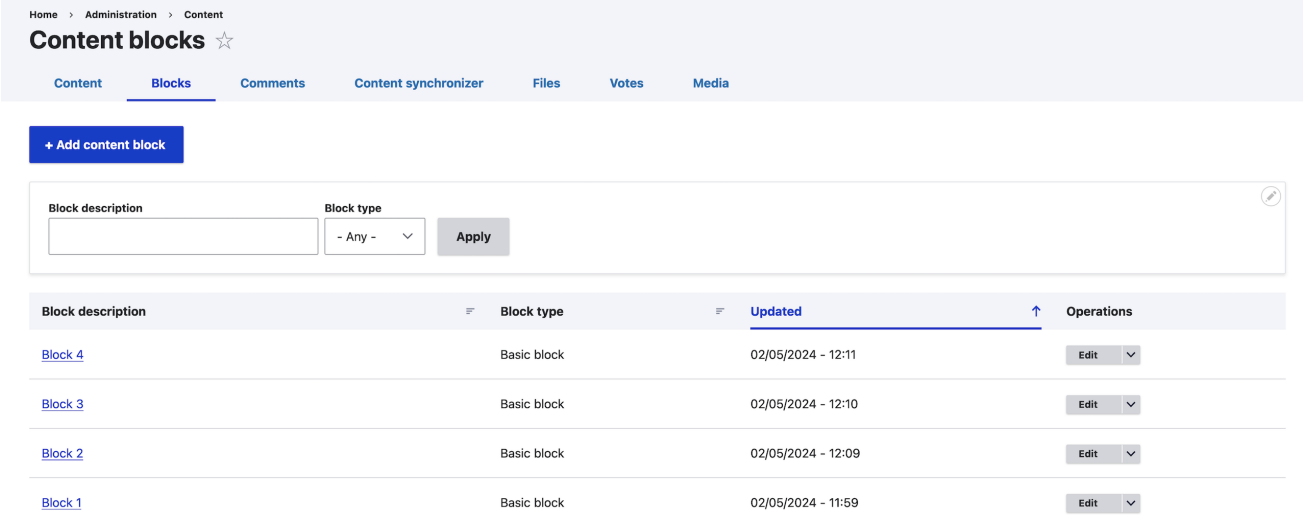
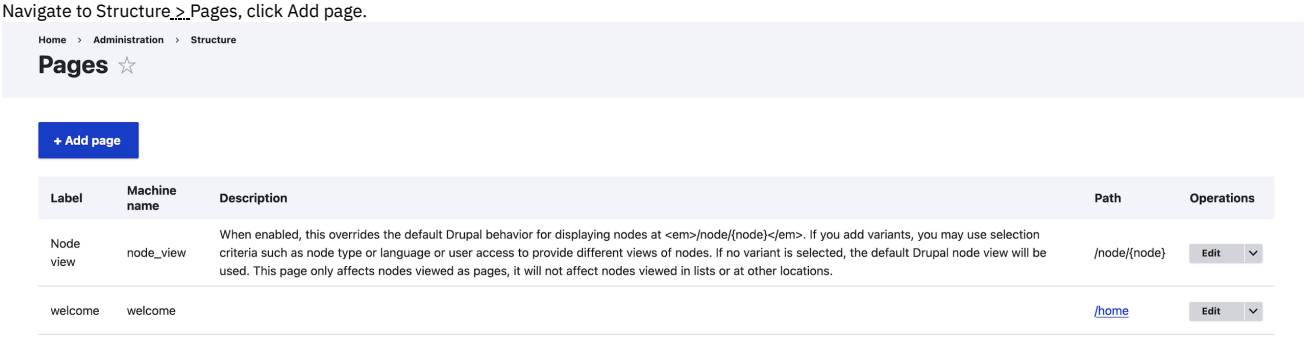
```

8. You can see the new blocks on the Content blocks page. If you are not on the Content blocks page, navigate to Content > Blocks to see the new blocks.

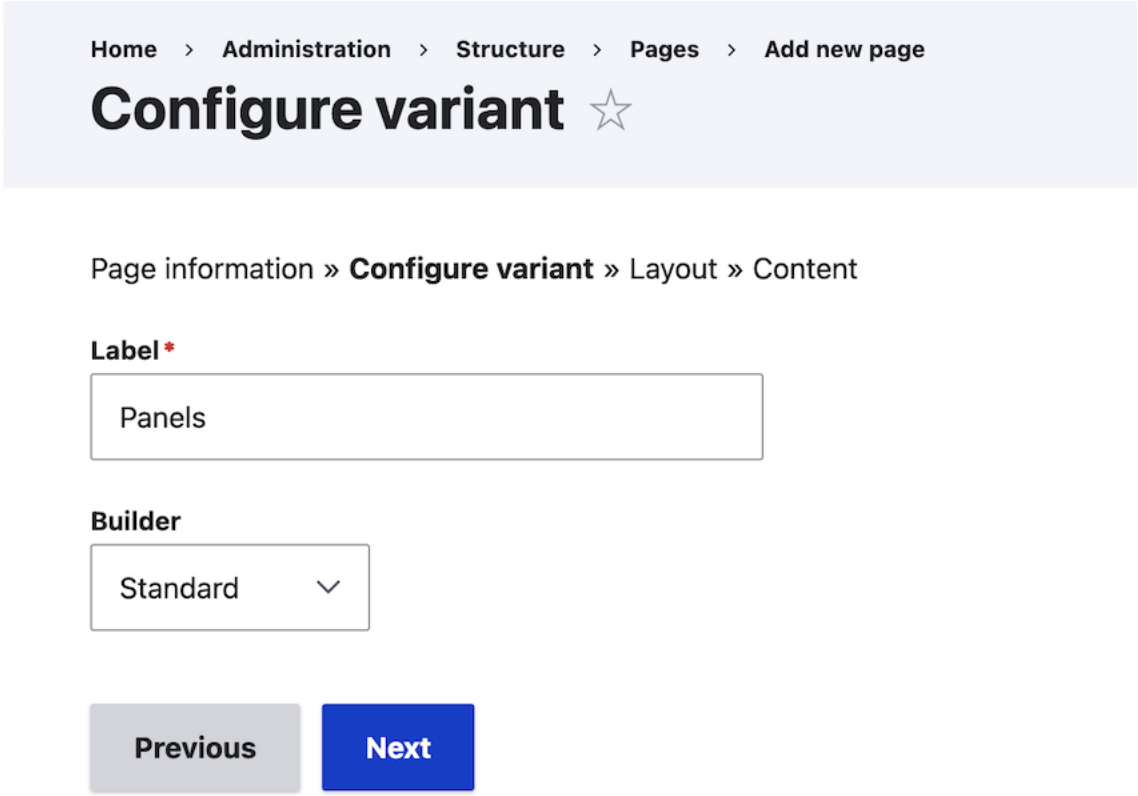


Create and configure a page

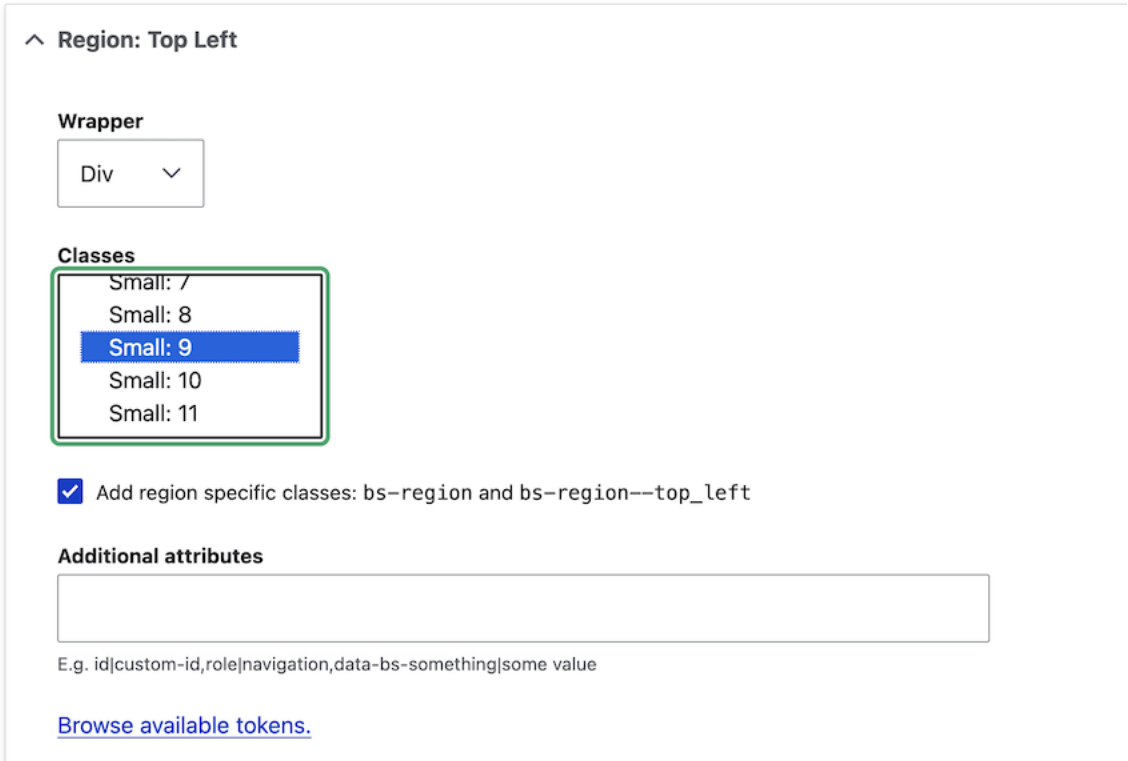
1. Navigate to Structure > Pages, click Add page.



2. In the Administrative title field, enter `Portal home`.
3. In the Path field, enter `newhome`.
4. From Variant type, select **`Panels`**.
5. Ensure all other checkboxes are clear.
6. Click Next.
7. Accept the defaults of `Panels` for Labels, and Standard for Builder, click Next.



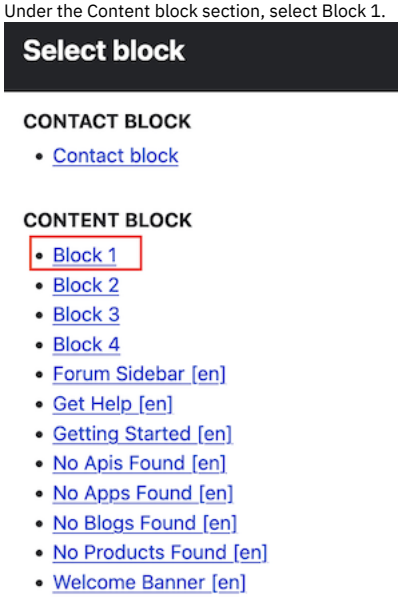
8. From Layout, select Two column bricks and click Next.
9. Keep all settings except for the following:
   - Top Left, set Classes to Small:9
   - Top Right, set Classes to Small:3
   - Bottom Left, set Classes to Small:4
   - Bottom Right, set Classes to Small:8



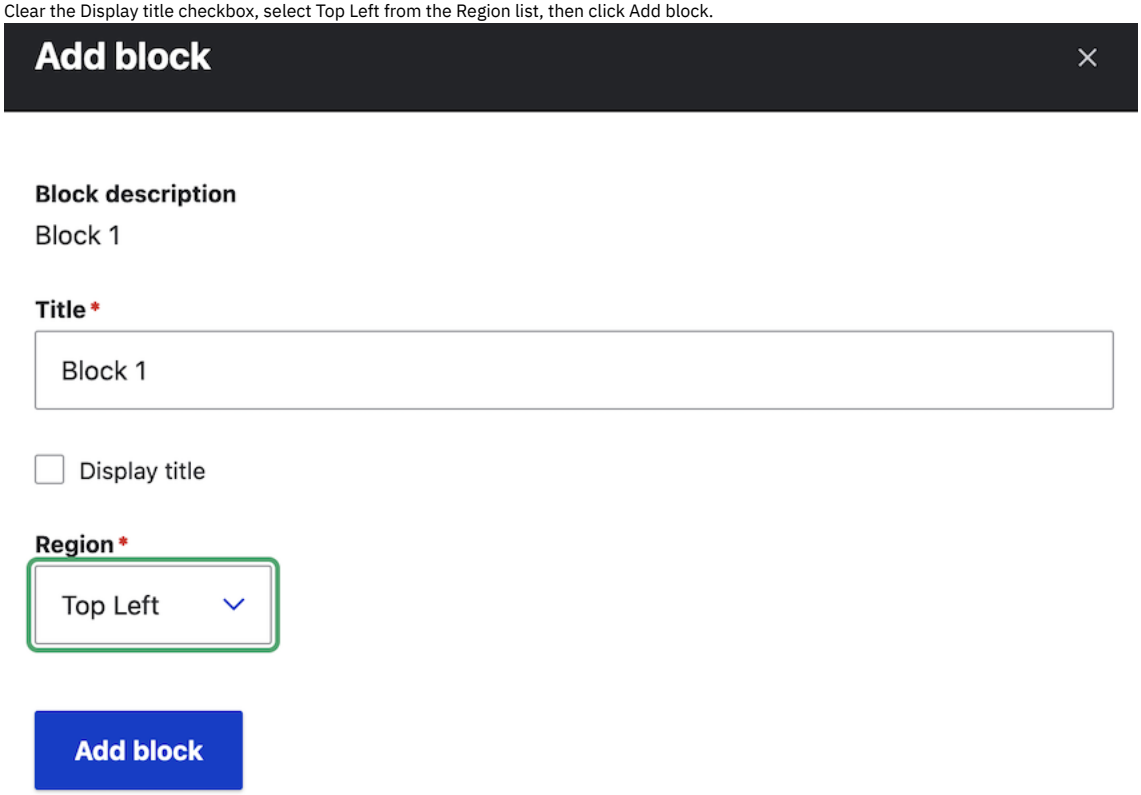
10. Click Next.

Adding the custom blocks to the page

1. Leaving Page title blank, click Add new block.
2. Under the Content block section, select Block 1.



3. Clear the Display title checkbox, select Top Left from the Region list, then click Add block.



You added Block 1, repeat steps 1 to 3 to add Block 2, Block 3, and Block 4:

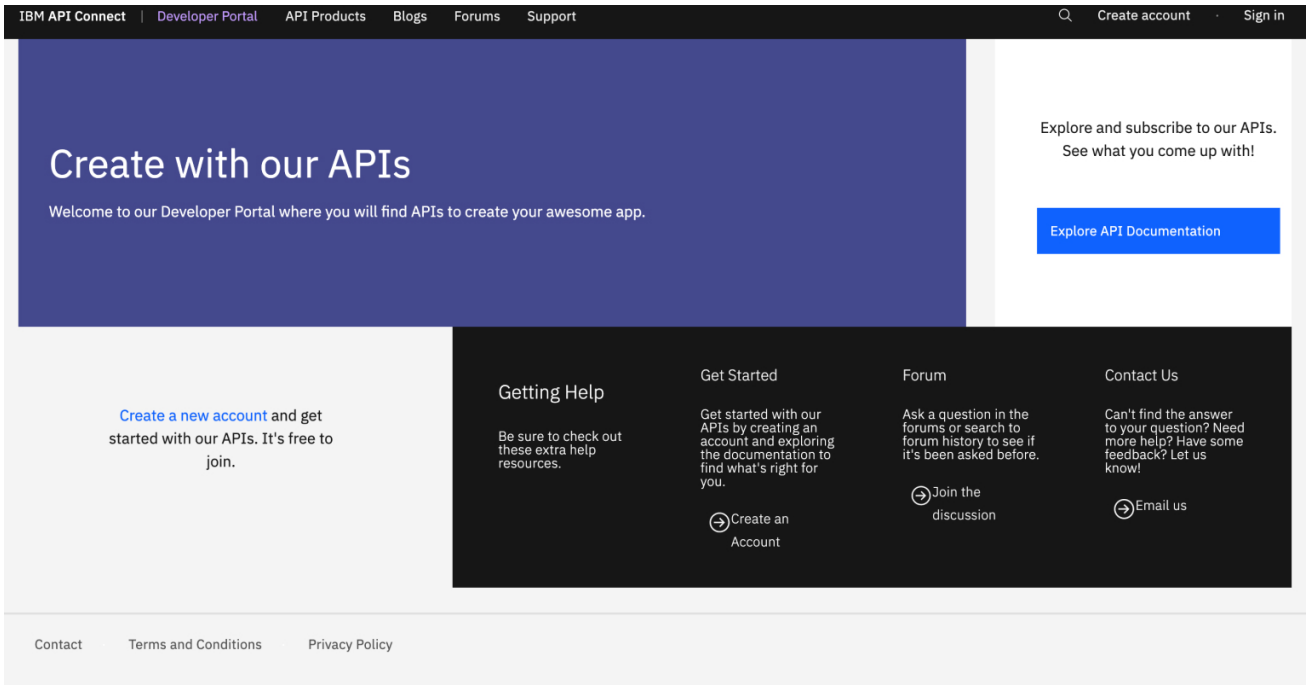
   a. For Block 2, select Top Right from the Region list.
   b. For Block 3, select Bottom Left from the Region list.
   c. For Block 4, select Bottom Right from the Region list.

4. Click Finish.
5. Click Update and save.

Changing the front page to be your new page

Note: In this tutorial, you create a new page and swap it with the default. If errors are made, the default page is still available as a backup.

1. Navigate to Structure > Pages.
2. Click the newhome URL link for your new Portal home page, check that your page looks as designed.



3. Navigate to Configuration > System > Basic site settings
4. In Front Page region set Default front page field to /newhome.
5. Click Save configuratoin.

What you did in this tutorial

The front page of your Developer Portal is now changed and laid out with the blocks of content that you specified.

What to do next

You can add further branding by adding content to your custom blocks such as images, or try to use one of the provided custom blocks such as the Featured Content Block. By default this block is English, you might want to consider adding versions in other languages.

Tutorial: Grouping products by category

You can configure the Developer Portal so that products are displayed in groups according to the category that they are tagged with.

You can use the **`Views`** module to fetch content from your Developer Portal site, such as lists of products, and present the content to users in different formats. You can combine multiple views on a new page to display whatever content you want.

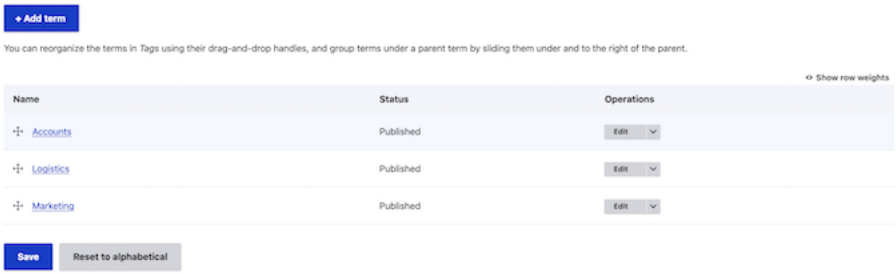
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

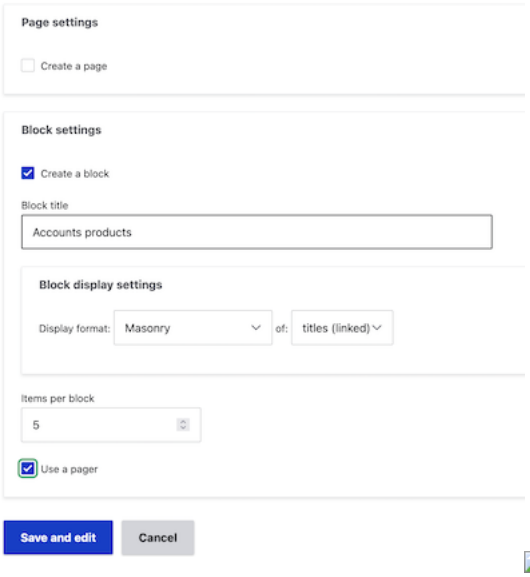
About this tutorial

In this tutorial you create three views in the Developer Portal, each one is configured to display a list of products according to their category. You then create a new page to show the views, where you see products that are grouped by category.

1. Log in to your Developer Portal as an administrator.
2. Create three new taxonomy tags.
   a. Navigate to Structure > Taxonomy.
   b. Under **`Vocabulary name`**, find Tags and click the arrow near to List terms .
   c. Click Add terms.
   d. In the **`Name`** field, enter `Accounts` and click Save.
   e. In the **`Name`** field, enter `Logistics` and click Save.
   f. In the **`Name`** field, enter `Marketing` and click Save.
   g. To show the list of new tags, navigate to Structure > Taxonomy, find Tags vocabulary, and click List terms.

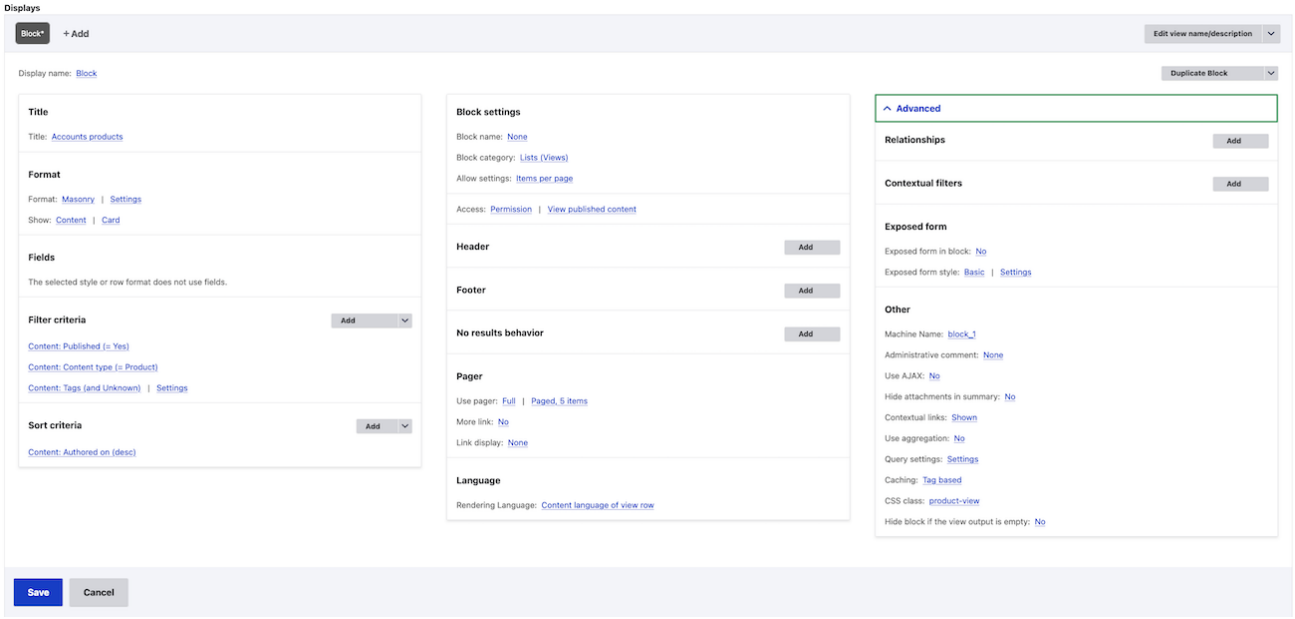


3. Create a view to display products with the **`Accounts`** category.
   a. Navigate to Structure > Views > +Add view.
   b. In the **`View name`** field, enter `Accounts products`.
   c. In the **`View Settings`** section, select the following options:
      - **`Show`**: Content
      - **`of type`**: Product
      - **`sorted by`**: Newest first
   d. In **`Page settings`** section, ensure that the Create a page checkbox is clear.
   e. In **`Block settings`** section, select the Create a block checkbox, and enter `Accounts products` in the **`Block title`** field.
   f. Ensure that the **`Block Display Settings`** section has the following default options:
      - **`Display format`**: Masonry
      - **`of: tiles (linked)`**
   g. Select the Use a pager checkbox.



page to add account category

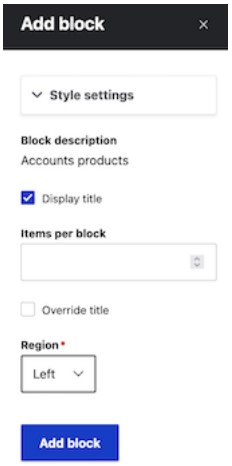
   h. Click Save and edit.
4. Configure the view block settings.
   a. In the **`Format`** section, click the Fields link next to the **`Show`** label.
   b. In the dialog box, select Content and click Apply.
   c. From the View mode list, select Card and click Apply.
   d. In the **`Filter Criteria`** section, click Add.
   e. In the **`Search`**field, enter `tag`, select the **`Tags (apic_tags)`** option from the list, and click Add and configure filter criteria.
   f. In the next dialog box, select the **`Tags`** and **`Client-side hierarchical`** options, then click Apply and continue.
   g. Under **`Operator`**, select Is all of, and from the **`Select terms from vocabulary Tags`** list, select Accounts, and click Apply.
   h. Under **`Advanced`**, click the None link next to the **`CSS class`** label.
   i. If you are using the default API connect theme, then enter the CSS class name `product-view` and click Apply. If you have your own css class that you want to use, then enter its name in here instead.
   j. Click Save to save all the changes.



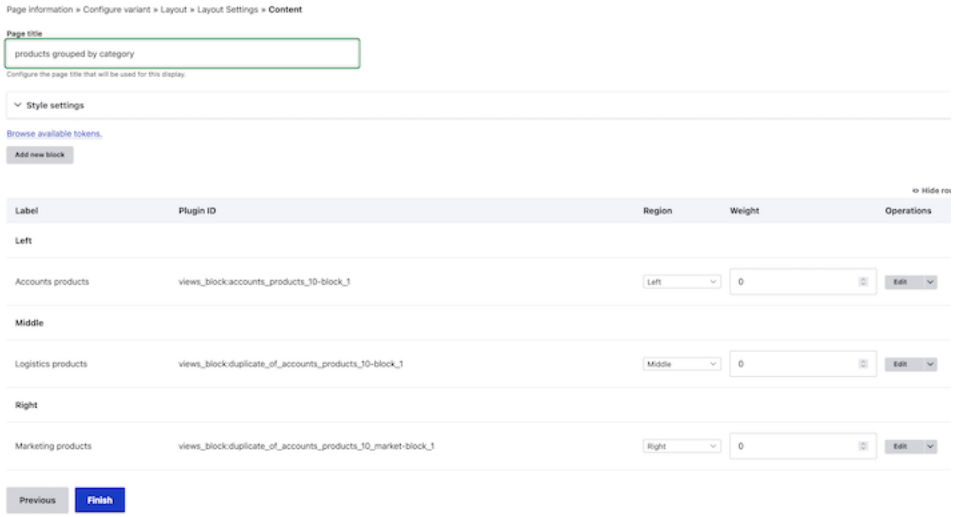
5. Create a view for the Logistics products.
    a. Select Structure > Views.
    b. Navigate to the **`Accounts products`** view. Click the arrow next to Edit and select Duplicate.
    c. In the **`View name`** field, enter `Logistics products`, update the machine name, and click Duplicate.
    d. In the **`Title`** section, click Accounts products.
    e. In the **`Title`** field, enter `Logistics products` and click Apply.
    f. In the **`Filter Criteria`** section, click the Content: Tags: (=Accounts) link.
    g. From the Select terms from vocabulary Tags list, select Logistics and click Apply.
    h. Click Save to save all the changes.
6. Repeat step 5 to create a view for the Marketing products.
7. Next, create a page to display the views.
    a. Navigate to Structure > Pages.
    b. Click +Add page.
    c. In the **`Administrative title`** field, enter `Products by category`.
    d. In the **`Path`** field, enter `products-by-category`.
    e. From the Variant type list, select Panels and click Next.

    f. Change the **`Label`** value to `Products grouped by category`.
    g. From the Builder list, select **`Standard`** and click Next.
    h. From the Layout list, select Three column then click Next.
    i. Leave all the defaults on the next page and click Next.
    j. Click Add new block.
    k. From the Lists (views) section, select Accounts products .
    l. Ensure that Display tile checkbox is selected and **`Region`** is set to Left.

m. Click Add block.



n. Click Add new block. Select **`Logistics products`** view from the list and set the **`Region`** to Middle, click Add block.
o. Click Add new block. Select **`Marketing products`** view from the list and set the **`Region`** to Right, click Add block.
p. Enter `Products grouped by category` in the **`Page title`** field, and click Finish.



8. From your API Manager, create three new products, or update existing ones, to give each one a category value of either Accounts, Logistics, or Marketing. Publish each of the products to the catalog with the configured Developer Portal.
9. Check that the **`Products grouped by category`** page shows your published products by category.
   a. Select Structure > Pages.
   b. Click the **`/products-by-category`** path link.
   c. You are redirected to the **`/products-by-category`** page and can see the products that you assigned to these categories.

What you did in this tutorial

You created three new views in the Developer Portal, and configured each one to display a list of products according to their category. You then created a new page to show the views.

Tutorial: Adding a field to the sign up form

You might want to collect and store additional information about your Developer Portal users. For example, you might want to collect a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you will add a Department code field to the Sign up form. This field is required for all portal users.

This tutorial takes you through the following steps:

1. Adding a field to a user entity.
2. Adding the new field to the Sign up form.
3. Testing the new field.

Adding a field to a user entity

1. Log in to your Developer Portal as an administrator.
2. Navigate to Configuration > People > Account settings and click the Manage fields tab.

You are on the **`Manage fields`** tab.

1. Click + Create a new field.
2. From the Choose a type of field list, select Plain text, and click Continue.
3. In the **`Label`** field enter, `Department code`, and select Text (plain).
4. Click Continue.

You are on the **`Department code settings for user`** page.

1. Accept the defaults of **`Maximum length`** (255) and **`Allowed number of values`** (Limited:1).
2. Click Save settings.

You are on the **`Manage fields`** page. Check that **`Department code`** is a listed field.

1. Under **`Label`**, find **`Department code`** and click Edit.
2. Add some help text. This is information that is displayed to the user to assist them completing the field on a form. Examples or links to further information are useful here. We are going to add an example in this tutorial.
3. Add `Example department code: DEP123.` into the **`Help text`** field.
4. Select the Required field checkbox.
5. Click Save settings.

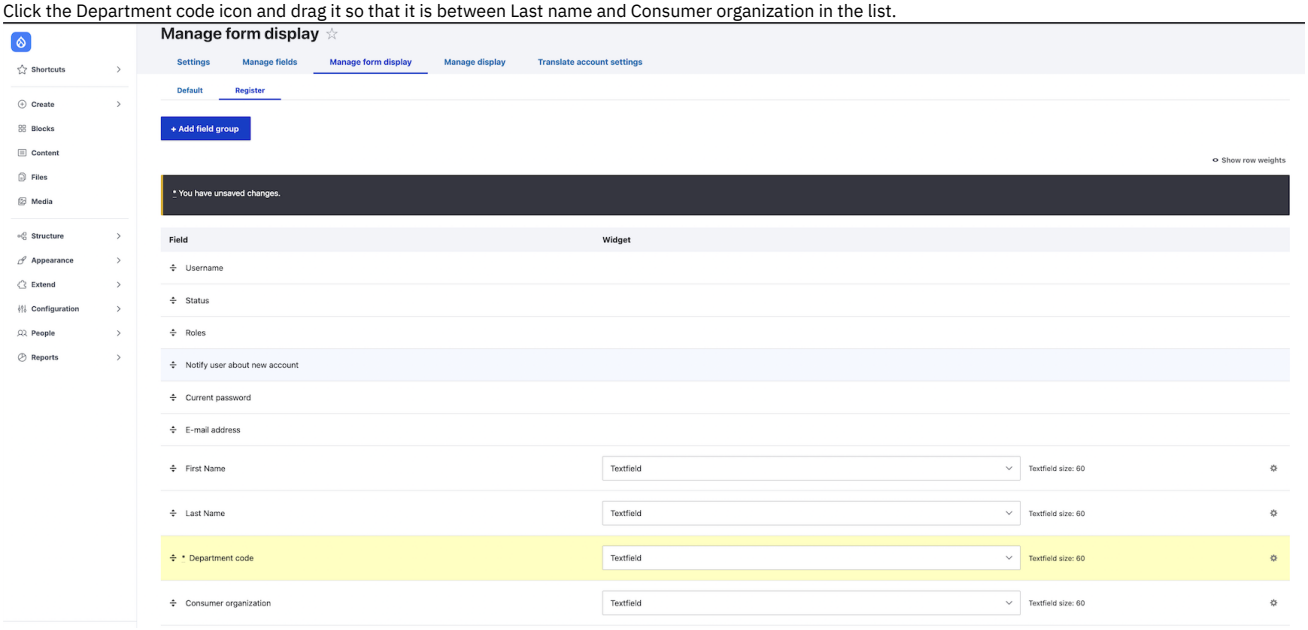
The field has now been created. You are back on the **`Manage fields`** tab.

Adding the new field to the Sign up form

1. Navigate to Configuration > People > Account settings and click the Manage form display tab.

You are on the Manage form display tab. These tabs, one for each form, show the fields that are displayed from the user entity, and in which order.

1. Switch to the Register tab. Notice that initially the new **`Department code`** field is underneath the **`Disabled row`** in the page. This means that it isn't shown on the form.
2. Click the Department code icon and drag it so that it is between Last name and Consumer organization in the list.



3. Click Save.

Testing the new field

1. Sign out as the Admin user.
2. Click Create a new account.
3. Observe that the **`Department code`** field is now part of the sign up form.

What you did in this tutorial

You added a Department code field to the Sign up form, then tested the form to ensure that the **`Department code`** field is now part of the sign up form.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this you would include the configuration in your custom module. For more information, see this Drupal documentation.

You might want to add extra validation to the Department code field on the Sign up form. For more information, see Tutorial: Adding validation to a field on the sign-up form.

Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about Adding a field to the sign up form, where you added a Department code field to the Sign-up form.

About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **`DEPnnn`**, where **`DEP`** is the string prefix and **`nnn`** is a three-digit number, for example, **`DEP123`**. The validation is done by using a custom module that is already available in IBM APIC Portal - addons. However, for more information, see Custom module development: creating a module skeleton.

This tutorial takes you through the following steps:

1. Cloning and packaging the validation module.
2. Installing and enabling the validation module.
3. Testing the validation in the sign up form.

Look at the files we will use in this link IBM APIC Portal - addons.

- user_field_example.info.yml - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10 || ^11
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- user_field_example.module - this contains a validation function and adds this to the Sign-up form by using the **`hook_form_alter`** function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form' ) {
      $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 *   where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
  }
}
```

Cloning and packaging the validation module

Validation is added to the **`Department code`** field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Package up the custom module.

   ```
   cd devportal-addons/apic_v10/modules
   tar -czf user_field_example.tgz user_field_example/
   ```

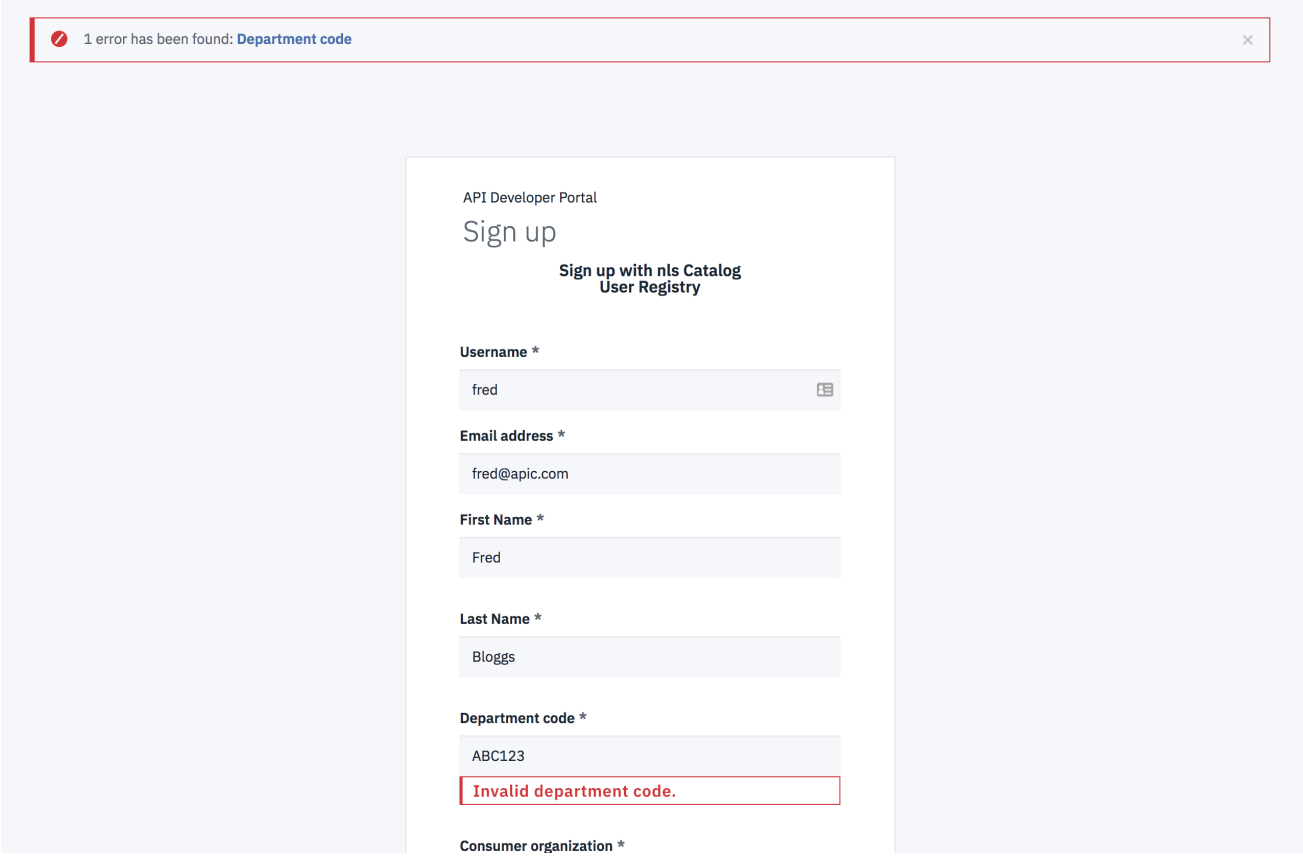
Installing and enabling the validation module

1. Log in to your Developer Portal as an administrator.
2. Click Extend > Extend.
3. Click + Add new module.
4. Under the Upload a module or theme archive section, click Browse file.
5. Browse to and select **`user_field_example.tgz`**, the packaged custom module that you created earlier. Click Open.
6. Click Continue.
7. Click the Enable newly added modules link.
8. Enter `IBM APIC Portal - user field example` in the filter box.
9. Select the **`IBM APIC Portal - user field example`** checkbox.
10. Click Enable.

The module is now installed and enabled.

Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click Create a new account.
3. Enter necessary details in all the fields, set **`Department code`** to **`ABC123`**.
4. Click Sign up.
5. Observe the failure message and highlighting on the **`Department code`** field.



6. Change the **`Department code`** field to **`DEP245`**, reenter the password and click **`Sign up`** to see that a valid code is accepted.

What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **`Department code`** field accepts only codes in the format of **`DEPnnn`**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see Drupal custom modules.

Tutorial: Adding a field group to group fields in a content type

You might want to change how your user account pages are displayed when you have lots of fields.

If you have many fields for one of your content types, for example, a user, then you might want to group some of these fields together when you display them to other users, or when these fields are being edited inside a user form.

Field groups allow you to create a parent field that contains other fields, set up as children, within that group. The **Fieldgroup** forms come with default HTML wrappers such as vertical tabs, horizontal tabs, accordions, fieldsets, or div wrappers.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

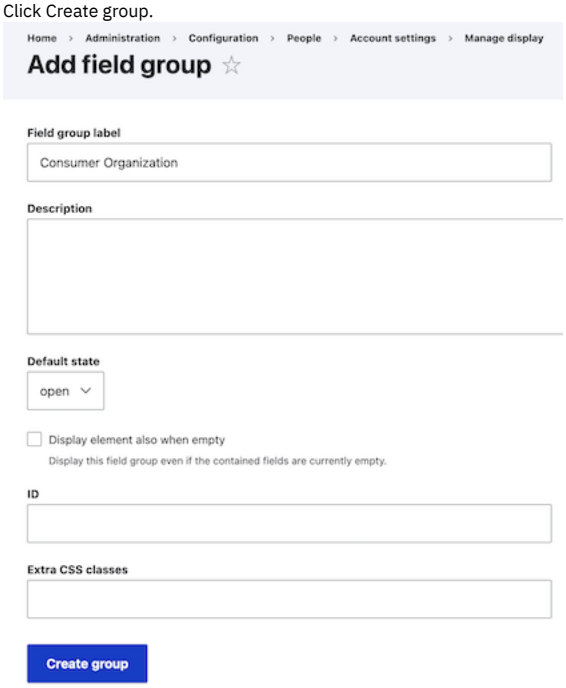
You will create field groups for various groups of user information. These groups can then be seen under the users own section on the account view and edit pages.

This tutorial takes you through the following steps:

1. Adding a field group called Consumer Organization to the user account display.
2. Adding a field group called Personal Details to the user form display.

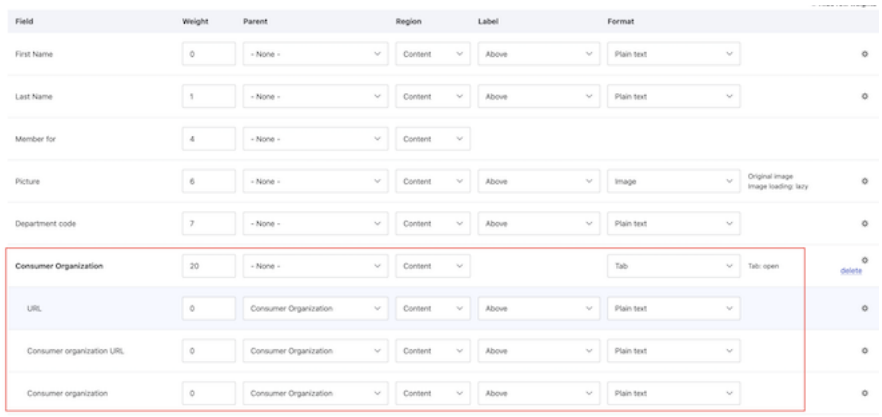
Adding a field group called Consumer Organization to the user account display

1. Log in to your Developer Portal as an administrator.
2. Navigate to Configuration > People > Account settings > Manage display.
3. Click + Add field group.
4. From the Add a new group list, select Tab.
5. In the **Label** field, enter `Consumer Organization`.
6. Click Save and continue.
7. From the Default state list, select **open**. This sets the tab to be expanded by default.
8. Click Create group.

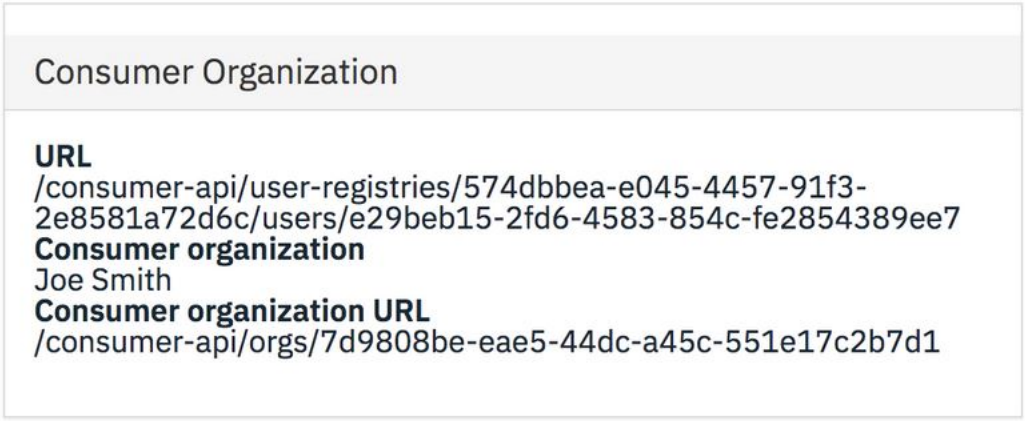


When the group is created, you can assign fields to that group and rearrange the group on the page. After you create the group, you are on the **Manage Display** page. Note: The **Weight**, **Parent**, and **Region** fields are hidden by default. Click Show row weights to view these fields.

1. Under **Field**, find Consumer organization and set the **Region** as Content.
2. Under **Field**, find URL and set **Region** as Content, and **Parent** as Consumer organization.
3. Repeat Step 2 for Consumer organization URL and Consumer organization.
4. Click Save. The Consumer organization, URL, and Consumer organization URL fields are listed under the Consumer organization row. These are fields are now set as the children of the **Consumer organization** group.



You can now see the new group of fields on the account page of a user.



Adding a field group called Personal Details to the user form display

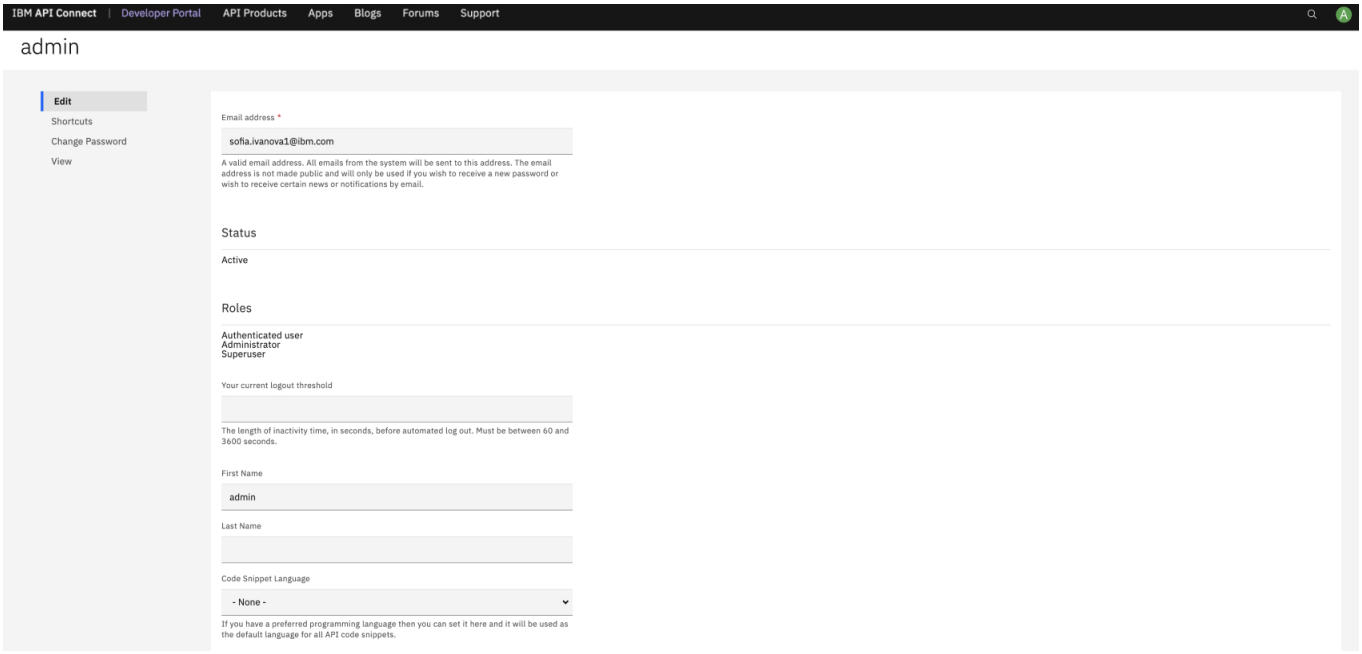
1. Navigate to Configuration > People > Account settings > Manage form display.
2. Click + Add field group.
3. From the Add a new group list, select Tab.
4. In the **`Label`** field, enter `Personal Details`.
5. Click Save and continue.
6. From the Default state list, select Open. This sets the tab to be expanded by default.
7. Click Create group.

Again, when the group is created, you can assign fields to that group and then rearrange the group on the page as you require. After you create the group, you are redirected to the **`Manage Display`** page.

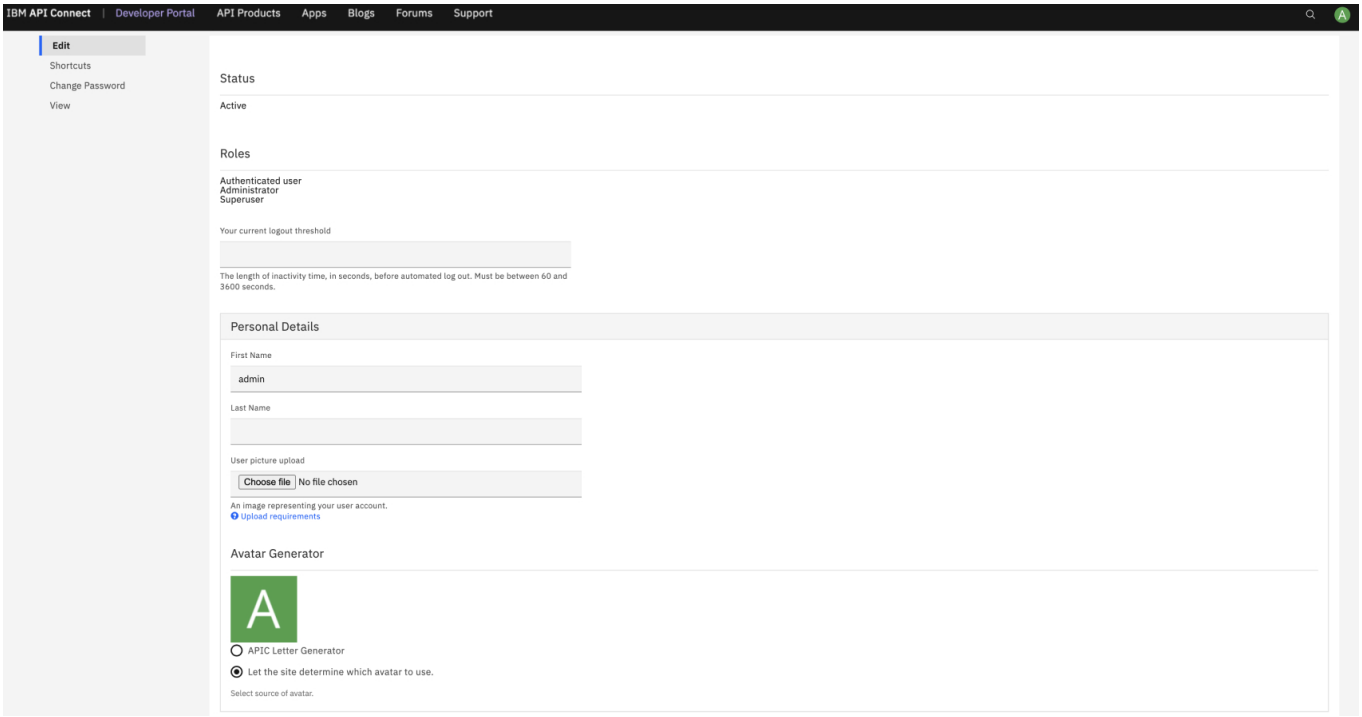
1. Under **`Field`**, find Personal details and set the **`Region`** as Content to move it to the top of the list.
2. Under **`Field`**, find First Name and set **`Parent`** as Personal details.
3. Repeat Step 2 for Last Name, User picture upload, and Avatar Generator.
4. Click Save. The First Name, Last Name, User picture upload, and Avatar Generator fields are listed under the Personal details row. These are fields are now set as the children of the **`Personal details`** group.

You and your user can now see the new grouped section when you edit their account.

Before:



After:



What you did in this tutorial

You have successfully created field groups for various groups of user information, and presented them to the user in its own section on the account view and edit pages.

You can check whether your field groups are applied, by viewing the profile of another user. Do this check by finding any other users published content and clicking the associated avatar. Or, from the Administrator dashboard you can click People and then click a user. You can see the new Consumer Organization field group on their profile page. If you then click **`Edit`** for the user, you can see the Personal Details field group.

What to do next

You can edit the user displays anytime by navigating back to Configuration > People > Account settings > Manage display or Manage form display.

You can delete the field group by clicking the Delete button in the field group row on either of these pages. You can also modify the type of group it is, for example, vertical tabs, horizontal tabs, accordions, and field sets.

Tutorial: Adding a custom block to the front page

You can customize the appearance of the front page of your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area, or region, of a web page such as the Products page or Apps page that can be displayed in regions, such as footer or sidebar, on your page.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so. The tutorial Adding a custom block to a page other than the front page explains how to add a custom block to any other page.

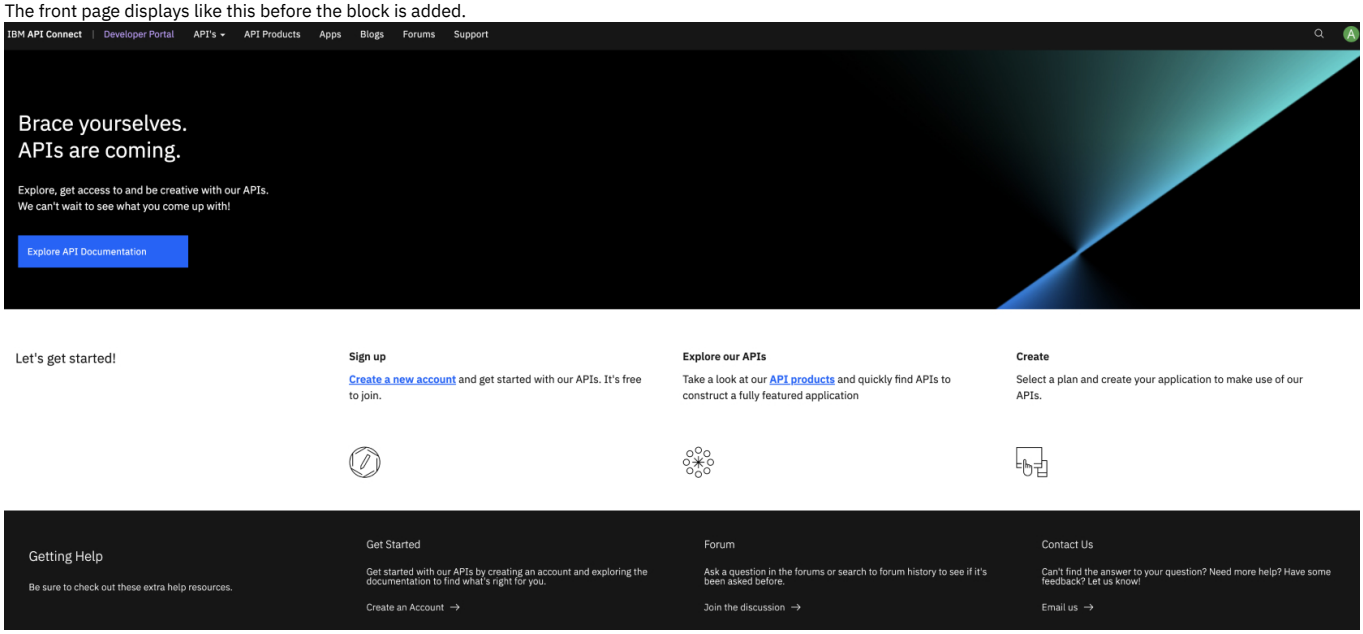
About this tutorial

In this tutorial, you create a block that contains a marketing announcement and add it to the front page of your Developer Portal.

This tutorial takes you through the following steps:

1. Creating a custom block
2. Adding the custom block to the front page.

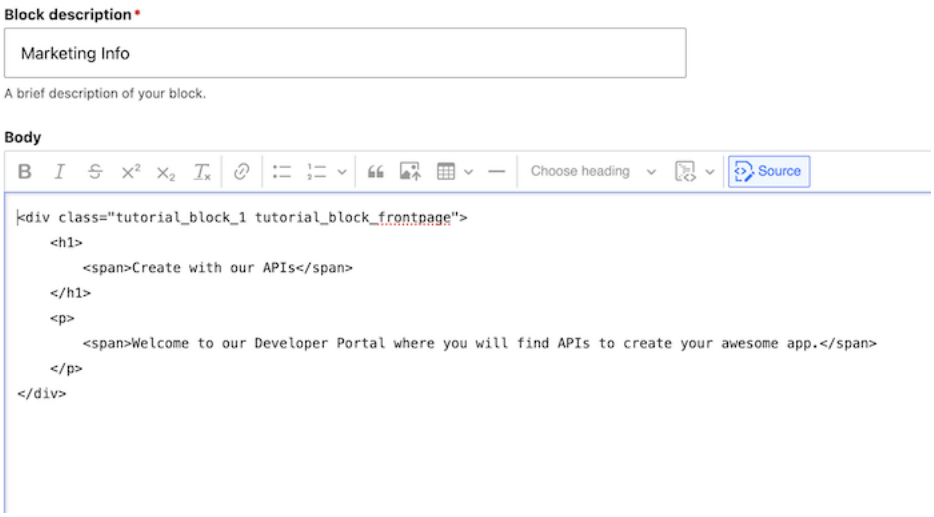
The front page displays like this before the block is added.



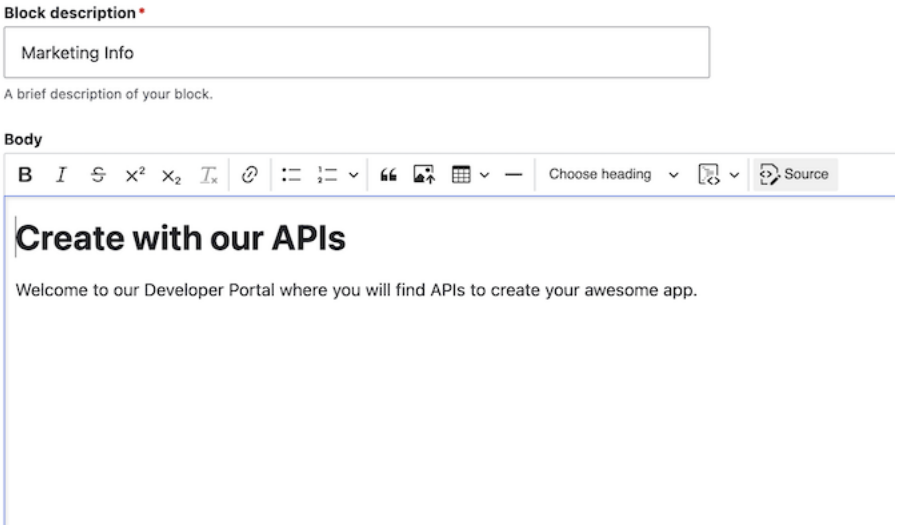
Creating a custom block

1. Log in to your Developer Portal as an administrator.
2. Click Blocks, then click + Add content block.
3. In the **`Block description`**, enter `Marketing Info`.
4. In the body area, click Source, then enter this HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>
<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```



5. To see a preview of the block, click Source again.



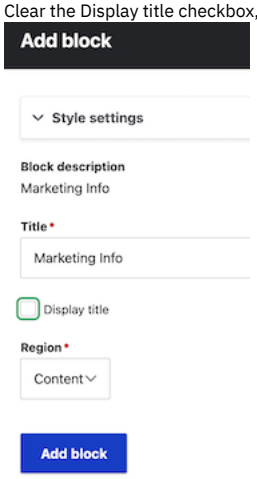
Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see Tutorial: Creating a custom theme for the Developer Portal.

6. Click Save.

You have now created the custom block.

Adding the custom block to the front page

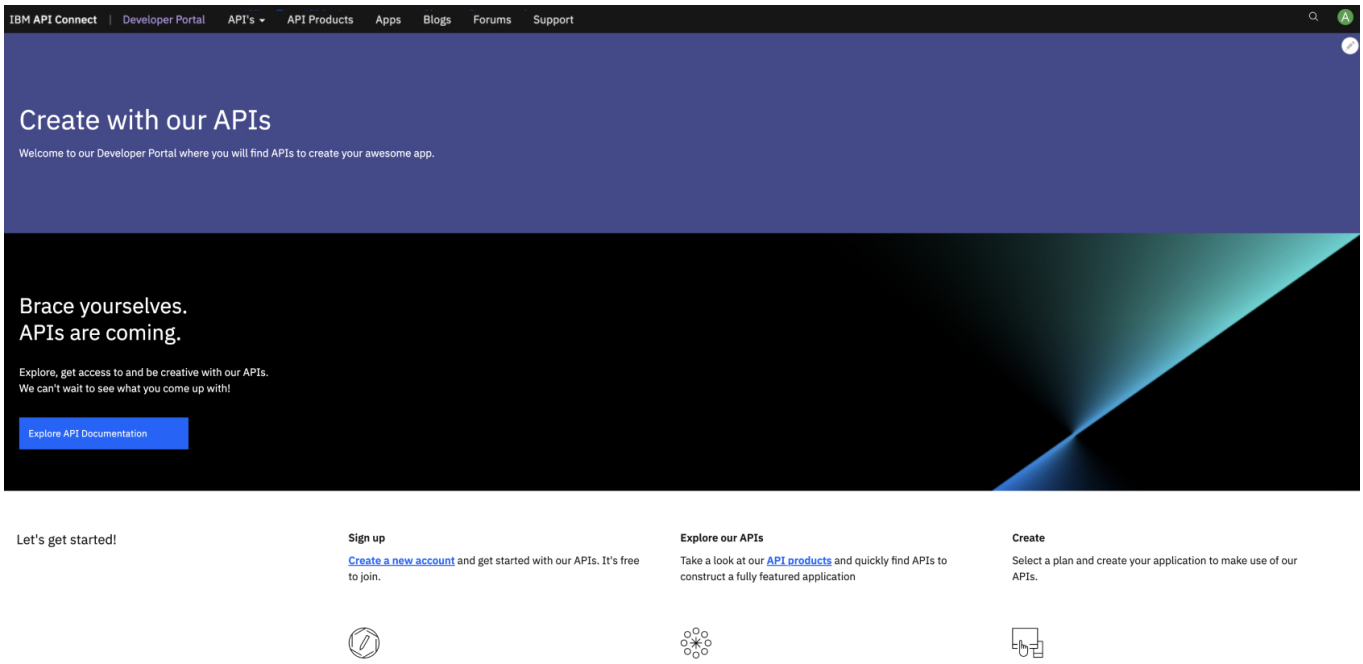
1. Navigate to Structure > Pages.
2. Find the **`Welcome`** label and click Edit.
3. Under Variants, click Panels > Content.
4. Click Add new block.
5. Under Content block, click **`Marketing Info`**.
6. Clear the Display title checkbox, keep Content in the **`Region`** list, and click Add block.



7. The **`Marketing Info`** label is now placed before the **`Welcome banner`** label. Click Update and save.

What you did in this tutorial

The front page now has the new block with a marketing message.



What to do next

You can add further branding by adding content to your custom blocks such as images, or try using one of the provided custom blocks such as the Featured Content Block. Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, you might want to consider adding translated versions.

Tutorial: Adding a custom block to a page other than the front page

You can customize the appearance of a page on your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area or region of a web page, such as the Products page or Apps page. Blocks can be displayed in regions, such as footer or sidebar, on your page.

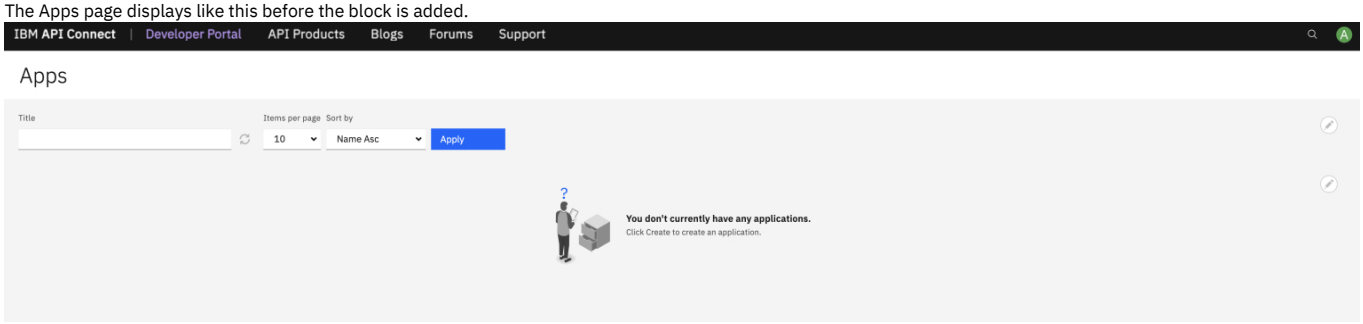
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so. The tutorial Adding a custom block to the front page explains how to add a custom block to the front page.

About this tutorial

In this tutorial, you create a custom block that contains extra guidance on application creation and registration, and add that custom block to the Apps page of your Developer Portal.

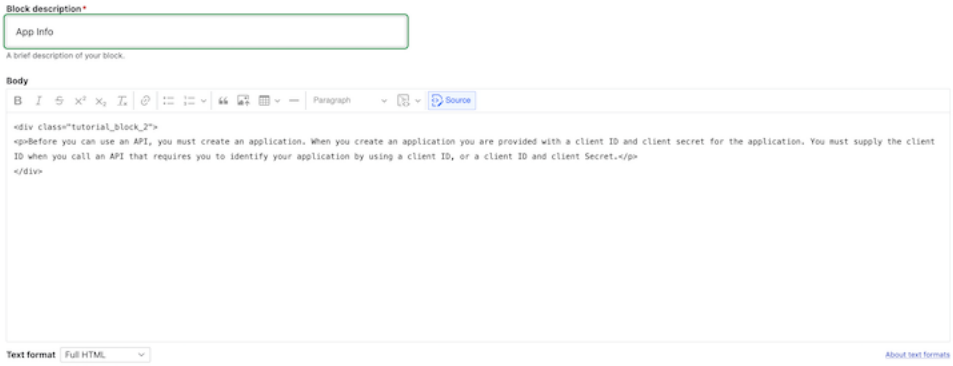
The Apps page displays like this before the block is added.



This tutorial takes you through creating a custom block, and configuring it to show on the Apps page.

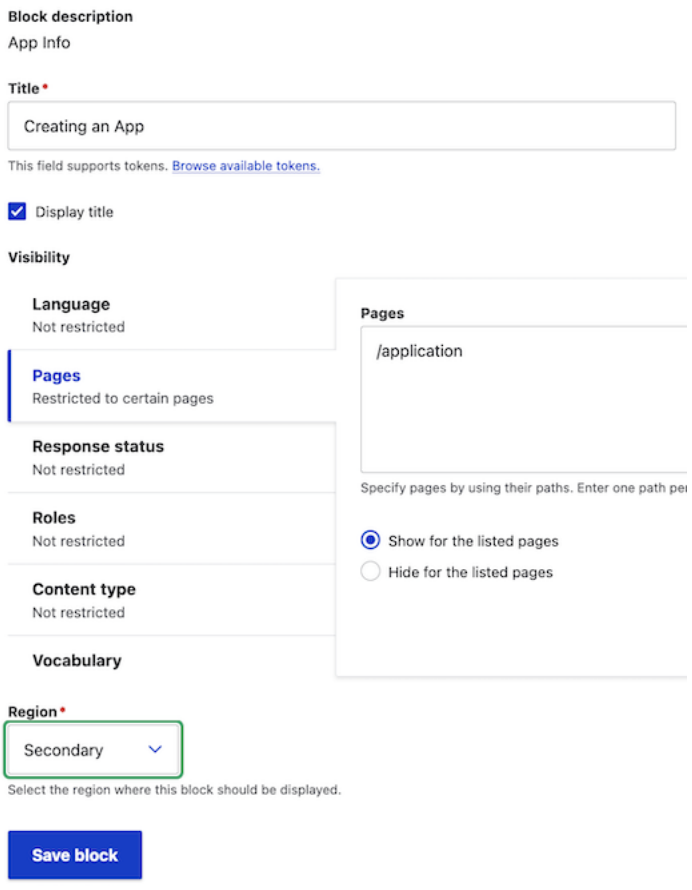
1. Log in to your Developer Portal as an administrator.
2. Click Blocks, then click + Add content block.
3. In the **`Block description`**, enter `App Info`.
4. In the body area, click Source, then enter this HTML:

```
<div class="tutorial_block_2">
<p>Before you can use an API, you must create an application. When you create an application you are provided with a
client ID and client secret for the application. You must supply the client ID when you call an API that requires you to
identify your application by using a client ID, or a client ID and client Secret.</p>
</div>
```



5. To see a preview of the block click Source again.

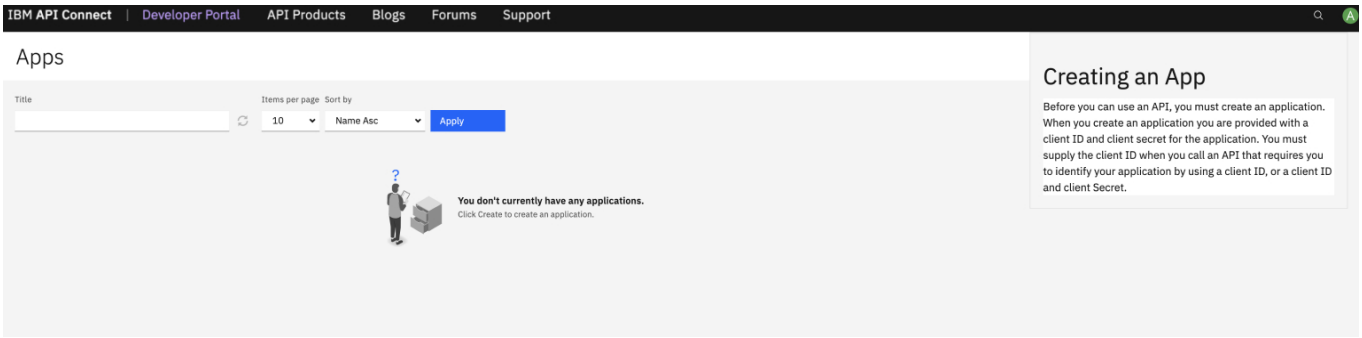
   Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see Tutorial: Creating a custom theme for the Developer Portal.
6. Click Save and configure.
7. In the **`Title`** field, enter `Creating an App` and ensure that the Display title checkbox is selected.
8. Under Visibility, click Pages.
9. In the **`Pages`** text area, enter `/application` , ensure that Show for the listed pages is selected.
10. From the Region list, select Secondary.



11. Click Save block.
12. Click Save blocks.

What you did in this tutorial

The Apps page now has an additional block with a guidance message.



What to do next

Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, so you might want to consider adding translated versions.

Tutorial: Configuring the RobotsTxt file

You can control the access of a visiting Web robot. You can configure the **`robots.txt`** file that exists on your web server, usually at the root level, to control access. Web robots are programs that crawl through the web to obtain web content for all the sites that are visited, and provide indexing for better performance of search engines. You can also specify separate rules for different robots.

Why would I want to edit Drupal's pre-existing robots.txt file?

Malicious robots might choose not to honor the **`robots.txt`** file, and by editing this file you are broadcasting which sites you do not want others to see. Therefore, you should not use this file to hide sensitive data. Instead, you might want to edit your **`robots.txt`** file to:

- Prevent duplicate information from being identified on your site
- Prevent internal pages from appearing in search engines
- Prevent private pages from appearing in search engines
- Prevent particular images, files, and so on, from being crawled
- Specify a **`crawl-delay`** attribute to prevent robots from overloading your server at load time
- Exclude a particular robot

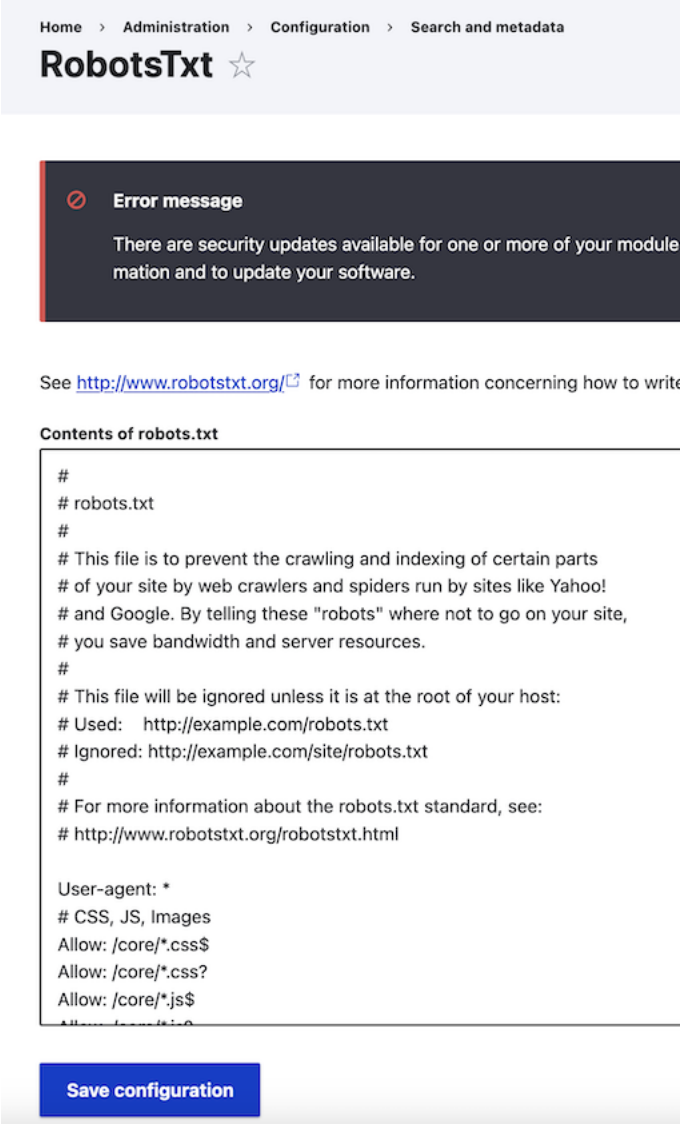
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You will edit the pre-existing **`robots.txt`** file and exclude access to a visiting robot called BadBot.

1. Log in to your Developer Portal as an administrator.
2. Navigate to Configuration > Search and Metadata > RobotsTxt.



3. In the **Contents of robots.txt** section, enter the policy to exclude access to a robot called BadBot.

```
User-agent: BadBot
Disallow: /
```

4. Click Save Configuration to save your changes.

What you did in this tutorial

You have now successfully customized the **robots.txt** file. Robots now use this updated file to decide where they can crawl on your site. The BadBot robot is excluded access.

You can check whether your **robots.txt** file is successfully changed by navigating to your site and appending /robots.txt. You should see the content you entered into that file.

```
#
# robots.txt
#
# This file is to prevent the crawling and indexing of certain parts
# of your site by web crawlers and spiders run by sites like Yahoo!
# and Google. By telling these "robots" where not to go on your site,
# you save bandwidth and server resources.
#
# This file will be ignored unless it is at the root of your host:
# Used:    http://example.com/robots.txt
# Ignored: http://example.com/site/robots.txt
#
# For more information about the robots.txt standard, see:
# http://www.robotstxt.org/robotstxt.html

User-agent: BadBot
Disallow: /

User-agent: *
# CSS, JS, Images
Allow: /core/*.css$
Allow: /core/*.css?
Allow: /core/*.js$
Allow: /core/*.js?
```

For more information on how to edit your **`robots.txt`** file, see https://www.robotstxt.org/.

What to do next

You can edit the **`robots.txt`** at any time by navigating back to the page within the configuration settings. You might choose to duplicate this file across all of your sites, or choose different policies for different sites.

Tutorial: Configuring the SecurityTxt file

You can use the **`security.txt`** file to provide your users with a standard way to report security vulnerabilities with your site.

The **`security.txt`** file is a file format that is designed to help your users disclose any security vulnerability. For more information, see securitytxt.org or A File Format to Aid in Security Vulnerability Disclosure.

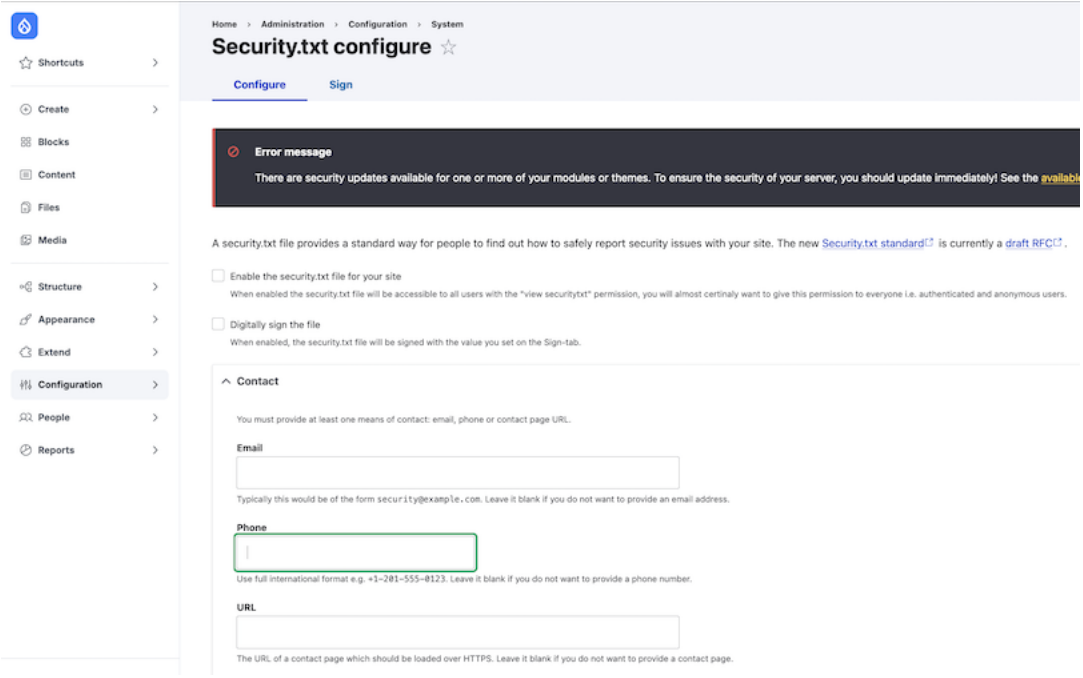
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You edit the **`security.txt`** file and provide information such as a URL of a contact page, for your customers to use if they have a security vulnerability.

1. Log in to your Developer Portal as an administrator.
2. Navigate to Configuration > System > Security.txt.



3. Select the Enable the security.txt file for your site checkbox.
4. Complete the form as per your requirement.
5. Click Save Configuration to save your changes.

What you did in this tutorial

You successfully customized the **`security.txt`** file.

What to do next

You can edit the **`security.txt`** at any time by navigating back to the page within the configuration settings.

Tutorials for using custom modules in the Developer Portal

You can configure custom modules to complete specific actions in the Developer Portal.

Note: You must have administrator access to complete the tutorials.
You can configure rules for the following events that occur in the Developer Portal:

- Change the profile page to display **`firstname`** **`last name`**, instead of **`username`**.
- Add validation to a field on the sign up form.

Tutorial: Changing the profile page to display firstname lastname, instead of username

You might want to change the profile page of your users on your Developer Portal to display their **`firstname`** and **`lastname`** rather than their **`username`**.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

In this tutorial, you change the profile page of your users to display their **`firstname`** and **`lastname`** rather than their **`username`**. The change to the profile page is done by using the custom module **`change account display`** that is already available in IBM APIC Portal - addons. However, for more information, see Custom module development: creating a module skeleton.

This tutorial takes you through the following steps:

1. Cloning and packaging the **`change account display`** module.
2. Installing and enabling the change account display module.

Cloning and packaging the `change account display` module

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

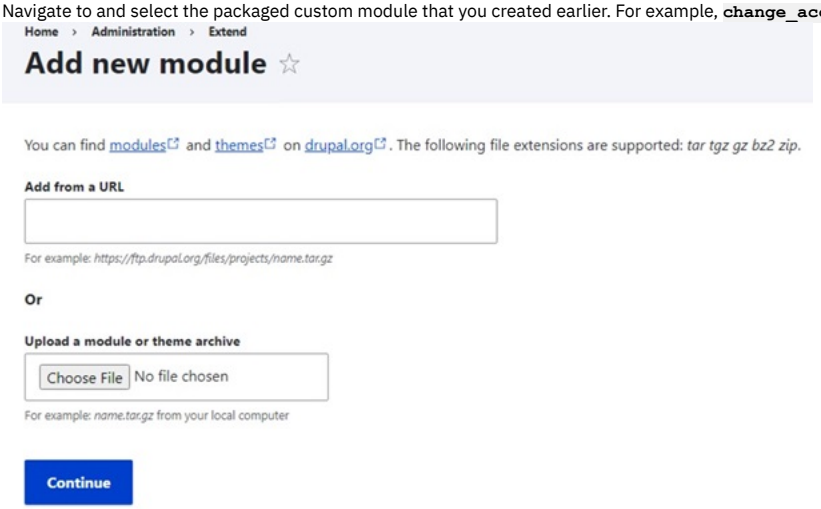
```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

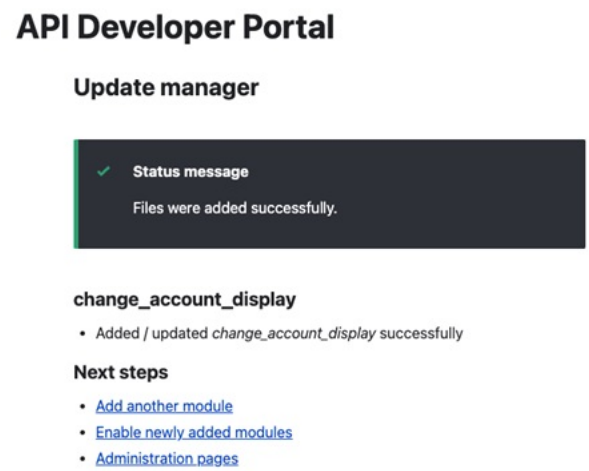
```
cd devportal-addons/apic_v10/modules
tar -czf change_account_display.tar.gz change_account_display/
```

Installing and enabling the `change account display` module

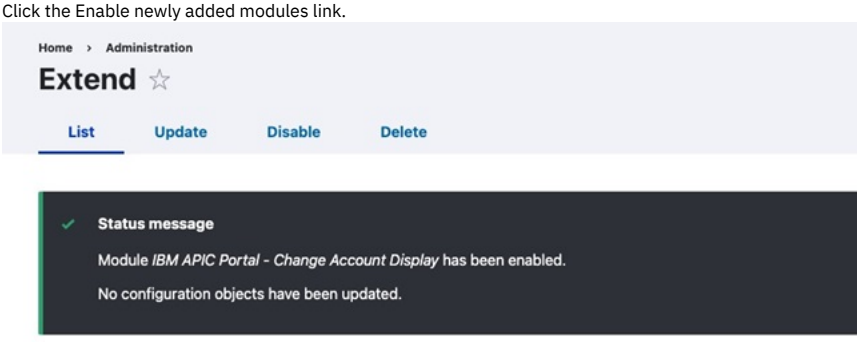
1. Log in to your Developer Portal as an administrator.
2. Click Extend > Extend.
3. Click + Add new module.
4. From the **`Upload a module or theme archive`** section, click Browse file.
5. Navigate to and select the packaged custom module that you created earlier. For example, **`change_account_display.tgz`**, then click Open.



6. Click Continue.



7. Click the Enable newly added modules link.

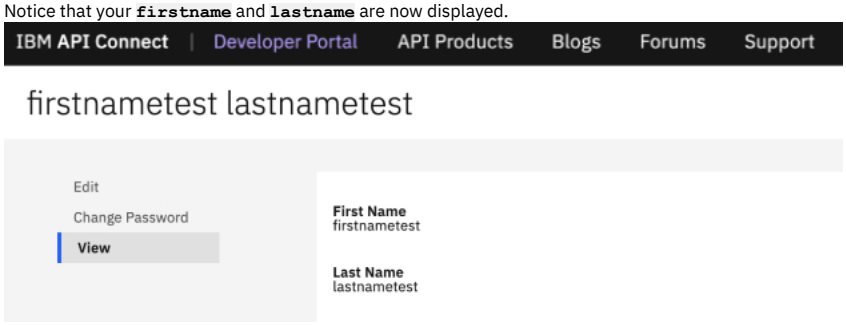


8. In the filter box, enter `Change Account Display`.
9. Select the Change Account Display checkbox.
10. Click Enable.

The module is now installed and enabled.

Test the profile page change

1. Sign out as the Admin user.
2. Sign in as a user of your Developer Portal.
3. Click the arrow icon next to your **username** and select My account.
4. Notice that your **firstname** and **lastname** are now displayed.



What you did in this tutorial

You used a custom module to change the profile page display for the users of your Developer Portal.

Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about Adding a field to the sign up form, where you added a Department code field to the Sign-up form.

About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **DEPnnn**, where **DEP** is the string prefix and **nnn** is a three-digit number, for example, **DEP123**. The validation is done by using a custom module that is already available in IBM APIC Portal - addons. However, for more information, see Custom module development: creating a module skeleton.

This tutorial takes you through the following steps:

1. Cloning and packaging the validation module.
2. Installing and enabling the validation module.
3. Testing the validation in the sign up form.

Look at the files we will use in this link IBM APIC Portal - addons.

- user_field_example.info.yml - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10 || ^11
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- user_field_example.module - this contains a validation function and adds this to the Sign-up form by using the **hook_form_alter** function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form' ) {
      $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
```

```
 * Valid entry = DEPnnn
 *   where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
  }
}
```

Cloning and packaging the validation module

Validation is added to the **Department code** field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Package up the custom module.

   ```
   cd devportal-addons/apic_v10/modules
   tar -czf user_field_example.tgz user_field_example/
   ```

Installing and enabling the validation module

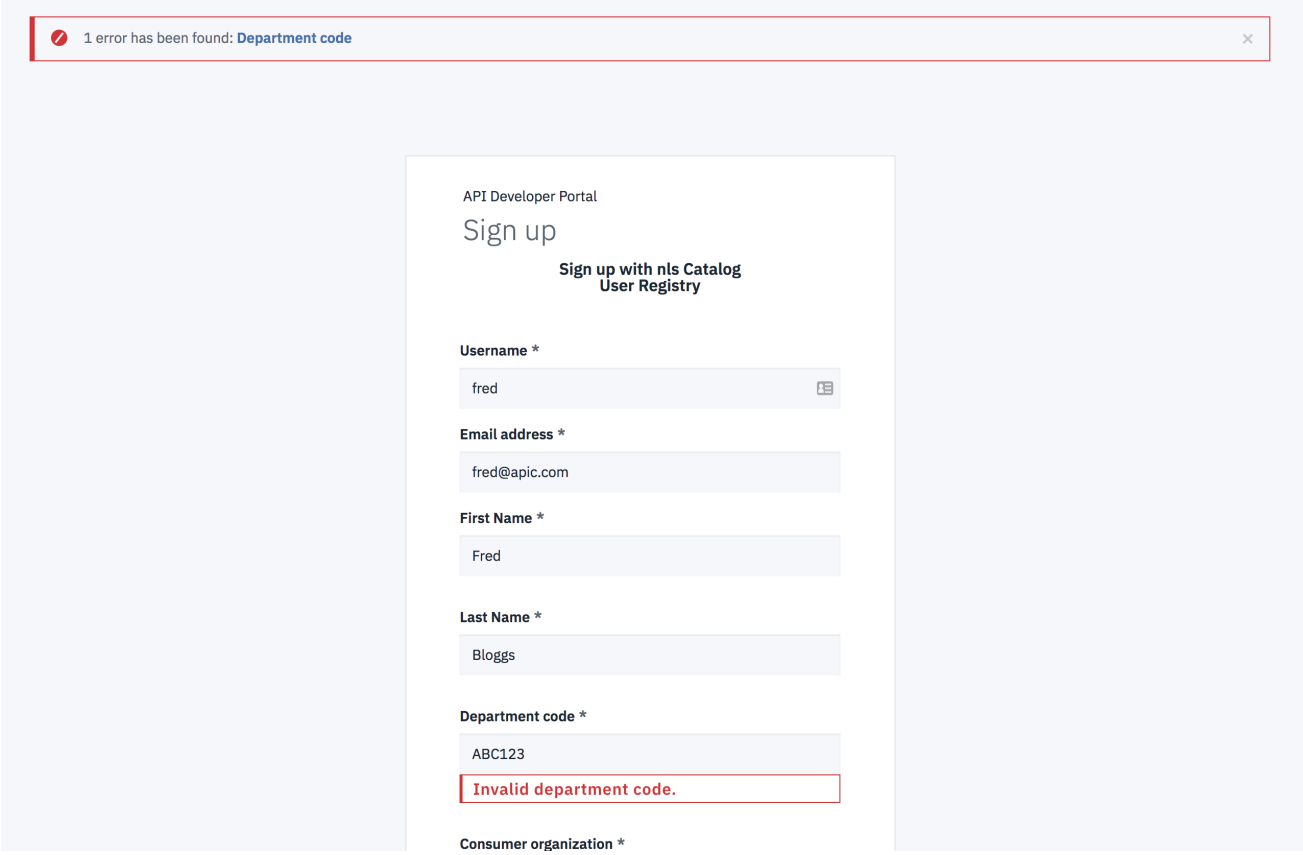
1. Log in to your Developer Portal as an administrator.
2. Click Extend > Extend.
3. Click + Add new module.
4. Under the Upload a module or theme archive section, click Browse file.
5. Browse to and select **user_field_example.tgz**, the packaged custom module that you created earlier. Click Open.
6. Click Continue.
7. Click the Enable newly added modules link.
8. Enter `IBM APIC Portal - user field example` in the filter box.
9. Select the **IBM APIC Portal - user field example** checkbox.
10. Click Enable.

The module is now installed and enabled.

Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click Create a new account.
3. Enter necessary details in all the fields, set **Department code** to **ABC123**.
4. Click Sign up.

5. Observe the failure message and highlighting on the **`Department code`** field.



6. Change the **`Department code`** field to **`DEP245`**, reenter the password and click **`Sign up`** to see that a valid code is accepted.

What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **`Department code`** field accepts only codes in the format of **`DEPnnn`**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see Drupal custom modules.

Tutorial: Using a custom weighting sort order on the product list page

You can use a custom weighting to sort your products on the API products list page of your Developer Portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

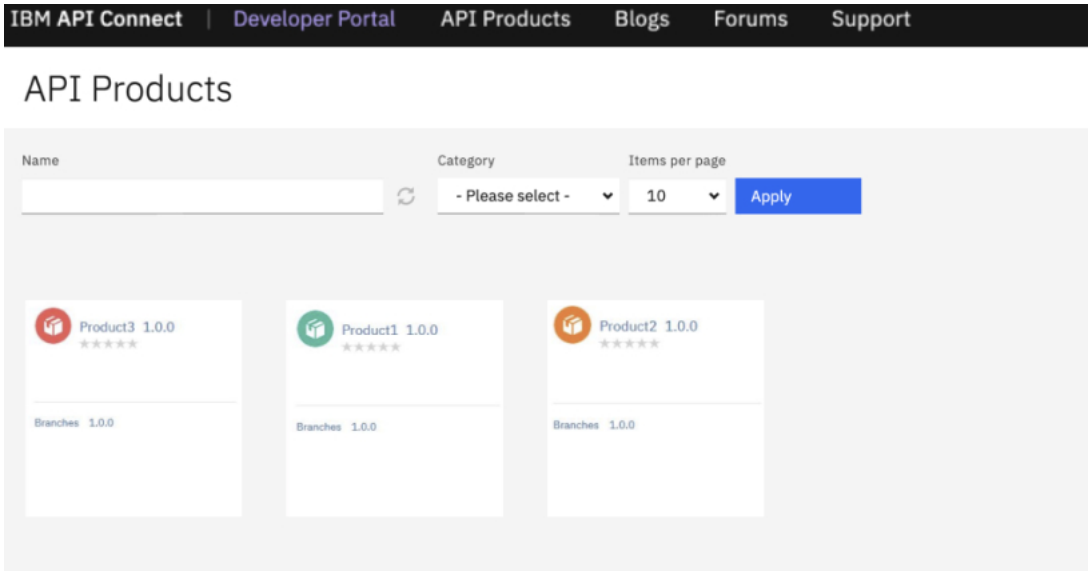
About this tutorial

In this task, you set up a weighting sort criteria and use it to list your products, on the API Products page, in a particular order. You set up the weightings so the order reads, Product3, Product1, and Product2.

This tutorial takes you through the following steps:

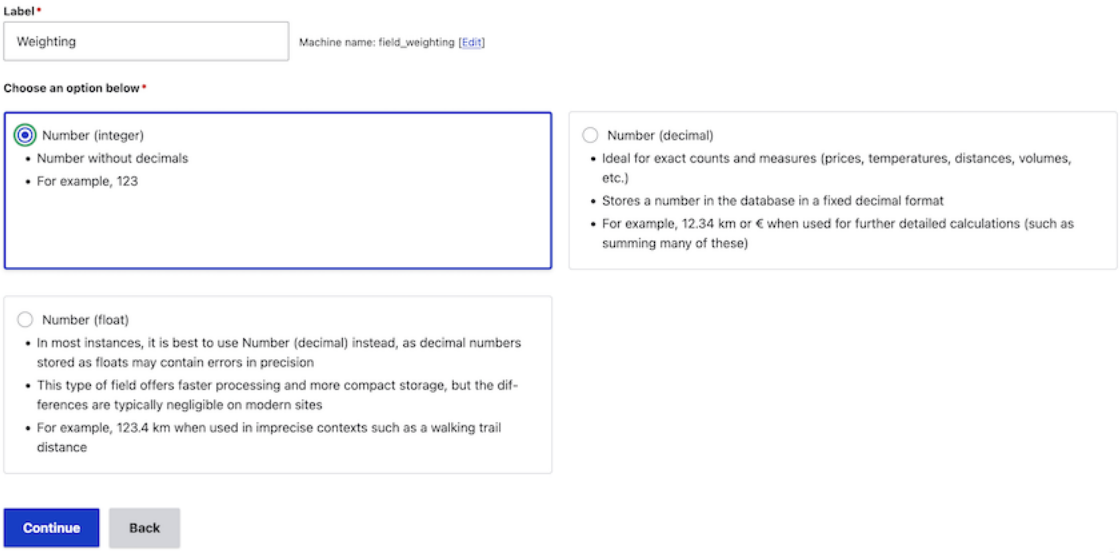
1. Add a custom integer field to the API content type
2. Modify the Products view to change the sort order
3. Add a weighting to each Product

Note: To complete this tutorial, you will need to have API products.
For example, the API Products page below displays Product1, Product2, and Product3 in this order before the weightings are added.



Add a custom integer field to the API content type

1. Log in to your Developer Portal as an administrator.
2. Navigate to Structure > Content types.
3. Find **`Product`** and click Manage fields.
4. On the Manage fields page, click + Create a new field.
5. From the Choose a type of field list, select Number, and click Continue.
6. In the **`Label`** field, enter `Weighting` and select Number (integer).

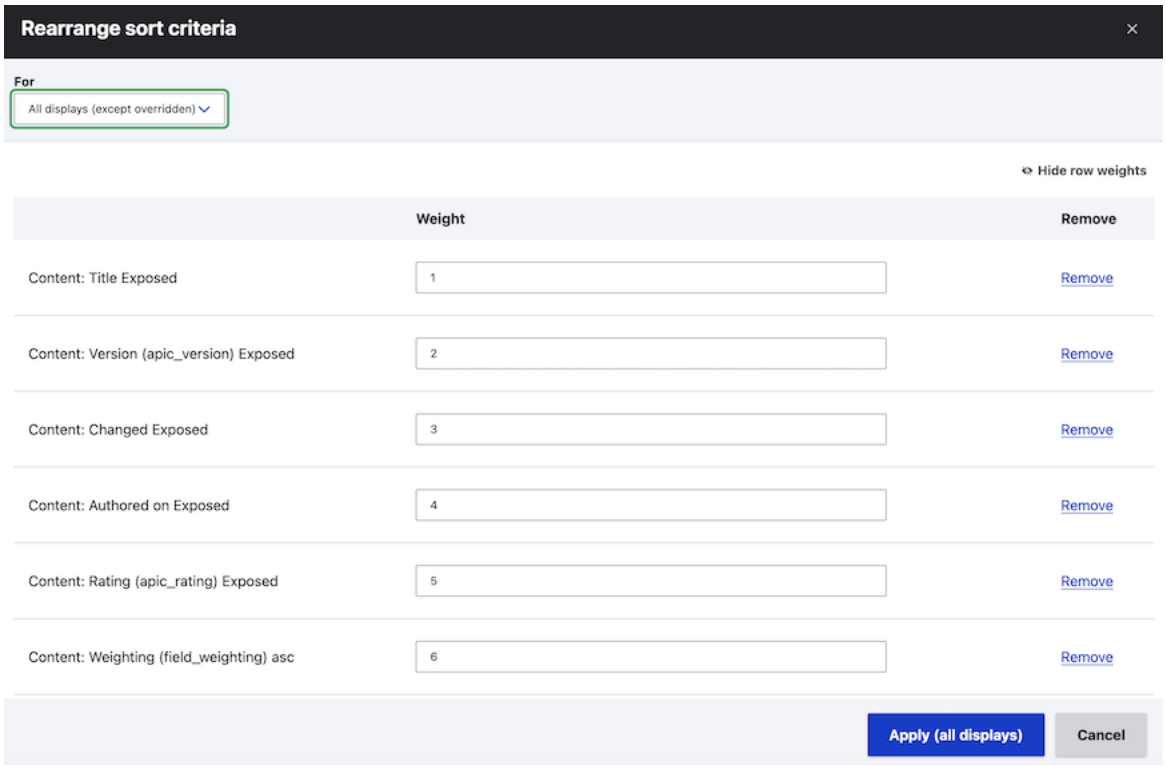


7. Click Continue.
8. Leave the **`Allowed number of values`** as 1.
9. Select the Set default value checkbox and enter `0` as the default value.
10. Click Save settings.

The **`Weighting`** field now shows in the **`Manage fields`** list.

Modify the Products view to change the sort order

1. Navigate to Structure > Views.
2. Find **`Products`** view and click Edit.
3. In the **`Sort criteria`** section, click Add.
4. In the Search field, enter `Weight`. Then, select **`Weighting (field_weighting)`**, and click Apply (all displays).
5. Leave the **`Order`** as **`Sort ascending`**, click Apply (all displays).
6. In the **`Sort Criteria`** section, click the arrow icon next to Add and click Rearrange.



7. For all rows except **`Weighting (field_weighting) asc`**, click Remove.
8. Click Apply (all displays).

You modified the **`Products`** view to sort based on **`Weighting (field_weighting)`**.

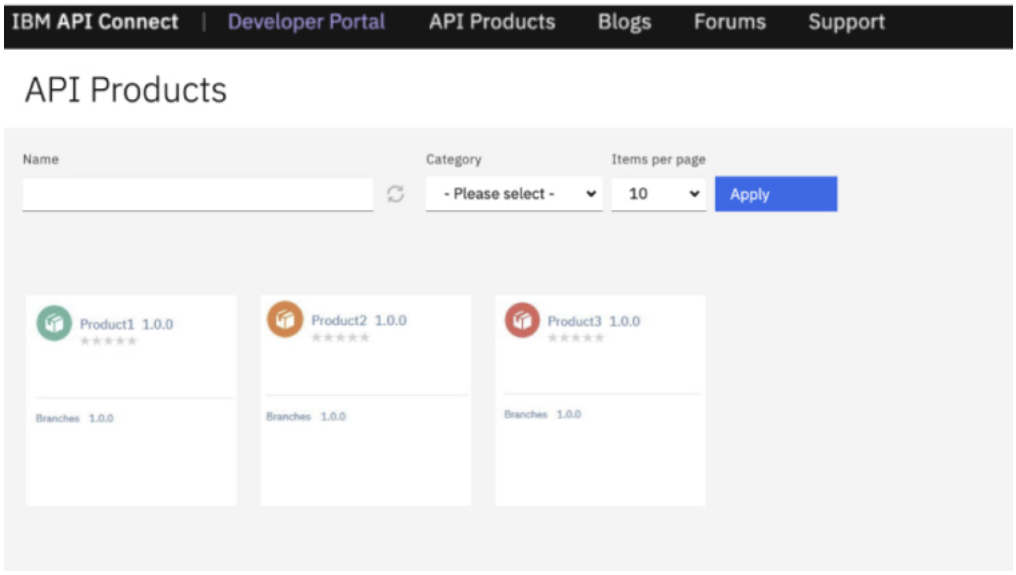
Add a weighting to each Product

1. Click Content, and from the **`Content type`** list, select **`Product`**.
2. Click Filter. A list of available Products on your site is displayed.
3. For Product1, click Edit, in the **`Weighting field`**, select `2` as the value, and click Save.
4. For Product2 click Edit, in the **`Weighting field`**, select `3` as the value, and click Save.
5. For Product3 click Edit, in the **`Weighting field`**, select `1` as the value, and click Save.

The API Products page displays Product3, Product1, and Product2 in this order after the weightings are added.

What you did in this tutorial

You changed the order that the API Products appear on the products page.

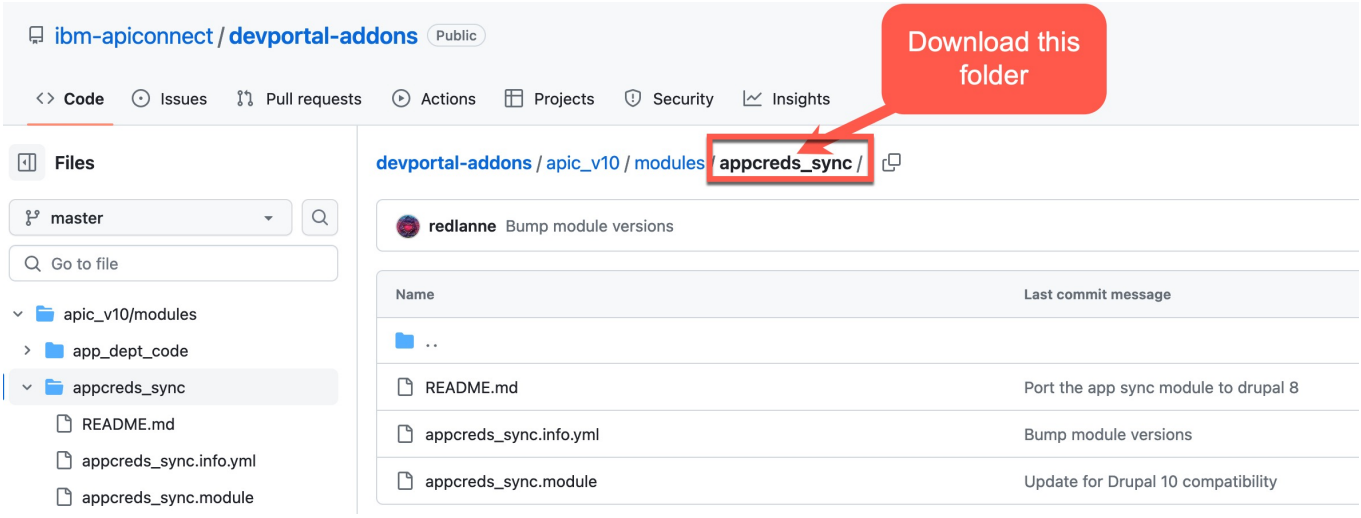


Tutorial: Synchronizing application credentials from the Developer Portal with an external server

You can synchronize application credentials from the Developer Portal with an external server.

Before you begin

You must have administrator access to the Developer Portal to complete this task.
Note: This module will only synchronize the credentials of applications created by consumers in the Developer Portal site UI. It cannot synchronize the credentials for applications created by the provider in the API Manager UI.
Download the Application credential synchronization folder.



Perform the following steps:

1. Clone the custom module. Here is an example if you are using Mac or Linux:

   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Navigate to the `appcreds_sync` folder:

   ```
   cd devportal-addons/apic_v10/modules/appcreds_sync
   ```

About this task

In this tutorial, you configure a custom module and install it in the Developer Portal to synchronize application credentials between the Developer Portal and an external credentials server.

The `appcreds_sync` folder that you downloaded is a custom module that contains multiple methods that can be configured with your REST endpoints, and any further specifications that you want to define, to synchronize your Developer Portal application credentials with an external credential server.

For more information, see Custom module development: background and prerequisites.

Procedure

To configure the custom module to synchronize application credentials:

1. In the appcreds_sync.module file, replace `example.com` with your REST endpoint for the following method types:
   - `http://example.com/app/create`
   - `http://example.com/app/delete`
   - `http://example.com/app/creds/create`
   - `http://example.com/app/creds/update`
   - `http://example.com/app/creds/delete`
   - `http://example.com/app/clientid/reset`
   - `http://example.com/app/clientsecret/reset`
2. Optional: Replace `username` and `password` with your username and password in the `_appcreds_sync_json_http_request` function:

   ```
   ('username' . ':' . 'password')
   ```

   Note: You can also configure the SSL settings if you need to.
3. Save the file, and package up the custom module:

   ```
   cd..
   tar -czf appcreds_sync.tar.gz appcreds_sync/
   ```

To install the configured custom module in the Developer Portal:

4. Log in to your Developer Portal as an administrator.

5. Click Extend > + Add new module.
6. In the Add from a URL field, enter a path to the module.
   Alternatively, upload the module in the Upload a module or theme archive section.
7. Click Continue.

To enable the module:

8. Click Extend and search for the custom module just installed, for example, Synchronise Application Credentials.
9. Select the checkbox next to the module name and click Enable.

Results

You have configured a custom module that synchronizes application credentials from the Developer Portal, installed that module in the Developer Portal, and enabled it. No further action or configuration is required.

Using the API Connect Backstage plug-in

The API Connect plug-in consolidates all your API Connect instances into a single location. By using the provider API, the plug-in groups data from each instance and displays it in a centralized dashboard. This grouping of data provides a clear overview of data distribution between different API Connect instances. The plug-in is valid for IBM® API Connect version 10.0.8.0 and later.

Key features

The following main features are available in the API Connect Backstage plug-in:

- The single page view of all APIs in an enterprise estate for quick discovery and easy navigation of API assets within Backstage. This feature minimizes the chance of functionality duplication.
- A simpler and quicker way to build software components in a standardized way and provide a central place to manage all projects and documentation.
- Faster adoption of APIs.
- Internal consumption without moving between different places.

- **Enabling the API Connect plug-in on Backstage**
  Install and configure the API Connect plug-in on Backstage.
- **Enabling the API Connect plug-in on Red Hat Developer Hub**
  Install and configure the API Connect plug-in on Red Hat Developer Hub.

Enabling the API Connect plug-in on Backstage

Install and configure the API Connect plug-in on Backstage.

The API Connect plug-in on Backstage provides a centralized view of all your APIs and products across multiple API Connect clouds, provider organizations, and catalogs. This tool is designed to give API teams a comprehensive overview of their API assets, which provides easier management and monitoring. It serves as a platform for teams to keep track of their infrastructure and microservices. For more information about Backstage, see Official Backstage documentation.

Prerequisites

To configure the API Connect plug-in successfully on Backstage, the following requirements must be met:

- A working Backstage application must be installed and configured.
  Note: Backstage is an external service and needs to be installed on a separate server that is external to API Connect. You do not need to make any changes to the API Connect deployment to set up the Backstage plug-in.
- The API Connect support agreement covers only the API Connect plug-in. The customer is responsible for the deployment and installation of the Backstage server.

Installing the API Connect plug-in for Backstage

1. Open https://github.com/ibm-apiconnect/backstage.
2. Clone the repository or download it as a zip file to get the install files.
3. Unpack the `ibm-apic-backstage-plugin.tar.gz` zip archive into the plugins directory.

   ```
   tar -xvf ibm-apic-backstage-plugin.tar.gz -C <backstage_app_base_path>/plugins
   ```

4. From the Backstage app base path, run the following command:

   ```
   yarn --cwd packages/backend add apic-backstage@^1.0.0
   ```

Configuring Backstage to use the API Connect plug-in

1. For the API Connect instance you want to configure, add the following details for a provider organization at the end of `app-config.yaml` file:
   - Name
   - URL
   - ClientID
   - ClientSecret
   - Username

- Password
- identityProvider
- apiKey

For example,

```
ibm:
 schedule: '*/10 * * * *'
 apic:
    - name: apic-instance-1
      url: https://api.<instance1>.com/api
      clientId: '<instance1-clientID>'
      clientSecret: '<instance1-clientSecret>'
      username: '<instance1-porg-user>'
      password: '<instance1-porg-pwd>'
      identityProvider: 'default-idp-2' # Default Local User Registry
    - name: apic-instance-2
      url: https://api.<instance2>.com/api
      clientId: '<instance2-clientID>'
      clientSecret: '<instance2-clientSecret>'
      apiKey: my-api-key  # OIDC registry
```

Here,

URL
: The value that corresponds to the `endpoint`.

client_id
: The value that corresponds to the `cliendId`.

client_secret
: The value that corresponds to the `clientSecret`.

identityProvider
: This value can be obtained by running the following API Connect CLI command:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
```

apikey
: The value that corresponds to the generated `apiKey`.

The `credentials.json` for `apic-instance-1` in this code is:

```
{
  "cloud_id": "<instance1-cloudID>",
  "toolkit": {
    "endpoint": "https://api.<instance1>com/api",
    "client_id": "<instance1-clientID>",
    "client_secret": "<instance1-clientSecret>"
  },
  "consumer_toolkit": {
    ...
  },
  ...
}
```

Note: Download the toolkit credentials to find the values of the `URL`, `ClientId`, and `ClientSecret`. For more information, see https://www.ibm.com/docs/en/api-connect/10.0.x?topic=configuration-installing-toolkit#task_qsv_cgq_nt__download_creds.
You can configure API Connect by using the local user registry or the OIDC user registry.

- **Using a local user registry**
  If the user details are in a local user registry, you must provide the `identityProvider` details, `username`, and `password` as shown in the example for `apic-instance-1`.
- **Using an OIDC registry**
  If the user details are located in an OIDC registry, you must provide the `apiKey` details. Use the following instructions to add the API key:
  - Edit the time period for when the API key expires, and authorize it to be used multiple times. For more information, see Configuring API key settings.
  - Create an API key. For more information, see Managing platform REST API keys.
  - Add the generated API key to the configuration which is shown in the example for `apic-instance-2`.

Note: The `username`, `password`, or the `apiKey` are for a provider organization member. In this example, it is assumed that there is only a single user who is a member of each provider organization. To add the user to the Backstage instance, the user must at least have the Viewer role for each provider organization. The user can also be a member of more than one provider organization.

2. For the Backstage application, edit `packages/backend/src/index.ts` and add the following code at the end of the file:

```
backend.add(import('@internal/apic-backstage'));
```

Enabling the API Connect plug-in on Red Hat Developer Hub

Install and configure the API Connect plug-in on Red Hat Developer Hub.

Red Hat Developer Hub is a developer platform for building Developer Portals and has developed several plug-ins for Backstage to further enhance its capabilities within the Developer Portal. The dynamic plug-in support is based on the backend plug-in manager package, which is a service that scans a designated root directory, `dynamicPlugins.rootDirectory`, for dynamic plug-in packages and loads them as needed. You can use the dynamic plug-ins that are preinstalled with Red Hat Developer Hub or install additional dynamic plug-ins from a public NPM registry.

Prerequisites

To configure the API Connect plug-in successfully on Red Hat Developer Hub, the following requirements must be met:

- A working Red Hat application must be installed and configured.
  Note: Red Hat Developer Hub is an external service and needs to be installed on a separate server that is external to API Connect. You do not need to make any changes to the API Connect deployment to set up the plug-in.
- The API Connect support agreement covers only the API Connect plug-in. The customer is responsible for the deployment and installation of the Backstage server.
  Note: If you encounter any issues with Red Hat Developer Hub, contact Red Hat by raising a Red Hat support case to address the issue.

Installing and configuring the API Connect plug-in on Red Hat Developer Hub

To install the plug-in on Red Hat Developer Hub, see Installing dynamic plug-ins.

The following package details are used to configure the plug-in on Red Hat Developer Hub:

```
- package: 'apic-backstage'
       integrity: 'REPLACE_INTEGRITY'
       disabled: false
       pluginConfig:
         ibm:
           schedule: '* * * * *'
           apic:
             - name: apic-instance-1
               url: APIC_API_URL
               clientId: 'APIC_CLIENT_ID'
               clientSecret: 'APIC_SECRET'
               username: 'PORG_USERNAME'
               password: 'PORG_PASSWORD'
               identityProvider: 'default-idp-2' # Default Local User Registry
             - name: apic-instance-2
               url: APIC_API_URL
               clientId: 'APIC_CLIENT_ID'
               clientSecret: 'APIC_SECRET'
               apiKey: my-api-key # OIDC Registry
```

Here,

URL
: The value that corresponds to the `endpoint`.

client_id
: The value that corresponds to the `cliendId`.

client_secret
: The value that corresponds to the `clientSecret`.

identityProvider
: This value can be obtained by running the following API Connect CLI command:

  ```
  apic identity-providers:list --scope provider --server myserver.com --fields title,realm
  ```

apikey
: The value that corresponds to the generated `apiKey`.

The `credentials.json` for `apic-instance-1` in this code is:

```
{
  "cloud_id": "<instance1-cloudID>",
  "toolkit": {
    "endpoint": "https://api.<instance1>com/api",
    "client_id": "<instance1-clientID>",
    "client_secret": "<instance1-clientSecret>"
  },
  "consumer_toolkit": {
    ...
  },
  ...
}
```

Note: Download the toolkit credentials to find the values of the **`URL`**, **`ClientId`**, and **`ClientSecret`**. For more information, see https://www.ibm.com/docs/en/api-connect/10.0.8_lts?topic=configuration-installing-toolkit.
You can configure API Connect using the local user registry or the OIDC user registry.

- **Using a local user registry**
  If the user details are located in a local user registry, you must provide the **`identityProvider`** details, **`username`**, and **`password`** as shown in the example for **`apic-instance-1`**.
- **Using an OIDC registry**
  If the user details are located in an OIDC registry, you must provide the **`apiKey`** details. Follow the instructions below to add the API key:

  1. Edit the time period for when the API key expires, and authorize it to be used multiple times. For more information, see Configuring API key settings.
  2. Create an API key. For more information, see Managing platform REST API keys.
  3. Add the generated API key to the configuration as shown in the example for **`apic-instance-2`**.

Analytics: understand your API usage

Monitor your API usage with API Connect analytics.

API Connect provides the capability to filter, sort, and aggregate your API event data. This data is then presented within correlated charts, tables, and maps, to help you manage service levels, set rate limits, establish controls, set up security policies, manage communities, and analyze trends. API analytics is built on the OpenSearch open source real-time distributed search and analytics engine.

- **Key concepts of API Connect analytics**

Key concepts of API Connect analytics

An overview of how API Connect analytics works.

How the gateway and analytics services work together

When a user calls one of your published APIs, the gateway that processes the API call creates an API event record that contains details of the API call such as the application ID, current time, result code, etc. For a full list of all the data stored in an API event record, see API event record field reference. The gateway buffers API event records for each API call until a threshold of either number of events, or elapsed time is reached. When this threshold is reached, the API events are sent in bulk to the analytics subsystem. API events are sent by the gateway to the analytics subsystem with TCP, and if a network failure occurs the gateway does retry. However, the gateway does not retain unsent API event records and retry indefinitely, and so delivery of every API event record is not guaranteed.
Tip: If the analytics dashboards in your UIs are not showing the API events that you expect, the most common cause is a communication failure between your gateway and analytics subsystems. Check both the gateway and analytics subsystem logs.

You can deploy multiple gateway and analytics services in all API Connect deployment types except for OpenShift top-level CR. After you register a gateway service in the Cloud Manager UI, you associate an analytics service with that gateway service. All API event data that the gateway generates is sent to its associated analytics service. Multiple gateways can be associated with the same analytics service. You cannot associate multiple analytics services with the same gateway.

Each analytics service in your API Connect deployment stores API event data only from the gateways it is associated with. When you view analytics data, you must select which analytics service you want to view the data from. API Connect provides no aggregated view of all analytics data from all analytics services. If you have multiple analytics services and want to combine the data from all of them, you can export or offload the data and manually create your own reports.

If you use the top-level CR on OpenShift or Cloud Pak for Integration, then your API Connect deployment consists of one gateway service and one analytics service. All API calls in your API Connect deployment are handled by the one gateway service, and all API event records that are generated, are stored by the one analytics service.

Customizing the analytics data that is stored for your APIs

Note: What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings. For more information, see Configuring analytics in the developer portal.
When you configure an API in the API Manager UI, you choose what data is stored in the API event records for calls to that API with the **`activity log`** property. The **`activity log`** property has separate settings for successful API calls, and for failed API calls. The activity log options are:

- none: API events are not logged.
- activity: Logs the API resource URI. **`activity`** is the default log setting for successful API calls.
- header: Logs the API resource URI and HTTP headers.
- payload: Logs API resource URI, HTTP headers, and request and response payloads. **`payload`** is the default log setting for failed API calls, since the response payload might have useful information on the cause of the failure.

The more detailed the **`activity log`** setting, the larger the API event records, and the greater the persistent storage requirements for the analytics subsystem. For more information about configuring activity logging, see Activity log policy.

If you want to make specific customizations to your API event data, two methods are available:

- Customize API event records as they arrive from the gateway, by using ingestion filters. Ingestion filters can be applied conditionally based on the data in the API event.
- Customize API event records as they are created on the gateway. Use a gateway script or the **`set-variable`** operation in the definitions of each API that you want to customize. See Customizing data with a gateway script or set-variable operation.

Retention and rollover of analytics data

API event data takes up persistent storage space on your analytics subsystem. To ensure that you do not run out of persistent storage space, API event data is summarized, and the oldest API event records are deleted. Analytics API event records are retained for a maximum number of days, which is defined by your deployment profile. Summary analytics data that is created from the API event records is retained for 1 year. You can change how long the analytics data is stored with the Retention and rollover settings.

Accessing your analytics data

You can view your analytics data in the Cloud Manager, API Manager, and Developer Portal UIs.

- The cloud admin user can see total API call volumes and call volumes per gateway in the Cloud Manager UI. Provider organization owners can enable the cloud admin user to also see analytics data and individual API event data for their provider organization.
- In the API Manager UI, the provider organization owner can see analytics data for APIs that are published in their catalogs.
- In the Developer Portal UI, the API consumer can see analytics data for APIs published in their consumer organization.
  Note: If two gateway services are configured for a catalog that has a portal site, those two gateway services must be associated with the same analytics service. If they are associated with different analytics services, then no analytics data is displayed in the portal UI.
  This limitation means that analytics data is not available in the developer portal sites of a two data center disaster recovery deployment, where two analytics subsystems are deployed.

The maximum number of API events that can be accessed from the UIs is 10,000. The maximum number of event records that can be displayed per page in the UIs is 200.

Your analytics data can also be accessed by using the toolkit CLI or REST API.

You can manage user access to analytics data with User roles and permissions. For more information about user-based analytics data visibility, see Catalogs, spaces, and analytics

You can export analytics data from your UIs, however, UI export is not a practical method if you want to export more than 200 API event records. Use the toolkit CLI or REST API to export more than 200 API event records at a time. If you think that you might want to regularly export all your analytics data, then consider Offloading your analytics data to a third-party system.

Offloading your analytics data to a third-party system

The API event data that is received from your gateways can be directed to a third-party system, instead of or in addition to being stored by the analytics subsystem.

For more information about offloading, see Offload to third-party systems.

Preinstallation planning

Review the analytics subsystem requirements and decide how you want to configure analytics for your environment.

- **Estimating storage requirements**
  Estimate the persistent storage requirements for your analytics subsystem.
- **Kubernetes and OpenShift preinstallation planning**
  Review deployment profiles, storage, and analytics settings that must be decided before installation.
- **VMware preinstallation planning**
  Review deployment profiles and other analytics settings that must be decided before installation.

Estimating storage requirements

Estimate the persistent storage requirements for your analytics subsystem.

This information applies only to data that is stored in your API Connect analytics subsystem, and not to data that is offloaded to a third-party system. If you plan to disable local storage, you can skip this topic. The formula and guidelines are based on how the API Connect analytics subsystem stores data, and cannot be directly applied to any other storage system.

Warning: Increasing the analytics storage space after installation is not a simple operation, and it can require reinstallation of the analytics subsystem. Decreasing storage space always requires reinstallation. If you do not have the information that is needed to make an estimate, then set your storage to at least 500Gi and monitor your usage closely. For an installation where you expect to store little or no analytics data, you can set the storage to 50Gi.
After installation, if you find you do not have enough space, then reduce the data retention period to keep less analytics data and stay within your persistent storage limit. See Running out of storage space for other steps that you can take if you run out of space.

To understand the concepts that are required for estimating your storage requirements, first review the following pages:

- OpenSearch nodes, indices, shards, and replicas.
- Activity log policy.
- Retention and rollover.

Use the following guidelines to provide an estimate of the amount of persistent storage you need for your API Connect analytics subsystem.

Factors that determine persistent storage requirement

Number of copies of the analytics data
: The number of copies of the analytics data you store depends on your deployment profile:

  - Three replica profiles store 3 copies of your analytics data (one OpenSearch shard replica per analytics replica).
  - One replica profiles store 1 copy of your analytics data.

Number of days that API data is retained
: The default number of days your API event data is retained depends on your deployment profile. For example, the **n1xc4.m32** profile retains data for 30 days. To see the retention period for each analytics deployment profile, see retention and rollover.

  API summary data is retained for 366 days by default on all deployment profiles.

  If you customized your retention and rollover settings, then use the updated retention periods in your calculations.

API event logging policy and customization
: The logging policy that you set for each API determines the size of the event records for that API. Typical sizes of API event records for each activity log policy are:

  - Activity logging: 1.5 Kb. This is the default log policy for successful API calls.
  - Header logging: 4 Kb.
  - Payload logging: 4 Kb plus size of expected request and response payloads. This is the default log policy for failed API calls.

  You can also Customize your analytics data to add, redact, or remove fields. If you add fields to your API events, calculate the average size of the new fields and add that number to your event size. If you remove fields, subtract this size only if you are also removing headers or payloads.

Percentage of each type of data
: Estimate the percentage of each type of log policy (activity, header, payload) for your published APIs. Use these percentages and your estimates of API event size to calculate you average API event size.
  Remember: API logging policy can be set differently for success and failure responses of the same API. The default is activity logging for successful API calls, and payload logging for failed calls. Consider the percentages of successful and failed calls that you expect in your calculations.

API calls per day
: Estimate the total number of API calls that you expect per day.

Backup configuration
: If you enable backups and configure **type=all**, then double your calculated storage requirement.

  If you enable backups and configure **type=default** (which only backs up summary data and shared queries), then increase your calculated storage requirement by 25%.

  For more information about analytics backups, see Backup, restore, and disaster recovery.

Calculating your persistent storage requirements

Calculate the expected size of your API event data with the following formula:

```
Storage required for API events = (average bytes per API event) * (API events per day) * (API event retention period) * (copies of data)
```

Calculate the expected size of your API summary data with the following formula:

```
Storage required for API summary data = (expected size of all API events with header logging) * (API events per day) * (summary data retention period) * (copies of data) * 0.1
```

Note: Ignore the percentages of different logging types you calculated for your APIs and assume that all your APIs are set to header logging. API summary data uses approximately 10% of the space of header-logged API event data per day. Remember that header logging includes everything that is logged by activity logging plus the API call headers.
Your analytics data must not use more than 70% of your persistent storage space. Add some buffer space in case your analytics data is larger than you expect. It is recommended that the persistent storage space you provide for your analytics subsystem is double the space that you calculated your data requires.

Example calculation, based on the following information:

```
Copies of data = 3
API event data retention = 45 days
API summary data retention = 366 days
Activity log bytes per call = 1500 bytes
Header log bytes per call = 15000 bytes
Payload log bytes per call = 30500 bytes
% of Activity log = 70%
% of Header log = 20%
% of Payload log = 10%
Calls per day = 100000
```

1. Calculate the average API event size:

   ```
   ( (70*1500) + (20*15000) + (10*30500) ) / 100 = 7100 bytes
   ```

2. Calculate the space needed for your API event data:

   ```
   7100 * 100000 * 45 * 3 = 89.3 Gi (95.6 Gb)
   ```

3. Calculate the space needed for your summary data:

   ```
   15000 * 100000 * 366 * 3 * 0.1 = 153 Gi (165 Gb)
   ```

4. Add API event data and summary data totals:

   ```
   153 Gi + 89.3 Gi = 242.3 Gi
   ```

5. Double the storage calculated in step 4 to get the storage size to allocate to your analytics subsystem:

   ```
   242.3 Gi * 2 = 484.6 Gi
   ```

6. If you plan to enable backups, then add extra space as follows:
   - If you plan to set backups **type=all**, then add the total that you calculated in step 4.

     ```
     242.3 Gi + 484.6 Gi = 726.9 Gi
     ```

- If you plan to set backups `type=default`, then multiply the total that you calculated in step 4 by 0.25 and add this to your total storage requirement:

  ```
  484.6 Gi + (242.3 Gi * 0.25) = 545.2 Gi
  ```

Kubernetes and OpenShift preinstallation planning

Review deployment profiles, storage, and analytics settings that must be decided before installation.

Deployment profile

Decide which deployment `profile` you want to use, the available profiles are:

- For Kubernetes and OpenShift (individual subsystem) installations: Analytics deployment profiles.
- For Cloud Pak for Integration and OpenShift top-level CR installations: API Connect deployment profiles.

For a scalable analytics deployment, choose a three replica profile. If you do not expect a high API transaction rate and plan to keep a limited amount of analytics data, then a one replica profile is sufficient.

Storage class

Before you install analytics, you must choose a storage class. `Ceph`, `Block`, and `Local Volume` are all supported; however, `Local Volume` is the most suitable for analytics. The analytics subsystem provides internal data replication and HA support, so the additional HA capabilities that `Ceph` or `Block` storage might give you are not needed. In addition, analytics requires a high throughput of disk I/O operations to successfully handle the analytics data load from the gateway. `Local Volume` is the best-performing storage class for disk I/O.

Note: GlusterFS, NFS, Rook-CephFS, or any shared file system storage class is not supported for analytics. If you use these storage classes, you might encounter severe performance degradation, pod crashloops, and possibly loss of data.

Storage type

Note: Storage type selection is available on three replica deployments only.
To make an informed choice on which storage type is best for you, first read and understand the OpenSearch concepts that are described in OpenSearch nodes, indices, shards, and replicas.
API Connect provides two OpenSearch storage types:

- **Shared storage**
  A single pod provides data storage and OpenSearch cluster management. Shared storage is the only option on a one replica deployment.
- **Dedicated storage**
  OpenSearch data storage and cluster management functions are split, and run in separate pods on each worker node:
  - The `storage-os-master` pod runs an OpenSearch "manager eligible" node that manages the OpenSearch cluster, but does not store any API event data.
  - The `storage` pod runs an OpenSearch "data" node that stores API event data.

  Dedicated storage is the default storage type for three replica deployments.

Dedicated storage facilitates horizontal scaling to support greater analytics data storage and throughput. Add worker nodes and increase the number of `storage` pod replicas to scale horizontally (you do not need to increase the number of `storage-os-master` replicas). Dedicated storage also provides greater stability and allows some OpenSearch configuration changes to be made without downtime.
You can change storage type after installation, see Dedicated storage and scaling up.

Disabling internal storage

The analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution if you are using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

Important:
If you disable local storage, the analytics views in your API Connect UIs remain accessible, but are empty.

Configure local storage disablement before installation. It is not possible to disable or re-enable internal storage after installation.

You can enable offload of analytics data to third-party systems after installation.

For the steps to disable internal storage, see Disable local storage.

Persistent storage space

Based on your expected API transaction rate, you can estimate how much storage space your analytics subsystem requires. See Estimating storage requirements.

Inter-subsystem communication security

By default the network communication from the management and gateway subsystems, to the analytics subsystem uses Kubernetes ingresses or OpenShift routes, and is secured with mTLS. You can configure alternative network communication options if your environment requires. For more information, see Network requirements for inter-

subsystem communication.

Kubernetes operating map counts

When the analytics service is configured to store data, it uses OpenSearch, which requires map counts higher than the operating system defaults. The minimum recommended value is `262144`. Unless you plan to disable local storage, increase the default map count on every Kubernetes worker node:

1. To change the map counts on the live system, run the following command on every Kubernetes node:

   ```
   sudo sysctl -w vm.max_map_count=262144
   ```

2. To persist this change when node restarts occur, add the following setting to the /etc/sysctl.conf file:

   ```
   vm.max_map_count = 262144
   ```

For more information, see Important settings in the OpenSearch documentation.

PV requirements

The number of PVs needed depends on if you disable local storage, and if you have backups configured.

Table 1. Analytics PV requirements

Deployment profile	Local storage disabled (ingestion only)	Local storage enabled	Local storage and backups enabled
Single node (n1)	1	2	3
Three node (n3)	3	6	9

To understand how much storage capacity your analytics subsystem needs, see Estimating storage requirements.

Firewall requirements

The analytics firewall requirements are documented here: Firewall requirements

VMware preinstallation planning

Review deployment profiles and other analytics settings that must be decided before installation.

Deployment profile

The first decision that you must make is which **`deployment-profile`** you want to use. The available deployment profiles for analytics are: **`n1xc2.m16`**, **`n1xc4.m32`**, **`n1xc6.m48`**, **`n3xc4.m16`**, **`n3xc4.m32`**, **`n3xc6.m48`**, **`n3xc8.m64`**. For more information about deployment profiles, see Deployment profiles.

For a typical production deployment, choose a three replica profile. A one replica profile is only sufficient if you expect a low API transaction rate and do not plan to retain much analytics data.

Storage space

Based on your expected API transaction rate, you can estimate how much storage space your analytics subsystem requires. See Estimating storage requirements.

Firewall requirements

The analytics firewall requirements are documented here: Firewall requirments.

Inter-subsystem communication security

If your network infrastructure requires that load-balancers implement TLS termination, then mTLS between API Connect subsystems can be disabled and JSON Web Token (JWT) security can be used instead.
Note: Although mTLS is disabled, the network communication is still secured with standard TLS, which does not require passthrough to be enabled on load-balancers.
For more information about configuring JWT for network security, see: Enable JWT security.

Disabling internal storage

If you are offloading your analytics data to a third-party system, you can choose to not store your API event data in your API Connect analytics subsystem by disabling local analytics storage. With local storage disabled, the CPU, memory, and storage requirements of your analytics subsystem are greatly reduced, but you lose the ability to view your analytics data in the Analytics UIs.
Important: It is not possible to enable or disable local storage after installation.

Managing your analytics subsystem

Understand the architecture of the analytics subsystem and how to configure it.

- **API Connect on VMware**
  An overview of the analytics VM, and how to configure analytics features.

- **API Connect on Kubernetes, OpenShift, and Cloud Pak for Integration**
  Understand the Kubernetes artifacts that make up the analytics subsystem, and how to configure your AnalyticsCluster CR.
- **OpenSearch nodes, indices, shards, and replicas**
  Understand the main concepts of the OpenSearch database: nodes, indices, shards, and replicas.

API Connect on VMware

An overview of the analytics VM, and how to configure analytics features.

Analytics data storage

The disk size for analytics data is specified at installation when you deploy your analytics OVA file, see Deploying the analytics subsystem OVA file.

You can increase the space available for your analytics data by adding a disk, see Adding disk space to a VMware appliance.
Warning: Do not attempt to increase the size of the existing data disk. Changing the disk size corrupts your existing analytics data.

Managing the analytics subsystems VMs

Manage your analytics VMs with the **apicup** command from your project directory. Some analytics settings are specified directly as arguments to the **apicup** command, for example:

```
apicup subsys set <analytics subsystem> <key> <value>
```

Other analytics settings are configured in a YAML file that is called `analytics-extra-values.yaml`, see Analytics extra-values file.

Some maintenance operations require SSH access to your analytics VMs. To access you analytics VMs with SSH, follow these steps:

1. Use an SSH client to login as the `apicadm` user:

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. If you need root user access, `sudo` to root:

   ```
   sudo -i
   ```

CAUTION:
Do not do any operations inside the analytics VM that are not described in the API Connect documentation or otherwise advised by IBM.

Analytics extra-values file

Create a file called analytics-extra-values.yaml to configure the following analytics features:

- Logstash persistent queue
- Offload to third-party systems
- Customizing data with ingestion filters
- Disable local storage
  Note: If you want to disable local storage, you must configure it **before** installation. You cannot change this setting after installation.

To create and apply the analytics-extra-values.yaml file, follow these steps:

1. Create a file called analytics-extra-values.yaml in your project directory.
2. The analytics-extra-values.yaml contains a single object called `spec`. Set the first line of the file to:

   ```
   spec:
   ```

   Define your analytics features inside the `spec` object. Use 2 spaces for indentation. For example, to disable local storage, set your analytics-extra-values.yaml as follows:

   ```
   spec:
     external:
       offload: # enable offload to third-party system
         enabled: true
         output: |
           http {
             url => "example.com"
             http_method => "post"
             codec => "json"
             content_type => "application/json"
             headers => {
               "x-acme-index" => "8"
               "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
             }
             id => "offload_http"
     storage:
       enabled: false # disable local storage
   ```

   Note: You can define one or more analytics features in the `spec` object. Do not leave the analytics-extra-values.yaml with an empty `spec` section.
3. Use the **apicup** command to assign your analytics-extra-values.yaml file to the `extra-values-file` property:

   ```
   apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
   ```

   Note: If `extra-values-file` is already set to analytics-extra-values.yaml, you do not need to rerun this command every time you edit analytics-extra-values.yaml.

4. Apply the analytics-extra-values.yaml file to your analytics subsystem with **apicup install**:

   ```
   apicup subsys install <analytics subsystem>
   ```

   Warning: Do not apply an empty analytics-extra-values.yaml file, or one that contains just the `spec:` line.

Configuring management-ca for analytics subsystem

To enable engagement email destination functionality in the analytics subsystem on an OVA stack, complete the following steps to make the Management CA available:

1. Run the following commands to extract the required certificates:

   ```
   apicup certs get <management-cluster-name> platform-api -t cert > platform-api.crt
   apicup certs get <management-cluster-name> platform-api -t key > platform-api.key
   apicup certs get <management-cluster-name> platform-api -t ca > platform-api-ca.crt
   ```

2. Run the following command to set the extracted certificates:

   ```
   apicup certs set <analytics-subsystem-name> mgmt-platform-api platform-api.crt platform-api.key platform-api-ca.crt
   ```

3. After setting the certificates, install the Analytics subsystem:

   ```
   apicup subsys install <analytics-subsystem-name>
   ```

Firewall requirements

Your analytics VMs must be reachable on the ports that are described in API Connect firewall requirements.

Analytics subsystem TLS certificates

No certificate-related sysadmin operations are normally required on your analytics VMs. The analytics subsystem has no user-facing certificates. For more information about certificates on VMware deployments, see API Connect TLS certificates best practices.

Extra values file reference

List of all the properties you can set in the `analytics-extra-values.yaml`.

Table 1. Fields that you can set in the `analytics-extra-values` file

Field	Type	Description	Comments
`external: offload: filter`	String	Filter configuration for external offload.	See Offload to third-party systems.
`external: offload: enabled`	Boolean	Enables analytics offload feature.	See Offload to third-party systems.
`external: offload: output`	String	Output configuration for external offload.	See Offload to third-party systems.
`external: offload: passwordSecretName`	String	The name of the secret that has the password to access the certificate keystore.	See Offload to third-party systems.
`external: offload: secretName`	String	The name of the secret that contains the certificates used for connecting to the offload target.	See Offload to third-party systems.
`ingestion: filter`	String	Filter to modify API event data that is stored internally (not offloaded).	See Customizing data with ingestion filters.
`ingestion: geoIPEnabled`	Boolean	Include the `client_geoip` and `gateway_geoip` fields in your API event records. Default is `true`.	Applies to both locally stored and offloaded data.
`ingestion: queue: type`	Object	Persistent queue settings. Default is `persisted`.	Set to `memory` if you want to disable the persistent queue. See Logstash persistent queue.
`ingestion: queue: volumeClaimTemplate: volumeSize`	String	Storage size for your persistent queue. Default is 50Gi.	Do not change this value. See Logstash persistent queue.
`ingestion: queue: volumeClaimTemplate: storageClassName`	String	Storage class name for your persistent storage. **Must** be set to local-storage.	See Logstash persistent queue.

Field	Type	Description	Comments
`ingestion: pipelineWorkers`	4 <= integer <= 128	Number of pipeline workers.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelineBatchSize`	10 <= integer <= 10000	Batch size of a pipeline worker.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelingBatchDelay`	10 <= integer <= 5000	Batch delay of a pipeline worker.	See Performance tuning with ingestion pipeline properties.
`ingestion: configReloadAutomatic`	Boolean	Whether to automatically reload the pipeline on configuration changes.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelineUnsafeShutdown`	Boolean	Whether to allow unsafe shutdown of the pipeline.	See Performance tuning with ingestion pipeline properties.
`storage: enabled`	Boolean	Set false to disable internal storage.	See Disable local storage.

API Connect on Kubernetes, OpenShift, and Cloud Pak for Integration

Understand the Kubernetes artifacts that make up the analytics subsystem, and how to configure your AnalyticsCluster CR.

The AnalyticsCluster Custom Resource (CR)

Your analytics subsystem is defined by a Custom Resource (CR) called **`AnalyticsCluster`**. Throughout this documentation, the **`AnalyticsCluster`** CR is also referred to as the "analytics CR".

Certain analytics features are configured in the **`AnalyticsCluster`** CR. How you edit the CR depends on your platform:

- **Kubernetes and OpenShift individual subsystem CRs:** Edit the **`AnalyticsCluster`** directly.
- **Cloud Pak for Integration and OpenShift top-level CR:** Edit the analytics section of the top-level CR. When saved, the changes to the top-level CR are applied to **`AnalyticsCluster`** CR. If you change the **`AnalyticsCluster`** CR directly, changes can be overwritten by the top-level CR.

Note: For convenience, the alias **`a7s`** can be used instead of **`AnalyticsCluster`** when you edit the CR. For example:

```
kubectl edit a7s
```

instead of:

```
kubectl edit AnalyticsCluster
```

The properties that you can configure in the **`AnalyticsCluster`** CR are listed in Analytics CR properties reference.

Ingresses

The analytics subsystem has one ingress, called the "ingestion endpoint". The ingestion endpoint serves requests coming from both the management subsystem and the gateway. The management subsystem communicates with the ingestion endpoint to query API event data stored by the analytics subsystem, and also to manage the analytics subsystem. The gateway sends API event data to the ingestion endpoint.

The ingestion endpoint is listed as **`ai-endpoint`** or **`<instance name>-ai-endpoint`** in the output of **`kubectl get ingress`**.

Note: In OpenShift, "routes" are used instead of ingresses. The functions of the ingestion endpoint are the same for both the Kubernetes **`ai-endpoint`** ingress and the OpenShift **`ai-endpoint`** route.

Pods

The following table shows the Kubernetes pods that make up an analytics subsystem:

Table 1. Analytics pods

Name	Description
`osinit`	OpenSearch initialization job. This pod is in **`completed`** state after installation.
`oscron`	Manages the jobs that transform API event data into summary data. Runs every 15 minutes.
`director`	Manages the analytics subsystem. The director pod serves all requests that come from the management subsystem, such as: initial subsystem registration, queries for analytics data, management of saved queries, and changes to retention settings.
`ingestion`	Logstash-based data pipeline that receives the API event data from the gateway, applies any ingestion filters that the user configures, and forwards the events to the storage pods and/or to third-party offload targets.
`mtls-gw`	Secures all communication that arrives on the analytics ingestion endpoint, forwarding communication from the management subsystem to the **`director`** pod, and communication from the gateway to the **`ingestion`** pod.
`storage`	The **`storage`** pods contain the OpenSearch database that stores all the analytics data. By default the storage pods also run the OpenSearch cluster management tasks. If dedicated storage is enabled the OpenSearch cluster management tasks are done by the **`storage-os-master`** pods, and the **`storage`** pods contain just the analytics data.
`storage-os-master`	The **`storage-os-master`** pod exists only on deployments where dedicated storage is enabled. The **`storage-os-master`** pods manage the OpenSearch cluster, while the **`storage`** pods are dedicated to the storage of the analytics data.

Name	Description
`warehouse`	The `warehouse` pod stores your local backups and stages them for transmission to your remote SFTP server or object-store.

PersistentVolumeClaims (PVCs)

The following table describes the PVCs that are created for the analytics subsystem:

Table 2. Analytics PVCs

Name	Description
`data-analytics-storage-<integer>`	The PVC that stores your analytics data. A `data-analytics-storage-<integer>` PVC is created for each analytics `storage` pod. The `<integer>` is the replica number, starting from 0.
`data-analytics-storage-os-master-<integer>`	If dedicated storage is enabled, then the `storage-os-master` PVCs are created. Each `storage-os-master` PVC corresponds to a `storage-os-master` pod. The `<integer>` corresponds to the pod replica number, starting from 0. The PVC stores data that is related to the management of your OpenSearch cluster.
`data-analytics-ingestion-<integer>`	If the persistent queue feature is enabled, a `data-analytics-ingestion-<integer>` PVC is created for each `ingestion` pod. The `data-analytics-ingestion-<integer>` PVC stores API event data temporarily when the `ingestion` pod is unable to forward the data to the `storage` pods. The `<integer>` corresponds to the pod replica number, starting from 0.
`data-a7s-warehouse`	If backups are enabled, then local backups are stored on this PVC.

Certificates

The following table describes the certificates that are used by the analytics subsystem:

Certificates	Issuer	Description
`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the `mtls-gw` pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the `analytics-ai-endpoint` certificate. If this certificate is updated, restart the `mtls-gw` pod for the update to take effect.
`analytics-ca or a7s-ca`	`selfsigning-issuer`	The issuer for the `analytics-client` and `analytics-server` certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If you update this certificate, you must then update the `analytics-client` and `analytics-server` server certificates, and then ensure that the following pods are restarted: • `storage`: Restarts automatically. • `warehouse`: Restarts automatically. • `ingestion`: Restarts automatically. • `director`: Restart manually.
`analytics-client-client or a7s-cl-client`	`ingress-issuer`	Legacy certificate from pre-v10.0.5 releases. Not used for anything and safe to delete. In v10.0.5, communication with the analytics subsystem uses the `analytics-ingestion-client` certificate.
`analytics-client or a7s-client`	`analytics-ca`	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, then the `storage`, `warehouse` and `ingestion` pods restart automatically. You must manually restart the `director` pod.

`analytics-server or a7s-server`	`analytics-ca`	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate.
		Required DNS names within the SAN section are:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<namespace>.svc.cluster.local`
		`*.<instance name>-server.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc.cluster.local`
		`<instance name>-server`
		`<instance name>-storage`
		`<instance name>-director`
		`<instance name>-ingestion`
		`<instance name>-mtls-gw`
		`<instance name>-storage-os-master`
		`<instance name>-warehouse`
		
		If this certificate is updated, then the `storage`, `warehouse` and `ingestion` pods restart automatically. You must manually restart the `director` pod.

For more information about certificates in API Connect, see API Connect certificates.

Analytics CR properties reference

List of all the properties that can be configured in the analytics CR.

Note: If you have a VMware deployment, do not edit the analytics CR directly. Use the **apicup** command and analytics-extra-values.yaml file. See Analytics extra-values file.

The following properties must be defined in your analytics CR:

- `ingestion.endpoint`
- `ingestion.clientSubjectDN`

All other properties are optional.
Note: If you are using Cloud Pak for Integration or the top-level CR on OpenShift, then configure your analytics properties in the `analytics` section of the top-level CR. Do not edit the analytics CR directly. If the properties you want to set are missing from the top-level CR, then copy them from the analytics CR to the top-level CR.

Table 1. Analytics subsystem CR properties.

Property	Type	Default value	Description	Comments
`allowUpgrade`	Boolean	false	Legacy property for upgrade to v10.0 5 from previous releases.	The `allowUpgrade` property is not used in v10.0.6 and can be deleted from the analytics CR.
`databaseBackup: host`	String		The URL to your S3 object store.	See Backup, restore, and disaster recovery.
`databaseBackup: path`	String		The path to your S3 object store at the URL specified by `databaseBackup.host`.	See Backup, restore, and disaster recovery.
`databaseBackup: schedule`	String		Specifies the frequency of automatic backups. Use any valid `cron` string.	See Backup, restore, and disaster recovery.
`databaseBackup: enableCompression`	Boolean	`true`	Specifies whether to compress the backups.	See Backup, restore, and disaster recovery.
`databaseBackup: credentials`	String		The name of your S3 object store authentication secret.	See Backup, restore, and disaster recovery.
`databaseBackup: backupCerts`	String		The name of the secret that contains your S3 server certificate.	See Backup, restore, and disaster recovery.
`databaseBackup: chunkSize`	String	`1gb`	Specifies the size of large file chunks. Format is lower case and no spaces, for example: `1gb`, `50mb`, `800kb`.	See Backup, restore, and disaster recovery.
`databaseBackup: enableServerSideEncryption`	Boolean	`true`	Specifies whether metadata files are stored in compressed format.	See Backup, restore, and disaster recovery.
`external: offload: filter`	String		Filter configuration for external offload.	See Offload to third-party systems.
`external: offload: enabled`	Boolean	`false`	Enables analytics offload feature.	See Offload to third-party systems.
`external: offload: output`	String		Output configuration for external offload.	See Offload to third-party systems.
`external: offload: passwordSecretName`	String		The name of the secret that has the password to access the certificate keystore.	See Offload to third-party systems.
`external: offload: secretName`	String		The name of the secret that contains the certificate that is used for connecting to the offload target.	See Offload to third-party systems.
`ingestion: endpoint`	Object		FQDN and TLS Secrets for client endpoint.	The external endpoint of the analytics subsystem. Both the gateway and management subsystems use the ingestion endpoint to communicate with your analytics subsystem. The gateway sends API event data to the ingestion endpoint.
`ingestion: clientSubjectDN`	String		Subject DN (distinguished name) for authenticating with ingestion endpoint (RFC 2253).	
`ingestion: filter`	String		Filter to modify API event data before it is sent for local storage (not offloaded).	See Customizing data with ingestion filters.
`ingestion: geoIPEnabled`	Boolean	`true`	Include the `client_geoip` and `gateway_geoip` fields in your API event records.	Applies to both locally stored and offloaded data.
`ingestion: queue`	Object		Persistent queue settings.	See Logstash persistent queue.
`ingestion: queue: type`	String		Persistent queue settings. Default is `persisted`.	Set to `memory` if you want to disable the persistent queue. See Logstash persistent queue.
`ingestion: queue: volumeClaimTemplate: volumeSize`	String		Storage size for your persistent queue. Default is 50Gi.	Do not change this value. See Logstash persistent queue.

Property	Type	Default value	Description	Comments

`ingestion:`
`  queue:`
 	
`volumeClaimTemplate:`
 	
`storageClassName`
	String		Storage class name for your persistent storage.	See Logstash persistent queue.

`ingestion:`
 	
`pipelineWorkers`
	4 <= integer <= 128	24	Number of pipeline workers.	See Performance tuning with ingestion pipeline properties.

`ingestion:`
 	
`pipelineBatchSize`
	10 <= integer <= 10000	250	Batch size of a pipeline worker.	See Performance tuning with ingestion pipeline properties.

`ingestion:`
 	
`pipelineBatchDelay`
	10 <= integer <= 5000	50	Batch delay of a pipeline worker.	See Performance tuning with ingestion pipeline properties.

`ingestion:`
 	
`configReloadAutomatic`
	Boolean	true	Whether to automatically reload the pipeline on configuration changes.	See Performance tuning with ingestion pipeline properties.

`ingestion:`
 	
`pipelineUnsafeShutdown`
	Boolean	false	Whether to allow unsafe shutdown of the pipeline.	See Performance tuning with ingestion pipeline properties.

`longTermDataEnabled`	Boolean	true	Enables the collection of long-term summary data that is required for reports and leaderboards.	If you set `longTermDataEnabled` to false, no long-term summary data is generated, however the `oscron` job still runs. Long-term summary data is only generated when local storage is not disabled.
`standaloneCluster`	Boolean	false	Legacy property related to Zen endpoints.	The `standaloneCluster` property is not used in v10.0.6 and can be deleted from the analytics CR.
`storage:` `  type`	String	`shared`	Type of storage deployment.	Shared or dedicated. See Storage type.

`storage:`
`  shared:`
 	
`volumeClaimTemplate:`
 	
`storageClassName`
	String	cluster default	Storage class name.	Name of the storage class for your analytics data. See Storage class.

`storage:`
`  shared:`
 	
`volumeClaimTemplate:`
 	
`volumeSize`
	String	`50Gi`	Volume size.	Size of the volume used for data storage. See Estimating storage requirements.

OpenSearch nodes, indices, shards, and replicas

Understand the main concepts of the OpenSearch database: nodes, indices, shards, and replicas.

OpenSearch do not use the term "database", but "search and analytics suite". For simplicity, in API Connect the terms "analytics database" or "OpenSearch database" are used instead of "search and analytics suite".

The term OpenSearch "cluster" is used when referring to the analytics subsystem of a multi-replica API Connect deployment.

Nodes

An OpenSearch cluster is made up of separate OpenSearch nodes. On Kubernetes, an analytics storage pod replica runs a single OpenSearch node. On VMware, a deployed analytics VM runs a single OpenSearch node.
You control the number of OpenSearch nodes that you have when you select your API Connect deployment profile: A one replica deployment has one OpenSearch node. A three replica deployment has three OpenSearch nodes.

If you installed a three replica deployment on Kubernetes or OpenShift, you can enable the dedicated storage feature to increase your number of OpenSearch nodes above three.

Indices

Your analytics API event data is stored in OpenSearch indices. The creation and management of your analytics indices is time-based. By default, your OpenSearch database creates a new index each day to be used for storing the API events that arrive that day; so on the day of installation your analytics subsystem has 1 index for API event data, and after 10 days your subsystem has 10 API event data indices. The maximum number of days that API event data is stored depends on your deployment profile, see Retention and rollover.
API Connect also creates indices for shared queries and for API summary data. By default API summary indices are kept for 1 year.

You can configure the retention and rollover periods for API event and summary data to suit your requirements and available storage space.

Shards

To efficiently distribute the data in OpenSearch indices across a cluster, the indices are subdivided into what are called "shards", which can be stored in different nodes of the cluster.

Replicas
: In a three node OpenSearch deployment, each shard (known as the "primary shard") has 2 replica shards that contain a copy of the data that is in the primary shard. OpenSearch stores the primary shard and each replica on different nodes to ensure that all data is available on all nodes, and to provide high-availability if one node fails.

  A single node OpenSearch deployment has no replica shards, since no other nodes are available to store them.

Installing the analytics subsystem

Links to the installation steps for each platform.

For all features and settings that must be decided and configured before installation, see Preinstallation planning.

It is recommended configure your backup settings after installation. See backup and disaster recovery.

Follow the installation steps for your platform:

- Kubernetes
- OpenShift and Cloud Pak for Integration
- VMware one-replica deployment
- VMware three-replica deployment

Backup, restore, and disaster recovery

How to back up your analytics subsystem and restore after a disaster.

An analytics subsystem backup consists of:

Analytics infrastructure configuration backup
: Your infrastructure configuration backup contains information such as endpoints, offload configuration, remote backup site credentials.
  The infrastructure configuration backup is also referred to as the "config backup".

  On VMware deployments, the config backup includes everything that you configure with the **apicup** command, and typically consists of the contents of your project directory. On Kubernetes and OpenShift, the config backup consists of YAML file backups of your analytics CR and certificates.

  Your config backup is needed for disaster recovery, where you must redeploy your analytics subsystem.

Analytics database backup
: Your database backup contains all your analytics summary data and shared queries. If you have storage capacity, you can configure your analytics database backups to include all your API event data. When you enable database backups, local backups are created at 55 minutes past each hour. You can configure your database backups to be periodically copied to a remote SFTP server or S3 compatible object-store. The configuration of your database backups, such as object-store credentials, are defined in your analytics infrastructure configuration. Therefore, to restore an analytics database backup after a disaster, you must first restore your config backup.
  Your analytics database backups are intended for use in two scenarios:

  - Disaster recovery: Your entire analytics subsystem fails. You redeploy the subsystem (use your config backup to ensure that the same config settings and certificates are defined) and then restore your most recent database backup.
  - Corrupted index recovery: One or more analytics indices are corrupted, so you restore just those indices from a backup that contains them.

  Analytics database backups are not intended for long-term storage of your analytics data. If you require long-term storage, use the offload or export features.

Review the backup, restore, and disaster recovery documentation for your platform:

- **Kubernetes, OpenShift, and Cloud Pak for Integration**
  How to configure analytics backups and recover from a disaster in Kubernetes, OpenShift, and Cloud Pak for Integration environments.
- **VMware**
  How to configure analytics backups and recover from a disaster in a VMware environment.

Kubernetes, OpenShift, and Cloud Pak for Integration

How to configure analytics backups and recover from a disaster in Kubernetes, OpenShift, and Cloud Pak for Integration environments.

The analytics subsystem backup consists of:

- Analytics infrastructure configuration backup:
  - Backup of your analytics CR YAML file.
  - Backup of any custom certificates you configured. For example, the certificates that secure your communication with your remote object-store, and any certificates used for connecting to third-party systems for analytics offload.

  The infrastructure configuration backup is also referred to as the "config backup".

  If you have a disaster, your config backup is essential for restoring your analytics subsystem.

- Analytics database backup. Analytics database backups are stored locally on a dedicated PVC called **`data-a7s-warehouse`**, and can also be configured for periodic transfer to a remote STFP server or S3 compatible object-store (for example, IBM Cloud Object Storage).
  Note: If you are using a self-managed S3 backup server, check that you have a DNS hostname entry and matching TLS certificate for your S3 backup endpoint.

Analytics subsystem backups are intended for restoration in the same environment where they were taken, or a different environment that has the same network configuration, endpoints, and deployment profile.

Taking an analytics infrastructure configuration backup

How to backup your analytics subsystem deployment configuration.

About this task

The analytics infrastructure configuration backup consists of:

- Backup of your analytics CR YAML file.
- Backup of any custom certificates you configured. For example, the certificates that secure your communication with your remote S3 object-store, and any certificates used for connecting to third-party systems for analytics offload.

Note: Every time that you update the analytics subsystem CR or any custom analytics certificates, take a new analytics infrastructure configuration backup.
The infrastructure configuration backup is also referred to as the "config backup".

If you have a disaster, your config backup is essential for restoring your analytics subsystem.

Note: For OpenShift® users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place.

Procedure

1. Backup your analytics CR to a file called analytics-subsystem-cr-backup.yaml:

   ```
   kubectl get a7s -o yaml > analytics-subsystem-cr-backup.yaml
   ```

2. Backup your analytics database backup secret to a file called analytics-backup-secret_backup.yaml:

   ```
   kubectl get secret analytics-backup-secret -o yaml > analytics-backup-secret_backup.yaml
   ```

   The backup secret is created when you configure analytics database backups: Configuring analytics database backups. If database backups are not yet configured, ensure that this secret is backed up when it is configured.

3. If you are using the analytics offload feature, then backup any custom offload certificates that are used:

   ```
   kubectl get secret <offload secret name> -o yaml > analytics-offload-secret_backup.yaml
   ```

   For more information about offload certificates, see Offload to third-party systems.

4. If your object-store has a self-signed CA certificate, then backup the secret that contains this certificate:

   ```
   kubectl get secret <object-store CA secret name> -o yaml > analytics-objstore-CA-secret_backup.yaml
   ```

   For more information about object-store CA certificates, see Creating the object-store CA certificates.

5. If you manually created or customized any other analytics subsystem certificates, then take a backup of them:
   To identify all the secrets in your analytics namespace, run:

   ```
   kubectl get secrets
   ```

   For each secret that you want to backup, use the following command:

   ```
   kubectl get secret <secret name> -o yaml > <backup filename>
   ```

   You do not need to backup any secrets that cert-manager created and maintains. For more information about analytics TLS certificates, see API Connect TLS certificates.

6. Copy all the backup files that were created in the previous steps to a safe location.

Configuring analytics database backups

Configure scheduled database backups of your analytics subsystem.

Before you begin

You must have a PV available for backups to be stored. If you did not configure this during installation, then configure it now:

1. Open the analytics CR for editing.
   - On Kubernetes and OpenShift individual subsystem installations, edit your analytics CR directly:

     ```
     kubectl edit a7s
     ```

   - On Cloud Pak for Integration and OpenShift top-level CR installations, edit the `APIConnectCluster` CR:

     ```
     kubectl edit APIConnectCluster
     ```

2. Add a `backup.volumeClaimTemplate` section to define your local backups PVC, in the `spec.storage` section. For example:

   ```
   spec:
     storage:
       backup:
         volumeClaimTemplate:
           storageClassName: <storage class>
           volumeSize: <backups size>
   ```

   where:
   - *<storage class>* is the storage class for this PVC, see Storage class.
   - *<backups size>* is the size you calculated for your backups in Estimating storage requirements.

   On Cloud Pak for Integration and OpenShift top-level CR installations, add `backup.volumeClaimTemplate` to `spec.analytics.storage`.

Procedure

1. Create the analytics backup secret for your object-store or remote SFTP server.
   If you want to store your backups in an object-store and use an access key and secret, then follow the documentation of your object-store provider to obtain an access key and secret. Documentation links for some common object-store providers:

   - IBM Cloud Object Storage
   - AWS

   Create a Kubernetes secret called `analytics-backup-secret` that contains your remote SFTP or object-store credentials in the same namespace as your analytics subsystem:
   - Object-store:

     ```
     kubectl -n <namespace> create secret generic analytics-backup-secret --from-literal=access_key='<your access key>' --from-literal=secret_key='<your access secret>'
     ```

     or

     ```
     kubectl -n <namespace> create secret generic analytics-backup-secret --from-literal=username='<username>' --from-literal=password='<password>'
     ```

   - SFTP server:

     ```
     kubectl -n <namespace> create secret generic analytics-backup-secret --from-literal=username='<username>' --from-literal=password='<password>'
     ```

   If your object-store or remote SFTP server credentials change, then update the `analytics-backup-secret` by deleting and then recreating as follows:
   a. Delete the `analytics-backup-secret`:

      ```
      kubectl -n <namespace> delete secret analytics-backup-secret
      ```

   b. Recreate `analytics-backup-secret` with your new credentials.
2. Open the analytics CR for editing.
   On Kubernetes and OpenShift individual subsystem installations, edit your analytics CR directly:

   ```
   kubectl edit a7s
   ```

   On Cloud Pak for Integration and OpenShift top-level CR installations, edit the `APIConnectCluster` CR:

   ```
   kubectl edit APIConnectCluster
   ```

3. Add the `databaseBackup` configuration.
   On Kubernetes and OpenShift individual subsystem installations, add `databaseBackup` to the `spec` section of the analytics CR. On Cloud Pak for Integration and OpenShift top-level CR installations, add `databaseBackup` to the `spec.analytics` section of the `APIConnectCluster` CR.

   ```
   databaseBackup:
     enabled: [true|false]
     protocol: [local|sftp|objstore]
     scope: [default|all]
     credentials: analytics-backup-secret
     host: <remote backup site hostname>
     port: <remote backup site port>
     path: <remote backup site path>
     backups3URIStyle: [host|path]
     backupCerts: <object-store server CA secret>
     schedule: <cron formatted schedule> # "0 2 * * *"
   ```

   where:
   - `enabled`: Set to `true` to enable backups. Set to `false` to disable.
   - `protocol`: Type of remote backup site, `objstore` or `sftp`.
     If you do not have a remote backup site then, set to `local`.

- **scope**: Set to **all** to include all your analytics data, or set to **default** to backup only the summary data and shared queries.
  To estimate the size of your analytics data, see Estimating storage requirements.
- **host**: is the hostname of your remote SFTP server or object-store endpoint.
  If you are using an object-store, then this property must include the corresponding region. Examples:
  - Region provided in the FQDN:

    s3.*s3region.s3domain*
  - Region provided in the path:

    s3.*s3domain/s3region*
  - If the endpoint has no region:

    s3.*s3domain*
- **path**:
  - If object-store is used, this property is a combination of the object-store bucket and the base path within the bucket. Use the format: **bucket_name/path**.
  - If a remote SFTP server is used, this property is the directory where your backups are stored.
- **backups3URIStyle**: If object-store is used, this property defines the path style, set to **host** or **path**.
- **backupCerts**: If object-store is used, this property is the name of a secret that contains your object-store server certificate.
  This property is only required if your object-store has a self-signed root certificate, see Creating the object-store CA certificates. If your object-store server does not have a self-signed root certificate, then you can omit this line.
- **schedule**: The cron schedule for when backups are copied to your remote SFTP server or object-store.
  This property does not control when backups are taken. Local backups are taken at 55 minutes past the hour, and this property defines the schedule for transferring the most recent local backup to your remote SFTP server or object store. The format for the schedule is any valid **cron** string. The time zone for backups is that of the **kube-controller-manager**.

  Do not set the schedule to more frequently than once an hour.

What to do next

After your backup settings are configured in your analytics CR, take a new config backup to capture the updated CR settings and backup secrets.

- **Creating the object-store CA certificates**
  Configure your analytics subsystem to trust your object-store.

Creating the object-store CA certificates

Configure your analytics subsystem to trust your object-store.

If your object-store presents a self-signed public server certificate, create a Kubernetes secret that contains the certificate, and specify the secret in your analytics CR.

1. Create a file called **ca.crt** that contains your object-store public server certificate.
   Note: If the certificate includes intermediate certificates, then provide the entire chain in the **ca.crt** file, for example:

   ```
   intermediate-certificate-1
   intermediate-certificate-2
   . . .
   intermediate-certificate-n
   root-certificate
   ```

   where the first certificate in the **ca.crt** (intermediate-certificate-1) is the issuer of the object-store server certificate, and each subsequent certificate is the issuer of the preceding certificate.
2. Run the following command to create a Kubernetes secret from the certificate file:

   ```
   kubectl create secret generic analytics-custom-objstore-server-ca --from-file=ca.crt=/path/to/cert.crt
   ```
3. Specify your new secret in your analytics CR:

   ```
   databaseBackup:
     ...
     backupCerts: analytics-custom-objstore-server-ca
     ...
   ```
4. Take a backup of the **analytics-custom-objstore-server-ca** secret object:

   ```
   kubectl get secret analytics-custom-objstore-server-ca -o yaml > analytics-custom-objstore-server-ca.yaml
   ```

   Keep the generated analytics-custom-objstore-server-ca.yaml with your infrastructure backup.

Running an on-demand analytics database backup

Deploy the **AnalyticsBackup** CR to initiate a backup of the analytics database.

Before you begin

Configure your backup settings in your analytics CR: Configuring analytics database backups.

About this task

An on-demand backup is triggered by creating an **AnalyticsBackup** CR. The API Connect operator detects the presence of the backup CR and runs the backup job.

When you trigger an on-demand backup, a local backup is taken and then copied to your remote backup location (SFTP of object-store). If a remote backup location is not configured, then the backup is stored locally.

Local backups are taken automatically every 55 minutes past each hour. If you trigger an on-demand backup while a scheduled local backup is running, then the on-demand backup waits until the scheduled backup is complete, and then creates a new local backup.

Note: You can run only one backup or restore process at a time.

Procedure

1. Create a file called analyticsbackup_cr.yaml and paste in the following contents:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  generateName: <backup prefix>
spec:
  name: <backup name>
  analyticsCluster: <cluster name>
  crType: create
  comment: <comment>
```

   where:
   - *<backup prefix>* is prefix for the name of your backup. The remainder of the name is automatically generated. Keep the prefix short, 8 characters or less.
   - Optional: *<backup name>*. If you don't want an autogenerated backup name with a prefix, you can specify the complete backup name here and remove the **metadata.generateName** property.
   - *<cluster name>* is the name or your analytics CR. To get the name of your analytics cluster, run:

     ```
     kubectl get AnalyticsCluster
     ```

   - *<comment>* is an optional comment that you can give your backup, for example "load test backup".
2. Deploy your CR by running the following command to create it in the namespace of your analytics subsystem:

```
kubectl -n <namespace> create -f analyticsbackup_cr.yaml
```

3. To see the progress of your backup, run the following command:

```
kubectl  -n <namespace> get analyticsbackup
```

```
NAME                  STATUS    ID                                      CR TYPE       CLUSTER     AGE   COMMENT
<backup name>         Running                                         analytics      create       12s   <comment>
```

   When the backup is complete the status changes from **Running** to **Ready**.
4. Display the details for your backup by running the following command:

```
kubectl  -n <namespace> get analyticsbackup <backup name> -o yaml
```

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  creationTimestamp: "2020-05-20T16:18:05Z"
  generateName: a7s-bup-
  generation: 1
  name: a7s-bup-gb6s5
  namespace: my-namespace
  resourceVersion: "867329"
  uid: f43b8400-733d-411a-9e9a-de2166bbfb0a
spec:
  indices:
  - all
status:
  conditions:
  - lastTransitionTime: "2022-06-30T16:18:24Z"
    message: SUCCESS
    status: Complete
    type: Ready

  id: my-backup-id
```

Restoring the analytics database

Deploy the **AnalyticsRestore** CR to initiate restoration of an analytics database backup.

About this task

Analytics database backups are restored by creating an **AnalyticsRestore** CR. The API Connect operator detects the presence of the restore CR, and triggers a restore of the backup that is specified in the CR.

Two types of restore are available:

- Repair. The repair restore is for recovering corrupted or accidentally deleted indexes. The repair restore compares the contents of your backup and your current analytics database. Any corrupted indexes in your current database are replaced by the corresponding indexes in your backup. Any indexes that are in your backup but are missing from your current database (and are still within your retention period) are restored from the backup.
  Note: The current write index is an exception. The current write index is where incoming API events are recorded, and contains the API event data for the current day (if you left your rollover period as the default). If your current write index is corrupted, then open a support case. The repair restore does not recover the current write index.
- Replace. The replace restore deletes all indexes in your current database and then restores all the indexes (including the current write index) from the backup that are within your retention period.
  A replace restore is used in a disaster recovery situation, where your analytics subsystem is redeployed.

Note: You can run only one backup or restore process at a time.
Note: Analytics database backups that were taken on an earlier release cannot be restored on V10.0.8.0.

Procedure

1. Get a list of available backups by running the following command:

   ```
   kubectl -n namespace get analyticsbackup | grep record
   ```

   ```
   NAME                  STATUS   ID                                        CR TYPE   CLUSTER       AGE   COMMENT
   analytics-bup-kxwq5   Ready    analytics-all-2020-09-07t03:49:15utc   record    analytics     34h
   analytics-bup-p29z8   Ready    analytics-all-2020-09-07t18:04:03utc   record    analytics     20h
   ```

   Note the ID of the backup that you want to restore.
   Note: You cannot restore backups that have **CR TYPE** of **create**.
2. Create a file called analyticsrestore_cr.yaml and paste in the following text:

   ```
   apiVersion: analytics.apiconnect.ibm.com/v1beta1
   kind: AnalyticsRestore
   metadata:
     generateName: a7s-restore-
   spec:
     analyticsCluster: <cluster name>
     backupID: <backup ID>
     type: [repair|replace]
   ```

   - **analyticsCluster** is the name or your analytics CR. To get the name of your analytics cluster, run:

     ```
     kubectl get AnalyticsCluster
     ```

   - **backupID** is the ID of the backup that you want to restore, identified in step 1. If you do not specify this property, then the most recent backup is restored.
   - **type** is the type of restore. Set **type** to **repair** to recover corrupted or missing indices. Set **type** to **replace** to delete all indices and replace with the indices from the backup.
3. Deploy your CR by running the following command to create it in the namespace of your analytics subsystem:

   ```
   kubectl -n <namespace> create -f analyticsrestore_cr.yaml
   ```

4. To monitor your restore, run the following command:

   ```
   kubectl -n <namespace> get analyticsrestore
   ```

   ```
   NAME               STATUS     ID                                        AGE
   a7s-restore-9z4fr Ready      analytics-all-2022-07-01t04:49:15utc              1h
   ```

   When the restore is successfully started, **STATUS** shows **Running**. When the restore is successfully completed, **STATUS** shows **complete**.
5. Display the details for a particular restore by running the following command:

   ```
   kubectl -n <namespace> get analyticsrestore <restore name> -o yaml
   ```

   where *<restore name>* is the name of your restore, that you identified in step 4.
   Example output for a one replica deployment where the repair restore is complete:

   ```
   apiVersion: analytics.apiconnect.ibm.com/v1beta1
   kind: AnalyticsRestore
   metadata:
     creationTimestamp: "2024-06-14T21:42:02Z"
     generateName: analytics-restore-
     generation: 2
     name: analytics-restore-82p6f
     namespace: apic
     ownerReferences:
     - apiVersion: analytics.apiconnect.ibm.com/v1beta1
       blockOwnerDeletion: true
       controller: true
       kind: AnalyticsCluster
       name: analytics
       uid: f71b0c9c-1c00-4c1b-b4a4-36643cb92c41
     resourceVersion: "20708170"
     uid: 858796d1-b4b0-42aa-a86e-5060bae9c405
   spec:
     analyticsCluster: analytics-2
   ```

```
  backupID: analytics-2-all-2024-06-14t21:14:18.628z
  enableIgnoreUnavailable: false
  enableOverride: false
  type: repair
status:
  backupID: analytics-2-all-2024-06-14t21:14:18.628z
  commentLeft: ""
  conditions:
  - lastTransitionTime: "2024-06-14T21:42:02Z"
    message: ""
    reason: StatusUnknown
    status: "False"
    type: Warning
  - lastTransitionTime: "2024-06-14T21:42:02Z"
    message: SUCCESS
    reason: Finished
    status: "True"
    type: Ready
    ...
  details: summary-api-2024.06.14-000001
  id: "2"
  phase: Ready
  state: ""
```

The `status.details` property shows the analytics index that was restored.

6. When restore is complete, delete the `AnalyticsRestore` CR:

```
kubectl -n <namespace> delete analyticsrestore <restore name>
```

Note: If your restore failed, and you want to investigate why, do not delete the `AnalyticsRestore` CR, it is needed for problem analysis.

Recovering from a disaster

Reinstall your analytics subsystem, restore your analytics CR, secrets, and your database backup.

About this task

Analytics subsystem backups can be restored in the same environment where they were taken, or in a different environment that has the same network configuration, endpoints, and deployment profile. You cannot restore an analytics subsystem backup in a different network environment, form factor, or deployment profile. If you want to move your API Connect deployment to a different form factor or change endpoints, see Migrating from v10 to v10 on a different form factor.

Procedure

1. Install the replacement analytics subsystem, configuring the same `ai-endpoint` as your original installation.
   Follow the installation procedures for your platform:
   - Kubernetes
   - OpenShift and Cloud Pak for Integration

   Refer to your infrastructure configuration backup to check the `ai-endpoint`. Also, if you disabled local storage, you must configure this in your analytics CR before installation.

2. Update the analytics CR on your replacement installation with the analytics backup settings and any other analytics features you configured in your previous installation.
   Your previous analytics settings are in your infrastructure configuration backup. If you are installed on Cloud Pak for Integration or OpenShift with the top-level CR, then add these settings to the `spec.analytics` section of your `APIConnectCluster` CR.
3. Re-create the analytics secrets that you backed up in your infrastructure configuration backup:
   a. Create the backup credential secret from your backup file: analytics-backup-secret_backup.yaml.

   ```
   kubectl -n <analytics namespace> apply -f analytics-backup-secret_backup.yaml
   ```

   b. If you are using the analytics offload feature, then create the offload secret from your backup file: analytics-offload-secret_backup.yaml.

   ```
   kubectl -n <analytics namespace> apply -f analytics-offload-secret_backup.yaml
   ```

   c. If your object-store has a self-signed CA certificate, then create the secret that contains the certificate from your backup file.

   ```
   kubectl -n <analytics namespace> apply -f analytics-objstore-CA-secret_backup.yaml
   ```

   d. If you manually created or customized any other analytics subsystem certificates, then restore those secrets from their backup files.

   ```
   kubectl -n <analytics namespace> apply -f <backup filename>
   ```

4. Restore the analytics database: Restoring the analytics database.

Deleting old backups

Manage the retention of your analytics backups.

To delete old backups, you can delete the backup files directly on your remote SFTP server or object-store.
Warning: For V10.0.7 and earlier, do not delete backup files directly from your remote server. In previous releases, the analytics database backups are incremental, and deleting any files can corrupt all the backups. Refer to the API Connect documentation for your API Connect version.

Troubleshooting backup and restore

Troubleshooting steps for problems with backup and restore of the analytics database on Kubernetes and OpenShift.

Check the CR status

List the analytics backup jobs:

```
kubectl -n <namespace> get analyticsbackup -n <namespace>
```

```
NAME                  STATUS   ID                                          CR TYPE                   AGE   COMMENT
<backup name>         Ready                                                create                   <age>   <comment>
```

check the status of the backup that you are interested in:

```
kubectl -n <namespace> get analyticsbackup <backup name> -o yaml
```

List the analytics restore jobs:

```
kubectl get analyticsrestore -n <namespace>
```

```
NAME               STATUS     ID                                          AGE
<restore name>     Ready      analytics-all-2022-07-01t04:49:15utc              1h
```

check the status of the restore job you are interested in:

```
kubectl -n <namespace> get analyticsrestore <restore name> -o yaml
```

Check the logs

Check for backup or restore related errors in the logs of the API Connect operator pod and analytics warehouse:

1. Identify the API Connect operator pod `ibm-apiconnect` by running the following command:

   ```
   kubectl -n <namespace> get pods
   ```

   Note: *<namespace>* might not be the same namespace as your analytics subsystem. On a default OpenShift deployment, the API Connect operator runs in a global namespace called `openshift-operators`.
2. View the API Connect operator pod logs with:

   ```
   kubectl -n <namespace> logs <ibm-apiconnect pod name>
   ```

   Check for messages with the "error" label that contain the words "analytics", "backup", or "restore".

3. Identify the name of your warehouse pod:

   ```
   kubectl get pods | grep warehouse
   ```

4. View warehouse pods logs with:

   ```
   kubectl logs <warehouse pod name>
   ```

Common problems with backup and restore

These are some frequent issues that can cause backup or restore to fail:

- Invalid login credentials for your remote backup server. Check that the username and password that you configured in your subsystem database backup settings is correct.
- The user does not have write permissions on the backup server. Check that the username you configured in your subsystem database backup settings has write permission to the specified backup path.
- Remote backup server storage full. Check your remote backup server and if the storage is full either extend the storage space or delete older backups.
- No network access to the remote backup server. Check that you can communicate with your remote backup server from your API Connect environment.
- TLS handshaking failure with the remote backup server. If your remote backup server has a self-signed CA certificate, check that this certificate is trusted by your API Connect deployment, see the database backup configuration steps for your subsystem for more information.

Increasing storage space for your local backup PVC

Local database backups are stored on the warehouse PVC. The warehouse PVC has either `data-a7s-warehouse` or `data-analytics-warehouse` in its name. By default the warehouse PVC has 150 Gi of storage space.

If you find you do not have enough space in your warehouse PVC, then follow these steps:

1. Disable analytics database backups.
   Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   set `spec.databaseBackup.enabled = false`.
2. Delete the warehouse PVC:
   a. Identify the name of your warehouse PVC:

   ```
   kubectl get pvc | grep warehouse
   ```

b. Delete the identified PVC:

```
kubectl delete pvc <warehouse PVC name>
```

3. Edit your analytics CR and increase the size of your warehouse PVC.
   Set the new size in **spec.storage.backup.volumeClaimTemplate.volumeSize**.

4. Re-enable analytics database backups.
   Edit your analytics CR and set **spec.databaseBackup.enabled = true**.

Backup failure due to warehouse node failure

The analytics warehouse service is responsible for staging and exporting analytics database backups to your remote SFTP or S3 object-store. The warehouse service runs as a single Kubernetes pod on all deployment profiles. In a three replica deployment, if the worker node where the warehouse pod is running fails, then take the manual steps that are documented here to recover the service.

When the warehouse pod is not running, the analytics CR reports that status of **Pending**, and all backup related features are unavailable.

To recover the warehouse service on a different worker node, complete the following steps:

1. Disable analytics database backups.
   Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   set **spec.databaseBackup.enabled = false**.

2. Identify the name of the warehouse PVC:

   ```
   kubectl get pvc | grep warehouse
   ```

   Look for the warehouse PVC in the output:

   ```
   NAME                                    STATUS   VOLUME                                     CAPACITY   ACCESS MODES
   STORAGECLASS   AGE
   warehouse-data-analytics-warehouse-0    Bound    pvc-4cbbb8a0-10ad-45de-b7da-ae6c26bde1de   150Gi      RWO
   standard       24h
   ```

3. Delete the warehouse PVC:

   ```
   kubectl delete pvc <name of warehouse pvc>
   ```

4. Re-enable analytics database backups.
   Edit your analytics CR and set **spec.databaseBackup.enabled = true**.

   The PVC is then re-created on one of the two available nodes, and the warehouse pod starts on this same node.

VMware

How to configure analytics backups and recover from a disaster in a VMware environment.

Analytics subsystem backups are intended for restoration in the same environment where they were taken, or a different environment that has the same network configuration, endpoints, and deployment profile.

- **Backing up your analytics subsystem**
  Backup your project directory and configure scheduled database backups.
- **Running an on-demand database backup**
  Run a backup of the analytics database outside the scheduled time.
- **Restoring an analytics database backup**
  Restore an analytics database backup.
- **Recovering from a disaster**
  Recover the analytics subsystem in a VMware environment.
- **Troubleshooting backup and restore on VMware**
  Troubleshooting steps for problems with backup and restore of the analytics database on VMware.

Backing up your analytics subsystem

Backup your project directory and configure scheduled database backups.

Project directory backups

The original project directory that was created with the **apicup** command during the initial product installation is essential for disaster recovery, see: Preparing to install API Connect in VMware. The project directory contains the YAML files that describe your deployment, encryption keys, and deployment ISO files. It is not possible to restore the analytics database on a deployment that uses a new or different project directory.

Take a new backup of your project directory every time you make any configuration changes with the **apicup** command. Store your project directory backups at a remote location.

Ensure that a backup is kept of your Analytics extra-values file, if this file is not located in your project directory.

Analytics database backups

Remote storage of analytics database backups requires a remote SFTP server or object-store (for example, IBM Cloud Object Storage).
Note: If you are using a self-managed S3 backup server, check that you have a DNS hostname entry and matching TLS certificate for your S3 backup endpoint.
Use the **apicup** command to configure backup settings for the analytics database.

1. Configure the backup settings with the **apicup** command:

   ```
   apicup subsys set <analytics subsystem> <key> <value>
   ```

   The configurable backup settings are:

   Table 1. Analytics backup settings

Key	Default value	Description
`analytics-backup-auth-pass`		Password for your remote SFTP server or object-store.
`analytics-backup-auth-user`		Username for your remote SFTP server or object-store.
`analytics-backup-certs`		Applicable to object-store backups only. The name of the Kubernetes secret inside your analytics subsystem that contains the object-store CA certificate. Follow the steps on Creating the object-store CA secret to create and assign this secret.
`analytics-backup-enabled`	`true`	Set to `false` if you want to disable analytics database backups completely. No local backups are taken and nothing is transferred to your remote SFTP server or object-store. Common scenarios for disabling backups are: • You have limited storage space in your analytics subsystem. • Maintenance operations that require that backups are temporarily disabled.

`analytics-backup-host`		The fully qualified domain name of the backup server, in lowercase only.
		• For `objstore` type backup, specify the S3 endpoint with the corresponding S3 region in the format `<S3endpoint>`, or with an optional S3 region in the format `<S3endpoint>/<S3region>`.
		
		`apicup subsys set <analytics subsystem> analytics-backup-host=s3.eu-gb.cloud-object-storage.appdomain.cloud`
		
		• For `sftp` type, the SFTP server hostname
		
		`apicup subsys set <analytics subsystem> analytics-backup-host=my.sftp.backup.domain.example.com`

`analytics-backup-path`		The location of the backups on the remote host:
		• S3 - the name of your S3 bucket to store backup data, optionally followed by a `/` and then any subdirectories inside the bucket. Valid examples:
		
		`bucket`
		`bucket/path`
		`bucket/lots/of/paths`
		
		Example:
		
		`apicup subsys set <analytics subsystem> analytics-backup-path=apic-backup`
		
		• SFTP - the full absolute path of the folder on the SFTP server, beginning with `/`.
		
		`apicup subsys set <analytics subsystem> analytics-backup-path=</folder>`
		
		When you specify a file path in a backup setting, be sure to escape any blank spaces in the path.

`analytics-backup-port`		The port number of the remote SFTP server or object-store. The default for SFTP is 22. For object-store the default is 443.
`analytics-backup-protocol`	`local`	Type of backup server: `objstore`, `sftp`, or `local`. Note: If set to `local` the only configurable properties are `analytics-backup-scope` and `analytics-backup-enabled`, all other properties are ignored.
`analytics-backup-schedule`	`0 2 * * *`	Determines the schedule for when backups are transferred to your remote SFTP server or object-store. The format for the schedule is any valid `cron` string. This property does not control the schedule for when backups are taken. Local backups are taken every hour. The `analytics-backup-schedule` property defines the schedule for transferring the most recent local backup to your remote SFTP server or object store. The time zone for backups is Coordinated Universal Time. Do not set the schedule to more frequently than once an hour.
`analytics-backup-scope`	`default`	Set to `default` to backup only summary data and shared queries, and exclude the API event data (which can be 100s of Gb - see Estimating storage requirements). Set to `all` to backup all analytics data.

2. Validate the backup settings:

   ```
   apicup subsys get <analytics subsystem> --validate
   ```

3. Apply the updated backup settings:

   ```
   apicup subsys install <analytics subsystem>
   ```

4. Run the health check to confirm that the subsystem handled the update successfully :

```
apicup subsys health-check <analytics subsystem>
```

No output is returned if no problems are detected.

Snapshots

Take a virtual machine (VM) snapshot of all your analytics VMs; see Using VM snapshots for backup and disaster recovery. Taking snapshots does require a brief outage while all the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can provide faster recovery when compared to redeploying OVAs and restoring from normal backups.

Important: VM snapshots are not an alternative to the standard API Connect backups that are described in the previous step. Do not rely solely on VM snapshots for your backups.

- **Creating the object-store CA secret**
  Configure your analytics subsystem to trust your object-store.

Creating the object-store CA secret

Configure your analytics subsystem to trust your object-store.

If your object-store presents a self-signed public server certificate, create a Kubernetes secret that contains the certificate, and specify the secret in your analytics CR.

1. Use an SSH client to login to your analytics VM as the `apicadm` user:

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

   If you have a three replica deployment, you can login to any one of the VMs. You do not need to repeat these steps on all VMs.

2. Switch to the root user:

   ```
   sudo -i
   ```

3. Create a file called `ca.crt` that contains your object-store public server certificate:

   ```
   echo "<certificate>" > ca.crt
   ```

   where *<certificate>* contains the full chain of your object-store CA certificate, for example:

   ```
   intermediate-certificate-1
   intermediate-certificate-2
   . . .
   intermediate-certificate-n
   root-certificate
   ```

4. Run the following command to create a Kubernetes secret from the certificate file:

   ```
   kubectl create secret generic analytics-custom-objstore-server-ca --from-file=ca.crt=/path/to/cert.crt
   ```

5. Verify that the secret is created:

   ```
   kubectl get secrets
   ```

   expected output is:

   ```
   NAME                                                  TYPE                  DATA   AGE
   ...
   analytics-custom-objstore-server-ca                   generic               1      7s
   ...
   ```

6. Take a backup of the new secret. Run:

   ```
   kubectl get secret analytics-custom-objstore-server-ca -o yaml
   ```

   Copy the output to a new file in your project directory called analytics-custom-objstore-server-ca.yaml.

7. Exit from your VM SSH session.
8. Set your `analytics-backup-certs` property to the Kubernetes secret that you created:

   ```
   apicup subsys set <analytics subsystem> analytics-backup-certs analytics-custom-objstore-server-ca
   ```

Running an on-demand database backup

Run a backup of the analytics database outside the scheduled time.

About this task

You can take an analytics backup at any time, you do not need to wait for the scheduled database backups to run. However, avoid running multiple backups at the same time.

When you trigger an on-demand backup, a local backup is taken and then copied to your remote backup location (SFTP of object-store). If a remote backup location is not configured, then the backup is stored locally.

Local backups are taken automatically every 55 minutes past each hour. If you trigger an on-demand backup while a scheduled local backup is running, then the on-demand backup waits until the scheduled backup is complete, and then creates a new local backup.

Procedure

1. Confirm that your analytics subsystem is working correctly:

   ```
   apicup subsys health-check <analytics subsystem>
   ```

   if successful, the command returns silently with exit code 0.
2. Start the backup by running the following command:

   ```
   apicup subsys backup <analytics subsystem>
   ```

3. Monitor the progress of your backup with:

   ```
   apicup subsys list-backups <analytics subsystem>
   ```

   ```
   NAME                      STATUS   ID                                          CR TYPE   CLUSTER      AGE   COMMENT
   analytics-backup-d8hsp    Ready    analytics-all-2024-06-14t21:12:25.136z      create    analytics    45m   backup for
   analytics service 1
   analytics-record-b5w74    Ready    analytics-all-2024-06-14t21:12:25.136z      record    analytics    43m
   ```

   When the backup is complete the status changes from `Running` to `Ready`.

Restoring an analytics database backup

Restore an analytics database backup.

Procedure

1. Retrieve a list of available backups that have the `CR TYPE` of `record`:

   ```
   apicup subsys list-backups <analytics subsystem> | grep record
   ```

   ```
   NAME                      STATUS   ID                                          CR TYPE   CLUSTER      AGE   COMMENT
   analytics-record-b5w74    Ready    analytics-all-2024-06-14t21:12:25.136z      record    analytics    43m
   ```

   The response includes the ID of each backup. Note the ID of the backup that you want to restore.
2. Restore the backup that you identified in step 1:

   ```
   apicup subsys restore <analytics_subsystem> --id "<backup ID>"  --type=[repair|replace]
   ```

   In a disaster recovery situation, set `--type=replace` to recover all the analytics data in the backup.

   If it is not a disaster recovery situation (you did not redeploy your analytics subsystem), then set `--type=repair` to recover missing or corrupted data from your backup. Repair is the default of you omit `--type`.

   Note: Recovery of API event data is possible only if the backup was taken with backup scope set to `all`. For more information about backup scope, see analytics-backup-scope.
3. To monitor the progress of your restore:

   ```
   apicup subsys list-restores <analytics subsystem>
   ```

   ```
   NAME                STATUS     ID                                          AGE
   a7s-restore-9bwfv   Running    defanalytics-all-2023-06-29t09:29:53utc     9s
   ```

   When the restore is successfully started, `STATUS` shows `Running`. When the restore is successfully completed, `STATUS` shows `complete`.

Recovering from a disaster

Recover the analytics subsystem in a VMware environment.

Recovering the analytics subsystem involves re-creating your analytics ISO files, redeploying you analytics VMs with the new ISO files, and then restoring the analytics database from your backup.

In a clustered deployment, if any one VM is corrupted then all the VMs in the cluster must be redeployed. You cannot replace just a single corrupted VM in a cluster.

Use the same project directory that you used for your original deployment, or a restore of your project directory backup.

1. Create your ISO files:

   ```
   apicup subsys install <install subsystem name> --out <output directory>
   ```

   The ISO files are created in the directory that is specified in *<output directory>*.
   Note: If your original ISO files are still available and you did not upgrade from the original installation, you can reuse them. However, if you upgraded your original deployment, you must create new ISO files using the version of **apicup** that corresponds to the version your API Connect installation was on at the time of the disaster. For example, do not attempt to deploy v10.0.8.x OVAs with ISO files that were created with **apicup** v10.0.6.0.
   If you are restoring in a different VMware environment, you can change the hostname, IP address, and other properties that you set with `apicup iface create` before you create the ISO files. Use `apicup iface`

create to define your new network interface, and then **apicup iface delete** to delete the original one. Do not update any other settings with **apicup**, and if your original VM hostname was used in any of your API Connect endpoints, then you cannot change the hostname.

2. Deploy your new analytics VMs. See Deploying the analytics subsystem OVA.
3. Verify your new analytics deployment. See Verifying installation of the analytics subsystem.
4. Restore your analytics database backup: Restoring an analytics database backup.

Troubleshooting backup and restore on VMware

Troubleshooting steps for problems with backup and restore of the analytics database on VMware.

Common problems with backup and restore

These are some frequent issues that can cause backup or restore to fail:

- Invalid login credentials for your remote backup server. Check that the username and password that you configured in your subsystem database backup settings is correct.
- The user does not have write permissions on the backup server. Check that the username you configured in your subsystem database backup settings has write permission to the specified backup path.
- Remote backup server storage full. Check your remote backup server and if the storage is full either extend the storage space or delete older backups.
- No network access to the remote backup server. Check that you can communicate with your remote backup server from your API Connect environment.
- TLS handshaking failure with the remote backup server. If your remote backup server has a self-signed CA certificate, check that this certificate is trusted by your API Connect deployment, see the database backup configuration steps for your subsystem for more information.

Backup failure in three replica deployment due to node failure

The analytics database backup service is responsible for staging and exporting analytics database backups to your remote SFTP or S3 object-store. The backup service runs on a single node on all deployment profiles. In a three replica deployment, if the node where the backup service is running fails, then take the manual steps that are documented here to recover the service.

To recover the backup service on a different node, complete the following steps:

1. Log in to one of the analytics VMs, and switch to the root user:
   a. Log in to the analytics VM:

      ```
      ssh apicadm@<analytics subsystem hostname>
      ```

   b. `sudo -i`
2. Disable analytics database backups.
   Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   set **spec.databaseBackup.enabled = false**.
3. Identify the name of the warehouse PVC:

   ```
   kubectl get pvc | grep warehouse
   ```

   Look for the warehouse PVC in the output:

   ```
   NAME                                     STATUS   VOLUME                                     CAPACITY   ACCESS MODES
   STORAGECLASS   AGE
   warehouse-data-analytics-warehouse-0   Bound    pvc-4cbbb8a0-10ad-45de-b7da-ae6c26bde1de   150Gi      RWO
   standard       24h
   ```

4. Delete the warehouse PVC:

   ```
   kubectl delete pvc <name of warehouse pvc>
   ```

5. Re-enable analytics database backups.
   Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   Set **spec.databaseBackup.enabled = true**.
   The PVC is then re-created on one of the two available nodes, and the warehouse pod starts on this same node.
6. Exit from the analytics VM.

API event record field reference

Reference table and examples of the data that is stored in an API event record.

When a user calls one of your published APIs, the gateway that processes the API call creates an API event record. Each API event record contains details of the API call such as the application ID, current time, result code, etc. Table 1 shows all the data that can be contained in an API event record.

Activity log settings

The contents of API event records depends on the activity log setting for each API, and any custom gateway scripts and ingestion filters that are configured. To find out more about activity logging and customizing API event contents, see Customize your analytics data.

Important: The maximum API event record size is 19 Mb. The analytics subsystem rejects any API event records that are larger than 19 Mb.

API event record fields

Table 1. API event record fields

Field name	Type	Description
@timestamp	Date	A timestamp that records when the Logstash data collection engine (which feeds data into OpenSearch) wrote the record.
ai_cache_hit	Boolean	Boolean indicating whether the response was served from the AI Gateway cache
ai_model	String	The name of the AI model used in this AI Gateway call
ai_request_tokens	Integer	The number of request tokens in this AI Gateway call
ai_response_tokens	Integer	The number of response tokens in this AI Gateway call
ai_total_tokens	Integer	The total (sum or request and response) tokens in this AI Gateway call
api_ref	String	The API reference (api_name:api_version)
api_type	String	The API type: rest, soap, graphql, asyncapi
api_id	String	The API identifier.
api_name	String	The name of the API.
api_resource_id	String	Field format is: **`api_name:api_version:method:path`**. Only available on API Gateway v10.5.3 or higher.
api_version	String	The version number of the API.
app_id	String	The identifier for the registered application.
app_name	String	The name of the registered application. Note: The property is set to **`undefined`** when a client ID is not used or is invalid on the API. The gateway needs a client ID to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked, because a single API can belong to multiple products (each of which have multiple plans and apps that are subscribed to those plans with client IDs).
app_type	String	The application type, with a value of **`Production`** or **`Development`**.
backend_method	String	The HTTP method used in the backend call
backend_request_body	String	The request body sent to the backend
backend_request_headers	Object	The HTTP headers of the backend request
backend_response_body	String	The response body from the backend
backend_response_headers	Object	The HTTP headers of the backend response
backend_status_code	string	The HTTP status code of the backend response
backend_time_to_serve_request	integer	Time taken to serve the backend request
backend_url	String	The full URL of the backend call
billing	Object	Object containing billing information for events using monetization
bytes_received	Number	The number of bytes received from the consumer in the request.
bytes_sent	Number	The number of bytes sent to the consumer in the response.
cached_response	Boolean	Boolean indicating whether this API call was served from the gateway cache
client_geoip.area_code	Number	The public switched telephone network (PSTN) area code of the client, as identified from its IP address.
client_geoip.asn	Number	Autonomous system number of client IP address.
client_geoip.as_org	String	
client_geoip.city_name	String	The city name of the client, as identified from its IP address.
client_geoip.continent_name	String	The continent name of the client, as identified from its IP address.
client_geoip.continent_code	String	The two-letter continent code of the client, as identified from its IP address.
client_geoip.country_code2	String	The two-letter country code of the client, as identified from its IP address.
client_geoip.country_code3	String	The three-letter country code of the client, as identified from its IP address.
client_geoip.country_name	String	The country name of the client, as identified from its IP address.
client_geoip.dma_code	Number	The Designated Market Area (DMA) code of the client, as identified from its IP address.

Field name	Type	Description
client_geoip.domain	String	The domain of the client IP address.
client_geoip.ip	String	The IP address of the client.
client_geoip.isp	String	The internet service provider of the client.
client_geoip.latitude	Number	The latitude of the client location, as identified from its IP address.
client_geoip.location	String	The longitude and latitude of the client location (separated by a comma), as identified from its IP address.
client_geoip.location.lat	Number	The latitude of the client location, as identified from its IP address.
client_geoip.location.long	Number	The longitude of the client location, as identified from its IP address.
client_geoip.longitude	Number	The longitude of the client location, as identified from its IP address.
client_geoip.organization	String	The client's organization, as identified from its IP address.
client_geoip.postal_code	String	The postal code of the client, as identified from its IP address.
client_geoip.region_iso_code	String	The ISO code of the client's region, as identified from its IP address.
client_geoip.region_name	String	The abbreviated form of the region that corresponds to the IP address of the client.
client_geoip.timezone	String	The time zone of the client, as identified from its IP address.
client_id	String	The unique ID of the client that is attached to the API request.
client_ip	String	The consumer's IP address
custom_data	Array map	Custom data can be added to this field.
datetime	Date	A timestamp that records when the API was invoked. The timestamp is always shown in Coordinated Universal Time.
developer_org_id	String	The identifier for the consumer organization that owns the application.
developer_org_name	String	The name of the consumer organization that owns the application.
endpoint_url	String	When the request failed, **`endpoint_url`** identifies the proxy or invoke target URL on which the request failed. It is not included with a successful request. On V5 compatible gateway, this field is only populated when the backend server URL that was invoked returns an HTTP 404 code.
env_id	String	The catalog identifier.
env_name	String	The name of the catalog.
event_id	String	Unique ID assigned to the event by the gateway. Generated based on a hashed version of the **`datetime`**, **`transaction_id`**, and **`client_id`** fields combined by using the SHA1 algorithm.
gateway_geoip.area_code	Number	The public switched telephone network (PSTN) area code of the gateway, as identified from its IP address.
gateway_geoip.asn	Number	Autonomous system number of client IP address.
gateway_geoip.as_org	String	
gateway_geoip.city_name	String	The city name of the gateway, as identified from its IP address.
gateway_geoip.continent_code	String	The two-letter continent code of the gateway, as identified from its IP address.
gateway_geoip.continent_name	String	The continent name of the gateway, as identified from its IP address.
gateway_geoip.country_code2	String	The two-letter country code of the gateway, as identified from its IP address.
gateway_geoip.country_code3	String	The three-letter country code of the gateway, as identified from its IP address.
gateway_geoip.country_name	String	The country name of the gateway, as identified from its IP address.
gateway_geoip.dma_code	Number	The Designated Market Area (DMA) code of the gateway, as identified from its IP address.
gateway_geoip.domain	String	The domain of the gateway IP address.
gateway_geoip.ip	String	The IP address of the gateway.
gateway_geoip.isp	String	The internet service provider of the gateway.
gateway_geoip.latitude	Number	The latitude of the gateway location, as identified from its IP address.
gateway_geoip.location	String	The longitude and latitude of the gateway location (separated by a comma), as identified from its IP address.
gateway_geoip.location.lat	Number	The latitude of the gateway location, as identified from its IP address.

Field name	Type	Description
gateway_geoip.location.long	Number	The longitude of the gateway location, as identified from its IP address.
gateway_geoip.longitude	Number	The longitude of the gateway location, as identified from its IP address.
gateway_geoip.organization	String	The gateway's organization, as identified from its IP address.
gateway_geoip.postal_code	String	The postal code of the gateway, as identified from its IP address.
gateway_geoip.region_name	String	The abbreviated form of the region that corresponds to the IP address of the gateway.
gateway_geoip.region_iso_code	String	The ISO code of the gateway's region, as identified from its IP address.
gateway_geoip.timezone	String	The time zone of the gateway, as identified from its IP address.
gateway_host	String	Gateway hostname (not set for all gateway types
gateway_ip	String	The IP address of the gateway.
gateway_port	Integer	Gateway port number (not set for all gateway types)
gateway_service_name	String	The name of the DataPower API gateway service. Configured by the cloud admin user when registering the gateway service. Only available on DataPower API Gateway v10.5.3 or higher.
gateway_time_to_serve_request	Float	The time taken to process this API request (total time to serve request - backend time to serve request) in the gateway
gateway_type	String	The type and version of the gateway that processed the call, in format: **`type`**/**`version`**. Set by all gateway types except for v5c, and only available on v10.0.8.0 or higher.
global_transaction_id	String	The DataPower global transaction ID. See https://www.ibm.com/docs/en/datapower-gateway/latest?topic=variables-varserviceglobal-transaction-id-servicevarsglobaltransactionid.
graphql_request_field_cost	Number	GraphQL APIs only. The maximum cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_request_max_nesting	Number	GraphQL APIs only. The maximum nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_request_top_field_counts	Object	GraphQL APIs only. The maximum number of times that a query can retrieve each field. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_request_top_type_counts	Object	GraphQL APIs only. The maximum number of times that a query can retrieve an object of each type. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_request_type_cost	Number	GraphQL APIs only. The maximum cost of all types retrieved in the query. The cost of each type is configured in the schema.
graphql_response_field_cost	Number	GraphQL APIs only. The cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_response_max_nesting	Number	GraphQL APIs only. The nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are considered nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_response_top_field_counts	Object	GraphQL APIs only. The number of times that each field was retrieved by the query. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_top_type_counts	Object	GraphQL APIs only. The number of times that an object of each type was retrieved by the query. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_type_cost	Number	GraphQL APIs only. The cost of all types that were retrieved in the query. The cost of each type is configured in the schema.
host	String	The hostname or IP address of the ingestion node that received the API event.
http_user_agent	String	The value of the User Agent header on the inbound request.
immediate_client_ip	String	The client IP address that is directly in front of the gateway. Usually **`immediate_client_ip`** is the IP of a load balancer.
latency_info.started	Number	The time delay (in milliseconds) between when the request was received and when the gateway started the corresponding task. Starting a task comprises multiple steps to prepare for executing an API; for example, completing the TCP/TLS handshake, verifying an app's client ID and secret, and matching the request URI to a catalog, API, and Plan. When the gateway receives a request, the "Start" duration is set to 0. The duration of each step within the Start task is then added up, and the total represents the duration of the Start task.
latency_info.task	String	The API transaction that was processed.
log_policy	String	The defined logging policy. Values include none, event, headers, and payload.
opentracing_info	Object	Opentracing information used in AI test generation calls in cp4i
operation_path	String	The path of the API request as would match the path in the open API documen
org_id	String	The identifier for the provider organization that owns the API and associated Products.
org_name	String	The name of the provider organization that owns the API and associated Products.

Field name	Type	Description
path_id	String	The path identifier
plan_id	String	The Plan identifier.
plan_name	String	The name of the Plan. Note: The property is set to **`undefined`** when a client ID is not used or is invalid on the API. The gateway needs a client id to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked because a single API can belong to multiple products (each of which have multiple plans and apps that are subscribed to those plans with client IDs).
plan_version	String	The version number of the Plan.
product_id	String	The product identifier
product_name	String	The Product name. Note: The property is set to **`undefined`** when a client ID is not used or is invalid on the API. The gateway needs a client ID to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app wasinvoked because a single API can belong to multiple products (each of which have multiple plans and apps that are subscribed to those plans with client IDs).
product_title	String	The title of the Product.
product_ref	String	The product reference (product_name:product_version)
product_version	String	The version number of the Product.
query_string	String	The URL query string value on the inbound request.
rate_limit.count	Number	The number of API calls remaining in the specified rate limit time window.
rate_limit.limit	Number	The maximum number of requests an application is allowed to make to the API during a specified time window.
rate_limit.period	Number	The time window that is used to set a rate limit for API calls.
rate_limit.reject	String	An indication of whether calls that exceed the specified rate limit are rejected. If true, the API call is rejected with a 429 status code. If false, a record is created in the Activity log.
rate_limit.shared	String	An indication of whether the rate limit is shared at a Plan level by all operations, or whether a rate limit is specified on indivIDual operations.
request_body	String	The body of the inbound request.
request_http_headers.*field_name*	String	A component of the HTTP header section of the inbound request; for example, the acceptable encodings, the identification string for the user agent, or the proxies through which the request was sent. Note: The following types of headers are considered sensitive and do not show in analytics data for security reasons: • Any secret key configured in the API security • Any header that contains **`secret`** • Any header that contains **`Authorization`**
request_method	String	The method of the inbound request.
request_protocol	String	The protocol of the inbound request.
resource	String	The name of the operation.
resource_id	String	The operation identifier.
resource_path	String	The operation path.
response_body	String	The body of the outbound response.
response_http_headers.*field_name*	String	A component of the HTTP header section of the outbound response; for example, the MIME type of the content or the data and time when the message was sent.
space_id	String	The space identifier for products published to a space
space_name	String	The space name for products published to a space
status_code	String	The status code set on the outbound response.
time_to_serve_request	Number	The time elapsed (in milliseconds) from when the gateway received the request to when it sent a response.
transaction_id	String	The identifier for the API transaction. See https://www.ibm.com/docs/en/datapower-gateway/latest?topic=variables-varservicetransaction-id-servicevarstransactionid.
uri_path	String	The URI path on the inbound request.
user_agent	Object	The parsed contents of the **`http_user_agent`** field, which contains information about the user that made the API call.
user_agent.device	String	Device name.
user_agent.major	String	User agent major version number.
user_agent.minor	String	User agent minor version number.
user_agent.name	String	User agent name.
user_agent.os_full	String	Detected operating system full name.
user_agent.os_major	String	Detected operating system major version number.
user_agent.os_minor	String	Detected operating system minor version number.
user_agent.os_name	String	Detected operating system name.

Field name	Type	Description
user_agent.os_patch	String	Detected operating system patch version.
user_agent.os_version	String	Detected operating system version.
user_agent.patch	String	User agent patch version.
user_agent.version	String	Detected user agent version.
api_type	String	Specifies the type of API that the event is associated with. Supported values are `rest`, `soap` and `graphql`. Note: The `v5c` `gateway` does not send this field, but the `API Gateway` and `Converged Gateway` support it.

Note:

- To ensure the value in the `client_geoip` field is accurate, the gateway must receive the `X-Forwarded-For` header in all API calls. Check with the administrator of your deployment environment to ensure that the `X-Forwarded-For` header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the `X-Forwarded-For` header: NGINX Configuration "use-forwarded-headers".

  The geoIP feature is useful with internet routable IP addresses only. For instance, 192.168.x.x and 10.x.x.x IP addresses, being internal private IP addresses, cannot be resolved to a geographical location.

- Not all fields are present on all events. Some fields are specific to certain types of APIs, while others are sent only by specific gateway types or versions.

Example API event record with payload logging set

Summary API event record field reference

Summary API event records are retained for longer durations than individual event records.

Summary API event record fields

Table 1 shows examples of the fields that are stored in a Summary API event record.

Table 1. API event record fields

Field name	Type	Description
api_ref	String	The API reference (api_name:api_version)
app_name	String	The name of the registered application. Note: The property is set to **undefined** when a client ID is not used or is invalid on the API. The gateway needs a client ID to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is cannot determine which plan, product, or app was invoked. This is because a single API can belong to multiple products, each of which have multiple plans and apps that are subscribed to those plans with client IDs.
bytes_received	Number	The number of bytes received from the consumer in the request.
bytes_sent	Number	The number of bytes sent to the consumer in the response.
catalog_name	String	The name of the catalog
datetime	Date	A timestamp that records when the API was invoked. The timestamp is always shown in Coordinated Universal Time.
developer_org_name	String	The name of the consumer organization that owns the application.
gateway_service_name	String	The name of the DataPower® API gateway service. Configured by the cloud admin during gateway service registration. Only available on DataPower API Gateway v10.5.3 or higher.
org_name	String	The name of the provider organization that owns the API and associated Products.
plan_id	String	The Plan identifier.
product_ref	String	The product reference (product_name:product_version)
space_name	String	The space name for products that are published to a space
status_code	String	The status code set on the outbound response.
summary_event_id	String	Unique ID assigned to the event
time_to_serve_request	Number	The time elapsed (in milliseconds) from when the gateway received the request to when it sent a response

Example Summary Event Record

```
{
            "api_ref": "switch-api:1.0.0",
            "app_name": "api-connect-app-4",
            "bytes_received": 888,
            "bytes_sent": 9177,
```

```
            "catalog_name": "api-connect-catalog-1",
            "datetime": "2025-06-11T04:00:00.000Z",
            "developer_org_name": "api-connect-emard-greenholt-awesome-fantastic-soft-sausages-consumer-organization",
            "gateway_service_name": "v6gw",
            "org_name": "ibm",
            "plan_id": "api-connect-crooks-group-luxurious-tasty-rubber-chair-product:1.0.0:default-plan",
            "product_ref": "api-connect-crooks-group-luxurious-tasty-rubber-chair-product:1.0.0",
            "space_name": null,
            "status_code": "201 Created",
            "summary_event_id": "A11ybP3Dnla5jttwIQuGjA",
            "time_to_serve_request": 571
        }
```

Use the following operations to retrieve analytics summary event data with the API Connect Analytics REST API:

Table 2. Operations to retrieve analytics summary event data

Operation	Description
`GET /summary`	This operation returns a list of summary event records.
`GET /summary/:id`	This operation returns a specific summary event record by its unique ID.
`GET /summary/count`	This operation returns the total number of summary event records.

Note: These operations are also present within the Analytics CLI in Toolkit.

Advanced configuration options

Configure advanced features and settings such as offload, retention period, and dedicated storage.

- **Dedicated storage and scaling up**
  Use dedicated storage for improved performance, stability, and scalability. Available on Kubernetes and OpenShift. Not available on VMware.
- **Retention and rollover**
  Manage how long your analytics subsystem stores data.
- **Logstash persistent queue**
  Configuring the Logstash persistent queue feature.
- **Offload to third-party systems**
  Offload your API event data for storage on a third-party system.
- **Replicating analytics data to a 2DCDR warm-standby data center**
  If you have a two data center warm-standby deployment, you can configure the analytics subsystem in your active data center to offload incoming API event records to the analytics subsystem in your warm-standby data center.
- **Disable local storage**
  If you are offloading you API event data to a third-party system, you can disable local storage to reduce subsystem resource requirements.
- **Shutting down the analytics subsystem**
  Disable the analytics service and shutdown the analytics subsystem.
- **Restarting analytics pods**
  How to restart the analytics pods in your API Connect deployment.
- **Enable Amazon SNS for Engagement**
  To enable Amazon SNS for Engagement, you must create the AWS client secret and reference the secret in the analytics custom resource YAML file.
- **Change deployment profile**
  Change your deployment profile to switch between one replica and three replica deployments, or to change the computing resources available for your subsystem.
- **Configuring TLS validation mode for engagement destinations**
  Configure the TLS validation mode for engagement destinations to allow or block connections to endpoints with untrusted certificates.
- **Performance tuning with ingestion pipeline properties**
  Fine tune your ingestion pipeline settings for optimal performance.

Dedicated storage and scaling up

Use dedicated storage for improved performance, stability, and scalability. Available on Kubernetes and OpenShift. Not available on VMware.

Note: Storage type selection is available on three replica deployments only.
To make an informed choice on which storage type is best for you, first read and understand the OpenSearch concepts that are described in OpenSearch nodes, indices, shards, and replicas.
API Connect provides two OpenSearch storage types:

- **Shared storage**
  A single pod provides data storage and OpenSearch cluster management. Shared storage is the only option on a one replica deployment.

- **Dedicated storage**
  OpenSearch data storage and cluster management functions are split, and run in separate pods on each worker node:
  - The `storage-os-master` pod runs an OpenSearch "manager eligible" node that manages the OpenSearch cluster, but does not store any API event data.
  - The `storage` pod runs an OpenSearch "data" node that stores API event data.

  Dedicated storage is the default storage type for three replica deployments.

Dedicated storage facilitates horizontal scaling to support greater analytics data storage and throughput. Add worker nodes and increase the number of `storage` pod replicas to scale horizontally (you do not need to increase the number of `storage-os-master` replicas). Dedicated storage also provides greater stability and allows some OpenSearch configuration changes to be made without downtime.
Note: For OpenShift® users: The example steps in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the `APIConnectCluster` CR (the top-level CR), instead of directly editing the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the `APIConnectCluster` CR.
The storage type is defined in the analytics CR, in the `spec.storage.type` section as follows:

- Shared storage:

```
storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
```

- Dedicated storage:

```
storage:
  type: dedicated
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
  master:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
```

Note: When scaling up dedicated storage, existing Persistent Volume Claims (PVCs) should be retained. No configuration or data loss occurs, and reconfiguring analytics from scratch is not required.

Changing from shared to dedicated storage

1. Edit your analytics CR:

   `kubectl -n <namespace> edit a7s`

2. Change storage type to dedicated:

```
  storage:
    type: dedicated
```

3. If your environment does not have a default storage class, or want to use a different storage class for your `storage-os-master` pods, then also add the `spec.storage.master` section to specify the storage class, for example:

```
  storage:
    type: dedicated
...
    master:
      volumeClaimTemplate:
        storageClassName: local_storage
```

Changing from dedicated to shared storage

1. Edit your analytics CR:

   `kubectl -n <namespace> edit a7s`

2. Change storage type to shared:

```
  storage:
    type: shared
```

3. Wait until all of your `storage` pods restart and are in the `Ready` state.
4. Edit your analytics CR and remove the `spec.storage.master` section.
5. Delete the `data-analytics-storage-os-master` PVCs:

   `kubectl -n <namespace> delete pvc data-analytics-storage-os-master-<integer>`

Horizontal scaling with dedicated storage

To take advantage of the horizontal scaling options with dedicated storage, see Horizontal scaling of storage pods.

Horizontal scaling of storage pods

Scale your storage pod replicas for increased API event data storage and throughput.

To take advantage of storage pod scaling, you must have a three replica deployment, and be using dedicated storage, see Dedicated storage and scaling up.

Note:

- The term "replica" when used with "data storage pod" refers to the Kubernetes storage pod, not OpenSearch replicas. OpenSearch replica settings are not configurable in API Connect.
- The OpenSearch term "node" refers to OpenSearch data storage nodes. OpenSearch nodes have a one-to-one relationship with the API Connect storage pod replicas, and have the same name.

This operation requires the use of the Analytics CLI.

Increase number of storage pod replicas

1. Edit your analytics CR:

```
kubectl -n <namespace> edit a7s
```

2. Add the following to the `spec:` section:

```
  template:
  - name: storage
    replicaCount: <new replica count>
```

where *<new replica count>* must be less than or equal to the number of worker nodes you have available.

3. Wait for the new storage pod replicas to start on your new worker nodes, and for the analytics cluster to rebalance your API event data to use your new replicas. The time the rebalancing takes depends on the size of your API event data and the network transmission speed between worker nodes. You can check the rebalancing status with the CLI health command:

```
apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
--format json
```

where:

- `<platform api endpoint>` is the platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

When rebalancing is complete, the `number_of_data_nodes` matches your updated `replicaCount`, and the highlighted `_shards` properties are all zero, as shown:

```
{
   "cluster_name":"apic-analytics-cluster",
   "status":"green",
   "timed_out":false,
   "number_of_nodes":8,
   "number_of_data_nodes":5,
   "discovered_master":true,
   "discovered_cluster_manager":true,
   "active_primary_shards":8,
   "active_shards":24,
   "relocating_shards":0,
   "initializing_shards":0,
   "unassigned_shards":0,
   "delayed_unassigned_shards":0,
   "number_of_pending_tasks":0,
   "number_of_in_flight_fetch":0,
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Note: If in the past you increased and then reduced the number of data storage replicas in your deployment, you might have an OpenSearch exclude list that contains the names of the previous replicas you removed. New storage pod replicas cannot be created if their name is in the OpenSearch exclude list. To empty the OpenSearch exclude list, follow the same steps that you used to create it: Create exclude list, but set `persistent.cluster.routing.allocation.exclude._name` to an empty string.

Reduce number of storage pod replicas

1. Verify that your analytics cluster health is green. Use the analytics CLI health command:

```
apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
--format json
```

where:

- `<platform api endpoint>` is the platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

Check that the status property is green:

```
{
   "cluster_name":"apic-analytics-cluster",
   "status":"green",
   "timed_out":false,
   "number_of_nodes":8,
   "number_of_data_nodes":5,
   "discovered_master":true,
   "discovered_cluster_manager":true,
   "active_primary_shards":8,
   "active_shards":24,
   "relocating_shards":0,
   "initializing_shards":0,
   "unassigned_shards":0,
   "delayed_unassigned_shards":0,
   "number_of_pending_tasks":0,
   "number_of_in_flight_fetch":0,
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Do not proceed if the status is not green.

2. Replicas are removed by reducing the Kubernetes `replicaCount` in the analytics CR. When `replicaCount` is reduced, the replicas that are deleted are always the highest numbered replicas. For example:

```
kubectl get pods | grep storage
```

```
NAME                                    READY   STATUS      RESTARTS   AGE
analytics-storage-0                     1/1     Running     0          140d
analytics-storage-1                     1/1     Running     0          140d
analytics-storage-2                     1/1     Running     0          140d
analytics-storage-3                     1/1     Running     0          140d
analytics-storage-4                     1/1     Running     0          140d
```

If you reduce **replicaCount** from 5 to 3, the two replicas that are deleted are **analytics-storage-3** and **analytics-storage-4**.
Before you reduce the **replicaCount**, you must ensure that replicas to be deleted contain no API event data. To make OpenSearch relocate all API event data to the replicas you are keeping, add the replicas that you want to delete to the OpenSearch exclude list:

a. Export the current analytics cluster settings to a JSON file:

```
apic -m analytics clustermgmt:getSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json > a7s_cluster_settings.json
```

This command creates a file called a7s_cluster_settings.json in your current directory.

b. Edit the a7s_cluster_settings.json file, and set the **persistent.cluster.routing.allocation.exclude._name** property to a comma-separated list of replicas you plan to remove. For example:

```
{
    "persistent": {
        "cluster": {
            "routing": {
                "allocation": {
                    "exclude": {
                        "_name": "analytics-storage-3,analytics-storage-4"
                    }
                }
            }
        },
        "plugins": {
            "index_state_management": {
                "metadata_migration": {
                    "status": "1"
                },
                "template_migration": {
                    "control": "-1"
                },
                "history": {
                    "enabled": "false"
                }
            }
        }
    },
    "transient": {}
}
```

You might need to add the **cluster.routing.allocation.exclude** structure if this property has not been set before.

c. Apply the updated a7s_cluster_settings.json file:

```
apic -m analytics clustermgmt:putSettings --server <platform api endpoint> --analytics-service <analytics service name> a7s_cluster_settings.json --format json
```

3. Wait for your analytics cluster to remove all data from the replicas you want to delete, which you specified in step 2. You can check that the data rebalancing is complete with the **clustermgmt:catAllocation** CLI command:

```
apic -m analytics clustermgmt:catAllocation --server <platform api endpoint> --analytics-service <analytics service name> --format json --return_format json
```

Replicas that don't have data appear as entries with a **shards** value of zero in the output (you can ignore the **disk.*** properties):

```
[
  {
    "shards": "5",
    "disk.indices": "113.3kb",
    "disk.used": "27.3gb",
    "disk.avail": "222.5gb",
    "disk.total": "249.8gb",
    "disk.percent": "10",
    "host": "192.168.87.226",
    "ip": "192.168.87.226",
    "node": "analytics-storage-0"
  },
  {
    "shards": "0",
    "disk.indices": "0",
    "disk.used": "36.9kb",
    "disk.avail": "212.9kb",
    "disk.total": "249.8kb",
    "disk.percent": "1",
    "host": "192.168.64.225",
    "ip": "192.168.64.225",
    "node": "analytics-storage-3"
  },
  {
    "shards": "5",
    "disk.indices": "16.8kb",
    "disk.used": "28.2gb",
    "disk.avail": "221.6gb",
    "disk.total": "249.8gb",
    "disk.percent": "11",
    "host": "192.168.112.227",
    "ip": "192.168.112.227",
    "node": "analytics-storage-1"
  },
  {
    "shards": "5",
    "disk.indices": "23.3kb",
```

```
    "disk.used": "29.3gb",
    "disk.avail": "220.4gb",
    "disk.total": "249.8gb",
    "disk.percent": "11",
    "host": "192.168.24.102",
    "ip": "192.168.24.102",
    "node": "analytics-storage-2"
  },
  {
    "shards": "0",
    "disk.indices": "0",
    "disk.used": "35.4kb",
    "disk.avail": "214.4kb",
    "disk.total": "249.8kb",
    "disk.percent": "1",
    "host": "192.168.91.149",
    "ip": "192.168.91.149",
    "node": "analytics-storage-4"
  }
]
```

The time rebalancing takes depends on the size of your API event data and the network transmission speed between pod replicas.
Note: The value in the `node` property of the `clustermgmt:catAllocation` output is the same as the names of the Kubernetes storage pod replicas.

4. Verify that your analytics cluster health is green. Use the analytics CLI health command:

```
apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
--format json
```

where:

- `<platform api endpoint>` is the platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

Check that the status property is green:

```
{
   "cluster_name":"apic-analytics-cluster",
   "status":"green",
   "timed_out":false,
   "number_of_nodes":8,
   "number_of_data_nodes":5,
   "discovered_master":true,
   "discovered_cluster_manager":true,
   "active_primary_shards":8,
   "active_shards":24,
   "relocating_shards":0,
   "initializing_shards":0,
   "unassigned_shards":0,
   "delayed_unassigned_shards":0,
   "number_of_pending_tasks":0,
   "number_of_in_flight_fetch":0,
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Do not proceed if the status is not green.

5. Edit your analytics CR:

```
kubectl -n <namespace> edit a7s
```

6. Update the `replicaCount`:

```
  template:
  - name: storage
    replicaCount: <new replica count>
```

where *<new replica count>* is the reduced number of replicas that you want.
Note: If the `replicaCount` property does not exist in the analytics CR, check that you are not attempting to reduce `replicaCount` to 2. Reducing `replicaCount` to less than 3 is not a supported operation.

7. Monitor the health status of your analytics cluster with the CLI health command:

```
apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
--format json
```

where:

- `<platform api endpoint>` is the platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

Confirm that the `status` is `green`, the `number_of_data_nodes` matches your updated `replicaCount`, and that the highlighted shard properties are all zero:

```
{
   "cluster_name":"apic-analytics-cluster",
   "status":"green",
   "timed_out":false,
   "number_of_nodes":6,
   "number_of_data_nodes":3,
   "discovered_master":true,
   "discovered_cluster_manager":true,
   "active_primary_shards":8,
   "active_shards":24,
   "relocating_shards":0,
   "initializing_shards":0,
   "unassigned_shards":0,
   "delayed_unassigned_shards":0,
   "number_of_pending_tasks":0,
   "number_of_in_flight_fetch":0,
```

```
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Retention and rollover

Manage how long your analytics subsystem stores data.

Each API event is recorded as a document in an OpenSearch index. When this index reaches a maximum size or age it is archived, and a new index is created for recording new API events. This is known as index rollover. When an archived index reaches a maximum age, which is known as the data retention maximum, it is deleted. You can specify the index rollover size and the data retention period in the Cloud Manager UI.

For more information about OpenSearch indices, see OpenSearch nodes, indices, shards, and replicas.
Note: If a rollover is in the *failed* state for more than 36 hours, an automated forced rollover is attempted. If this attempt is unsuccessful, the following error message is displayed in the analytics director pod logs:

```
Error triggering forced rollover
```

To learn more about OpenSearch indices, see OpenSearch nodes, indices, shards, and replicas.

The index rollover settings determine how long an index accumulates data before it "rolls over" and a new index is created. You can control the duration of an index two ways: by setting a maximum age for the index (default is 1 day), or by setting a maximum number of documents that can be recorded in the index (default is 25 million documents). When the rollover occurs, a new index is created for new API events to be stored in, while the previous index is archived and kept until its age exceeds the data retention setting. If you change the rollover settings, consider both the amount of data to be stored within each index and the total number of indices. Allowing indices to grow too large, or storing too many indices, can cause performance problems.

The data retention setting determines how long the stored indices are retained. When an index's creation date exceeds the retention period, that index and all its data is deleted.
Note: It is the creation date of the index that is used to determine retention, not the age of the newest record in the index.
The default retention period depends on the deployment profile, as shown in the following table:

Table 1. Default analytics retention periods

Profile	Retention (days)
n1xc2.m16	3
n1xc4.m32	30
n1xc6.m48	45
n3xc4.m16 - DEPRECATED	2
n3xc4.m32	30
n3xc6.m48	45
n3xc8.m64	45

Reasons for changing this setting might include storage constraints, and the data retention requirements for your organization. You might want to set this value to be less than the default if you have a high transaction load and limited persistent storage space, especially if payload logging is enabled on many of your APIs. Increasing the retention period above the default is not recommended, if you want to store your analytics data for longer, then Offload to third-party systems.
The most recently created index (the index that is currently being written to) is not deleted, even if you set the retention period as small as 1 hour. If you regularly need to delete data quickly, adjust the index rollover so that a new index is rolled over to sooner, and the old index can be deleted.

Before an index is deleted, the API event data in the index is summarized and stored in a separate summary index to provide long-term data. The summary index has a separate retention setting, which is set to one year by default.

Note: The rollover and retention settings have a significant impact on the memory that is required by the analytics subsystem. If rollover is set to higher than one day, then more analytics data can be stored before a performance deterioration is observed. However, a higher rollover setting has the disadvantage that more data is deleted when an index reaches the retention age. For example, if you set your rollover period to seven days and you have the default 90-day retention period, then when your oldest index reaches the 90 days since it was created, it is deleted and you are left with 83 days of API event data.
To view and update the rollover and retention settings, use the Cloud Manager UI.

1. From the Cloud Manager UI, click Topology.
2. Select the Analytics Service you want to view or edit.
3. Click Advanced settings.

Alternative method using the Analytics CLI.

1. View the current retention and rollover settings by using the `clustermgmt:getStorageSettings` analytics CLI command:

   ```
   apic -m analytics clustermgmt:getStorageSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json
   ```

   - `<platform api endpoint>` is the platform API endpoint.
   - `<analytics service name>` is the name of analytics service as configured in the Cloud Manager UI.
2. To update the retention and rollover settings create a JSON file that is called `retention_and_rollover_settings.json`, paste in the output from step 1 and set the retention and rollover setting as required. Apply these new settings with: `clustermgmt:putStorageSettings`

   ```
   apic -m analytics clustermgmt:putStorageSettings --server <platform api endpoint> --analytics-service <analytics service name> retention_and_rollover_settings.json
   ```

   - `<platform api endpoint>` is the platform API endpoint.
   - `<analytics service name>` is the name of analytics service as configured in the Cloud Manager UI.

Note:
If the retention or rollover process fails, the Cloud Manager and API Manager UIs show the following error message:

Error: Analytics internal storage rollover might be experiencing problems. Contact your system administrator to investigate further. Rollover failure means that data retention is not correctly enforced and storage usage continues to grow which can eventually lead to service shutdown.

If you see this error, then open a support case.

Logstash persistent queue

Configuring the Logstash persistent queue feature.

The Logstash persistent queue provides enhanced reliability in the data pipeline. The ingestion pod buffers incoming API event data to persistent storage so that no events are lost if the downstream local storage pods or offload targets are temporarily unavailable.

For example, when you restart the analytics storage pods they take a few seconds to be able to receive API event data. While the storage pods are restarting, incoming API events are held in the persistent queue until the storage pods are available again. If the storage pods are unavailable and persistent queue is not enabled, then new API event data is lost during the storage pod outage.

If you find you are missing API event records, it is possible that the default persistent queue size is insufficient. This topic provides the steps to increase your persistent queue size.

Note: For OpenShift® users: The example steps in this topic use the Kubernetes **`kubectl`** command. On OpenShift, use the equivalent **`oc`** command in its place. If you are using a top-level CR you must edit the **`APIConnectCluster`** CR (the top-level CR), instead of directly editing the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the **`APIConnectCluster`** CR.

Customizing the persistent queue size

By default the size of the persistent queue is 8 Gi. If you want to change this size then follow these steps according to your platform:
Note: The configuration of the size of the persistent queues is supported only on API Connect 10.0.8.1 and later.

1. Calculate the storage space required based on the queue size you want to set.
   - Local storage enabled and no offload configured: **`2 x queue size + 5 Gi`**.
   - Local storage enabled and one offload target configured: **`3 x queue size + 5 Gi`**.
   - Local storage enabled and two offload targets configured: **`4 x queue size + 5 Gi`**.
   - Local storage disabled and one offload target configured: **`2 x queue size + 5 Gi`**.
   - Local storage disabled and two offload targets configured: **`3 x queue size + 5 Gi`**.

   Note: Disabling local storage and having no offload configured would require **`1 * queue size + 5 Gi`**, but this configuration makes no sense as it means no analytics data is recorded anywhere.
2. Check if the required storage exceeds the current value of **`ingestion.queue.volumeClaimTemplate.volumeSize`**. By default this is 50 Gi, so if you are increasing the queue size above 11 Gi, then you must increase storage.
   On Kubernetes and OpenShift you can check this by looking at the analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

   On VMware, check in your analytics-extra-values.yaml file. If this file does not exist, or does not contain **`ingestion.queue.volumeClaimTemplate.volumeSize`**, then it is still set to the 50 Gi default.

3. If you need more storage than you have defined in **`ingestion.queue.volumeClaimTemplate.volumeSize`**, then follow these steps:
   Note: Increasing the ingestion storage size causes analytics ingestion downtime. No incoming API event data is stored or offloaded while you complete these steps.
   a. VMware: Login to one of you analytics VMs and switch to root user:

      ```
      ssh apicadm@<analytics VM>
      ```

      ```
      sudo -i
      ```

   b. Scale down the ingestion pods to 0 replicas.
      Identify the name of the ingestion **`StatefulSet`**:

      ```
      kubectl get sts | grep ingestion
      ```

      Set ingestion replicas to zero:

      ```
      kubectl scale sts <ingestion statefulset> --replicas=0
      ```

   c. Delete the ingestion pod PVCs.
      Identify the ingestion pod PVCs:

      ```
      kubectl get pvc | grep ingestion
      ```

      Delete all ingestion PVCs:

      ```
      kubectl delete pvc <name>-analytics-ingestion-<integer>
      ```

   d. Update the analytics CR with the new **`defaultQueueSize`** and **`volumeSize`**:

      ```
      queue:
        type: persisted
        defaultQueueSize: <queue size>Gi
        volumeClaimTemplate:
          ...
          volumeSize: <volumeSize>Gi
      ```

   e. Scale the ingestion pods back up:

      ```
      kubectl scale sts <ingestion statefulset> --replicas=<original number of replicas>
      ```

f. Verify that ingestion pod and PVC are recreated:

```
kubectl get pods | grep ingestion

kubectl get pvc | grep ingestion
```

g. VMware: Exit from the VM and update analytics-extra-values.yaml to contain your new settings:

```
ingestion:
  queue:
     type: persisted
     defaultQueueSize: <queue size>Gi
     volumeClaimTemplate:
        storageClassName: local-storage
        volumeSize: <volumeSize>Gi
```

You do not need to apply this change with **apicup** because you already made the update within the VM. The update of analytics-extra-values.yaml is to ensure that the next time **apicup subsys install** is run, it does not overwrite your ingestion configuration with old settings.

4. If you have sufficient storage defined in `ingestion.queue.volumeClaimTemplate.volumeSize`, then follow these steps:
   - **Kubernetes, Openshift, and Cloud Pak for Integration:** Edit your analytics CR:

     ```
     kubectl -n <namespace> edit a7s
     ```

     Add the `spec.ingestion.queue.defaultQueueSize` property to your analytics CR, and set the `volumeClaimTemplate.volumeSize` appropriately. For example:

     ```
     queue:
       type: persisted
       defaultQueueSize: <queue size>Gi
       volumeClaimTemplate:
         ...
         volumeSize: <volumeSize>Gi
     ```

   - **VMware:** Configure the persistent queue size in the analytics-extra-values.yaml file.
     - From your project directory, open the analytics-extra-values.yaml file for editing. If this file does not exist, then create it: Analytics extra-values file.
     - Add the following text to the file, inside the `spec` object:

       ```
       ingestion:
         queue:
            type: persisted
            defaultQueueSize: <queue size>Gi
            volumeClaimTemplate:
               storageClassName: local-storage
               volumeSize: <volumeSize>Gi
       ```

     - Ensure that your `extra-values-file` property is set to point to your analytics-extra-values.yaml file:

       ```
       apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
       ```

     - Apply the analytics-extra-values.yaml to your analytics subsystem:

       ```
       apicup subsys install <analytics subsystem>
       ```

Important points:

1. `defaultQueueSize` is optional. If not specified it defaults to 8 Gi.
2. `defaultQueueSize` must be specified in Gi, and must be an integer.
3. The minimum value for `defaultQueueSize` 8 Gi.
4. The maximum value for `defaultQueueSize` 100 Gi.
5. The `ingestion.queue.volumeClaimTemplate.volumeSize` must be at least 30 GI, the recommended and default value is 50 Gi.

Offload to third-party systems

Offload your API event data for storage on a third-party system.

The analytics event data that is sent from the gateway to analytics can be offloaded to a third-party system in real time. The third-party system can provide enhanced monitoring, alerting, storage, and analysis, in addition to what the built-in analytics subsystem provides. Multiple target systems are supported, and the data can be modified before offloading.

APIC supports offloading analytics data to the following third-party systems:

- HTTP endpoints
- OpenSearch
- Elasticsearch
- Apache Kafka
- Syslog servers

You can configure two offload targets that run in parallel. If you want to offload to more than two targets, you can append additional targets to your second offload target configuration.

If you do not need internal storage and want to use only the third-party system for working with your analytics data, consider disabling internal storage entirely as explained in Disable local storage.

- **Configuring offload on Kubernetes and OpenShift**
  Configure your analytics subsystem to offload API event data to a third-party system.

- **Configuring offload on VMware**
  Configure your VMware analytics subsystem to offload API event data to a third-party system.
- **Sample output plugins for offloading data**
  Review sample output plugins to see how to code your own plugins for offloading data from API Connect analytics.
- **Using offloaded analytics data to train AI models**
  How to use API Connect analytics data to train AI models.
- **Troubleshooting offload**
  Checks to help determine the cause of offload failure.

Configuring offload on Kubernetes and OpenShift

Configure your analytics subsystem to offload API event data to a third-party system.

Procedure

1. Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   Note: If you are using the OpenShift® top-level CR deployment, edit your `APIConnectCluster` CR instead. Updates should be made in the `spec.analytics` section.
2. Set `spec.external.offload` to true, and add the offload plugin configuration:
   The following example shows an HTTP output plugin:

   ```
   spec:
     external:
       offload:
         enabled: true
         output: |
           http {
             url => "https://example.com"
             http_method => "post"
             ssl_verification_mode => "none"
             id => "API Connect analytics event data"
           }
   ```

   In this example, the URL points to an HTTPS endpoint, but verification of the endpoint's server certificate is disabled by setting `ssl_verification_mode` to "none". If you want your analytics subsystem to verify the endpoint server certificate, then see Configuring offload server certificates on Kubernetes and OpenShift.

   The `id` property is not mandatory, but it is recommended.

   For more information about the HTTP output plugin configuration, see the Logstash HTTP plugin documentation.

3. Optional: Add a `filter` after the output plugin configuration to modify data before it is sent to the offload target.
   The following example filter removes the `query_string` field:

   ```
   spec:
     external:
       offload:
         enabled: true
         output: |
           http {
             ...
           }
         filter: |
           ruby {
             remove_field => ["query_string"]
           }
   ```

   For information about modifying offloaded data, see Customizing data with ingestion filters.
4. Optional: To configure a second offload target, create a new `spec.external.offload2` section and add the configuration for this second target to this section.
   If you have three or more offload targets, then you can put multiple configurations in `spec.external.offload2`. For example:

   ```
   spec:
     external:
      offload:
         enabled: true
         output: |
           http {
             url => "https://target1.com"
             ...
           }
       offload2:
         enabled: true
         output: |
           http {
             url => "https://target2.com"
             ...
           }
         output: |
           http {
             url => "https://target3.com"
             ...
         }
   ```

Note: Multiple offload targets defined in `spec.external.offload2` are run in series. If offload to the first target in `offload2` fails, then subsequent offloads are not run. Define your most important offload target first.

5. If you want to offload API events or audit events selectively, use the offload filters as follows:
   Note: If API Connect is configured to send audit events to a registered analytics service and if offload filters are not used, the default offload includes both API events and audit events. When filter is used to offload a specific event, the offload includes only that event and all other events are discarded.
   a. To offload only API events, add a `filter` after the output plug-in configuration as in the following example:

   ```
   filter: |
     if "apicapievent" not in [tags] {
       drop {}
     }
   ```

   b. To offload only audit events, add a `filter` after the output plug-in configuration as in the following example:

   ```
   filter: |
     if "audit" not in [tags] {
       drop {}
     }
   ```

6. Save the changes to your analytics CR. The ingestion pods restart automatically.
7. Update your analytics subsystem infrastructure backup with your updated analytics CR. See Backup, restore, and disaster recovery.

- **Configuring offload server certificates on Kubernetes and OpenShift**
  Configure your analytics subsystem to trust your offload endpoint.
- **Configuring offload client certificates on Kubernetes and OpenShift**
  Configuring client keys for analytics offload.

Configuring offload server certificates on Kubernetes and OpenShift

Configure your analytics subsystem to trust your offload endpoint.

Before you begin

You must have the offload target's server certificate in either of these formats:

- Base64 encoded `pem` file.
- JKS file. If you are using a JKS file, encode the contents in Base64:

  ```
  cat <JKS certificate filename> | base64
  ```

  Note: IBM® API Connect does not support .p12 format certificates for analytics. It supports only `PEM` and `JKS` certificate formats.

About this task

The ingestion pod of your analytics subsystem sends your API event data to your offload target. If your offload target uses TLS, then your ingestion pod must be configured to trust the offload target. The steps in this procedure insert the server certificate in the ingestion pod's offload certificates directory, so that the ingestion pod can validate the certificate it receives from the offload endpoint.

Procedure

1. Create a file called analytics_offload_certificates.yaml, and paste in the following contents:
   - If you are using a JKS file, then in the `data` section of the secret, paste the encoded JKS string as shown:

     ```
     apiVersion: v1
     kind: Secret
     metadata:
       name: offload-certificates
     data:
       keystore.jks: "<base64 encoded JKS string>"
     ```

   - If you are using a PEM file, then in the `stringData.cacert` section paste the contents of the PEM file.

     ```
     apiVersion: v1
     kind: Secret
     metadata:
       name: offload-certificates
     stringData:
       cacert: |-
         -----BEGIN CERTIFICATE-----
         MIIDIDCCAomgAwIBAgIENd70zzANBgkqhkiG9w0BAQUFADBOMQswCQYDVQQGEwJVUzEQMA4GA1UE
         ChMHRXF1aWZheDEtMCsGA1UECxMkRXF1aWZheCBTZWN1cmUgQ2VydGlmaWNhdGUgQXV0aG9yaXR5
         MB4XDTk4MDgyMjE2NDE1MVoXDTE4MDgyMjE2NDE1MVowTjELMAkGA1UEBhMCVVMxEDAOBgNVBAoT
         B0VxdWlmYXgxLTArBgNVBAsTJEVxdWlmYXggU2VjdXJlIEN1cnRpZmljYXRlIEF1dGhvcml0eTCB
         nzANBgkqhkiG9w0BAQEFAAOBjQAwgYkCgYEAwV2xWGcIYu6gmi0fCG2RFGiYCh7+2gRvE4RiIcPR
         fM6fBeC4AfBONOziipUEZKzxa1NfBbPLZ4C/QgKO/t0BCezhABRP/PvwDN1Dulsr4R+AcJkVV5MW
         8Q+XarfCaCMczE1ZMKxRHjuvK9buY0V7xdlfUNLjUA86iOe/FP3gx7kCAwEAAaOCAQkwggEFMHAG
         A1UdHwRpMGcwZaBjoGGkXzBdMQswCQYDVQQGEwJVUzEQMA4GA1UEChMHRXF1aWZheDEtMCsGA1UE
         CxMkRXF1aWZheCBTZWN1cmUgQ2VydGlmaWNhdGUgQXV0aG9yaXR5MQ0wCwYDVQQDEwRDUkwxMBoG
         A1UdEAQTMBGBDzIwMTgwODIyMTY0MTUxWjALBgNVHQ8EBAMCAQYwHwYDVR0jBBgwFoAUSOZo+SvS
         spXXR9gjIBBPM5iQn9QwHQYDVR0OBBYEFEjmaPkr0rKV10fYIyAQTzOYkJ/UMAwGA1UdEwQFMAMB
         Af8wGgYJKoZIhvZ9B0EABA0wCxsFVjMuMGMDAgbAMA0GCSqGSIb3DQEBBQUAA4GBAFjOKer89961
         zgK5F7WF0bnj4JXMJTENAKaSbn+2kmOeUJXRmm/kEd5jhW6Y7qj/WsjTVbJmcVfewCHrPSqnI0kB
         BIZCe/zuf6IWUrVnZ9NA2zsmWLIodz2uFHdh1voqZiegDfqnc1zqcPGUIWVEX/r87yloqaKHee95
     ```

```
    70+sB3c4
    -----END CERTIFICATE-----
```

Note: If you have multiple offload targets, then add the certificates for each target with a unique name. For example:

```
stringData:
  certname_target1: |-
    -----BEGIN CERTIFICATE-----
    ...
  certname_target2: |-
    -----BEGIN CERTIFICATE-----
    ...
```

2. Create the **offload-secret** in your analytics namespace, from the analytics_offload_certificates.yaml file.

   ```
   kubectl -n <namespace> apply -f analytics_offload_certificates.yaml
   ```

   Verify that the **offload-secret** was created:

   ```
   kubectl -n <namespace> get secrets
   ```

3. If the output plugin you are configuring supports the use of an offload-secret and you plan to utilize a password-protected keystore to store the CA certificate for the target offload server, create a Kubernetes secret to securely store the keystore's password:

   ```
   kubectl -n <namespace> create secret generic offload-credentials --from-literal=keystore_password='<KeystorePassword>'
   ```

4. Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   Note: If you are using the OpenShift® top-level CR deployment, edit your **APIConnectCluster** CR instead. Updates should be made in the **spec.analytics** section.
5. Add the new property **spec.external.offload.secretName**, and set it to **offload-secret** (the secret you created in step 2).

   ```
   offload:
     enabled: true
     secretName: offload-secret
     output: |
       ...
   ```

   When your ingestion pod restarts, it copies the contents of the offload-secret into its /etc/velox/external_certs/offload directory.

   If you want to use a password-protected keystore, also include the property **spec.offload.passwordSecretName** and set it to offload-credentials (the secret you created in step 3):

   ```
   offload:
     enabled: true
     secretName: offload-secret
     passwordSecretName: offload-credentials
     output: |
       ...
   ```

6. Update your plugin properties to include the path to the server certificate. The property name for the endpoint server certificate depends on your output target. For HTTP the property name is **ssl_certificate_authorities**. Consult the Logstash documentation to confirm the property name used by other plugin types such as Syslog and Elasticsearch.
   Example HTTP output plugin:

   ```
   ...
         output: |
           http {
             url => "https://example.com"
             http_method => "post"
             id => "API Connect analytics event data"
             ssl_certificate_authorities => "/etc/velox/external_certs/offload/<certname>"
           }
   ```

   where *<certname>* is the name that you specified in the analytics_offload_certificates.yaml file in step 1, either **cacert** or **keystore.jks** depending on the format of certificate used.
   If you want to use a password protected keystore, configure the relevant properties of your desired plugin type to point to the keystore location and password.
   Example HTTP output plugin:

   ```
   ...
         output: |
           http {
             url => "https://example.com"
             http_method => "post"
             id => "API Connect analytics event data"
             ssl_truststore_password => "${keystore_password}"
             ssl_truststore_path => "/etc/velox/external_certs/offload/keystore.jks"
           }
   ```

7. Save the updated analytics CR.
   When you save the updated CR, your ingestion pod restarts itself automatically and detects the new **secretName** in the CR. On startup, the ingestion pod copies the certificate from the specified **secretName** to its /etc/velox/external_certs/offload directory. You can verify that the certificate was successfully imported with:

   ```
   kubectl exec -ti <ingestion pod> -- bash -ic "ls /etc/velox/external_certs/offload"
   ```

   This command should return the certificate name that you specified in the analytics_offload_certificates.yaml file, either **cacert** or **keystore.jks** depending on the format of certificate used.
   When your ingestion pod communicates with your HTTPS endpoint, it verifies the server certificate that the endpoint returns against the certificate that is stored in /etc/velox/external_certs/offload.

8. Ensure that you take a backup of your offload secret and your updated analytics CR. For more information about backups, see Backup, restore, and disaster recovery

Configuring offload client certificates on Kubernetes and OpenShift

Configuring client keys for analytics offload.

The topic Configuring offload server certificates on Kubernetes and OpenShift covers how to configure your ingestion pod to trust your offload endpoint server certificate. This topic covers how to configure mTLS client certificates to be used when your ingestion pod communicates with the offload endpoint.

To configure client certificates, follow the same steps as Configuring offload server certificates on Kubernetes and OpenShift, but add your client certificate and key to the analytics_offload_certificates.yaml file.

For example:

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-certificates
stringData:
  cacert: |-
    -----BEGIN CERTIFICATE-----
    ...
  clientcert: |-
    -----BEGIN CERTIFICATE-----
    ...
  clientkey: |-
    -----BEGIN CERTIFICATE-----
    ...
```

All certificates added to the `offload-certificates` secret are created as individual files in the ingestion pod's /etc/velox/external_certs/offload directory. You can confirm that the certificate files were created with this command:

```
kubectl exec -ti <ingestion pod> -- bash -ic "ls /etc/velox/external_certs/offload"
```

In this example, the command output that is returned shows the three certificate files corresponding to the ones specified in analytics_offload_certificates.yaml:

```
cacert  clientcert  client
```

Note: If you have multiple offload targets, then add the certificates for each target with a unique name. For example:

```
stringData:
  certname_target1: |-
    -----BEGIN CERTIFICATE-----
    ...
  certname_target2: |-
    -----BEGIN CERTIFICATE-----
    ...
```

Update the offload plugin configuration in your analytics CR to reference the certificates in /etc/velox/external_certs/offload as required.

Example HTTP plugin that specifies client certificates:

```
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "https://example.com"
          http_method => "post"
          ssl_certificate_authorities => "/etc/velox/external_certs/offload/cacert"
          ssl_certificate => "/etc/velox/external_certs/offload/clientcert"
          ssl_key => "/etc/velox/external_certs/offload/clientkey"
          id => "API Connect analytics event data"
        }
```

For other plugin types the TLS property names might differ, check the Logstash documentation.
Important: After updating your offload configuration, take a new analytics infrastructure configuration backup to ensure that you have backups of your analytics_offload_certificates.yaml file, your offload secret, and your analytics CR. See Backup, restore, and disaster recovery.

Configuring offload on VMware

Configure your VMware analytics subsystem to offload API event data to a third-party system.

Procedure

1. From your project directory, open the analytics-extra-values.yaml file for editing. If this file does not exist, then create it: Analytics extra-values file.
2. Add the following text to the file, inside the `spec` section:

```
spec:
...
  external:
    offload:
      enabled: true
```

```
      output: |
        <output definition>
```

where *<output definition>* is the configuration for the chosen output plugin that will send data to the target third-party system.The following example enables offloading to HTTP:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "https://example.com"
          http_method => "post"
          ssl_verification_mode => "none"
          id => "API Connect analytics event data"
        }
```

In this example, the URL points to an HTTPS endpoint, but verification of the endpoint's server certificate is disabled by setting **ssl_verification_mode** to "none". If you want your analytics subsystem to verify the endpoint server certificate, then see Configuring offload server certificates on VMware.

The **id** property is not mandatory, but it is recommended.

For more information about the HTTP output plugin configuration, see the Logstash HTTP plugin documentation.

3. Optional: Add a **filter** after the output plugin to modify data before it is sent to the offload target.
The following example filter removes the **query_string** field:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "example.com"
          http_method => "post"
          id => "offload_http"
        }
      filter: |
        ruby {
          remove_field => ["query_string"]
        }
```

For information about modifying offloaded data, see Customizing data with ingestion filters.

4. Optional: To configure a second offload target, create a new **spec.external.offload2** section and add the configuration for this second target to this section.
If you have three or more offload targets, then you can put multiple configurations in **spec.external.offload2**. For example:

```
spec:
  external:
   offload:
      enabled: true
      output: |
        http {
          url => "https://target1.com"
          ...
        }
    offload2:
      enabled: true
      output: |
        http {
          url => "https://target2.com"
          ...
        }
      output: |
        http {
          url => "https://target3.com"
          ...
      }
```

Note: Multiple offload targets defined in **spec.external.offload2** are run in series. If offload to the first target in **offload2** fails, then subsequent offloads are not run. Define your most important offload target first.

5. Save the analytics-extra-values.yaml file.
6. Ensure that your **extra-values-file** property is set to point to your analytics-extra-values.yaml file:

```
apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
```

7. Apply the analytics-extra-values.yaml to your analytics subsystem:

```
apicup subsys install <analytics subsystem>
```

8. Take a backup of your updated analytics-extra-values.yaml file. For more information about backups, see Backup, restore, and disaster recovery.

- **Configuring offload server certificates on VMware**
Configure your analytics subsystem to trust your offload endpoint.
- **Configuring offload client certificates on VMware**
Configuring client keys for analytics offload.

Configuring offload server certificates on VMware

Configure your analytics subsystem to trust your offload endpoint.

Before you begin

You must have the offload target's server certificate in either of these formats:

- Base64 encoded `pem` file.
- JKS file. If you are using a JKS file, encode the contents in Base64:

  ```
  cat <JKS certificate filename> | base64
  ```

Procedure

1. SSH to your analytics VM, or one of the VMs if you have a three replica deployment.

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. Switch to the root user:

   ```
   sudo -i
   ```

3. If you are using a JKS file, create a file to contain your certificate.

   ```
   echo "<certificate>" > <certificate filename>
   ```

4. Follow the steps for Configuring offload server certificates on Kubernetes and OpenShift.
   When you follow Kubernetes steps on VMware, run all operations as the root user. You do not need to specify a namespace when running **kubectl** commands on VMware. For example if a step has the command:

   ```
   kubectl -n <namespace> apply -f analytics_offload_certificates.yaml
   ```

   you can omit the `-n <namespace>`.
   To identify the ingestion pod, run:

   ```
   kubectl get pods
   ```

5. Keep a backup of the server certificate as part of your analytics infrastructure backup. For more information about backups, see Backup, restore, and disaster recovery.

Configuring offload client certificates on VMware

Configuring client keys for analytics offload.

Procedure

1. SSH to your analytics VM, or one of the VMs if you have a three replica deployment.

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. Switch to the root user:

   ```
   sudo -i
   ```

3. Refer to the Kubernetes steps documented in Configuring offload client certificates on Kubernetes and OpenShift.
   When you follow Kubernetes steps on VMware, run all operations as the root user. You do not need to specify a namespace when running **kubectl** commands on VMware. For example if a step has the command:

   ```
   kubectl -n <namespace> apply -f analytics_offload_certificates.yaml
   ```

   you can omit the `-n <namespace>`.
   To identify the ingestion pod, run:

   ```
   kubectl get pods
   ```

4. Keep a backup of your client certificates as part of your analytics infrastructure backup. For more information about backups, see Backup, restore, and disaster recovery.

Sample output plugins for offloading data

Review sample output plugins to see how to code your own plugins for offloading data from API Connect analytics.

For complete details of output plugin syntax, see the Logstash output plugins documentation.

HTTP

Example HTTP output plug-in:

```
http {
   url => "example.com"
```

```
   http_method => "post"
   format => "json"
   content_type => "application/json"
   headers => {
      "x-acme-index" => "8"
      "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
   }
   id => "offload_http"
}
```

Example HTTP output plug-in that references a custom certificate for accessing the third-party endpoint:

```
http {
   url => "https://example.com:443"
   http_method => "post"
   format => "json"
   content_type => "application/json"
   headers => {
      "x-acme-index" => "8"
      "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
   }
   id => "offload_http"
   ssl_certificate_authorities => "/etc/velox/external_certs/offload/cacert"
}
```

Note: Ensure that the endpoint, which receives the offload data, is able to handle the raw JSON data.
For more information about offloading to HTTP, refer to the HTTP output plugin documentation.

Elasticsearch

To configure data offload to an Elasticsearch cluster, you must specify the following properties:

- One or more server Elasticsearch server URLs.
- A dynamically configured name to define how indices are created.
- The number of primary shards for storing the indexed documents.
- The number of replica shards for redundancy.
- Server authentication credentials (if requried).

The naming syntax that you specify for your indices determines how many indices are created and how they are characterized. For example, you can define indices that are created based on a date pattern, or indices that are created to store data by provider organization or by API name.

Example Elasticsearch output plugin:

```
elasticsearch {
      hosts => "https://example.com:443"
      index => "apiconnect"
      ssl  => true
      cacert => "/etc/velox/external_certs/offload/cacert"
}
```

For more information about offloading to Elasticsearch, refer to the Elasticsearch output plugin documentation.

Apache Kafka

To configure data offload to a Kafka cluster, provide host and port connection details for one or more servers, and the name of the Kafka topic. To be able to identify API Connect data, include the string identifier **id**.

Example Kafka output plug-in:

```
kafka {
      topic_id => "api_events"
      bootstrap_servers => "example.com:9093"
      codec => "json"
      id => "apic_kafka_offload"
      ssl_truststore_location => "/usr/share/logstash/jdk/lib/security/cacerts"
      ssl_truststore_password => "changeit"
      ssl_truststore_type => "JKS"
      security_protocol => SSL
}
```

You can configure Kafka with an external certificate and a keytab file. The example below shows how to set up Kafka offload with Kerberos authentication to secure data transmission to the Kafka topic.

1. Encode keytab file.

   ```
   cat keystore.keytab | base64
   ```

2. Create a secret to contain the keytab file.

   ```
   apiVersion: v1
           kind: Secret
           metadata:
           name: offload-keytab
           data:
           keystore.keytab: "<base64_encoded_keytab>"
   ```

3. Replace **base64_encoded_keytab** with the base64-encoded keytab content.
4. Save the file.
5. Apply the secret.

```
kubectl apply -f offload_keytab.yaml -n <namespace>
```

6. Edit the Analytics CR and add a reference to the secret in the offload section. For information, refer to the following sample configuration.

```
    offload:
    enabled: true
    output: |
    kafka {
    topic_id => "test"
    bootstrap_servers => "example.com:9093"
    id => "kafka_offload"
    kerberos_config => {
    keytab => "/etc/velox/external_certs/offload-keytab/keystore.keytab"
    principal => "<kerberos_principal>"
    service_name => "kafka"
      }
    }
  secretName: offload-keytab
```

Each field label represents the following:

- topic_id: The ID of the Kafka topic where data will be sent
- bootstrap_servers: The IP address and port of the Kafka broker
- id: A unique id for Kafka output configuration
- kerberos_config: Contains the Kerberos authentication settings
- keytab: Path to the Kerberos keytab file
- principal: The Kerberos principal name used for authentication
- service_name: Service name for Kerberos

For more information on offloading to Apache Kafka, refer to the Kafka output plugin documentation.

Syslog

To configure data offload to Syslog, you must provide host and port connection details for the server.

Restriction: Syslog does not support the use of chained client certificates for TLS profiles.
Example Syslog output plug-in:

The `msgid` field behavior depends on the selected RFC format.

```
syslog {
  host => "example.com"
  port => 601
  protocol => "ssl-tcp"
  id => "offload_syslog"
  appname => "apiconnect"
  msgid => "%{org_id}"
  facility => "user-level"
  severity => "informational"
  codec => "json"
  ssl_cacert => "/etc/velox/external_certs/offload/cacert"
}
```

Attention: Due to a third-party issue with Logstash, most of the facility values are not set correctly on the offload server. As a temporary workaround, set the facility to "user-level" to ensure that the corresponding value is correctly sent to the offload server. When Logstash corrects this problem, you must update the offload configuration to change the value to a more appropriate setting.
For more information about offloading to Syslog and specific requirements of different certificate fields, see the Syslog output plugin documentation.

OpenSearch

To configure data offload to OpenSearch, see the Ship to OpenSearch documentation.

Noname

To configure data offload to Noname, see the Noname documentation.

Example Noname offload plugin:

```
http {
  url => "https://<ENGINE_URL>/engine?structure=ibm-apiconnect"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  headers => ["x-nn-source-index", "<INDEX>", "x-nn-source-key", "<KEY>"]
  id => "noname-offload"
  ssl_certificate_authorities => "/etc/velox/external_certs/offload/cacert"
}
```

Combining offload configuration with filters

The following examples show how to use filters to control what data is offloaded.

Offload events from `catalog1` only:

```
   offload:
     enabled: true
     if  [catalog_name] == "catalog1" {
```

```
          http {
            url => "http://offloadhost.example.com/offload"
            http_method => "post"
            codec => "json"
            content_type => "application/json"
            id => "offload_http"
          }
        }
```

Offload to different locations based on catalog name:

```
offload:
  enabled: true
  output: |
    if  [catalog_name] == "catalog1" {
      http {
        url => "http://offloadhost.example.com /offload1"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload1_http"
      }
    }
    else if  [catalog_name] == "catalog2" {
      http {
        url => "http://offloadhost2.example.com /offload2"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload2_http"
      }
    }
```

Use the catalog name as a variable in the offload location:

```
offload:
  enabled: true
  http {
    url => "http://offloadhost.example.com /%{[catalog_name]}"
    http_method => "post"
    codec => "json"
    content_type => "application/json"
    id => "offload_http"
  }
```

Do not offload events from `apic` and `sandbox` catalogs:

```
offload:
  enabled: true
  if  [catalog_name] !~ /sandbox|apic/ {
    http {
      url => "http://offloadhost.example.com /%{[catalog_name]}"
      http_method => "post"
      codec => "json"
      content_type => "application/json"
      id => "offload_http"
    }
  }
```

Using offloaded analytics data to train AI models

How to use API Connect analytics data to train AI models.

API Connect analytics holds full information on all of your API events. This information can prove invaluable in training AI models by using machine learning. Possible use cases include training data for automated tests or for security anomaly detection.

IBM Cloud Pak for Data (CP4D) includes the means to train AI models with data from various data sources. It is not possible for CP4D to pull data directly from API Connect's internal analytics database because the database is secured with no external access. However, you can offload your analytics data to an external database, and then configure CP4D to load data from that external database. You can use any external database that both API Connect analytics offload and CP4D support. The simplest option might be an external ELK stack (Elasticsearch Logstash Kibana). A list of supported data sources for CP4D can be found here: https://www.ibm.com/docs/en/cloud-paks/cp-data/latest?topic=data-supported-sources.

Documentation on how to configure Cloud Pak for Data to access Elasticsearch can be found here: https://www.ibm.com/docs/en/cloud-paks/cp-data/latest?topic=catalogs-elasticsearch-connection.

When your analytics data is offloaded to an external database, you can use it to train your AI model. Here is an example of how to create and train an AI model in CP4D using IBM Watson Machine Learning: https://www.ibm.com/docs/en/cloud-paks/cp-data/latest?topic=deploying-managing-ai-assets.

Troubleshooting offload

Checks to help determine the cause of offload failure.

- Check the ingestion pod logs for error messages that are related to offload:
  - Kubernetes, OpenShift, and Cloud Pak for Integration:

```
kubectl -n <namespace> logs <analytics ingestion pod name>
```

- VMware: Find the ingestion pod logs in the `mustgather` script output: Gathering logs.

A common problem is TLS handshaking errors, such as untrusted or expired certificates.

- Check logs on your third-party system.
- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that firewall settings are not causing connection problems.
- If offloading data to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

Replicating analytics data to a 2DCDR warm-standby data center

If you have a two data center warm-standby deployment, you can configure the analytics subsystem in your active data center to offload incoming API event records to the analytics subsystem in your warm-standby data center.

About this task

If you have a two data center disaster recovery deployment, with an analytics subsystem deployed in each data center, then you can replicate the API event data between the data centers.

The offload feature is used for the API event data replication. In 2DCDR deployments, since both data centers have the same contents in their management subsystem databases, the analytics data from all data centers can be seen from the management UIs in either data center.

Analytics two data center replication key points:

- Only API event data that is generated by API Gateways can be replicated. Data from V5 compatible gateways cannot be replicated.
- The feature requires additional CPU, RAM, and storage space. Use dedicated storage and horizontal scaling to meet the resource requirements.
- The limitation of no analytics data available in the portal sites still exists with this configuration.
- The feature is not recommended on VMware deployments because it is not possible to scale horizontally beyond three replicas.

The steps in this task refer to your two data centers as DC1 (the active data center) and DC2 (the standby data center).

Note: For OpenShift® users: The example steps in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the `APIConnectCluster` CR (the top-level CR), instead of directly editing the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the `APIConnectCluster` CR.

Procedure

1. In DC1, identify the analytics ingestion client secret, by running this command in the management subsystem namespace:

   ```
   kubectl -n <management namespace> get secrets | grep "\-client"
   ```

   The secret name is either `analytics-ingestion-client` or `a7s-ing-client`, possibly prefixed with other text.

2. In DC1, view the contents of the analytics ingestion client secret:

   ```
   kubectl -n <management namespace> get secret -o yaml <analytics ingestion secret>
   ```

   The output should look like this:

   ```
   apiVersion: v1
   data:
     ca.crt: <ca.crt encoded certificate string>
     tls.crt: <tls.crt ncoded certificate string>
     tls.key: <tls.key encoded certificate string>
   ...
   ```

3. In DC1, convert the `tls.key` value to PKCS #8 format.
   a. Base64 decode `tls.key`, and copy to a file called tls.key:

      ```
      echo <tls.key encoded certificate string> | base64 --decode > tls.key
      ```

   b. Convert the tls.key file contents to PKCS #8, and Base64 encode it to a file called converted_tls.key:

      ```
      openssl pkcs8 -topk8 -in tls.key -nocrypt | base64 -w 0 > converted_tls.key
      ```

4. In DC2, create or update your analytics_offload_certificates.yaml file, using the DC1 certificate strings and TLS key that you obtained in steps 2 and 3.
   If you did not previously configure analytics offload targets, then create a new file that is called analytics_offload_certificates.yaml and paste in the following contents:

   ```
   apiVersion: v1
   kind: Secret
   metadata:
     name: offload-certificates
   data:
     replication_ca.crt: <ca.crt string from ingestion secret>
     replication_tls.crt: <tls.crt string from ingestion secret>
     replication_tls.key: <converted_tls.key file contents>
   ```

   If you already have other offload targets configured, then edit your existing analytics_offload_certificates.yaml file and add the certificate strings from the previous step under the data section:

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-certificates
data:
  replication_ca.crt: <ca.crt string from ingestion secret>
  replication_tls.crt: <tls.crt string from ingestion secret>
  replication_tls.key: <converted_tls.key file contents>
  existing_offload_target1_ca.crt: hGywkdWE...
  existing_offload_target1_tls.crt: kY7fW..
  ...
...
```

5. In DC2, apply the analytics_offload_certificates.yaml file to create the **offload-certificates** secret:

   ```
   kubectl -n <analytics namespace> apply -f analytics_offload_certificates.yaml
   ```

   A new secret that is called **offload-certificates** is created. Verify that this secret exists by running:

   ```
   kubectl -n <analytics namespace> get secrets
   ```

   If you previously created offload targets, then this secret is updated.

6. In DC2, identify the analytics ingestion client secret, by running this command in the management subsystem namespace:

   ```
   kubectl -n <management namespace> get secrets | grep "\-client"
   ```

   The secret name is either **analytics-ingestion-client** or **a7s-ing-client**, possibly prefixed with other text.

7. In DC2, view the contents of the analytics ingestion client secret:

   ```
   kubectl -n <management namespace> get secret -o yaml <analytics ingestion secret>
   ```

   The output should look like this:

   ```
   apiVersion: v1
   data:
     ca.crt: <ca.crt encoded certificate string>
     tls.crt: <tls.crt ncoded certificate string>
     tls.key: <tls.key encoded certificate string>
   ...
   ```

8. In DC2, convert the **tls.key** value to PKCS #8 format.
   a. Base64 decode **tls.key**, and copy to a file called tls.key:

      ```
      echo <tls.key encoded certificate string> | base64 --decode > tls.key
      ```

   b. Convert the tls.key file contents to PKCS #8, and Base64 encode it to a file called converted_tls.key:

      ```
      openssl pkcs8 -topk8 -in tls.key -nocrypt | base64 -w 0 > converted_tls.key
      ```

9. In DC1, create or update your analytics_offload_certificates.yaml file, using the DC2 certificate strings and TLS key that you obtained in steps 7 and 8.
   If you did not previously configure analytics offload targets, then create a new file that is called analytics_offload_certificates.yaml and paste in the following contents:

   ```
   apiVersion: v1
   kind: Secret
   metadata:
     name: offload-certificates
   data:
     replication_ca.crt: <ca.crt string from ingestion secret>
     replication_tls.crt: <tls.crt string from ingestion secret>
     replication_tls.key: <converted_tls.key file contents>
   ```

   If you already have other offload targets configured, then edit your existing analytics_offload_certificates.yaml file and add the certificate strings from the previous step under the data section:

   ```
   apiVersion: v1
   kind: Secret
   metadata:
     name: offload-certificates
   data:
     replication_ca.crt: <ca.crt string from ingestion secret>
     replication_tls.crt: <tls.crt string from ingestion secret>
     replication_tls.key: <converted_tls.key file contents>
     existing_offload_target1_ca.crt: hGywkdWE...
     existing_offload_target1_tls.crt: kY7fW..
     ...
   ...
   ```

10. In DC1, apply the analytics_offload_certificates.yaml file to create the **offload-certificates** secret:

    ```
    kubectl -n <analytics namespace> apply -f analytics_offload_certificates.yaml
    ```

    A new secret that is called **offload-certificates** is created. Verify that this secret exists by running:

    ```
    kubectl -n <analytics namespace> get secrets
    ```

    If you previously created offload targets, then this secret is updated.

11. In DC1, edit the analytics CR, and set the **spec.external.offload** section as shown:

    ```
    kubectl edit a7s
    ```

```
external:
    offload:
      enabled: true
      output: |
        if  [gateway_service_name] == "<DC1 gateway service name>" {
          http {
            url => "https://<DC2 analytics ingestion endpoint>/ingestion"
            http_method => "post"
            codec => "json"
            content_type => "application/json"
            id => "offload1_http"
            ssl_certificate_authorities => "/etc/velox/external_certs/offload/replication_ca.crt"
            ssl_certificate => "/etc/velox/external_certs/offload/replication_tls.crt"
            ssl_key => "/etc/velox/external_certs/offload/replication_tls.key"
          }
        }
      secretName: offload-certificates
```

where:

- *<DC1 gateway service name>* is the name of the gateway service in DC1.
- *<DC2 analytics ingestion endpoint>* is the analytics ingestion endpoint of the analytics service in DC2.

If you have multiple offload targets, then see Multiple offload targets.

After you save the updated the CR, the analytics ingestion pod restarts, and new API events are sent to DC2.
Note: If you later return to edit properties in the `external.offload.output` section, you might need to restart the ingestion pod manually:

```
kubectl delete pod <analytics ingestion pod>
```

12. In DC2, edit the analytics CR, and set the `spec.external.offload` section as shown:

```
kubectl edit a7s
```

```
external:
    offload:
      enabled: true
      output: |
        if  [gateway_service_name] == "<DC2 gateway service name>" {
          http {
            url => "https://<DC1 analytics ingestion endpoint>/ingestion"
            http_method => "post"
            codec => "json"
            content_type => "application/json"
            id => "offload1_http"
            ssl_certificate_authorities => "/etc/velox/external_certs/offload/replication_ca.crt"
            ssl_certificate => "/etc/velox/external_certs/offload/replication_tls.crt"
            ssl_key => "/etc/velox/external_certs/offload/replication_tls.key"
          }
        }
      secretName: offload-certificates
```

where:

- *<DC2 gateway service name>* is the name of the gateway service in DC2.
- *<DC1 analytics ingestion endpoint>* is the analytics ingestion endpoint of the analytics service in DC1.

After saving the updated the CR, the analytics ingestion pod restarts, and new API events are sent to DC1.

13. Confirm that replication is working by making a test API call to your DC2 gateway service and confirming that you see the event in the Discover view of the API Manager UI in DC1.

    To verify replication from DC1 to DC2, you must complete a failover of the management subsystem so that you can access the API Manager UI in DC2 and see data from the analytics subsystem in DC2.

If API events are not replicating between your data centers, then check the ingestion pod logs for error messages when API calls are made:

```
kubectl logs <analytics ingestion pod>
```

Disable local storage

If you are offloading you API event data to a third-party system, you can disable local storage to reduce subsystem resource requirements.

The analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution if you are using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

Important:
If you disable local storage, the analytics views in your API Connect UIs remain accessible, but are empty.

Configure local storage disablement before installation. It is not possible to disable or re-enable internal storage after installation.

You can enable offload of analytics data to third-party systems after installation.

Disabling local storage on Kubernetes, OpenShift and Cloud Pak for Integration

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

During the API Connect installation process, set `storage.enabled` to false in the CR:

```
storage:
  enabled: false
```

The relevant installation pages for each platform are:

- Kubernetes analytics install
- OpenShift analytics subsystem install
- OpenShift top-level CR install.
- Cloud Pak for Integration: Use the YAML tab to edit the CR before installation, see *API management deployment* in https://www.ibm.com/docs/en/cloud-paks/cp-integration.

Disabling local storage on VMware

During installation of the analytics subsystem, create the analytics extra-values file, and insert:

```
storage:
  enabled: false
```

Do not create your analytics subsystem ISO files before the `extra-values-file` property is set:

```
apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
```

Shutting down the analytics subsystem

Disable the analytics service and shutdown the analytics subsystem.

About this task

This operation requires the use of the analytics CLI.

Disabling the analytics subsystem stops the collection and storage of data and makes the subsystem inaccessible.

Procedure

1. Backup your analytics data as explained in Backup, restore, and disaster recovery.
2. Setup the toolkit CLI so you can run analytics CLI operations: Analytics CLI.
3. Optional: Disable shard allocation.
   Disable shard allocation to prevent new shards from being created for replication when a node is unavailable. For more information about shards, see OpenSearch nodes, indices, shards, and replicas.

   a. Create a JSON file called `analytics_persistent_settings.json` and insert the contents:

   ```
   {"persistent":{"cluster.routing.allocation.enable":"none"}}
   ```

   b. Run the following analytics CLI command:

   ```
   apic --mode analytics clustermgmt:putSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
   ```

   where:
   - *<platform api endpoint>* is the platform API endpoint.
   - *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.

   Expected output:

   ```
   {"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"none"}}}},"transient":{}}
   ```

4. Optional: Run a synced flush of storage.
   The synced flush operation flushes all current index operations synchronously and writes all in-flight transactions to disk.

   ```
   apic --mode analytics clustermgmt:postFlush --server <platform api endpoint> --analytics-service <analytics service name> --format json
   ```

   where:
   - *<platform api endpoint>* is the platform API endpoint.
   - *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.

   When you flush storage, the response looks like the following example, with the *failed* count set to zero:

   ```
   {
       "_shards": {
           "total": 16,
           "successful": 6,
           "failed": 0
       }
   }
   ```

   This operation occasionally fails, but it is safe to rerun it multiple times until it passes and the "failed" count is zero.

5. Unassociate the analytics service from all gateway services.
   a. In Cloud Manager, click Topology.
   b. In the section for the Availability Zone that contains the analytics service, locate the Gateway service that the analytics service is associated with.

c. Click ⋮ and select Unassociate.

For more information, see Associating an analytics service with a gateway service.

6. Unregister the analytics service from Cloud Manager:
   a. In Cloud Manager, click Topology.
   b. In the section for the Availability Zone that contains the analytics service, locate the analytics service and click Delete.

   For more information, see Registering an analytics service.

7. **Kubernetes, OpenShift, and Cloud Pak for Integration only:** Set replicas to zero for the analytics pods by editing the Deployments and StatefulSets that manage them: `director`, `mtls-gw`, `ingestion`, and `storage`:

   ```
   kubectl -n <namespace> edit deploy analytics-director
   kubectl -n <namespace> edit deploy analytics-mtls-gw
   kubectl -n <namespace> edit sts analytics-ingestion
   kubectl -n <namespace> edit sts analytics-storage
   ```

   Note: The Deployments and StatefulSets on Cloud Pak for Integration and OpenShift with the top-level CR have the name format *<instance name>-a7s-...*
   Set *replicas* to zero:

   ```
   spec:
     ...
     replicas: 0
     ...
   ```

   The analytics `director`, `mtls-gw`, `ingestion`, and `storage` pods all terminate.
8. **VMware only:** Shutdown your analytics VMs from your VMware console.

Reenabling the analytics subsystem

9. **Kubernetes, OpenShift, and Cloud Pak for Integration only:** Repeat step 7 but in reverse order and setting the *replicas* value back to what it was before.
   The pods all start:

   ```
   kubectl get deploy -n <namespace>
   analytics-director                      1/1     1            1           7h10m
   analytics-mtls-gw                       1/1     1            1           7h6m

   kubectl get sts -n <namespace>
   analytics-ingestion   1/1     7h10m
   analytics-storage     1/1     7h12m
   ```

10. **VMware only:** Start your analytics VMs from your VMware console.
11. Reregister the analytics service: Registering an analytics service.
12. Reassociate your analytics service with your gateways Associate new analytics service(s) with gateway(s).
13. Enable shard allocation by following these steps:
    Note: If you did not disable shard allocation in step 3, skip this step.
    a. Create a JSON file called `analytics_persistent_settings.json` and insert the contents:

    ```
    {"persistent":{"cluster.routing.allocation.enable":"all"}}
    ```

    b. Run the following analytics CLI command:

    ```
    apic --mode analytics clustermgmt:putSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
    ```

    where:
    - *<platform api endpoint>* is the platform API endpoint.
    - *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.

    When you enable shard allocation, the response looks like the following example:

    ```
    {"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"all"}}}},"transient":{}}
    ```

Restarting analytics pods

How to restart the analytics pods in your API Connect deployment.

About this task

Certain scenarios might require you to restart your analytics subsystem pods. To restart your analytics pods, follow the steps in this topic.

Procedure

1. **VMware users only:** Log in to your analytics VM and switch to the root user:

   ```
   ssh apicadm@<vm hostname>

   sudo -i
   ```

2. Restart the analytics pods.
   - **Kubernetes and OpenShift:** Run the following command:

     ```
     kubectl -n <namespace> delete pod -l app.kubernetes.io/instance=<analytics CR>
     ```

   - **VMware:** Run the following command:

```
kubectl delete pods --all
```

3. Verify that all analytics pods restart successfully:

   ```
   kubectl -n <namespace> get pods
   ```

   where *<namespace>* is the namespace where the analytics subsystem is installed. VMware users can omit `-n <namespace>`.

Enable Amazon SNS for Engagement

To enable Amazon SNS for Engagement, you must create the AWS client secret and reference the secret in the analytics custom resource YAML file.

About this task

To enable Amazon SNS for Engagement, complete the following steps.

Procedure

1. Create the AWS credentials secret.
   Run the following command to create a Kubernetes/OpenShift secret containing your AWS credentials:

   ```
   kubectl create secret generic <aws-creds-secret> \
     --from-literal=access_key_id=<aws_access_key_id> \
     --from-literal=secret_access_key=<aws_secret_access_key> \
     -n <namespace>
   ```

   Here,

   aws-creds-secret
   : The name for the secret

   aws_access_key_id
   : Your actual AWS IAM Access Key ID

   aws_secret_access_key
   : Your actual AWS IAM Secret Access Key

   namespace
   : The namespace where your Analytics CR is deployed

   Important: The keys must be named exactly as follows:
   - access_key_id
   - secret_access_key

   If you rename these keys, the integration will fail.
2. Reference the Secret in the Analytics CR.
   In your Analytics Custom Resource YAML, add the following entry under the `spec` header:

   ```
   spec:
             awsCredentialsSecret:
                secretName: <aws-creds-secret>
   ```

   Replace *aws-creds-secret* with the exact name of the secret that you created in Step 1. The analytics service can now use the AWS credentials for accessing Amazon SNS.

Change deployment profile

Change your deployment profile to switch between one replica and three replica deployments, or to change the computing resources available for your subsystem.

- **Change deployment profile on Kubernetes and OpenShift**
  Update your analytics CR to change your deployment profile.
- **Change deployment profile on VMware**
  Use the **apicup** command and deploy new VMs to change your deployment profile.

Change deployment profile on Kubernetes and OpenShift

Update your analytics CR to change your deployment profile.

Note: This topic covers Kubernetes and OpenShift individual subsystem installations. For other platforms see:

- Changing deployment profile on Cloud Pak for Integration
- Changing deployment profile on OpenShift, top-level CR

Note: If you have a three replica profile, and want to change to one replica, you must first change your analytics configuration to shared storage. Dedicated storage is not supported on the one replica profile.

1. Verify that subsystem is in `Running` state.

   ```
   kubectl -n <namespace> get a7s
   ```

2. Edit the analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

   Change `spec.profile` value to the new profile that you want to use: Analytics deployment profiles.

3. Monitor you analytics pods to confirm the expected number of replicas are running:

   ```
   kubectl -n <namespace> get pods
   ```

4. Verify that subsystem is in `Running` state.

   ```
   kubectl -n <namespace> get a7s
   ```

Change deployment profile on VMware

Use the **apicup** command and deploy new VMs to change your deployment profile.

For information about the available deployment profiles, see Planning your deployment topology and profiles.
Note:
The procedures to change deployment profile do not permit the endpoints to be changed.

If you want to change a one replica deployment to a three replica deployment, and you used the hostname of your original VM in your endpoints, you cannot change these endpoints. In this scenario, you must configure load-balancers and logical DNS records so that your original VM hostname routes to the new VMs of your three replica deployment.

If you want to change endpoints, you can use the form-factor migration process.

Moving to a profile that has the same number of VMs

Complete the following steps to change your deployment profile:

1. Take backups of your analytics configuration and database: VMware analytics backup.
2. Shutdown your analytics VMs.
3. Update the CPU and memory resources for your analytics VMs in your VMware console, as required for your new profile.
4. Restart your VMs.
5. In your project directory, update your deployment profile:

   ```
   apicup subsys set <subsystem name> deployment-profile=<new profile>
   ```

6. Apply the new profile:

   ```
   apicup subsys install <subsystem name>
   ```

If for any reason you are not able to change the CPU or memory on your VMs, redeploy them following the disaster recovery process: Recovering from a disaster.

Moving from a one replica to a three replica deployment profile

1. Take backups of your analytics configuration and database: VMware analytics backup.
   Note: You do not need to take VMware snapshots, since your existing VM is deleted and replaced when you change deployment profile.
2. In your project directory, update your deployment profile:

   ```
   apicup subsys set <analytics subsystem name> deployment-profile=<three replica profile>
   ```

3. Define the hostname and network interfaces for the two new analytics VMs. Use the `apicup hosts create` and `apicup iface create` commands. For more information, see Preparing the analytics subsystem for deployment.
4. Shutdown your existing analytics VM.
5. Follow the disaster recovery steps: Recovering from a disaster, but note that you must create a new ISO file for your original single analytics VM. Do not attempt to reuse the previous ISO file in your new three replica deployment.
6. When disaster recovery steps are complete and your new deployment is verified, delete your original VM (which you shutdown in step 4).

Moving from a three replica to a one replica deployment profile

1. Take backups of your analytics configuration and database: VMware analytics backup.
   Note: You do not need to take VMware snapshots, since your existing VMs are deleted and replaced when you change deployment profile.
2. In your project directory, update your deployment profile:

   ```
   apicup subsys set <subsystem name> deployment-profile=<one replica profile>
   ```

3. Delete two of your three VMs from your configuration with the `apicup hosts delete` command.
4. Shutdown your existing API Connect VMs.
5. Follow the disaster recovery steps: Recovering from a disaster, but note that you must create a new ISO file for your analytics VM. Do not attempt to reuse a previous ISO file in your new one replica deployment.
6. When disaster recovery steps are complete and your new deployment is verified, delete your original VMs (which you shutdown in step 4).

Configuring TLS validation mode for engagement destinations

Configure the TLS validation mode for engagement destinations to allow or block connections to endpoints with untrusted certificates.

Before you begin

- Ensure that you have access to the **AnalyticsCluster** custom resource (CR) for OpenShift or Kubernetes.
- Ensure that you have access to the **analytics-extra-values.yaml** file for VMware deployments.

About this task

By default, API Connect analytics runs in secure mode, which means the TLS validation is enabled for all engagement destination endpoints. As a result, all the TLS-secured endpoints must present certificates that are signed by a trusted certificate authority (CA) included in the default Java™ truststore.

You can configure engagement destinations to run in insecure mode by using a template override in the **AnalyticsCluster** custom resource (CR). Use this option if you need to send engagement data to a TLS-secured endpoint with a certificate that is not trusted by the default configuration.

Procedure

1. For OpenShift and Kubernetes deployments, complete the following steps:
   a. Edit the analytics CR to disable TLS validation by overriding the **ENGAGEMENT_TLS_VALIDATION** environment variable. For more information, see Managing your API Connect CRs.

```
template:
 - name: storage
   containers:
   - name: storage
     env:
     - name: ENGAGEMENT_TLS_VALIDATION
       value: "false"
```

   b. Edit the analytics CR to enable TLS validation by overriding the **ENGAGEMENT_TLS_VALIDATION** environment variable. For more information, see Managing your API Connect CRs.

```
template:
 - name: storage
   containers:
   - name: storage
     env:
     - name: ENGAGEMENT_TLS_VALIDATION
       value: "true"
```

2. For VMware deployments, complete the following steps:
   a. To create the **analytics-extra-values.yaml** file, run the following command:

```
vi analytics-extra-values.yaml
```

   b. In the **analytics-extra-values.yaml** file, add the following configuration:

```
spec:
  template:
  - name: storage
    containers:
    - name: storage
      env:
      - name: ENGAGEMENT_TLS_VALIDATION
        value: "true/false"
```

   Save and close the file.
   c. Use the **apicup** CLI to set the extra values file for your analytics subsystem:

```
./apicup subsys set <subsystem name> extra-values-file analytics-extra-values.yaml
```

   d. To apply the configuration, run the following command:

```
./apicup subsys install <subsystem name>
```

Performance tuning with ingestion pipeline properties

Fine tune your ingestion pipeline settings for optimal performance.

Table 1.

Field	Type	Default value	Description	Comments
ingestion: pipelineWorkers	4 <= integer <= 128	24	Number of pipeline workers.	More workers mean more CPU and memory requirements, but gives you the benefit of extra threads to pull data off the ingestion HTTP interface and process it for storage. Increasing the number of pipeline workers excessively results in diminishing returns. **pipelineWorkers** should usually be a multiple of the number of cores of your hardware. Adjust with caution.

Field	Type	Default value	Description	Comments
`ingestion: pipelineBatchSize`	10 <= integer <= 10000	250	Batch size of a pipeline worker.	Pulling more or less data off the HTTP interface per worker can have benefits. Recommended values are `125`, `250`, and `500`. Increasing the value requires more memory.
`ingestion: pipelineBatchDelay`	10 <= integer <= 5000	50	Batch delay of a pipeline worker.	How long to wait for the batch size to fill before leaving the HTTP interface to process for storage. Having threads wait too long causes idle threads in your system; however, setting this value too low decreases performance. Adjust with caution.
`ingestion: configReloadAutomatic`	Boolean	true	Whether to automatically reload the pipeline on configuration changes.	Typically, when the underlying files for the pipeline are modified, the pipeline process automatically reloads and picks up the changes. However, in Kubernetes environments where the pipeline is mapped to ConfigMaps, this is unreliable. Ingestion pod restarts are usually required.
`ingestion: pipelineUnsafeShutdown`	Boolean	false	Whether to allow unsafe shutdown of the pipeline.	Typically, the pipeline attempts to empty all workers' batches before shutdown to prevent data loss. You might need to enable this setting if the pipeline is badly configured and refuses to respond to shut down requests (uncommon). Adjust with caution.

Customize your analytics data

How to customize the data stored in your API event records.

- **Activity log policy**
  Configure the activity log policy to manage the level of detail of the data stored in API events.
- **Customizing data with a gateway script or set-variable operation**
  Customize your API event records on the gateway before they are sent to your analytics subsystem.
- **Customizing data with ingestion filters**
  Customize you API event records as they are received from the gateway.

Activity log policy

Configure the activity log policy to manage the level of detail of the data stored in API events.

When you configure an API in the API Manager UI, you choose what data is stored in the API event records for calls to that API with the `activity log` property. The `activity log` property has separate settings for successful API calls, and for failed API calls. The activity log options are:

- none: API events are not logged.
- activity: Logs the API resource URI. `activity` is the default log setting for successful API calls.
- header: Logs the API resource URI and HTTP headers.
- payload: Logs API resource URI, HTTP headers, and request and response payloads. `payload` is the default log setting for failed API calls, since the response payload might have useful information on the cause of the failure.

Note:
If your gateway is configured to authenticate all API calls with an OAuth provider, the data that is related to the OAuth call is only included in the API event data when the OAuth call fails. Successful OAuth authentication is not recorded in the API event data.

Important: The maximum API event record size is 19 Mb. The analytics subsystem rejects any API event records that are larger than 19 Mb.

Defining log setting in the API Manager UI

1. In the API Manager UI Develop view, select the API that you want to work with. If you are not familiar with the API Manager UI Develop view, see Working with API definitions.
2. Select the Gateway tab, expand Gateway and portal settings, then select Activity Log.
3. Select Enabled, then select the preferred log setting for Success Content and Error Content:
   - none: API events are not logged.
   - activity: Logs the API resource URI. `activity` is the default log setting for successful API calls.
   - header: Logs the API resource URI and HTTP headers.
   - payload: Logs API resource URI, HTTP headers, and request and response payloads. `payload` is the default log setting for failed API calls, since the response payload might have useful information on the cause of the failure.
4. Click Save to save your changes.

Defining log setting in source for DataPower® API Gateway

Use the `activity-log` extension to configure your logging preferences.

```
activity-log:
  success-content: <success log setting: none, activity, header, payload>
  error-content: <failure log setting: none, activity, header, payload>
  enabled: <if activity logging is enabled: true or false>
```

Note: If payload logging is enabled, for the gateway to capture payloads buffering must also be enabled.

```
activity-log:
  success-content: <success log setting: none, activity, header, payload>
  error-content: <failure log setting: none, activity, header, payload>
```

```
  enabled: <if activity logging is enabled: true or false>
buffering: true
```

Examples:

No logging of successful calls, header logging for failed calls

```
activity-log:
    success-content: none
    error-content: header
    enabled: true
```

Disable activity logging

```
activity-log:
    enabled: false
```

Defining log setting in source for DataPower Gateway (v5 compatible)

The activity-log policy has the following format:

```
- activity-log:
  version: <version>
  title: <title>
  description: <description>
  content: <success log setting: none, activity, header, payload>
  error-content: <failure log setting: none, activity, header, payload>
```

where:

- *<version>* is the policy version number. Set version to 1.0.0.
- *<title>* is a title for the policy.
- *<description>* is a description for the policy.

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

Note: If payload logging is enabled, for the gateway to capture payloads buffering must also be enabled.

```
activity-log:
  success-content: activity_to_log_if_call_successful
  error-content: activity_to_log_if_call_unsuccessful
  enabled: is_activity_logging_enabled
buffering: true
```

Examples:

Maintain default log behavior

Do not specify `content` or `error-content`:

```
- activity-log:
  version: 1.0.0
  title: default activity logging
```

No logging of successful calls, activity logging for failed calls

```
- activity-log:
  version: 1.0.0
  title: no logging for successful calls
  content: none
  error-content: activity
```

Customizing data with a gateway script or set-variable operation

Customize your API event records on the gateway before they are sent to your analytics subsystem.

Before you begin

Ensure that you are familiar with the API Manager UI, and working with API definitions.
Note: This feature is not available with DataPower® Gateway (v5 compatible).

About this task

During API execution, the activity data is stored in the `log` context variable, which populates the API event record on completion of the API execution. For more information about `log` context variables, see API activity logging context variables.

The analytics subsystem stores analytics data as individual API event records. The API event record fields are documented here: API event record field reference. It is possible to customize the API event records for specific APIs. You can modify the contents of existing API event fields, and add new custom fields by using a gateway script or the `set-variable` operation.
Note: If you want to make updates to all incoming API event data, rather than specific APIs, you can use ingestion filters instead.

Procedure

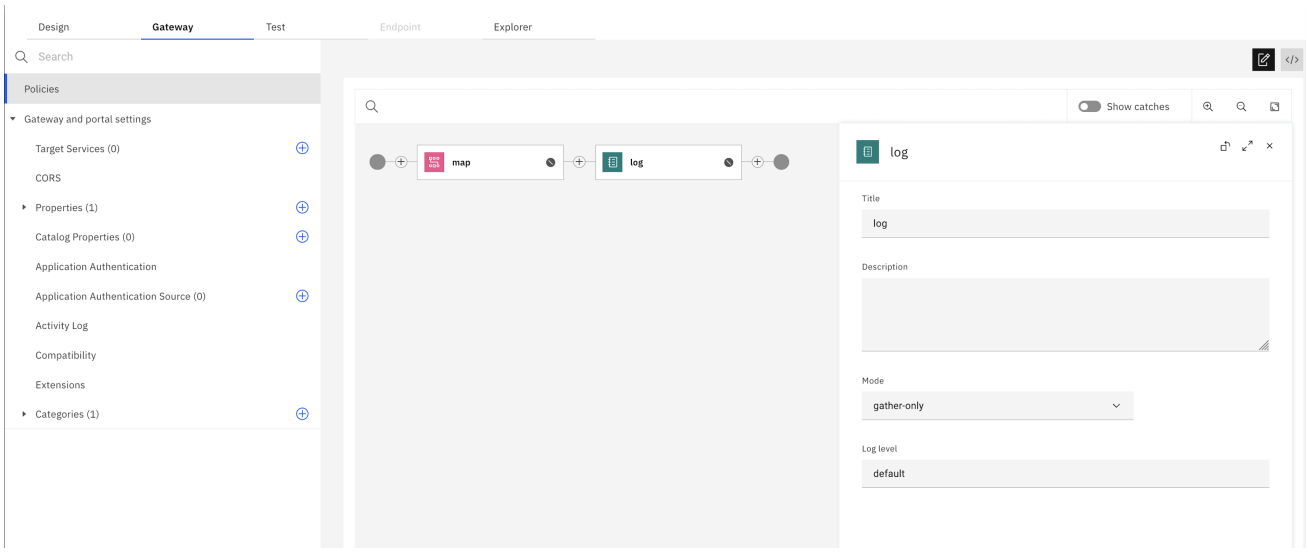
1. In the API Manager UI, click the Develop APIs and products tile, select the APIs tab, click Add, select API.

2. Select New OpenAPI, give the API the title of "Hello World", and click Next. Click Next again to accept the security defaults, and then click Edit API.
3. Select the YAML source view </>. Replace the generated YAML with the following YAML and click Save:

```
swagger: '2.0'
info:
  title: Hello World
  x-ibm-name: hello-world-rest
  version: 1.0.0
schemes:
  - https
basePath: /hello-world
securityDefinitions:
  clientID:
    type: apiKey
    in: header
    name: X-IBM-Client-Id

x-ibm-configuration:
  phase: realized
  testable: true
  enforced: true
  properties:
    target-url:
      value: http://example.com/operation-name
      description: The URL of the target service
      encoded: false
  cors:
    enabled: true
  activity-log:
    enabled: true
    error-content: header
    success-content: activity
  application-authentication:
    certificate: false
  assembly:
    execute:
      - map:
          version: 2.0.0
          title: map
          inputs:
            name:
              schema:
                type: string
              variable: request.parameters.name
          outputs:
            response:
              schema:
                $ref: '#/definitions/Result'
              variable: message.body
          actions:
            - set: response.hello
              from: name
              value: '''Hello '' +$(name)'
    catch: []
    finally: []
  gateway: datapower-api-gateway
  categories:
    - /tests
  type: rest
definitions:
  Result:
    type: object
    additionalProperties: false
    properties:
      hello:
        type: string
paths:
  /hello:
    get:
      parameters:
        - name: name
          in: query
          required: false
          type: string
      responses:
        '200':
          description: OK Response
          schema:
            $ref: '#/definitions/Result'
    parameters: []
```

4. Click the Form icon to switch to the Form view and select the Gateway tab.
5. Ensure that Policies is selected.
6. On the canvas, click the plus icon ⊕ at the last position in the flow. The palette listing the available elements to build the assembly flow appears.
7. From the palette, add the Log policy element onto the canvas by clicking it. Set the log policy Mode drop-down to Gather-only. This step is so that the "log" context variable is populated, for use in the next step.

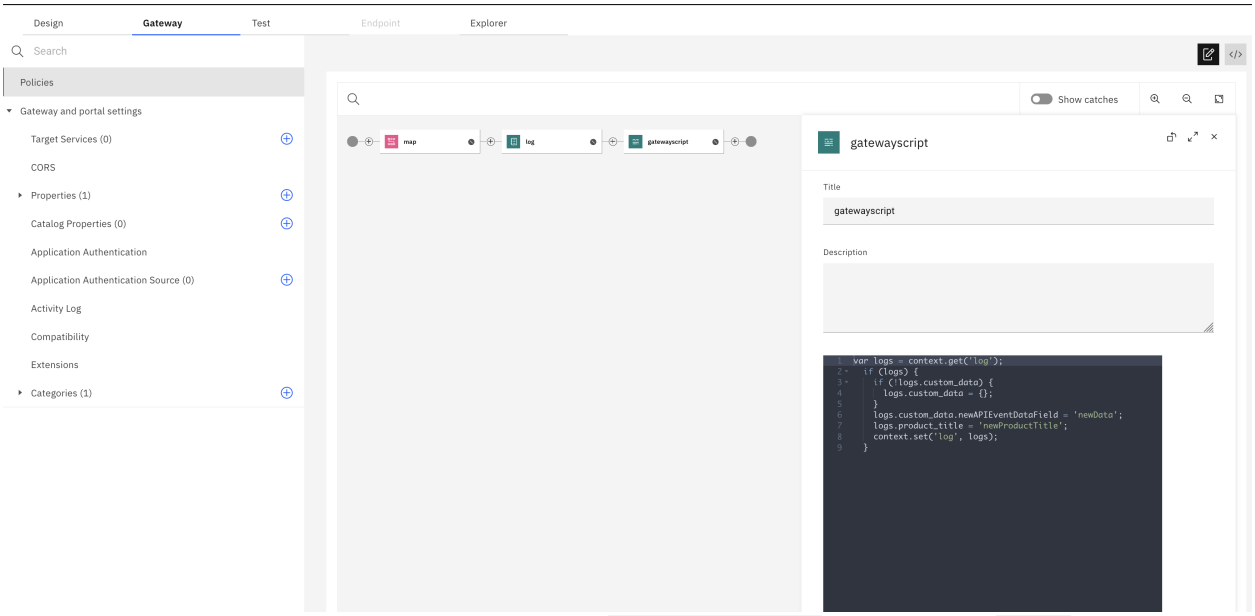


8. Modify API event data or add custom data either with a gateway script or by using the set-variable operation.

Gateway script method

Add a gateway script policy to the assembly flow and paste in the following script code:

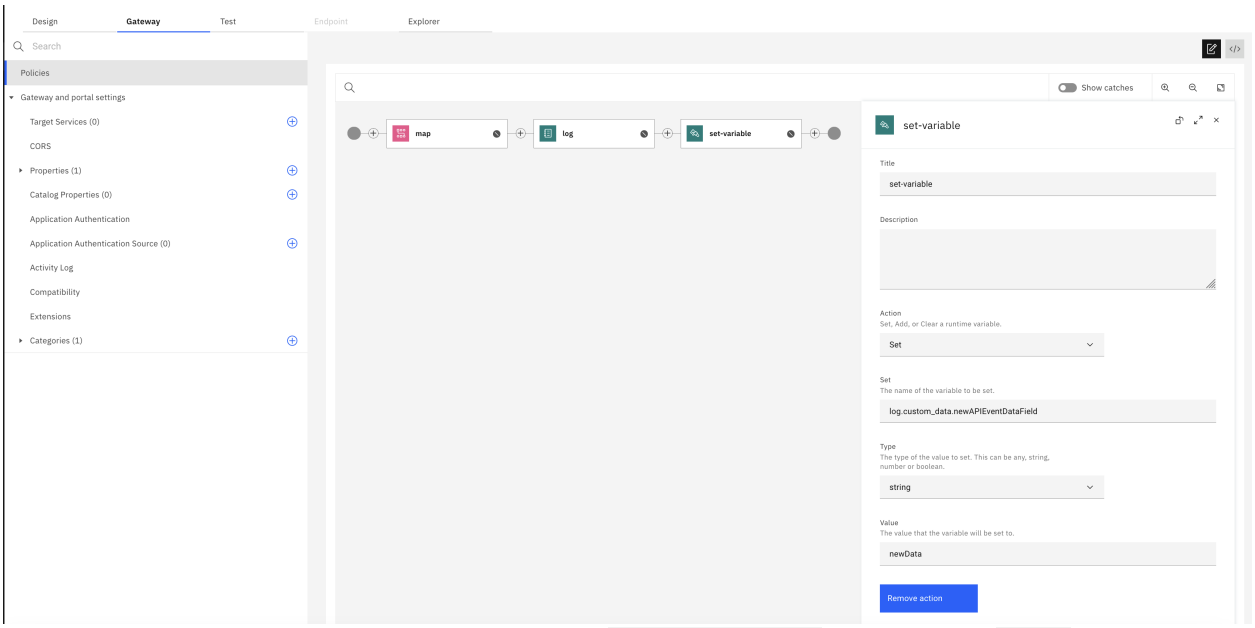
```
var logs = context.get('log');
  if (logs) {
    if (!logs.custom_data) {
      logs.custom_data = {};
    }
    logs.custom_data.newAPIEventDataField = 'newData';
    logs.product_title = 'newProductTitle';
    context.set('log', logs);
  }
```



In this example, the new field that is added to the API event record is called **`newAPIEventDataField`** and its value is set to **`newData`**. The value of the existing field **`product_title`** is changed to **`newProductTitle`**.

Set-variable method

If you cannot or do not want to use a gateway script, then you can use a set-variable policy instead. Add a set-variable policy to the assembly flow, and set it as follows:



In this example, the new field that is added to the API event record is called **`newAPIEventDataField`** and its value is set to **`newData`**
The YAML code for set-variable is:

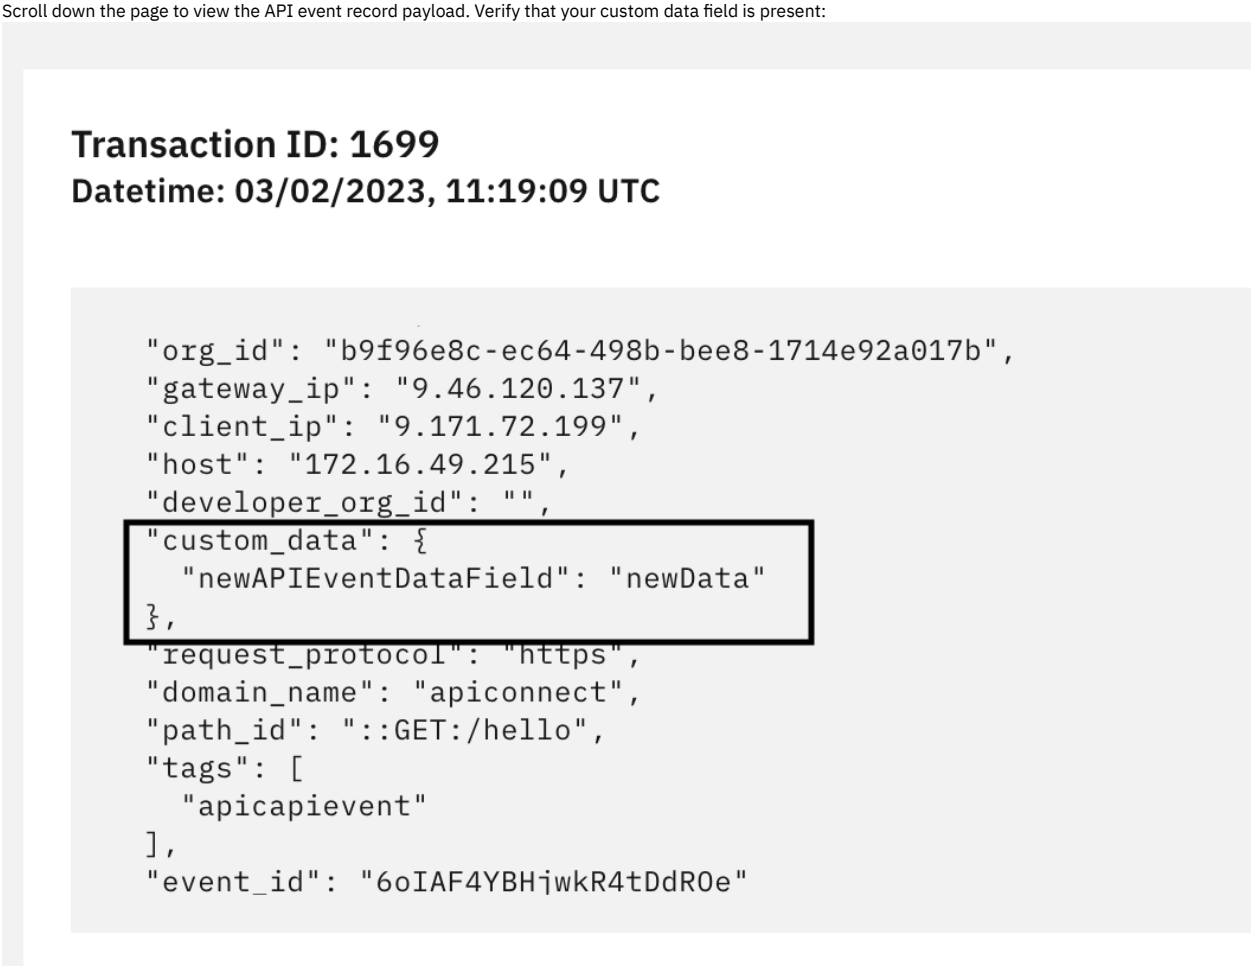
```
      - set-variable:
          version: 2.0.0
          title: set-variable
          actions:
            - set: log.custom_data.newAPIEventDataField
              value: newData
              type: string
            - set: log.product_title
              value: newProductTitle
              type: string
```

Warning: **`context.log.custom_data`** supports the addition of primitive typed values such as strings and integers, no limit is enforced on how many you can add, but adding too many does impact performance. Add data only to the **`context.log.custom_data`** object. Do not add data to **`context.log`**.

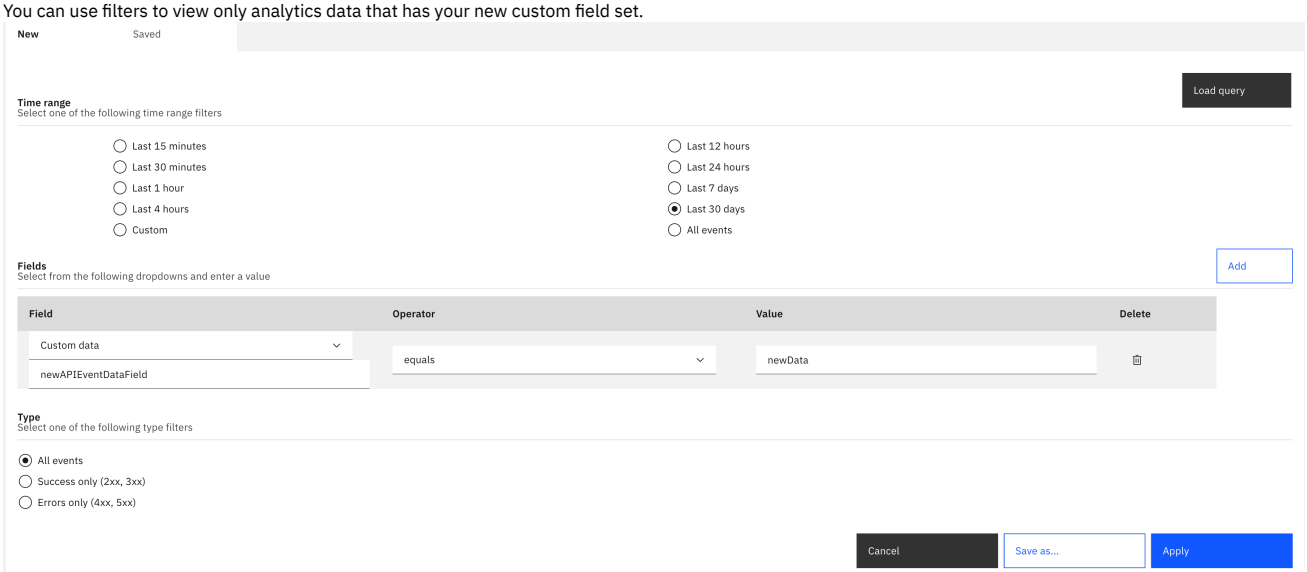
The field types cannot be changed. If you attempt to assign a value of the wrong type to a field, then the event record is lost. For example, if you define a custom field as an integer, and a particular API call results in a string being assigned to this variable, then the analytics database does not store the event record for that API call. If your APIs might return different types, then define the new **`custom_data`** type as a string and ensure that everything you assign to it is converted to a string before it is assigned.

9. Publish your "Hello World" API to a catalog.
10. Make a test call to the API and verify that the new custom data is set.
    a. From the Analytics view, select Discover and click the API event record corresponding to your test call:

b. Scroll down the page to view the API event record payload. Verify that your custom data field is present:



11. You can use filters to view only analytics data that has your new custom field set.



12. To use new data with REST API calls, use the custom_data query parameter:

```
/cloud/events?custom_data[newAPIEventDataField]=newData
```

Customizing data with ingestion filters

Customize you API event records as they are received from the gateway.

Create ingestion filters to customize the analytics API event records as they are received from the gateway and before they are sent on to internal storage or offloaded to a third-party system. Filters enable you to add new fields, modify existing fields, or remove fields from the API event record. Filters are applied to all incoming API events, but you can include a conditional check in your filter syntax if you want a filter to apply to specific APIs only.

Ingestion filters use Logstash plug-ins. For more information about Logstash plug-ins, see the Logstash documentation.

All fields in the API event record are modifiable with ingestion filters, but to avoid problems you must adhere to the following restrictions:

- Do not modify the following fields:
  - org_id
  - catalog_id
  - space_id
  - developer_org_id
  - datetime
  - @timestamp
- Do not change the data type of existing fields. Create a new field that has the type you want and copy the contents to this field.
- If you want to sanitize data, it is more efficient to delete fields entirely than delete their contents.

To review all the fields in the API event record, see API event record field reference.

For examples of ingestion filters, see Example ingestion filters.

The steps for configuring ingestion filters depend on your platform:

- **Kubernetes and OpenShift individual subsystem installations**
  Define ingestion filters to customize API event data before it is stored or offloaded.
- **Cloud Pak for Integration and OpenShift top-level CR**
  Define ingestion filters to customize API event data before it is stored or offloaded.
- **VMware**
  Define ingestion filters to customize API event data before it is stored or offloaded.

Kubernetes and OpenShift individual subsystem installations

Define ingestion filters to customize API event data before it is stored or offloaded.

Procedure

1. Edit your `AnalyticsCluster` CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

2. Filters for API events that are offloaded to a third-party system are defined in the `external.offload` section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the `ingestion` section.

   Ingestion filters - for API event data stored by API Connect
   Add the filter definition to the `ingestion` section:

   ```
   ingestion:
     ...
     filter: |
       if [api_name] == "test-api" {
         mutate {
           remove_field => ["query_string"]
         }
       }
   ```

   In this example, a conditional filter is used to apply the change to API event records where the API name is `test-api`.

   Offload filters - for API event data that is sent to a third-party system.
   Add the filter definition to the `external.offload` section:

   ```
   external:
     offload:
       filter: |
         mutate {
           remove_field => ["query_string"]
         }
   ```

   In this example, no conditional filter is used; the change is applied to all APIs.

   For more examples, see Example ingestion filters.

3. Save the changes. Updates to filters take effect after approximately 30 seconds.

Cloud Pak for Integration and OpenShift top-level CR

Define ingestion filters to customize API event data before it is stored or offloaded.

Procedure

1. Edit your `APIConnectCluster` CR:

   ```
   oc -n <namespace> edit APIConnectCluster
   ```

2. In the `analytics.spec` section, add your ingestion filter.
   Filters for API events that are offloaded to a third-party system are defined in the `external.offload` section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the `ingestion` section.

Ingestion filters - for API event data stored by API Connect
Add the filter definition to the **ingestion** section:

```
ingestion:
  ...
  filter: |
    if [api_name] == "test-api" {
      mutate {
        remove_field => ["query_string"]
      }
    }
```

In this example, a conditional filter is used to apply the change to API event records where the API name is **test-api**.

Offload filters - for API event data that is sent to a third-party system.
Add the filter definition to the **external.offload** section:

```
external:
  offload:
    filter: |
      mutate {
        remove_field => ["query_string"]
      }
```

In this example, no conditional filter is used; the change is applied to all APIs.

For more examples, see Example ingestion filters.

3. Save the changes. Updates to filters take effect after approximately 30 seconds.

VMware

Define ingestion filters to customize API event data before it is stored or offloaded.

About this task

Procedure

1. From your project directory, open the analytics-extra-values.yaml file for editing. If this file does not exist, then create it: Analytics extra-values file.
2. Inside the **spec** object of your analytics-extra-values.yaml file, define your ingestion filters.
   Filters for API events that are offloaded to a third-party system are defined in the **external.offload** section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the **ingestion** section.

   Ingestion filters - for API event data stored by API Connect
   Add the filter definition to the **ingestion** section:

   ```
   ingestion:
     ...
     filter: |
       if [api_name] == "test-api" {
         mutate {
           remove_field => ["query_string"]
         }
       }
   ```

   In this example, a conditional filter is used to apply the change to API event records where the API name is **test-api**.

   Offload filters - for API event data that is sent to a third-party system.
   Add the filter definition to the **external.offload** section:

   ```
   external:
     offload:
       filter: |
         mutate {
           remove_field => ["query_string"]
         }
   ```

   In this example, no conditional filter is used; the change is applied to all APIs.

   For more examples, see Example ingestion filters.

3. Ensure that your **extra-values-file** property is set to point to your analytics-extra-values.yaml file:

   ```
   apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
   ```

4. Apply the analytics-extra-values.yaml to your analytics subsystem:

   ```
   apicup subsys install <analytics subsystem>
   ```

Example ingestion filters

Review example ingestion filters to see how to add, modify, and delete fields from API event records.

You can use these example filters in the **ingestion.filter** and the **external.offload.filter** configurations. For more information about the filter syntax, see the Logstash documentation: https://www.elastic.co/guide/en/logstash/current/filter-plugins.html.

Add a field

You can add custom data to API event data by adding a field.

To avoid naming conflicts with future or current analytics fields, include a prefix that ensures your new field name is unique. For example, instead of naming the field **employee_num** you might name it **x_mycompany_employee_num**.

The following example copies the contents of the **X-Employee-Num** field from the request header and adds it to the **x_mycompany_employee_num** field.

```
if [request_http_headers] {
  ruby {
    code => "event.get('[request_http_headers]').collect {|i| event.set('[x_mycompany_employee_Num]', i['X-Employee-Num']) if
i.has_key?('X-Employee-Num')}"
  }
}
```

Modifying an existing field

Sometimes you don't want to remove a field entirely from your data, but you want to redact sensitive information such as IDs. You can modify the contents of a field and replace information with symbols or a message.

Remember: The following fields must not be modified if the data is being written to internal analytics storage: **org_id**, **catalog_id**, **space_id**, **developer_org_id**, **datetime**, and **@timestamp**.
The following example replaces sensitive information in the **X-Employee-Name** and **X-Employee-ID** request headers with the string: **********sanitized**********.

```
if [request_http_headers] {
  ruby {
    code => "headers=['X-Employee-Name','X-Employee-ID']; newHeaders = event.get('[request_http_headers]').collect {|i|
headers.each {|header| i[header] = '********sanitized********' if i.has_key?(header)}; i}; event.set('[request_http_headers]',
newHeaders)"
  }
}
```

Removing an existing field

Use the mutate **remove_field** operation to delete a field. To remove multiple fields, delimit the field names with commas.

The following example removes multiple fields (**request_http_headers**, **response_http_headers**, **request_body**, **response_body**, and **query_string**) from the API event record:

```
mutate {
  remove_field => ["request_http_headers", "response_http_headers", "request_body", "response_body", "query_string"]
}
```

Drop API event records

If you want certain API events to not be stored at all, use the **drop** syntax.

Do not store events from the **apic** and **sandbox** catalogs:

```
if  [catalog_name] =~ /sandbox|apic/ {
  drop { }
}
```

Access your analytics data

How to view, analyze, and export your analytics data.

- **API Connect UIs**
  View, query, and export your analytics data from the API Connect Analytics UIs.
- **Counting total API calls for your analytics service**
  Count the API calls for the analytics subsystem and see the total categorized by response status.
- **Export your analytics data**
  Export your analytics data with either the toolkit CLI or the REST API.
- **Allowing API Connect cloud admin users to view provider organization analytics data**
  The owner of a provider organization can enable or disable the sharing of analytics data with API Connect cloud administrators.
- **Sharing analytics data for API discovery**
  Share your provider organization's analytics data to enable API discovery.
- **Analytics CLI**
  How to access your analytics data with the toolkit CLI.
- **Analytics REST API**
  How to access your analytics data with the REST API.

API Connect UIs

View, query, and export your analytics data from the API Connect Analytics UIs.

- **Accessing analytics in the Cloud Manager UI**
  How to view, analyze, and export your analytics data from the Cloud Manager UI.
- **Accessing analytics in the API Manager UI**
  How to view, analyze, and export your analytics data from the API Manager UI.
- **Accessing analytics in the Developer Portal**
  How to view your analytics data from the Developer Portal.

Accessing analytics in the Cloud Manager UI

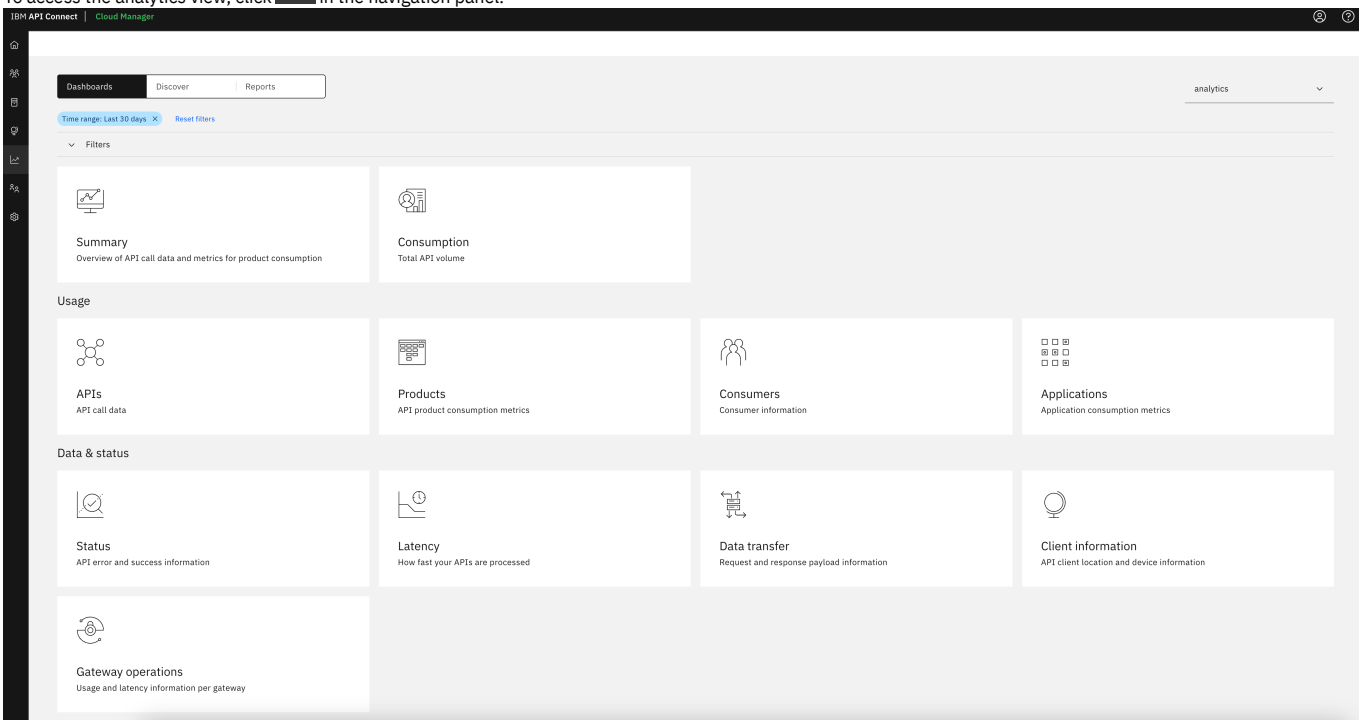
How to view, analyze, and export your analytics data from the Cloud Manager UI.

The Cloud Manager UI analytics view shows total API call volume data, and total call volumes per gateway.

The Cloud Manager UI analytics view also shows analytics data for provider organizations where the organization owner allows sharing of this data. For more information about analytics data sharing, see Allowing API Connect cloud admin users to view provider organization analytics data.
Note: If no provider organization owners enable data sharing with the cloud admin user, then the only analytics data you can see are on the following dashboards:

- Consumption: Total API calls in your cloud. Required for consumption-based licensing.
- Gateway Operations: Call volume and latency information for each gateway in each gateway service. This information can be used to determine whether load is being spread evenly or if a gateway is under-performing.

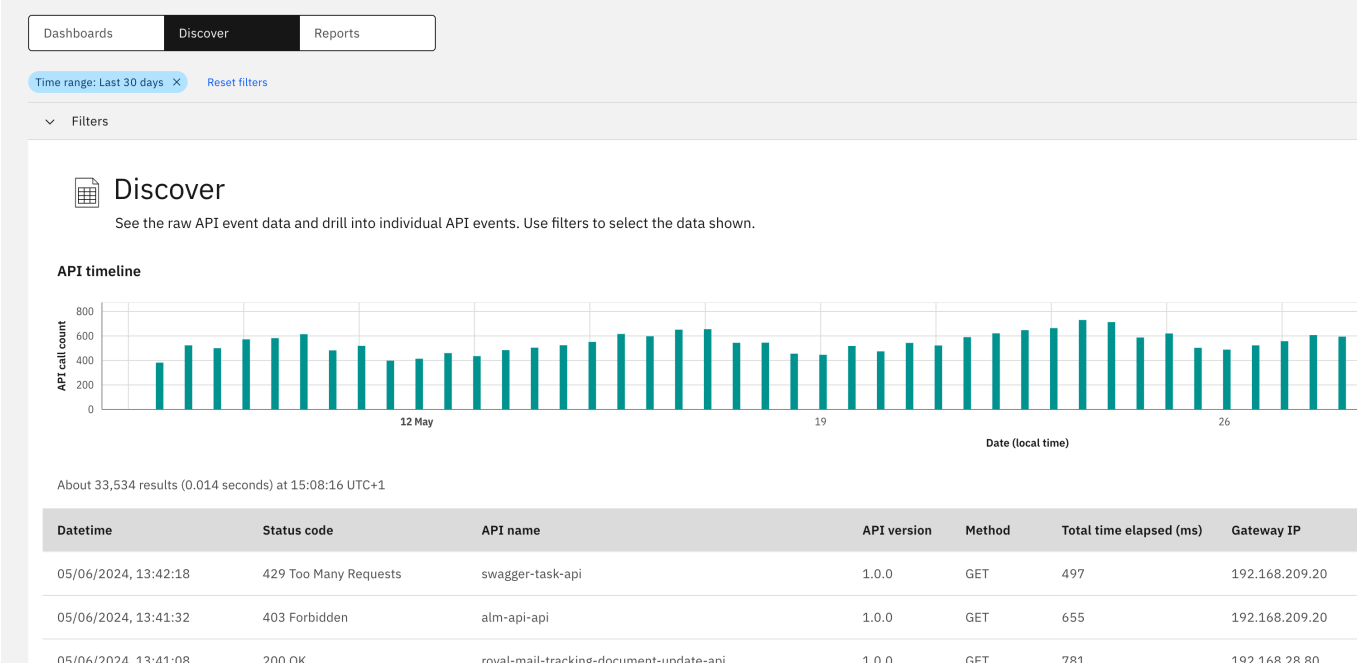
To access the analytics view, click in the navigation panel:



If you have multiple analytics services, use the list at the upper-right to select the analytics service whose API event data you want to view.

Discover view

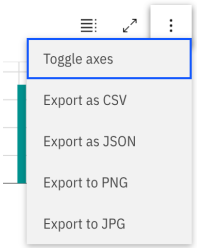
By default the Dashboards tab is displayed. To view your API calls over time, and in tabular form, select Discover:



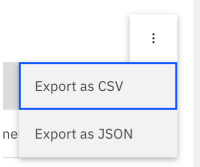
The maximum number of API events that can be accessed from the UI is 10,000. The maximum number of event records that can be displayed per page on the Discover view is 200.

You can customize the columns that are displayed in the Filters section.

You can switch the timeline chart to a logarithmic y axis, and export the data for the chart by clicking Actions at the upper right of the chart:



You can export the API event data from the table by clicking Actions at the upper right of the table:



Note: When you export from the Discover view, only the data that is displayed on the current page of results is exported. If you want to export the data from all pages, you must export separately from each page. To export all your analytics data, do not use the UI, see Export your analytics data.
If you see unexpected HTTP OPTIONS events in the Discover view, these events are due to CORS requests from browser-based API test tools. For more information about test tools and the OPTIONS call, see Testing an API.

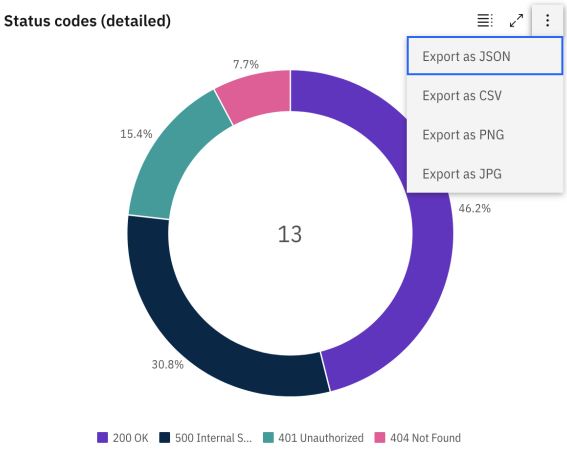
Dashboards view

The following dashboards are available:

- Summary: At a glance information on call volumes, latencies and when those calls are happening.
- Consumption: Total API calls in your cloud. Required for consumption-based licensing.
- APIs: Everything that you need to know about which APIs are being called and which ones aren't.
- Products : Which products are the most popular both in total and over time.
- Consumers: Determine which consumer organizations are making the most API calls in total and over time.
- Applications: Which applications are responsible for the most API calls both in total and over time.
- AI usage: Track AI token counts and model usage to see how AI services are being used.
- Status: Critical information on API call successes and failures, showing both success and failure rates over time along with an HTTP response code breakdown.
- Latency: How long APIs take to return a response, and the change in latency over time.
- Data transfer: All about request and response payloads. Which APIs, consumers and applications are responsible for the largest request and response payloads.
- Client information: Who is calling your APIs and from what devices.
  Note: Only internet-accessible IP addresses can be resolved to a geographical location. Internal IP addresses are ignored.

- Gateway Operations: Call volume and latency information for each gateway in each gateway service. This information can be used to determine whether load is being spread evenly or if a gateway is under-performing.

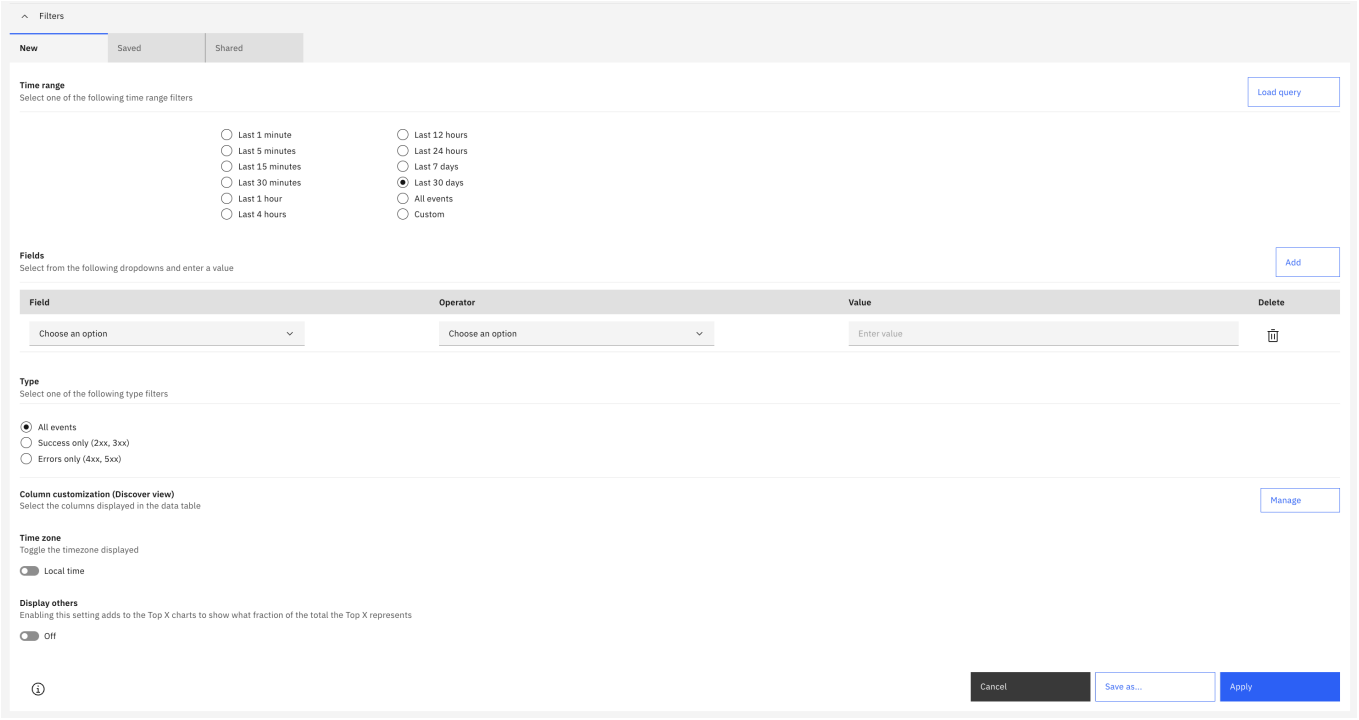
Each chart in a dashboard can be exported as a PNG or JPG image. The source data for each chart can be exported as a JSON or CSV file. To export a chart, click Actions at the upper right:



It is also possible to enlarge the chart to full-screen by clicking . To see the source data in tabular form click .

Filtering displayed data

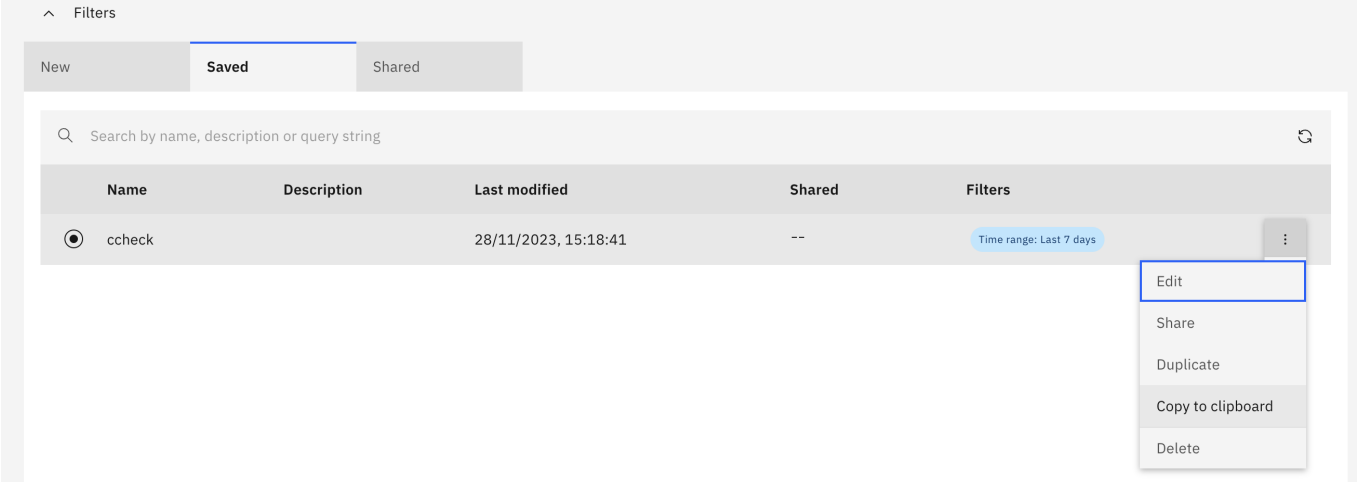
You can filter the data that is displayed in the Dashboards and Discover view by defining filters (also called "queries"). Expand the Filters section to view, define, and apply queries to your displayed data:



You can save and share the queries that you define:

- Shared queries are visible to all users at the same scope. They are not visible to users in a different scope. For example, a query that Cloud Manager UI users shares is not visible to an API Manager UI user. Within the API Manager UI, a query that is created at catalog scope is not visible to users who are viewing analytics data at provider organization scope.
- Other users cannot edit or delete queries that you share, but they can create a duplicate query, which they can edit and share.
- All queries have a name and an optional description. The name does not need to be unique.

Saved queries can be exported as strings for use in REST API and toolkit CLI queries, for example:



copies the following string to the clipboard:

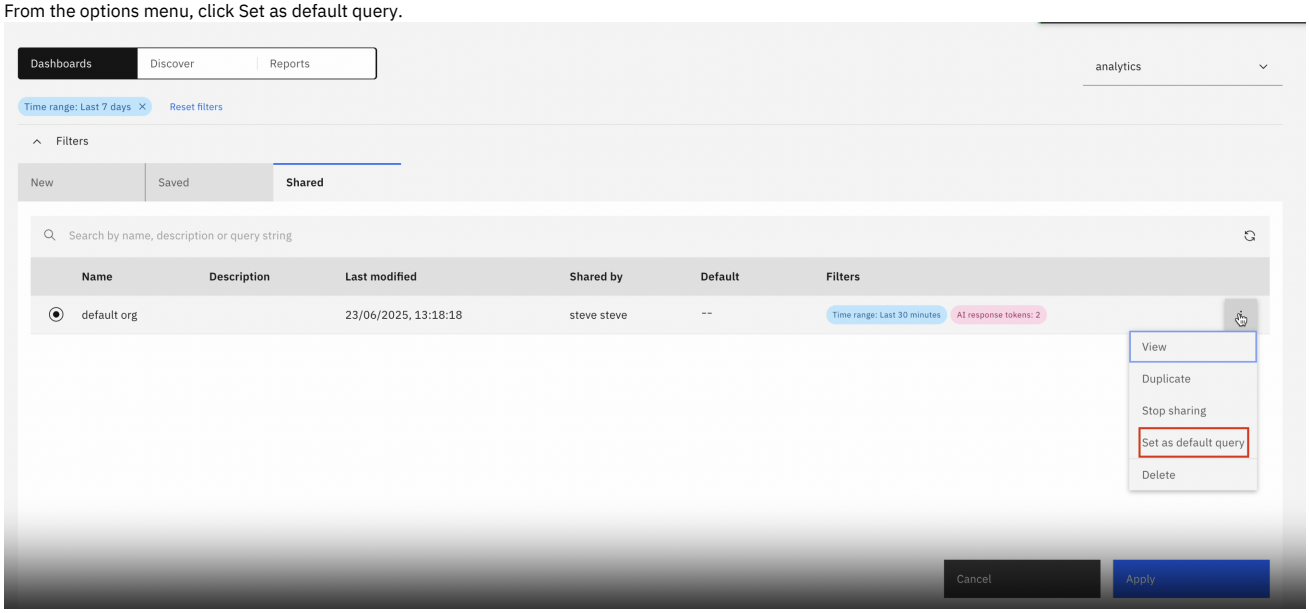
```
timeframe=last7days
```

Set a default query in analytics

You can now set a default query that is automatically applied when you visit the Dashboard or Discover pages in Analytics. The default query is configured per user and per scope (organization, catalog, or space).
Note:

- Only shared queries can be set as default queries.
- Each scope can have one default query per user. A different default query can be set for each catalog and space.

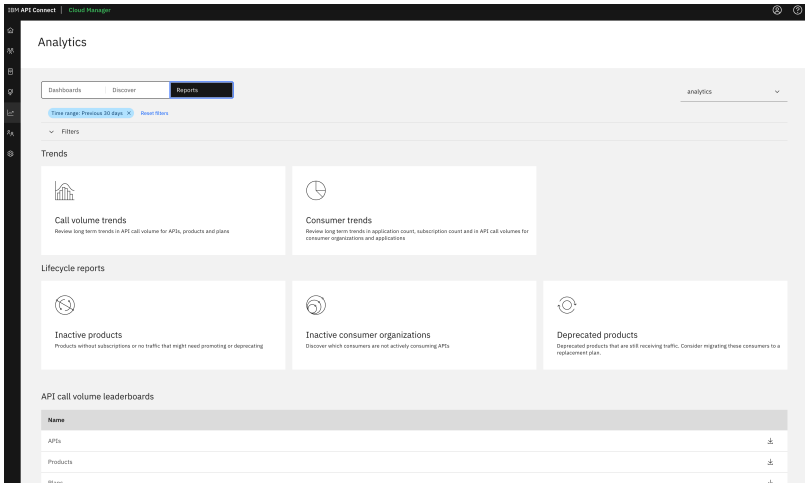
1. Ensure that the query you want to set as default is saved.
2. To share the saved query, complete the following steps.
   - Click Saved tab.
   - From the options menu, click Share.
   - In Share query window, click Share.
3. Click Shared tab.
4. From the options menu, click Set as default query.



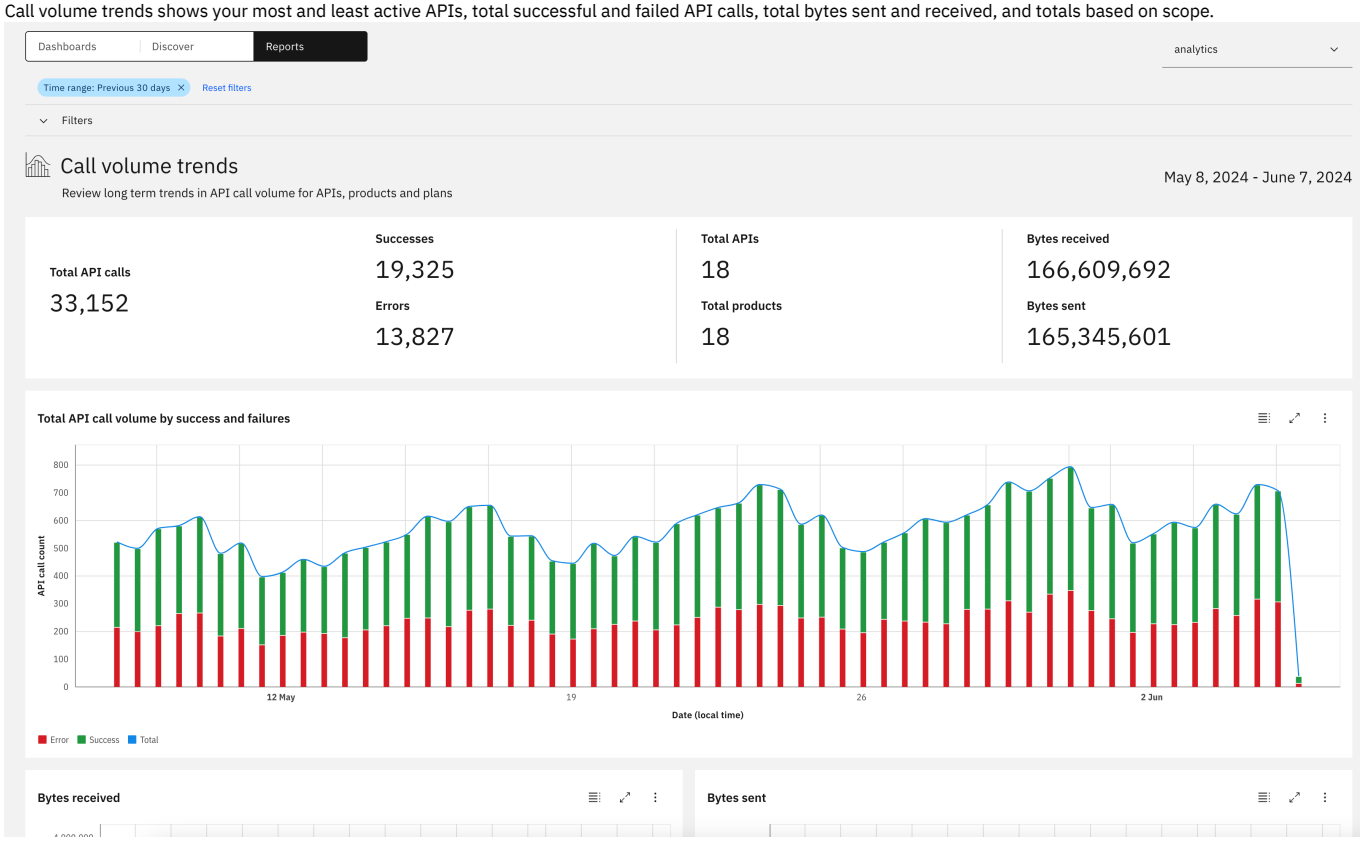
5. In Default query window, click Default.
6. To apply the default query immediately. Click Apply. The default query is applied immediately for all users in that scope. If you do not click Apply after setting the default query, it is automatically applied the next time you visit the Dashboard or Discover tabs.

Reports view

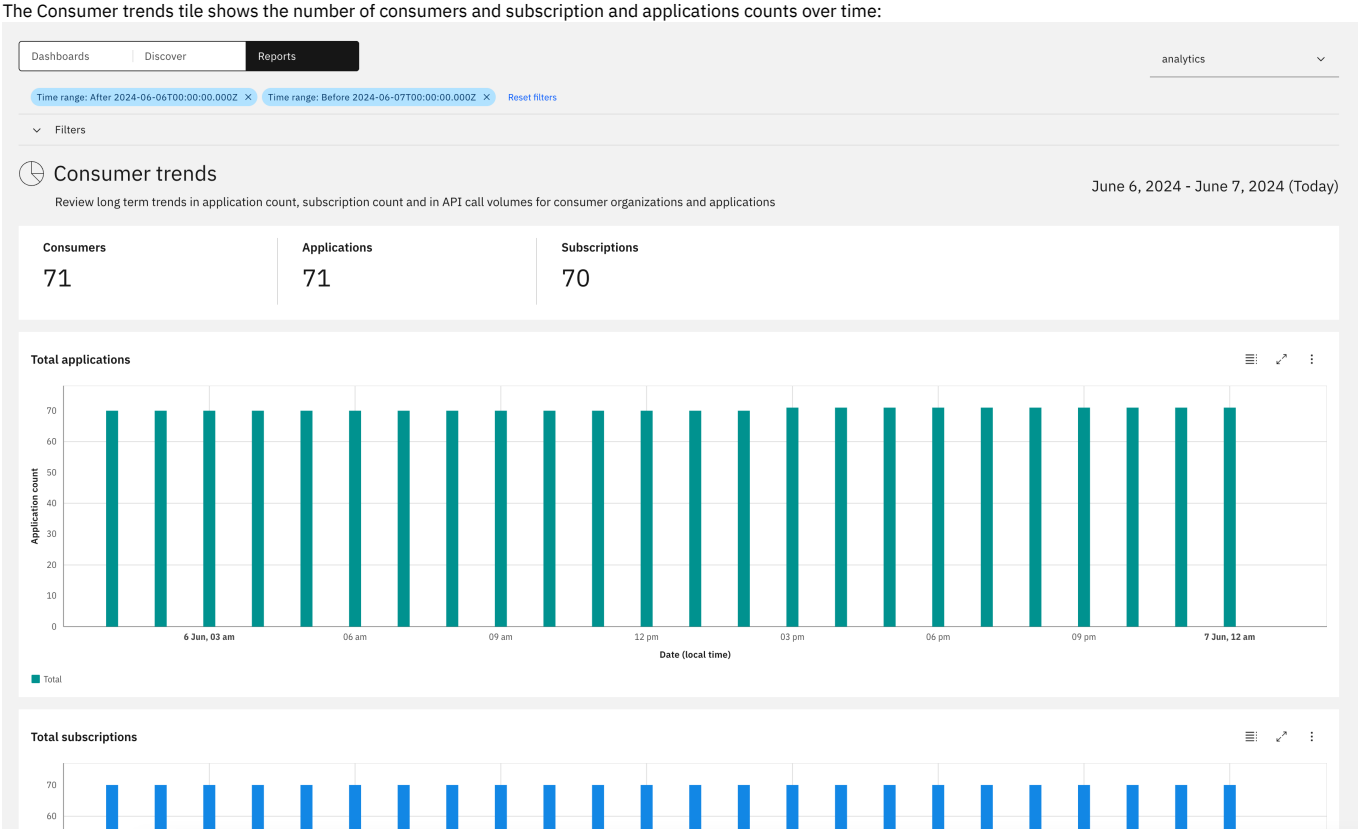
The reports view displays long-term summary data rather than individual API events.
Note: The reports view was introduced in v10.0.6, and does not include data that was generated before upgrade to v10.0.6.
The reports view contains 5 tiles and an API call volume leaderboard



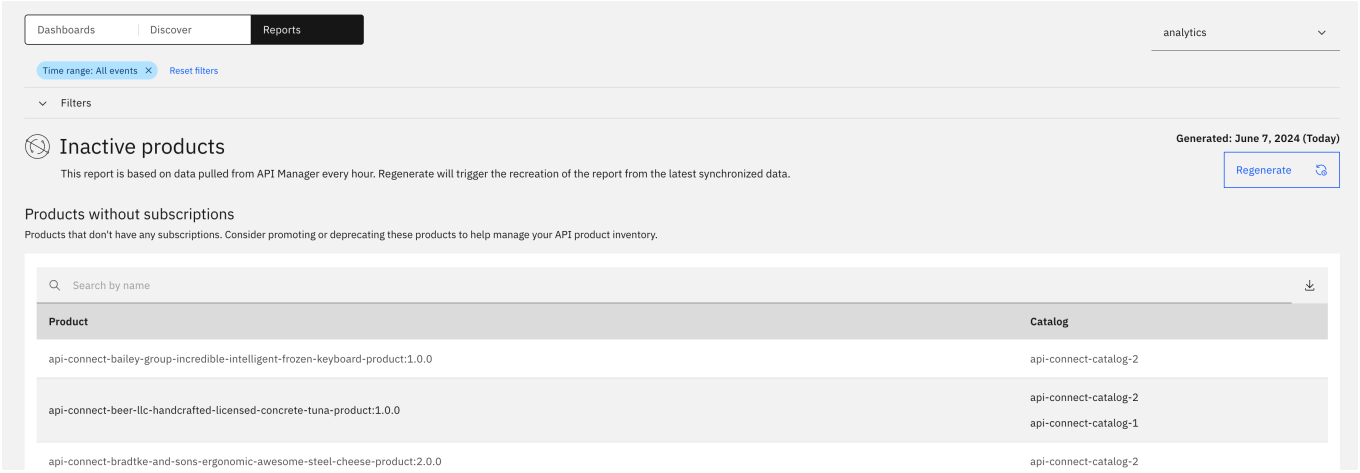
Call volume trends shows your most and least active APIs, total successful and failed API calls, total bytes sent and received, and totals based on scope.



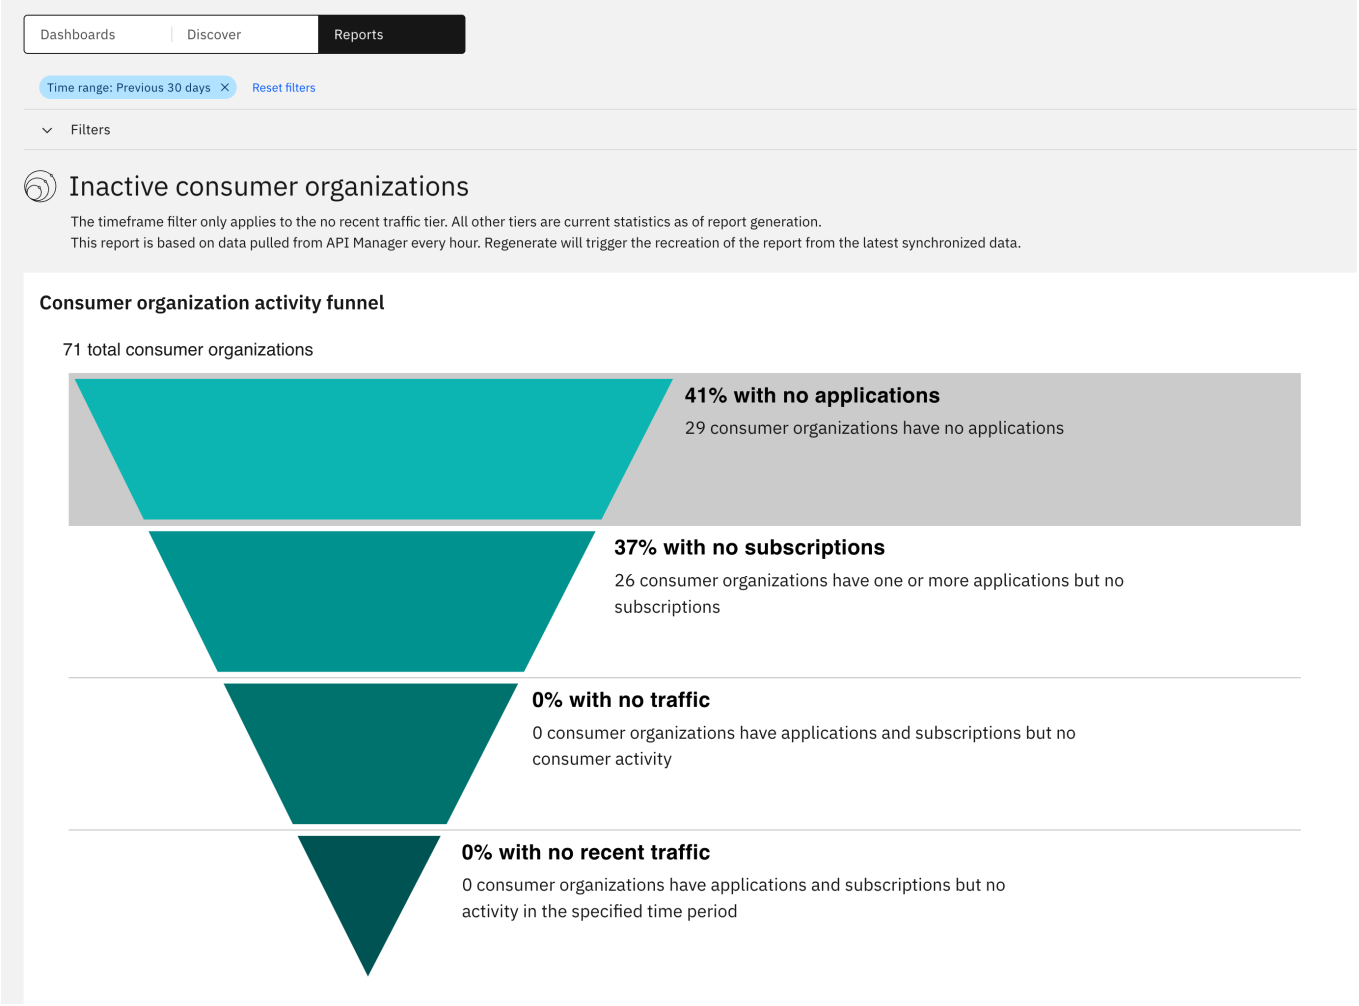
The Consumer trends tile shows the number of consumers and subscription and applications counts over time:



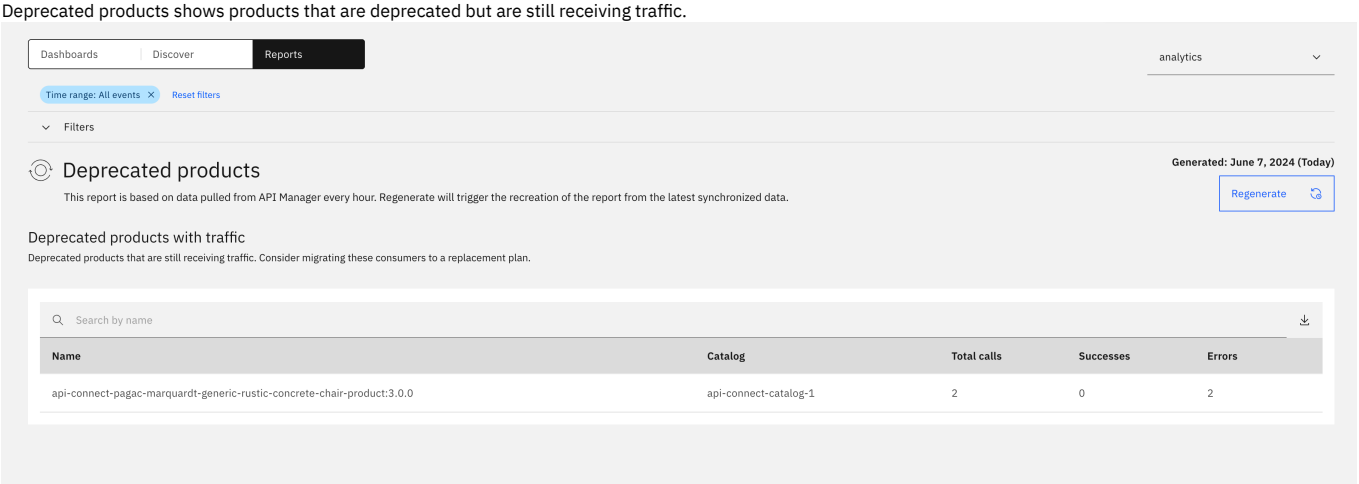
Inactive products shows products that have no subscriptions, and products that have no traffic.



Inactive consumer organizations shows consumer organizations that have no applications, subscriptions, recent traffic, or no traffic at all.



Deprecated products shows products that are deprecated but are still receiving traffic.



API call volume leaderboards shows leaderboards for APIs, Products, Plans, Applications, Consumer organizations. Click in the name column to see the data for each item.

Accessing analytics in the API Manager UI

How to view, analyze, and export your analytics data from the API Manager UI.

Analytics data is displayed in dashboards in the API Manager UI. Dashboards are scoped at the provider organization, catalog, and space level.

The ability to access analytics data at a catalog or space level depends on your assigned roles and permissions. For more information about catalogs and spaces, see Working with catalogs and Using syndication in API Connect.

To access the analytics dashboard, complete the following steps:

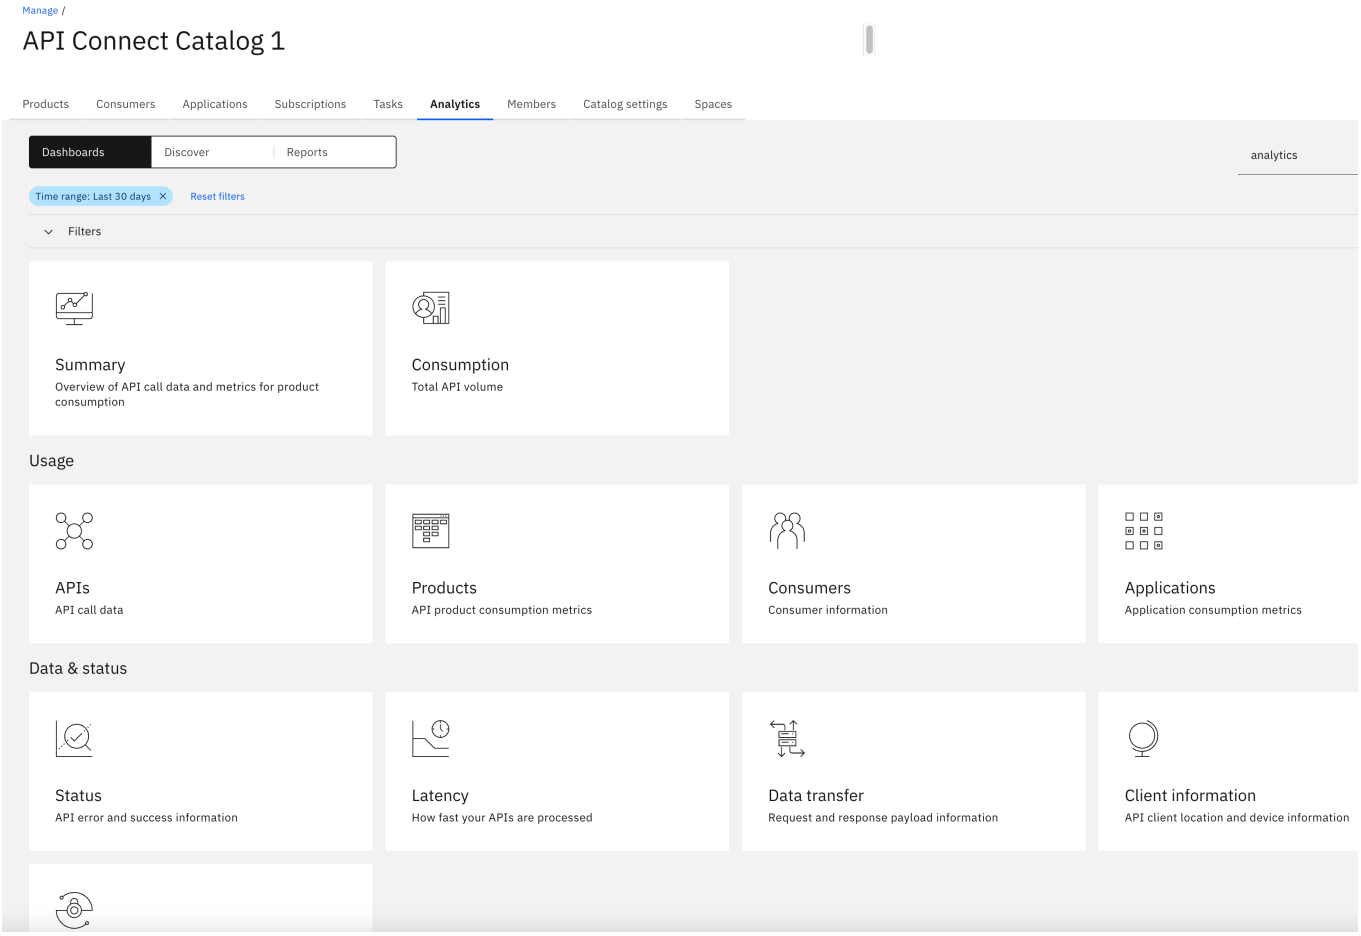
1. In the API Manager UI, select Manage in the navigation panel.
2. From the list of available catalogs in the API Manager Dashboard, select the required catalog.
3. If spaces are enabled and want to see analytics at the scope of a space, then:
   a. Click the Spaces tab.
   b. Select the space that you want to view.
4. Click the Analytics tab.

Analytics dashboards

The analytics dashboards in the API Manager UI show the API event data at the scopes of provider organization, catalog, and space.

The provider organization scoped dashboards are accessed from the analytics icon in the navigation panel.

Catalog scoped dashboards are accessed from the Analytics tab when viewing the catalog:



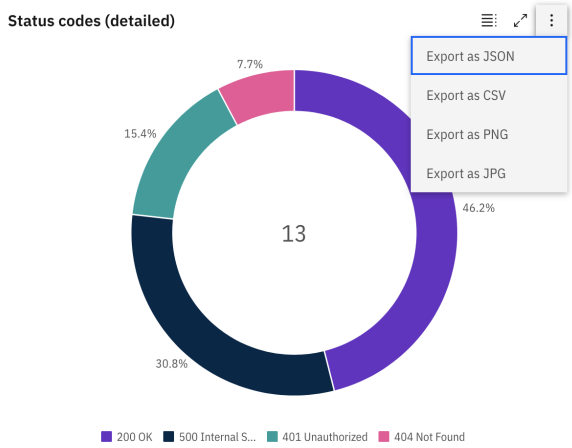
The space scoped dashboards are accessed from the Analytics tab when viewing the space.

The following dashboards are available:

- Summary: At a glance information on call volumes, latencies and when those calls are happening.
- Consumption: Total API calls in your cloud. Required for consumption-based licensing.
- APIs: Everything that you need to know about which APIs are being called and which ones aren't.
- Products : Which products are the most popular both in total and over time.
- Consumers: Determine which consumer organizations are making the most API calls in total and over time.
- Applications: Which applications are responsible for the most API calls both in total and over time.
- AI usage: Track AI token counts and model usage to see how AI services are being used.
- Status: Critical information on API call successes and failures, showing both success and failure rates over time along with an HTTP response code breakdown.
- Latency: How long APIs take to return a response, and the change in latency over time.

- Data transfer: All about request and response payloads. Which APIs, consumers and applications are responsible for the largest request and response payloads.
- Client information: Who is calling your APIs and from what devices.
  Note: Only internet-accessible IP addresses can be resolved to a geographical location. Internal IP addresses are ignored.
- Gateway Operations: Call volume and latency information for each gateway in each gateway service. This information can be used to determine whether load is being spread evenly or if a gateway is underperforming.

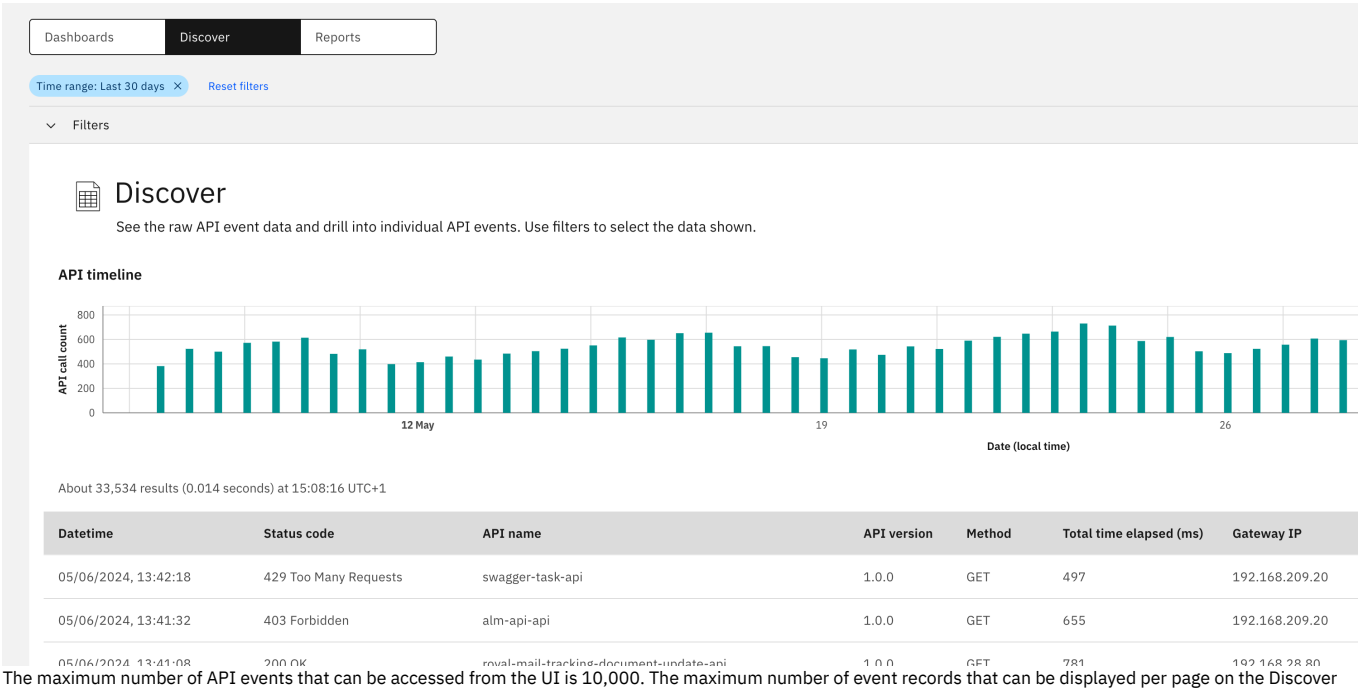
Each chart in a dashboard can be exported as a PNG or JPG image. The source data for each chart can be exported as a JSON or CSV file. To export a chart, click Actions at the upper right:



It is also possible to enlarge the chart to full-screen by clicking . To see the source data in tabular form click .

Discover view

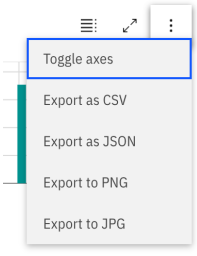
By default the Dashboards tab is displayed. To view your API event data in tabular form, select Discover:



The maximum number of API events that can be accessed from the UI is 10,000. The maximum number of event records that can be displayed per page on the Discover view is 200.

You can customize the columns displayed in the Filters section. You can sort the table in ascending or descending order by clicking on the column headers.

You can switch the timeline chart to a logarithmic y axis, and export the data for the chart by clicking Actions at the upper right of the chart:

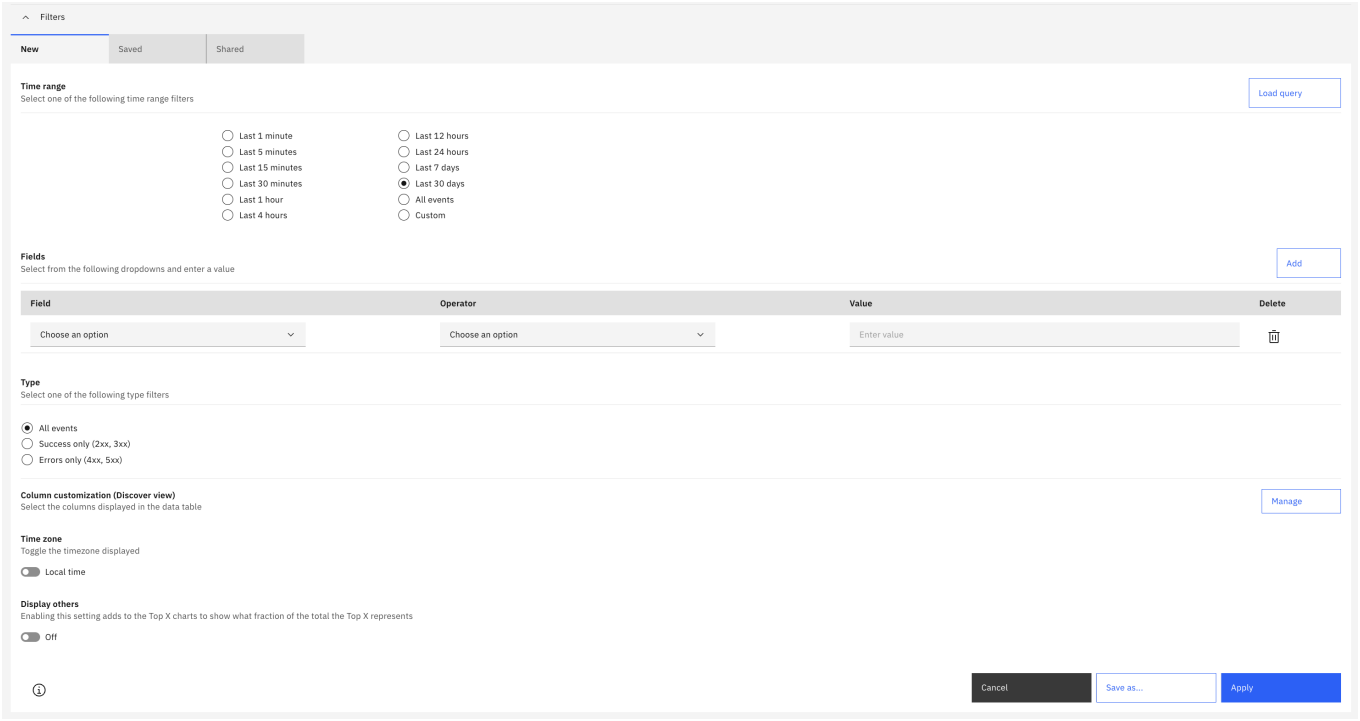


You can export the API event data from the table by clicking Actions at the upper right of the table:

Note: When you select Export as CSV or Export as JSON to export from the Discover view, only the data that is displayed on the current page of results is exported. To export data from all pages, select Full data as CSV or Full data as JSON option. You can also export all your analytics data using the toolkit CLI. For more information, see Export your analytics data.
If you see unexpected HTTP OPTIONS events in the Discover view, these events are due to CORS requests from browser-based API test tools. For more information about test tools and the OPTIONS call, see Testing an API.

Filtering displayed data

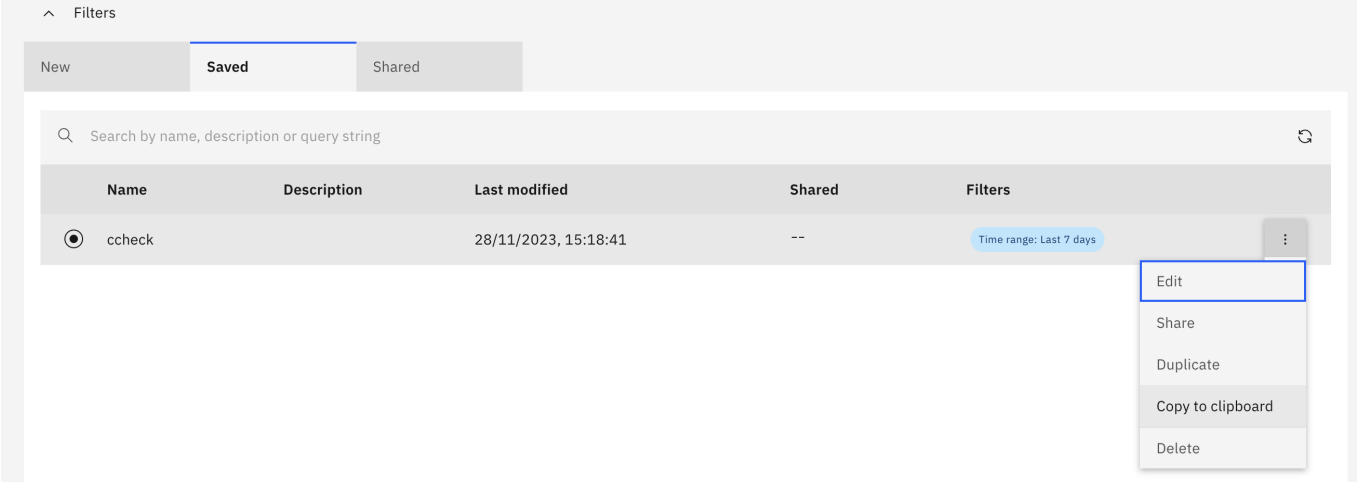
You can filter the data that is displayed in the Dashboards and Discover view by defining filters (also called "queries"). Expand the Filters section to view, define, and apply queries to your displayed data:



You can save and share the queries that you define:

- Shared queries are visible to all users at the same scope. They are not visible to users in a different scope. For example, a query that Cloud Manager UI users shares is not visible to an API Manager UI user. Within the API Manager UI, a query that is created at catalog scope is not visible to users who are viewing analytics data at provider organization scope.
- Other users cannot edit or delete queries that you share, but they can create a duplicate query, which they can edit and share.
- All queries have a name and an optional description. The name does not need to be unique.

Saved queries can be exported as strings for use in REST API and toolkit CLI queries, for example:



copies the following string to the clipboard:

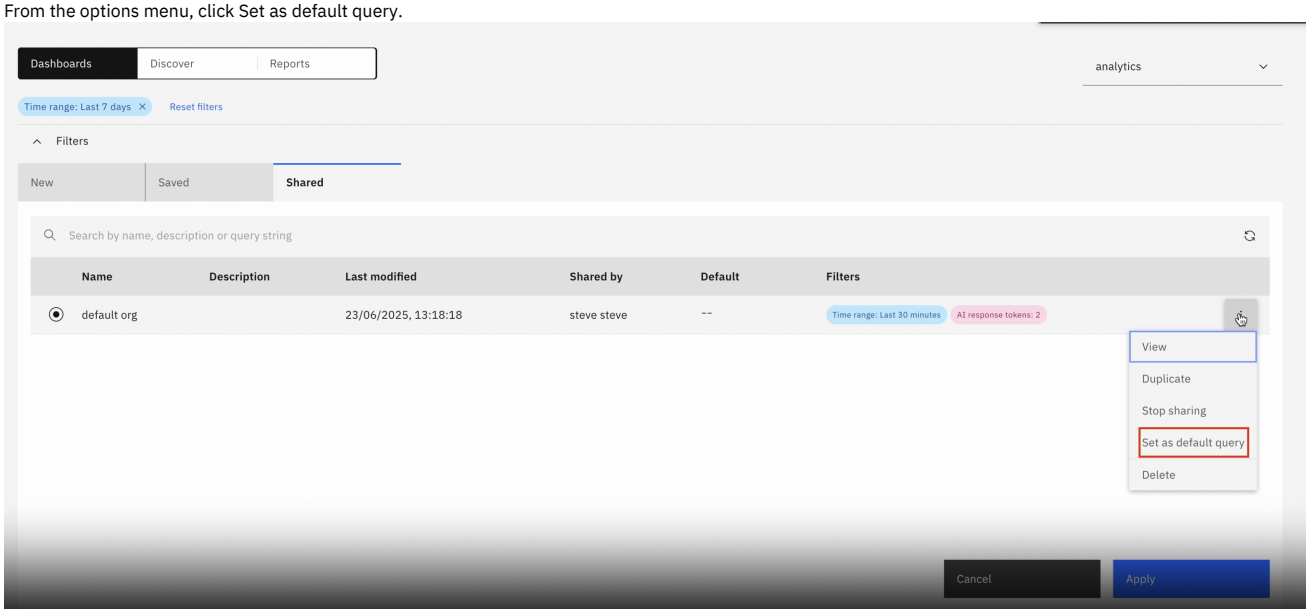
```
timeframe=last7days
```

Set a default query in analytics

You can now set a default query that is automatically applied when you visit the Dashboard or Discover pages in Analytics. The default query is configured per user and per scope (organization, catalog, or space).
Note:

- Only shared queries can be set as default queries.
- Each scope can have one default query per user. A different default query can be set for each catalog and space.

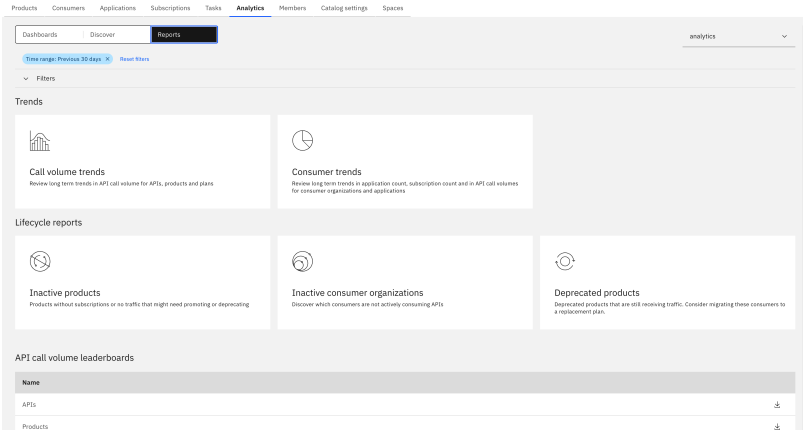
1. Ensure that the query you want to set as default is saved.
2. To share the saved query, complete the following steps.
   - Click Saved tab.
   - From the options menu, click Share.
   - In Share query window, click Share.
3. Click Shared tab.
4. From the options menu, click Set as default query.



5. In Default query window, click Default.
6. To apply the default query immediately. Click Apply. The default query is applied immediately for all users in that scope. If you do not click Apply after setting the default query, it is automatically applied the next time you visit the Dashboard or Discover tabs.

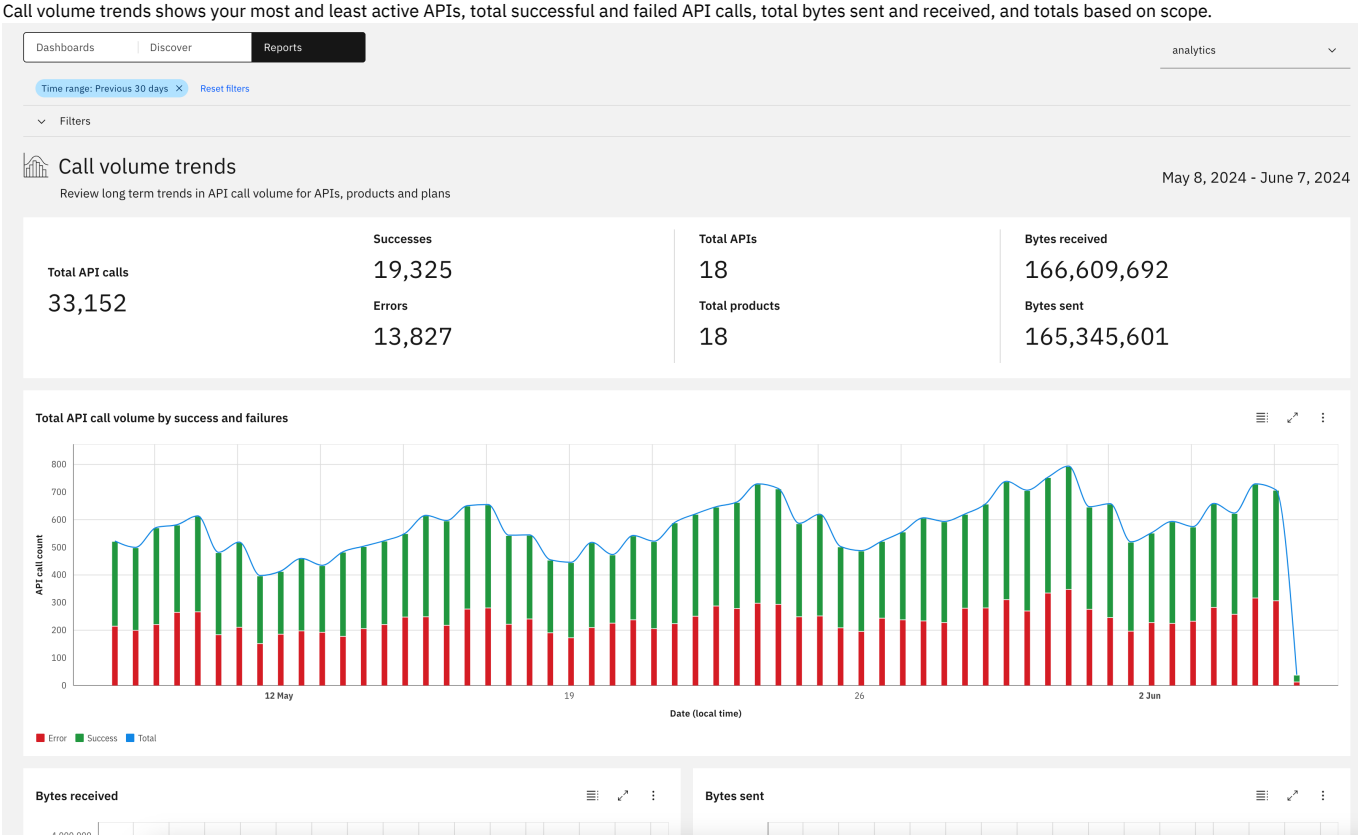
Reports view

The reports view displays long-term summary data rather than individual API events.

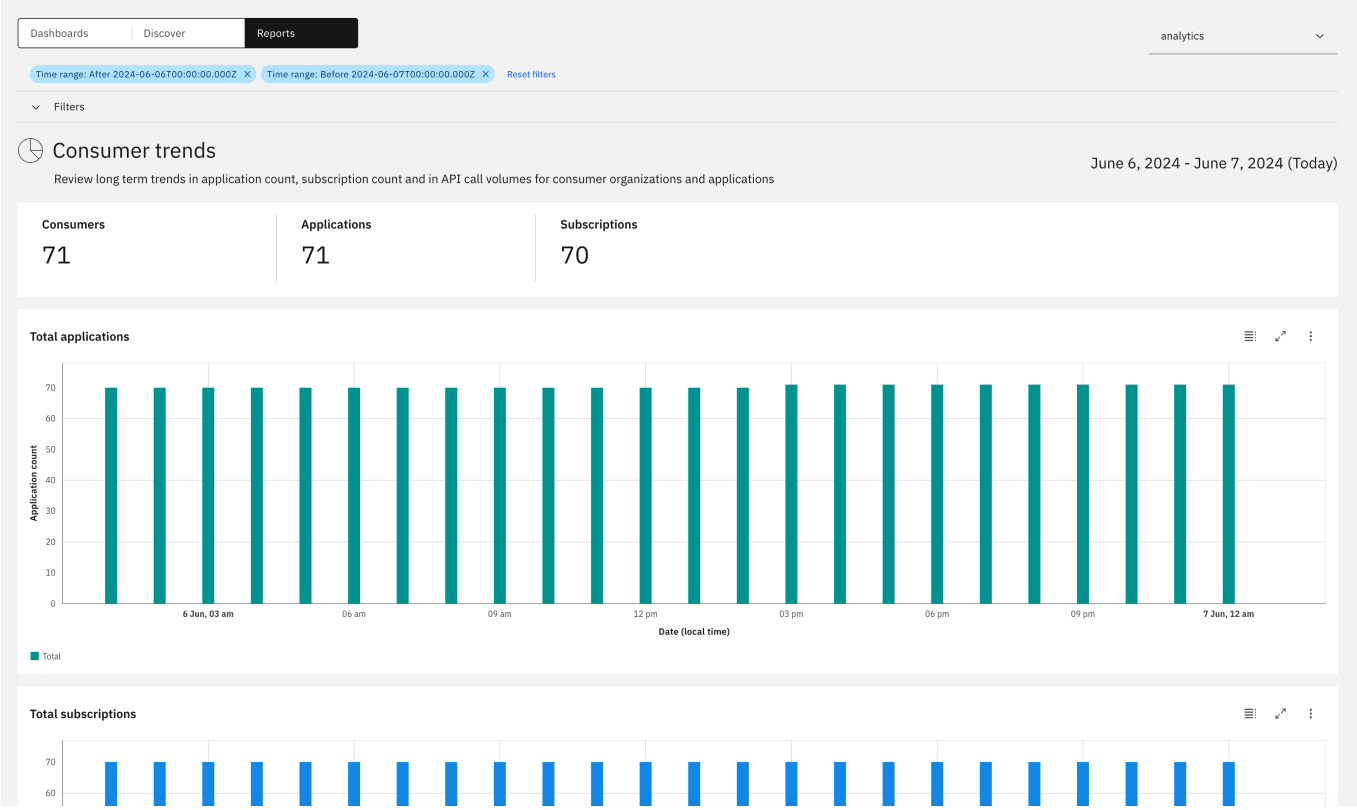


Note: The reports view was introduced in v10.0.6, and does not include data that was generated before upgrade to v10.0.6.

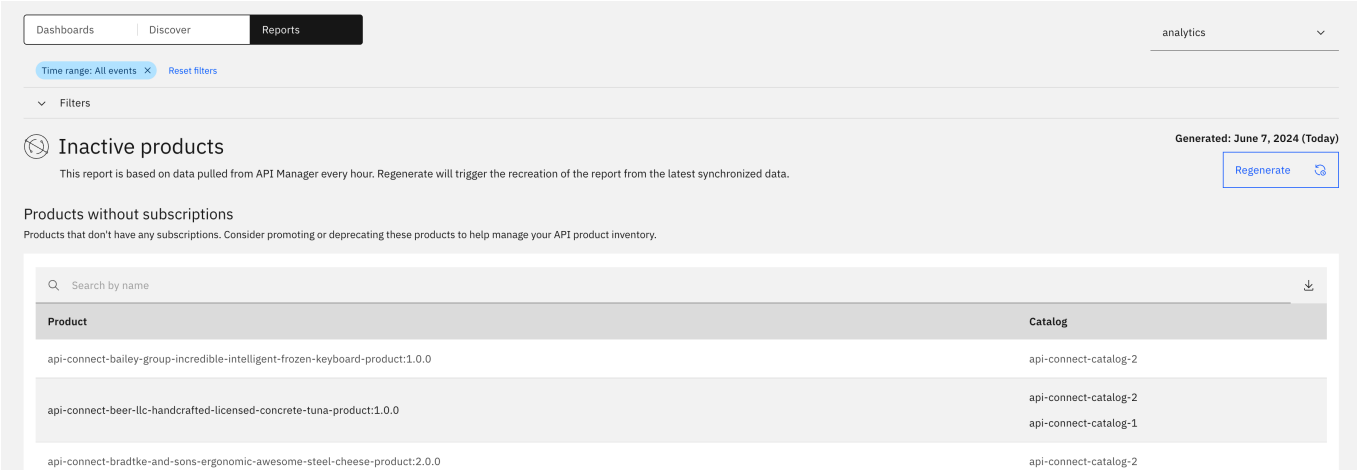
Call volume trends shows your most and least active APIs, total successful and failed API calls, total bytes sent and received, and totals based on scope.



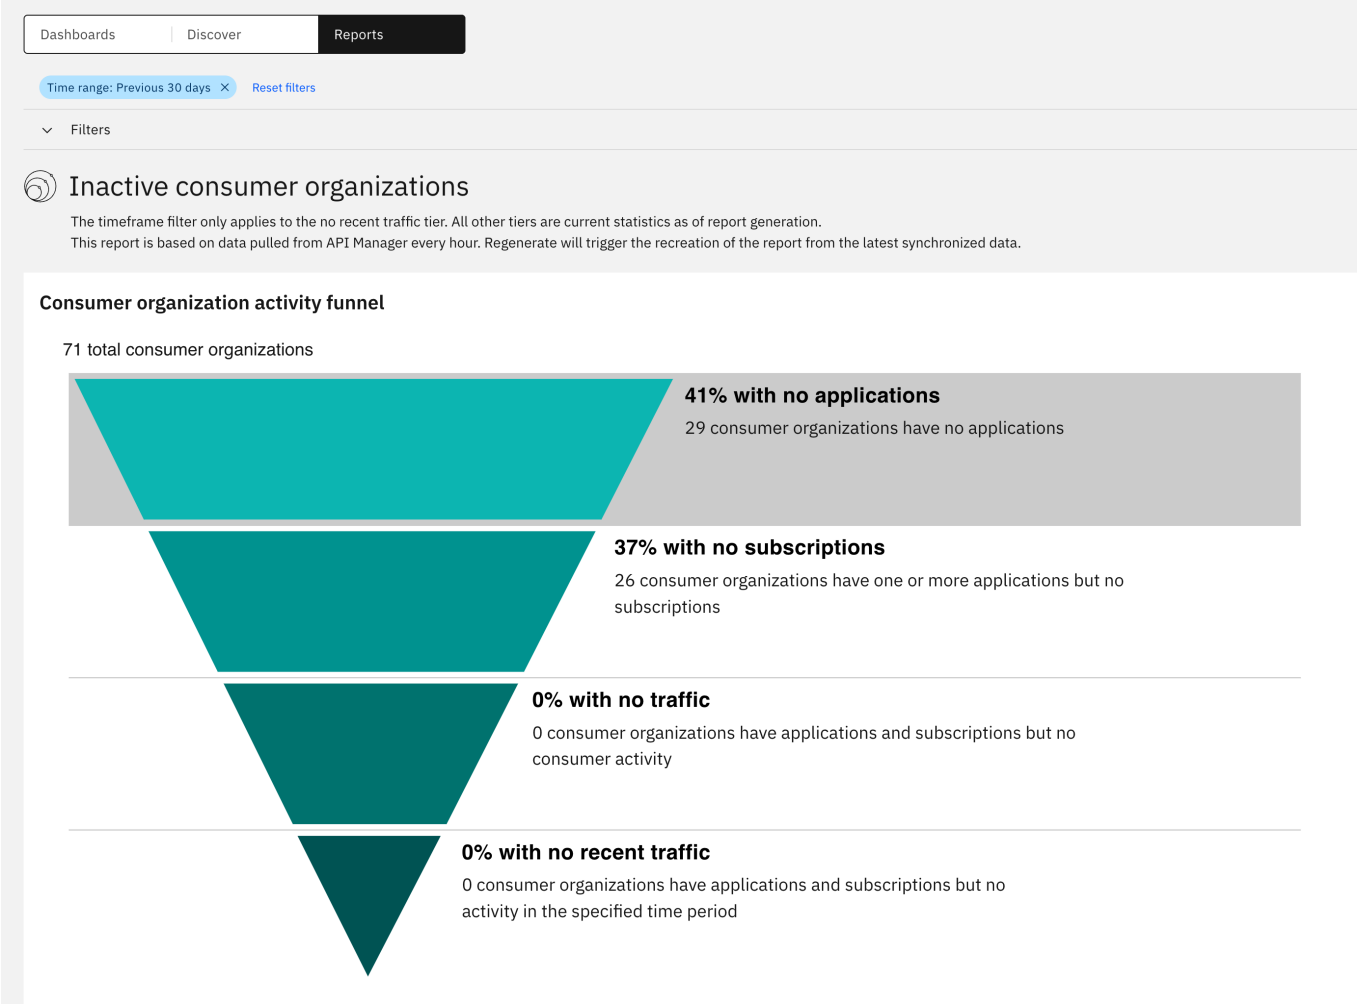
Consumer trends shows the number of consumers and subscription and applications counts over time:



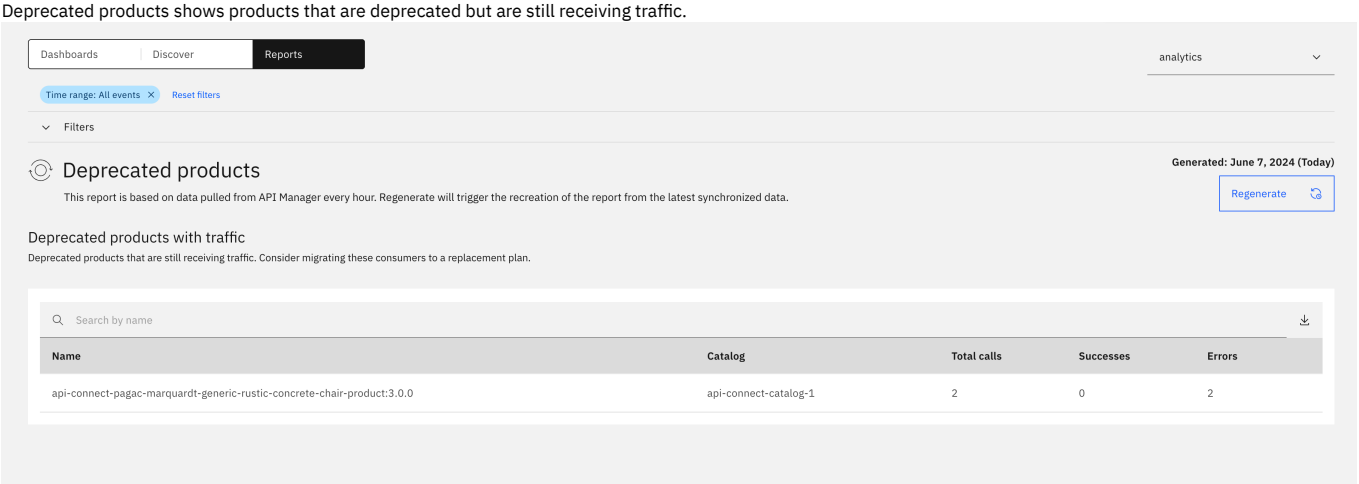
Inactive products shows products that have no subscriptions, and products that have no traffic.



Inactive consumer organizations shows consumer organizations that have no applications, subscriptions, recent traffic, or no traffic at all.



Deprecated products shows products that are deprecated but are still receiving traffic.



The API call volume leaderboards section shows leaderboards for APIs, Products, Plans, Applications, Consumer organizations. Click in the name column to see the data for each item.

Accessing analytics in the Developer Portal

How to view your analytics data from the Developer Portal.

Restriction: The Developer Portal sites show analytics data from the analytics service that is associated with the gateways that are used by the catalog. If a Developer Portal site's catalog uses more than one gateway service, then those gateway services must be associated with the **same** analytics service. If multiple analytics services are used by a catalog's gateways, then no analytics data is shown in the portal site corresponding to that catalog. Analytics services are associated with gateway services in the Cloud Manager UI, see Associating an analytics service with a gateway service.

Viewing organization scoped analytics data

1. Click the arrow next to your consumer organization name on the Developer Portal home page, and click My organization.
2. Click the Analytics tab.

From the Analytics tab, you can see your organization analytics, which include: API statistics, total calls, and total errors.

Viewing application scoped analytics data

1. Click Apps from the Developer Portal dashboard.
2. Click the name of the application for which you want to view analytics data.

From the Dashboard tab, you can see your application analytics, which include: API statistics, total calls, and total errors.

Counting total API calls for your analytics service

Count the API calls for the analytics subsystem and see the total categorized by response status.

Note: If your API Connect bases costs on usage, you can use the following methods to track this information so that you can accurately report it. If your organization did not deploy the analytics subsystem, then this feature is not available. If you deployed analytics but offload your data and disabled local storage, then you must capture usage information from the third-party system where you offload data.
You can see the total API calls over time for each analytics service in the consumption dashboard or report in the Cloud Manager UI.

Alternatively, the Analytics CLI can be used to get your API count:

1. Login as the cloud admin user:

   ```
   apic login --server <platform api endpoint> --username admin --realm admin/default-idp-1
   ```

2. Use the following CLI command to retrieve a count of all analytics events recorded by the analytics service:

   ```
   apic -m analytics events:cloudCount --server <platform api endpoint> --analytics-service <analytics service name> --format
   json
   ```

   where *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.
3. If required, additional filters can be applied to the results. For example, `--timeframe last12hours`. See the `help` output from: `apic -m analytics events:cloudCount -h` for more details.

Export your analytics data

Export your analytics data with either the toolkit CLI or the REST API.

The analytics export function in the UIs export just the data that is displayed in the UI, and is limited to 200 API events per page.

To export up to 10,000 API event records, use the toolkit CLI.

To export all your analytics data, use the REST API.
Note: If you plan to export you API event data regularly, consider using the offload feature instead. See Offload to third-party systems.

Exporting with the toolkit CLI

1. Follow the steps to install and configure the toolkit CLI.
2. Login with the correct user for the scope of analytics data you want to export. For example, to export all API event from a provider organization called `prod`, login as a member of that organization:

   ```
   apic login --server <platform api endpoint> --username <provider org member> --realm provider/default-idp-2
   ```

3. Use the `events` command to export your analytics data. For example, to export the events for a provider organization:

   ```
   apic -m analytics events:orgList --server <platform api endpoint> --analytics-service <analytics service name> --org <org
   name> --format=json
   {
       "total": 200,
       "search_time": 7,
       "events": [
           {
   ```

```
            "log_policy": "activity",
...
```

Note: Data is returned as a JSON array, each element is a single API event record.

Exporting with the REST API

1. Follow the steps to get started with the Analytics REST API.
2. Use the `events` API to export your data. For example, to get all analytics API event records from a provider organization, specify the organization's API path:

```
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url
'https://<management_server_api_endpoint>/analytics/<analytics_service>/orgs/<provider_organization>/events'

{
    "total": 45543,
    "search_time": 36,
    "events": [...]
```

To get just the events for a catalog, specify the catalog in the API path; for example:

`/analytics/<analytics_service>/catalogs/<provider_organization>/<catalog>/events`

Allowing API Connect cloud admin users to view provider organization analytics data

The owner of a provider organization can enable or disable the sharing of analytics data with API Connect cloud administrators.

About this task

Beginning with API Connect version 10.0.7.0, analytics data is not shared with cloud admins by default; the owner of a provider organization must enable the sharing of analytics data with cloud admins.

This setting does not apply to total API call volume data. Cloud admins can always see the total volume of API calls across all provider organizations and for specific gateways. The setting applies only to analytics data that identifies the provider organization.

Procedure

To enable sharing of analytics data with cloud administrators, complete the following steps.

1. In API Manager, click Settings > Analytics > Share analytics data.
2. Click the slider to set it to On.

Sharing analytics data for API discovery

Share your provider organization's analytics data to enable API discovery.

About this task

API discovery is an optional add-on to IBM® API Connect that can be used to discover and add APIs to your API development process. For more information about the API discovery feature, see Configuring a DataPower API Gateway proxy collector for API discovery.

Procedure

To enable API discovery, complete the following steps.

1. In API Manager, click Settings > Analytics > Share analytics data.
2. Click the slider to set it to On.

Analytics CLI

How to access your analytics data with the toolkit CLI.

About this task

The toolkit CLI provides commands for viewing your analytics data, and also for configuring analytics storage settings. To view organization scoped event data, login to the toolkit CLI with provider organization user credentials. To view cloud scoped event data and analytics storage settings, login to the toolkit CLI as the cloud admin user.

Procedure

1. Install the toolkit: Setting up the API Connect toolkit
2. Log in with the CLI.
   For example:

```
apic login --server <platform api endpoint> --username <username> --realm <realm>
```

Where:

- *<platform api endpoint>* is the FQDN or base URL of your platform API endpoint, for example: `platform.example.com` or `https://platform.example.com`
- *<username>* is the provider org owner. To access cloud scoped data, login as the admin user.
- *<realm>* is the user registry realm for the specified *<username>*. By default the realm for provider organization owners is `provider/default-idp-2`. The realm for cloud admin users is `admin/default-idp-1`.

For more information, see: Toolkit CLI Login.

3. View the available toolkit analytics commands by using `-m analytics -h`. Example:

```
apic -m analytics -h

...
Available Commands:

  Creating applications and artifacts
     config                                  Manage configuration variables

  Publishing to the cloud
     clustermgmt                             Clustermgmt operations
     dashboards                              Dashboards operations
     events                                  Events operations
     filterparams                            Filterparams operations

  Other commands
     licenses                                Review the license for API Connect
     validate                                Validate an API or product definition
     version                                 Get the API Connect toolkit version
...
```

4. View your analytics events by using the `events` commands:

```
apic -m analytics events -h
Type "apic [command] --help" for help on the following related commands:
      events:catalogCount  Count events at catalog scope.
      events:catalogGet    Get specific event at catalog scope.
      events:catalogList   List events at catalog scope.
      events:cloudCount    Count events at cloud scope.
      events:cloudGet      Get specific event at cloud scope.
      events:cloudList     List events at cloud scope.
      events:orgCount      Count events at organization scope.
      events:orgGet        Get specific event at organization scope.
      events:orgList       List events at organization scope.
      events:spaceCount    Count events at space scope.
      events:spaceGet      Get specific event at space scope.
      events:spaceList     List events at space scope.

# To get a count of all API events at cloud level:
apic -m analytics events:cloudCount --analytics-service <analytics service name> --server <management server api endpoint>
--format=json
{
    "total": 200
}

# To get all the cloud level events:
apic -m analytics events:cloudList --analytics-service <analytics service name> --server <management server api endpoint>
--format=json
{
    "total": 200,
    "search_time": 7,
    "events": [
        {
            "log_policy": "activity",
...
```

Analytics REST API

How to access your analytics data with the REST API.

Before you begin

API Connect REST API calls are authenticated by using a bearer token in the authorization header. Use the toolkit credentials to request a bearer token. Toolkit credentials can be found in the API Manager UI:

1. Log in to the API Manager UI.
2. From the home page, click the Download toolkit tile.
3. Download the Toolkit credentials.
4. Open the downloaded `credentials.json` file:

```
...
  "toolkit": {
    "endpoint": "https://mgmt.api.example.com/api",
    "client_id": "7409693f-f726-48b4-8909-7c0d26f13e81",
    "client_secret": "5feeb0be-17f8-41a4-96d6-d40f33d69ef6"
  },
...
```

Take note of the `toolkit.client_id`, `toolkit.client_secret`, and `toolkit.endpoint` from this file. You use these values to get your bearer token.

Procedure

1. Create an API key. For more information about how to create an API key, see Management platform REST API keys.
2. Use your credentials to request a bearer token:

```
curl -v -k -X POST -d '{"api_key": "<api_key>", "client_id": "<client_id>", "client_secret": "<client_secret>",
"grant_type": "api_key"}' -H 'Content-Type: application/json' -H 'Accept: application/json'
https://<management_server_platform_api_endpoint>/api/token
```

   Where:
   - *<api-key>* is the API key you have generated.
   - *<client_id>* is the client ID from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
   - *<client_secret>* is the client secret from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.

   The bearer token is returned in the access_token property:

```
{
    "access_token": "<bearer_token>",
    "token_type": "Bearer",
    "expires_in": 28800
}
```

   Note the `expires_in` value, which is the number of seconds before the token expires. After expiry, you must request a new bearer token.

3. Use the returned bearer token to call the analytics REST API:

```
# This call to /orgs/<provider_organization>/events requires a bearer token that was requested with provider org
credentials:
curl -k -H 'Authorization: Bearer <bearer_token>' -X GET --url 'https://<platform api
endpoint>/analytics/<analytics_service>/orgs/<provider_organization>/events'

{
    "total": 300,
    "search_time": 3,
    "events": [...]
}

# This call to the consumer API: orgs/<consumer org>/dashboard, requires a bearer token that was requested with consumer
org credentials.
curl -k -H 'X-IBM-Consumer-Context: <provider org>.<catalog>' -H 'Authorization: Bearer <bearer_token>' -X GET --url
'https://<consumer api endpoint>/consumer-analytics/orgs/<consumer org>/dashboard'
{
    "search_time": 16,
    "status_codes": {
        "total": 300,
        "data": [...]
    },
    "min_response_time": {
        "data": ...
    ...

# This call to /cloud/events requires a bearer token that was requested with admin credentials:
curl -k -H 'Authorization: Bearer <bearer_token>' -X GET --url 'https://<platform api
endpoint>/analytics/<analytics_service>/cloud/events'

{
    "total": 45543,
    "search_time": 36,
    "events": [...]
```

   Where:
   - *<platform api endpoint>* is the `toolkit.endpoint`, but with the `/api` at the end replaced with `/analytics` to access the analytics APIs.
   - *<analytics_service>* is the name of the analytics service.
   - *<bearer_token>* is the token from step 2. Do not wrap the token with quotation marks.

4. Use query parameters to filter your results and display only certain fields.
   If you want to search for specific analytics event records, then append query parameters to the API call. For example, to get only event data for calls to a specific API and product:

```
/events?api_name=<api name>&product_name=<product name>
```

   To get only certain API event record fields in the output, then append the `fields` query parameter. For example, to get only the API name and the time of the call:

```
/events?fields=api_name,datetime
```

   To request only events before or after a certain time, use the `start` and `end` parameters. For example:

```
/events?start=2024-07-11T10:01:00.000Z&end=2024-07-11T10:02:00.000Z
```

What to do next

Complete documentation of the analytics REST API is here: Analytics REST API.

- **Using the events scroll operation to export analytics data**
  Use the `/events/scroll` operation to export 10,000 or more analytics event records with the REST API.

Using the events scroll operation to export analytics data

Use the **/events/scroll** operation to export 10,000 or more analytics event records with the REST API.

The standard method to retrieve analytics event data with the API Connect Analytics REST API is using the **/events** API call. The **/events** API call is optimized for fast retrieval of the most recent event data, and is limited to returning a maximum of 10,000 API event records. If you want to retrieve more than 10,000 event records, then use the **/events/scroll** API, which is optimized for retrieval of large sets of analytics event data.

When you query your analytics data with **/events/scroll**, OpenSearch finds all the event records that match your query and creates a pointer that is called the scroll context. You then use the scroll context to retrieve the event data in batches.

Important: The creation of the results set and scroll context uses a lot of OpenSearch resources. It is recommended to not run multiple different **/events/scroll** queries simultaneously, and to delete the scroll context after your event data is retrieved.

Exporting analytics events with /events/scroll

The **/events/scroll** operation returns event data in batches. You define the batch size in the first call to **/events/scroll**, and then retrieve each batch in subsequent calls. You must make each subsequent call to **/events/scroll** within a certain time, called the scroll context keep-alive time. The procedure is as follows:

1. Make the first **/events/scroll** call. Specify the batch size and the keep-alive time for the scroll operation. For example, to return event data in batches of 1000, and to keep the scroll context alive for 10 minutes, then POST the following JSON to **/events/scroll**:

   ```
   {
     "size": 1000, # Return the first 1000 event records.
     "scroll": 10m # Keep the scroll context alive for 10 minutes.
   }
   ```

   - **size** defines the batch size.
   - **scroll** defines the keep-alive time and uses the format *<number><units>*, for example: 30s, 5m, 3h, 1d. The maximum value for **scroll** is 1d.

   Example response:

   ```
   {
       "total": 5926, # The total events found that match the query.
       "scroll_id": "FGl....", # Scroll context id to be used to get the next batch.
       "events": [...] # First batch of event data.
   }
   ```

2. Make the next **/events/scroll** call, specifying the **scroll_id** from the previous response:

   ```
   {
     "size": 1000,
     "scroll_id": "<as returned from previous call>",
     "scroll": 10m
   }
   ```

   The API returns the next batch of 1000 event records, and a new **scroll_id** for the next call.
   Note: If your **scroll_id** is expired, the following response is returned:

   ```
   {
     "status": 404,
     "message": [
       {
         "trace": "7c7b3b11ee0e95b61452e8a78086d8e2",
         "errors": [
           {
             "code": "search_context_missing_exception",
             "message": "No search context found for id [48420]",
             "more_info": ""
           }
         ]
       }
     ]
   }
   ```

   If your **scroll_id** expires, then you must start again. Set a higher keep-alive time for the scroll context to allow more time for event record batches to be returned and the next **/events/scroll** call to be made.

3. Continue making **/events/scroll** calls, updating the **scroll_id** each time with the response from the previous call.
4. After the last call to retrieve your event data, delete the scroll context with a POST to **/events/scroll/delete**:

   ```
   {"scroll_id": "<as returned from previous call>"}
   ```

   Example response:

   ```
   {
       "succeeded": true,
       "num_freed": 15
   }
   ```

   Note: The scroll context is automatically deleted when it expires, but if you have a long keep-alive time, then it is recommended to delete it explicitly to release resources.

Worked example

The following example shows how you can use the **curl** command to manually retrieve your API event data by using the **/events/scroll** API.

Note: For large amounts of analytics data, manual retrieval with **curl** is slow and prone to human error. A better approach is to write a script to make the `/events/scroll` calls and update the `scroll_id` each call. See https://ibm.biz/apic-analytics-events-scroll for an example Python script.

1. Get a count of total event records to decide the optimal batch size and number of calls to make:

   ```
   curl -k -X GET --url 'https://example.api.connect.com/analytics/analytics/cloud/events/count' -H 'Authorization: Bearer <bearer_token>'

   {
       "total": 12453
   }
   ```

   For 12453 events, a batch size of 1250, and a total of 10 calls might be a good balance between size of output and number of calls.

2. Make the first request, specifying the batch size of 1250, and a scroll context keep-alive time of 5 minutes:

   ```
   curl -k -X POST -d '{"size": "1250", "scroll": "5m"}' --url
   'https://example.api.connect.com/analytics/analytics/cloud/events/scroll' -H 'Content-Type: application/json' -H
   'Authorization: Bearer <bearer_token>'
   ```

   Returns:

   ```
   {
       "total": 12453, # The total events found that match the query.
       "scroll_id": "<scroll_id>",
       "events": [...] # First batch of 1250 events.
   }
   ```

3. Make the second request, specifying the `scroll_id` returned from the previous request:

   ```
   curl -k -X POST -d '{"size": "1250", "scroll": "5m", "scroll_id": "<scroll_id from previous response>"}' --url
   'https://example.api.connect.com/analytics/analytics/cloud/events/scroll' -H 'Content-Type: application/json' -H
   'Authorization: Bearer <bearer_token>'
   ```

4. Repeat the request 8 more times, updating the `scroll_id` with the output from the previous request each time.
   Because total events are 12453 and batch size is 1250, the last request returns just 1203 events.

   Any subsequent requests that you make with the `scroll_id` return an empty events array.

5. Delete the scroll context:

   ```
   curl -k -X POST -d '{"scroll_id": "<scroll_id from previous response>"}' --url
   'https://example.api.connect.com/analytics/analytics/cloud/events/scroll/delete' -H 'Content-Type: application/json' -H
   'Authorization: Bearer <bearer_token>'
   ```

Performance comparison of `/events/scroll` and `/events`

The following tables show performance comparisons for querying analytics event data by using scripted calls. Times are the total time to retrieve all event records in seconds. The `/events` API cannot retrieve more than 10000 events (nor batches of 1000 or more), so these fields are marked as n/a.
Note: Response times on your analytics subsystem might vary according to the size of your API event records, total number of records, and your available hardware resources.

Table 1. Fetching 1000 event records (5.3 Mb)

Batch size	Number of calls	`/events` time	`/events/scroll` time
100	10	7	9
500	2	3	4
1000	1	n/a	3
2000	1	n/a	5

Table 2. Fetching 10,000 event records (26 Mb)

Batch size	Number of calls	`/events` time	`/events/scroll` time
100	100	67	75
500	20	27	32
1000	10	n/a	24
2000	5	n/a	20

Table 3. Fetching 100,000 event records (265 Mb)

Batch size	Number of calls	`/events` time	`/events/scroll` time
100	1000	n/a	732
500	200	n/a	299
1000	100	n/a	258
2000	50	n/a	196

Table 4. Fetching 760,265 event records (2 GB)

Batch size	Number of calls	`/events` time	`/events/scroll` time
100	7603	n/a	5647
500	1521	n/a	2423
1000	761	n/a	2158
2000	381	n/a	1919

Troubleshooting analytics

How to diagnose and resolve common issues with the analytics subsystem.

- **No analytics data in UIs**
  How to check that your analytics subsystem is receiving API event data from the gateways.
- **Running out of storage space**
  Actions that you can take if your analytics data is using more persistent storage space than you expected.
- **Offload failure**
  What to check if offload to a third-party system is failing.
- **Gathering postmortem logs**
  The logs to gather for upload to a support case.
- **Analytics subsystem CR is in error state**

No analytics data in UIs

How to check that your analytics subsystem is receiving API event data from the gateways.

Note: **VMware users:** The operations to confirm API event data is arriving from the gateways must be run from inside the analytics VM. To access your analytics VM:

1. Use an SSH client to login as the `apicadm` user:

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. `sudo` to root:

   ```
   sudo -i
   ```

The **kubectl** commands in these operations specify a *<namespace>* argument. On VMware, replace *<namespace>* with "default". Alternatively you can omit `-n <namespace>` from the commands completely.

1. The `mtls-gw` is the pod that receives the API events from the gateway. Identify the name of your `mtls-gw` pod or pods with:

   ```
   kubectl get pods -n <namespace>
   ```

   Expected output:

   ```
   NAME                                                    READY   STATUS      RESTARTS   AGE
   ...
   analyt-mtls-gw-7665f5d445-4cx4n                           1/1     Running     0          3d19h
   ```

2. For each `mtls-gw` pod, run the following command to see the logs of that pod:

   ```
   kubectl logs <mtls-gw pod name> -n <namespace>
   ```

3. The gateway sends API event data to the `mtls-gw` pod as an HTTP POST call to the path `/x2020/v1/apievent/_bulk`.
   Every time that the `mtls-gw` pod receives API event data from the gateway, it logs the following message, known as a `_bulk` message:

   ```
   10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-""-" 2841 0.072 0.070
   ```

   Check the `mtls-gw` pod logs for recent `_bulk` messages.

   If you find no `_bulk` messages in the `mtls-gw` logs, then the analytics subsystem is not receiving API event data from the gateway. Check the network connection between your gateway and analytics subsystems, and review *Analytics endpoints* in the gateway documentation.

   The HTTP return code is shown in the `mtls-gw` log messages. In the example, this code is 200, which means the API event data was received successfully by the analytics subsystem. Whatever the return code is, if your `mtls-gw` pod logs contain recent "_bulk" messages and you do not see any analytics data for this time period in the UI, then gather postmortem logs and open an IBM support case.

Running out of storage space

Actions that you can take if your analytics data is using more persistent storage space than you expected.

Reduce retention period

The simplest remedy to running out of storage space is to reduce the data retention period.

By default, API event records are retained for a maximum number of days. This maximum depends on your deployment profile. To see the default retention settings for each profile, refer to Retention and rollover.

If your analytics subsystem was deployed more recently than your retention period and you are running out of storage space, then there is a risk that your persistent storage fills up before the retention period is reached. For example, if you deployed the `n1xc4.m32` profile 15 days ago, and you are already low on storage space, then it is likely you all your storage is consumed before the 30-day retention period for this profile is reached. Check in the Cloud Manager UI how many days back your API event data goes, and set the retention period to a lower number. For example, if you see API event records from 15 days ago, reduce your storage requirement by one-third by setting your retention period to 10 days.

VMware users: add extra disk

You can increase the space available for your analytics data by adding a disk, see Adding disk space to a VMware appliance.
Warning: Do not attempt to increase the size of the existing data disk. Changing the disk size corrupts your existing analytics data.

Kubernetes and Openshift users: Reinstall with larger PVCs

It is not possible to increase PVC size after installation. If you require more space for your analytics data, the analytics subsystem must be reinstalled. Follow these steps:

1. Take a backup of your analytics subsystem: Kubernetes, OpenShift, and Cloud Pak for Integration.
2. Reinstall your analytics subsystem with a larger PVC size:
   - Kubernetes
   - OpenShift and Cloud Pak for Integration
3. Restore your analytics data from your backup: Recovering from a disaster.

Note: If you use a storage class that supports volume expansion, then instead of reinstalling you can attempt to increase the PVC size and then increase the storage **volumeSize** in the analytics CR. If this is successful then you do not need to reinstall the analytics subsystem.
If you want to try increasing your PVC size, then consult your Kubernetes or Openshift administrator for the steps.

Reduce space used by new API event data

To reduce the storage required for new analytics data, update the activity log settings of your APIs: Activity log policy.
Tip: If you're not able to update the activity log setting for your APIs, you can disable response payload logging for all APIs with ingestion filters. For example:

```
filter {
  if "apicapievent" in [tags] {
     mutate {
           remove_field => ["response_body"]
        }
  }
}
```

What to do if your storage is 100% full

If your storage space is 100% full, your analytics subsystem might be unresponsive, so reducing the retention period is not possible. In this scenario, follow the disaster recovery steps: Recovering from a disaster.

Offload failure

What to check if offload to a third-party system is failing.

- Check the ingestion pod logs for error messages that are related to offload:
  - Kubernetes, OpenShift, and Cloud Pak for Integration:

    ```
    kubectl -n <namespace> logs <analytics ingestion pod name>
    ```

  - VMware: Find the ingestion pod logs in the **mustgather** script output: Gathering logs.

  A common problem is TLS handshaking errors, such as untrusted or expired certificates.
- Check logs on your third-party system.
- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that firewall settings are not causing connection problems.
- If offloading data to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

Gathering postmortem logs

The logs to gather for upload to a support case.

The `mustgather` script

See the appropriate page for your platform:

- Gathering logs in a VMware environment
- Gathering logs on Kubernetes and OpenShift.

Gathering the pod logs

If the **mustgather** script fails, the pod logs can be gathered manually:

- **VMware:** SSH into your analytics VM and run **apic logs**:
  1. Use an SSH client to login as the **apicadm** user:

     ```
     ssh apicadm@<analytics VM FQDN>
     ```

  2. **sudo** to root:

     ```
     sudo -i
     ```

  3. Run the **apic logs** command:

```
apic logs
```

4. Two compressed files are created: appliance-logs, and node-logs. Copy both files off the VM and upload to the support case.

- **Kubernetes and Openshift:** Get the logs from all analytics pods in your environment. Use the command:

  ```
  kubectl -n <namespace> logs <analytics pod name> > <analytics pod name>.log
  ```

  where:
  - *<namespace>* is the namespace of your analytics subsystem.
  - *<analytics pod name>* is the name of the analytics pod. See the list of analytics pods.

  The logs for each pod are written to the file *<analytics pod name>*.log. Upload all the generated logs to the support case.

Getting the OpenSearch cluster status

If the `mustgather` script fails you can use the toolkit CLI to get the status of your OpenSearch cluster, and a list of the indices.

1. Follow the steps to install and configure the toolkit CLI.
2. Login to the CLI as the cloud admin user:

   ```
   apic login --server <platform api endpoint> --username admin --realm provider/default-idp-1
   ```

3. Get the OpenSearch cluster status with:

   ```
   apic --mode analytics clustermgmt:catIndices --server <platform api endpoint> --analytics-service <analytics service name>
   --format json
   ```

4. Get the details of the OpenSearch indices with:

   ```
   apic --mode analytics clustermgmt:catIndices --server <platform api endpoint> --analytics-service <analytics service name>
   --format json
   ```

Upload the cluster status and indices output to the support case.

Analytics subsystem CR is in error state

If the analytics subsystem CR is in error state and contains the following message relating to the analytics client endpoint, remove the client endpoint definition from the analytics CR as it is no longer used.

```
"APIC_APICOPS_0089E - The provided issuer did not sign the certificate. Expected Issuer: "CN=<NAME>",
          Signed Issuer: "CN=<NAME>", see status.SystemCheck for more details."
```

For example, if you encounter an issue as stated above, remove the following block from the CR specification.

```
client:
         clientAuthEnabled: true
         clientSubjectDN: CN=analytics-client-client,O=cert-manager
         enabled: true    endpoint:
         annotations:
         cert-manager.io/issuer: production-ingress-issuer
         hosts:
        - name: ac.apps.2dcdr.awsciondemand.com
        secretName: analytics-endpoint-secret
```

Note: If you are using a top level `APIConnectCluster CR`, then remove the block from the `spec.analytics` section.

Reference information

Reference information for IBM® API Connect, including summary reference material for the developer toolkit command-line tool (CLI), a link to the API Connect Version 10.x Whitepaper, and information about the API Connect platform REST APIs.

Reference item	Description
The API Connect REST APIs	The platform REST APIs that can be used to manage the API Connect cloud configuration, access the API provider capability, and use the consumer API microservice.
API Connect TLS certificates	Table of all TLS certificates created and used by an API Connect installation.
API Connect v10.x White Paper	A comprehensive technical guide to best practices, considerations, and deployment options for API Connect. The whitepaper covers the major components of API Connect, as well as considerations for configuring different clouds and environments, to help users with their API strategies. The target audience for the whitepaper are solution and integration architects.
API Connect 101	Opening cases on the IBM Support site, Technical notes, Product documentation hub, Severity guidelines.

The API Connect REST APIs

How to get started with the API Connect REST APIs

The API Connect REST APIs can be used for the following actions:

- Automate the administration of API Connect.
- Implement scripts and tools to support a continuous integration environment for API development and publishing.
- Manage catalogs of APIs, and their subscribers.
- View analytics data.

Complete reference documentation for the API Connect REST APIs is available here: API Connect REST API documentation.

Prerequisites

To use the API Connect REST APIs, you must meet the following prerequisites:

- Have an API Connect user that is a member of a provider or consumer organization. To call APIs that are cloud scoped, your user must be a member of the admin organization, see Adding members to the admin organization.
- App credentials: A client_id and client_secret. These credentials can be obtained from the API Manager or Cloud Manager UI, or provided to you by your API Connect administrator.

To get the API endpoint URLs and the app credentials, follow these steps:

1. In the API Manager UI home page, click the Download toolkit tile.
2. Download the Toolkit credentials (you do not need to download the CLI or API Designer).
3. Open the downloaded **credentials.json** file to see the platform and consumer endpoints, and the credentials to call APIs on these endpoints:

```
{
  "cloud_id": "e8fcdec3-bfb9-44bd-bf90-03d8639c4916",
  "toolkit": {
    "endpoint": "https://example-platform-api.ibm.com/api",
    "client_id": "7ad7b6c5-fa07-4222-808d-8de7266dcd1a",
    "client_secret": "b7127e44-4811-48be-be9d-6591302de04a"
  },
  "consumer_toolkit": {
    "endpoint": "https://example-consumser-api.ibm.com/consumer-api",
    "client_id": "3b10e0db-1cd4-4aa8-af02-51a83e334f1c",
    "client_secret": "a5a672b7-e3b2-4d2b-984b-4059ea82ae65"
  },
  "governance": {
    "endpoint": "https://example-governance.ibm.com/governance",
    "client_id": "ba48537c-7a6e-4232-92b6-ae67ad764933",
    "client_secret": "790d8a6d-e323-46bd-a05c-3d212e93d794"
  },
  "discovery": {
    "endpoint": "https://example-discovery.ibm.com/discovery",
    "client_id": "d872a2f4-bc6e-4e91-b187-bbb5b99d4605",
    "client_secret": "c0b5ddf9-58e6-4246-88de-243ce217731a"
  }
}
```

   The endpoints and credentials that are contained in the **credentials.json** file are
   a. **toolkit**: The platform API endpoint. Use this for provider organization scoped and cloud scoped API calls.
   b. **consumer_toolkit**: The consumer API endpoint. Use this for consumer organization scoped API calls, such as creating an app in a consumer organization.
   c. **governance**: See the API Governance feature.
   d. **discovery**: See the API Discovery feature.

Note: Your API Connect cloud administrator might provide you with different app credentials to use. In this case, do not use the credentials that are in the **credentials.json** file.

Generating app credentials

If you are the cloud administrator, you can create separate app credentials for each user with the toolkit CLI. Follow these steps:

1. Create a JSON file that contains the new credentials:

```
{
  "name": "User1App",
  "client_id": "User1ID",
  "client_secret": "User1Secret",
  "client_type": "<toolkit or consumer_toolkit>"
}
```

   Where **client_type** is set to **toolkit** for creating credentials for provider organization members, and set to **consumer_toolkit** for consumer organization members.

2. Use the toolkit CLI to register the credentials:
   a. Log in as a cloud admin user:

```
apic login --server <platform api endpoint> --username <username> --realm <realm>
```

   b. Register the new credentials:

```
apic registrations:create --format json --server <platform API endpoint>  <JSON credentials file>
```

   If you do not have the toolkit CLI installed, then refer to Setting up the API Connect toolkit.

Obtaining a bearer token

Each call to the REST APIs must be authenticated with a bearer token in the HTTP **Authorization** header. For more information about how to create an API key, see Managing platform REST API keys.

Use your app credentials to obtain a bearer token.

```
curl -v -k -X POST -d '{"api_key": "<api_key>", "client_id": "<client_id>", "client_secret": "<client_secret>", "grant_type": "api_key"}' -H 'Content-Type: application/json' -H 'Accept: application/json' https://<management_server_platform_api_endpoint>/api/token
```

Where:

- **<api-key>** is the API key you have generated.
- **<client_id>** is the client ID from the "toolkit" section of the **credentials.json** file, or as provided by your API Connect cloud administrator.
- **<client_secret>** is the client secret from the "toolkit" section of the **credentials.json** file, or as provided by your API Connect cloud administrator.
- **provider/default-idp-2** for provider organization members.
- consumer: **<provider org>:<catalog>/<catalog>-idp** for consumer organization members.

The bearer token is returned in the **access_token** property:

```
{
    "access_token": "<bearer_token>",
    "token_type": "Bearer",
    "expires_in": 28800
}
```

Note: The **expires_in** value is the number of seconds before the token expires. After expiry, you must request a new bearer token.

Making REST API calls

Use your bearer token when you make calls to the REST API:

```
curl -k -X <HTTP Method> --url 'https://<rest api endpoint>/<api path> -H 'Authorization: Bearer <bearer_token>'
```

If you make calls to the consumer API, then you must include an extra header that specifies the provider organization and catalog:

```
-H 'X-IBM-Consumer-Context: <provider org>.<catalog>'
```

Example REST API calls

Get a list of the provider organizations

User a bearer token that was created with provider organization member credentials, and specify the platform API endpoint:

```
curl -k -X GET --url 'https://<platform api endpoint>/api/orgs' -H 'Authorization: Bearer <bearer_token>'
```

Get a list of the apps in a catalog

Use a bearer token that was created with consumer organization member credentials, specify the consumer API endpoint, and include the **X-IBM-Consumer-Context** header:

```
curl -k -X GET --url 'https://<consumer api endpoint>/consumer-api/orgs/<consumer org>/apps' -H 'X-IBM-Consumer-Context: <provider org>.<catalog>' -H 'Authorization: Bearer <bearer_token>'
```

Get analytics API event data for a catalog:

```
curl -k -X GET --url 'https://<platform api endpoint>/analytics/<analytics service>/orgs/<provider org>/events' -H 'Authorization: Bearer <bearer_token>'
```

For provider organization scoped analytics data, use *<platform api endpoint>*.

For consumer organization scoped analytics data, use *<consumer api endpoint>*, and **/consumer-analytics** instead of **/analytics**. Also include the **X-IBM-Consumer-Context** header. For example:

```
curl -k -X GET --url 'https://<consumer api endpoint>/consumer-analytics/orgs/<consumer org>/dashboard' -H 'X-IBM-Consumer-Context: <provider org>.<catalog>' -H 'Authorization: Bearer <bearer_token>'
```

For more information about querying analytics data with the REST API, see Using the analytics REST API.

Get a list of the availability zones in your API Connect deployment

Use a bearer token that was created with cloud admin user credentials, and specify the platform API endpoint:

```
curl -k -X GET --url 'https://<platform api endpoint>/api/orgs/admin/availability-zones' -H 'Authorization: Bearer <bearer_token>'
```

Reference documentation for the API Connect REST APIs: API Connect REST API documentation.

Troubleshooting failed REST API calls

The HTTP return code and error message provide information on the possible causes of the failure:

- HTTP 403: "Forbidden". Check that your bearer token was created with the correct credentials for the API call.
- HTTP 404: "Not Found". Verify that your API endpoint URL and path are correct. Are you making a consumer API call on the platform API endpoint?
- HTTP 401: "Unauthorized". Check that your bearer token is correct and is not expired. If this is returned when you request a bearer token, verify that the **username**, **password**, **realm**, **client_id**, and **client_secret** are correct.

Example: Using the platform REST APIs to publish a product containing a SOAP API

Review this sample scenario to see how you can use the API Connect platform REST APIs to publish a product that contains a SOAP API.

This example demonstrates how to format a request to publish the product, and includes sample files that illustrate the product definition, the API definition, and the SOAP API's WSDL description.

Using the `Catalogs` API

Publish the product using the API Connect platform **`Catalogs`** API:

- To publish a product to a catalog, use the following syntax:

  `POST catalogs/{org}/{catalog}/publish`

- To publish a product to a space within a catalog, additionally specify the space with the following syntax:

  `POST catalogs/{org}/{catalog}/{space}/publish`

The payload in both cases is a multipart, form-encoded body containing three required parts and one optional part:

- (Required) A part named **`product`** with media type **`application/yaml`** or **`application/json`**, containing the yaml or JSON source for the product to be published.
- (Required) One or more occurrences of a part named **`openapi`** with media type **`application/yaml`** or **`application/json`**, containing the YAML or JSON source for each API in the product.
- (Required for SOAP APIs) One or more occurrences of a part named **`wsdl`** with media type **`application/wsdl`**, **`application/wsdl+xml`**, **`text/xml`**, or **`application/zip`** containing the WSDL definitions (and referenced XSD files if applicable) associated with the API content.
- (Optional) A part named **`gateway_service_urls`** with media type **`application/yaml`** or **`application/json`** which is a YAML or JSON array of URLs to specify a subset of the configured gateway services within the catalog or space as publish targets. These URLs can be obtained using the following calls:
  - For a catalog:

    `GET /api/catalogs/{org}/{catalog}/configured-gateway-services`

  - For a space:

    `GET /spaces/{org}/{catalog}/{space}/configured-gateway-services`

Within the **`product`** content, the form of the references to APIs in the **`apis`** section is significant. Each API reference must use the **`name`** property instead of the **`$ref`** form that may appear in other situations. Here is an example showing a product that refers to the API **`globalweather`** version **`1.0.0`** in the correct form:

```
info:
  version: 1.0.0
  title: GlobalWeatherProduct
  name: globalweatherproduct
plans:
  ...
apis:
  globalweather1.0.0:
    name: globalweather:1.0.0
...
```

Example publish operation using cURL

This example publishes a product containing a SOAP API to the *Sandbox* catalog of the *onlinebanking* provider organization, using the **`curl -F`** option to create a set of form-encoded payload parts and the **`@`** prefix to read the content for each part from a file. Note the part name (**`product`**, **`openapi`**, **`wsdl`**) and the content type of each part given by the **`type=`** value.

In this example, the access token has been retrieved earlier and placed in an environment variable named **`TOKEN`**. The command is split onto multiple lines for ease of reading but must be entered as a single line.

Request:

```
curl -v -k
  -F "product=@globalweatherproduct_1.0.0.yaml;type=application/yaml"
  -F "openapi=@globalweather_1.0.0.yaml;type=application/yaml"
  -F "wsdl=@globalweather.wsdl;type=application/wsdl"
  -H "Authorization: Bearer $TOKEN"
  -H 'Content-Type: multipart/form-data'
  -H 'Accept: */*' https://dev.apic.example.com/api/catalogs/onlinebanking/sandbox/publish
```

Response:

```

```

The request specifies three files, which are included with this example for reference:

- Product definition `-F "product=@globalweatherproduct_1.0.0.yaml;type=application/yaml"`
- API definition `-F "openapi=@globalweather_1.0.0.yaml;type=application/yaml"`
- WSDL description `-F "wsdl=@globalweather.wsdl;type=application/wsdl"`

Example Product file: globalweatherproduct_1.0.0.yaml

The following code sample contains a Product definition.

The Product definition file globalweatherproduct_1.0.0.yaml is referenced by the example scenario in Example: Using the platform REST APIs to publish a product containing a SOAP API.

```

        </wsdl:service>
</wsdl:definitions>
```

API Connect TLS certificates

Details of all Kubernetes TLS certificate objects that are created and used in a default installation of API Connect.

Overview

TLS is used to secure communications between API Connect pods, subsystems, external services, and users. The TLS certificates that are used by API Connect are created automatically during the installation of API Connect. The certificates are managed by an open source product called cert-manager.

The certificates that are described in this topic all exist as Kubernetes certificate objects in the API Connect namespace where the subsystem that uses the certificate is installed. Run **`kubectl get certs -n <namespace>`** to see the certificates in your environment. Some of the API Connect Kubernetes certificates are also stored in the management subsystem database. These certificates can be seen in the Cloud Manager UI, in the truststores and keystores of the subsystem default TLS profiles. When the management subsystem **`apim`** pod is restarted, the certificates in the management database are reloaded from the Kubernetes certificates.

Note: The API invocation certificate that callers to the published APIs on your gateways see is configured in the Cloud Manager UI when you register your gateway services. For more information about API invocation certificates, see Registering a gateway service and TLS profiles overview.
The certificates that are created and used by API Connect are categorized as follows:

- CA certificates - API Connect creates self-signed CA certificates to sign all the API Connect end-entity certificates. The CA certificates are:
  - **`ingress-ca`** - used by the ingress-issuer. The ingress-ca signs all user-facing and inter-subsystem certificates.
  - **`management-ca`** - signs all the management intra-subsystem certificates.
  - **`portal-ca`** - signs all the portal intra-subsystem certificates.
  - **`analytics-ca`** - signs all the analytics intra-subsystem certificates.

  CA certificates have a default duration of 10 years. All the end-entity certificates have a default duration of 2 years.
- Ingress certificates - API Connect creates a self-signed issuer that is called the ingress-issuer. Ingress certificates are the API Connect certificates that are issued by the ingress-issuer. Ingress certificates are divided into two types:
  - Inter-subsystem certificates - certificates that are used for communication between API Connect subsystems, for example between the management subsystem and gateway. By default, communication between most subsystems uses mTLS. From v10.0.5.3, it is possible to use JWT instead of mTLS: Using JWT instead of mTLS on Kubernetes and OpenShift, Using JWT instead of mTLS on OVA.
  - User-facing certificates - certificates that API Connect users see when they interact with the API Connect UIs and REST API.
- Intra-subsystem certificates - certificates that are used between pods in the same subsystem. Intra-subsystem certificates are signed by a subsystem specific CA certificate: **`management-ca`**, **`portal-ca`**, **`analytics-ca`**. The gateway subsystem is a single pod, and has no intra-subsystem certificates.

On OVA deployments, certificate management is done with the **`apicup`** command, see API Connect TLS certificate best practices. Do not login to your VMs by **`ssh`** and attempt to modify certificates directly, unless advised by IBM.

Note: On Cloud Pak for Integration, and OpenShift top-level CR deployments, some certificate names are contracted and prefixed with the **`APIConnectCluster`** instance name. For example, the certificate **`managment-ca`** is called ***`<apic instance name>`*`-mgmt-ca`**.

Customizing certificates

It is possible to customize certificates with ones from your own organization. However it is recommended to customize only the user-facing certificates, which are the certificates that your users see when they access the API Connect UIs, CLI, and the REST API.

Important: If you do customize certificates, then you are responsible for maintaining those certificates. Ensure that your custom certificates meet the requirements that are defined in the Reference tables (which are subject to change in future fix packs), and that you renew them before they expire.
All other certificates are used internally between API Connect microservices.
Note: The inter and intra-subsystem certificates use of a self-signed root CA presents no security risk. For internal communications with a limited number of predefined endpoints, use of locally generated self-signed CA certificates can be more secure than external CA certificates, as certificates are only ever issued for the known components and the domain of trust is kept as small as possible.

Renewing certificates

Cert-manager handles the renewal of expired certificates so that the user does not need to monitor or manually renew any of the certificates. However, there are scenarios where the renewal of certificates must be triggered manually. Every API Connect certificate has a corresponding Kubernetes secret object of the same name, deleting this secret triggers cert-manager to re-create the secret with a new TLS certificate. For more information about certificate renewal, see Renewing TLS certificates.
Remember: The Kubernetes certificate objects do not contain the TLS certificates themselves, they are pointers to Kubernetes secrets that contain the TLS certificate. See Key Concepts: Cert-manager, Issuers, and Secrets.
For most of the certificates, when they are renewed, the pods that use those certificates are automatically restarted so that they pick up the updated certificate. The minority of certificates that require manual pod restarts after renewal are identified in the reference tables.

Table 1. Certificates that require manual pod restarts

Certificates	Issuer	Description

Certificates	Issuer	Description
`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the **`mtls-gw`** pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the **`analytics-ai-endpoint`** certificate. If this certificate is updated, restart the **`mtls-gw`** pod for the update to take effect.
`analytics-ca or a7s-ca`	`selfsigning-issuer`	The issuer for the **`analytics-client`** and **`analytics-server`** certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If you update this certificate, you must then update the **`analytics-client`** and **`analytics-server`** server certificates, and then ensure that the following pods are restarted: • **`storage`**: Restarts automatically. • **`warehouse`**: Restarts automatically. • **`ingestion`**: Restarts automatically. • **`director`**: Restart manually.
`analytics-client-client or a7s-cl-client`	`ingress-issuer`	Legacy certificate from pre-v10.0.5 releases. Not used for anything and safe to delete. In v10.0.5, communication with the analytics subsystem uses the **`analytics-ingestion-client`** certificate.
`analytics-client or a7s-client`	`analytics-ca`	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, then the **`storage`**, **`warehouse`** and **`ingestion`** pods restart automatically. You must manually restart the **`director`** pod.
`analytics-server or a7s-server`	`analytics-ca`	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. Required DNS names within the SAN section are: **`*.<namespace>`** **`*.<namespace>.svc`** **`*.<namespace>.svc.cluster.local`** **`*.<instance name>-server.<namespace>.svc`** **`*.<instance name>-server.<namespace>.svc.cluster.local`** **`<instance name>-server`** **`<instance name>-storage`** **`<instance name>-director`** **`<instance name>-ingestion`** **`<instance name>-mtls-gw`** **`<instance name>-storage-os-master`** **`<instance name>-warehouse`** If this certificate is updated, then the **`storage`**, **`warehouse`** and **`ingestion`** pods restart automatically. You must manually restart the **`director`** pod.
`api-endpoint or mgmt-platform-api`	`ingress-issuer`	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
`apim-endpoint or mgmt-api-manager`	`ingress-issuer`	API Manager UI server certificate.
`cm-endpoint or mgmt-admin`	`ingress-issuer`	Cloud Manager UI server certificate.
`consumer-catalog-endpoint **`	`ingress-issuer`	The consumer catalog endpoint server certificate can be modified to a consumer catalog interface certificate while retaining the consumer catalog description.
`gateway-client-client or gw-dr-client`	`ingress-issuer`	Client certificate for communications with the gateway service. Restart the **`apim`** and **`taskmanager`** pods after update. This certificate must have the same CA as the **`gwv6-manager-endpoint or gw-gateway-manager`** certificate on the gateway. This certificate is loaded by the management subsystem into the **`Gateway management client TLS client profile`** that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the gateway, then create a new profile and specify it when you register the gateway service.
`management-db-replication`	`management-ca`	This certificate is used to secure instances within the management subsystem of API Connect.
`management-db-server`	`management-ca`	This certificate is used to secure connections within the management subsystem of API Connect.
`management-client or mgmt-client`	`management-ca`	Client certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.
`db-client-apicuser`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`natscluster-mgmt`	`management-ca`	Intra-subsystem certificate for the **`nats`** pods.
`management-s3proxy-all`	`ingress-issuer`	Inter-subsystem certificate for communication between management subsystem and s3proxy pods. Used for management database local and SFTP backups.
`portal-admin or ptl-director or portal-director`	`ingress-issuer`	Server certificate used on the **`portalAdminEndpoint`**. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the **`portal-admin-client`** certificate. This certificate must have the same CA as the **`portal-admin-client`** certificate on the management subsystem. This certificate is used by the **`portal-nginx`** pod.

Certificates	Issuer	Description

`portal-admin-client or ptl-adm-client`	`ingress-issuer`	Client certificate used for communication with the portal subsystem on the `portalAdminEndpoint`. This certificate must have:
		• The same CA as the server certificate `portal-admin or ptl-director` on the portal subsystem.
		• The common name must match the `spec.adminClientSubjectDN` in the portal CR:
		`kubectl describe cert portal-admin-client`
		`Spec:`
		`Common Name: ptl-adm-client`
		`kubectl get ptl -o yaml`
		`spec:`
		`adminClientSubjectDN: CN=ptl-adm-client`
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=ptl-adm-client, O=cert-manager`, but they must be identical.
		This certificate is loaded by the management subsystem into the `Portal Director TLS client profile` that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the portal, then create a new profile and specify it when you register the portal service.

`portal-ca or ptl-ca`	`selfsigning-issuer`	The issuer for the portal-client and portal-server certificates. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.
`portal-client or ptl-client`	`portal-ca`	Client certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.

`portal-server or ptl-server`	`portal-ca`	Server certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate.
		Required DNS names within the SAN section are:
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<namespace>.svc.cluster.local`
		`*.<instance name>-server.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc.cluster.local`
		`<instance name>-server`
		`*.<instance name>-<site name>-db-all.<namespace>.svc`
		`*.<instance name>-<site name>-www-all.<namespace>.svc`
		`*.<instance name>-<site name>-db-all.<namespace>.svc.cluster.local`
		`*.<instance name>-<site name>-www-all.<namespace>.svc.cluster.local`
		`*.<namespace>.svc.cluster.local`
		`<instance name>-db`
		`#<remote portal CR name>-db # For 2DCDR only.`
		<instance name> and *<remote portal CR name>* are truncated if more than 15 characters.
		This certificate is used by all portal pods.

`portal-web`	`ingress-issuer`	The server certificate used on the `portalUIEndpoint`. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default `portal-web` certificate is issued by the `ingress-issuer`, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate. This certificate is used by the `portal-web` ingress (`portal-web` route on OpenShift).

If you renew a CA certificate, any end-entity certificates that use this CA certificate must also be renewed. The following command identifies and renews all certificates that are signed by `ingress-ca` in the specified namespace:

```
kubectl get secrets -n <namespace> -o custom-columns='NAME:.metadata.name,ISSUER:.metadata.annotations.cert-manager\.io/issuer-name' --no-headers=true | grep ingress-issuer | awk '{ print $1 }' | xargs kubectl delete secret -n <namespace>
```

Warning: Cert-manager automatically renews the `ingress-ca` 30 days before it expires. The automatic renewal of `ingress-ca` does not trigger the renewal of the end-entity certificates that are signed by `ingress-ca`. When `ingress-ca` is automatically renewed, you must manually renew all end-entity certificates.

Reference tables

The tables show all the API Connect certificates that are created in all possible deployment configurations.

Each table corresponds to a subsystem, and shows the certificates that are used by that subsystem.
Note: On Cloud Pak for Integration or top-level CR deployments, some of the certificates have a shortened name. Where two names for a certificate are shown in the tables, the second name is the name that is used on Cloud Pak for Integration or top-level CR deployments. For example, `management-ca or mgmt-ca`.

Table 2. Management certificates

Certificate name	Issuer	Description

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.
`management-ca or mgmt-ca`	`selfsigning-issuer`	The issuer for the management subsystems intra-subsystem certificates: management-client, management-server, postgres, and nats certificates. Communication between management subsystem pods fails if there is a problem with this certificate. This certificate is also used as the CA for REST API calls to the management subsystem from the other subsystems, when using `in-cluster` communication. See In-cluster service communication between subsystems

`management-server or mgmt-server`	`management-ca`	Server certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.
		Required DNS names within the SAN section are:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<namespace>.svc.cluster.local`
		`*.<instance name>-server.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc.cluster.local`
		`<instance name>-server`

`analytics-ingestion-client or a7s-ing-client`	`ingress-issuer`	Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:
		
		• The same CA as the server certificate `analytics-ai-endpoint` on the analytics subsystem.
		• The common name must match the `spec.clientSubjectDN` in the analytics CR:
		
		`kubectl describe cert analytics-admin-client`
		
		`Spec:`
		`  Common Name:  a7s-ing-client`
		
		`kubectl get a7s -o yaml`
		
		`  spec:`
		`    clientSubjectDN: CN=a7s-ing-client`
		
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=a7s-ingestion-client`, or they could both be `CN=a7s-ingestion-client, O=cert-manager`, but they must be identical.
		
		To update this certificate, use kubectl. Restart the `apim`, `taskmanager`, and `analytics-proxy` pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.
		
		This certificate is loaded by the management subsystem into the `Analytics ingestion TLS client profile` that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the analytics subsystem, then create a new profile and specify it when you register the analytics service.

`consumer-endpoint or mgmt-consumer-api`	`ingress-issuer`	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
`consumer-catalog`	`ingress-issuer`	Consumer catalog endpoint server certificate.
`db-client-postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`mgmt-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate used in the warm-standby data center's `<remote-sitename>-postgres` pod to connect to the active data center.
`mgmt-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's `<management_CR>-tunnel` pod. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the `spec.multiSiteHA.replicationEndpoint` defined in the management CR.
`hub-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `hub-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.

Table 3. Portal certificates

Certificate name	Issuer	Description
`ptl-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate that is used in the warm-standby data center's `<remote-sitename>-www` and `<remote-sitename>-db` pods to connect to the active data center. This certificate is used by all the portal pods related to 2DCDR replication: `portal-db-remote`, `portal-www-remote`, and `portal-tunnel`.

Certificate name	Issuer	Description
`ptl-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's **`<portal_CR>-tunnel`** pod, the counterpart to the **`ptl-replication-client`** certificate. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the **`spec.multiSiteHA.replicationEndpoint`** defined in the portal CR. This certificate is used by all the portal pods related to 2DCDR replication: **`portal-db-remote`**, **`portal-www-remote`**, and **`portal-tunnel`**.

Table 4. Gateway certificates

Certificate name	Issuer	Description
`gateway-peering or gw-peer`	`ingress-issuer`	This certificate secures the communication between gateways in your gateway cluster. If you update this certificate, then restart your gateway pods. See Changing the secret for gateway peering.
`gateway-service or gw-svc`	`ingress-issuer`	Legacy certificate that is not used.
`gwv6-endpoint or gw-gateway`	`ingress-issuer`	Legacy certificate that is not used.
`gwv6-manager-endpoint or gw-gateway-manager`	`ingress-issuer`	The **`gatewayManager`** endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the **`gateway-client-client`** certificate on management subsystem If you update this certificate, then all gateway pods are restarted automatically.

Note: The API invocation certificate that callers to the published APIs on your gateways see is configured in the Cloud Manager UI when you register your gateway services. For more information about API invocation certificates, see Registering a gateway service and TLS profiles overview.

Table 5. Event gateway certificates -Cloud Pak for Integration only

Certificate name	Issuer	Description
`event-gateway-management-client`	`ingress-issuer`	The **`event-gateway-management-client`** certificate exists only on Cloud Pak for Integration deployments.

TLS certificates organized by usage

Certificates tables organized by where they are used.

Note: The API invocation certificate that callers to the published APIs on your gateways see is configured in the Cloud Manager UI when you register your gateway services. For more information about API invocation certificates, see Registering a gateway service and TLS profiles overview.

Table 1. Management to gateway communication

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem **`apim`** pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the **`portal-www`** pods for the update to take effect.
`gateway-client-client or gw-dr-client`	`ingress-issuer`	Client certificate for communications with the gateway service. Restart the **`apim`** and **`taskmanager`** pods after update. This certificate must have the same CA as the **`gwv6-manager-endpoint or gw-gateway-manager`** certificate on the gateway. This certificate is loaded by the management subsystem into the **`Gateway management client TLS client profile`** that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the gateway, then create a new profile and specify it when you register the gateway service.
`gwv6-manager-endpoint or gw-gateway-manager`	`ingress-issuer`	The **`gatewayManager`** endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the **`gateway-client-client`** certificate on management subsystem If you update this certificate, then all gateway pods are restarted automatically.

Table 2. Management to portal communication

Certificate name	Issuer	Description

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.

`portal-admin-client or ptl-adm-client`	`ingress-issuer`	Client certificate used for communication with the portal subsystem on the `portalAdminEndpoint`. This certificate must have:
		
		• The same CA as the server certificate `portal-admin or ptl-director` on the portal subsystem.
		• The common name must match the `spec.adminClientSubjectDN` in the portal CR:
		
		`kubectl describe cert portal-admin-client`
		
		`Spec:`
		`  Common Name:  ptl-adm-client`
		
		`kubectl get ptl -o yaml`
		
		`  spec:`
		`    adminClientSubjectDN: CN=ptl-adm-client`
		
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=ptl-adm-client, O=cert-manager`, but they must be identical.
		
		This certificate is loaded by the management subsystem into the `Portal Director TLS client profile` that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the portal, then create a new profile and specify it when you register the portal service.

`portal-admin or ptl-director or portal-director`	`ingress-issuer`	Server certificate used on the `portalAdminEndpoint`. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the `portal-admin-client` certificate. This certificate must have the same CA as the `portal-admin-client` certificate on the management subsystem. This certificate is used by the `portal-nginx` pod.

Table 3. Management and gateway to analytics communication

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.

Certificate name	Issuer	Description

`analytics-ingestion-client or a7s-ing-client`	`ingress-issuer`	Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:
		• The same CA as the server certificate **`analytics-ai-endpoint`** on the analytics subsystem.
		• The common name must match the **`spec.clientSubjectDN`** in the analytics CR:
		`kubectl describe cert analytics-admin-client`
		`Spec:`
		`  Common Name:  a7s-ing-client`
		`kubectl get a7s -o yaml`
		`  spec:`
		`    clientSubjectDN: CN=a7s-ing-client`
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be **`CN=a7s-ingestion-client`**, or they could both be **`CN=a7s-ingestion-client, O=cert-manager`**, but they must be identical.
		To update this certificate, use kubectl. Restart the **`apim`**, **`taskmanager`**, and **`analytics-proxy`** pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.
		This certificate is loaded by the management subsystem into the **`Analytics ingestion TLS client profile`** that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the analytics subsystem, then create a new profile and specify it when you register the analytics service.

`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the **`mtls-gw`** pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the **`analytics-ai-endpoint`** certificate. If this certificate is updated, restart the **`mtls-gw`** pod for the update to take effect.

Table 4. User-facing certificates

Certificate name	Issuer	Description
`api-endpoint or mgmt-platform-api`	`ingress-issuer`	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
`consumer-endpoint or mgmt-consumer-api`	`ingress-issuer`	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
`consumer-catalog`	`ingress-issuer`	Consumer catalog endpoint server certificate.
`apim-endpoint or mgmt-api-manager`	`ingress-issuer`	API Manager UI server certificate.
`cm-endpoint or mgmt-admin`	`ingress-issuer`	Cloud Manager UI server certificate.
`portal-web`	`ingress-issuer`	The server certificate used on the **`portalUIEndpoint`**. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default **`portal-web`** certificate is issued by the **`ingress-issuer`**, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate. This certificate is used by the **`portal-web`** ingress (**`portal-web`** route on OpenShift).
`hub-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the **`hub-endpoint`**. If there is a problem with this certificate, then the user's browser shows a warning or error message.

Table 5. Inter-subsystem certificates

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem **`apim`** pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the **`portal-www`** pods for the update to take effect.

Certificate name	Issuer	Description

`analytics-ingestion-client or a7s-ing-client`	`ingress-issuer`	Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:
		• The same CA as the server certificate `analytics-ai-endpoint` on the analytics subsystem.
		• The common name must match the `spec.clientSubjectDN` in the analytics CR:
		`kubectl describe cert analytics-admin-client`
		`Spec:`
		`  Common Name:  a7s-ing-client`
		`kubectl get a7s -o yaml`
		`  spec:`
		`    clientSubjectDN: CN=a7s-ing-client`
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=a7s-ingestion-client`, or they could both be `CN=a7s-ingestion-client, O=cert-manager`, but they must be identical.
		To update this certificate, use kubectl. Restart the `apim`, `taskmanager`, and `analytics-proxy` pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.
		This certificate is loaded by the management subsystem into the `Analytics ingestion TLS client profile` that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the analytics subsystem, then create a new profile and specify it when you register the analytics service.

`portal-admin-client or ptl-adm-client`	`ingress-issuer`	Client certificate used for communication with the portal subsystem on the `portalAdminEndpoint`. This certificate must have:
		• The same CA as the server certificate `portal-admin or ptl-director` on the portal subsystem.
		• The common name must match the `spec.adminClientSubjectDN` in the portal CR:
		`kubectl describe cert portal-admin-client`
		`Spec:`
		`  Common Name:  ptl-adm-client`
		`kubectl get ptl -o yaml`
		`  spec:`
		`    adminClientSubjectDN: CN=ptl-adm-client`
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=ptl-adm-client, O=cert-manager`, but they must be identical.
		This certificate is loaded by the management subsystem into the `Portal Director TLS client profile` that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the portal, then create a new profile and specify it when you register the portal service.

`gateway-client-client or gw-dr-client`	`ingress-issuer`	Client certificate for communications with the gateway service. Restart the `apim` and `taskmanager` pods after update. This certificate must have the same CA as the `gwv6-manager-endpoint or gw-gateway-manager` certificate on the gateway. This certificate is loaded by the management subsystem into the `Gateway management client TLS client profile` that you can see in the Cloud Manager UI (see TLS profiles). If you want the management subsystem to present a different client certificate to the gateway, then create a new profile and specify it when you register the gateway service.
`api-endpoint or mgmt-platform-api`	`ingress-issuer`	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
`consumer-endpoint or mgmt-consumer-api`	`ingress-issuer`	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
`apim-endpoint or mgmt-api-manager`	`ingress-issuer`	API Manager UI server certificate.
`cm-endpoint or mgmt-admin`	`ingress-issuer`	Cloud Manager UI server certificate.
`mgmt-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate used in the warm-standby data center's `<remote-sitename>-postgres` pod to connect to the active data center.
`mgmt-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's `<management_CR>-tunnel` pod. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the `spec.multiSiteHA.replicationEndpoint` defined in the management CR.
`hub-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `hub-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.
`management-s3proxy-all`	`ingress-issuer`	Inter-subsystem certificate for communication between management subsystem and s3proxy pods. Used for management database local and SFTP backups.
`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the `mtls-gw` pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the `analytics-ai-endpoint` certificate. If this certificate is updated, restart the `mtls-gw` pod for the update to take effect.

Certificate name	Issuer	Description
`portal-admin or ptl-director or portal-director`	`ingress-issuer`	Server certificate used on the **`portalAdminEndpoint`**. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the **`portal-admin-client`** certificate. This certificate must have the same CA as the **`portal-admin-client`** certificate on the management subsystem. This certificate is used by the **`portal-nginx`** pod.
`portal-web`	`ingress-issuer`	The server certificate used on the **`portalUIEndpoint`**. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default **`portal-web`** certificate is issued by the **`ingress-issuer`**, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate. This certificate is used by the **`portal-web`** ingress (**`portal-web`** route on OpenShift).
`ptl-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate that is used in the warm-standby data center's **`<remote-sitename>-www`** and **`<remote-sitename>-db`** pods to connect to the active data center. This certificate is used by all the portal pods related to 2DCDR replication: **`portal-db-remote`**, **`portal-www-remote`**, and **`portal-tunnel`**.
`ptl-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's **`<portal_CR>-tunnel`** pod, the counterpart to the **`ptl-replication-client`** certificate. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the **`spec.multiSiteHA.replicationEndpoint`** defined in the portal CR. This certificate is used by all the portal pods related to 2DCDR replication: **`portal-db-remote`**, **`portal-www-remote`**, and **`portal-tunnel`**.
`gateway-peering or gw-peer`	`ingress-issuer`	This certificate secures the communication between gateways in your gateway cluster. If you update this certificate, then restart your gateway pods. See Changing the secret for gateway peering.
`gwv6-endpoint or gw-gateway`	`ingress-issuer`	Legacy certificate that is not used.
`gateway-service or gw-svc`	`ingress-issuer`	Legacy certificate that is not used.
`gwv6-manager-endpoint or gw-gateway-manager`	`ingress-issuer`	The **`gatewayManager`** endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the **`gateway-client-client`** certificate on management subsystem If you update this certificate, then all gateway pods are restarted automatically.
`event-gateway-management-client`	`ingress-issuer`	The **`event-gateway-management-client`** certificate exists only on Cloud Pak for Integration deployments.

Table 6. Intra-subsystem certificates

Certificate name	Issuer	Description
`management-ca or mgmt-ca`	`selfsigning-issuer`	The issuer for the management subsystems intra-subsystem certificates: management-client, management-server, postgres, and nats certificates. Communication between management subsystem pods fails if there is a problem with this certificate. This certificate is also used as the CA for REST API calls to the management subsystem from the other subsystems, when using **`in-cluster`** communication. See In-cluster service communication between subsystems
`management-client or mgmt-client`	`management-ca`	Client certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.
`management-server or mgmt-server`	`management-ca`	Server certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate. Required DNS names within the SAN section are: **`*.<namespace>`** **`*.<namespace>.svc`** **`*.<namespace>.svc.cluster.local`** **`*.<instance name>-server.<namespace>.svc`** **`*.<instance name>-server.<namespace>.svc.cluster.local`** **`<instance name>-server`**
`db-client-apicuser`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`db-client-postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`natscluster-mgmt`	`management-ca`	Intra-subsystem certificate for the **`nats`** pods.
`analytics-ca or a7s-ca`	`selfsigning-issuer`	The issuer for the **`analytics-client`** and **`analytics-server`** certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If you update this certificate, you must then update the **`analytics-client`** and **`analytics-server`** server certificates, and then ensure that the following pods are restarted: • **`storage`**: Restarts automatically. • **`warehouse`**: Restarts automatically. • **`ingestion`**: Restarts automatically. • **`director`**: Restart manually.

Certificate name	Issuer	Description
`analytics-client or a7s-client`	`analytics-ca`	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, then the **`storage`**, **`warehouse`** and **`ingestion`** pods restart automatically. You must manually restart the **`director`** pod.

`analytics-server or a7s-server`	`analytics-ca`	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate.
		Required DNS names within the SAN section are:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<namespace>.svc.cluster.local`
		`*.<instance name>-server.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc.cluster.local`
		`<instance name>-server`
		`<instance name>-storage`
		`<instance name>-director`
		`<instance name>-ingestion`
		`<instance name>-mtls-gw`
		`<instance name>-storage-os-master`
		`<instance name>-warehouse`
		
		If this certificate is updated, then the **`storage`**, **`warehouse`** and **`ingestion`** pods restart automatically. You must manually restart the **`director`** pod.

`portal-ca or ptl-ca`	`selfsigning-issuer`	The issuer for the portal-client and portal-server certificates. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.
`portal-client or ptl-client`	`portal-ca`	Client certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.

`portal-server or ptl-server`	`portal-ca`	Server certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate.
		
		Required DNS names within the SAN section are:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<namespace>.svc.cluster.local`
		`*.<instance name>-server.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc.cluster.local`
		`<instance name>-server`
		`*.<instance name>-<site name>-db-all.<namespace>.svc`
		`*.<instance name>-<site name>-www-all.<namespace>.svc`
		`*.<instance name>-<site name>-db-all.<namespace>.svc.cluster.local`
		`*.<instance name>-<site name>-www-all.<namespace>.svc.cluster.local`
		`*.<namespace>.svc.cluster.local`
		`<instance name>-db`
		`#<remote portal CR name>-db # For 2DCDR only.`
		
		<instance name> and *<remote portal CR name>* are truncated if more than 15 characters.
		This certificate is used by all portal pods.

Troubleshooting API Connect

This section provides some general troubleshooting steps for use when encountering common problems with API Connect.

About

The following sections provide advice on diagnosing some common problems. This information can help you to identify whether a specific API Connect component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem.

- Unable to access Management UIs
- Unable to access the portal sites
- Login failure on Management UIs
- Login failure on Portal sites
- Management operations not reflected on Gateway or Portal

Related information

- IBM Support Service Requests and PMRs
- Gathering logs on Kubernetes and OpenShift
- Gathering logs on VMware

Unable to access Management UIs

If you are unable to access the UI login page, getting a blank page, an HTTP 404, or some other error.

When this happens it means that either the Management subsystem is down, or the access attempt is not reaching the Management subsystem due to a problem in the environment.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                                      READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch           1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

Check the following:

- Is the access attempt actually reaching the Management subsystem? To confirm this, check what is in the logs of the `juhu` pods which run on the Management subsystem. The `juhu` pods are the entry point for all UI, REST, and CLI requests to the Management subsystem. For every access request there should be line logged by the `juhu`pod, for example: When the user attempts to access the admin UI login page, the following is logged by the juhu pod:

  ```
  kubectl logs abc-management-juhu-fc8f6bb5d-jnw2q --since=5m
  ...
  9.20.85.205 - - [27/May/2022:10:35:49 +0000] [675fa59030a1a68028712ad2fdb2fdb1] "GET /api/cloud/admin/identity-providers
  HTTP/1.1" 200 301 "https://apimsvc20.hursley.ibm.com/auth/admin/sign-in/" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7)
  AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36" "9.145.13.216" [127.0.0.1:2000]
  request_time=0.222 upstream_response_time=0.224
  ...
  ```

  Note that the timestamp of these log records are not the time when the request arrived, but the time when the response to the request was sent back. To work out the arrival time you can subtract the `request_time=0.222` that appears later in the log message. If there is nothing logged in the `juhu` pods at the time the UI access is attempted, then check if you have any network problems between your browser and the Management subsystem. If you are on OVA then the tcpdump utility is available which you can use to confirm if traffic is reaching your Management VM, for example `tcpdump -i any src host 9.20.86.22 and dst port
  443`
- Are the Management subsystem pods all up and running? Check this with `kubectl get ManagementCluster -n <namespace>`. If this does not show all pods running, then check which pods are failing: `kubectl get pods -n <namespace>`. If you are on OVA then gather postmortem logs and open a support case at this point. Otherwise it's worth checking the reasons why the pods are failing to start with `kubectl describe` as it might be something in your kubernetes environment that you can fix. Note that on the Management subsystem the `postgres` pods will need to be running first, so if these are not running then most other Management pods will not start.
- Check the logs of the `apim` pods while attempting to access the UI. The `juhu` pods receive the requests from the UI, and send them on to the `apim` pods for processing. The logs of the `apim` pods may reveal some clues as to the cause of the problem. If nothing is logged in the `apim` pods at the time of the access attempt then it suggests a problem in the environment, the `juhu` pods unable to forward requests to `apim`.

- Gathering logs on Kubernetes and OpenShift
- Gathering logs on VMware

Unable to access the portal sites

If you are unable to access the login page of a portal site, getting a blank page, an HTTP 404, or some other error.

A portal site outage can occur for one of the following reasons:

- The portal site is down.
- The portal subsystem is down (and so all sites are down).
- The access attempt is not reaching the portal due to a problem in the network or Kubernetes environment.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                                      READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch           1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

Check for the following problems:

- Does the access attempt reach the portal subsystem?
  To confirm that your browser is able to reach the portal site, check the `admin` container logs of the portal's `www` pods. The `nginx` process that runs in the `admin` container is the entry point for site access. For every attempt to access a portal site, the `admin` container logs the HTTP call, for example:

  ```
  # kubectl logs abc-portal-site1-www-0 -c admin | grep nginx
  ...
  ```

```
[     nginx stdout]   584 ce6ce0:adad58:00580c 2022-05-27 12:57:38: "9.145.11.161, 9.20.85.206" portal.site1.example.com
"GET /providerorg1/sandbox/ HTTP/1.1" 200 5026 5315 5992 "-" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36" 0.330 "-"
...
```

Note: On v10.0.6, v10.0.5.4 and previous releases, the **nginx** logs are in the **web** container. Use the same command, but replace "**-c admin**" with "**-c web**".
If the **admin** container logs nothing at the time the site access is attempted, then check for:

- Network problems between your browser and the portal subsystem.
- Problems with Kubernetes ingresses or OpenShift routes to the portal web endpoint.
- If you are on VMware, then the **tcpdump** utility is installed, and you can use it to confirm if traffic is reaching your portal VM. For example:

```
tcpdump -i any src host 9.20.86.22 and dst port 443
```

- Are the portal subsystem pods all up and running?
  Run **kubectl get ptl** to check that your portal pods are running. If this does not show that all pods are running, then check which pods are failing: **kubectl get pods**. If you are on VMware, then gather postmortem logs and open a support case. If you are on Kubernetes or OpenShift, then check why the pods are failing to start with **kubectl describe <pod name>**. On the portal subsystem, the **-db-** pods must be running first; the other pods do not start until the **-db-** pods are running.
- If the **admin** container logs show that the access attempt is received, then check the **web** container logs to see whether there are any errors at the PHP level.

- Gathering logs on Kubernetes and OpenShift
- Gathering logs on VMware

Login failure on Management UIs

If you are able to access the Management UIs login page, but the login attempt is failing.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: **ssh apicadm@mgmt1.example.com**
2. **Sudo** to the root user: **sudo -i**
3. From here you can run **kubectl** commands, for example:

```
# kubectl get pods
NAME                                                              READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch                   1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with **-n** in the **kubectl** commands.

Check the logs of the **juhu** and **apim** pods at the time of the login attempt to confirm that the login attempt did reach the Management subsystem. For more information on the **juhu** logs see Unable to access Management UIs. If the login attempt reached the Management subsystem, more details of the login failure for Local User Registry users can be found in the **lur** pod logs, and for LDAP users in the **ldap** pods. Example:

```
# kubectl logs abc-management-lur-8bbc47b54-9vl8q --since=1m -f
...
2022-05-27T13:41:13.511Z audit [4d55be1800dcef18c64e0470484e6eac] START: >>>>>>>> [POST]: /user-login
2022-05-27T13:41:13.704Z lur:error [4d55be1800dcef18c64e0470484e6eac] Requested login, but user, notauser not found in user
registry,
2022-05-27T13:41:13.706Z bhendi:error [4d55be1800dcef18c64e0470484e6eac] Error in POST post:/user-login (user.js:login)
  - status : 401
...
```

Related information

- Gathering logs on Kubernetes and OpenShift
- Gathering logs on VMware

Login failure on Portal sites

If you are able to access the Portal sites login page, but the login attempt is failing.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: **ssh apicadm@mgmt1.example.com**
2. **Sudo** to the root user: **sudo -i**
3. From here you can run **kubectl** commands, for example:

```
# kubectl get pods
NAME                                                              READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch                   1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with **-n** in the **kubectl** commands.

All Portal users except for the site Admin user are ultimately authenticated by the Management subsystem, however Portal adds additional security controls such as IP banning and Flood control which should be first place to check for portal login issues: Managing Developer Portal security.

If the login problem is with the Admin user, then check the logs of the **web** container in the **www** pod at the time of the attempt, for example:

```
# kubectl logs abc-portal-site1-www-0 -c web --since=1m
...
[   php-fpm stderr]   585 ce6ce0:adad58:c3852e 2022-05-27 14:16:49: WARNING: [pool www] child 1023 said into stderr: "WATCHDOG:
[NOTICE] [user] Login attempt failed for admin. | user: anonymous | uri:
https://provorg1.sandbox.portal.apimsvc21.hursley.ibm.com/provorg1/sandbox/user/login | referer:
https://portal.site1.example.com/provorg1/sandbox/user/login
...
```

If the Portal site itself is not rejecting the user login, then check the Management server logs during the login attempt: Login failure on Management UIs. It may also be worth checking the logs of the **admin** container in the **www** pod, which manages the Portal end of the communications with the Management subsystem.

Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address**.

Management operations not reflected on Gateway or Portal

Where publishes or deletes executed on the Management subsystem are not reflected on the gateway or portal within a few minutes. These problems are often caused by a network failure between Management and the other subsystems, or due to TLS handshaking failures.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

   ```
   # kubectl get pods
   NAME                                                    READY   STATUS      RESTARTS      AGE
   abc-management-analytics-proxy-5f8bcd74c4-jbhch         1/1     Running     1 (97d ago)   113d
   ...
   ```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

For Gateway, the first place to check is the processing status page: Reviewing processing status and downloading gateway logs

For Portal and Gateway check the logs of the **taskmanager** pods at the time of the publish attempt. These pods send the publish operations to the gateway and portals via webhooks. If there is a network problem you may see socket timeout errors in the logs of these pods, or TLS errors if there is problem with your certificates. A common problem are load-balancers doing TLS termination instead of passthrough (where JWT security is not used, see Using JWT instead of mTLS on Kubernetes and OpenShift, Using JWT instead of mTLS on OVA). If the logs suggest that the webhook was sent successfully then check the gateway director (gwd) logs on the Gateway, and the **www** pod **admin** container logs on the portal, for example:

```
kubectl logs abc-portal-site1-www-0 -c admin
```

Taskmanager pods execute "send" tasks to publish operations to the gateways and portals. The taskmanager pods log messages about the progress of tasks, so there should be messages in a taskmanager pod for a send task soon after applying a change on the Management subsystem. A "send running in pod" message like the following example means the send task is running:

```
2023-05-05 14:02:37.270 management-taskmanager-f5d6fd77-dmnnt taskmanager apim:taskmanager:info:taskProcessor [0d30189c-db39-
4260-bb1f-a75a3ac5f1ba] task id: b3933261-5799-473d-9b83-9e29c245fde8 / kind: send running in pod: management-taskmanager-
f5d6fd77-dmnnt / containerId: cri-o://d5afe6d3960e333c1ea5d8f95b79564e769bc2ed5de9d8baebebd84b3f3ad4be 269ms after claimed
```

If the taskmanager logs an error containing "dispatching task failed for task"(logged when attempting to start a task) or an error containing "Stale claimed task" (logged 15 minutes later), API Connect might have a problem running tasks. A small number of these errors might be reported from time to time, and the system recovers automatically. But if the errors continue being reported, restart the natscluster pods (all together) and then restart the taskmanager pods to recover by running the following commands:

```
kubectl -n <namespace> delete po -l app.kubernetes.io/name=natscluster
kubectl -n <namespace> delete po -l app.kubernetes.io/name=taskmanager
```

When raising a support case, be sure to include logs from both the Management subsystem and the affected subsystems gateway/portal, stating when the publish attempt was made.

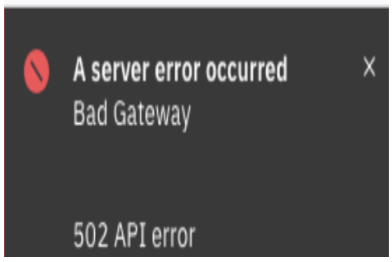
UI error after certificate rotation in Cloud and API Manager

Cloud Manager and API Manager UI displays an error.

After management-ca certificate rotation, both Cloud Manager and API Manager UI might display a 502 API error, indicating a server error occurred. Additionally, missing reload messages **The apim microservice is reloading server certificates for port** in **management-apim** pods.



To resolve this error, restart the affected **`management-apim`** pods by deleting these pods.

Resolving self-signed certificate errors in TLS connections

If you are unable to establish a Transport Layer Security (TLS) connection with the server.

Symptom
: When you try to register a portal, analytics, or gateway service in topology of Cloud Manager, the system displays the following error: **`Unable to verify first certificate`** or **`Self-signed certificate in chain`**.

Cause
: The server issues its own certificate, which means it certifies itself, and the client does not trust it because it trusts only certificates issued by a trusted certificate authority (CA).

Solution
: To resolve this issue, implement the following solutions:

- Obtain a Certificate from a CA
- Add the server's self-signed certificate to the client's truststore
- Configure the client to trust the CA
- Additional steps

Obtain a Certificate from a CA

To obtain a certificate from a CA, complete the following steps:

1. Decide on the type of certificate required for your server.
2. Select a trusted CA that is recognized by most clients.
3. Create a Certificate Signing Request (CSR) on your server that uses a tool like OpenSSL.
4. Provide the CSR to the chosen CA and follow their instructions for obtaining a certificate.
5. After the CA issues the certificate, install it on your server.
6. Update your server's configuration to use the newly installed certificate.

Add the server's self-signed certificate to the client's truststore

To add the server's self-sighed certificate to the client's truststore, complete the following steps:

1. Export the server's self-signed certificate in a format that can be imported into the client's truststore.
2. Determine the location of the client's truststore, which might vary depending on the client software or operating system.
3. Use a tool like OpenSSL or the client's built-in certificate management utility to import the server's certificate into the truststore.

Configure the client to trust the CA

To configure the client to trust the CA, complete the following steps:

1. Obtain the CA's certificate that issued the server's self-signed certificate.
2. Export the CA's certificate in a format that can be imported into the client's truststore.
3. Use a tool like OpenSSL or the client's built-in certificate management utility to import the CA's certificate into the truststore.

Additional steps

To establish a Transport Layer Security (TLS) connection with the server, complete the following steps:

1. Ensure that the server's certificate is properly chained to the CA's certificate.
2. Verify that the client's truststore contains the expected certificates.
3. Test the TLS connection that uses a tool like OpenSSL to ensure that the certificate is being properly validated.

Externally linked support topics

Topics that are linked to externally, covering maintenance operations, known issues, and error handling.

- **Management subsystem Postgres failover steps V10.0.6.0**
  V10.0.6 only: If your Postgres leader pod is not the original Postgres leader, complete the failover steps to restore the original pod as leader.

- **Restore blocked on 2DCDR deployments**
  V10.0.7.0 and later. Management database restore is blocked on two data center disaster recovery deployments.

Management subsystem Postgres failover steps V10.0.6.0

V10.0.6 only: If your Postgres leader pod is not the original Postgres leader, complete the failover steps to restore the original pod as leader.

Before you begin

This topic applies only to three replica deployments of API Connect.

Follow the steps in this topic if one or more of the following conditions are reported:

- If the **apicops version:pre-upgrade** command reports:

  ```
  Current postgres leader is not the original leader
  ```

- Openshift and Cloud Pak for Integration only: Your API Connect cluster CR reports `Error` status, and the output of:

  ```
  oc get apiconnectcluster -n <namespace> -o yaml
  ```

  shows:

  ```
  Original PostgreSQL primary is running as replica, please perform failover to original primary before attempting upgrade.
  Refer - https://ibm.biz/BdPLWU
  ```

- When you attempt to upgrade the management subsystem by editing the management CR to change the version and license and you see this error:

  ```
  Original PostgreSQL primary is running as replica, please perform failover to original primary before attempting upgrade.
  Refer - https://ibm.biz/BdPLWU
  ```

About this task

The management subsystem uses Postgres as the database. A three replica API Connect deployment has a Postgres cluster that consists of 1 Postgres leader, and 2 Postgres replicas.
Note: In Kubernetes terminology, every pod in a cluster is called a "replica". In Postgres terminology, a Postgres cluster consists of "members", one of the members is designated as the leader, and the others are designated as "replicas". During normal operation, the Postgres cluster member that is the leader can change; one of the Postgres replicas can become the leader, and the original leader become a replica.
If the current Postgres cluster leader in your management deployment is not the original leader, then problems can occur during upgrade. To prevent upgrade problems, follow the steps in this topic to identify the original Postgres leader and assign it as the leader again.
Note: If you have an OVA deployment, run the steps that are documented in this topic from your management virtual appliance, as the root user: Login to your management virtual appliance with an SSH client and the username `apicadm`, then switch to the root user with `sudo -i`.

Procedure

1. Assign your management subsystem namespace to a new environment variable called `$NAMESPACE`

   ```
   export NAMESPACE=<management namespace>
   ```

   Note: On OVA deployments, set this to "default":

   ```
   export NAMESPACE=default
   ```

2. Identify the original name of your Postgres cluster, and assign it to a new environment variable `$PGCLUSTER_NAME`.

   ```
   export PGCLUSTER_NAME=$(kubectl -n $NAMESPACE get pgcluster | awk 'NR==2{print $1}')
   ```

   Confirm the variable is set correctly with:

   ```
   echo $PGCLUSTER_NAME
   ```

3. Get a list of the PVCs whose names start with `$PGCLUSTER_NAME` in your API Connect namespace.

   ```
   kubectl -n $NAMESPACE get pvc $PGCLUSTER_NAME $PGCLUSTER_NAME-wal
   ```

   ```
   NAME                       STATUS   VOLUME              CAPACITY   ACCESS MODES   STORAGECLASS    AGE
   m1-33253de3-postgres       Bound    local-pv-2b61c0bd   234Gi      RWO            local-storage   6h42m
   m1-33253de3-postgres-wal   Bound    local-pv-bd893695   234Gi      RWO            local-storage   6h42m
   ```

   Note: If no PVCs are returned then check the `apicops` error or management CR warning, if it says "The original primary PVC is not attached to any pods in this namespace", then do not proceed with these steps. Instead, to re-create your Postgres cluster with a new leader:
   a. Take a new management database backup Backup and restore.
   b. Restore the management database from the new backup.

4. Get the names of all the Postgres pods.

   ```
   kubectl get pods -n $NAMESPACE -l 'role in (master,replica)'
   ```

   ```
   NAME                                        READY   STATUS    RESTARTS   AGE
   m1-33253de3-postgres-dbd7966db-ltfhq        1/1     Running   0          61s
   m1-33253de3-postgres-dxxx-c54776d87-wldgb   1/1     Running   0          26m
   m1-33253de3-postgres-xwjf-8577b6c669-9chcp  1/1     Running   0          26m
   ```

5. Identify which pod was the original Postgres leader.

Describe each Postgres pod to see which one is using the two PVCs identified in step 3.

```
kubectl -n $NAMESPACE describe pod <pod-name> | grep 'ClaimName'

k describe pod m1-33253de3-postgres-dbd7966db-ltfhq | grep ClaimName
    ClaimName:  m1-33253de3-postgres
    ClaimName:  m1-33253de3-postgres-wal

k describe pod m1-33253de3-postgres-dxxx-c54776d87-wldgb | grep ClaimName
    ClaimName:  m1-33253de3-postgres-dxxx
    ClaimName:  m1-33253de3-postgres-dxxx-wal

k describe pod m1-33253de3-postgres-xwjf-8577b6c669-9chcp | grep ClaimName
    ClaimName:  m1-33253de3-postgres-xwjf
    ClaimName:  m1-33253de3-postgres-xwjf-wal
```

In this example, the highlighted pod `m1-33253de3-postgres-dbd7966db-ltfhq` is the pod that is using the PVCs identified in step 3.
Set this pod to the environment variable *$ORIGINAL_POSTGRES_LEADER*:

```
export ORIGINAL_POSTGRES_LEADER=<pod-name>
```

Note: If none of the Postgres pods are using the PVCs identified in step 3, then do not proceed with these steps. Instead, to re-create your Postgres cluster with a new leader:

a. Take a new management database backup Backup and restore.
b. Restore the management database from the new backup.

6. Run the **patronictl list** command in each Postgres pod and examine the output.

```
kubectl -n $NAMESPACE exec -it <postgres-pod> -- patronictl list
```

Example output for each Postgres pod:

```
Defaulted container "database" out of: database, set-libpq-certs (init)
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Leader  | running |  8 |           |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
```

Each Postgres pod should show the same output, although the order of the records might differ. The names in the `Member` column should match the names of the Postgres pods. Check the following:

- If the original Postgres pod that you identified in step 5 has a `Lag in MB` of zero and a `TL` the same as the `Leader` pod, then continue to step 7.
- If the pod labeled `Leader` shows a `TL` that is less than the other pods, or a non-null `Lag in MB`, then proceed no further and open a support case.
- If the original Postgres pod that you identified in step 5 shows a lower `TL` than the other pods, or a nonzero value in `Lag in MB`, then reinitialize that pod:

  ```
  kubectl exec -it $ORIGINAL_POSTGRES_LEADER -n $NAMESPACE -- patronictl reinit <cluster name>
  $ORIGINAL_POSTGRES_LEADER
  ```

  where:

  - *<cluster name>* is the name of the Postgres cluster that is shown in the **patronictl list** output:

    ```
    + Cluster: <cluster name> ...
    ```

  Run **patronictl list** again to confirm that the `Lag in MB` is reducing. Do not proceed until it is zero. If it is not reducing, open a support case.

7. Make the pod that you identified in step 5 the `Leader`.
Run:

```
kubectl -n $NAMESPACE exec -it <postgres pod> -- patronictl failover
```

and select your $ORIGINAL_POSTGRES_LEADER as the candidate to failover to:

```
Candidate ['m1-33253de3-postgres-dbd7966db-ltfhq', 'm1-33253de3-postgres-dxxx-c54776d87-wldgb'] []: m1-33253de3-postgres-
dbd7966db-ltfhq
Current cluster topology
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Leader  | running |  8 |           |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
Are you sure you want to failover cluster m1-33253de3-postgres, demoting current master m1-33253de3-postgres-xwjf-
8577b6c669-9chcp? [y/N]: y
2021-12-10 22:07:02.15154 Successfully failed over to "m1-33253de3-postgres-dbd7966db-ltfhq"
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Leader  | running |  8 |           |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Replica | stopped |    |   unknown |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
```

8. Run **patronictl list** to confirm that the pod that was identified in step 5 is the new leader, and that `TL` and `Lag in MB` are reported to be the same in each pod.

```
kubectl exec -it <postgres-pod> -n $NAMESPACE -- patronictl list

+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Leader  | running |  9 |           |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  9 |         0 |
```

```
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Replica | running |  9 |          0 |
+--------------------------------------------+-----------------+---------+---------+----+------------+
```

Restore blocked on 2DCDR deployments

V10.0.7.0 and later. Management database restore is blocked on two data center disaster recovery deployments.

From V10.0.7.0, you cannot restore the management database on an API Connect two data center disaster recovery deployment. You must remove the 2DCDR configuration before you can restore the management database. For more information, see the 2DCDR backup and restore documentation for your platform:

- 2DCDR backup and restore considerations on Kubernetes, OpenShift, and Cloud Pak for Integration.
- 2DCDR backup and restore considerations on VMware
